

HOUSING MARKET ASSESSMENT Ottawa¹

Date Released: Second Quarter 2017

Housing market intelligence you can count on

¹ Ontario part of Ottawa-Gatineau CMA

Highlights

- The overall assessment for the Ottawa CMA is weak evidence of problematic housing market conditions.²
- We detect moderate evidence of overbuilding due to a high but declining inventory of completed and unsold condominium³ units.
- We detect weak evidence of overvaluation as price indices point to a modest upward trend in prices.
- The Housing Market Assessment (HMA) analytical framework considers four factors to assess the evidence of problematic housing market conditions: overheating; acceleration in the growth of house prices; overvaluation; and, overbuilding. A brief summary of the framework is presented on page 6 of this report.

HMA Overview⁴

As Canada's authority on housing, CMHC contributes to market stability by providing information on potential imbalances that could affect housing markets. With the Housing Market Assessment (HMA), CMHC offers information and analysis that can help Canadians make more informed decisions.

The HMA combines the results from a technical framework with insights gained through CMHC's Market Analysts' knowledge of local market

conditions. These insights position CMHC to provide additional context and interpretation to the results of the HMA framework.

The HMA framework detects problematic market conditions in local housing markets by identifying imbalances. An example would be the detection of overbuilding, a situation in which the inventory of unsold new homes accumulates due to supply outpacing demand. Such an imbalance could be resolved by an adjustment in house prices. As an example, lower prices would help resolving an excess

supply imbalance by supporting stronger demand and/or reducing supply. However, other unexpected development that do not originate from the housing market could accentuate or reduce an imbalance.

Color codes indicate the level of evidence of problematic conditions. The HMA is a comprehensive framework that considers the intensity of signals of imbalances (that is, how far the indicator is from its historical average), and the persistence over time. Generally, low intensity and persistence are

² Results are based on data as of the end of December 2016 and local market intelligence up to end of February 2017. CMHC continuously monitors market developments and will issue HMA updates on a quarterly basis.

³ Unless otherwise specified, condominiums or condominium units refer to condominium apartments and condominium rows. Condominium apartments make up about 99% of total condominium starts on the new home market since 2010. On the resale market however, over the same period, condominium apartments made up around 50% of total condominium transactions, while condo rows took up 35% and the remaining share was taken up by stacked townhouse condos. Total condominium sales represent on average 20% of all resale market activity.

⁴ A detailed description of the framework is available in the appendix of the [National edition](#).

associated with potential weaker evidence of problematic conditions. As the number of intense and persistent signals increases, the associated evidence of problematic conditions becomes stronger.

In Detail

Overheating

We continue to detect weak evidence of overheating in the existing home market in the Ottawa CMA. Activity remained in balanced⁵ market territory for 2016 as a whole despite stronger sales and a decline in new listings. In Q4-2016 the seasonally adjusted sales-to-new-listings (SNL) ratio remained fairly flat relative to the previous quarter and at the higher bound of a balanced market

at about 58%. This level remains substantially below the overheating threshold of 80%, whereby demand would be running far ahead of supply. In Q4-2016, balanced market conditions prevailed for both market segments: freehold⁶ and condominium, with freehold activity just at the border of a balanced market at 60%. Seasonally adjusted data to February shows that overall market balance is just tipping into sellers' market territory reflecting slightly stronger demand conditions on the freehold side relative to supply.

Price Acceleration

We detect weak evidence of price acceleration in the Ottawa market. A moderation in the MLS average price growth into the second half of

2016 meant that for 2016 as a whole, growth was lower at 1.3% versus 1.7% in 2015. The MLS average price growth has remained below 2% since 2013, in line with inflation, mainly due to a decline in condominium prices. Looking at the CREA MLS HPI quarterly price movements, single-detached homes continue to lead growth in terms of prices. Single-detached homes are still the most sought after dwelling type in Ottawa, making up over half the resale market transactions, so that demand is closely matched with supply. The year started off with a drop from Q4-2015 levels, but gained momentum in the remaining quarters, particularly in Q4-2016. However, the most recent data in February points to a more modest upward trend in the CREA MLS HPI Benchmark Price.

"We detect moderate evidence of overbuilding in Ottawa due to a high inventory of completed and unsold condominium apartments relative to the population."

