## Data in Many Forms ...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

## How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

Population Projections Section,  
Demography Division,

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 951-0695)  
or to the Statistics Canada reference centre in:

St. John's	(772-4073)	Winnipeg	(983-4020)
Halifax	(426-5331)	Regina	(780-5405)

## Des données sous plusieurs formes ...

Statistique Canada diffuse les données sous diverses formes. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordinarolingue et le système d'extraction de Statistique Canada.

## Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section des projections démographiques,  
Division de la démographie,

Statistique Canada, Ottawa, K1A 0T6 (téléphone: 951-0695) ou au  
centre de consultation de Statistique Canada à:

## Preface

Statistics Canada last published population projections for Canada, the provinces and the territories in 1985. Since then, unpublished interim projections, based on the 1986 Census population, were released in September 1988. The projections presented in this report use 1989 population estimates as their base. Moreover, they take into account emerging trends in international and internal migration. Most notably, the number of immigrants to Canada has virtually doubled as the result of a federal government decision to upwardly revise the target number of immigrants. There has also been a resumption of the westward flow of internal migrants - namely to British Columbia. These developments are likely to have a long-term impact on the dynamics of population growth.

It bears emphasizing that population projections are not predictions. Rather, they represent an attempt to establish plausible twenty-year scenarios based on a rigorous analysis of current and emerging demographic trends. As such, they are a valuable tool for planners and policy makers.

Ivan P. Fellegi,  
Chief Statistician of Canada.

## Préface

Les dernières projections démographiques pour le Canada, les provinces et les territoires, publiées par Statistique Canada, remontent à 1985. En septembre 1988, des projections intérimaires, basées sur les données du recensement de 1986, ont été rendues publiques sans toutefois être publiées. La nouvelle série présentée dans ce document prend appui sur les estimations de population de 1989. De plus, elles tiennent compte des tendances récentes de la migration tant internationale qu'interne. Suite à la révision à la hausse du nombre souhaitable d'immigrants pour le Canada par le gouvernement fédéral, le nombre d'immigrants reçus a doublé au pays. Par ailleurs, on voit apparaître une résurgence du mouvement de migration interne vers l'Ouest, avec la Colombie-Britannique comme pôle d'attraction. Ces changements sont susceptibles de modifier à long terme la dynamique de la croissance démographique.

Sous peine de se répéter, il convient de rappeler que les projections ne sont pas des prédictions. À partir d'une analyse rigoureuse des tendances démographiques, elles présentent des scénarios plausibles d'évolution de la population au cours des deux prochaines décennies. De ce fait, elles sont un outil précieux aux fins de la planification et de l'élaboration des politiques.

Ivan P. Fellegi,  
Statisticien en chef du Canada.

## Acknowledgements

This report, and the projections herein, represents the joint effort of the staff of the Population Projections Section and several other members of Demography Division. The projections were developed by a team headed by J. Perreault, with research contributions on component assumptions by R. Costa, M. Declos, D. Larrivée and S. Loh. J. Perreault drafted the manuscript, which was then reviewed and edited by Y. Lavoie of Université du Québec, M.V. George, R. Riordan, A. Romaniuc and, in part, by C. Fortier. The report was prepared under the general direction of M.V. George and A. Romaniuc, with M. Declos and S. Rémillard acting as coordinators. Finally, the manuscript was reviewed by D.B. Petrie and E.T. Pryor, both from the professional and corporate point of view.

Computer programming was done by V. Kawka. Research support was provided by M. Charbonneau, L. Dell'Oso and I. Kisbee. P. Chase and N. Hymers were responsible for word processing.

During the preparation of these projections, a number of related federal departments and several experts in the field were consulted. The Federal-Provincial Committee on Demography, and the Provincial and Territorial Statistical Focal Points provided feedback in developing the projection assumptions for the provinces, and in selecting the projection scenarios included in this volume.

## Remerciements

Ce rapport de même que les projections qu'il contient sont le produit de la collaboration de la section des projections démographiques et de plusieurs membres de la Division de la démographie. Sous la supervision de J. Perreault, une équipe de chercheurs, formée de R. Costa, M. Declos, D. Larrivée et S. Loh, a élaboré les hypothèses relatives aux composantes de ces projections. J. Perreault a rédigé la version préliminaire du rapport. Celle-ci a par la suite été révisée et éditée par Y. Lavoie de l'Université du Québec, M.V. George, R. Riordan, A. Romaniuc, et en partie par C. Fortier. Le rapport a été préparé sous la direction générale de M.V. George et A. Romaniuc, avec M. Declos et S. Rémillard assurant la coordination. D.B. Petrie et E.T. Pryor ont lu le rapport tant du point de vue de son contenu que de celui des exigences institutionnelles.

La programmation informatique est l'oeuvre de V. Kawka. L'assistance de recherche a été fournie par M. Charbonneau, L. Dell'Oso et I. Kisbee. P. Chase et N. Hymers ont été responsables du traitement de texte.

Au cours de la préparation de ces projections, nombre de départements fédéraux pertinents et d'experts dans le domaine ont été consultés. Le comité fédéral-provincial de démographie et les coordonnateurs statistiques provinciaux et territoriaux ont fait connaître leurs avis lors de l'élaboration des hypothèses de projection provinciales et de la sélection des scénarios de projection inclus dans ce volume.

## Highlights

### General

The demographic pattern emerging by the year 2000 could be marked by:

- (1) a slowdown in population growth;
- (2) a gradual ageing of the population at first, followed by substantial acceleration by 2015 as the baby-boom cohorts reach retirement age;
- (3) an increasing role played by immigration in the dynamics of Canada's population growth, and;
- (4) a preponderance of internal migration in the provincial distribution of the population.

### Population Growth

Canada's population size, which was 26 million in 1989, would reach between 29 and 32 million by 2011, depending on the projection assumptions selected.

However, Canada's population growth is losing momentum. The average annual rate declined from 2.6% for the 1951-61 decade to 1.7% for 1961-71 and 1.2% for 1971-81. Over the 1981-89 period, it averaged 0.9%.

The fertility rate, which has dropped from an average of four births per woman in 1959 to about 1.7, is the main cause of the slowdown in population growth.

Although the current fertility rate is below the level required to ensure the replacement of generations (2.1 births per woman), the population will continue to grow, albeit slowly, until 2006 even in the absence of migration. During that period, the

## Points saillants

### Général

Le régime démographique qui émerge à l'horizon 2000 serait marqué par:

- (1) le ralentissement de la croissance démographique;
- (2) le vieillissement de la population, graduel d'abord, puis substantiel à partir de 2015 alors que les générations du baby-boom arriveront à l'âge de la retraite;
- (3) l'apport grandissant de l'immigration au renouvellement démographique du Canada; et
- (4) le rôle prépondérant de la migration interne dans la distribution provinciale de la population.

### Croissance démographique

La population du Canada, qui était de 26 millions en 1989, se situerait vers 2011 entre 29 et 32 millions selon les hypothèses de projection retenues.

Toutefois, la croissance démographique du pays est en perte de vitesse. De 2.6% pour la décennie de 1951-61, le taux annuel moyen est tombé successivement à 1.7%, 1.2% et 0.9% pour les périodes 1961-71, 1971-81 et 1981-89.

Ce ralentissement de la croissance démographique est principalement dû à la chute de l'indice synthétique de fécondité qui est passé de quatre à 1.7 naissance par femme, depuis 1959.

Bien que la valeur actuelle de l'indice synthétique de fécondité soit inférieure au seuil de renouvellement des générations (2.1 naissances par femme), la population canadienne continuera de croître, lentement il est vrai, jusqu'en 2006 environ, et ce, même en l'absence de

population will have a relatively high proportion of women of childbearing age.

After the turn of the century, save for a reversal in fertility trends, the size of the population and its pace of growth will depend largely on the level of immigration.

At the current fertility rate (1.67), Canada's population will reach a maximum of 32.7 million around 2030 with annual immigration of 145,000 (the actual average for the last three years), and 34.2 million by 2035 with an immigration level of 200,000. Annual emigration is assumed to be 45,000 in the first case, and varies between 65,000 and 90,000 in the second (assuming an emigration rate of 2.5 per thousand).

To obtain an annual rate of population growth of one percent, given the current fertility rate and an assumed emigration rate of 2.5 per thousand inhabitants, the annual number of immigrants would need to be increased gradually, from 200,000 in 1995 to 320,000 in 2011 and to 560,000 in 2036.

## Age Structure

The median age of the population would rise from its current 33 years to 41 years by 2011, and further to 45 years by 2036, assuming the continuation of current population trends.

If the current demographic trends persist, an inversion of the age pyramid may occur in the long run. The proportion of people under age 18 might drop from 25.1% in 1989 to 20.2% in 2011, and further to 18.1% in 2036. Meanwhile, the share of those aged 65 and over may grow from 11.3% to 15.5% and finally to 24.5% in these same years.

The absolute number of people under age 18 would decrease from 6.6 million in 1989 to 6.4 million in 2011.

The population aged 65 and over will increase from three million in 1989 to close to five million in

migration. En fait, jusqu'à cette date, la population comptera une proportion relativement forte de femmes en âge de procréer.

Si ces tendances de la fécondité se maintiennent, l'effectif de la population et son rythme de croissance seront dès le début du XXI<sup>e</sup> siècle, largement tributaires de l'immigration.

Au niveau de fécondité en vigueur (1.67), la population du Canada atteindra un maximum de 32.7 millions d'habitants autour de 2030 avec une immigration annuelle de 145,000 (moyenne des trois dernières années) et de 34.2 millions autour de 2035 avec une immigration de 200,000. Dans le premier scénario, l'émigration annuelle est de 45,000; dans le second, elle varie entre 65,000 et 90,000 (dans l'hypothèse d'un taux d'émigration de 2.5 pour mille).

Compte tenu de ce faible indice synthétique de fécondité et sous l'hypothèse d'un taux d'émigration égal à 2.5 pour mille, il faudrait, pour générer une croissance démographique d'un pour cent par an, augmenter le nombre annuel d'immigrants progressivement de 200,000 en 1995 à 320,000 en 2011 et 560,000 en 2036.

## Structure par âge

L'âge médian de la population, qui est actuellement de 33 ans, pourrait atteindre 41 ans vers 2011 et 45 ans vers 2036 si les tendances démographiques actuelles se maintiennent.

Si les tendances démographiques actuelles persistent, la pyramide des âges finira par s'inverser, la proportion des jeunes de moins de 18 ans passant de 25.1% en 1989 à 20.2% en 2011 et 18.1% en 2036, et celle des personnes âgées de 65 ans et plus, de 11.3% à 15.5% et 24.5% aux mêmes dates.

En nombre absolu, l'effectif des moins de 18 ans diminuerait de 6.6 à 6.4 millions en 1989 et 2011.

Les personnes âgées de 65 ans et plus verront quant à elles leur effectif grossir de trois millions en 1989 à près

2011, and to about eight million by 2036. More than half will be 75 years of age or older.

The labour force group (age 18-64) should continue to increase, and will reach a maximum of between 19.2 and 20.6 million by the year 2016.

The labour force group will, however, become progressively older. From 37 in 1989, the median age will increase to 43 by 2011.

Currently, Canada's dependency ratio of 57% (the young and the elderly in relation to the population aged 18 to 64) is the lowest ever recorded, and will remain so for two more decades. However, the dependency ratio may increase significantly thereafter - up to 72% by 2036 - and the distribution of the dependent group will become skewed towards older ages.

## Provincial Trends

Ontario will continue to have the largest population, while Quebec's share may further decline. Alberta and British Columbia could either remain stable or increase, depending on the scenario selected.

Ontario's share of the Canadian population may increase from 36.5% in 1989 to 37.4% by 2011, while Quebec's share may decline from 25.5% to 24.2% in these same years. In 1951, their respective shares were 32.8% and 29.0%, respectively.

The difference between Quebec and Ontario in the pace of population growth has been widening over the years. The size of their populations were, respectively, 4.1 and 4.6 million in 1951, 5.3 and 6.2 in 1961, and 6.7 and 9.6 in 1989, and may reach 7.7 and 11.8 million (projection 3) by 2011. This implies a Quebec to Ontario population ratio of 0.89, 0.85, 0.70 and 0.65 for these same years.

Considering the observed convergence in fertility between the provinces, internal migration is the major factor in determining provincial population distribution.

de cinq millions en 2011 et huit millions en 2036. Plus de la moitié d'entre elles auront alors 75 ans et plus.

Quant à la population active, âgée de 18 à 64 ans, elle continuera de croître jusqu'à atteindre un maximum de 19.2 à 20.6 millions vers 2016.

Cette population active connaîtra un vieillissement progressif, l'âge médian allant de 37 ans en 1989 à 43 ans en 2011.

À l'heure actuelle, le rapport de dépendance (la somme des personnes jeunes et âgées divisée par la population des 18 à 64 ans) du Canada est à 57%, le plus bas jamais enregistré et le restera pour encore au moins deux décennies. Cependant par après, le rapport de dépendance pourrait croître de façon significative, jusqu'à atteindre 72% vers 2036 et ce sont les plus âgés des dépendants qui auront le plus de poids.

## Perspective provinciale

L'avenir, tel qu'il se dégage des projections, consacre la prépondérance de l'Ontario, réduit la part du Québec et maintient ou renforce (selon le scénario considéré) la position de l'Alberta et de la Colombie-Britannique.

Le poids démographique de l'Ontario pourrait augmenter de 36.5% en 1989 à 37.4% en 2011, celui du Québec diminuer, dans le même temps, de 25.5% à 24.2%. En 1951, ces pourcentages étaient respectivement de 32.8% et 29.0%.

L'écart entre les taux de croissance du Québec et de l'Ontario ne cesse de s'accroître. Les populations respectives de ces deux provinces étaient de 4.1 et 4.6 millions en 1951, de 5.3 et 6.2 en 1961, de 6.7 et 9.6 en 1989 et pourraient éventuellement atteindre 7.7 et 11.8 millions en 2011 (projection 3), soit un rapport de 0.89, 0.85, 0.70 et 0.65, pour les années correspondantes.

Compte tenu de la convergence des niveaux de fécondité observée dans les provinces, la migration interne s'affirme comme le facteur déterminant de la distribution provinciale de la population.

## The Underlying Assumptions

These projections are based on a combination of assumptions encompassing:

- (a) fertility levels of 1.20, 1.67 and 2.10 children per woman;
- (b) annual levels of immigration of 140,000 and 200,000;
- (c) a life expectancy at birth of 84.0 years for females and of 77.2 years for males by 2011;
- (d) three distinct interprovincial migration scenarios: one with Ontario attracting a considerable number; the second with the West becoming once again a major destination; and a third falling between the two preceding patterns.

## Les hypothèses sous-jacentes

Ces projections reposent sur une combinaison des hypothèses suivantes:

- (a) des niveaux de fécondité de 1.20, 1.67 et 2.10 naissances par femme;
- (b) des niveaux d'immigration annuelle de 140,000 et 200,000;
- (c) une espérance de vie à la naissance croissant jusqu'à 84.0 ans pour les femmes et 77.2 ans pour les hommes en 2011;
- (d) trois scénarios de migration interprovinciale : un avec l'Ontario comme pôle d'attraction; un autre avec une migration tournée vers l'Ouest; et le troisième qui se situe entre les deux précédents.

## Introduction

This report presents population projections for Canada, the provinces and territories from 1989 to 2011. In order to assess the long-term growth and age structure implications of assumed demographic trends, the projection period has been extended to 2036 for Canada. In the latter case, the parameters of each population growth component - fertility, mortality and migration - have been kept constant up to 2036 at the levels projected for 2011.

Eighteen series of projections have been generated, encompassing all possible combinations of the three fertility, one mortality, three internal migration and two international migration assumptions. Any of these combinations can be made available to interested users. In order to maintain the analysis and the report within manageable limits however, only four series have been selected for inclusion in this volume. These selected series encompass a range of variations in terms of the growth rate and population size for each province/territory and for Canada as a whole over the projection period. Each appears to be plausible in light of the time-series analysis and other information pertinent to emerging demographic trends.

