### Acknowledgements

This is one of the four projection reports prepared for each designated group of the Employment Equity Program by the Population Projections Section, Demography Division, Statistics Canada under the direction of M.V. George, Chief, Population Projections Section, and R. Verma, Senior Analyst, Population Projections Section; B. Laroche, Director, Demography Division, supported and encouraged the work of this project. The other reports are women; population with aboriginal ancestry; and visible minorities.

The completion of this study represents the support and contributions of several persons from inside and outside the Demography Division. Thanks to P. Johnston for her Technical assistance; to V. Kawka for the computer programming; to L. Wise, S.Y. Dai and L. Dell'Oso for reviewing and copy editing the manuscript; to A. D. Furrie, Director of the Postcensal Survey Division for her support in using the HALS data and for her comments on the present study; to J.-P. Morin for the information on survey methodology, to R. Langlois, to M. Patry, and to M. Simard for their help in the retrieval and use of the HALS data; and to S. Roller, to R. Vevers, and to L. Hunter for the use of the LMAS data and the information on survey methodology. Thanks are also expressed to I. Trachtenberg, to A. Paletta, and to D. Norris of the Employment Equity Program, to R. Wilkins of Canadian Centre for Health Information, and to A. Bélanger (formerly of Demography Division) for their support and/or comments on the study.

Many thanks go to the Interdepartmental Working Group on Employment Equity who initiated and sponsored the project.

## **EXECUTIVE SUMMARY**

This report analyses the trends and patterns of persons with disabilities at work among the Canadian working age population (15-64 age group), and for the first time develops projections of this group by age and sex for the years 1991 to 2016.

A derived projection approach is used in these projections. This method involves applying age-sex specific work disability prevalence rates to the corresponding given projected total population of working ages (15-64). Thus the overwhelming impact of demographic factors, especially the aging of the population on the size and composition of the disabled population, is taken into account by this method. The base population projections used are based on the 1991 Census. These were specially prepared for the purposes of the Employment Equity Data Program.

The future assumptions on disability prevalence rates for projections are based on a comparative analysis of the data from the 1986 and 1991 Household Activity Limitation Surveys (HALS) and the 1989 and 1990 Labour Market Activity Surveys (LMAS). Comparative analysis of disability data shows that disabilities have been increasing, especially for those persons with mild disabilities across all the age groups. However, the work disability rates by age in the past five years have been fairly stable. Hence, it has been assumed that the 1986 age-specific work disability prevalence rates will prevail for the projected period, 1991-2016.

Three projection scenarios are presented in order to provide a range of plausible options. However, the variations in the growth of disabled persons at work shown in the three scenarios represent solely the impact of demographic change since the disability rates are assumed to remain constant over the projection

period. The projection results show that persons with work disabilities at working ages in Canada, would expand from 1.4 million in 1991 to 2.2 million by 2016. While the total population is aging, the annual average growth rates of the population with work disabilities will be growing faster than the population without work disabilities. More importantly, among the total working age population with disabilities, the proportion of persons aged 45 to 64 would increase from 59% in 1986 to 70% by 2016.

The provincial shares of the Canadian population with work disabilities would remain fairly stable in most provinces during the projection period except for the three largest provinces: Ontario, Quebec and British Columbia. Ontario would have the highest increase in the provincial share of population with work disabilities during the projection period, while Quebec would have the largest decrease in the provincial share.

## **1. Introduction**

This report describes the data used, methodology, and underlying assumptions, and presents projections of persons with work disabilities by age and sex for Canada, the provinces and territories, 1991-2016. The projections are for the population of working age 15-64. These projections have been developed by applying the age-specific work disability prevalence rates estimated from the 1986 Health and Activity Limitation Survey (HALS) to the projected total population by age and sex produced by the Population Projections Section of the Demography Division. The total population projections used are based on the 1991 Census count as of June 4, adjusted for incompletely enumerated Indian reserves.

The assumptions on disability prevalence rates for the projections are based on a comparative analysis of the data from HALS (1986 and 1991) and the Labour Market Activity Survey (LMAS, 1989 and 1990). Three projection scenarios are presented in this report, in order to provide a range of plausible options for the future persons with disabilities at work, for Canada and the provinces.

The report begins with a description of the definition and measurement of disability. This is followed by a description of the projection model, an evaluation and analysis of the data used, the underlying assumptions of future trends, a brief description of the projection results, and a note on limitations of the projections. Finally, the Appendix 2 tables provide detailed projection figures for Canada, the provinces and territories.

