RECOMMENDED CITATION

Dredge, L.A. and Kerr, D.E., 2016. Reconnaissance surficial geology, Armark Lake, Nunavut, NTS 66-K south; Geological Survey of Canada, Canadian Geoscience Map 274 (preliminary), scale 1:125 000. doi:10.4095/298791

ABSTRACT

Preliminary surficial geology studies, based on air photo interpretation and limited recent field data, were undertaken in the south half of the Armark Lake map area to

provide an understanding of surficial materials and regional glacial history. Much of the map area is covered by till veneer and swaths of sandy till with streamlined forms indicating ice flow to the NNW. Till blankets contain material derived from Thelon sandstone bedrock south of the map area, although till veneers are derived from more local bedrock. Subglacial meltwater corridors, spaced across the area, are also oriented NNW. An extensive, sandy kame moraine, characterized by kettle topography and kame terraces, marks a recessional ice margin on the north side of Garry Lake. Short-lived ice-marginal and proglacial lakes covered much of the terrain below an elevation of 220 m, leaving flat sandy deposits with thermokarst depressions and tundra ponds. The most extensive glacial lake deposits lie north of the kame moraine.

RÉSUMÉ

Afin d'acquérir une meilleure compréhension des matériaux superficiels de la demie sud de la région cartographique d'Armark Lake et de l'histoire glaciaire régionale, nous avons entrepris des études préliminaires de la géologie des formations superficielles en se fondant sur l'interprétation de photos aériennes et d'une quantité limitée de données de terrain récentes. Une grande partie de la région est couverte d'un placage de till et de bandes de till sableux avec des formes profilées indiquant un écoulement glaciaire vers le nord-nord-ouest. Les nappes de till contiennent des matériaux dérivés du grès de Thelon, présent dans le socle au sud de la région cartographique, bien que les matériaux des placages de till proviennent de sources plus locales dans le socle. Des chenaux d'eau de fonte sous-glaciaires, dispersés dans la région, sont également dirigés vers le nord-nord-ouest. Une vaste moraine de kame sableuse, caractérisée par une topographie de kettles et la présence de terrasses de kame, constitue la trace d'une marge glaciaire de retrait du côté nord du lac Garry. Des lacs juxtaglaciaires et proglaciaires de courte durée couvraient une grande partie du terrain au-dessous de 220 m d'altitude et ont laissé des dépôts plats sableux marqués de dépressions thermokarstiques et d'étangs de toundra. Les dépôts de lac glaciaire les plus étendus se trouvent au nord de la moraine de kame.

SHEET 1 OF 1, SURFICIAL GEOLOGY

GENERAL INFORMATION

Authors: L.A. Dredge and D.E. Kerr

Geology based on aerial photograph interpretation by L.A. Dredge, 2015,
with minor revisions by D.E. Kerr, 2015.

Geology conforms to Surficial Data Model v. 2.1

Geomatics by L. Robertson

Cartography by M.J. Baldock

Initiative of the Geological Survey of Canada, conducted under the auspices of Natural Resources Canada's Geo-mapping for Energy and Minerals (GEM) program

Map projection Universal Transverse Mercator, zone 14.
North American Datum 1983

Base map at the scale of 1:50 000 from Natural Resources Canada, with modifications.
Elevations in metres above mean sea level

Proximity to the North Magnetic Pole causes the magnetic compass to be erratic in this area.

Mean magnetic declination 2016, 3°00'E, decreasing 10.1' annually. Readings vary from 4°35'E in the SW corner to 1°21'E in the NE corner of the map.

This map is not to be used for navigational purposes.

Eastern longitude: 100°00'00"W

Northern latitude: 66°30'00"N

Southern latitude: 66°00'00"N

SOFTWARE VERSION

Data has been originally compiled and formatted for use with ArcGIS™ desktop version 10.2.2 developed by ESRI®.

DATA MODEL INFORMATION

Surficial

The Geological Survey of Canada (GSC) through the Geo-mapping for Energy and Minerals Program (GEM) has undertaken the Geological Map Flow to develop protocols

for the collection, management (compilation, interpretation), and dissemination of surficial and bedrock geology data and map information. To this end, a data model has been created.

The Surficial Data Model (SDM) was designed using ESRI geodatabase architecture. The XML workspace document provided can be imported into a geodatabase, and the geodatabase will then be populated with the feature datasets, feature classes, tables, relationship classes, subtypes, and domains.

Shapefile and table (.dbf) versions of the data are included within the data. Column names have been simplified and the text values have been maintained within the shapefile attributes. The direction columns are numerical, to display rotation for points, and the symbol fields will hold the correct values to be matched to the appropriate style file.

For a more in depth description of the data model please refer to the official publication:
