PREFACE

Censuses of the population of Canada as a whole are taken every ten years, a supplementary Census of the Prairie Provinces being taken every five years at the mid-point between decennial censuses. In the intercensal years, the Dominion Bureau of Statistics collects and publishes statistical information on the economic and social activities and conditions of the people of Canada but undertakes no actual measure of the size and composition of the population.

However, the usefulness of the information published annually by the Bureau is in many cases greatly enhanced by relationship to annual population figures. In particular the yearly data required by authorities in the fields of health and welfare assume full significance only when expressed in ratio to population. The aim of this publication is to meet such public and governmental requirements by providing reliable estimates of the age and sex distribution of the population of Canada and each province for the intervening years between the periodic censuses from 1921 to date.

Similar figures have been published previously in Analytical Report No.1 of the Health and Welfare Division of the Bureau, covering the period 1931-1948. Subsequently, annual supplements were issued containing corresponding estimates for the years 1949, 1950 and 1952. The present publication differs from its predecessor by including, for the first time, figures for the years 1921-1930 and in presenting revised estimates for the years 1942-1950 based on results of the 1951 Census. Data for Newfoundland are included commencing with 1949, the year in which that province entered the Canadian confederation.

The figures represent the actual or estimated population as of June 1 in each year, rounded to hundreds but expressed in thousands for convenience. Those for 1921, 1931, 1941 and 1951 are actual census counts as are those for the Prairie Provinces in 1926, 1936 and 1946. All other figures are estimates calculated by the methods described in the Introduction.

The future publication of population estimates will be regularized by the issuance in each intercensal year of a one-page supplement to the present publication and by the preparation, as soon as possible after each decennial census, of a new edition containing revised estimates for the previous decade based on census results.

The estimates in the present publication, which is issued by the Health and Welfare Division, were calculated in the Census Division under the direction of the Senior Research Statistician of the Bureau.

Herbert Marshall,  
Dominion Statistician.

PREFACE

Les recensements de la population du Canada entier ont lieu tous les dix ans et un recensement supplémentaire des provinces des Prairies a lieu tous les cinq ans, soit à mi-chemin entre les recensements décennaux. Dans les années intercensales, le Bureau fédéral de la statistique réunit et publie des renseignements statistiques sur l'activité économique et sociale de la nation canadienne de même que sur les conditions dans lesquelles elle vit; il n'établit aucune mesure réelle de l'importance numérique et de la composition de la population.

Toutefois, les renseignements publiés annuellement par le Bureau revêtent souvent une utilité beaucoup plus grande si on les rapproche des chiffres annuels de la population. Les données annuelles, par exemple, exigées par les autorités dans les domaines de la santé et du bien-être ne prennent toute leur importance que si elles sont exprimées en fonction de la population. La présente publication doit donc répondre à ces besoins du public et du gouvernement en donnant des estimations fiables de la répartition de la population du Canada et de chaque province selon l'âge et le sexe pour les années écoulées entre les recensements périodiques depuis 1921.

Des chiffres semblables, qui embrassaient la période de 1931-1948, ont été publiés dans le Rapport analytique n° 1 de la Division de la santé et du bien-être du Bureau. Dans la suite, des suppléments annuels ont été publiés qui contenaient des estimations correspondantes pour les années 1949, 1950 et 1952. La présente publication diffère de la précédente en ce que, pour la première fois, on y trouve des chiffres pour les années 1921-1930 de même que des estimations rectifiées pour les années 1942-1950 et basées sur les résultats du recensement de 1951. Les données de Terre-Neuve sont incluses à compter de 1949, année où cette province est entrée dans la Confédération canadienne.

Les chiffres sont ceux de la population réelle ou estimative le 1<sup>er</sup> juin chaque année; ils sont arrondis à la centaine mais, pour plus de commodité, exprimés en milliers. Ceux de 1921, 1931, 1941 et 1951 de même que ceux de 1926, 1936 et 1946 pour les provinces des Prairies sont les chiffres réels du recensement. Tous les autres sont des estimations établies d'après les méthodes décrites dans l'introduction.

Les estimations de la population qui paraîtront à l'avenir seront régularisées par la publication, au cours de chaque année intercensale, d'un supplément d'une page à la présente publication et par la préparation, le plus tôt possible après chaque recensement décennal, d'une nouvelle édition contenant les estimations revisées de la décennie précédente basées sur les résultats du recensement.

Les estimations contenues dans la présente publication de la Division de la santé et du bien-être ont été établies à la Division du recensement sous la surveillance du directeur des recherches statistiques du Bureau.

Le statisticien du Dominion  
Herbert Marshall

## INTRODUCTION

The data available for the calculation of the estimates shown were not the same throughout the period covered, so that a different method of estimation has been used for each of the three decades included. The methods are generally similar in that in each case an initial census was the starting point of calculation, and in general natural increase and net immigration were added at each age for each province. Estimates of interprovincial migration were derived from the 1941 Census, the ration book counts during the war, and the post-war quarterly surveys of the labour force.