The report begins with a description of the methods and assumptions underlying the projections. This is followed by a presentation of the projection results, along with a brief analysis. Finally, the appendix provides detailed tables of the four projections, and a summary table of the 14 projections not selected. Also included is a simulation of future total population to 2011 for Canada and the provinces/territories, assuming zero migration.

## Introduction

Ce rapport présente les projections de la population du Canada, des provinces et des territoires de 1989 à 2011. Afin d'évaluer les effets à long terme des tendances démographiques, telles que projetées, sur la croissance et la structure par âge de la population, la période de projection a été prolongée jusqu'en 2036 pour le Canada. Dans ce cas, les paramètres de chaque composante de l'accroissement démographique - fécondité, mortalité et migration - ont été maintenus constants jusqu'en 2036 aux niveaux projetés pour 2011.

Dix-huit séries de projections ont été produites, représentant toutes les combinaisons possibles des trois hypothèses de fécondité, de celle de mortalité, des trois de migration interne et des deux de migration internationale. Les utilisateurs intéressés peuvent obtenir chacune de ces combinaisons. Cependant, afin de conserver au document une taille et un niveau d'analyse acceptables, seules quatre séries ont été retenues pour fins de publication. Ces séries sélectionnées recouvrent un éventail de variations du taux de croissance et de la taille de la population de chaque province et territoire comme du Canada dans son ensemble, au cours de la période de projection. Cet éventail de projections semble plausible compte tenu de l'analyse des séries chronologiques et d'autres informations pertinentes relatives aux tendances démographiques qui émergent.

Ce rapport décrit d'abord la méthodologie et les hypothèses sous-jacentes aux projections. Il présente ensuite les résultats des projections, suivis d'une brève analyse. Enfin, les annexes incluent les tableaux détaillés des quatre projections de même qu'un tableau résumé des 14 projections non sélectionnées. De plus, on y trouvera une simulation de la population totale future jusqu'en 2011, tant du Canada que des provinces et territoires, dans l'hypothèse d'une migration nulle.

## I. Methods and Assumptions

### Introduction

As in previous projections, the general method used herein is the **regional cohort component approach**. There are two basic steps in this approach. First, a separate analysis of previous trends in each component of population growth – fertility, mortality and migration (internal and international) – is made using appropriate demographic parameters. These parameters, generally in the form of absolute values, rates and ratios, are then extrapolated and added or applied to the population of the base year to obtain the future population by age and sex for each region. The base population of these projections is the 1989 population estimates<sup>1</sup>. National figures are obtained by aggregating the projections for the provinces and territories. Projection results are provided by age and sex for each year<sup>2</sup>.

### Fertility Projections

Although the fertility level in Canada has now reached the lowest level in recorded history (1.67 children per woman), it continues to be the most important demographic factor influencing population growth and age structure<sup>3</sup>. As in the past, trends in population growth and age structure will depend heavily on the future course of fertility.

The direction that fertility will take has been the subject of considerable discussion and speculation among demographers. Much of the discussion has focused on whether fertility will continue to fall, or will stabilize at the present level. Few expect another upward cycle similar to the post-war baby

## I. Méthodes et hypothèses

### Introduction

Tout comme les projections précédentes, celles contenues dans ce volume reposent sur la **méthode des composantes régionales**. La démarche générale comporte deux étapes : dans un premier temps, on effectue une analyse des tendances de chacune des composantes de la croissance, soit la fécondité, la mortalité et la migration (interne et internationale), à partir de paramètres démographiques appropriés. Ces paramètres sont ensuite extrapolés sous forme de nombres absolus, de taux ou de rapports, puis ils sont, selon le cas ajoutés ou appliqués à la population de l'année de départ de façon à générer, pour chaque région, les effectifs futurs selon l'âge et le sexe. La population de départ est celle estimée au 1<sup>er</sup> juin 1989<sup>1</sup>. Les effectifs au niveau national sont obtenus par sommation des effectifs des provinces et des territoires. Les résultats sont fournis par âge et sexe, pour chaque année<sup>2</sup>.

### Projection de la fécondité

Même si la fécondité au Canada atteignait récemment le niveau le plus faible de son histoire (1.67 naissance par femme), elle garde par rapport aux autres facteurs démographiques le poids le plus considérable dans la croissance de la population et l'influence la plus sentie sur la structure par âge<sup>3</sup>. Comme par le passé, accroissement et structure démographiques seront dans les décennies à venir intimement liés à l'évolution de la fécondité.

↳ La question cruciale est de savoir si la fécondité continuera à chuter ou si elle se stabilisera au niveau actuel. Rares sont ceux qui s'attendent à ce qu'un nouveau cycle, à l'instar de l'explosion démographique d'après-

boom. However, a slight upturn in fertility should not be ruled out. There has recently been some indication of such a possibility.

### The Method

The derivation of the annual number of births is obtained by applying projected age-specific fertility rates to the female population of corresponding childbearing ages. Instead of projecting each specific rate, which would require the development of an assumption for each age, a parametric model is used (Romaniuk, 1975) to obtain the age-specific rates. Only three indices are required: (1) the total fertility rate which measures the level of fertility; (2) the mean age of fertility; and (3) the modal age of fertility. The latter two provide a convenient measure of the age pattern of childbearing. The application of the model rests on an analysis of each of these parameters, and the formulation of assumptions on their future course over the projection period.

### The Assumptions

The assumptions regarding the fertility parameters were made first at the national level. The values for the provinces and territories were then derived by means of an analysis of the pattern of convergence among the regional indices. Because of the lesser role played by changes in the age-specific fertility rates on the number of births, the mean and modal ages of fertility have been kept constant at the level observed in the most recent year – 27.4 years and 26.6 years, respectively.

The trend analysis of fertility thus focuses essentially on the total fertility rate. The following three assumptions were selected:

**Low assumption:** The total fertility rate for the country continues to decline from 1.67 births per woman in 1989 to 1.2 by 2011.

**High assumption:** An upturn in fertility by 1991: the value of the total fertility rate remains constant

guerre, se produise dans un avenir prévisible. Toutefois, une légère reprise de la fécondité n'est pas à exclure. D'ores et déjà certains indices apparus tout récemment portent à croire à une telle possibilité.

### La méthode utilisée

Le nombre annuel des naissances tel que généré, repose essentiellement sur l'application de taux de fécondité projetés par année d'âge, à la population féminine en âge de procréer. Plutôt que de projeter chacun des taux, et donc de formuler des hypothèses d'évolution de la fécondité à chaque âge, on dérive, à l'aide d'un modèle paramétrique (Romaniuk, 1975), à partir de trois indices seulement, la série des taux par âge. Le premier de ces indices, l'indice synthétique de fécondité, décrit l'intensité de la fécondité; les deux autres, les âges moyen et modal à l'accouchement, permettent d'en déterminer le calendrier. L'utilisation de ce modèle requiert une analyse de chacun des trois paramètres et l'élaboration d'hypothèses relatives à leur évolution au cours de la période de projection.

### Les hypothèses

Dans un premier temps, on a défini les hypothèses au niveau national. Puis, dans un deuxième temps, on a établi les valeurs des paramètres de chaque province et territoire sur la base d'une analyse des mouvements de convergence des indices régionaux. Étant donné la faible incidence du calendrier de la fécondité sur le nombre des naissances, on a maintenu constants les âges moyen et modal à l'accouchement au niveau observé récemment, soit 27.4 ans et 26.6 ans respectivement.

C'est donc essentiellement sur les tendances de la fécondité, telle que mesurée par l'indice synthétique, qu'a porté l'analyse. Trois hypothèses ont été retenues :

**Hypothèse faible :** Poursuite de la baisse : l'indice synthétique de fécondité pour l'ensemble du pays passe de 1.67 naissance par femme en 1989 à 1.2 en 2011.

**Hypothèse forte :** Remontée de la fécondité à partir de 1991 : la valeur de l'indice synthétique est maintenue à

at 1.67 births per woman (current level) up to 1991, then increases gradually to 2.1 births per woman by 2011.

**Medium assumption:** The total fertility rate remains constant at the level observed in the years 1985 and 1986, at 1.67 births per woman.

In the high and low assumptions, the values of the total fertility rates for the intervening years were obtained by linear interpolation.

The indices for each province/territory were estimated by a ratio approach. An analysis of their long-term trend indicates a tendency to converge toward the national average. Therefore, it was assumed that regional disparities would generally continue to decrease, and that the fertility rates for the provinces would continue to converge toward the national level.

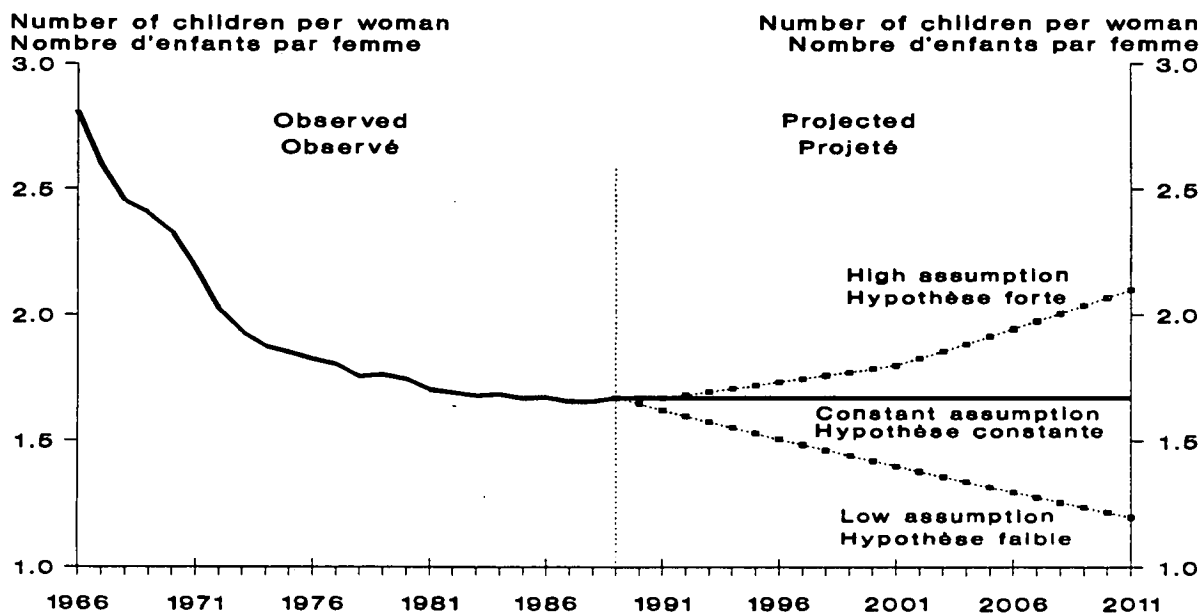

1.67 naissance par femme (niveau actuel) jusqu'en 1991, puis haussée graduellement jusqu'à 2.1 naissances par femme en 2011.

**Hypothèse moyenne :** L'indice synthétique de fécondité est maintenu constant au niveau des années récentes (1985 et 1986), soit 1.67 naissance par femme.

Dans le cas des hypothèses faible et forte, on a estimé les valeurs de l'indice synthétique de fécondité de chacune des années intermédiaires par interpolation linéaire.

Pour ce qui est des indices de chaque province et territoire, on les détermine au moyen de la méthode des rapports. L'analyse de leur évolution a mis en évidence leur tendance à converger vers la moyenne nationale. On a donc supposé que, de façon générale, les disparités régionales continueraient de s'atténuer et que la fécondité des provinces allait tendre graduellement vers le niveau national.

The observed (1971-1986) and the projected (1991-2011) total fertility rates are shown in Table 1 and Figure 1.

On trouvera au tableau 1 et à la figure 1 les indices observés (1971-1986) et projetés (1991-2011).

### Rationale for the Assumptions

#### Low fertility assumption

Analysts often believe that the post-World War II baby boom was a marked deviation in an otherwise long-term downward trend in fertility. This being the case, a continuation of the downward trend is an assumption which deserves due

### Justification des hypothèses

#### L'hypothèse faible

Les analystes reconnaissent en général que le «baby boom» qui a suivi la Seconde Guerre mondiale constitue une anomalie dans l'évolution séculaire à la baisse de la fécondité. L'hypothèse de la poursuite du déclin mérite dès

consideration. There are three factors reinforcing this assumption.

The first is related to the effect of further improvement in women's economic status (Butz and Ward, 1979). There are many indications that the participation of women in the work force could continue to increase due to the dynamics of social change surrounding the role of women in society. It is likely that the pace will increase substantially in an expanding economy. But even if the economy and job opportunities expand only slowly, rising expectations for an improved lifestyle will most likely exert upward pressure on women to join or remain in the work force. The Department of Finance (1980) has projected that, by the turn of the century, 65% to 71% of women aged 20 and over will be part of the labour force. This compares to 58% in 1989.

In a recent international symposium on family policies, G. Fortin (1989) drew several conclusions from a study of the socioeconomic status of families in Quebec, and notably that:

"... increasingly, childbearing occurs among couples in their thirties who are comfortably off because they have a double income or one of the spouses has a high income (...). Since a minority of couples only reach the third or fourth quartile of family incomes in their thirties, the conditions considered as ideal are seldom met to enable them to have two children, let alone three." [Translation]

Profound changes affecting marriage and family lifestyles have occurred over the last two decades, and they are likely to exert downward pressure on the fertility rate. Marriages have declined substantially, whereas common-law unions are on the rise, thus decreasing the population exposed to the risk of marital pregnancy (Dumas and Boyer, 1984). In addition, divorces have increased, especially among young adults (Dumas, 1990).

Finally, the widespread use of efficient contraceptives, sterilization, or other means of birth control (Romaniuc, 1984) could entail further reductions in the number of unwanted pregnancies.

lors d'être prise en compte. Trois considérations viennent par ailleurs étayer cette hypothèse.

La première a trait à l'incidence de l'autonomie financière croissante des femmes (Butz et Ward, 1979). De nombreux indices laissent croire que la participation des femmes au marché du travail continuera à augmenter suite aux transformations des valeurs sociales qui sont venues modifier le rôle de la femme. Il est possible que ce rythme s'accélère considérablement dans une économie en pleine expansion. Même dans des conditions de stagnation économique et de possibilités d'emploi réduites, l'aspiration à un niveau de vie amélioré devrait inciter les femmes à participer au marché du travail. À la fin du siècle, selon les projections du ministère des Finances (1980), de 65% à 71% des femmes âgées de 20 ans et plus seront actives contre 58% en 1989.

Dans le cadre d'un colloque international sur les politiques familiales, G. Fortin (1989) tirait d'une étude de la situation socio-économique des familles québécoises, entre autres conclusions, la suivante :

«...la naissance des enfants se concentre de plus en plus chez les couples autour de la trentaine bénéficiant d'une situation financière stable et avantageuse, résultat d'un double revenu ou du revenu supérieur d'un des conjoints (...). Comme une minorité de couples atteignent le troisième ou quatrième quartile des revenus familiaux dans la trentaine, les conditions perçues comme idéales sont rarement réunies pour leur permettre d'avoir deux et, encore moins, trois enfants.»

Au plan social, on ne peut manquer de souligner l'effet dépressif qu'exercent sur la fécondité les bouleversements survenus, depuis deux décennies, au chapitre de la nuptialité et des modes de vie familiaux. On assiste en effet à une baisse considérable des mariages alors qu'augmentent les unions consensuelles, moins génératrices de naissances (Dumas et Boyer, 1984), et que le divorce se fait plus fréquent, surtout chez les jeunes adultes (Dumas, 1990).

Enfin, l'utilisation généralisée de contraceptifs efficaces, stérilisation ou autres mesures (Romaniuc, 1984), devrait continuer à réduire la part déjà faible des grossesses non désirées menées à terme.

