A NOTE TO USERS

REGIONAL LABOUR FORCE SERIES

Thirty seasonally adjusted and unadjusted labour force series by regions (Tables 16A to 16F) are added in this issue. They are: labour force, employed, employed non-agricultural, unemployed, unemployment rate, and not in the labour force. Regional participation rates may be obtained by expressing the labour force series as a percent of the population 14 years and over, which is the sum of the labour force and not in the labour force series. The method of seasonal adjustment is the U.S. Bureau of the Census method II, X-9 computer program.

Canada totals obtained by summing the seasonally adjusted data for the five regions will usually be different from the Canada totals on page S-1 which are obtained from a direct adjustment using the same X-9 program. These differences, which are the result of a statistical discrepancy, are small and do not generally affect the interpretation of the movement of the series.

The back records for the above series, from 1953 on are available on request.

SEASONALLY ADJUSTED CONSUMER CREDIT

The seasonally adjusted counterparts for the consumer credit series in Table 80 are provided in this issue. The total monthly series (column 10, Table 80) is the sum of the nine monthly components. The quarterly series are adjusted directly and added to the monthly series to obtain the total quarterly consumer credit (column 14, Table 80).

The total monthly and quarterly consumer credit series are also included as economic indicators on pages S-8 and S-9 respectively.

CHANGES IN TABLES 14 AND 15

Table 14 is changed to carry wages and salaries by provinces rather than labour income. Table 15 is changed to include monthly rather than quarterly data. These changes make the two tables consistent with each other, and give improved series provincially.

REVISIONS

(1) The unadjusted data for retail trade (Table 76) have been revised from January 1963. The adjusted data in Table 76 and on page S-5 have been revised from January 1961.

(2) The seasonally adjusted data on exports and imports by major countries and country groups on page S-7 and Table 83 have been completely revised from 1946 on to allow for the new warehousing concept which has been extended back to January 1955, and as a result of which both exports and imports are on the "general" trade basis. Prior to this date the series are still on the "special" trade basis, but the differences between them are small as the warehousing adjustment tended to become negligible in the earlier years.

(3) The seasonally adjusted data for the new motor vehicles sales on page S-5 have been revised from January 1964.

ANNUAL SUPPLEMENT

The fourth (1964) edition of this supplement will be appearing in August and will carry the back records for all the series in the "S" section of the Review.

Annual Subscription: \$5.00 — Single copy: 50c.

This review and other publications of the Dominion Bureau of Statistics, including a free annotated catalogue of current publications, may be ordered from the Information and Public Relations Division, Dominion Bureau of Statistics, Ottawa, Ontario, and remittances made payable to the Receiver General of Canada.

MERCHANDISING AND SERVICES DIVISION¹

SOME ELEMENTS OF NEWNESS IN A BASIC PROGRAMME OF STATISTICS

Traditionally, the statistics of Retail Trade, Wholesale Trade, and the Service Trades have been on a Decennial Census of considerable detail, with Intercensal sampling to produce current estimates of a limited number of special indicators, such as sales or revenue, value of inventories, and—in Retail Trade—customer receivables on books, together with occasional surveys on Operating Results in both Retail and Wholesale Trade. This statement does not take into account a number of intercensal series which are not samples, e.g., department stores, corporate chains, and so on. However, at the moment, the concern is with the general approach. While the timing and content of the Census, taken in connection with the relatively few surveys maintained currently, represent a lack of urgent statistical emphasis in the distant past, the presently increasing interest—and, therefore, the increasing statistical emphasis—cannot alter the fundamental pattern of some sort of a Census taken less frequently than each year, with sampling as the main intercensal survey device. This pattern is set by the very large number of individual businesses to be surveyed. Even if current total-coverage surveys were possible in terms of resource allocations, the time-lag involved would rule them out in many instances. The timeliness required in the publication of current estimates of Retail Sales, Consumer Credit, and similar important indicators requires the use of sampling techniques.

The purpose of this article is to indicate some important areas in which increasing interest has resulted in increased emphasis, to show to some extent the total statistical situation within which the emphasis had to be viewed and expressed, the major decisions arrived at, and, in some detail, the resulting new elements in the statistical programme in each of the three fields of Retail Trade, Wholesale Trade and the Service Trades.

Some of the demands developing during the last few years have been for more accurate and up-to-date information on sales or revenue, inventories, and other selected items, by store-type trades (hardware, grocery, drug stores, beauty parlours, etc.) and by fine geographical divisions. To deal with these involved considering both major aspects of the existing programme, i.e., Census and intercensal sampling. It is only in a Census year that all stores can be examined and carefully classified to store type trades on the basis of commodity or other activity data collected at that time and it is only in the same year, when data are available for each store, that geographical analysis below the provincial level is possible. List samples, as used in current intercensal series, must depend on the Census for benchmarks and new sample frames, and, very largely, embody during their life the trade structure in existence at its commencement. Commodity wise, the current sample-based estimates of sales must be interpreted in the light of the com-

modity data collected in the last Census, modified by any special knowledge an expert user may have. In addition, sampling by its very nature cannot yield fine trade or geographical breakdowns. At best, in Canada, it can provide reasonably accurate estimates by groups of closely related trades at the provincial level. Therefore, although it was possible to conceive of some improvements in current samples within a possible resource allocation, the Census itself appeared to be the main area of possible improvement to meet the needs of those users under discussion at this point.

Going along with the foregoing requirements has been the evident need for a more frequent total assessment of the structural or organizational developments taking place, and which are difficult to investigate or measure accurately in current, intercensal series lacking a Census base, or in which the Census base is out of date. The developments referred to here cover a wide range, from ownership groupings, through affiliations for competitive purposes, such as what are commonly referred to as Voluntary Chains, to such groupings as Shopping Centres, and include other areas involving a number of merchandising characteristics, such as the Supermarket, the Discount House, and so on. The growth of the Co-operative is a good example that cuts across a number of fields.

Statistics measuring gross trading margin, or an equivalent, and detail of operating results have a variety of users, and their importance needs no stressing. However, the timing of such surveys is a matter of concern. In Retail Trade, details of a trading statement, yielding gross trading margin, were collected in the Decennial Census of 1961, but Operating Results detail are collected in annual sample surveys. In Wholesale Trade, both gross trading margin and Operating Results were collected in the Decennial Census of 1961, and the same Census yields Operating Results data for the Service Trades. In general, the inclusion of any, or all of these items in a Census survey slows response, creates problems of incomplete reporting, and, in general, delays publication. In addition, it is doubtful that the Census timing is adequate in these areas. These problems were taken into account in the considerations leading to proposals to meet the needs of users.

Although a requirement for commodity detail of sales or of service activities entering into other revenues has been observable in statements made previously, and has, in fact, been attached to each Decennial Census effort, it seems desirable to make this a subject of special comment. For many users, an analysis of the universe in terms of commodities, rather than trades, would be the desideratum. And if this analysis could be carried down to fine geo-

¹ Copies of this article are available on request.

graphical divisions, so much the better. But these are probably the most difficult of all statistics to collect in the distributive and service trades. In a surprisingly large number of instances, businesses cannot supply detail beyond main lines, or, if they can supply it, are unable to give it for individual locations if they are multi-location businesses. To determine what detail is desirable in terms of what is possible is time consuming, to collect and process the data received (which varies greatly between respondents in detail actually given, and in the quality of what is reported) is even more time-consuming, and many important countries simply do not attempt to collect detail going beyond that which is required for simple classification of the respondent in the Census year. And to collect such data currently is simply out of the question. What should be done, then?