## **2. Definition and Measurement of Disability**

### **2.1 Disability**

Although disability in the United States, often refers to limitations in performing socially defined roles and activities due

to a health condition (LaPlante, 1991; Nagi, 1976, 1991), disability research in Canada is dominated by the World Health Organization's functional limitation approach (WHO, 1980). The WHO's definition of disability is as follows:

*In the context of health experience, a disability is any restriction or lack (resulting from an impairment) of ability to perform an activity in the manner or within the range considered normal for a human being. (WHO, 1980:143).*

In the WHO framework, the disability concept refers to functional limitations, and in Canada this is operationalized mainly through a series of questions about the Activities of Daily Living (ADL) developed by the Organization for Economic Co-operation and Development (OECD, 1982).

With regard to restriction of limitation in a social context, the WHO conceptual scheme refers to a handicap as follows:

*In the context of health experience, a handicap is a disadvantage for a given individual, resulting from an impairment or a disability, that limits or prevents the fulfilment of a role that is normal (depending on age, sex, and social and cultural factors) for that individual (WHO, 1980:183).*

Here handicap reflects interaction with the individual's surroundings (WHO, 1980:14). However, the present study prefers the term "activity limitation" to the term "handicap" because the latter "sometimes has been used to imply an absolute limitation that does not require for its actualization any interaction with external social circumstances" (Pope and Tarlov, 1991:77).

To measure disability in Canada, the HALS questionnaires asked individuals 19 basic ADL questions on whether or not they were limited in specific activities, such as walking up and down stairs, cutting food, reading newsprint, etc. In addition, questions were also asked on whether or not individuals were limited in activities at home, school, work, or leisure, because of a physical or psychological condition. It is important to point out that the working definition of disability used in HALS refers to a long-term disability only (lasting at least six months), and that those persons who would be disabled except for their use of a technical aid are not considered disabled (i.e., functional limitation rather than impairment is measured).

In general, as a health indicator, the concept of disability adopted in Canada focuses on the health "consequences of disease and injury which are reflected in restrictions on a person's daily living and social activities" (United Nations, 1988:17). As a result, the operational definition of disability is equivalent to WHO's definition of disability and handicap or Nagi's definition of functional limitation and disability.

## **2.2 Work disability**

Work disability in the Canadian context is defined by the Employment Equity Regulation introduced by the federal government in 1986 as follows:

*3(b) persons with disabilities are considered to be persons who:*

*(i) have any persistent physical, mental, psychiatric, sensory or learning impairment, and*

*(ii) consider themselves to be, or believe that an employer or a potential employer would be likely to consider them to be, disadvantaged in employment by*

*reason of an impairment referred to in subparagraph  
(i) ... (See Roberts and Steele, 1992:5).*

An operational definition for work disability was therefore developed by the Interdepartmental Committee on the Employment Equity Data Program. Thus, persons who are limited at work refers to those aged 15 to 64 who indicate that they are limited in the kind or amount of work activities they can do, due to a long-term physical condition or health problem. Only those people who stated that they were disabled in the general screening stage and were limited at work were identified as "work limited".

It should be pointed out that the operational definition for work disability includes those persons who were partially and completely unable to work due to a long-term physical condition or health problem. Of those with work disabilities from the 1986 HALS, 49% stated that they were completely unable to work. Should these persons be excluded from the labour force participation data?

In the United States, it was found that among the 9.9 million persons of working age who said that they were unable to work during 1983-1985, "some 23% would be able to work if the working environment were made more hospitable" (LaPlante, 1991:71). Others have argued that many individuals who have withdrawn from the working environment cannot be expected to work, nor can the workplace be adjusted to accommodate them without great difficulty or expense (Chirikos, 1991:166). Such economic views on persons unable to work might be subject to the criticism of being cost driven.

For the purposes of the Canadian Employment Equity Program, it is assumed that the majority of persons who were unable to work, were discouraged workers who were facing barriers of an attitudinal or physical nature, and might work if these barriers could be removed and accommodations made. Although such an assumption seems

somewhat too strong, it is of fundamental importance to the Employment Equity program.