Thus, the question is: How much of a decline in fertility rates can be expected in Canada? If the recent experience of Western European countries can be taken as a guide, it would be reasonable to anticipate declines in the total fertility rate to a level even as low as 1.2 births per woman (Table 2). The northern provinces of Italy already have a fertility rate of 1.1 births per woman. In Denmark and Luxembourg, as well as in the Federal Republic of Germany after excluding the higher fertility of foreign workers, fertility rates of 1.5 births per woman or lower have been observed. The same has been seen in four of Canada's large metropolitan areas (Quebec, Montreal, Ottawa and Victoria). According to a demolinguistic study, the fertility of Montreal's English-speaking population has been of the order of 1.3 births per woman (Tremblay and Bourbeau, 1985).

La question se pose alors : quelle limite inférieure assigner à la fécondité? Sur la base de l'évolution observée au cours des années quatre-vingts, notamment en Europe occidentale, l'hypothèse d'un recul de l'indice synthétique de fécondité jusqu'à 1.2 naissance par femme n'est pas à rejeter (tableau 2). En Italie, la fécondité des provinces du nord s'est abaissée jusqu'à 1.1 naissance par femme. En République Fédérale d'Allemagne, si on exclut la fécondité plus forte des travailleurs étrangers, et dans quelques autres pays de l'Europe, notamment le Luxembourg et le Danemark, on a observé des indices inférieurs à 1.5 naissance par femme. C'est également le cas dans quatre grandes régions métropolitaines (Québec, Montréal, Ottawa et Victoria). Selon une étude démographique, l'indice serait de l'ordre de 1.3 naissance par femme chez les anglophones montréalais (Tremblay et Bourbeau, 1985).

### High fertility assumption

Given current trends, it is more difficult to provide a rationale for an upward trend in fertility. Some experts believe that the current low level fertility might have been caused partially by a postponement of births. It is therefore possible that

### L'hypothèse forte

Dans la conjoncture actuelle, l'hypothèse d'une remontée considérable de la fécondité est plus difficile à justifier. Certains experts sont d'avis que le faible niveau des indices du moment résulte, en partie, de l'ajournement des naissances plutôt que d'une décision bien arrêtée de

some of these delayed births may eventually be made up, thus bringing about a rise in the total fertility rate. The slight increase in fertility since 1982 in some of the provinces, the increase in the number of women having a child, and in childbearing among women in their thirties, may be indicative of a catch-up effect of postponed births.

Another argument – that of Easterlin (1980) – is often advanced to justify a possible upturn in fertility. Indeed, when the cohorts of the 1970s and 1980s enter the labour market, they could, because of their smaller numbers, be in a better employment situation. This will be a different situation from that which prevailed in the very competitive environment faced by the baby-boom cohorts. Thus, these smaller cohorts may be more inclined to have larger families, and an upturn in fertility could ensue in such a way as to cause the baby-boom/baby-bust cycle to recur.

Further, if institutional and economic solutions are found to ease the pressure on women arising from the dual pursuit of motherhood and employment, their involvement in work outside the home could become less of an impediment to childbearing. An upturn in fertility attributable to various pronatalist policies has been witnessed in recent years in several Eastern European countries. The legislation introduced in Quebec, which provides the payment of a lump sum to parents for their children, and a fairly large premium for the third and higher rank child, may have a positive effect on fertility. Some analysts attribute the observed increase in births of third children in 1989 to the generous allowance to parents of a third child.

One additional factor is likely to exert an upward effect on the fertility rate in Canada. Recent studies seem to confirm that the period fertility rates of foreign-born women tend to be higher than those of Canadian-born women<sup>4</sup> (Gauthier, 1988; Ram and George, 1989). If the proportion of foreign-born women were to increase (it is currently

n'avoir qu'un ou deux enfants ou aucun. Un certain rattrapage serait donc à prévoir, ce qui entraînerait à la hausse l'indice synthétique de fécondité. La très faible remontée de l'indice dans quelques provinces depuis 1982 donne à penser que l'on en est peut-être à effectuer ce rattrapage. On peut interpréter de la même manière l'augmentation des enfants de troisième rang et celle des maternités chez les femmes dans la trentaine.

Un autre argument, mis de l'avant par Easterlin (1980), est souvent avancé pour justifier une possible reprise de la fécondité. En effet, lorsque les générations des années soixante-dix et quatre-vingt arriveront sur le marché du travail, du fait de leur faible effectif, elles jouiront d'une situation d'emploi favorable, très différente de celle de vive concurrence qu'avaient connue les générations nombreuses du «baby boom», peu enclines à constituer des familles nombreuses. Une remontée de la fécondité devrait s'ensuivre, de sorte que le cycle, alternance de générations à effectif réduit et à effectif gonflé, est théoriquement appelé à se répéter.

Non négligeables, quoique de portée encore inconnue, des mesures sociales ou économiques pourraient alléger la double tâche associée au cumul de la maternité et d'un emploi faisant du travail de la femme à l'extérieur du foyer un moindre obstacle à la procréation. Rappelons qu'une remontée de la fécondité, suite à l'application de politiques natalistes, a été observée dans plusieurs pays de l'Europe de l'Est. Les mesures adoptées au Québec, prévoyant le versement aux parents de primes à la naissance de leurs enfants, particulièrement du troisième et ceux de rang supérieur, constituent une prise en charge par l'État d'une partie du coût de l'enfant et pourrait avoir un effet positif sur la fécondité. Quelques analystes lient l'augmentation des naissances de rang trois observée en 1989 à la générosité de la prime.

Enfin, un autre facteur, structurel celui-là, a trait aux différences de fécondité selon le lieu de naissance. Des études récentes tendent en effet à confirmer que la fécondité des femmes nées à l'étranger (sur la base de données transversales) serait supérieure à celle des femmes canadiennes<sup>4</sup> (Gauthier, 1988; Ram et George, 1989). Or, si la fraction que représente la population féminine née à l'étranger devait augmenter (elle est présentement de 16% au Canada et 24% en

16% in Canada and 24% in Ontario), then the fertility rate will increase accordingly.

A rise in the fertility rate to 2.1 births per woman, the replacement level, is therefore considered plausible. This was the level observed in the early seventies and, given current demographic trends, represents an upper bound at least in the foreseeable future. It may also be noted that a total fertility rate of 2.2 births per woman is considered a plausible scenario in the latest population projections by the U. S. Bureau of the Census (1989).

#### Medium fertility assumption

In several Canadian provinces, as well as in the United States, there are indications that fertility levels are stabilizing and that declines have been slowing down. In fact, there has been no significant change in the fertility rate in Canada or the United States during the 1980s, and expected family size, as indicated by respondents to numerous surveys, has remained basically unchanged. The medium assumption generally reflects this tendency for fertility to remain unchanged at the 1985 level of 1.67 births per woman.

#### **Concluding Comments**

The total fertility rates for Canada, the provinces and the territories, under the three selected assumptions, are presented in Table 1 and in Figure 1 (Canada only). It is not possible to forecast fertility trends. Current data, however, suggest that future trends in fertility are likely to oscillate around the present low level of childbearing (Szabó, 1988). But as Westoff (1983) writes:

"No social changes are on the horizon that would lead to the expectation that the fertility rate will increase substantially (to a total fertility rate greater than 2.5, for example). More likely is the continuation of rates at or below replacement, and in some instances these rates may indeed fall closer to the one- than to the two-child average."

Ontario), il en résulterait une augmentation de l'indice de fécondité.

Nous avons fixé l'hypothèse forte à la valeur de remplacement des générations, soit 2.1 naissances par femme. Ce niveau était observé au début des années soixante-dix et, dans la conjoncture démographique actuelle, cette valeur fait figure de borne supérieure, du moins dans l'avenir prévisible. À noter qu'un indice synthétique de fécondité de 2.2 naissances par femme est considéré, par le U. S. Bureau of the Census (1989), dans ses dernières projections de population, comme un scénario plausible.

#### L'hypothèse moyenne

Dans plusieurs provinces canadiennes, de même qu'aux États-Unis, on observe une apparente stabilisation de la fécondité. En fait, au cours des années quatre-vingt, l'indice de fécondité au Canada et chez nos voisins du Sud n'a pas varié de façon notable. En outre, la taille attendue de la famille, telle qu'indiquée par les répondants de nombreuses enquêtes, est demeurée à peu près inchangée depuis quelques années. L'hypothèse moyenne traduit, de façon générale, cette tendance à la constance des comportements procréateurs; elle est fixée au niveau observé depuis 1985, soit 1.67 naissance par femme.

#### **Conclusion**

Les indices synthétiques de fécondité pour le Canada, les provinces et les territoires, selon les trois hypothèses retenues, sont présentés au tableau 1 et à la figure 1 (Canada seulement). On ne peut pas prédire l'évolution de la fécondité. Toutefois, les données actuelles laissent croire que la fécondité dans l'avenir oscillera de part et d'autre des niveaux faibles que l'on connaît présentement (Szabó, 1988). En 1983, Charles Westoff écrivait :

«Aucune perspective de changement social ne porte à penser que la fécondité pourrait augmenter sensiblement (pour dépasser 2.5 naissances par femme, par exemple). Il est plutôt probable que la fécondité se situera autour du seuil de remplacement, ou au-dessous et, dans certains cas, les indices pourraient se rapprocher davantage d'une naissance par femme en moyenne que de deux.» [Traduction]

## Mortality Projections

Progress achieved in mortality at middle and older ages has been and continues to be substantial. The question is whether such a pace of improvement can be maintained for many more years. How far can human longevity be extended? For projection purposes, it is not so much the biological limit of human life which matters, but rather it is the average span of life and the gains in life expectancy at various ages.

### The Method

The projection of the annual number of survivors is made by applying projected survival ratios, by age and sex, to the population at the beginning of each year. These projected survival ratios are obtained in two steps. First, gains in life expectancy at birth are established for each sex. This mortality indicator has certain specific analytical advantages: it gives a global view of the intensity (or level) of mortality, and moreover, it allows a certain flexibility for simulating various scenarios. Second, parallel to what is done for the fertility component, the mortality indicator is translated into an age-specific mortality schedule.

The age-specific mortality pattern is obtained on the basis of an analysis of mortality trends by age as measured by the most recent life tables (the  $L_x$  vector). Assumptions were formulated as to the pace of mortality decline at each age<sup>5</sup>.

### Assumption and Rationale

One cannot but be amazed by the rapid pace at which the life expectancy in Canada – as well as in most industrialized countries – is progressing. Gains of the order of one year were observed between 1971 and 1976, and over one-and-a-half years between 1976 to 1981. Within the 1981-86 period, the pace of improvement slowed down, although not to the same degree in all provinces. In

## Projection de la mortalité

Les progrès réalisés vers la fin de la vie adulte et aux âges avancés ont été et continuent d'être considérables. Un tel rythme pourra-t-il se poursuivre encore longtemps? Jusqu'où pourra-t-on faire reculer les limites de la vie humaine? Pour ce qui concerne les projections démographiques, la question n'est d'ailleurs pas tant la limite de la vie humaine que la vie moyenne et les gains réalisés aux divers âges.

### La méthode utilisée

La projection du nombre annuel de survivants est effectuée en appliquant des probabilités de survie perspectives, par année d'âge et sexe, à la population en début d'année. Ces probabilités futures sont obtenues en deux étapes. La première porte sur la détermination des gains d'espérance de vie à la naissance pour chaque sexe. Cet indice synthétique possède un avantage analytique indéniable : il donne un aperçu global de l'intensité de la mortalité et permet une certaine souplesse dans la simulation de divers scénarios. Parallèlement à ce qui se fait pour la projection de la fécondité, cet indice est traduit, dans un deuxième temps, en un calendrier de la mortalité par année d'âge.

On a obtenu le schéma de mortalité par âge à partir d'une analyse de l'évolution de la mortalité par âge, telle que mesurée par les tables de mortalité les plus récentes (le vecteur  $L_x$ ), et d'hypothèses quant au rythme de baisse de la mortalité aux divers âges<sup>5</sup>.

### Hypothèse

L'espérance de vie au Canada, comme d'ailleurs dans la plupart des pays industrialisés, continue de progresser à un rythme relativement rapide. Les gains étaient de l'ordre d'un an entre 1971 et 1976, et d'un an et demi entre 1976 et 1981. Au cours de la période 1981-86, le rythme d'amélioration ralentit, mais diffère selon la province. Plusieurs provinces affichent en 1986 des

1986, several provinces showed life expectancies in excess of 80 years for females, and 73 years for males (Table 3).

Similar trends are observed in other countries. In Japan for instance, life expectancy for males increased by two years between 1980 and 1986. The life expectancy of Japanese females was close to 79 years in 1980, and reached 81 years in 1986. In France, between 1980 and 1986, gains in the order of 1.5 years have been observed for males and females, whereas in Sweden they hardly exceeded one year.

espérances de vie supérieures à 80 ans chez les femmes et à 73 ans chez les hommes (tableau 3).

La mortalité dans les autres pays suit une tendance similaire. Au Japon, par exemple, l'espérance de vie chez les hommes progressait de deux ans entre 1980 et 1986. Chez les femmes japonaises, l'espérance de vie, de l'ordre de 79 ans en 1980, atteignait en 1986, 81 ans. En France, entre 1980 et 1986, les gains sont de près de 1.5 an, tant pour les hommes que pour les femmes, alors qu'en Suède, ils dépassent à peine une année.

Sources: 1971-1981: Statistique Canada, *Tables de mortalité, Canada et provinces, 1970-1972, 1975-1977, 1980-1982*, n° 84-532 au catalogue, hors série; 1986: Statistique Canada, Division de la santé, données non publiées; 1989, 1996 et 2011: Valeurs projetées.

However, the pace of mortality decline has not been constant over time, and it would be hazardous to expect a life expectancy gain of one year per quinquennium over a 50-year period. The biological limit of human life has been set by experts at about 90 years (Duchêne and Wunsch, 1986). It is, however, difficult to formulate a defensible mortality assumption consistent with such a value.

### Gains in Life Expectancy at Birth

A single mortality assumption has been selected in line with the assumptions adopted by most industrialized countries, namely that current gains in life expectancy will continue, but at a gradually diminishing pace (Hämäläinen, 1988). The projected gains are of the order of 3.5 years (faster gains are postulated at the beginning), spread over a 22-year period (1989-2011), yielding an average gain of 0.8 years per five-year period<sup>f</sup>.

It should be noted that such a gain would only mean that the life expectancy of the whole population closely resembles the life expectancy of the most affluent groups. A French study has revealed a differential of several years between the average life span for the occupational groups at the top of the socioeconomic spectrum and that for the whole population (Desplanques, 1985). A similar differential exists in Canada's population. As Wilkins (1980) states:

"Social disparities where mortality is concerned, regardless of the indicator used - socio-occupational category, educational level, area of residence - seem to have the same importance in Canada as in the United States, in Great Britain or in France." [Translation]

Toutefois, la mortalité semble avoir évolué selon des phases de baisse d'intensité variable, et il serait téméraire de prolonger sur 50 ans des gains de l'ordre d'un an par période quinquennale. La limite biologique de la vie humaine a été fixée par des experts à 90 ans environ (Duchêne et Wunsch, 1986). Il n'en demeure pas moins difficile de formuler et de défendre une hypothèse de mortalité qui fixe les modalités selon lesquelles une telle valeur pourrait être atteinte.

### Gains d'espérance de vie à la naissance

On a opté pour une seule hypothèse, alignée sur celle adoptée par d'autres pays industrialisés, à savoir que les gains actuels se poursuivront mais à un rythme décroissant (Hämäläinen, 1988). Le gain projeté d'espérance de vie (postulé plus rapide au début) est de l'ordre de 3.5 ans, échelonné sur 22 ans (1989-2011), soit un gain moyen de 0.8 an par période quinquennale<sup>f</sup>.