Another major area of increasing interest is the development of statistics on employment capable of reflecting labour input. The use of part-time employees, the large number of working proprietors who may or may not carry on more than the one activity, the unpaid family workers who help in many of the small businesses, all complicate the problem of using a count of paid employees as a basic statistic. It is difficult, also, except in large businesses, to collect man hours worked by the paid employees. In the Decennial Census of 1961, detail was asked which permits the conversion of total payroll into rough full-time man year equivalents, while for working proprietors and unpaid family workers, hours worked in the business in selected weeks was sought. While a massive study will emerge from this, it will lack currency. Also, considerable lack of response was encountered, and, in general, these questions added considerably to the burden of the Census.

Taking all the foregoing problems into account — together with others not dealt with here — a decision was arrived at recently to convert from a Decennial to a Quinquennial Census approach. The first Quinquennial Census will be taken to cover the year 1966. At the same time, it was decided that the Census itself should be considerably stream-lined. Since the basic reason for converting was the need for an up-to-date look at a rapidly changing universe, it appeared to be fundamental that the Census should not seek the kind of detail which slows down response from business, introduces a lengthy processing period, and brings about a time lag of three to four years in the publication of vital information. The decision, then, was that the Census should be limited to what are usually thought of as principal statistics, i.e., sales or revenue, employment, payroll, value of inventories, customers receivables on books (Retail Trade) and a few other questions designed to show the amount of retail selling done by wholesalers, the amount of wholesale selling done by retailers, and so on, to round out the universes in each case. Sufficient main commodity line information to permit the classification of a business to a trade would be collected, but the fairly detailed commodity information usually sought would be drop-

ped. Similarly, detailed investigation of the trading statement, gross trading margin, operating results, etc., surveyed in the Census of 1961, would not be included in the Quinquennial Census approach. There would be, however, a number of "tick" questions requiring no actual data-reporting, to enable the classification of the respondent according to one or more of a number of groupings of immediate interest for studying structural and other changes, and/or providing bases for intercensal series. Such a Census should meet all the predominant requirements for trade and geographical analysis, and should be capable of being collected and published within about one and a half years. At the same time it will provide new benchmarks and new sampling frames for the important intercensal programmes.

The dropping of fine commodity and other detail from the Census proper does not mean that these are down-graded in importance. Referring particularly to commodity detail (—and as indicated elsewhere — such detail has never been reported by more than a sample of respondents, with the weakness that the sample has been "self-selected", i.e., it represented those businesses which were willing or able to give the detail without undue effort and did not necessarily represent the universe). What is intended is that the detail will be sought in each intercensal period, as a post-Census extension of the Census, within properly designed samples, with a maximum of warning to selected respondents, follow-up work in the field, etc. The result will be that the quality of the estimates will be improved. Obviously, since such sampling will be undertaken after each Quinquennial Census, the estimates will be available at least twice as often as previously. Detailed questions on employment leading to rough measures of labour input will appear on sample surveys, similar to the commodity surveys. This area is still so experimental that sample approaches appear to be adequate, particularly since the timing of the results can be improved. At the same time, any existing current survey which is suitable will carry employment questions, in an attempt to improve the total data available. It should be understood that implicit in the foregoing is an exploration of total labour income. In connection with data on gross trading margin, and operating expenses, these will be collected through intercensal sampling, very likely along the lines already introduced in Retail Trade.

Having dealt with this major change in approach in the Statistics of Merchandising and Services, it seems desirable now to consider in some detail the new elements in the presently approved or projected statistical programme in each of the three fields under review.

Retail Trade

For many users, the most useful statistical product in this area would be a detailed analysis of all commodities sold at retail, without regard to whether the seller was a retail merchant, a wholesale merchant, a manufacturer, a door-to-door can-

vasser, or whatever the case might be, together with a cost of merchandising analysis at the individual commodity level, and, probably, a distribution of all these data into small geographical divisions. What all users must put up with, however, are the statistics of business units of one kind or another, classified to Retail Trade, and to a commodity-type classification, such as Grocery, Hardware, etc., on the basis of the level at which the major part of the sales are made and on the basis of the major commodity lines handled. Only in a Census year can they determine the commodity structure of the trades comprising the business units which are classified into the detailed trades called Grocery, Hardware, etc., and only in the same year can they ascertain what elements of Wholesale Trade have thus crept into Retail Trade, and what elements of Retail Selling are accounted for by businesses classified to Wholesale Trade, Manufacturing, and so on. And, in the past, only in such a year could they find estimates of direct selling to households.

What is being led up to here is that, commencing with the Census of 1961, and inherent in Retail Trade statistics in future years, two kinds of business units were dealt with. The first of these was the store, or location, which is a statistical unit capable of supplying from its records such simple, but vitally important data as sales, payroll, and inventory, and which can be classified to reasonably homogeneous trades, to fine geographical areas, or into other classifications representing groupings of stores. The second was the establishment, which is a statistical unit capable of yielding from its records a trading statement and the full detail of operating results. In all cases where an owner operates only one store, or location, the establishment and the location are identical, but where an ownership entity includes more than one store or location at which some business activity is carried on, the establishment will include all business locations if in fact operating expense data are available only for the total activity. If a particular ownership entity includes nine business locations, but can supply operating results data separately for one group of four and another group of five, then each group becomes an establishment. Each establishment must be classified precisely as a location is classified, i.e., by major activity and commodity lines sold. The trade series into which these establishments are fed are slightly less homogeneous than those into which the locations are fed, and, because an establishment can include locations somewhat dispersed in space, the establishment-trade series are not susceptible to fine geographical area breakdowns. The introduction of the establishment as a statistical unit was an absolute requirement to meet the increasing emphasis on operating results, and similar data, but it is also an important element in a major effort to produce a complete and fully integrated set of statistics for the economy. It is regretted that this important aspect is outside the scope of this article. The essential fact to note is that all future Censuses must produce an appropriate set of statistics for locations and for estab-

lishments, and that intercensal series will use either one or the other of these as a benchmark or as a sampling frame.

Commodity Statistics

In the Quinquennial Census, approximately thirty-five main commodity lines will be specified, and data collected from large and medium size businesses, to permit their classification to store-type trades, e.g., Grocery, Hardware, etc. Small businesses, representing some fifty per cent in number, and about twenty per cent in value of sales, will be permitted to make their own specifications of broad lines. In general, the data collected for classification purposes will be capable of being compiled by trades, so that the broad commodity structure of trades can be shown. However, important fractions of commodity lines reported in particular trades will be hidden in other trades, where they are less significant, and it will not be possible to add through from trade to trade to show totals for the commodity lines. After the Census survey proper is completed, a sample survey of commodity detail of some one hundred and twenty items or lines will be undertaken as a special post-Census effort. This survey should permit the add-through of items to total, so that a commodity pattern of retail sales can be established for provinces and for metropolitan centres within provinces. Commodity estimates below this level are not seen to be feasible at any future date, except in some limited instances where a manageable segment may agree to maintain the necessary records.