### 3. Projection Model

Considering the data available and the simplicity of the method, a derived projection approach is used in this study. This involves applying age-sex specific work disability prevalence rates to the corresponding projected total population of working ages (15-64):

$$dP(x,s,i,t) = P(x,s,i,t) * r(x,s,i,t)$$

where:  $dP(x,s,i,t)$  is the number of persons with work disabilities of age  $x$ , sex  $s$ , living in province  $i$ , at time  $t$ ;

$P(x,s,i,t)$  is the latest projected population of age  $x$ , sex  $s$ , living in province  $i$ , and at time  $t$ ;

$r(x,s,i,t)$  is the projected work disability prevalence rate for the population of age  $x$ , sex  $s$ , living in province  $i$ , and at time  $t$  (see Belanger, 1991).

The projected number of disabled persons obtained by this model is the result of the interaction of two factors: the projected population; and the prevalence rate. As the projected population composition is determined by the past and future demographic components, the derived projection approach, as adopted here, takes into account changes in demographic factors, and more particularly the aging of the population, which will have the largest impact on the size and composition of the projected population with work disabilities. This is due to the exponential shape of the distribution of the disability rate by age group (see

Furrie, 1989). Disability being a health issue, the age-specific disability rates, tend to be higher among the older age groups (Yu, 1991).

#### 4. Base Population Projection

The present projections of persons with work disabilities are derived from the population projections (based on the 1991 Census) specially prepared for the purpose of the employment equity groups projections by the Population Projections Section of the Demography Division (Statistics Canada, 1993). Three selected population projection scenarios have been used as the base. The underlying component assumptions of these projection scenarios are presented in Table 1.

The total fertility rate will decrease from 1.80 to 1.65 for the low fertility assumption and increase to 1.85 and 2.05 for the medium and high assumptions, respectively. There are three assumptions on mortality: high, medium, and low. For the high mortality assumption, the life expectancy at birth ( $e_0$ ) will increase from 74.2 years in 1991 to 77.0 years in 2016 for males, while for females it will increase from 80.8 to 83.0 years. For the medium mortality assumption, the life expectancy for males and females will increase to 78.0 and 84.0, respectively by 2016, and for the low mortality assumption, the  $e_0$  will be 79.0 for males and 85.0 for females in 2016. The immigration levels are kept constant at 250,000 persons per annum. There are two scenarios for internal migration. Scenario A represents the most recent trend in interprovincial migration, from 1989 to 1991; and Scenario B reflects the trends from 1986 to 1991. The former is primarily favourable for British Columbia, and to a lesser extent, Alberta, and the latter is centered primarily on Ontario as the receiving province.

The overwhelming impact of demographic factors on the growth of the disabled population calls for paying particular attention to the selection of scenarios for the projected population to be used as the base.

**Table 1. Population Projections and the Underlying Component Assumptions, Canada, 1991 to 2016**

Projection Scenario	Mortality Level ( $e_0$ )		Total Fertility Rate (number of children per woman)		Annual Immigration	Internal Migration	
	Sex	1991	2016	1991	2016		
HLB	M	74.2	77.0	1.80	1.65	250,000	B
	F	80.8	83.0				
MMA	M	74.2	78.0	1.80	1.85	250,000	A
	F	80.8	84.0				
LHA	M	74.2	79.0	1.80	2.05	250,000	A
	F	80.8	85.0				

**Note:**

HLB: High mortality; low fertility; and internal migration pattern B.  
 MMA: Medium mortality; medium fertility; and internal migration pattern A.  
 LHA: Low mortality; high fertility; and internal migration pattern A.

**5. Smoothing of the Age-specific Work Disability Prevalence Rates from the 1986 HALS**

The work disability prevalence rates estimated from the 1986 HALS were used to project the future growth of the number of persons with work disabilities. The survey results show that there were 1,255,000 persons aged 15-64 with work disabilities in Canada, representing 7.36% of the total population of working age.

Although the sample size of HALS is quite large, a disaggregation by age, sex, and province, can possibly result in unreliable estimates due to small numbers, especially for smaller provinces (Bélanger, 1991). Because of the small numbers involved

in some cases, there was a wide scattering of the age-specific work disability rates, even when the smaller provinces in terms of population were grouped to form regions. The following regions were used in this study: Atlantic, Quebec, Ontario, Manitoba, Saskatchewan, Alberta, British Columbia, and the Yukon and Northwest Territories.

