## Releases

Wholesale trade, February 20092Wholesale sales fell $0.6 \%$ to $\$ 41.0$ billion in current dollars in February. Declining sales in themachinery and equipment trade group and the "other products" sector were major factorscontributing to this decrease. In terms of the volume of sales, wholesale sales were flat.
Police-reported Crime Severity Index, 1998 to 2007
According to the new Police-reported Crime Severity Index, police-reported crime in Canada in 2007 was less serious overall than 10 years earlier. The traditional Police-reported Crime Rate, which tracks the volume of police-reported crime, also dropped over the 10 years, but to a lesser degree. However, the seriousness of police-reported violent crime did not follow this downward trend and remained stable.6

## Releases

## Wholesale trade

February 2009
Wholesale sales fell $0.6 \%$ to $\$ 41.0$ billion in current dollars in February. Declining sales in the machinery and equipment trade group and the "other products" sector were major factors contributing to this decrease. In terms of the volume of sales, wholesale sales were flat.

Canadian wholesalers sell to both the domestic and international markets, and are active importers and exporters. The decline in sales reflected both lower export demand for Canadian goods, a significant part of which flows through wholesale markets, and weaker sales in Canada.

In February, four out of seven sectors, accounting for over two-thirds of total wholesale sales, posted declines.

The machinery and electronic equipment sector declined $1.6 \%$, largely as a result of lower sales in the machinery and equipment trade group ( $-5.2 \%$ ), which accounts for close to half of the sales in this sector. Within this trade group, declines were observed in industrial as well as in mining, oil and gas well machinery and equipment wholesalers.

## Note to readers

Wholesale sales in volume terms are calculated by deflating current dollar values using import and industry product price indexes. Since many of the goods sold by wholesalers are imported, fluctuations in the value of the Canadian dollar can have an important influence on the prices of goods bought and sold by wholesalers.

The wholesale sales series in chained (2002) dollars is a chained Fisher volume index with 2002 as the reference year.

Unadjusted monthly data were revised as of January 2006, while seasonally adjusted estimates were revised as of January 2004. Factors influencing revisions include late receipt of respondent information, correction of information on data provided, the replacement of estimated figures with actual values (once available), the re-classification of companies within, into and out of the wholesale trade industry and updates to seasonal and trading day factors.

Data in constant prices have also been revised to incorporate the revision to the current dollar series for the period from 2004 to date.

The revised data are now available on CANSIM and by special request, and will also appear in the February 2009 issue of Wholesale Trade (63-008-XWE, free).

Sales in the "other products" sector fell 4.0\% to $\$ 5.3$ billion in February, offsetting a $4.0 \%$ rise in January. The main contributors were declines in all other wholesalers and agricultural chemical and other farm supplies. This was the lowest level in this sector since August 2007. The "other products" sector includes a wide range of wholesaling activity ranging from recycled metal, recycled paper and paperboard, stationery and office supplies, and other paper and disposable plastic products wholesalers, to agricultural feed and seed wholesalers and agricultural chemical and other farm suppliers, chemical (except agricultural) and allied products, and all other wholesalers.

Declines were also seen in the food and beverages sector ( $-1.0 \%$ ) and the building materials sector ( $-0.9 \%$ ).

The largest increase came in the automotive products sector, which rose $4.0 \%$ in February, following a $21.8 \%$ decline in January. Sales of motor vehicles increased $9.4 \%$, offsetting some of the losses in January. Sales in motor vehicle parts and accessories fell 7.6\% in February, its largest drop since April 2003.

## Wholesale sales down in five provinces

Provincially, Saskatchewan registered the largest decrease (-6.4\%) in February, following a 10.7\% increase in January. Lower sales in the "other products"
and machinery and electronic equipment sectors were behind most of the decreases for the month.

Wholesale sales in Alberta fell 3.2\%, the fifth decline in six months. Weakness was seen in several sectors, including machinery and electronic equipment, and building supplies.

Wholesale sales in Quebec rose $1.4 \%$, while they declined $0.7 \%$ in Ontario.

Sales increased in three out of four Atlantic provinces, with Newfoundland and Labrador (+5.0\%) and Nova Scotia ( $+4.0 \%$ ) leading the way.

