1937

The Honourable, The International Joint Commission  
Washington, D. C., and Ottawa, Canada.

Gentlemen:-

In compliance with the Provisions of  
Clause 10 of your Order of the 4th of October, 1921,  
directing the division of the waters of St. Mary and  
Milk Rivers between the United States and Canada, we  
are transmitting herewith a report on the operations  
during the irrigation season of 1937.

Respectfully submitted,

Accredited Officer of the United States.

Accredited Officer of His Majesty.

April 5th, 1938.

It is with deepest regret that we record the sudden death, in Helena, Montana, on February 9, 1938, of Mr. William A. Lamb, District Engineer, United States Geological Survey.

Mr. Lamb has been closely associated with the flows of the waters in the St. Mary and Milk river basins since 1910 as District Engineer in charge of surface waters investigations in Montana and since 1928 as field engineer for the accredited officer for the United States in the matter of the division of the waters of St. Mary and Milk rivers.

Mr. Lamb's intimate knowledge of the international problems involved, his sterling character and his ever ready and able co-operation will be greatly missed.

## Introduction

The field work incidental to the division and administration of the waters of the St. Mary and Milk Rivers in Alberta, Saskatchewan and Montana was conducted, during the irrigation season of 1937, by the same engineers as in previous years.

Mr. N. C. Grover, Chief Hydraulic Engineer, United States Geological Survey, as accredited officer for the United States was represented in the field by Mr. W. A. Lamb, District Engineer, Helena, Montana. Mr. J. T. Johnston, Controller, Dominion Water and Power Bureau, as accredited officer of His Majesty, was represented by Mr. S. G. Dawson, Ottawa, Canada.

The water of the two rivers was divided between the two countries in accordance with the Order of the Commission dated in Ottawa, Canada, on the 4th day of October, 1921.

The hydrometric data on which this report is based, were obtained in Montana by engineers of the United States Geological Survey under the personal supervision of Mr. Lamb; while those from streams and ditches in Canada were collected by Mr. W. T. McFarlane, under the direction of Mr. O. H. Hoover, Engineer in charge, Dominion Water and Power Bureau, Calgary, Alberta. The joint international gauging stations were visited frequently by representatives of both countries.

When the natural flow of St. Mary River fell below the combined capacity of the two canals diverting therefrom, and when the demand for water in each country was equivalent to or in excess of its share of the natural flow of St. Mary River, which, this season occurred towards the middle of July and continued until the closing of the season, the field engineers kept closely informed as to the natural flow of the river, the water stored or released from storage and the quantity diverted by each country. Any discrepancy in the division was therefore discovered and adjustments made to allow each country its proper share as set forth in the Order of the Commission dated October 4th, 1921. Statements showing the daily division of water were prepared and forwarded to the Superintendent, Lethbridge section. Canadian Pacific Irrigation System; to the Project Manager, United States Bureau of Reclamation, Malta, Montana; and to the Controller, Dominion Water and Power Bureau.

#### Division of Water

The United States St. Mary canal was opened at the headgates on April 18th and, except for 16 days in June when it was closed for repairs; was kept in continuous operation until October 7th, water being delivered to the North Branch Milk River on May 3rd. As the loss in the

canal between the intake and the crossing of the St. Mary River, which this year was about 14.7% of the water diverted at the headgates, is assumed to return directly to the river and eventually become available to Canada, the discharge of 141,600 acre-feet passing in the canal at the St. Mary River crossing is considered as the actual quantity diverted from the St. Mary River by the United States. A slight increase to this quantity was delivered to the North Branch Milk River and made available for irrigation in Montana. The increase between the St. Mary River crossing and the Hudson Bay Divide, the end of the canal, was due to local inflow.

On November 1st, 1936, a total of 229 acre-feet of water remained in storage in Sherburne reservoir. Approximately 2,000 acre-feet of water was in storage on April 1st, 1937. The maximum storage reached during the season was 61,300 acre-feet on July 7th. On October 31st, 2,300 acre-feet of water remained in storage.

As only a small quantity of water was diverted in Canada from Milk River, the natural flow of the river is considered as being delivered to the United States at Eastern Crossing. The total diversion for irrigation from the Milk River in Montana was 212,172 acre-feet.

The total recorded flow delivered to the United States at the International Boundary from the Northern

tributaries of Milk River during the year 1937 was 33,800 acre-feet, which is 41.5% of the flow recorded in 1936 and about 20% of the average for the years of record.

For the first time on record, it was necessary to apportion the waters of the Frenchman River at the International Boundary. Canada stored or held back 5,700 acre-feet of the natural flow of Frenchman River for irrigation on lands near East End and Val Marie, Saskatchewan, while 5,120 acre-feet of the natural flow were delivered to Montana. The natural flow of Frenchman River, during 1937, was the lowest on record and only 14% of the mean for the last 22 years.

The Canadian Pacific Railway canal at Kimball, Alberta, diverted 191,300 acre-feet from the St. Mary River during the period of operation from the 15th of April to the fourth of October, 170,000 acre-feet being used to irrigate lands in Southern Alberta.

The Dominion Water and Power Bureau is dependent to a large extent upon the irrigators themselves for records of the diversions in Canada from the Northern tributaries of Milk River as, in the majority of cases, the diversions are too small to justify the expense of appointing and paying gauge observers. Consequently the records are believed to be incomplete and of doubtful value.

This year little information on the total diversion from these tributaries is available, however, the diversions reported in Canada are shown in table 3 and were; from Lodge Creek, 335 acre-feet; from Battle Creek, 270 acre-feet; from Frenchman River, 6,000 acre-feet. There were no diversions from the other tributaries.

