Report to
THE INTERNATIONAL JOINT COMMISSION
on
THE DIVISION AND USE MADE OF THE WATERS OF
ST. MARY AND MILK RIVERS

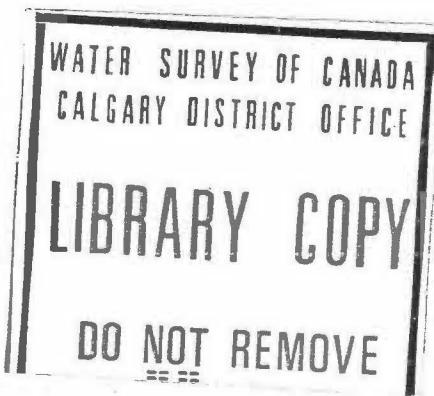

by

J. T. JOHNSTON
representing Canada

and

N. C. GROVER
representing the United States

1934

The Honourable, the International Joint Commission,
Washington, D.C., and Ottawa, Canada.

Gentlemen:-

In compliance with the Provisions of
Clause 10 of your Order of the 4th October, 1921,
directing the division of the waters of St. Mary
and Milk Rivers between the United States and
Canada, we are transmitting herewith a report on
the operations during the irrigation season of
1934.

Respectfully submitted,

J. Johnston
Accredited Officer of His Majesty,

N. Grover
Accredited Officer of the United States

April 2nd, 1935.

Introduction

The field work incidental to the division and administration of the waters of the St. Mary and Milk Rivers in Alberta, Saskatchewan and Montana was conducted, during the irrigation season of 1934, by the same engineers as in previous years.

Mr. N. C. Grover, Chief Hydraulic Engineer, United States Geological Survey, as accredited officer for the United States was represented in the field by Mr. W. A. Lamb, District Engineer, Helena, Montana. Mr. J. T. Johnston, Director, Dominion Water Power and Hydrometric Bureau, as accredited officer of His Majesty, was represented by Mr. S. G. Dawson, Ottawa, Ontario.

The water of the two rivers was divided between the two countries in accordance with the Order of the Commission dated in Ottawa, Canada, on the 4th day of October, 1921.

The hydrometric data, on which this report is based, were obtained in Montana, by engineers of the United States Geological Survey under the personal supervision of Mr. Lamb; while those from streams and ditches in Canada were collected by Mr. W. T. McFarlane, Dominion Water Power and Hydrometric Bureau, Calgary, Alberta. The joint international stations were visited frequently by representatives of both countries.

When the natural flow of St. Mary river fell below the combined capacity of the two canals diverting therefrom, and when the demand for water in each country was equivalent to or in excess of its share of the natural flow of St. Mary river, which occurred early in July and continued until the closing of the season, the field engineers kept closely informed as to the natural flow of the river, the water stored or released from storage and the quantity diverted by each country. Any discrepancy in the division was therefore discovered and adjustments made to allow each country its proper share as set forth in the Order of the Commission dated October 4th, 1921. Statements showing the daily division of water were prepared and forwarded to the Superintendent, Lethbridge section, Canadian Pacific Irrigation System; to the Project Manager, United States Bureau of Reclamation, Malta, Montana; and to the Director, Dominion Water Power and Hydro-metric Bureau.

Division of Water

The United States St. Mary canal was opened on April 23rd and kept in continuous operation until September 8th, water being first delivered to the North Branch Milk River on April 25th. During the period between September 8th and the end of October, while a small flow was diverted through the head gates, no water passed the St.

Mary crossing nor was delivered to Milk River. As the loss in the canal between the intake and the crossing of the St. Mary River, which this year was about 14% of the water diverted at the headgates, is assumed to return directly to the river and eventually become available to Canada, the discharge of 165,000 acre-feet passing in the canal at the St. Mary River crossing is therefore considered as the actual quantity diverted from the St. Mary River by the United States. Of this quantity, 163,000 acre-feet were delivered to the North Branch Milk River and made available for irrigation in Montana. The slight loss in the canal between St. Mary River crossing and Hudson Bay Divide, the end of the canal, was due to evaporation and seepage.

On November 1, 1933, a total of 20,120 acre-feet of water remained in storage in Sherburne reservoir. Practically the same amount of water was in storage on April 1, 1934. The maximum storage reached during the season was 53,400 acre-feet on May 28. On October 31 2,700 acre-feet remained in storage.

As only 50 acre-feet is reported as being diverted in Canada from Milk River, the natural flow of the river is considered as being delivered to the United States at Eastern Crossing. The total diversion for irrigation

from Milk River in Montana was 223,666 acre-feet.

The total recorded flow delivered to the United States at the International Boundary from the Northern tributaries of Milk River during the year 1934 was 62,900 acre-feet, which is 86% of the flow recorded in 1933 and about 33% of the average for the years of record.

The Canadian Pacific Railway canal at Kimball, Alberta, diverted 164,000 acre-feet from the 22nd of April to the 31st of October, 153,000 acre-feet being used to irrigate lands in Southern Alberta.

The Dominion Water Power and Hydrometric Bureau is largely dependent upon the irrigators themselves for records of the diversions in Canada from the Northern tributaries of Milk River as, in the majority of cases, the diversions are too small to justify the expense of appointing and paying gauge observers. Consequently the records are believed to be incomplete and of doubtful value and do not show the total diversion. However, the diversions reported from the Northern tributaries in Canada and shown in Table 3 are; from Lodge creek - 450 acre-feet; from Battle creek - 860 acre-feet; from Frenchman river - 1505 acre-feet. There were no diversions from the other tributaries.