Mentionnons que ce gain ne ferait que rapprocher l'espérance de vie de l'ensemble de la population de celle des groupes les plus favorisés. Une étude française a mis en évidence un écart de plusieurs années entre la vie moyenne du groupe occupationnel au haut de l'échelle socio-économique et celle de l'ensemble (Desplanques, 1985). Un écart semblable existe au sein de la population canadienne. Wilkins (1980) rapporte :

«Les disparités sociales de mortalité, quel que soit l'indicateur utilisé - catégorie socio-professionnelle, niveau d'éducation, secteur de résidence - semblent revêtir la même importance au Canada qu'aux États-Unis, en Grande-Bretagne ou en France.»

Source: Tableau 3.

### Sex Differentials

Recent trends in sex differentials show that there has been some "catching up" of the male survival rate. It was assumed that gains in life expectancy among males (3.5 years) would be slightly larger than those among females (3.2 years)<sup>7</sup>. Thus, excess female life expectancy, which was 7.1 years in 1981, becomes slightly reduced over the projection period (Table 4).

### Distribution of Gains by Age

Moreover, the mortality decline does not occur at the same pace for all ages. This is because at certain ages mortality is already so low that further improvement becomes virtually impossible. Among newborns for instance, the infant mortality rate is now at an all-time low of eight per thousand; for a nine-year old child, the probability of survival is close to one. Thus, the potential for further improvement is nearly nil at ages where mortality is already very low.

Therefore, any future improvement in the number of survivors will result from decreases in mortality in ages where the risks of dying are high. The uncertainty lies in the assessment of the pace at which mortality will decline at those ages. The assumption with regard to the distribution of gains by age was developed based on an analysis of the recent past. Larger gains are assumed at older ages,

### Écart entre les sexes

L'évolution récente des écarts entre les sexes montre qu'il y a eu un certain rattrapage chez les hommes. On a fait l'hypothèse que les gains du sexe masculin seront légèrement supérieurs (3.5 ans) à ceux du sexe féminin (3.2 ans)<sup>7</sup>. On réduit un peu la surmortalité masculine, qui est de 7.1 ans en 1981 (tableau 4).

### Distribution des gains par âge

On constate par ailleurs que le recul de la mortalité ne s'effectue pas au même rythme à tous les âges. Il ne peut en être autrement puisqu'à certains âges, la mortalité a déjà atteint un niveau si faible que toute baisse ultérieure devient pratiquement impossible. Ainsi, chez les nouveau-nés, le taux de mortalité infantile a atteint un niveau très faible, soit huit pour mille. À neuf ans, la probabilité de survie approche l'unité. Le potentiel de baisse ultérieure est donc quasi nul aux âges de très faible mortalité.

Donc, tout progrès à venir susceptible de modifier de façon sensible le nombre des survivants se produira aux âges où les risques de décéder sont élevés. L'incertitude réside dans l'évaluation du rythme auquel se poursuivra la baisse de la mortalité à ces âges. L'hypothèse quant à la distribution des gains par âge a été déterminée à partir de l'analyse du passé récent. Des gains importants sont postulés aux âges avancés et des gains modestes aux jeunes

whereas modest gains are postulated at younger ages. The projected gains are less rapid than those recently observed, and yield for instance, by 2011, a life expectancy at age 65 of approximately 22 years for females (compared to 19 in 1986) and of 17 years for males (compared to 15 in 1986).

The recent emergence of new age-sex specific mortality risks presents a difficult problem. For example, there are diverse opinions as to the future incidence of AIDS-related deaths. According to extrapolations made by the Federal Centre for AIDS at Health and Welfare Canada, the expected number of AIDS cases could vary between 7,600 and 13,000 over the next five years. Moreover, 93% of all AIDS-related deaths are occurring among males, and the age cohorts between 30 and 50 are the most severely hit. It is still too early to postulate the pattern of change in this phenomenon for the future, and to identify its impact on the mortality structure. Therefore, no assumption of AIDS-related increases in mortality rates has been made in these projections.

### Regional Variations

In terms of mortality, not all provinces are at the same level, although regional differences have narrowed over the years. In 1971, excluding the territories, the differential in life expectancy between the highest and lowest provincial values was close to three years among males; by 1986, it had fallen to two years. Among women, it dropped from over two years in 1971 to 1.3 years in 1986. For the most part, these regional differences are assumed to continue in the future.

The mortality in the two Canadian territories has been projected in a different manner. Life expectancy in the territories is much lower than in the provinces, with a differential of more than four years compared to the national average. According to recent life tables constructed for the territories, the current mortality level appears to approximate that observed for the country as a whole some 20 years ago. The 1971 national life tables best reflect the current mortality level in the two territories. A convergency assumption was made

âges. Les gains projetés, moins rapides que ceux observés récemment, donnent à 65 ans, vers 2011, une espérance de vie féminine de l'ordre de 22 ans (contre 19 en 1986) et masculine de 17 ans (contre 15 en 1986).

L'apparition récente et parfois brusque de nouveaux risques concentrés à certains âges, ou inégalement répartis selon le sexe, pose à l'analyste un problème de taille. On connaît la progression fulgurante du SIDA dans le monde. Au Canada, selon des extrapolations du Centre fédéral sur le SIDA, à Santé et Bien-être Canada, le nombre de cas attendus au cours des cinq prochaines années pourrait varier entre 7,600 et 13,000. Des décès reliés au SIDA, 93% sont survenus dans la population masculine, plus particulièrement chez les 30 à 50 ans. Il est encore trop tôt pour postuler l'évolution du phénomène dans l'avenir et déterminer son impact sur la structure des décès. Aussi n'avons-nous pas prévu de hausse des taux de mortalité aux âges critiques.

### Les disparités régionales de mortalité

En matière de mortalité, toutes les provinces n'en sont pas au même point, quoique les disparités régionales s'amenuisent avec le temps. Ainsi en 1971, si on excepte les territoires, l'écart entre les valeurs provinciales extrêmes était de près de trois ans chez les hommes, alors qu'en 1986, il était tombé à deux ans. Chez les femmes, il est passé d'un peu plus de deux ans en 1971 à 1.3 an en 1986. La projection maintient, grosso modo, ces disparités régionales.

Les deux territoires canadiens ont fait l'objet d'un traitement différent. L'espérance de vie y est beaucoup plus faible que dans les provinces, avec un écart de plus de quatre années par rapport à la moyenne nationale. Des tables de mortalité pour les territoires, construites récemment, ont révélé que la mortalité s'apparente à celle observée pour l'ensemble du pays il y a près de vingt ans. Les tables canadiennes de 1971 se sont avérées les plus aptes à rendre compte de leur mortalité actuelle. Une hypothèse de convergence a été retenue selon laquelle

whereby the gap in life expectancy between the two territories and Canada as a whole would be cut in half by 2011.

## International Migration Projections

Immigration is expected to play an increasing role as a major component of demographic growth in Canada during the coming decades. With fertility below the replacement level, and the prospect of negative natural increase at the turn of the century, the maintenance of a stable population size (or at very least, the postponement of its decline) will depend essentially on the immigration component.

Immigration in Canada is a phenomenon controlled by the Canadian Parliament, which establishes as of November 1st of each year, the target levels deemed desirable for the following year<sup>8</sup>. In the process, various considerations are taken into account: economic (levels of unemployment, manpower requirements, anticipated shortages of workers in certain sectors), humanitarian (reunification of family members, refugees, etc.), and demographic. With regard to the latter, the 1976 Immigration Act explicitly states demographic aspects as its first objective:

"To support the attainment of such demographic goals as may be established by the Government of Canada in respect of the size, rate of growth, structure and geographic distributions of the Canadian population."<sup>9</sup>

Current annual levels of immigration are of the order of 150,000 to 160,000, a substantial increase when compared to the level of 84,000 in 1985. (Employment and Immigration Canada, 1987).

Much less is known about emigration flow. Estimates of emigrants based on indirect data<sup>10</sup> show that the number of emigrants has fluctuated between 40,000 and 60,000 per year since the mid-seventies.

l'écart entre l'espérance de vie des territoires et celle du pays serait réduit de moitié en 2011.

## Projection de la migration internationale

On n'insistera jamais trop sur l'importance cruciale que l'immigration est appelée à prendre en tant que facteur d'accroissement numérique de la population canadienne au cours des prochaines décennies. Dans une perspective de fécondité sous le seuil de remplacement, donc d'un accroissement naturel qui selon toute vraisemblance deviendra négatif au tournant du siècle, c'est sur l'apport de l'immigration que reposera essentiellement le maintien de l'effectif de la population, ou à tout le moins, le report de sa décroissance.

L'immigration au Canada est un phénomène contrôlé par le Parlement canadien qui établit au 1<sup>er</sup> novembre de chaque année les niveaux cibles jugés souhaitables pour l'année qui suit<sup>8</sup>. Diverses considérations sont prises en compte, tant économiques (le niveau de chômage, les besoins de main-d'oeuvre et les pénuries anticipées de travailleurs dans certains secteurs, etc.) qu'humanitaires (réunion des membres d'une famille, accueil des réfugiés, etc...). Une des considérations retenues est d'ordre démographique. À cet égard, il convient de rappeler ici que le premier objectif énoncé dans la Loi sur l'immigration de 1976 se lit comme suit :

«Favoriser la poursuite des objectifs démographiques établis par le gouvernement du Canada, relatifs aux chiffres, au taux de croissance, à la composition et à la répartition géographique de la population canadienne.»<sup>9</sup>

Présentement, les niveaux annuels, de l'ordre de 150,000 à 160,000, sont en hausse alors que le nombre d'immigrants n'était que de 84,000 en 1985. (Emploi et Immigration Canada, 1987).

Quant aux flux de sorties, la deuxième composante de l'accroissement migratoire, ils sont beaucoup moins bien connus. L'estimation du nombre d'émigrants, fondée sur des données indirectes<sup>10</sup>, en fait varier l'ordre de grandeur de 40,000 à 60,000 par an depuis le milieu des années soixante-dix.

Net migration is, therefore, positive, and could surpass the contribution of natural increase (if fertility remains at its current level) by the turn of the century. All the more so if fertility decreases further.

## The Method

The approach used for projecting international migration was dictated to a certain extent by the fact that immigration is a phenomenon under government control. In addition, there is a paucity of reliable data on emigration<sup>11</sup>. In the case of immigration, the analysis of past trends shows wide fluctuations in annual levels, identifying extreme values and turning points. As a first step, assumptions have been formulated in terms of future annual levels for Canada as a whole. Among the factors considered are the planned immigration levels by category of immigrants already announced by Parliament for the next year, such as the number of refugee claimants and indications as to the pace of "backlog clearance" of refugees, etc. In the second step, the assumed national levels were distributed by province of destination on the basis of an assumed proportional distribution, and then by age and sex.

As for the emigration component, the paucity of data precluded a detailed analysis of the flows. However, emigration rates for the last 15 years have been calculated based on indirect information derived from various administrative records.

## Assumptions

### Immigration

Two immigration assumptions have been developed:

**A high assumption** whereby annual levels (currently of the order of 160,000) would increase gradually to reach 200,000 by 1994. It is assumed that this level would remain constant thereafter.

**A low assumption** of 140,000 immigrants per year reached by 1991 and remain constant thereafter.

Donc, le bilan migratoire est positif et sa contribution à la croissance démographique est appelée à augmenter considérablement dans l'avenir; elle dépasserait, vraisemblablement au tournant du siècle, l'apport de l'accroissement naturel, si la fécondité devait rester à son niveau actuel et à fortiori, si elle diminuait.

## La méthode utilisée

Le fait que l'immigration soit un phénomène contrôlé par le Parlement canadien et la faible fiabilité des données d'émigration<sup>11</sup> dictent en quelque sorte le choix de la méthode employée pour projeter la migration internationale. Pour l'immigration, l'analyse des tendances du passé nous a permis de constater la grande variabilité des niveaux annuels, de repérer les valeurs extrêmes et d'identifier les points de retournement. Puis, avec la prise en compte de divers facteurs, une hypothèse globale est dans un premier temps formulée quant à l'évolution future des volumes annuels pour le Canada. Parmi ces facteurs, mentionnons entre autres les niveaux par catégorie d'immigrants déjà annoncés par le Parlement, dont le nombre de réfugiés en attente de statut (et le nombre d'arrivées courantes), le rythme d'étude des cas de réfugiés, etc. On établit ensuite une hypothèse sur la distribution par province de destination, puis sur la répartition par âge et sexe des immigrants.

Quant à l'émigration, la pauvreté des données n'en permet pas une analyse bien détaillée. On a calculé néanmoins des taux d'émigration pour les 15 dernières années à partir des données indirectes de divers fichiers administratifs.

## Les hypothèses

### L'immigration

Deux hypothèses d'immigration ont été retenues:

**Une hypothèse forte** : les volumes annuels, actuellement autour de 160,000, augmentent graduellement pour atteindre 200,000 en 1994. Cette valeur est par la suite maintenue constante.

**Une hypothèse faible** de 140,000 immigrants annuellement à partir de 1991 et maintenue constante par la suite. Ce

This figure is slightly lower than that observed since the late 1980s (Table 5).

chiffre est légèrement inférieur à ceux qu'on a observés depuis la fin des années quatre-vingt (tableau 5).

### Rationale for the assumptions

The rationale for these assumptions is as follows. For the high assumption, an increase in immigration could be brought about as a result of a convergence of economic, humanitarian and

### Justification des hypothèses

L'hypothèse forte suppose une convergence des facteurs économiques, humanitaires et démographiques déjà à l'oeuvre. On observe une certaine pénurie de main-d'oeuvre dans certains secteurs, pénurie qui ne pourra

demographic factors. Labour force considerations would no doubt be important. If, for instance, the rate of entry into the labour force continues to decline (the 18-24 age group is expected to drop in number by almost half a million between 1986 and 1996), then one could expect an exacerbation of the current shortage of manpower. There are already indications of a shortage of unskilled labour for youth-oriented jobs. Selective immigration could be used to alleviate such shortages. Also, a larger work force would help to defray the increased cost of retirement pensions when baby boomers reach retirement age.

It is expected that the number of immigrants will increase over the next two or three years as the refugee backlog is cleared. At the tabling of Bill C-55 on January 1, 1989, the estimated backlog was about 85,000 cases. According to Minister B. McDougall (1988), this backlog is expected to be cleared in its entirety within two years .

For humanitarian reasons, Canada might be pressed to accept more refugees, whose current number is estimated at two million in the world. For 1990, the government has announced that between 36,000 and 39,000 refugees will be admitted (Employment and Immigration Canada, 1989). Even though it is now the largest single category, an increase in the number of immigrants in the family category is also a possibility. For 1990, the entry of 61,000 immigrants in this category is expected. (Employment and Immigration Canada, 1989).

Many immigrants subsequently return to their home country. It has been estimated that during the first five years after their arrival, as many as 10% do so (Michalowski, 1989). Net intake is much less than that which the gross immigration flows would suggest. If return migration increases for whatever reason, it would be necessary to admit larger numbers of immigrants to achieve the same net targets.

Last, but not least, the prospect of a negative natural increase - early in the next century - and the overall ageing of the Canadian population will no doubt be strong incentives to increase immigration. Unless there is a mass inflow, immigration cannot

qu'être exacerbée par le déclin du taux d'entrée dans la population active. Le groupe des 18-24 ans devrait diminuer de près d'un demi-million entre 1986 et 1996. Déjà le manque de travailleurs non qualifiés est perceptible dans les emplois spécifiquement destinés aux jeunes. L'immigration sélective pourrait pallier cette pénurie. Par ailleurs, une immigration sélective des jeunes pourrait être privilégiée afin de permettre de faire face aux coûts des régimes de pension à l'arrivée à la retraite des générations du baby-boom.

On peut s'attendre à ce que l'étude des dossiers des revendicateurs du statut de réfugié se traduise, dans les deux ou trois prochaines années, par un gonflement du nombre d'immigrants. On a estimé, à la promulgation de la Loi C-55 le 1<sup>er</sup> janvier 1989, que le nombre des cas en attente se chiffrait à environ 85,000 et qu'ils seraient traités en deux ans selon le ministre B. McDougall (1988).