## Inventory-to-sales ratio continues to climb

## Inventories edged up 0.1\% in February.

Among the 15 wholesale trade groups, 7 reported higher inventory levels, including alcohol and tobacco (+2.2\%), office and professional equipment (+1.5\%) and building supplies (+1.3\%).

These increases were partially offset by declines in inventories of the lumber and millwork (-2.5\%), computer and electronic equipment ( $-1.5 \%$ ), and farm products (-3.4\%) trade groups.

The slowdown in sales and the slight gain in inventories led to an increase in the inventory-to-sales ratio from 1.43 in January to 1.44 in February. This was the highest level since October 1995. The average inventory-to-sales ratio for 2008 was 1.27.

The inventory-to-sales ratio is a measure of the time in months required to exhaust inventories if sales were to remain at their current level.

Inventory-to-sales ratio continues to increase

## Available on CANSIM: tables 081-0007 to 081-0010.

Definitions, data sources and methods: survey number 2401.

The February 2009 issue of Wholesale Trade (63-008-XWE, free) will soon be available.

Wholesale trade estimates for March will be released on May 21.

Note: Figures may not add up to totals due to rounding.

## Police-reported Crime Severity Index

1998 to 2007

According to the new Police-reported Crime Severity Index (PRCSI), police-reported crime in Canada in 2007 was less serious overall than 10 years earlier. The traditional Police-reported Crime Rate (PRCR), which tracks the volume of police-reported crime, also dropped over the 10 years, but to a lesser degree. However, the seriousness of police-reported violent crime did not follow this downward trend and remained stable.

Police-reported overall Crime Severity Index and Police-reported Crime Rate, 1998 to 2007

The Police-reported Crime Severity Index tracks changes in the severity of police-reported crime. Each offence is assigned a weight and more serious crimes are assigned higher weights, or relative importance. Changes in more serious crimes, such as break-ins and robberies, drive changes in the index.

Crime severity is expressed as an index for which 2006 is the base year at 100. In 2007, the index for overall crime was 94.6, down from 119.1 in 1998. This means that crime severity fell by about $20 \%$ during the decade. The 10 -year decline was driven by a $40 \%$ drop in break-ins.

## Note to readers

This release launches the Police-reported Crime Severity Index (PRCSI), a new tool that, for the first time, tracks changes in the severity of police-reported crime.

For a full explanation of the index and how it is calculated, consult the report Measuring Crime in Canada: Introducing the Crime Severity Index and Improvements to the Uniform Crime Reporting Survey (85-004-XWE, free). A short backgrounder is also available by request.

The new index adds to existing measures of crime. The traditional Police-reported Crime Rate (PRCR) will continue to be released annually. Statistics Canada also releases victimization data from the General Social Survey every five years. The new index will become part of Statistics Canada's annual release of police-reported crime statistics in July 2009.

The index was developed in response to a request by the police community to create a measure of crime that reflects the relative seriousness of different offences and addresses limitations of the current Police-reported Crime Rate. Its development was guided by a Working Group comprised of representatives from police; federal, provincial/territorial justice partners; and academics.

The Police-reported Crime Rate, which measures changes in the volume of crime, counts each criminal incident equally. As a result, the rate is dominated by high volume, less-serious offences.

The Police-reported Crime Severity Index measures changes in the severity of crime from year to year. Each type of offence is assigned a weight derived from actual sentences handed down by courts in all provinces and territories. Weights are calculated using the five most recent years of available sentencing data.

More serious crimes are assigned higher weights, less serious offences lower weights. As a result, when all crimes are included, more serious offences have a greater impact on changes in the index.

The seriousness of police-reported crime fell in every year during the decade, except for 2003. In that year, the index rose as a result of increases in robberies and break-ins.

The traditional Police-reported Crime Rate measures changes in the volume of police-reported crime. The majority of offences making up the rate are high-volume, less-serious offences, such as mischief and minor thefts.

The Police-reported Crime Rate also dropped between 1998 and 2007 but to a lesser degree than the index. The volume of police-reported crime fell by $15 \%$ compared with the $21 \%$ decline in the severity of crime.

The index and the rate provide different information on police-reported crime trends and may diverge at points. For example, between 1999 and 2002, the Police-reported Crime Rate was relatively stable while there was a notable drop in crime severity.