Any question as to the proper share of the St.

Mary River being delivered to either country was decided in the following manner. Record of the daily flow was kept of Swiftcurrent creek at Many Glacier and of Canyon creek near Many Glacier, but the flow of the other creeks entering Swiftcurrent creek above the Sherburne dam were estimated. The total flow of these creeks gave the inflow into Sherburne reservoir. The losses by evaporation in the reservoir were considered when estimating the flow from the unrecorded small streams. A record of the outflow from the reservoir was kept at the gauging station just below the dam. The difference between the inflow and the outflow showed the quantity of water being stored or released from storage. A measurement of the United States' St. Mary canal at St. Mary crossing was made to find the water being diverted by the United States, and a measurement of the St. Mary River at Kimball, near the International Boundary, to determine the water being delivered to Canada.

If the water was being stored in Sherburne reservoir, the natural flow of St. Mary river at the Boundary was obtained by adding the quantity of water stored to that diverted by the St. Mary canal and that delivered to Canada, a two day lag was allowed for stored water to reach the Boundary. If stored water was being released, the quantity released was deducted from the combined flow of the St. Mary

canal and that in the river at Kimball to determine the natural flow.

The natural flow having been determined, the share to which each country was entitled was calculated on the following basis:-

(1) When the natural flow of the St. Mary River was 666 cubic-feet per second or less, Canada was entitled, by the ruling of the Commission, to three-fourths of that flow and the United States to one-fourth.

(2) When the natural flow of the St. Mary River was greater than 666 cubic-feet per second, Canada was entitled to 500 cubic-feet per second plus one-half of the increase over 666 cubic-feet per second, and the United States was entitled to the remainder.

No actual division was made of the waters of Milk River and its Northern tributaries.

Water Supply

The precipitation in the drainage basins of St. Mary and Milk Rivers, during the winter of 1933-34, was about normal, but for the full year was considerably below normal.

In the mountainous areas tributary to the St. Mary River basin, as shown by the thirteenth annual international survey of the snow conditions on the headwaters of Swiftcurrent creek, an area considered typical of the headwaters of St. Mary River, the snow cover was 80% of the mean of the twelve years of record while the water content of this snow cover was 110% of the mean. The run-off of 30,500 acre-feet from the area surveyed, during May, June and July was about 17% in excess of the average for the twelve year period.

The natural flow of 629,000 acre-feet of St. Mary River at the boundary during the irrigation season of 1934, from the 1st of April to the end of October, was 4% in excess of the average for the thirty-two years of record.

On the prairies, forming the major portion of the drainage basin of Milk River and its tributaries in Canada and Montana, while the winter precipitation was about normal, during the irrigation season there was a deficiency of rainfall in all months except June.

The run-off from the prairies, as indicated by the Northern tributaries of Milk River, was about 33% of the average for the years of record.

The twenty-three international gauging stations

previously used in the determination of the daily natural flow of the streams in the St. Mary and Milk River basins were maintained and operated under the joint supervision of the field engineers. Several stations previously maintained by Canada on international streams and canals diverting therefrom were abandoned.

An appendix to this report gives the results of current meter measurements, the daily gauge heights and the discharge at all the gauging stations operated in the two drainage basins during 1934.

Description of Tables

The tables following have been prepared to summarize the data on the division and use made of the waters in the St. Mary and Milk River basins.

Table No. 1 shows the method used to determine the natural flow of the St. Mary River during the irrigation season of 1934, the water available for use and used by United States and Canada. In this table there are four pages for each month from April to October, inclusive.

Page 1 (water stored or released from Sherburne reservoir) shows the daily inflow into and the outflow from Sherburne reservoir. The difference gives the quantity of water stored or released from storage. On this

sheet the unrecorded inflow is determined by comparison with the recorded flows in Swiftcurrent and Canyon creeks and with the use of the water levels of Sherburne reservoir to give the gain or loss in storage, after direct application of the evaporation and seepage losses has been made. This estimate is put in the column headed "unrecorded inflow."

Page 2 (determination of the natural flow of the St. Mary River) shows the actual flow of St. Mary River at Kimball near the International Boundary, the quantity of water diverted, stored or released from storage, by the United States and the computed natural flow of St. Mary River, or that flow which would have crossed the boundary had there been no interference. It has been determined that two days are required for stored water released from Sherburne reservoir to influence the flow at the boundary, consequently, a two day lag has been applied to the stored or released water.

Page 3 (water available for use and used by the United States) shows the water available for use by the United States under the ruling of the Order of October 4th, 1921, the water diverted and stored and the excess or deficit in the quantity used over the quantity available.

Page 4 (water available for use and used by Canada) shows the natural flow of St. Mary River at the International Boundary, Canada's share by the ruling of the Commission, the actual discharge of St. Mary River at Kimball, which is the quantity available for use by Canada, the quantity used by Canada and the excess or deficit of the quantity received by Canada as compared with the share.

Table 2 is the statement showing the quantity in acre-feet taken each month by each country and the quantity thereof applied to the land, the quantity diverted from St. Mary River, the loss or waste from the canals and the diversions from Milk River in the United States.

Table 3 shows the available information on the diversions from the Northern tributaries of Milk River in Canada.

Table 4 gives the diversions from the Northern tributaries of Milk River in the United States.