Some consideration is being given to another development which, while not capable of yielding commodity estimates, might be useful in market research, namely, that where trades are commencing to handle commodity lines previously handled only in other trades, a "tick" question might be added, in which stores could simply indicate whether or not they do handle such lines. This would permit no more than a count of the "yes" stores, by trade and by geographical location, but, for some purposes, even this limited knowledge would be useful. It is expected that this idea will be developed for use to round out a knowledge of the number of locations engaged in a particular service. For example, T.V. repair and maintenance may be a classification to which can be assigned a business primarily devoted to this, but it may also be a customer service provided by a large business classified elsewhere. A "tick" question would elicit this fact. In all such areas, simple devices of this nature may represent an important advance in statistical measures.

Retail Store Sales, Inventories and Credit Receivables on Books

The statistical unit for these data, for the purpose of fine trade and geographical analysis, is the individual store. Such statistics will be made available in full trade detail, and by all the standard Census geographical detail, every five years. Having in mind the many special area definitions emerging

as requirements, it is the intention to seek out and to satisfy the greatest number possible. In marketing studies for example, an area of interest may not conform to city or county boundaries, but may be related to population density. Within a metropolitan centre, there may be definable divisions, the statistics for which can show important shopping shifts.

Intercensal sampling for these significant items uses the Census results as benchmarks and the Census itself as a sampling frame. The change from a Decennial to a Quinquennial Census automatically improves the current sample results, since it provides a new benchmark, and a new sampling frame, every five years instead of every ten. An additional major problem in producing accurate intercensal estimates from what may be called list sample, is that, while such a sample gives some measure of deaths of stores, it does not give a measure of new store births. Obviously it cannot do this since its frame is only the stores in existence in the last Census year. In the past, the avenues open for measuring births have precluded anything more than an annual net birth-death adjustment. The very important estimates of Retail Sales are made monthly but these monthly estimates have not been completely sensitive to short-term change. Commencing with 1966, an attempt will be made to introduce a somewhat rough net birth-death adjustment each month, with an annual correction.

Of interest to those concerned with geographical statistics is that all future samples for Retail Trade Sales will permit estimates with the maximum trade group detail for each province separately, thus ensuring that some of the smaller provinces, previously grouped, will be observable as entities.

Operating Expenses

The statistical unit for Operating Expense Surveys is the ownership unit or establishment for which such detailed records are maintained. As pointed out in the opening of the Retail Trade section, trade statistics using the establishment as the statistical unit tend to be somewhat less homogeneous than those using the individual store or location. However, it should be noted that even if operating expenses could always be collected at the level of the individual store, there would still be problems in their use by business men, since the commodity/activity mix of stores classified to a trade can differ considerably, except that each must be over fifty per cent engaged in the activity on which the classification is assigned. This problem will be referred to later.

Operating Expense Surveys will be undertaken in a three year cycle, on a sample basis. Commencing with 1963, a survey was taken of the Food Trades (publication pending), and, for 1964, a survey is now under way for the General Merchandise, Apparel and Accessories, and Hardware and Home Furnishings Trades. For 1965, a survey will be taken covering the Automotive Group and the remaining Trades. Following this, the cycle will commence again with the Food Trades.

It is possible to return here to the point raised earlier regarding the use of these data by some business men.

In those instances where the data may not be adapted to the use of some individual businesses, i.e., the ratios will be somewhat generalized because of activity and/or commodity mix within trades, an effort will be made to develop a secondary series by sorting out of the sample the data from relatively "pure" businesses. The word "pure" is used here to suggest those respondents whose commodity or activity structures closely resemble those suggested by the name given to the trade, i.e., they are coded to the trade on the basis of ninety to one hundred per cent of the required commodity lines or activities, rather than on the basis of something slightly over fifty per cent. This is not to be thought of as an immediate development, and likely will be introduced as the second cycle of surveys begins, or, in other words, with the Food Trades survey to be undertaken for the year 1966. Ratios from these secondary series should have a more precise application.

It may be interesting to note that the Operating Results surveys will be developed gradually into relatively full-scale surveys, including a trading statement (with the resulting measure of gross trading margin) and a supplementary section on employment and additional labour income. In this latter area, they should meet most of the needs referred to elsewhere. In total, these surveys will represent the effort in Retail Trade to collect and publish intercensal statistics that fit an integrated pattern for industrial statistics using the establishment as the statistical unit and now being developed in the Dominion Bureau of Statistics, and which will be further developed into company statistics.

Statistics of Segments of Retail Trade

The title of this sub-section may not be very enlightening, but it is, in fact, intended to cover a great variety of groupings, ranging from form of organization, such as incorporated, unincorporated, etc., through groupings according to number of stores owned, with chains as a separate sub-segment, department stores, groupings in a single location such as shopping centres, voluntary associations of independents, usually referred to as voluntary chains, discount houses, which, while representing one kind of grouping of stores under a distinctive and attractive business title, may, in some instances, represent within a single store a number of concessionaire units whose ownership links them to other groups and so on.

The importance of the new opportunity to look at many of these statistically every five years, instead of every ten, need not be stressed. What should be stressed here are the complications that some of the newer segments introduce not only when an attempt is made to define and measure them, but also into the definitions and measurements of what may be termed "older" segments. For example, a

department store may contain within it one or more departments which are actually operated by concessionaire units of chains, and the department store itself may operate a unit in a shopping centre. A chain will operate units in department stores, in shopping centres and in discount houses. A discount house may also be a department store proper, or, although it appears to be a department store, it may be made up largely or entirely of concessions, and is thus outside the definitions, a voluntary chain will contain among its members (usually thought of as independents), a chain proper in an instance where the owner of four or more stores may find it advantageous to be associated with a larger group. Quite apart from the difficult definitional problems involved in describing each segment, there is an increasing need to visualize statistical surveys as serving two purposes (1) supplying statistical measures that adequately describe the segment as a total phenomenon and (2) supplying statistics that are non-duplicating, and which can fit into the pattern of trade statistics. These problems are, and will continue to be, of pressing concern.

The Voluntary Chain Segment is to be measured and studied through a new total-coverage survey to be taken annually. A first experimental attempt, covering the Food Trades only, was made for the year 1963, and for 1964 all trades where such associations exist are being surveyed. The main problem is a meaningful presentation of the data, since the associations vary from the very loose, in which no more than advertising may be shared in common, to an almost complete control by, and supply of goods from, a central body. What must be developed is a considerable number of classifications, representing areas of reasonable similarity, so that data may be presented within them. It may be some two or three years before truly meaningful data can be released. However, such a series is a necessary complement to the existing series on what are commonly called Corporate Chains.

Direct Selling to Households (and other selling not measured through Retail location or establishment series)

The attempt to survey the sales through the main channels of direct selling, which included door-to-door selling by large companies, newspapers delivered, magazine subscriptions secured, book club sales, and others, as undertaken to supplement the 1961 Census, will be enlarged and carried on as a cyclical investigation spread over a period of years. Work on this will commence in 1966.

Also, an effort will be made to measure the importance of sales made through visible, but "closed to public" outlets, such as company stores for employees, union stores, etc., which are excluded from Retail Trade by definition.

Provincial Administrative Records

Provincial taxes of one kind or another imposed at the retail level have brought into existence important, if somewhat limited, store sales data. A

classification has been worked out with the Province of Ontario, and is under discussion with the Provinces of Nova Scotia, New Brunswick and Prince Edward Island. This classification will permit a common use of data if it eventually emerges. Some extension of this effort is anticipated. Even if no total statistical product comes into existence, any small result will be of interest, particularly since it will reflect a reasonably current scene.

Wholesale Trade

As in Retail Trade, two main statistical reporting units are now in use. See the first part of the Retail Trade section for explanatory comment.

