Farm Product Price Index, March 2015

The Farm Product Price Index (FPPI) increased 5.4% in March compared with March 2014, mainly as a result of higher cattle and grain prices. This was the eighth consecutive year-over-year increase, which began in August 2014 and was mainly the result of higher livestock prices.

Chart 1 The 12-month change in the Farm Product Price Index

12-month % change

The livestock and animal products index rose 7.5% in March compared with March 2014, continuing a year-over-year growth trend that started in April 2013.

The main contributor to the increase continued to be prices for cattle and calves, which rose 44.6%. Tight supplies and the depreciation of the Canadian dollar relative to the US currency (from March 2014 to March 2015, the Canadian dollar depreciated 12.0% relative to the US dollar) have contributed to the higher prices. Canada's beef cow herd continued to contract. As of January 1, 2015, it was down 2.0%, its lowest level since 1992. Meanwhile, the US beef cow herd rose 2.1%, the first increase since January 2006, but remained at its third lowest level since 1962.

Also contributing to the year-over-year increase, but to a lesser extent, were gains in the eggs (+1.4%) and poultry (+0.2%) index.

The advance of the livestock and animal products index over the 12-month period was moderated by declines in the hogs (-32.2%) and dairy (-3.4%) index. The decline in the hogs index followed a 10.8% drop in February, which was the first decline on a year-over-year basis since April 2013. Hog prices had increased over North American supply concerns following the outbreak of porcine epidemic diarrhea virus. In the latest hog inventory releases, however, the number of US market hogs were up 7.7% compared with 2014, while in Canada they were up 1.9%.

The crops index was up 4.7% in March compared with March 2014, the third consecutive year-over-year gain which began in January 2015, after a slide that had started in August 2013. The main contributors to the increase were the grains (+8.6%) and specialty crops (+29.1%) indexes. Moderating the increase were lower oilseeds (-0.9%), fruits (-6.2%) and vegetable indexes (-1.3%), while potatoes (+0.1%) were virtually unchanged. Despite the International Grain Council forecasting an increase in total world grain stocks by the end of this 2014/2015 crop year, lower Canadian production and limited supplies of higher quality grains for selected crops such as durum, barley and corn have kept upward pressures on prices for these grains.

Compared with February, the FPPI edged up 0.5%, as a 1.3% increase in the livestock and animal products index more than offset a 0.4% decline in the crops index.

Note to readers

The growth rate of the total Farm Product Price Index (FPPI) is derived from a weighted average of the component indices using a different set of weights in consecutive months; it is not a weighted average of the growth rates of its crop and livestock components. Given this, the growth rate of the composite FPPI can lie outside the growth rate of these components.

Table 1 Farm Product Price Index

	March 2014 ^r	February 2015 ^r	March 2015 ^p	February to March 2015	March 2014 to March 2015

StatCan Blog, June 2015

The 2011 National Household Survey—the complete statistical story

In today's *StatCan Blog*, Chief Statistician Wayne R. Smith addresses issues and questions concerning the quality of 2011 National Household Survey (NHS) data. In late 2010, the mandatory long-form census was replaced with the voluntary NHS.

The Chief Statistician outlines the mitigating strategies and tools adopted by the agency to protect data quality. He addresses the three principal challenges associated with the NHS: sampling error risk, non-response bias, and the variability of response rates at various geographic levels.

While acknowledging the NHS challenges, Mr. Smith says that the survey yields "a rich and robust database of information" fit for use for all Canadians.

The June 2015 edition of the StatCan Blog is now available from the Stay Connected module of our website.

Asphalt roofing, April 2015

Shipments of asphalt shingles reached 3.2 million metric bundles in April, down 29.5% from the previous month. Production of asphalt shingles decreased 6.6% to 3.8 million metric bundles.

Compared with April 2014, asphalt shingles shipments were up 4.6% while the production of asphalt shingles was 4.4% lower.

Note to readers

The monthly survey, Asphalt Roofing, measures production, shipments and exports of asphalt roofing products, including the destination of shipments.

Data in this release are subject to revisions and not seasonally adjusted. Data for the months of December 2013 and January 2015 have been revised.