Anne-Marie M Shaker
Senior Market Analyst

Figure 1

Sales to New Listings Ratio Signals Balanced Market Conditions

Sources: CREA, and calculations (threshold) by CMHC
Last data point: Q4-2016

⁵ Balanced market bounds are 40 to 60 per cent. Lower than 40 per cent, the ratio implies a buyer's market; 60 to 80 per cent implies a seller's market, 80 per cent and above implies overheating.

⁶ Freeholds include homeowner single-detached homes, semis and rows.

Figure 2

Modest Growth in Benchmark Price for Single Family Homes

Last data point: Q4-2016

Overvaluation

We detect weak evidence of overvaluation for the Ottawa CMA, with average overvaluation hovering just below the problematic threshold. While Ottawa had witnessed strong price growth at intermittent periods during the last decade, recent years have seen growth rates moderate considerably. However, Q4-2016 seasonally adjusted average MLS price grew at 3.6% relative to the previous quarter. This is the strongest quarterly growth rate since Q3-2009. However earnings⁷ growth rebounded strongly at 5% for 2016 compared to 2015, improving overall affordability. In addition, employment also trended slightly higher in Q4-2016 compared to the previous quarter, and was up 2.3% for the year compared to 2015. More recent data to February point to even stronger employment, but weaker earnings.

Figure 3

Employment and Earnings Grow in Q4-2016

Sources: Statistics Canada, seasonal adjustment, and quarter-over-quarter growth calculations by CMHC
Last data point: Q4-2016

Overbuilding

We detect moderate evidence of overbuilding for Ottawa. The number of completed and unsold dwelling units trended down for the second consecutive quarter, but remained substantial in absolute terms and relative to 10k population. The slow decline in inventory is driven by a decline in completed and unsold apartments (homeowner and condominium) which represent on average 62% of total inventory. It must be noted that since 2015 the number of unsold low-rise units has been rising. Overall, the number of unsold units reached 7.7 units per 10k population by the end of Q4-2016, while more recent data to

⁷ Average weekly earnings are used here as a proxy for income.

February point to a further decline to 7.2 units per 10k population. Improved employment and earnings in 2016 have supported demand in the resale and new home markets.⁸ The seasonally adjusted number of condominium apartment units under construction trended up once more to 1,383 units in Q4-2016, but remains below previous peaks seen in 2014. Nevertheless, inventory management therefore continues to be necessary until the high number of completed and unsold units are absorbed by the market.

Figure 4

Source: Statistics Canada and CMHC, seasonal adjustment and calculations by CMHC.
Last data point: Q4-2016

⁸ Seasonally adjusted condominium apartment sales grew a strong 12% in Q4-2016 on top of 13.9% growth in the previous quarter signaling improved demand conditions. For the year, condominium apartment sales grew 6.7% over 2015. The vacancy rate for both purpose-built and condominium apartment units offered for rent also eased in 2016 according to the latest CMHC Rental Market Report conducted in October 2016. The purpose-built apartment vacancy rate declined to 3.0% from 3.4 the previous year, while the vacancy rate for condominium apartment units also went down to 1.1% from 2.6%.

Overview of the Housing Market Assessment analytical framework

To obtain an accurate picture of the overall state of the housing market, it is important to consider multiple data points and lines of evidence rather than relying on just one measure or indicator.

The Housing Market Assessment (HMA) analytical framework provides a comprehensive and integrated view that relies on a combination of signals from several indicators to assess housing market conditions.

Specifically, the framework considers four main factors that may provide an early indication of potentially problematic housing market conditions: (1) overheating when demand outpaces supply; (2) sustained acceleration in house prices; (3) overvaluation of house prices in comparison to levels that can be supported by housing market fundamentals (listed below);

and, (4) overbuilding when the inventory of available housing units is elevated.

For each factor, the framework tests for: (1) the presence or incidence of signals of potentially problematic conditions, but also considers; (2) the intensity of the signals, i.e. how their magnitude compares with their historical average or how consistent they are with known or suspected house price bubbles, such as for Toronto in the late 1980s and early 1990s; and, (3) the persistence of signals over time.

Generally, a situation in which we detect few signals with low intensity or lack of persistence is associated with weak evidence of problematic conditions. Conversely, as the intensity, number, and/or persistence of the signals increases, the likelihood of a factor becoming problematic increases.