For the 1922-1930 decade the national figures were calculated by straight line interpolation for each age-sex cohort of the 1921 Census to its known population in the 1931 Census. This gave annual estimates for artificial age groups for each year which were then converted back into the conventional age groups by simple pro-rating. The provincial age-sex figures were calculated from the starting point of existing annual estimates of provincial populations at all ages. These provided, for each province, the annual proportion of the 1921-1931 change which could be used to bring forward each cohort throughout the ten year period. The results were then adjusted to agree, first with the national figure for each age-sex group, then with the provincial totals for all ages. Finally a check was made against births for children 0-4 years of age.

For the 1932-1940 decade the estimates previously published are shown without change. These had been calculated by following the 1931 population at each single age into the next higher age reached each year by subtracting annual deaths. With births added each year, this process gave "expected" figures for 1941 which were compared with the actual figures of the 1941 Census. The difference ratios for each age and sex were then used to adjust the annual estimates. The final step was adjustment of the provincial age-sex figures to agree with the previously estimated provincial and national totals.

For the 1942-1950 decade the methods used were similar to those for 1932-1940, additional adjustments being made in the light of information from ration book counts, labour force surveys, official immigration figures by age and sex, and emigration data taken from publications of the United States and United Kingdom. The unrecorded emigration disclosed by the 1951 Census was distributed in proportion to immigration between 1942 and 1951 separately for each province, and the national figure obtained by addition.

For 1952 estimates, the deaths for 1951-1952 in each five year age group were subtracted from the 1951 Census figures for corresponding age groups, and births were added to the age group 0-4. The artificial groupings so derived were divided by applying 1951 age-group proportions and re-assembled into the standard age groups. Immigrants were added by age and estimates of emigration subtracted.

## INTRODUCTION

Les données dont on disposait pour le calcul des estimations n'étaient pas les mêmes pour toute la période observée. Il a fallu, en conséquence, recourir à une méthode différente pour chacune des trois décennies étudiées. Quant aux méthodes, elles sont généralement semblables en ce que dans chaque cas on a pris comme point de départ des calculs un recensement initial et on y a ajouté, à chaque âge et pour chaque province, l'accroissement naturel et l'immigration nette. Les estimations de la migration interprovinciale ont été tirées du recensement de 1941, des carnets de rationnement distribués durant la guerre et des relevés trimestriels de la main-d'œuvre d'après-guerre.

Pour la décennie de 1922-1930, les chiffres nationaux ont été calculés, pour chaque cohorte âge sexe de 1921, par interpolation en ligne droite à sa population connue au recensement de 1931. Cela a donné, pour chaque année, des estimations annuelles pour des groupes d'âge artificiels, lesquels furent ensuite ramenés aux groupes d'âge normaux par simple répartition proportionnelle. Les chiffres des provinces, selon l'âge et le sexe, ont été calculés d'après le point de départ des estimations annuelles existantes des populations provinciales à tous âges. Cela a donné, pour chaque province, la proportion annuelle de changement entre 1921 et 1931 qui pouvait servir à reporter d'une année à l'autre durant la période de dix ans chaque cohorte de 1921. On a ensuite fait concorder les résultats, d'abord avec le chiffre national pour chaque groupe selon l'âge et le sexe et, ensuite, avec les totaux provinciaux pour tous les âges. Finalement, pour les enfants de 0-4 ans, on a fait une vérification à la lumière des naissances.

Pour la décennie de 1932-1940, les estimations publiées antérieurement sont données sans changement. On les avait calculées en suivant la population de chaque âge en 1931 jusqu'à l'âge suivant et en soustrayant les décès de l'année. En ajoutant les naissances de chaque année, on a obtenu par cette méthode les chiffres "prévus" pour 1941, lesquels furent comparés avec les chiffres réels du recensement de 1941. On a ensuite employé les différences proportionnelles pour chaque âge et chaque sexe afin de rectifier les estimations annuelles. Pour terminer, on a rectifié les chiffres provinciaux selon l'âge et le sexe pour les rendre conformes aux totaux provinciaux et nationaux antérieurement estimés.

Les méthodes employées pour la décennie de 1942-1950 furent les mêmes que pour 1932-1940, des rectifications supplémentaires ayant été faites à la lumière des renseignements tirés des carnets de rationnement, des relevés de la main-d'œuvre, des chiffres officiels sur l'immigration selon l'âge et le sexe et des données sur l'emigration tirées des publications des Etats-Unis et du Royaume-Uni. L'emigration non enregistrée que le recensement de 1951 a révélée a été répartie proportionnellement à l'immigration de 1942 et de 1951 pour chaque province séparément, et le chiffre national a été obtenu par addition.

Quant aux estimations de 1952, les décès de 1951-1952 dans chaque groupe d'âge quinquennal ont été soustraits des chiffres du recensement de 1951 pour les groupes d'âge correspondants et les naissances ont été ajoutées au groupe de 0-4 ans. Les groupes artificiels ainsi obtenus ont été divisés d'après les proportions de 1951 selon l'âge et le sexe et reformés en groupes d'âge normaux. Les immigrés ont été ajoutés par âge et l'emigration estimative a été soustraite.