Pour des raisons humanitaires, le Canada pourrait être amené à accueillir plus de réfugiés, le nombre de ceux-ci étant actuellement estimé à deux millions dans le monde. Le gouvernement a annoncé qu'il admettrait de 36,000 à 39,000 réfugiés en 1990 (Emploi et Immigration Canada, 1989). On peut également anticiper une augmentation des immigrants de la catégorie de la famille, la plus importante actuellement. En 1990, on prévoit l'entrée de 61,000 immigrants de cette catégorie. (Emploi et Immigration Canada, 1989).

De nombreux immigrants repartent. On a estimé que 10% d'entre eux le faisaient durant les cinq années qui suivaient leur arrivée (Michalowski, 1989). Le gain net est donc inférieur au volume des entrées. Il en résulte que si la proportion des immigrants qui repartent devait pour une raison ou pour une autre augmenter, il faudrait, pour obtenir les mêmes niveaux de migration nette, hausser les niveaux d'immigration.

Enfin, la perspective d'un accroissement naturel négatif dès le début du prochain siècle et d'un vieillissement généralisé de la population constitue une puissante incitation à renforcer l'immigration. Cette composante ne peut, à moins d'arrivées massives, corriger

prevent decline or ageing, but it can slow down these trends. The intention shown currently by the government to increase the number of immigrants could be carried over into the coming decades.

Given the above considerations, a range of immigration from 140,000 to 200,000 would seem to be a plausible assumption for the coming two decades. By 2011, the migration contribution under the high assumption would represent 0.6% of the Canadian population, as in 1988, compared to 0.5% under the low assumption.

### Emigration

The emigration assumption has been set at a fixed share of the Canadian population, and, in view of the increase in the number of immigrants, at a higher level than that observed during the last ten years. This proportion has been set at 0.25%. The number of emigrants therefore rises with the size of the population. It may reach close to 80,000 per year by 2011.

### Geographic distribution of immigrants

The geographic distribution of immigrants and emigrants, by province and territory, does not change significantly from year to year. The average distribution of immigrants and emigrants for each province/territory for the period 1985 to 1987 has been assumed for the projection period. (Figure 2).

l'évolution anticipée, mais elle peut la ralentir. La volonté que manifeste actuellement le Canada de hausser le nombre d'immigrants ressort donc d'une préoccupation qui pourrait s'étendre sur les décennies à venir.

Il semble qu'un éventail de 140,000 à 200,000 immigrants par année puisse représenter l'immigration des deux prochaines décennies. En 2011, l'apport de l'immigration prévu selon l'hypothèse forte représenterait, comme en 1988, 0.6% de la population canadienne contre 0.5% selon l'hypothèse faible.

### L'émigration

On assume que l'émigration future formera une proportion constante de la population canadienne et qu'elle sera plus élevée que celle observée au cours des dix dernières années, vu l'augmentation du nombre d'immigrants. On a fixé cette fraction à 0.25%. On comprend que le nombre annuel d'émigrants varie alors en raison directe de l'effectif de la population. Il pourrait s'approcher de 80,000 en 2011.

### Répartition géographique des immigrants

On a observé que la répartition des immigrants par province et territoire de même que celle des émigrants ne changeait pas significativement d'année en année. Il n'était pas téméraire dans ces conditions de faire l'hypothèse que la répartition de la période 1985-1987 se maintiendrait jusqu'à l'horizon 2011. (Figure 2).

(2) Les niveaux d'émigrants dérivés pour 2010-2011 correspondent à la projection 2 pour l'hypothèse faible et à la projection 3 pour l'hypothèse forte.

### Age-sex distribution

As for the future age and sex distribution of immigrants and emigrants, it was also decided to keep those of the period 1985 to 1987 constant over the projection period, as calculated for each province/territory. In recent years, a slightly older age distribution of immigrants has been observed, following the shift in the various categories of immigrants. A trend towards further ageing of this structure is, however, possible.

### **Internal Migration Projections**

Internal migration is clearly the most unstable component of population growth in Canada. Compared to the relative smoothness of mortality and fertility curves, the fluctuations that occur in internal migration are abrupt, of large amplitude, and are often in reverse direction. The analysis of

### Répartition par âge et sexe

Pour établir les structures futures par âge et sexe des immigrants et des émigrants, on a également opté pour le maintien de celles de la période 1985-1987. Calculées par province et territoire, elles ont été appliquées aux effectifs concernés sur toute la période de projection. Elles reflètent le vieillissement récent de la distribution par âge découlant de l'évolution de la composition des flux d'immigrants. Il est toutefois possible que le vieillissement de cette structure par âge observé ces dernières années s'accroisse davantage.

### **Projection de la migration interne**

La migration interne est, de toute évidence, la composante la plus instable de la croissance démographique au Canada. Par rapport à la relative souplesse qui caractérise les mouvements de la fécondité et de la mortalité, la migration interne présente des fluctuations brusques, d'amplitude considérable et souvent

the recent past does illustrate the volatile nature of this internal migration. At the very beginning of the decade, Alberta, experiencing an economic boom, posted very high migration gains of some 40,000 per year (Table 7). There was then no indication that a few years later, Alberta would experience a net loss of the order of 30,000. Being the most difficult to predict, internal migration is responsible for the greatest source of error in forecasting provincial population growth. An additional and non-negligible factor contributing to uncertainty has emerged with the Free Trade Agreement signed between Canada and the U.S.A. The impact of this agreement on migration flows is still largely unknown.

In the present situation of constant and eventually declining births, and increasing deaths, the contribution of natural increase to population growth is bound to diminish, while that of migration will increase sharply.

### Three migration assumptions

#### Migration focused on Ontario (Scenario A)

This scenario reflects a population flow towards Ontario as the major province of attraction. This is in fact the situation which has prevailed since 1981, and prior to 1971. Under this assumption, British Columbia experiences small net migration gains, but Alberta and almost all the other provinces sustain migration losses. It is assumed that the heavy flows will gradually taper off, and that the losses and gains will become less pronounced in the long run.

#### Long-term trends scenario (Scenario B)

This scenario reflects the long-term trend in interprovincial migration observed since the 1960's. It falls somewhere between scenarios A and C, the former focussing on Ontario as outlined above, and the latter reflecting, as shown below, Alberta and British Columbia as provinces of attraction. It should be noted that this is the favourable scenario for the Atlantic provinces. It is a medium assumption for all the Central and Western provinces, except Manitoba.

des retournements imprévisibles. L'analyse du passé récent illustre très bien la nature instable du phénomène. Au tout début de la décennie par exemple, l'Alberta, en plein essor économique, affichait des gains migratoires très élevés de près de 40,000 par année (tableau 7). Rien ne permettait alors de prévoir que quelques années plus tard, le bilan migratoire ferait apparaître une perte nette de l'ordre de 30,000. La migration interne est la composante la moins prévisible et la plus susceptible de fausser l'estimation de l'accroissement démographique à venir au niveau infranational. Les accords de libre-échange entre le Canada et les États-Unis, dont on ignore encore les conséquences au plan économique, ajoutent à la difficulté de conjecturer sur les mouvements internes futurs.

Dans la conjoncture actuelle de stabilité (et d'éventuel déclin) du nombre des naissances et de hausse de celui des décès, la contribution de l'accroissement naturel est appelée à diminuer et celle de l'apport migratoire, à croître considérablement.

### Trois scénarios de migration

#### Migration centrée sur l'Ontario (Scénario A)

Ce scénario reflète un courant migratoire avec l'Ontario comme principale province d'attraction. C'est effectivement la situation qui a prévalu depuis 1981 et à une époque antérieure à 1971. Selon ce scénario, le bilan migratoire est faiblement positif pour la Colombie-Britannique, toutefois négatif pour l'Alberta ainsi que pour presque toutes les autres provinces. On suppose que les valeurs très fortes s'atténueront graduellement, pertes et gains devenant moins prononcés avec le temps.

#### Scénario des tendances à long terme (Scénario B)

Ce scénario représente la tendance de fond du courant migratoire interprovincial, tel qu'observé depuis les années soixante. Il se situe entre les scénarios A et C, le premier, comme on l'a mentionné ci-dessus, étant centré sur l'Ontario, le second reflétant, on le verra bientôt, comme provinces d'attraction l'Alberta et la Colombie-Britannique. Il convient de noter que ce scénario favorise plus particulièrement les provinces de l'Atlantique. C'est une hypothèse moyenne pour toutes les provinces du Centre et de l'Ouest à l'exception du Manitoba.

Westward migration (Scenario C)

Scenario C is based on the possibility that the economic boom in the West will recur, and that the migrant population will partially resume the flow to Alberta and British Columbia. The latter province is already experiencing large gains. This movement, however, as anticipated, is less pronounced than the one in 1974-81, since the latter was accompanied by a particularly deep recession in Ontario, the province of origin of many migrants and the traditional province of attraction. This scenario is most favourable to the population growth of Alberta and British Columbia.

The levels of net migration generated on the basis of these three scenarios are shown in Table 7.

Migration tournée vers l'Ouest (Scénario C)

Ce scénario est lié à la possibilité d'une reprise éventuelle de l'essor économique de l'Ouest et donc d'un retour partiel du mouvement migratoire vers l'Alberta et la Colombie-Britannique. Le bilan migratoire est d'ores et déjà fortement positif dans cette dernière province. Cependant le mouvement, tel qu'anticipé, est moins prononcé que celui de 1974-81 puisque ce dernier était accompagné, comme on le sait, d'une récession particulièrement forte en Ontario, province d'attraction traditionnelle et source importante de migrants. C'est le scénario le plus favorable à la croissance démographique de l'Alberta et de la Colombie-Britannique.

La migration nette pour chacun des trois scénarios est présentée au tableau 7.

## Choice of Projection Series

A total of 18 projections were developed using all possible combinations of the three fertility, the two international migration, and the three internal migration scenarios. From these, a subset was selected for publication purposes. The selection was made on the basis of a variety of considerations, the primary one being the need for a combination of assumptions that would reflect a continuation of

## Choix des projections

En combinant entre elles les trois hypothèses de fécondité, les deux hypothèses de migration internationale et les trois scénarios de migration interne, on obtient un ensemble de 18 projections. Parmi ces 18 projections, nous avons dû faire le choix d'un sous-ensemble approprié pour la publication. Nous avons fondé ce choix sur diverses considérations dont la première a consisté à privilégier une combinaison d'hypothèses qui illustrerait la poursuite des

current trends. With this objective, a scenario which incorporates the most recent course of events (Projection 3) was first selected. The other scenarios are intended to reflect possible deviations from current trends. They were selected to provide a plausible range of growth possibilities in each province and for Canada as a whole. The four selected projections are summarized in Table 8.

At the national level, Projection 1 is a low-growth scenario. Projections 2 and 3 are medium-growth scenarios, whereas projection 4 yields much higher growth.

tendances observées récemment. Nous avons été ainsi amenés à définir un scénario qui, à court terme, correspond à l'évolution la plus récente (projection 3). Les autres scénarios retenus présentent certains décrochages par rapport aux tendances récentes. On les a choisis de façon à offrir un éventail d'évolutions plausibles de la population de chaque province et du Canada pris globalement. On trouvera les quatre projections retenues sous forme schématique au tableau 8.

Au niveau national, la projection 1 correspond à une croissance faible, les projections 2 et 3, à une croissance moyenne, alors que la projection 4 engendre une croissance forte par rapport aux autres.

Scénario C: Retour partiel du mouvement vers l'ouest.

Source: Derived from Text Tables.  
Source: Provenant des tableaux du texte.

At the provincial level, the choice of projection series is more complex, primarily because of the additional assumptions on internal migration. As interprovincial net migration is zero at the national level, migration gains by one province represent losses for other provinces, and vice versa. It is, therefore, not possible to identify a series which offers a high- or a low-growth assumption for all provinces together.

Au niveau provincial, la situation est beaucoup plus complexe, à cause notamment de l'introduction d'hypothèses portant sur la migration interne. La migration interprovinciale nette étant égale à zéro à l'échelle nationale, il s'ensuit que les gains d'une province doivent nécessairement correspondre à des bilans négatifs pour d'autres. On ne peut donc identifier une projection qui offre un scénario de croissance forte ou faible pour toutes les provinces simultanément.

Table 9 shows the population reached by 2011 and the ranking of the series for each province.

Le tableau 9 donne, pour chaque province, la population atteinte en 2011 selon chacune des projections et son classement par ordre décroissant.

## II. Projection Results

### Introduction

The selected projections circumscribe three growth scenarios: "high growth", "medium growth" and "low growth". At the national level, the high-growth scenario combines an upturn in fertility and an immigration level of 200,000 per year (Projection 4). The medium-growth scenario assumes a constant fertility rate of 1.67 births per woman, and immigration of either 200,000 per year (Projection 3) or 140,000 per year (Projection 2). Finally, a level of immigration of 140,000 per year combined with a fertility rate of 1.2 births per woman yields the low-growth scenario (Projection 1). The mortality assumption is the same in all projections: life expectancy at birth increases to 77.2 years for males and to 84.0 years for females by 2011.

For the provinces, the analysis of the results extends until 2011. At the national level, it is extended to 2036. At that time, the baby-boom cohorts will all be 65 years of age or older; only by following these cohorts through retirement age does the study of ageing reach its full dimension.

### National Population Size and Growth

Whichever projection is considered, Canada's population will henceforth grow at a slower pace than in the past, and the ageing process will accelerate. Considering the internal migration assumptions, only minor changes in the overall distribution of population among the provinces and territories are expected until 2011 (Table 15).

Under Projection 1 (low growth), during the coming decades, the population of Canada will continue to increase, albeit at a slower pace. The population would begin to decline around 2016; in 2036, its size will be slightly larger, by some 5%, than it currently is.

## II. Résultats des projections

### Introduction

Les projections retenues délimitent trois types de croissance: forte, moyenne et faible. La croissance forte provient, au plan national, de la combinaison d'une reprise de la fécondité jusqu'à 2.1 naissances par femme et d'une immigration de 200,000 personnes par an (projection 4). La croissance moyenne découle de l'association d'une fécondité constante de 1.67 naissance par femme avec une immigration de 200,000 personnes par an (projection 3) ou de 140,000 par an (projection 2); enfin, il résulte d'un niveau d'immigration de 140,000 personnes par an combiné à une fécondité de 1.2 naissance par femme une croissance faible (projection 1). La mortalité ne varie pas d'une projection à l'autre; dans toutes, l'espérance de vie à la naissance augmente pour atteindre, en 2011, 77.2 ans chez les hommes et 84.0 ans chez les femmes.

Pour les provinces, l'analyse des résultats de ces projections s'arrête en 2011 alors qu'au niveau national, nous l'étendons jusqu'en 2036. À ce moment, toutes les cohortes du baby-boom auront atteint ou dépassé 65 ans; l'étude de l'impact du vieillissement démographique ne prend toute sa signification qu'avec la prise en compte de ces cohortes jusqu'à l'âge de la retraite.