To remove the observed random noise, the age schedules of work disability prevalence rates were smoothed (c.f. Figures 1 to 9 of Appendix 1). The rates by age were graduated by applying the following exponential function:

$$D(x) = e^{a+bx}, \quad (1)$$

where:  $D(x)$  is the estimated age-specific work disability rate at age  $x$ ; and  $a$  &  $b$  are parameters in the model.

In order to estimate the values of  $a$  and  $b$ , a logarithmic transformation of both sides of the equation was performed. This gave the regression equation below:

$$\ln[D(x)] = a+bx. \quad (2)$$

The values of parameters  $a$  and  $b$  were then obtained by a simple least squares method.

Table 2 shows the values of the estimated parameters  $a$  and  $b$ , mean square error (MSE), and R-square for Canada and each region. The goodness of the fit of this model was determined by the level of R-square. If the value of R-square was under 0.55, it was considered a poor fit. At the Canada level, the values of R-square were quite high: 0.93 (females) and 0.95 (males). At the regional level the goodness of the fit of the model varied. For the Yukon and Northwest Territories, the R-square values were very low, especially for females, 0.35. This is likely due to the small

sample sizes. The female age schedule for the Yukon and Northwest Territories were, therefore, replaced by the smoothed female values for Canada as a whole.

**Table 2. Estimated Parameters for Work Disability Rate by Single Years of Age and Sex, from a Logarithmic Transformation Model, Canada and Regions**

Region	Sex	a	b	MSE	R-Square
Canada	F	-0.080	0.050	0.044	0.93

Data source: 1986 HALS household survey.

## **6. Recent Trends in Disability and Work Disabilities**

Prior to projecting the population with work disabilities, it is crucial to examine recent trends in age-specific work disability rates. Ideally, the 1991 HALS is the best data source for comparative purposes, because of the screening questions on

disability (especially work disabilities) which are consistent with those used in the 1986 HALS. It also has a very large sample which is adequate for further disaggregation. However, the 1991 HALS data on work disabilities are not yet available for use in the present projections.

**Table 3. Prevalence Rates of Disabilities by Age Group and Sex, Canada, 1986 and 1991 (based on 13 selected questions)**

Age Group	Females		Males	
	1986	1991	1986	1991
15-19	3.83	6.04*	3.61	7.50*
20-24	4.32	5.75*	4.44	5.78*
25-29	5.01	6.43*	5.53	7.42*
30-34	7.19	8.98*	7.71	9.27*
35-39	8.43	10.82*	8.55	10.06
40-44	10.47	11.27	9.49	12.14*
45-49	12.60	15.58*	12.17	14.94*
50-54	15.62	18.33	19.00	19.79
55-59	22.94	23.28	21.51	23.09
60-64	27.35	31.07*	29.69	28.06
CDR	10.16	12.08*	10.26	12.33*
SDR(a)	10.16	12.07	10.26	12.05

\* Statistically significant difference at the 0.05 level compared to 1986 rates.

(a) Statistical test was not applied.

Note: CDR = Crude disability rate.  
 SDR = Standardized disability rates using the 1986 HALS age distribution.

Source: 1986 and 1991 HALS.

The only information readily available from the 1991 HALS is on persons with disabilities. Table 3 shows that the age-specific disability rates for both males and females (based on the 13 questions) are slightly higher in 1991 than in 1986, while the overall pattern is similar. According to the Statistics Canada's Daily (1992),

most of the increase occurred among those reporting a mild disability. The increase among this group can be attributed at least partially to an aging population as well as to a change in survey methodology which enable a more comprehensive enumeration of persons with disabilities related to a mental health condition or handicap, or learning disabilities. As well, an increased awareness of disability in society in recent years may have made people more willing to report their limitations in activity and the barriers which they encounter in their everyday activities (*Statistics Canada, The Daily, Oct. 13, 1992:2*).

Since this increase in prevalence rates occurred for almost every age group, the explanation must be something other than the aging factor. It seems that the other aforementioned factors, such as the improvement of survey methodology with more screening questions on disabilities, and increased awareness of disability in society in recent years may be more relevant.

Concerning recent trends, it is reasonable to expect that recent work disability rates have increased along with the observed trend in the general disability rate.<sup>1</sup> To assess this, this study turns to a comparative analysis on the age-specific disability rate and work disability rate from the 1986 HALS and the 1989 and 1990

---

<sup>1</sup>General disability in this report refers to those persons who answered "YES" to any of the disability questions from the LMAS survey or from Section A of HALS surveys.