The framework takes into account demographic, economic, and financial determinants of the housing market such as population, personal disposable income, and interest rates to detect potentially problematic housing market conditions. The framework also takes into account developments in both resale and residential construction markets.

The framework was developed on the basis of its ability to detect problematic housing market conditions in historical data, such as the house price bubble Toronto experienced in the late 1980s and early 1990s. The ability of the HMA to detect current problematic conditions relies on the assumption that historical relationships between prices and fundamental drivers of housing markets have not changed.

Housing Market Assessment Factors

Overheating

Overheating is caused by demand significantly and persistently outpacing the supply of housing. The sales-to-new listings ratio is used as an indicator to assess possible overheating conditions in the existing home market. To identify problematic overheating conditions, the framework compares the sales-to-new listings ratio to thresholds. When demand is strong relative to supply, house prices typically grow at a faster rate. Sustained overheating conditions on the existing home market may lead to acceleration in house prices for existing and new homes. However, as supply and demand begin to balance out, indicators of overheating (and acceleration) would begin to soften and house prices would gradually moderate.

Acceleration in House Prices

Under balanced market conditions, house prices are expected to increase over time, in line with increases in households' cost of

living. House price acceleration occurs when the growth in house prices strengthens over time on a persistent basis. Acceleration in house prices over an extended period can cause their pace of increase to depart from the overall price inflation and eventually lead to overvaluation.

To assess acceleration in house prices, the HMA framework uses a statistical test* that was developed to identify periods of accelerating asset prices.

Overvaluation

Overvaluation is detected when house prices remain significantly above the levels warranted by fundamental drivers of housing markets such as income, population, and actual and expected financing costs.

The HMA framework uses combinations of different house price measures and models to estimate house price levels warranted by fundamental drivers.

The difference between observed house prices and their estimated levels consistent with housing market fundamentals allows for an estimation of the degree of over- and undervaluation. The use of different price measures and models improves the reliability of results.

Overbuilding

Overbuilding is detected when the supply of readily available housing units significantly exceeds demand. In such a context, downward pressure on house prices would occur until the excess supply is eventually absorbed.

To assess overbuilding conditions in the housing market, the HMA framework uses two indicators that relate to the supply of readily available housing units: the rental vacancy rate, and the inventory of completed and unsold housing units per 10,000 population. The HMA framework compares the current level and recent trends in these indicators with thresholds.

Note 1: Colour codes indicate the level of evidence of problematic conditions. The HMA reflects a comprehensive framework that not only tests for the presence or incidence of signals of potentially problematic conditions, but also considers the intensity of signals (that is, how far the indicator is from its historical average) and the persistence of signals over time. Generally, low intensity and persistence are associated with a lower potential of upcoming problematic conditions. As the number of persistent signals increases, the evidence of a problematic condition developing increases.

Note 2: Results at the CMA level are not segmented by housing type or neighbourhood. They represent an assessment of the entire CMA. However, specific CMA reports provide further detailed analysis of these markets.

Note 3: The colour scale extends to red only for those factors that have multiple indicators signaling significant incidence, intensity and persistence of potentially problematic conditions. As a result, only overvaluation and overbuilding can receive a red rating, since they are assessed using more than one indicator.

Note 4: To ensure the framework is as current as possible, on a regular basis, we undertake a model selection process whereby our house price models for overvaluation are tested for statistical significance at the national and CMA level. The result of this process may change the number of indicators of a problematic condition from the previous assessment.

* See Phillips, Wu and Yu (2008) "Explosive Behaviour in the 1990s NASDAQ When Did Exuberance Escalate Asset Values?" for further details on the methodology.

CMHC—HOME TO CANADIANS

Canada Mortgage and Housing Corporation (CMHC) has been Canada's national housing agency for almost 70 years.

CMHC helps Canadians meet their housing needs. As Canada's authority on housing, we contribute to the stability of the housing market and financial system, provide support for Canadians in housing need, and offer objective housing research and information to Canadian governments, consumers and the housing industry. Prudent risk management, strong corporate governance and transparency are cornerstones of our operations.

For more information, visit our website at www.cmhc.ca or follow us on [Twitter](#), [LinkedIn](#), [Facebook](#) and [YouTube](#).