In Wholesale Trade, the notion that the main survey approaches must be a Census taken less frequently than each year, with intercensal sampling, does not quite hold good. Unlike Retail Trade, the number of businesses is reasonably small, being less than thirty-five thousand and a total-coverage annual survey is feasible. However, sampling must be resorted to for estimates required more frequently than once a year, and should be used to secure detail of operating results and similar data. In this area, then, the decision was to develop an annual full-coverage survey limited to basic items, such as sales and other revenue, inventory, and salaries and wages paid, rather than to do this only once in every five years, as in other areas. This annual survey uses the establishment as the statistical unit, and, therefore, fits into the general integrated pattern of establishment statistics and the developing pattern of company statistics. In the Quinquennial Census year, the annual Wholesale Trade survey will be incorporated into the total Census effort, to ensure comparable data from all establishments as classified at that time to Retail, Wholesale and the Service Trades. In addition, in the Quinquennial Census year, all the locations contained in establishments will be identified separately, and data secured from each, so that location runs, by fine trade and geographical area breakdowns, may be made available. These runs will fit into the general Census year pattern of location statistics in the three fields under survey.

It should be noted that the annual survey was introduced to cover Wholesalers Proper for the year 1963, and the remaining segments, such as Co-operative Marketing Associations, Agents and Brokers, etc., are being added for the year 1964. Data will commence to be published as soon as the difficulties inherent in all new surveys are ironed out.

Commodity Statistics

At present, no commodity data are collected through the annual survey, but, since this is a new survey, decisions are not necessarily final. In the Quinquennial Census year, it will be necessary to

specify some one hundred broad lines, spread across the approximately one hundred and thirty-five commodity type trades in order to ensure proper classification of the statistical (or business) units. It will be possible to compile these to show the broad commodity structure of trades, but an addition to secure totals for commodity lines will not be possible. Intercensally, some form of sampling will be used to produce estimates of detail at the level of some three hundred items or lines, and an addition of these may be carried out. Present plans call for timing of commodity sampling in Wholesale Trade to coincide with similar intercensal sampling undertaken in Retail Trade.

Sales and Inventories

These data will be available quinquennially for the universe of establishments and for the universe of locations, in full trade detail, and by the maximum geographical area detail possible in each instance. Obviously, the greatest geographical detail will be available from the location series. Annually, data will be available for the universe of establishments, in full trade detail, but with geographical detail limited to the major economic areas. Quarterly, a sample of the universe of establishments will be maintained, largely for the National Accounts. The reliability of the sample estimates should be increased by the frequent availability of sampling frames and of annual benchmarks.

Operating Results

Operating results data will be collected intercensally by sampling, preferably in a three year cycle with as close as possible a coincidence in trades covered each year with those covered in Retail Trade. The establishment will be the statistical unit. Unlike Retail Trade, these statistics of establishments will not be the major intercensal attempt to produce statistics within the general integrated effort covering the economy. As already pointed out, the new annual survey achieves this end. The Operating Results surveys here, then, may be considered simply as a desirable investigation of detail not collected in the annual, capable of adequate estimation through a sample approach, with the resulting data supplementing the annual.

Employment and Payroll

Employment and payroll data will be available from the Quinquennial Census, and payroll data from the annual survey. It is probable that questions on employment will be added as time goes on. But attempts to measure labour input and supplementary labour income are seen as future sample efforts, or as parts of more detailed annual schedules directed mainly to the large businesses on an occasional basis. No final decisions have been reached, except the basic one that such detailed inquiries will not be a part of the Quinquennial Census effort, but will, instead, be entered into during each intercensal period.

Statistics of Segments

While the word "segment" may be considered as describing a number of important sub-divisions of the universe, the main segmentation—which dominates not only the meaning of any analysis but also the statistical approaches necessary—is that based on what is usually termed "type of operation". On this basis there are five main segments, as follows: (1) Co-operative Marketing Associations and Other Dealers in Primary Products, (2) Wholesale Merchants, (3) Agents and Brokers, (4) Manufacturers' Sales Branches and (5) Petroleum Bulk Tank Plants and Truck Distributors. These five segments are broken down into thirty-one sub-divisions, each attempting to describe an important "operational" group. The importance of this segmentation cannot be over-stated, and it is perhaps best apprehended if the statistics of the total universe are thought of as the add-through of special surveys designed to analyse and measure each segment as a separate universe with some of the measures made common to all. Much of the difficulty encountered in reading meaning into historical series in Wholesale Trade lies in the difficulty of devising adequate definitions for the sub-divisions of segments, into which businesses can be meaningfully assigned, taken in conjunction with the relative ease with which a business can change its nature and so move into a different sub-division, or into a different segment. What will be undertaken, as the annual survey develops, is an extensive study of the viability of many of the sub-divisions, in the sense of providing data with historical meaning. For example, under agents and brokers, there are some eight sub-divisions of recognizable interest, as follows: (1) export agent or broker, (2) import agent or broker, (3) auction business, (4) purchasing agent or resident buyer, (5) selling agent, (6) commission merchant, (7) broker (merchandise) and (8) manufacturers' agent. Can such sub-divisions be maintained?

Going beyond the questions of adequately defining segments and sub-divisions of segments in terms of continuing statistical meaning, it may be noted that segments contain special problems related to the kind of financial data they can report and the extent to which they can provide location statistics with values attached. As an example of the latter, Oil Companies in general have an extensive distribution system comprising many individual locations. But records tend to recognize the "through-put" at each location in volume terms, with values attached only when a final sale is made. Value statistics are really only available around the boundaries of a marketing area. This fact may have to be recognized in future statistical efforts. Co-operatives and Manufacturers' Sales Branches can be used to illustrate other problems.

Co-operatives comprise a segment of Wholesale Trade which warrants identification. Quantitatively it is important and likely to be more so. There are the sub-segments of marketing and purchasing co-operatives, very different in organization and operation. In the co-operative movement, the

concepts of the so-called profit-oriented business often do not apply, e.g., profit, gross margin, cost of goods sold, purchases. To force the statistics of an economically and politically significant sector of business into a framework which is not appropriate, is only doing half a job. To be of service to co-operatives, statistics should recognize their requirements.

Furthermore, the operating practices of co-operatives often place them in a "natural" category to be distinguished from other types of business, when the purpose of the statistics, as it usually is, is to accurately aggregate social and economic values of one kind or another. Co-operatives are organized to perform a limited number of quite specialized functions. Therefore, in those areas of activity where co-operatives are found in any number they usually account for a sizeable part of the whole. Take, for instance, the marketing of grain, livestock, fruit, dairy products and other agricultural items; of fish and lumber products. The purchasing co-operatives are important in farm supplies, the supplying of the local consumers' co-operative store and, in some regions, especially important in the securing of supplies of petroleum products. In all these business activities, if special attention is not given to collecting statistics from co-operative organizations, an accurate picture of business conditions will not be furnished.

The Dominion Bureau of Statistics is now discussing with the Co-operative Union of Canada, co-operative associations of various kinds and the Federal Department of Agriculture how to work out a suitable approach to statistics of co-operatives. It is expected that the first real change in approach will come with the Quinquennial Census of Merchandising and Service Establishments in 1966.