LMAS surveys.<sup>2</sup> The major findings based on the comparison of data from the three surveys are:

- (1) The age-specific disability rates observed in 1989 and 1990, especially female disability rates, are higher than those observed in 1986, and most of the differences are statistically significant (Table 4).
- (2) The age-specific work disability rates have remained quite stable in 1986, 1989, and 1990. The differences in terms of rates are statistically insignificant (Table 5).
- (3) The disability rates by degree of severity show that only in the case of mild disabilities, again especially for females, has there been an increase over recent years. There has been virtually no increase in the rates of moderate and severe disabilities (Table 6). This indicates that the recent increase in disability rates can mainly be attributed to mild disabilities.
- (4) The work disability rates by degree of severity appear stable, particularly for males (Table 7).

In summary, it can be said that the apparent increase of general (total) disability is not followed by a corresponding change in work disability; the possible increase associated with the latter, therefore, can not be substantiated.

---

<sup>2</sup>For the 1989 and 1990 LMAS surveys, the rates of disability and work-disability for the 15-19 age group refer to rates for persons aged 16-19. This is because the LMASs interviewed people aged 16 and over, instead of 15 and over at the time of 1986 and 1991 HALS surveys.

Table 4. Prevalence Rates of General Disability by Age Group and Sex, Canada, 1986, 1989 and 1990 (based on 13 selected questions)

Age Group	Females			Males

## **7. Assumptions of Future Trends**

Given the data limitations, and lack of consensus in terms of theoretical and empirical explanations, developing plausible assumptions on future trends of work disability rates is a difficult task. There has been little agreement as to the recent trends of disability due to a lack of directly comparable time series data (especially given the different types of questions used by different survey questionnaires). In the context of the U.S. studies, most analysts have observed that disability rates (especially work disability rates) have been increasing (Chirikos, 1986; Yelin, 1989; DeJong, et al., 1989), though a recent study by Pope and Tarlov (1991) indicates that such rates have been relatively unchanged since the early 1980s.

With respect to the theoretical explanations on disability prevalence, little agreement has been reached. Some analysts have argued that the recent decline in mortality was associated with similar improvements in morbidity and disability, while others have shared the opposite view by arguing that the recent mortality decline was the result of prolonging the lives of people with disease or disabilities (see Crimmins, et al. 1989).

Indeed, the nature of disability trends is very ambiguous. A changing social condition can "reduce" some disabilities and "create" new disabilities. As Galvin (1987:48) observed, while the potential development for longer health life (such as generic structuring, parental care, health promotion, seat belt usage) may substantially reduce some causes of chronic illnesses and disabilities, "other unperceived forces (like AIDS, chemical disasters, toxic shock syndrome and asbestosis) are at work 'creating' new illnesses and disability". In terms of the recent world recession and technical revolution, their implications for the direction of changes in future disability trends is another controversial issue. As Cornes (1987:6) observed, in the eyes of

vocational rehabilitation services' personnel, the new development in microtechnology and communications - in which physical requirements are replaced by electronic skills, strength and precision - will bring an optimistic future for disabled people to perform home-based employment. But to many analysts, such developments may lead to "the emergence of a 'culture gap' between people with and without disabilities".

Under such uncertainty, the existing practice of projecting populations with disabilities, concentrates on future change in the numbers of persons with disabilities due to demographic change, while holding the disability prevalence rates constant (Manton, 1989; Vachon, 1987; McBride, 1989). On the other hand, Manton (1989) and McBride (1989) had also drawn alternative assumptions on the general health of the elderly population suggesting improvements with respect to disabilities as mortality is reduced. Manton (1989:34) had observed that few existing population risk-factor intervention programs have been explicitly targeted toward reducing disability, and that it might be useful "to explore the potential impact of prevention programs targeted to reduce the rate of growth of the disabled elderly population". He also stated that in order to do so, it was necessary to have a detailed knowledge of the basic disease mechanism which was beginning to emerge, but that the detail was "currently unclear" (Manton, 1989:47).