### Croissance de la population canadienne

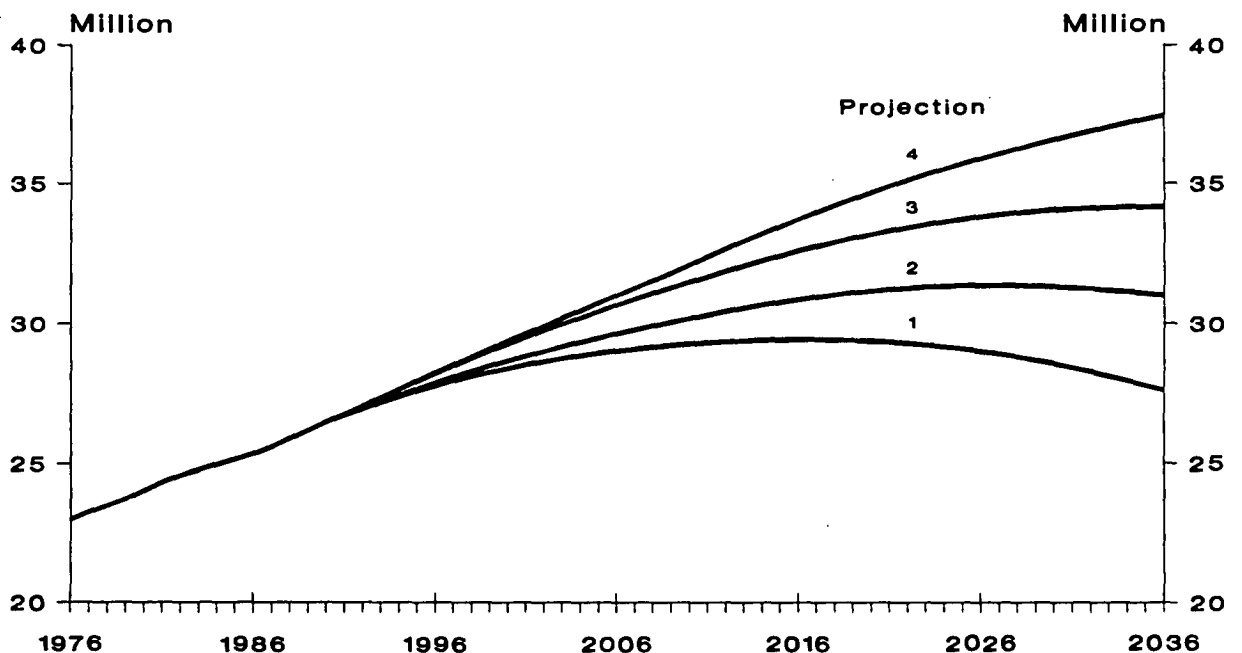

Quelle que soit la projection considérée, la population canadienne croîtra dorénavant à un rythme plus lent que par le passé et son vieillissement s'accroîtra. Soulignons que la répartition de la population par province et territoire, compte tenu des hypothèses de migration interne, ne variera pas substantiellement d'ici 2011 (tableau 15).

Selon la projection 1 (croissance faible), au cours des prochaines décennies, la population canadienne augmenterait de plus en plus lentement à mesure qu'on s'approcherait de l'horizon 2011; elle n'amorcerait cependant son déclin que vers 2016. En 2036, la population serait légèrement supérieure, de près de 5%, à ce qu'elle est actuellement.

Under the high-growth scenario (Projection 4), the population would reach 32 million by 2011, and 37 million by 2036 (Figure 3). Canada's population took some 40 years to grow from 13 million to the current 26 million, but unless a drastic change in the components of growth occurs, it is unlikely that the population will ever double again<sup>12</sup>.

Quant à la projection impliquant une forte croissance (projection 4), elle porte la population du Canada à 32 millions vers 2011, et à 37 millions en 2036 (figure 3). Il est très possible que la population du Canada, qui a mis une quarantaine d'années pour passer de 13 à 26 millions, ne double jamais plus à moins d'une modification radicale dans l'évolution des facteurs de croissance<sup>12</sup>.

Figure 3  
Trends in the Total Population of Canada, 1976 to 2036, According to Four Projections  
Évolution de la population du Canada, 1976 à 2036, selon quatre projections

Sources: 1976-1989: La même qu'au tableau 5; 1990-2036: Tableaux de l'annexe.

Under the assumption that fertility will continue to fall (Projection 1), the number of births decreases substantially while the number of deaths continues to rise. As a result, natural increase - the excess of births over deaths - reaches the zero mark around the year 2007. This situation will, however, occur only around 2020 if the fertility rate remains at its current level (Figure 4).

Dans l'hypothèse d'une poursuite de la chute de la fécondité (projection 1), le nombre des naissances diminue sensiblement alors que celui des décès augmente régulièrement et l'accroissement naturel, c'est-à-dire l'excédent des naissances sur les décès, devient nul vers 2007. Si toutefois la fécondité continue à se maintenir au niveau actuel, les décès égaleront les naissances vers 2020 seulement (figure 4).

Sources: 1989: Statistique Canada, Estimations annuelles postcensitaires de la population suivant l'état matrimonial, l'âge, le sexe et composantes de l'accroissement, Canada, provinces et territoires au 1<sup>er</sup> juin 1989, n° 91-210 au catalogue, annuel, vol. 7, septième édition, février 1990; 1990-2036: Tableaux de l'annexe.

The projected rates of growth under the four demographic projections are shown in Table 10. All projections yield a positive increase until at least 2016. Since migration gains exceed losses from negative natural increase, the population decline is postponed by about 10 years. The decrease of the population is observed around 2016 in Projection 1, 10 and 20 years later in Projections 2 and 3 respectively.

If, under the current fertility rate of 1.67 births per woman, an annual growth rate of 1% was to be maintained, 200,000 immigrants would be required in 1995, 320,000 in 2011 and 560,000 in 2036.

Les taux prospectifs d'accroissement figurent au tableau 10 pour les quatre projections. Jusqu'en 2016 au moins, on observe un accroissement total positif pour les quatre projections. Notons que l'apport migratoire fait reculer d'environ 10 ans le déclin de la population, en surpassant l'accroissement naturel. C'est ainsi que le déclin de la population surviendra vers 2016 dans le cas de la projection 1, 10 et 20 ans plus tard pour les projections 2 et 3 respectivement.

Si on voulait, dans le contexte de fécondité actuelle (1.67 naissance par femme), conserver un taux d'accroissement annuel de 1%, il faudrait que l'entrée d'immigrants soit de 200,000 en 1995, 320,000 en 2011 et de 560,000 en 2036.

## Changes in the Age Structure

Under all the projection series, the ageing of Canada's population accelerates as a result of a low fertility.

The proportions of young and elderly in the population move in opposite directions. Whichever projection is considered, the pace of decrease in the percentage of young people is slower than the increase in the elderly population. In the 1986 Census, young people (age 0-17) made up 26% of Canada's population, and the elderly, 11%. If the current fertility rate remains constant, by 2020 the relative share of these two groups would be identical, at 19% (Projection 3). By 2036, the elderly would make up a quarter of the total population, and the young only 18% (Table 11).

Under the assumption of an upturn in fertility (Projection 4), the proportion of Canadians 65 and older would reach 15% in 2011 and 22% in 2036, slightly more than the proportion of young people (Table 11). On the other hand, a fertility rate of 1.2 births per woman (Projection 1) would reduce by half the proportion of young people, and would multiply by 2.7 the percentage elderly. The population would then contain two elderly for every child by 2036 (29% elderly compared to 13% children).

Changes in the age structure are giving shape to a Canadian society which will be quite different from what it is today. In the medium-growth assumption (Projection 3), the median age of the population would rise from its current 33 years to 41 years in 2011, and to 45 years by 2036. The inversion of the age pyramid, presented in Figure 5, offers a vivid illustration of the structural changes which will inevitably accompany the ageing of Canada's population. Thus, 19% of the electorate would be over age 65 in 2011, and 30% in 2036 (Projection 3) compared to 15% in 1989. Whichever scenario is considered, the ageing process seems to be an inevitable part of Canada's demographic future.

## Modifications de la structure par âge

Le vieillissement de la population canadienne, consécutif à la baisse de la fécondité, s'accroît selon toutes les projections retenues.

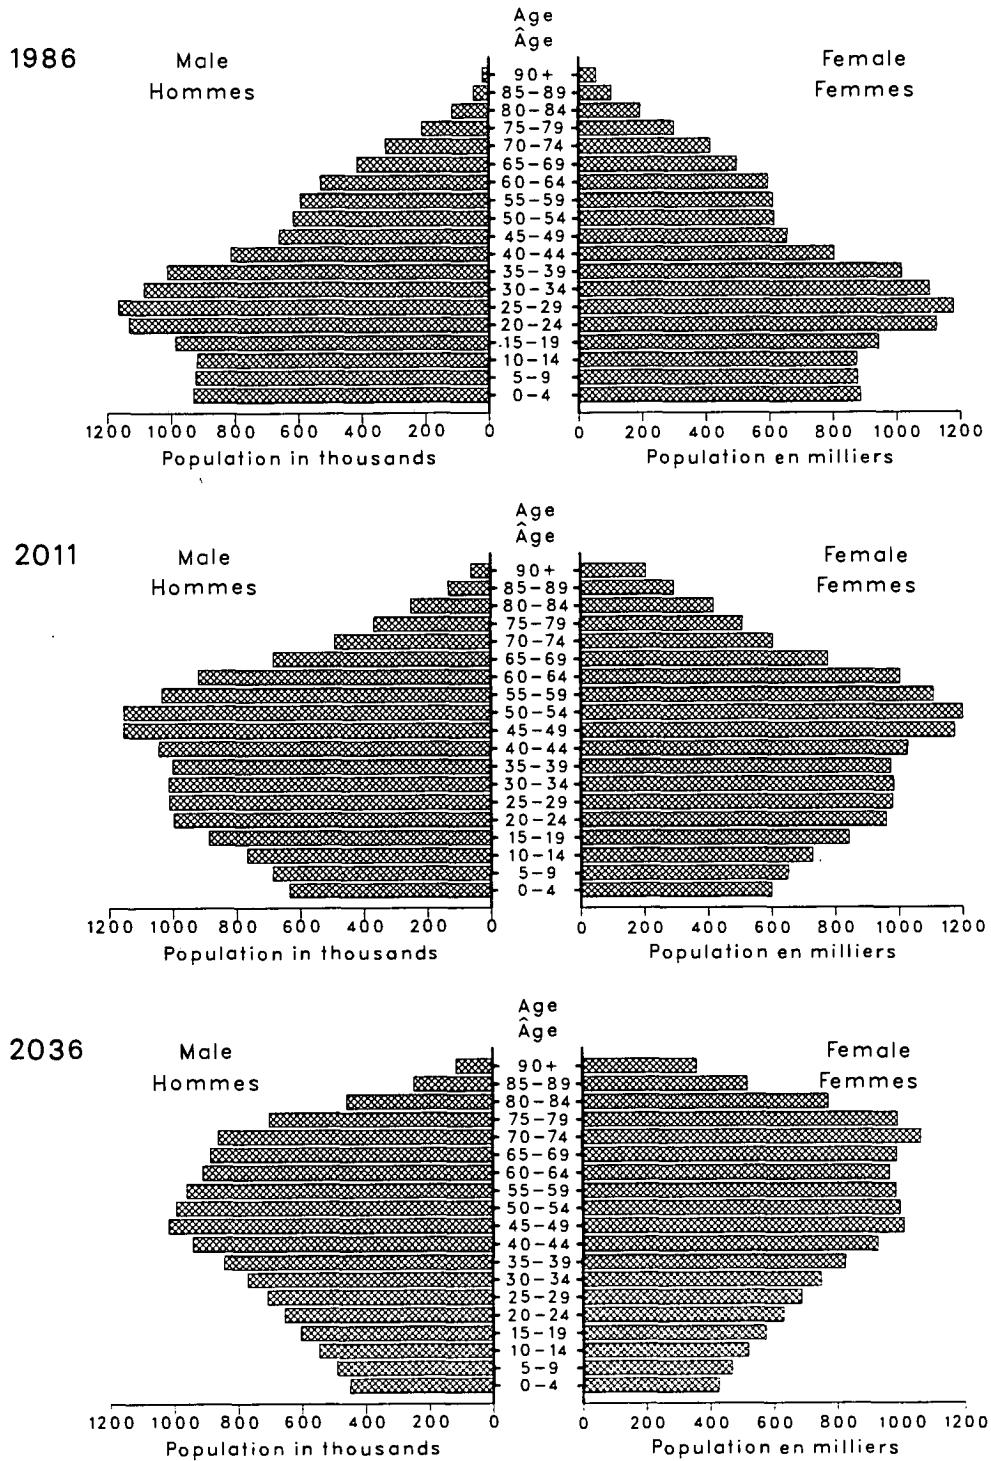

La proportion des jeunes évolue en sens contraire de celle des personnes âgées : le rythme de diminution du pourcentage des jeunes est cependant, quelle que soit la projection considérée, moins rapide que celui de l'augmentation de la fraction des personnes âgées. Au recensement de 1986, les jeunes de 0-17 ans représentaient 26% de la population canadienne et les personnes âgées, 11%. Vers 2020, si la fécondité actuelle persistait, leurs parts relatives seraient équivalentes, soit 19% (projection 3). En 2036, les personnes âgées formeraient le quart de la population totale et les jeunes, 18% seulement (tableau 11).

Dans l'hypothèse d'une reprise de la fécondité (projection 4), la proportion des 65 ans et plus atteindrait 15% en 2011 et 22% en 2036, elle surpasserait alors légèrement celle des jeunes (tableau 11). À l'opposé, une fécondité de 1.2 naissance par femme (projection 1) réduirait de moitié la proportion des jeunes et multiplierait par 2.7 celle des 65 ans et plus, de sorte qu'on compterait deux personnes âgées pour un jeune en 2036, soit 29% de 65 ans et plus contre 13% de 0-17 ans.

On peut donc entrevoir, pour le prochain siècle, une société passablement différente de celle que l'on connaît aujourd'hui. Dans l'hypothèse d'une croissance moyenne (projection 3) l'âge médian de la population, actuellement de 33 ans, pourrait atteindre 41 ans en 2011 et 45 ans en 2036. L'inversion de la pyramide des âges, présentée à la figure 5, illustre de façon dramatique les bouleversements structurels dont s'accompagnera le vieillissement de la population. Sur un autre plan, 19 électeurs sur 100 auraient 65 ans ou plus en 2011 et 30 en 2036 (projection 3) contre 15 sur 100 en 1989. Quelle que soit la projection considérée, le vieillissement de la population semble bel et bien inscrit dans le devenir de la population canadienne.

Source: Appendix Tables.  
 Source: Tableaux de l'annexe.

### **Preschool and School-age Population, Age 0-17**

The projections for this age group are the most uncertain. Indeed, their future number depends largely on the fertility assumption the more we move away from the projection base. In 1989, there were 6.6 million children aged 0-17. In 2011, they may number somewhere between 5.1 and 7.1 million, depending on whether fertility decreases (Projection 1) or increases (Projection 4). In a longer-term perspective, the margin would widen, and in 2036 there is a difference of 4.6 million between the lowest (3.6 million) and the highest number (8.2 million) (Table 11).

#### Preschool Population, Age 0-4

The population aged 0-4 is currently estimated to be 1.8 million. By 2011, it may be as low as 1.2 million or as high as 2.1 million, depending on the fertility level which prevails. If fertility were to stabilize at the current level, and immigration were to increase, the number of children aged 0-4 would reach its highest value, of close to 1.9 million, in 1991 (Figure 6). Twenty years later, by 2011, the pre-school age population will have dropped to about 1.7 million.

#### Elementary School Population, Age 5-13

Under the declining fertility assumption, the number of children in the 5-13 age group would oscillate between 3.3 and 3.4 million until the turn of the century. It would then drop rapidly, and would be only 77% of its current 2.5 million in 2011. Under the constant fertility assumption, the size of this group would fluctuate between 3.0 and 3.4 million until 2011. Under the rising fertility assumption of Projection 4, it would increase to slightly over 3.4 million in 2011 (Figure 6).

### **Les jeunes d'âge scolaire et préscolaire: les 0-17 ans**

C'est dans ce groupe d'âge que la projection comporte le plus d'incertitude. En effet, son effectif futur repose essentiellement sur le niveau prévu de fécondité, et ceci, plus on s'éloigne du début de la projection. En 1989, on comptait 6.6 millions de jeunes âgés de 0 à 17 ans. En 2011, leur effectif pourrait osciller entre 5.1 et 7.1 millions selon que la fécondité baisse (projection 1) ou augmente (projection 4). À plus long terme, la fourchette s'élargit et en 2036, un écart de 4.6 millions sépare la valeur la plus faible (3.6 millions) de la plus forte (8.2 millions) (tableau 11).