The segment, Manufacturers' Sales Branches, should represent an important extension of manufacturers' control of the distribution of their own goods at the Wholesale level through recognizable business locations. It cannot, of course, measure the extent to which the Manufacturer may by-pass the businesses engaged in Wholesaling by direct plant sales at the Wholesale level. But, even in the world of recognizable business locations many important Manufacturers' Sales Branches are not measurable statistically as such because the accounting systems of the Manufacturers do—in some cases, must—regard the manufacturing and distributing efforts as a single, integrated whole. In such instances, the Sales Branches are lost to the universe of Wholesale Trade. What meaning, then, can be attached to the statistics for this segment, except that its existence enables the separate compilation of statistics of independent Wholesalers? In conjunction with the 1961 Census, employment and payroll data were collected for the "lost" Sales Branches, to secure some measure of their importance, and it is planned that this supplementary survey be repeated.

The Service Trades

As in Retail and Wholesale Trade, two main statistical reporting units are now in use. See the first part of the Retail section for explanatory comment.

The Service Trades to be discussed here are a selected group, covered in the Census of Retail, Wholesale and the Service Trades, and considered intercensally to be a discrete universe. The Census covers establishments and locations operated for profit such as motion picture theatres, bowling alleys, amusement parks, accounting services, advertising agencies, marketing research, barber shops, dry cleaners, hotels, restaurants and funeral directors; or, more specifically, those industries defined by Division 10 of the Standard Industrial Classification—Community, Business and Personal Service Industries—with the following exceptions: Major Groups 1, 2 and 3 (education, health, welfare and religious services), three-digit Industries 864 and 866 in Major Group 5 (engineering, scientific and legal services), Industry 873 in Major Group 6 (private households), and Industry 891 in Major Group 7 (labour organizations and trade associations). Some trades only in Industry 899 such as collection agencies, driving schools, detective agencies and equipment rental businesses are covered by the Census. There are one or two exceptions in Industry 869 such as armoured car services which are not covered. On the other hand, dude ranches which are included in Industry 876 in the Classification are the only businesses in that Industry covered by the Census. Covered also for the transportation and storage sector of business were nineteen trades, examples: aircraft servicing, freight forwarding, grain country elevators, parking lots, taxicabs and travel agencies.

Omitting the transportation and storage sector, some one hundred and twenty trades are distinguished, including some eighty-five thousand business locations. In terms of number, the universe is somewhat more than twice as large as the Wholesale Trade universe, and slightly more than half the size of the Retail Trade universe. In the sense of presenting survey-taking problems, it would appear to resemble Retail Trade, which must rely very heavily on an occasional Census linked by intercensal sampling, rather than Wholesale Trade, where total-coverage surveys can be taken each year. In fact, it bears a partial resemblance to both. Out of the one hundred and twenty trades mentioned, there are eight for which lists can be maintained, which do not pose excessive survey-taking problems and which can be—and are—dealt with each year in total-coverage surveys. The eight referred to are: Regular Theatres, Outdoor Motion Picture Theatres, Film Exchanges, Motion Picture Production, Dry Cleaners, Power Laundries, Hotels and Advertising Agencies. While these represent only a small percentage of the number of trades, they account for about thirty-one per cent of total revenue. In addition, it is customary to take a survey of Funeral Directors once in each intercensal period, bringing

the total percentage of revenue known intercensally through total-coverage surveys to about thirty-three per cent. For the remainder of the trades, even sampling is difficult, due to the high birth/death rate of businesses, and only one trade is sampled, namely, Restaurants, Cocktail Lounges and Taverns. However, the weight of this trade is such that the sample estimates raise the total of what is known intercensally to about sixty-six per cent. Of all the foregoing, only the Restaurant sample yields information at intervals of less than one year.

Against this background it is possible to visualize the impact of the major changes in the programme. Full detail of trades, by fine geographical classification, will be available every five years instead of every ten, for the key items of revenue, number of persons employed and payroll, on a business location basis. On an establishment basis, the detail will be available at the provincial level.

Commodity or Service Activity Detail

This does not call for a large number of items, and will be continued as part of the Census effort, to be available in future every five years. Specific activity detail related to the trades covered each year will continue to be available annually.

Revenue

As already indicated, this will be available for all trades every five years, for eight selected trades annually on a total-coverage basis, for one trade (Funeral Directors) on a total-coverage, but occasional basis, and for Restaurants on a sample basis monthly.

Employment and Payroll

This will be available every five years and is available annually for the trades covered. Measurements designed to yield labour input, and to secure additional labour income are being dropped from the Census and will be pursued (1) through occasional additional questions to the trades covered annually and (2) by cyclical sampling in other trades.

Operating Expenses

These are being dropped from the Census. Much data along these lines are available from the special annual surveys and additional questions can be added as desired. In other trades cyclical sampling will be undertaken.

Two desirable new developments at present not capable of being mentioned as part of a reasonably firm programme, are the introduction of annual samples to measure revenue of trades not otherwise covered, and of either monthly or quarterly sample surveys to serve as current indicators. The basic problem is to develop lists of businesses actually in existence during each year. This is being worked at, and, if the lists can be secured, annual surveys of revenue only can be taken which incorporate into them birth/death occurrences during the year. From these could be developed current samples which, even if they did not reflect current birth/death changes, would show rough, short-term trends. As everyone is aware, the Service Trades are of rapidly increasing interest, and there is no doubt that solutions must be found to the statistical difficulties with which they abound.