Since we have not observed significant changes in the recent trends of age-specific work disability rates in Canada, and are unclear as to the dynamics of future change, it has been assumed that the 1986 age-specific work disability prevalence rates will prevail for the projection period. This single assumption approach with regard to disability prevalence rates does not necessarily mean that there will be only one projection of the future trends in work disability. The assumed disability prevalence rates will be applied to three population projections which will yield three projections of persons with work disabilities. For projecting the

population with work disabilities, only that segment of the population that is likely to affect the future disabled population at work (namely, persons from 15-64 age group) is relevant. Fertility rates over the next 15 years will not affect the number of disabled persons at work. Therefore, particular attention has been given to the underlying mortality assumptions in selecting appropriate population projections to produce projections of persons with disabilities.

It has also been observed that among the total counts of population with work disabilities, a large number of persons were reported as "completely unable" to work (almost half of the total population with work disabilities). As to the accuracy of this observation, further study would appear necessary and the 1991 HALS survey would appear promising in this regard.

#### **8. A Brief Description of the Projected Results**

The Canadian population with work disabilities is projected to increase from 1.4 million in 1991 to 2.2 million by 2016, for all three scenarios, based on the assumption of constant age-specific work disability prevalence rates (Table 8). The projected female population size with work disabilities is larger than that of males at the national level for all three scenarios.

The annual average growth rates of the Canadian population with work disabilities, are much higher than for the population without work disabilities, for all three scenarios (Table 9). From 2006 on, the annual average growth rates would slow down as the growth rate for the total working age population slows down.

**Table 8. Estimated and Projected Population with Work Disabilities for Three Scenarios,  
1991–2016**

**Scenario HLB : Low**

(in thousands)

Year	Male	Female	Both Sexes
1991	699.1	720.6	1419.7
1996	767.1	792.5	1559.7
2001	851.3	884.1	1735.4
2006	947.4	988.3	1935.7
2011	1028.7	1077.5	2106.2
2016	1072.7	1124.3	2197.0

**Scenario MMA : Medium**

(in thousands)

Year	Male	Female	Both Sexes
1991	699.1	720.6	1419.7
1996	767.9	793.1	1561.1
2001	853.3	885.4	1738.7
2006	950.9	990.4	1941.3
2011	1034.4	1080.8	2115.2
2016	1081.1	1129.3	2210.4

**Scenario LHA : High**

(in thousands)

Year	Male	Female	Both Sexes
1991	699.1	720.6	1419.7
1996	768.2	793.3	1561.5
2001	854.2	886.0	1740.2
2006	952.8	991.7	1944.4
2011	1037.9	1083.3	2121.3
2016	1087.1	1133.9	2221.0

Note: HLB – High mortality, Low fertility, and internal migration pattern B

MMA – Medium mortality, Medium fertility, and internal migration pattern A

LHA – Low mortality, High fertility, and internal migration pattern A

Table 9. Annual Average Rates of Growth, for the Population with Work Disabilities, without Work Disabilities, and the Total Working Age Population, for the Three Scenarios, and for Five Projection Periods

	2001–2006	2.32%	1.17%	1.27%
	2006–2011	1.77%	0.89%	0.97%
	2011–2016	0.91%	0.54%	0.57%

Note: Same as for Table 8.

Table 10. Projected Crude Rates (in percent) of Work Disability, Canada, Provinces and Territories, 1991 and 2016

Provinces or Territories	1991	2016 (Three Scenarios)		
		HLB-Low	MMA-Medium	LHA-High
NF	8.93	12.50	12.28	12.25
PEI	9.48	11.73	12.14	12.17
NS	9.48	12.13	12.12	12.10
NB	9.39	12.35	12.23	12.21
QUE	6.92	8.40	8.39	8.36
ONT	7.62	8.81	8.87	8.84
MAN	8.82	10.48	10.58	10.54
SAS	8.45	10.38	10.66	10.60
ALT	7.35	9.05	8.84	8.82
BC	8.18	9.43	9.28	9.25
YUK	6.57	8.50	8.36	8.28
NWT	5.93	7.65	7.60	7.54
Canada	7.69	9.14	9.14	9.11

Note: Same as for Table 8.

Table 10 shows that the projected crude work disability rate increases from 7.69 % in 1991 to 9.14 % in 2016, for scenario HLB and MMA, and 9.11 % for scenario LHA. Since the work disability prevalence rates are age related, when the population is aging, the crude rate will continue to increase even with constant age-specific rates.