The severity index fell due to a decrease in several serious crimes, such as break-ins (-16\%) and robberies
(-11\%), while an increase in reported incidents of mischief kept the rate stable.

## Police-reported violent crime severity

The Violent Crime Severity Index and the traditional violent crime rate include only police-reported crimes against the person, such as homicide, robberies and sexual assault. Changes in more serious violent crimes, because they are assigned higher weights, have a greater impact on the violent severity index than on the rate.

Police-reported Violent Crime Severity Index and police-reported violent crime rate, 1998 to 2007

In contrast to the downward trend in the seriousness of police-reported crime as a whole, the index for just violent crime stayed relatively stable during the decade. This suggests that the situation with respect to serious crimes against the person was about the same as 10 years ago.

In 1998, the Violent Crime Severity Index value was 98.0 and in 2007, it was 96.5 , a drop of about $2 \%$. The traditional violent crime rate was also at about the same level in 2007 as in 1998.

However, the Violent Crime Severity Index and the rate moved in different directions at various points throughout the decade.

For example, between 2004 and 2006, the violent crime severity index rose by $4 \%$. During this period, there were increases in many serious violent crimes,
including attempted murder and aggravated assault, the most serious form of assault.

These increases were not picked up in the violent crime rate, due to a decline in minor assaults, the highest-volume violent crime.

## Severity of crime in the provinces and territories

The Police-reported Crime Severity Index can be used for measuring the increase or decrease in the severity of police-reported crime over time in any given jurisdiction. It can also be used to compare severity among jurisdictions in any given year.

Police-reported crime rates have generally been higher in the west and north than in eastern and central regions of the country. This is also true for crime severity. Provincially, Saskatchewan, Manitoba and British Columbia had crime severity index values well above the other provinces in 2007.

Ontario and Quebec have had the lowest police-reported crime rates in recent years. However, with respect to the seriousness of police-reported crime, Prince Edward Island and New Brunswick had the lowest index values.

Crime severity fell in every province during the 10-year period, with the largest declines in Ontario and Quebec.

## Severity of crime in Toronto, Montréal and Vancouver

Among Canada's three largest census metropolitan areas, crime was less serious overall in Toronto in 2007 than in either Montréal or Vancouver.

Canada's largest metropolitan area, Toronto, had a Police-reported Crime Severity Index of 65.6 in 2007, well below the national average of 94.6 and the lowest of all 27 census metropolitan areas.

Montréal had an overall index of 94.3 while Vancouver's overall index was 128.5, well above the national average and sixth highest of all metropolitan areas.

On the other hand, Toronto's violent severity index was almost the same as the national average while the indexes for both Montréal and Vancouver were above. Vancouver's violent index was sixth highest of all the metropolitan areas.

## Other census metropolitan areas

Of all census metropolitan areas, overall crime severity was highest in Regina in 2007. Regina's index value of 189.0 was about twice the national average of 94.6. However, the severity of police-reported crime in Regina has been declining in recent years.

Regina was followed by Saskatoon and Winnipeg in 2007. The seriousness of police-reported crime in Saskatoon has also declined in recent years, while in Winnipeg crime severity has remained relatively stable.

Although the Atlantic provinces had below-average Police-reported Crime Severity Index values, this was not the case for the three major metropolitan areas in those provinces. In 2007, Saint John, Halifax and St. John's all had overall index values above the national average.

For violent crime, index values were again highest in Saskatoon, Regina and Winnipeg. Québec had the lowest index value for violent crime.

Available on CANSIM: tables 252-0051 and 252-0052.
Definitions, data sources and methods: survey number 3302.

The report, Measuring Crime in Canada: Introducing the Crime Severity Index and Improvements to the Uniform Crime Reporting Survey (85-004-XWE, free), is now available. From the Publications module of our website, choose All subjects, then Crime and justice.

1. The crime rate consists of all Criminal Code offences excluding traffic. It also excludes drug offences and all federal statutes.
2. The violent crime rate has been expanded to include a number of offences not previously included in the violent crime rate, including uttering threats, criminal harassment and forcible confinement.
Note: $\quad$ This table does not show the Non-violent Crime Severity Index or the property and Other Criminal Code crime rate. Rates are expressed per 100,000 population.