Productivity Studies

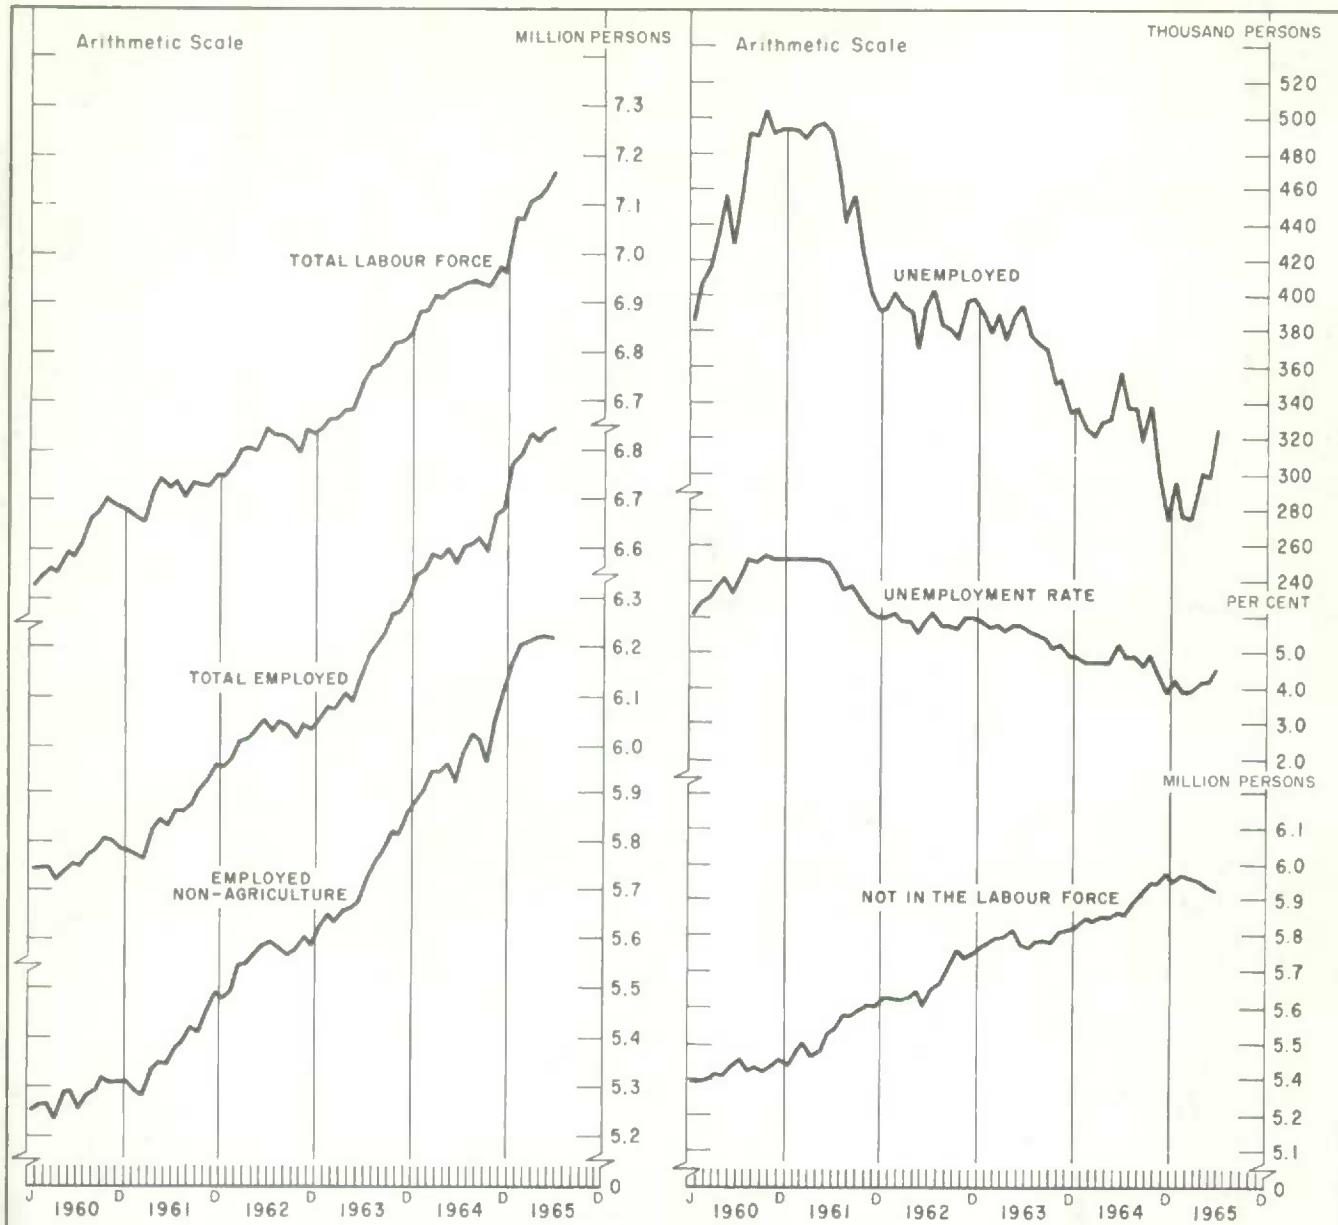

Measures and analyses of productivity have become increasingly important in recent years, and the Bureau has now embarked upon a massive productivity research programme. Attention, however, has largely been confined to the industrial sector of the economy. With the phenomenal growth of the distributive trades, a great deal of interest is being shown by the business community, trade associations, the Economic Council of Canada and other research organizations in the development of techniques to measure and analyse the efficiency of our distribution system.

To those interested in these problems, it will be obvious that some of the new elements referred to in this article are motivated by discernible future statistical requirements in this area. However, it should be noted that conceptual as well as data-supply problems have to be overcome before any major effort can occur. Some rough primary work is under way for a limited number of Retail Trades to show sales and value added, per person engaged, sales and value added per store, and so on. These may be extended and refined for publication at a future date.

Note: The material in this article reflects only the problems as they are viewed by the Division primarily concerned with Retail, Wholesale and Service Trade statistics: it should not be taken as reflecting possible developments in other Divisions concerned (a) with capital and repair expenditures, and (b) current employment and payroll measures. Also, it does not reflect special Productivity studies, in which the Distributive Trades are now included at the global level.

LABOUR FORCE (More detail in Table 16)