#### Les enfants d'âge préscolaire, les 0-4 ans

On estime présentement à 1.8 million le nombre des 0-4 ans. En 2011, les jeunes d'âge préscolaire pourraient diminuer à 1.2 million ou augmenter à 2.1 millions, dépendant de l'hypothèse de fécondité adoptée. Si la fécondité devait se stabiliser à son niveau actuel et l'immigration augmenter, le nombre d'enfants âgés de 0-4 ans atteindrait sa valeur maximale en 1991 (figure 6). Cette année-là, l'effectif pourrait se situer à près de 1.9 million. Vingt ans plus tard, en 2011, l'effectif des jeunes d'âge préscolaire aurait diminué à 1.7 million environ.

#### Les jeunes du secteur scolaire élémentaire, les 5-13 ans

Dans l'hypothèse d'une poursuite de la baisse de la fécondité, le nombre des jeunes de 5-13 ans fluctuerait entre 3.3 et 3.4 millions jusqu'en 2000. Après, il s'affaîsserait pour ne représenter que 2.5 millions en 2011, soit 77% de ce qu'il était en 1989. S'il y avait stabilisation de la fécondité, l'effectif pourrait osciller entre 3.0 et 3.4 millions jusqu'en 2011. La projection 4 (reprise de la fécondité) le porte à un peu plus de 3.4 millions en 2011 (figure 6).

### Secondary School Population, Age 14-17

Over the next 10 to 15 years, the number of teenagers in the 14-17 age group will reflect the recent past trends in fertility. In 1989 they numbered 1.4 million. In 2011, this population will be between 1.3 and 1.5 million, depending on whether the low or the constant fertility assumption prevails.

### Les adolescents du niveau secondaire, les 14-17 ans

Au cours des 10 à 15 prochaines années, le nombre d'adolescents âgés de 14-17 ans reflétera l'évolution récente de la fécondité; en 1989, on en compte 1.4 million. En 2011, leur effectif se situerait entre 1.3 et 1.5 million, selon que l'on retient l'hypothèse de baisse ou de stabilisation de la fécondité.

### **Young Adults, Age 18-24**

The young adult group is especially important because of its strategic position in the life cycle.

### **Les jeunes adultes, les 18-24 ans**

Les jeunes adultes forment un groupe d'une importance cruciale au plan socio-économique puisqu'ils

These are the prime ages for entry into the labour force, college and university, and is the time in life when considerations about marriage and family begin to arise.

In 1989, this group was made up of the very first of the baby-bust cohorts. Estimated currently at 2.8 million, this age group would fluctuate between 2.7 and 2.9 million until 2011, depending on the projection scenario considered. The 18-24 age group can be projected with reasonable confidence since most of its members are already born.

sont à la phase de leur établissement dans la société : ils préparent leur carrière (collège et université), entrent sur le marché du travail, pensent à fonder un ménage, commencent à voter.

En 1989, ce groupe est formé des toutes premières générations de l'implosion démographique. Son effectif, présentement de 2.8 millions, devrait osciller entre 2.7 et 2.9 millions en 2011 selon la projection considérée. La population des 18-24 ans de la première décennie du 21<sup>e</sup> siècle peut être prévue avec une certaine assurance puisque les jeunes qui la formeront sont, dans une large majorité, déjà nés.

### The Population Aged 18-64

In 2011, there will be almost 19 million Canadians between the ages of 18 and 64, nearly 3 million more than in 1989. The population of this group would remain fairly stable for a few years. It would then enter a period of decline such that by

### La population des 18-64 ans

En 2011, la population canadienne comptera plus de 19 millions d'adultes âgés de 18 à 64 ans, un accroissement de près de trois millions par rapport à l'effectif de 1989. Au-delà, leur nombre pourrait demeurer à peu près stable durant quelques années, puis amorcer, à mesure que s'y

2036, it would have shrunk to a level slightly below its current size under Projection 1, i.e. if fertility were to drop to 1.2 births per woman (Table 11). Only the high-growth scenario (Projection 4) generates continuous growth in this group throughout the third decade of the next century, after a decline during the second decade. Indeed, it is only after some twenty years that the assumed rising fertility will start to affect the size of the adult age groups.

intégreront les générations creuses, un déclin qui le mènerait, en 2036, à un niveau un peu au-dessous de son niveau actuel si la fécondité s'abaissait à 1.2 naissance par femme (projection 1) (tableau 11). Seul le scénario de croissance forte (projection 4), entraîne une augmentation de la population adulte au cours de la troisième décennie du prochain siècle, après un recul au cours de la deuxième décennie toutefois. Ce n'est en effet qu'après une vingtaine d'années que la reprise de la fécondité touche les âges adultes.

Figure 7  
**Dependency Ratios, Canada, 1986 to 2036 (Projection 3)**  
**Évolution des rapports de dépendance au Canada, 1986 à 2036 (Projection 3)**

Note: The dependency ratio expresses the number of people of "dependent ages" per 100 persons of "working age".  
 Nota: Le rapport de dépendance représente le nombre de personnes aux "âges dépendants" pour 100 personnes en âge de travailler.

Source: Calculated using the same source as in Table 11.  
 Source: Calculés à partir des données provenant de la même source qu'au tableau 11.

The 16.7 million people aged 18-64 currently make up 64% of Canada's total population; by 2011, they may still account for two-thirds of the population if fertility continues to drop. Until then, Canada will have the largest labour force population in its history. During the next 20 years, the dependency ratio, i.e. the ratio of young and elderly

Les 16.7 millions de personnes âgées de 18-64 ans représentent actuellement 64% de la population totale; en 2011, ils pourraient en former les deux tiers si la fécondité continuait à chuter. Le Canada compterait vraisemblablement à cette époque le plus fort contingent d'adultes de son histoire. Au cours des deux prochaines décennies, le rapport de dépendance, c'est-à-dire le

to persons of working age, will be at its minimum. Currently, the ratio is around 57. Thus, for every 100 persons of working age (18-64) in Canada, there are 57 "dependents"<sup>13</sup>. This ratio would be somewhere between 51 under Projection 1 and 59 under Projection 4, by 2011. Then, as the first baby-boom cohorts reach retirement age, the dependency ratio will start to increase, and may reach between 72 and 80 by the year 2036 (Figure 7).

### The Population Aged 65 and Older

When considering the future number of people aged 65 and over, there is very little difference between the four scenarios. The cohorts who will make up this age group by 2036 are already born. The projected population size varies only through the migration assumption<sup>14</sup>. As the mortality assumption is identical in all four series, Projection 1 will be used to illustrate growth and structure of this age group.

The 65-and-over population will grow at a very rapid pace during the coming decades, especially after 2011 with the arrival of the baby-boom cohorts. In 1989, the population of this group is estimated at three million. By 2020 it will have doubled, and by 2036, the number of elderly will be in the order of eight million (Table 11). This potential number of people of retirement age will undoubtedly be a major challenge of the 21st century.

Not only will the number of elderly people increase substantially, but this group will also grow older. By dividing the group into two subgroups, those 65-74 and those 75 and over, we can readily see how ageing will affect it. In 1989, the 65-74 subgroup accounted for 60% of the elderly population, but by 2011 and 2036, respectively, it will account for about 53% and 48%. The ageing trend is particularly pronounced among elderly women: as early as 2011, the proportion of women 75 and older will be larger than that of the 65-74 age group (Table 13).

rappport numérique entre les jeunes et les personnes âgées aux personnes en âge de travailler, serait à son minimum. Présentement, ce rapport est de l'ordre de 57, c'est-à-dire que pour 100 personnes âgées de 18-64 ans on retrouve 57 "dépendants"<sup>13</sup>. Il pourrait se situer entre 51, selon la projection 1, et 59, selon la projection 4, vers 2011. Puis, avec l'arrivée à l'âge de la retraite des premières générations du baby-boom, on assisterait à une augmentation du rapport de dépendance, lequel pourrait varier à l'horizon 2036, entre 72 et 80 pour 100 "actifs" (figure 7).

### Les 65 ans et plus

Pour ce groupe d'âge, les populations prévues varient seulement en fonction de l'hypothèse de migration, de sorte qu'on observe peu d'écart entre elles selon la projection retenue<sup>14</sup>. Les personnes qui formeront le groupe des 65 ans et plus d'ici 2036 sont déjà nées et, quelle que soit la projection considérée, elles sont soumises à la même loi de mortalité. Nous allons en illustrer l'évolution et la structure à partir de la projection 1.

La population des personnes âgées croîtra à un rythme rapide au cours des prochaines décennies, plus particulièrement au-delà de 2011, alors que les générations nées après la deuxième guerre mondiale commenceront à en faire partie. En 1989, on estime à trois millions l'effectif des 65 ans et plus. Vers 2020, il aura vraisemblablement doublé, et en 2036, il oscillera autour de huit millions (tableau 11). Cette augmentation des personnes âgées représentera, à n'en pas douter, le défi majeur du prochain siècle.

Non seulement le groupe des personnes âgées augmentera-t-il sensiblement, mais encore il le fera plus rapidement aux grands âges. Si on divise l'effectif des 65 ans et plus en deux sous-groupes, soit les 65-74 ans et les 75 ans et plus, on peut facilement constater le vieillissement du groupe. En 1989, les 65-74 ans, représentaient 60% de l'ensemble des personnes âgées; vers 2011, ils en représenteront environ 53% et en 2036, 48% seulement. Chez les femmes âgées, le vieillissement est particulièrement évident, alors qu'en 2011, la proportion des 75 ans et plus aura même dépassé celle des 65 à 74 ans (tableau 13).

**TABLE 13. Population Aged 65 and Over, by Sex and Age Group, Canada, 1986, 1989, 2011 and 2036, According to the Low-Growth Scenario**

**TABLEAU 13. Population âgée de 65 ans et plus répartie selon le sexe et le groupe d'âge, Canada, 1986, 1989, 2011 et 2036, selon le scénario de croissance faible**

Sex and age group - Groupe d'âge et sexe							
Years Années	65-74		75+		Total		
	'000	%	'000	%	'000	%	
<b>Male - Hommes</b>

The current substantial numerical imbalance between the sexes in the elderly population is expected to continue in the future. Elderly females will continue to outnumber males: by 2036, there will be 70 males for every 100 females.

Le déséquilibre numérique entre les sexes chez les personnes âgées, déjà sensible dans la structure actuelle, est appelé à se maintenir dans l'avenir: en 2036 il y aura 70 hommes pour 100 femmes.

### Provincial Trends

There is a much greater margin of uncertainty in the results at the provincial level than at the national level. The reason is the presence of an additional growth factor, interprovincial migration, which is very unstable and unpredictable.

### Les résultats au niveau provincial

Les résultats à l'échelon provincial comportent une marge d'incertitude beaucoup plus élevée qu'au niveau national. C'est qu'on se trouve en présence d'un facteur de croissance additionnel, la migration interne, fort instable et difficile à prévoir.

Sources: 1989: Statistique Canada, *Estimations annuelles postcensitaires de la population suivant l'état matrimonial, l'âge, le sexe et composantes de l'accroissement, Canada, provinces et territoires au 1<sup>er</sup> juin 1989*, n<sup>o</sup> 91-210 au catalogue, annuel, Vol.7, septième édition, février 1990; 2011: Tableaux de l'annexe.

As can be seen from Table 14, positive growth is expected for all provinces over the 22-year projection period. However, in the range of projections selected, there are some cases of annual population decline in the provinces: such is the case in the Atlantic Provinces under Projection 1, and in Saskatchewan under Projection 2. In general, the rate of growth in the provinces, though uneven, declines fairly steadily in keeping with the trend projected for the Canadian population as a whole.

Comme on peut le constater au tableau 14, les croissances prévues dans les provinces et territoires sont positives si l'on considère l'ensemble de la période des 22 prochaines années. Dans l'éventail de projections que nous avons retenu, on retrouve toutefois des cas de déclin démographique dans les provinces : c'est le cas des provinces de l'Atlantique selon la projection 1 et de la Saskatchewan (projection 2). De façon générale, le rythme de croissance des provinces, quoique fort inégal, diminue plus ou moins régulièrement, suivant en cela l'évolution prévue pour la population canadienne dans son ensemble.

By 2011, under Projection 1, most provinces would have a very low or negative growth rate.

Provincial shares of the Canadian population change very slowly over time. According to the projections, Ontario will continue to have the largest proportion; Quebec's percentage may decline slightly, and that of Alberta and British Columbia would remain stable or increase depending on the projection (Table 15).

Vers 2011, selon la projection 1, la plupart des provinces présenteraient un taux de croissance très faible ou négatif.

Le poids démographique respectif des provinces change très lentement. Ainsi l'avenir, tel qu'on peut le prévoir, consacre la prépondérance de l'Ontario, réduit la part du Québec et maintient ou augmente (selon les projections) celles de l'Alberta et de la Colombie-Britannique (tableau 15).

## Conclusion

The foregoing analysis of the projection results provides a wealth of information about the unprecedented direction that demographic trends in Canada may take in the decades to come. Two phenomena are likely to dominate the nation's demographic future: first, a slowdown in population growth followed by a decline in population size if the current demographic trends persist; second, a profound change in the age structure of an increasingly older population.

Immigration will no doubt become a major issue as, and if, natural increase becomes negative. In addition, the sheer number of retirees (8 million persons aged 65 and over by 2036) will represent a challenge to the nation. The ageing of the elderly group itself, due to greater longevity, will emerge as a major issue of public concern. Pension costs, health care, housing, quality of life and leisure, are issues likely to figure prominently on political and economic agendas.

Economic and social needs vary from one age group to another, making adjustments to age-specific requirements difficult, especially when boom and bust periods alternate. The three prime age groups - the young, those making up the labour force (age 18-64), and the population aged 65 and over - will experience shifts in varying degrees during the projection period. Fewer children, more elderly, and a larger but older workforce are all on the horizon of the year 2000.

The evolving demographic trend - the drastic slowdown in growth and the ageing of the population - will have major implications for a wide range of social and economic policy sectors. The issue of transfer of resources from the young to the elderly is but one. Another important issue is the dominant role of migration in the dynamics of population growth.

## Conclusion

Les résultats présentés dans ce rapport viennent jeter un éclairage nouveau sur l'orientation que la population canadienne est appelée à prendre au cours des décennies à venir. Deux phénomènes domineront vraisemblablement l'avenir démographique de la nation: d'abord, un ralentissement de la croissance qui pourrait être suivi d'une diminution de la population totale, si les tendances démographiques observées persistent; puis, un bouleversement profond de la structure par âge d'une population de plus en plus vieillissante.

La question de l'immigration deviendra sans aucun doute un sujet majeur surtout si l'accroissement naturel devient négative. Le nombre de retraités (8 millions de personnes de 65 ans et plus en 2036) et leur vieillissement, dû à une longévité accrue, constitueront des défis de taille. Le coût des pensions, les soins médicaux, le logement, la qualité de la vie et les loisirs seront probablement des préoccupations politiques et économiques dominantes.

Les besoins d'ordre économique et social varient d'un groupe d'âge à l'autre, et les satisfaire s'avère difficile, en particulier lorsque les générations pleines et creuses alternent. Les trois principaux groupes d'âge - les jeunes, les 65 ans et plus et la population active (les 18-64 ans) - pourraient connaître de profondes mutations au cours de la période de projection. Moins d'enfants, plus de personnes âgées et une population active plus nombreuse mais aussi plus vieille formeront la population à l'horizon 2000.

Cette nouvelle situation démographique, à savoir un ralentissement de la croissance accompagné d'un vieillissement de la population, ne manquera pas de mettre en évidence le rôle de la migration dans la dynamique de l'accroissement démographique, et soulèvera le problème du transfert des ressources entre les segments jeunes et âgés de la société.