Any question as to the proper share of the St. Mary River being delivered to either country was decided in the following manner. Record of the daily flow was kept of Swiftcurrent Creek at Many Glacier and of Canyon Creek near Many Glacier, but the flow of the other creeks entering Swiftcurrent Creek above the Sherburne dam were estimated. The total of these creeks gave the inflow into Sherburne Reservoir. The losses by evaporation in the reservoir were considered when estimating the flow from the unrecorded small streams. A record of the outflow from the reservoir was kept at the gauging station just below the dam. The difference between the inflow and the outflow showed the quantity of water being stored or released from storage. A record of the daily flow of the United States' St. Mary canal at St. Mary Crossing was kept to find the water being diverted by the United States and a record of the daily flow of the St. Mary River at Kimball, near the International Boundary, was kept to determine the water being delivered to Canada.

6.

If water was being stored in Sherburne reservoir, the natural flow of St.Mary River at the Boundary was obtained by adding the quantity of water stored to that diverted by the St.Mary canal and that delivered to Canada, a two day lag was allowed for stored water to reach the Boundary. If stored water was being released, the quantity released was deducted from the combined flow of the St.Mary canal and that in the river at Kimball to determine the natural flow.

The natural flow having been determined, the share to which each country was entitled was calculated on the following basis:-

(1) When the natural flow of the St.Mary River was 666 cubic-feet per second or less, Canada was entitled, by the ruling of the Commission, to three-fourths of that flow and the United States to one-fourth.

(2) When the natural flow of the St.Mary River was greater than 666 cubic-feet per second, Canada was entitled to 500 cubic-feet per second plus one-half of the increase over 666 cubic-feet per second, and the United States was entitled to the remainder.

No actual division was made of the waters of Milk River or its Northern tributaries except Frenchman River.

#### Water Supply

On the foothills and in the mountainous areas forming the headwaters of the St. Mary and Milk Rivers, the precipitation during 1937 was above normal, while on the prairies tributary to the Milk River, it was considerably below normal.

In the mountainous areas tributary to the St. Mary River basin, as shown by the sixteenth annual international survey of the snow conditions on the headwaters of Swift-current Creek, an area considered typical of the headwaters of St. Mary River, the snow cover was the mean of the fifteen years of record while the water content of this snow cover was slightly in excess of the mean. The run-off of 73,000 acre-feet from the area surveyed, during May, June and July was about 109% of the average for the fifteen year period.

The natural flow of 500,700 acre-feet of St. Mary River at the boundary during the irrigation season of 1937, from the first of April to the end of October, was 84% of the average for the 34 years of record.

The run-off from the prairies, as indicated by the Northern tributaries of Milk River, was 20% of the average for the years of record.

The twenty-three international gauging stations previously used in the determination of the daily natural flow of the streams in the St.Mary and Milk River basins were maintained and operated under the joint supervision of the field engineers. Several new stations were established by Canada on the Frenchman River.

An Appendix to this report gives the results of current meter measurements, the daily gauge heights and the discharge at all the gauging stations operated in the two drainage basins during 1937.

#### Description of Tables

The tables following have been prepared to summarize the data on the division and use made of the waters in the St.Mary and Milk River basins.

Table No. 1 shows the method used to determine the natural flow of the St.Mary River during the irrigation season of 1937, the water available for use and used by United States and Canada. In this table there are four pages for each month from April to October, inclusive.

Page 1, (water stored or released from Sherburne reservoir) shows the daily inflow into and outflow from Sherburne reservoir. The difference gives the quantity of water stored or released from storage. On this sheet the unrecorded inflow is determined by comparison with the recorded flows in Swiftcurrent and Canyon Creeks and with the use of the water levels of Sherburne reservoir to give the gain or loss in storage, after direct application of evaporation and seepage losses has been made. This estimate is put in the column headed "unrecorded inflow".

Page 2, (determination of the natural flow of the St. Mary River) shows the actual flow of St. Mary River at Kimball near the International Boundary, the quantity of water diverted, stored or released from storage, by United States and the computed natural flow of St. Mary River, or that flow which would have crossed the boundary had there been no interference. It has been determined that two days are required for stored water released from Sherburne reservoir to influence the flow at the boundary, consequently, a two day lag has been applied to the stored or released water.

Page 3, (water available for use and used by the United States) shows the water available for use and used by the United States under the ruling of the Order of

October 4th, 1921, the water diverted and stored and the excess or deficit in the quantity used over the quantity available.

Page 4, (water available for use and used by Canada) shows the natural flow of St.Mary River at the International Boundary, Canada's share by the ruling of the Commission, the actual discharge of the St.Mary River at Kimball, which is the quantity available for use by Canada, the quantity used by Canada and the excess or deficit of the quantity received by Canada as compared with the share.

Table 2 is a statement showing the quantity in acre-feet taken each month by each country and the quantity thereof applied to the land, the quantity diverted from St.Mary River, the loss or waste from the canals and the diversions from Milk River in the United States.

Table 3 shows the determination of the natural flow of Frenchman River at the International Boundary. This table consists of three pages; page 1 shows the quantity used by Canada at East End and the loss or gain in the river between East End and 50 Mile, page 2 shows the quantity used by Canada at Val Marie and the loss or gain between 50 Mile and Val Marie, page 3 shows the gain or loss between Val Marie

11.

and the International Boundary and the Natural flow of Frenchman River at the Boundary.

Table 4 shows the available information on the diversions from the Northern tributaries of Milk River in Canada.

Table 5 gives the diversions from the Northern tributaries of Milk River in the United States.