Table 11. Percentage Distribution of Population With and Without Work Disabilities by Selected Age Groups and Sex, 1991 and 2016 (Scenario MMA)

Age Group	Population With Disabilities			Population Without Disabilities		
	Both	Male	Female	Both	Male	Female
<b>1991</b>						
15 - 44	42.5	42.6	42.4	73.3	73.4	73.2
45 - 54	24.1	24.4	23.8	15.4	15.5	15.4
55 - 64	33.4	33.0	33.8	11.3	11.2	11.5
Total (15-64)	100.0	100.0	100.0	100.0	100.0	100.0
<b>2016</b>						
15 - 44	29.7	30.4	29.1	61.7	62.6	60.9
45 - 54	27.2	27.2	27.1	20.4	20.1	20.7
55 - 64	43.1	42.4	43.8	17.9	17.3	18.5
Total (15-64)	100.0	100.0	100.0	100.0	100.0	100.0

Note: Same as for Table 8.

Table 11 indicates that for both populations, with and without disabilities at work, the percentages would decrease in the case of the younger age group (15-44), and increase in the older age groups (45-54 and 55-64) over the 25-year period. Males with disabilities at work in the 15-44 age group would decrease by 12.2 percentage points, while females would decrease by 13.3 percentage points. A similar trend would prevail for the population without disabilities at work over the same period, and the percentage of males aged 15-44 would decrease by 10.8 points, and females by 12.3 points. These decreases in the proportion of the disabled and non-disabled populations of the younger age group (15-44), are purely due to demographic factors (chiefly the effect of aging on the population age structure), hence these decreases in the 15-44 age group are

transferred upward to the older age groups as the projection moves toward 2016. As a result, at the end of the projection period, the proportions of the population aged 45-64 with and without disabilities at work, would be 70% and 38%, increasing from 57% and 27% in 1991, respectively.

Table 12. Provincial Distribution (in percent) of the Projected Population with Work Disability, 1991 and 2016

Provinces or Territories	1991	2016 (Three Scenarios)		
		HLB - Low	MMA - Medium	LHA - High
NF	2.42	2.18	2.25	2.25
PEI	0.56	0.52	0.45	0.45
NS	4.02	3.56	3.66	3.66
NB	3.21	2.79	2.91	2.91
QUE	23.17	21.15	20.81	20.81
ONT	36.78	41.65	39.19	39.19
MAN	4.39	3.93	3.71	3.71
SAS	3.64	2.59	2.42	2.42
ALT	8.89	8.17	9.76	9.76
BC	12.68	13.23	14.55	14.56
YUK	0.09	0.11	0.12	0.12
NWT	0.15	0.11	0.17	0.17
Canada	100.0	100.0	100.0	100.0

Note: Same as for Table 8.

The provincial shares of the Canadian population with work disabilities would remain relatively stable in most provinces during the projected period except for the three large provinces: Ontario, Quebec and British Columbia (Table 12). Ontario's share

of population with disabilities would have the highest increase (between 2.4 and 4.9) in the next 25 years, while Quebec's share would decrease the most among the provinces (by 2 percent).

## 9. Limitations of Projections

The accuracy of the derived projections of persons with disabilities at work presented here depends on three main aspects: (i) the quality of the population projection which form the projection base; (ii) the reliability and suitability of the disability data used; and (iii) the underlying assumptions on the disability prevalence rates.

The reliability of the population projections depends on the accuracy of the base population used, and the degree to which the underlying assumptions on each component represent the actual trend. Hence, the fact that the base population for these projections was derived from projections based on the 1991 Census population unadjusted for census coverage errors, and that both the base population and the demographic components are two years out of date, would seem to affect the reliability of these projections. Nonetheless, the effects of the above are considered to be negligible.

The work disability prevalence rates used were estimated from the 1986 HALS. It would have been more appropriate to use the data from the 1991 HALS, but it was not possible to use them as the relevant data were not available.

Concerning the assumptions on the work disability prevalence rates, only one assumption has been developed and combined with the three series of population projections. Variations between the three scenarios of population with work disabilities are, therefore, only attributable to variations in the dynamics of

population projections; and not to variations in the propensity for persons to become disabled at work.

The three projection scenarios should not be taken as predictions. They present the resulting projected number of persons with disabilities based on the underlying assumptions. In general, the uncertainty of the projected numbers can be expected to increase over the projection period. Nevertheless, the three scenarios presented are expected to provide a plausible range in the future number of disabled persons at work over the projected period.
