

# RURAL MUNICIPALITY OF CALEDONIA NO-99, SASKATCHEWAN

FIGURE 1

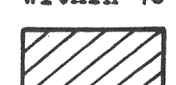

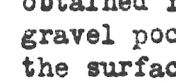

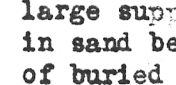

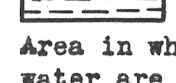

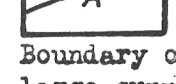

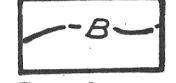

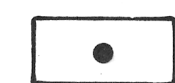

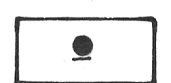

Map showing the surface and bedrock geology as it affects the supply of ground water, and areas in which the ground water occurs

FIGURE 2

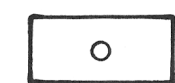

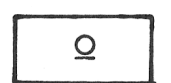

Map showing the drainage and relief, and the location and types of wells with source of ground water supply

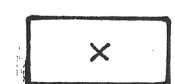

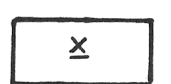

-  Recent stream deposits in which occur supplies of generally drinkable water within 30 feet of the surface
-  Area of glacial lake clays in which only very small supplies of highly mineralized water are obtained within 40 feet of the surface
-  Area of boulder clay or till plain in which small supplies of highly mineralized ground water are obtained from isolated sand and gravel pockets within 40 feet of the surface
-  Boundary of area in which fairly large supplies of water occur in sand beds along sides and bottom of buried pre-glacial stream channel from 90 to 200 feet from the surface
-  Area in which large supplies of water are obtainable from the Ravenscrag formation within 50 feet of the surface
-  Boundary of area in which fairly large supplies of drinkable water are obtained from sand and gravel beds in the lake clays within 40 feet of the surface
-  Boundary of areas in which fairly large supplies of drinkable water are obtained from isolated pockets of sand and gravels in boulder clay within 30 feet of the surface
-  Outcrop of the Marine shale formation

   
Well class 1  
In drift In bedrock

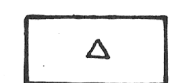

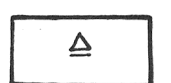

Flowing wells (These are usually designated as Flowing Artesian wells)

   
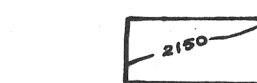

Well class 2  
In drift In bedrock

Wells in which the water is under pressure but does not rise to the surface (These are usually designated as Non-flowing Artesian wells)

   
Well class 3  
In drift In bedrock

Wells in which the water does not rise above the water table (These are usually designated as Non-Artesian wells)

   
Dry holes  
In drift In bedrock

 Contours (interval 50 feet)
