ABSTRACT

In the fall of 1986, the Geological Survey of Canada (GSC), the United States Geological Survey (USGS), two Canadian universities -- University of Western Ontario and University of Saskatchewan, and four American universities -- Northern Illinois University, Southern Illinois University, University of Wisconsin-Madison and University of Wisconsin-Oshkosh participated in a major deep seismic experiment in Lake Superior under the GLIMPCE (Great Lakes International Multidisciplinary Program on Crustal Evolution) umbrella. This Open-File Report presents the seismic sections for line A, which was shot specifically for refraction recording. The main target for study by this line was the Mid-continent Rift System. All recording stations, 31 in total (26 land stations and 5 OBSs), recorded energy from shots fired every two minutes (333 m spacing) by a tuned airgun array towed by a contracted ship along line A in Lake Superior. These data are the densest such data ever recorded in the continental North America over such distances. It is also unique since coincident seismic reflection and refraction are available.

RESUME

Pendant l'automne 1986, la Commission géologique du Canada (CGC), le United States Geological Survey (USGS), deux universités canadiennes -- université de Western Ontario et université de la Saskatchewan, et quatre universités américaines -- Université de Northern Illinois, université de Southern Illinois, Université du Wisconsin-Madison et université du Wisconsin-Oshkosh ont participé à un levé de sismique profonde dans la région du lac Supérieur, levé effectué sous les hospices de GLIMPCE (Great Lakes International Multidisciplinary Program on Crustal Evolution). Dans ce dossier public, nous présentons les profils de sismique réfraction enregistrés pour la ligne A lorsque celle-ci fut effectuée spécialement pour la sismique réfraction. La cible principale de cette ligne était le système du rift mid-continental. Toutes les stations, 31 au total, (26 stations terrestres et 5 OBSs) enregistrèrent l'énergie en provenance de tirs effectués toutes les deux minutes (espacement d'environ 333 m) par un réseau de canons à air tiré le long du profil A par un vaisseau sous contrat. Ces données sont les plus denses jamais enregistrées en Amérique du Nord sur de telles distances. C'est aussi un ensemble de données unique puisque sismique réflexion et sismique réfraction coïncidentes sont disponibles.

INTRODUCTION

The Great Lakes International Multidisciplinary Program on Crustal Evolution (GLIMPCE) was initiated at the end of 1985. It is a consortium of Canadian and U.S. government, academic and industry scientists interested in the evolution of the midcontinental region of North America. Its main purpose is to conduct and coordinate future geoscientific research in the Great Lakes region. In the fall of 1986 (August and September), it conducted its first major experiment via a contract to Geophoto Services Ltd. (GSI, Calgary). The seismic vessel M/V Fred J. Agnich recorded 8 lines of multichannel seismic reflection data whilst 8 government and academic groups recorded seismic wide-angle reflection/refraction data at various land stations and OBSS (Figure 1). This experiment was jointly funded by the Geological Survey of Canada through its contribution to the Canadian LITHOPROBE program and by the United States Geological Survey. The main targets of this survey were: (i) the Mid-Continent (Keweenawan) Rift System (MRS) and Hemlo and Michipicoten granite/greenstone belts in Lake Superior, (ii) the Niagara Fault and the Penokean foldbelt in Lake Michigan and (iii) the Grenville Front and Huronian foldbelt in Lake Huron.

The purpose of this open-file report is to present the seismic refraction data for Line A in Lake Superior and make them available

to the scientific community in such a way that independent interpretations of the data can be undertaken. Most details regarding the survey will not be repeated here as they are given in Hutchinson et al (1988). Coordination between the shooting vessel and the land recording crews was achieved through a coordinator located in Sault Ste Marie for all data in Lake Superior, and in Ottawa for all data in Lake Huron.

ENERGY SOURCE

The source of energy was provided by a tuned airgun array with an operating volume of 127.49 litres. The array was towed at a depth of $12 \text{ m} \pm 1 \text{ m}$ in Lake Superior. During the shooting of line A in refraction mode, this array was detonated every 2 minutes providing an average spacing between shots of about 333 m. Its computed signature is given in figure 2. All shot information relevant to this report is given in appendix A.

LINE RECORDING

During the recording of profile A in refraction mode, 8 sites were occupied on the north shore of Lake Superior (7 by the GSC and one by the University of Saskatchewan), 8 sites were occupied on the south shore of Lake Superior (5 by the University of Wisconsin-Madison, 2 by the Northern Illinois University and one by the University of Wisconsin-Oshkosh), 4 sites were occupied on Keweenaw Peninsula (3 by the University of Wisconsin-Madison and

one by the Southern Illinois University) and 5 USGS OBSSs were deployed along the profile. In addition, fan recording was performed on Michipicoten Island where one site was run by the University of Western Ontario, on Isle Royale Island where two sites were occupied by the University of Wisconsin-Madison, on the northwestern shore of Lake Superior where one site was occupied by the University of Wisconsin-Madison and on the southwestern shore of Lake Superior where two sites were occupied by the University of Wisconsin-Madison. In all, 31 sites were occupied (figure 3). Details about the recording for each institution can be found in Hutchinson et al. (1988).

PLOTTING PARAMETERS

Of the 31 sites occupied, 29 provided useful data and the various seismic sections are given in figures 5 to 33 (all in back pocket). All sections have been plotted with a reduction velocity of 6.5 km/s ($T-X/6.5$ km) and display 18 seconds of data starting at -2 s for the land data and 16 seconds starting at 0 s for the OBSSs. The data have been bandpass filtered with a 5 to 24 Hz filter for which the response is given in figure 4. The geographic north is always to the left of the sections with the south to the right. Seismic sections are organized such as to present the on-line data from north to south first followed by the fan sections.

Each trace of the land data (figures 5 - 12 and 18 - 33) has been normalized to its maximum value. Fan profiles have been

plotted with the northern end (last shot) of the profile being the origin. All distances were then calculated with respect to this origin. In this manner, direct comparison between seismograms recorded at each site from a single shot can be accomplished.

The OBS data (figures 13 - 17) have had the same treatment as the land data with the exception that instead of being normalized, the amplitudes have been scaled by a factor equals to $X/10$, where X is the distance. The effect of such a scaling is to preserve relative amplitude differences.

For uniformity, and to take advantage of existing seismic processing packages, these data were put into a common SEG-Y format that was modified to accommodate the needs of the seismic refraction data. Copies of the digital data displayed in this report can be obtained at cost from:

ACKNOWLEDGEMENTS

The authors of this report are particularly in debt to all of the people (professionals and students) who spent long hours in the field in order to collect these data. A list of most of these people is given in Hutchinson et al. (1988) and will not be repeated. We would like to express special thanks to Tom J. Jefferson from the University of Wisconsin-Oshkosh and John T. Shay from Oregon State University who plotted the data. We thank John Clink (GSI) and the captain and crew of Fred J. Agnich for their cooperation during the experiment. We thank the captain and crew of the U.S. Coast Guard Katmai Bay for their help during the deployment and recovery of the USGS OBSS in Lake Superior. We also thank the Ontario Geological Survey for providing helicopter logistics on Mitchipicoten Island.