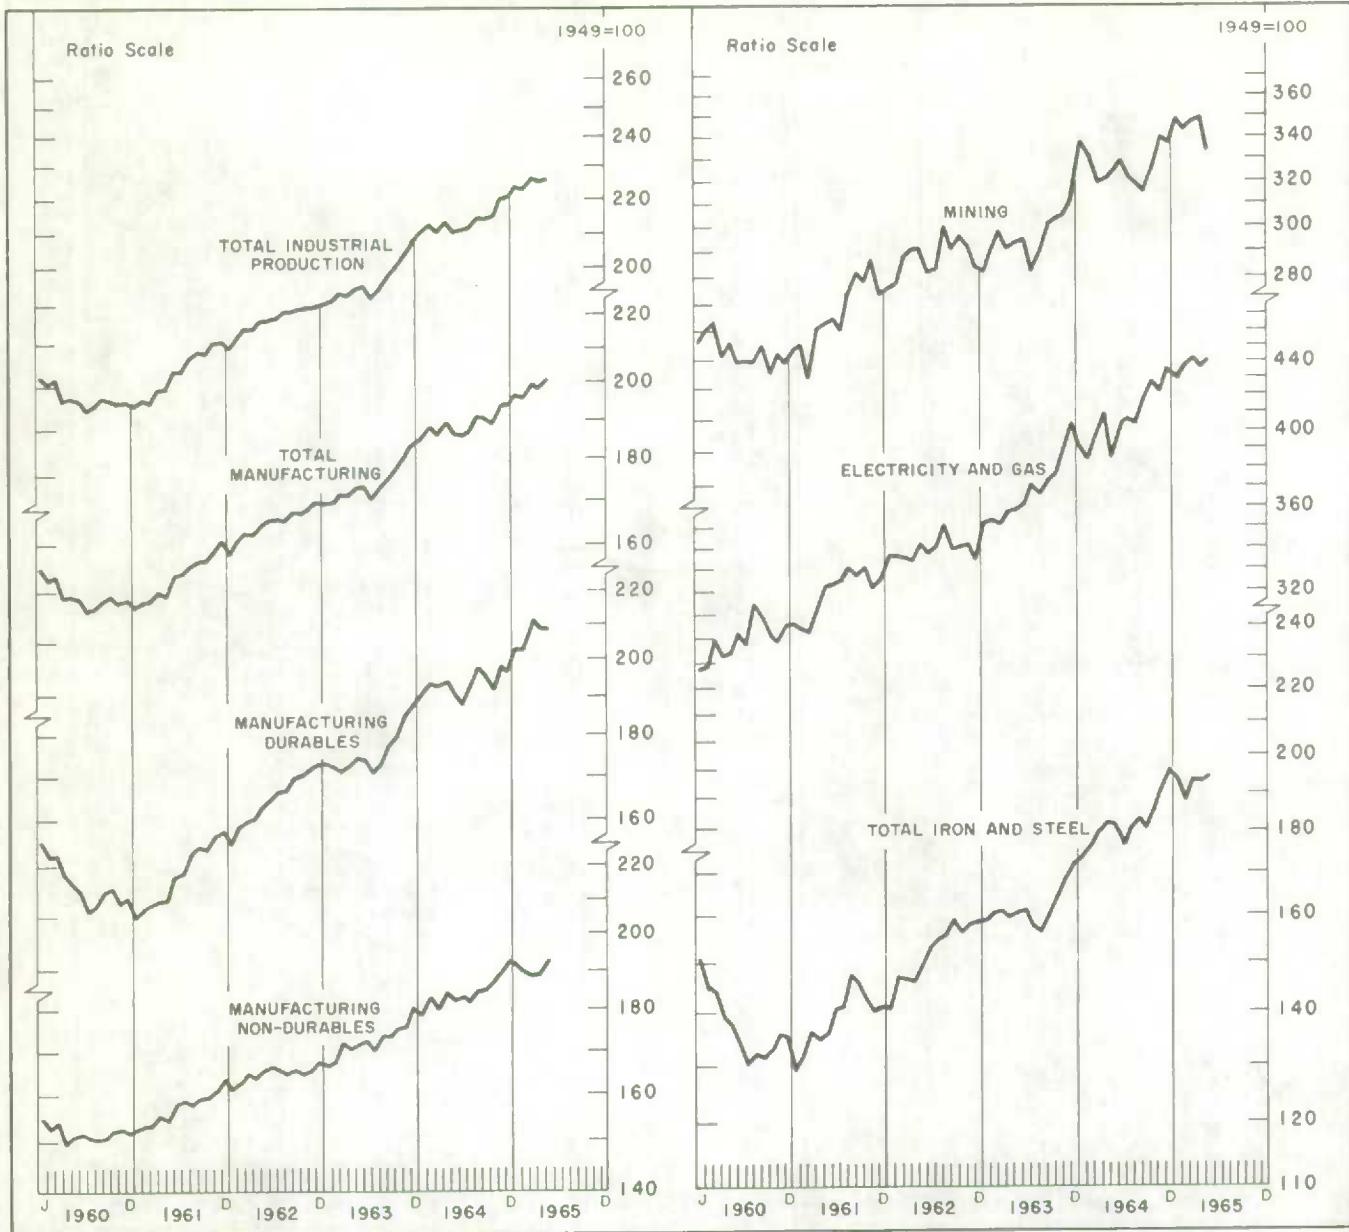

Unemployment was higher in June; employment and total labour force showed little change. The unemployment rate was 4.5 per cent.

	total labour force	total employed	employed non-agriculture	unemployed	unemployment rate	not in the labour force

EXPORTS AND IMPORTS (More detail in Table 83)

Exports were generally somewhat lower in May; exports to the United Kingdom were lower.
 Total imports declined in May reflecting primarily lower imports from the United Kingdom and "all other countries."

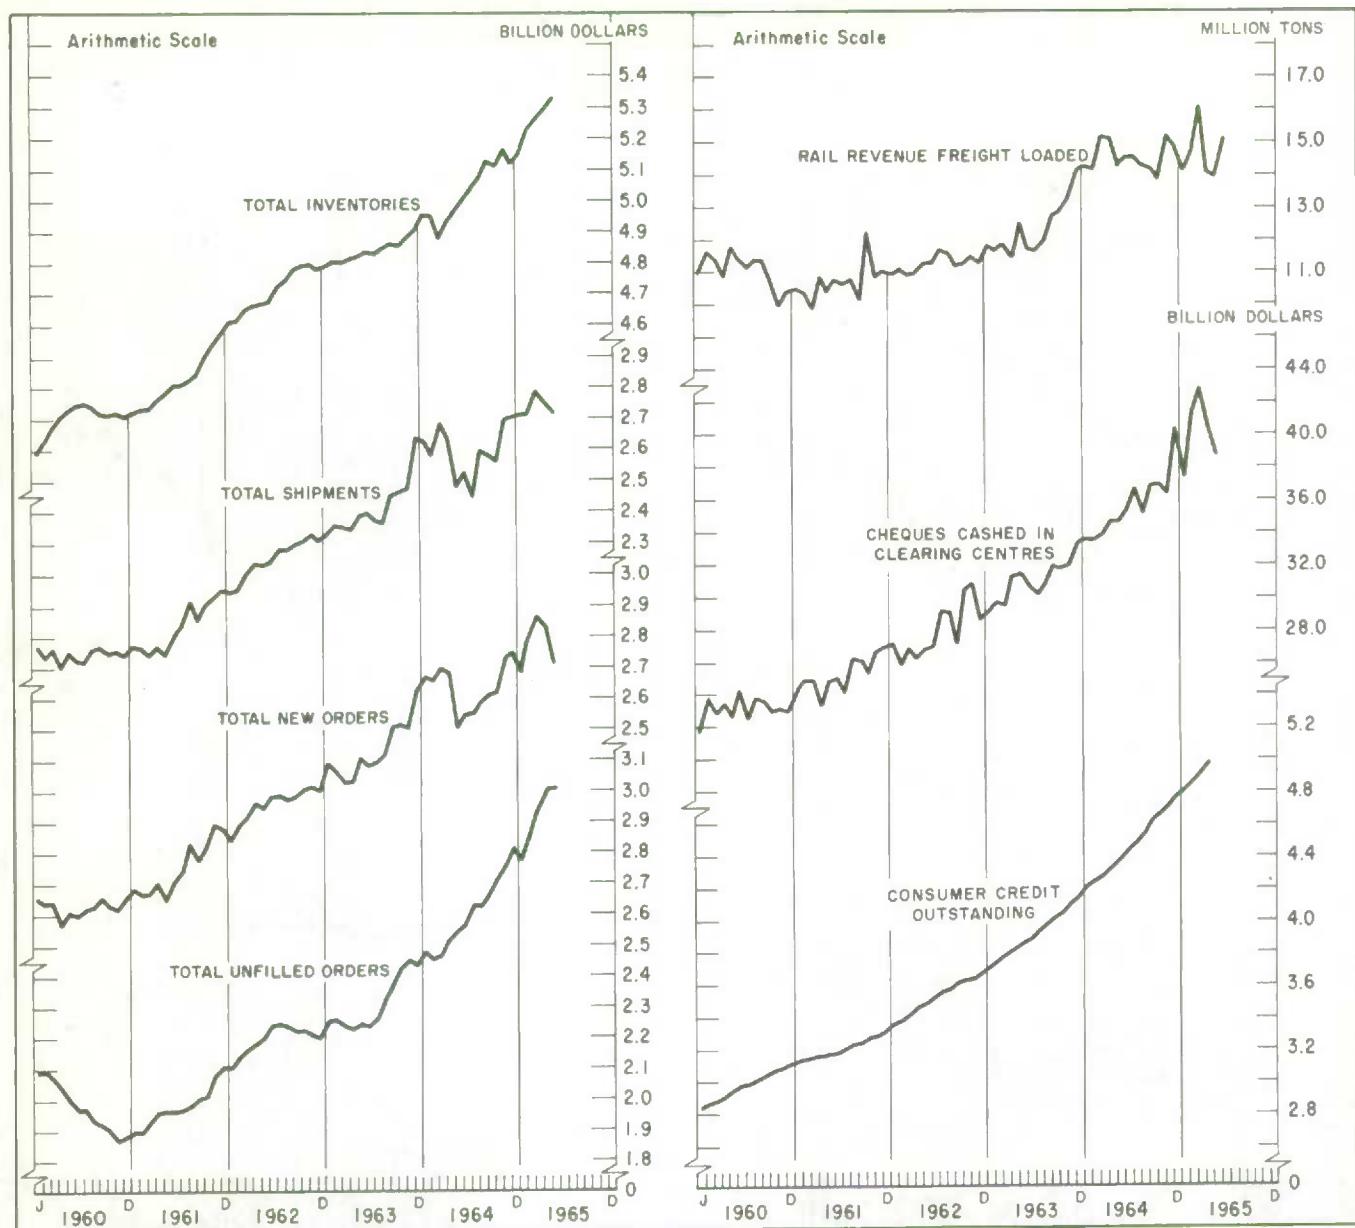

exports including re-exports (million dollars)

imports (million dollars)

	all countries	United States	United Kingdom	all other countries	all countries	United States	United Kingdom	all other countries

¹Gross National Product at market prices excluding accrued net income of farm operators from farm production. ²Before dividends paid to non-residents; see also footnotes on Table 99. ³Total of all monthly and quarterly series as in column 14, Table 80.