## Limitations of Projections

The accuracy of any projection is conditional on the reliability of the base population and component data, and the degree to which the underlying assumptions successfully anticipate future trends. Population change is influenced by various socioeconomic and/or political factors, which cannot be clearly foreseen, and whose impact on demographic changes cannot be accurately measured. As Nathan Keyfitz (1972) observed some years ago: "If the future is wholly different from the past, no amount of data and experience can assist prediction". In general, the uncertainty of future population change can be expected to increase over the projection period, and to be greater for smaller populations.

The assumptions on the components of growth - namely, fertility, mortality, international migration and internal migration - are made on the basis of an analysis of past trends and expected changes in the future, based on current knowledge. The assumed future values are intended to provide a plausible range in the expected trends for each component during the projection period.

In preparing the projections, assumptions were made on life expectancy, the total fertility rate, the convergence between provincial and national trends, national levels of immigration and emigration, the distribution of immigrants and emigrants by province, and on trends in interprovincial migration by age and sex. While multiple assumptions were made in the case of fertility, immigration and interprovincial migration, one single assumption is offered for mortality and emigration. The desire to offer a range of plausible assumptions had to be balanced against the practical consideration of generating an excessive number of scenarios. A single assumption was made for a given component if it was determined that alternative assumptions would not have a substantial impact on the overall results.

## Limites des projections

La qualité d'une projection dépend de la fiabilité des données relatives à la population de départ, de celle des séries chronologiques portant sur les composantes, et de la justesse des hypothèses formulées. Divers facteurs socio-économiques et politiques, qui sont imprévisibles et dont on ne peut pas mesurer précisément l'impact, peuvent influencer sur l'évolution démographique. Comme l'a fait observer Nathan Keyfitz (1972): "Si l'avenir se révèle totalement différent du passé, il est difficile de faire des prévisions, peu importe la quantité de données disponibles et l'expérience acquise". En général, le niveau d'incertitude s'accroît avec le temps et est beaucoup plus élevé dans le cas de populations de taille réduite.

Les hypothèses relatives à l'évolution des phénomènes démographiques, à savoir la fécondité, la mortalité, la migration internationale et la migration interne sont fondées sur une analyse des tendances passées et traduisent les variations que l'on peut prévoir dans l'état actuel des connaissances. Elles ont été conçues de façon à fournir un éventail plausible pour chacune des composantes.

Dans la préparation des projections, on a dû formuler un certain nombre d'hypothèses portant notamment sur l'espérance de vie, l'indice synthétique de fécondité, la convergence des indices régionaux de fécondité, les effectifs d'immigrants et d'émigrants et leur répartition géographique et démographique, l'évolution de la migration interprovinciale par âge et sexe. Nous proposons plus d'une hypothèse dans le cas de la fécondité, de l'immigration et de la migration interprovinciale. Quant à la mortalité et à l'émigration, elles ne font l'objet que d'une seule hypothèse. Nous avons voulu fournir un éventail de scénarios vraisemblables sans les multiplier indûment. On a retenu une hypothèse unique pour une composante donnée qu'après avoir vérifié que d'autres options plausibles n'auraient pas d'effet appréciable sur l'ensemble des résultats.

## **The Impact of Population Underenumeration on Projections**

The base population for the current set of projections is the 1989 postcensal estimates for Canada and the provinces, based on data from the 1986 Census and on demographic components. A study of the 1986 Census has estimated undercoverage to be of the order of 3.2% for Canada, approximately 2% in Newfoundland and 4.5% in British Columbia (for details see Statistics Canada, Catalogue No. 99-135). The study also shows that undercoverage is not evenly distributed among age groups, and tends to be higher among young adults aged 20-24, for instance, where it reaches 9%. This level of undercoverage is carried forward to future years. The age pattern of undercoverage in the projected population, however, will change since it is the age cohorts and not the age groups which retain their initial rate of undercoverage.

The impact of undercoverage on the base population can be illustrated by comparing a projection using a base population adjusted for undercoverage, with a projection using a non-adjusted base. We have not made such a comparison because a similar evaluation has been made for prior projections, (see Statistics Canada, Catalogue No. 91-520, 1979, pp. 32-36).

## **Availability of Unpublished and Customized Projections**

The application of the projection model to the possible combinations of assumptions on each component yielded 18 population projections by age and sex for each year to 2011 for the provinces and the territories and up to the year 2036 for Canada. The components of population growth were also produced for each year. These data are available from Statistics Canada for the cost of data retrieval, either on computer print-media, magnetic tape, or diskette.

In addition, Statistics Canada's projection model is capable of producing customized population,

## **Effets du sous-dénombrement de la population sur les projections**

La population de départ pour la projection actuelle est celle estimée au 1<sup>er</sup> juin 1989 pour le Canada et les provinces sur la base des données du recensement de 1986 et des composantes démographiques. Une étude du sous-dénombrement de la population totale en estime l'ordre de grandeur en 1986 à 3.2% pour le Canada, 2% à Terre-Neuve et 4.5% en Colombie-Britannique (pour les détails, voir la publication n° 99-135 au catalogue de Statistique Canada). L'étude révèle également que ce phénomène n'est pas réparti de façon uniforme entre les groupes d'âge et qu'il tend à être plus élevé dans certains: par exemple, il atteint 9.0% chez les 20-24 ans. Dans le cas des effectifs futurs, on doit se rappeler que le sous-dénombrement selon l'âge qui touche la population de départ est un biais qui suit les générations, non les groupes d'âge.

Il est possible d'illustrer les effets du sous-dénombrement de la population de départ en comparant les effectifs de deux projections, l'une corrigée du sous-dénombrement et l'autre, non corrigée. Le rapprochement n'a pas été fait ici, une comparaison analogue ayant été effectuée lors de projections antérieures (voir la publication n° 91-520 au catalogue de Statistique Canada, 1979, pp. 32-36).

## **Comment obtenir les projections non publiées**

En appliquant le modèle de projection à toutes les combinaisons possibles d'hypothèses, on obtient 18 projections selon le sexe, pour chaque âge et chaque année, jusqu'en 2011 pour les provinces et les territoires et jusqu'en 2036 pour le Canada. Les composantes de la croissance démographique sont également produites pour chaque année. L'utilisateur peut, en assumant les frais d'extraction des données, obtenir de Statistique Canada ces données de projection, imprimé d'ordinateur, ruban magnétique ou disquette.

On peut également obtenir des projections spéciales, de population ou de ménages et de familles, d'après les

household and family projections and simulations based on user-specified input assumptions. Requests for special projections for either one or more specified spatial units, population groups or components of growth, will be considered on a cost-recovery basis.

Further enquiries regarding user services for special population projections, the projection methodology and unpublished projection data may be addressed to Population Projections Section, Demography Division, Statistics Canada, Ottawa, K1A 0T6 (telephone (613) 951-0695).

hypothèses fournies par les utilisateurs, de même que des projections particulières pour des sous-régions ou encore des sous-groupes selon la formule de recouvrement des frais.

Les demandes de renseignements concernant les services offerts aux utilisateurs, les méthodes de projection et les données non publiées peuvent être adressées à la section des projections démographiques, Division de la démographie, Statistique Canada, Ottawa, K1A 0T6 (téléphone (613) 951-0695).

## Notes

1. Statistics Canada, **Postcensal Annual Estimates of Population by Marital Status, Age, Sex and Components of Growth for Canada, Provinces and Territories, June 1, 1989**. Catalogue No. 91-210, Annual, Vol. 7, February 1990, Ottawa, Table 2.

2. For details on the projection algorithm, see **Technical Report on Population Projections for Canada and the Provinces, 1972-2001**. Catalogue No. 91-516, 1975, pp. 21-37.

3. This is true only at the national level; at the provincial level it is often internal migration which constitutes the most important growth factor.

4. This higher level of fertility is a recent phenomenon, and is related essentially to changes in place of birth among immigrants since the seventies.

5. This method was used in previous projections (see **Population Projections for Canada, Provinces and Territories, 1984-2006**. Catalogue No. 91-520, 1985 (pp. 23-25). Research is currently underway to develop a more flexible approach.

6. This assumption is of the same order as that of other industrialized countries such as France and the United States.

7. The views among experts are divided as to whether the sex differential in mortality will narrow or widen. While some say it will narrow, others believe that it may widen to 10 or 12 years by the turn of the century (U. S. Bureau of the Census, 1984, p. 18; and Hämäläinen, 1988).

## Notes

1. Statistique Canada, **Estimations annuelles post-censitaires de la population suivant l'état matrimonial, l'âge, le sexe et composantes de l'accroissement, Canada, provinces et territoires au 1<sup>er</sup> juin 1989**. N° 91-210 au catalogue, annuel, vol. 7, février 1990, Ottawa, tableau 2.

2. Pour plus de détails sur l'algorithme de projection, voir le **Rapport technique sur les projections démographiques pour le Canada et les provinces, 1972-2001**. N° 91-516 au catalogue, 1975, pp. 21-37.

3. Ceci est vrai seulement à l'échelle nationale. Au niveau provincial, c'est parfois la migration interne qui constitue le facteur numérique le plus important de la croissance démographique.

4. Cette surfécondité, un phénomène assez récent, est liée essentiellement au changement de provenance des immigrants depuis la décennie soixante-dix.

5. Cette méthode, déjà utilisée auparavant, est décrite plus en détail dans **Projections démographiques pour le Canada, les provinces et les territoires, 1984-2006**. N° 91-520 au catalogue, 1985, pp. 23-25. Des recherches sont en cours dans la division pour développer une approche plus flexible.

6. Cette hypothèse concorde avec celles retenues par d'autres pays industrialisés, notamment la France et les États-Unis.

7. Les spécialistes ne s'entendent pas sur la question à savoir si l'écart existant entre les mortalités masculine et féminine va s'atténuer ou s'accroître. Certains pensent qu'il pourrait diminuer de plusieurs années; d'autres croient, au contraire, qu'il sera de l'ordre de 10 à 12 ans à la fin du siècle (à ce sujet, voir U. S. Bureau of the Census, 1984, p. 18, et Hämäläinen, 1988).

8. As of the 1<sup>st</sup> of November of each year, according to the 1976 Immigration Act.

9. Canada, the House of Commons, Bill C-24, an Act respecting immigration to Canada, adopted July 25, 1977, p. 5.

10. Estimates produced by the Population Estimates Section, Demography Division, Catalogue No. 91-210.

11. As it is very difficult to evaluate the quality of annual estimates of emigration, these figures should be considered more an order of magnitude than a precise estimate.

12. A quick extrapolation of the trends underlying the high-growth scenario over 100 years reveals that the population would take more than a century to double from 25 to 50 million.

13. Age groups 0-17 and 65 and over are here referred to as the dependent age groups, while those 18-64 are the working age group.

14. The proportion of this group in the total population varies widely depending on the fertility assumption.

8. Au 1<sup>er</sup> novembre de chaque année, selon la Loi sur l'immigration de 1976.

9. Canada, Chambre des Communes, Loi C-24, Loi concernant l'immigration au Canada, adoptée le 25 juillet 1977, p. 5.

10. Estimation produite par la section des estimations démographiques, Division de la démographie, n° 91-210 au catalogue.

11. Comme il est très difficile d'évaluer la qualité de l'estimation de l'émigration annuelle, elle doit être considérée comme un ordre de grandeur plutôt qu'un niveau précis.

12. Une rapide extrapolation sur 100 ans des tendances illustrées dans le scénario de croissance forte révèle qu'il faudrait plus d'un siècle pour que la population passe de 25 à 50 millions.

13. Les groupes d'âge dits «dépendants» sont ici les jeunes de 0-17 ans et les 65 ans et plus; la population dite «active» est celle de 18-64 ans.

14. La proportion que ce groupe représente dans la population totale varie pour sa part considérablement selon l'hypothèse de fécondité que l'on retient.

## ROCK SOLID INFORMATION

## DE L'INFORMATION SOLIDE COMME LE ROC

**G**et a focus on Canada's markets and business opportunities with **the** source of reliable information... Statistics Canada and its unequalled family of outstanding publications and services.

Relying on Statistics Canada means you're building your decisions on hard facts assembled by a professional organization with a world-wide reputation for scrupulous accuracy and complete reliability.

Join the thousands of corporations and individuals who base their Canadian business decisions on Statistics Canada publications. Year after year.

For more information on Statistics Canada's extensive range of publications and information services, please call toll-free 1-800-267-6677.

At Statistics Canada, we provide information you can build on.

**S**tatistique Canada vous offre des produits et services de qualité qui vous donnent une image claire du secteur canadien des affaires.

Joignez-vous aux milliers de personnes et d'entreprises qui, année après année, fondent leurs décisions sur les publications de Statistique Canada.

Vous fier à Statistique Canada, c'est fonder vos décisions sur des renseignements solides, recueillis par un organisme dont la réputation internationale en est une d'exactitude et de fiabilité.

Pour obtenir plus de renseignements sur toute la gamme de publications et de services qu'offre Statistique Canada, veuillez composer le numéro sans frais 1-800-267-6677.

Statistique Canada fournit l'information à la base des grandes réalisations.

# Introducing

*Perspectives on Labour and Income*

Canada's essential employment and income information now in one quarterly journal.

If you're responsible for developing employment strategies, negotiating labour contracts, forecasting economic trends, or administering social programs, you'll find *Perspectives on Labour and Income* indispensable.

It will keep you up-to-date on the latest Canadian trends in employment... **unemployment insurance, pensions, and industry changes...** and income... **earning gaps between men and women, family income and spending habits,** and more. Every issue of this quarterly journal contains:

- **Feature Articles...** in-depth information on vital topics
- **Forum...** an arena for discussion among researchers and readers
- **Sources...** a compendium of new information sources, news and updates on current research
- **Key Labour and Income Facts...** over 60 indicators let you monitor the trends on a national and provincial level.

**Don't miss a single issue. Order your subscription today!**

*Perspectives on Labour and Income* (Catalogue No. 75-001E) is \$50 annually (4 issues) in Canada, and \$60 annually outside Canada.

To order, write: **Publication Sales, Statistics Canada, Ottawa, Ontario K1A 0T6**, or contact your nearest Statistics Canada Reference Centre, listed in this publication.

# Nouveau !

*L'emploi et le revenu en perspective*

Toute l'information essentielle sur l'emploi et le revenu au Canada dans une nouvelle revue trimestrielle.

Si vous avez la responsabilité d'élaborer des stratégies d'emploi, de négocier des contrats de travail, de prévoir les nouvelles tendances du marché ou d'administrer des programmes sociaux, vous ne pouvez pas vous passer de *L'emploi et le revenu en perspective*.

Cette revue vous renseigne sur tout ce qui se passe dans le domaine de l'emploi... **les employés à temps partiel, les pensions, les changements de l'industrie...** et des revenus... **les disparités salariales entre hommes et femmes, le revenu familial et les habitudes de consommation** et plus encore. Chaque numéro de cette revue trimestrielle comprend :

- **Des articles de fond...** des analyses détaillées sur des sujets de l'heure
- **Un forum...** une tribune pour échanger vos idées et connaître l'opinion des autres chercheurs et lecteurs
- **Des sources...** un condensé de nouvelles sources d'information, de renseignements et une mise à jour sur les recherches en cours.
- **Des indicateurs clés de l'emploi et du revenu...** plus de 60 indicateurs vous permettant d'analyser les tendances du marché provincial et national.

**Ne ratez pas un seul numéro. Abonnez-vous dès aujourd'hui !**

Un abonnement à *L'emploi et le revenu en perspective* (n° 75-001F au catalogue) coûte 50 \$ pour quatre numéros par an au pays et 60 \$ annuellement à l'étranger.

Pour commander, écrivez à **Vente des publications, Statistique Canada, Ottawa (Ontario), K1A 0T6** ou communiquez avec le Centre régional de consultation de Statistique Canada le plus près de chez vous (voir la liste dans cette publication).