PRICES (More detail in Tables 28, 30, 31, 84, 85 and 100)

The general wholesale price index and the index of 30 industrial materials advanced in June. The index of industrial common stocks declined.

The consumer price index rose 0.7 per cent in June reflecting mainly an increase in the food index.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. ²Includes logging, fishing, trapping and hunting. ³Includes mechanical and construction. ⁴Includes a small number in non-specified occupations. ⁵Does not include students entering Canada on students' visas. ⁶Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. Source: Quarterly Bulletin, Department of Citizenship and Immigration.

¹Includes change in farm inventories. ²Includes residual error of estimate. The seasonally adjusted data include an arbitrary smoothing of crop production, standard seasonal adjustments for withdrawals of grain from farm stocks and the change in livestock items. Because of arbitrary elements, too precise an interpretation should not be given to the series.

The seasonally adjusted data include an arbitrary smoothing of crop production, standard seasonal adjustments for withdrawals of grain from farm stocks and the change in livestock items. Because of arbitrary elements, too precise an interpretation should not be given to the series.

¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. ²The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ³The labour force as a percentage of the population 14 years of age and over. ⁴The unemployed as a percentage of the labour force. ¹See footnote 1, table 16. Labour force obtained as the sum of employed and unemployed from tables 16B and 16D. ²Canada totals, obtained by summing the seasonally adjusted data for the five regions, are usually different from the totals given on page S-1. These differences are small and are due to a statistical discrepancy. See also note to users. Source: The Labour Force, (71-001) D.B.S.

¹In calculating time loss, only the workers directly affected by the strike or lockout are taken into account; time lost by workers indirectly affected, such as those laid off as a result of a work stoppage is not included. ²The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; the total, however, includes all work stoppages. ³The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately; should strikes occur in these industries, they also will be shown in the total. ⁴Includes miscellaneous manufacturing industries. ⁵Includes also publishing and allied industries. ⁶Includes also the storage and communication industries. Source: Labour Gazette, Department of Labour.

¹The data in Tables 19 to 26 are based on reports from employers usually employing 15 persons and over and covering the respondents last pay period(s) in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. ²Excludes agriculture, fishing, trapping and domestic service. ³Includes storage and communication. ⁴Includes insurance and real estate. ⁵Excludes public administration and defence and such community services as health and education. Source: Employment and Payrolls, (72-002), D.B.S.

¹Monthly shipments represent an estimated projection of the latest available census of manufacturer's values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), D.B.S.

Table 33: manufacturing inventories¹ by industries as in the revised standard industrial classification (million dollars)

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. ²Total manufacturing inventory owned by manufacturers including warehouse stocks. ³Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. ⁴End of period. Annual figures for inventories and unfilled orders are end of December values. ⁵Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), O.B.S.

¹Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp.

²100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports. ³Customs exports. ⁴Mill shipments destined for export. Sources: Pulpwood Production (25-001), Trade of Canada, Exports (65-004), D.B.S.; Bulletins of Canadian Pulp and Paper Association and Newsprint Association of Canada.

¹Data on shipments relate to rolling mills products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ²Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. ³Includes appliances and utensils.

Note: Some groupings are not entirely comparable to year 1964 due to change in classifications but in general the differences are minimal. ⁴Excluding shipments for re-processing at maker's own plant. Source: Primary Iron and Steel (41-001), D.B.S.

¹Data refer to city proper for Port Arthur, Fort William, Regina and Saskatoon; in other cases to metropolitan areas. ²The data on building permits are collected for 1,400 municipalities and individual figures are available on request. Some of the annual totals for 1963 and 1964 differ slightly from the sum of the twelve monthly totals, due to the addition of statistics received too late to be included in the monthly data. Source: Building Permits (64-001), D.B.S.

¹The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside of registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. Source: Building Permits (64-001), D.B.S.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 5,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. ²End of period. Source: New Residential Construction (64-002), D.B.S.

¹Footnote and Source are at Bottom of Table 63. ²Starting in January 1962, the data are not entirely comparable with earlier years because more centres are included and because of the expansion of the boundaries of metropolitan areas. This is based on information from the 1961 census.

Note: Components may not add to totals due to rounding. ¹The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. ²Excluding trucks. ³The total value of all machines shown in this table is greater than the value shown for farm machinery in Table 78 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. Source: Farm Implement and Equipment Sales (63-009), D.B.S.

*See also Table 30. ¹Excluding Newfoundland. Western grain prices used in the construction of the Index prior to August 1, 1964 are final prices. From August 1, 1964 to date, the western grain prices used in the index are initial prices only for wheat, oats and barley.²Barley No. 1 feed; hogs grade "B" alive.³Based on price for hogs including Dominion premium up to September 1960. A rise in ratio favours production of beef.

Price of

100 lbs. good steer as a percentage of the price of 100 lbs. live hog, grade B.

⁴Price of 100 lbs. good steer as a percentage of the price of 100 lbs. good lamb.⁵Previous to January, 1958, quotations referred to steers up to 1,000 lbs. Now they refer to all weights.⁶Grade "B1" hogs. Sources: Coarse Grains Quarterly (22-001), Index Numbers of Farm Prices of Agricultural Products (62-004), D.B.S., Livestock and Meat Trade Report, Dept. of Agriculture.

¹Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last three months are not so adjusted.

²Includes stocks held by manufacturers, wholesalers and other warehouses. Many mills were operating at more than the standard 26 working days in the month.

¹Monthly averages for years 1963 and 1964 differ from the averages of the monthly data due to revisions which cannot be allocated by months. ²Includes scheduled and non-scheduled carriers, groups I to IV. These groups cover all air carriers with gross operating revenues of over \$60,000 annually prior to January, 1964 and over \$100,000 annually since. ³United States and other foreign carriers. Excludes in transit passengers. ⁴Cargo includes air freight and express but excludes mail and excess baggage. ⁵Data prior to 1964 do not include bulk transportation. Because of survey limitations, data after January 1, 1964 refer only to aircraft having a minimum authorized take-off weight on wheels in excess of 18,000 lbs. Source: Civil Aviation (51-001), D.B.S.

¹The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. ²In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. Source: Commercial Failures (61-002) Quarterly, D.B.S.

Note: This series gives total new settled-for ordinary insurance sales in Canada, exclusive of revivals, increases, dividend additions, reinsurance acquired and pension bonds without insurance. Totals are estimates projected from the sales reported by 34 companies operating in Canada representing 82 per cent of new ordinary insurance sales. ¹The Canada totals by months for 1963 and 1964 do not correspond to the sum of the provincial totals as revision applied to the national total are not yet available for the provinces. Neither the monthly figures for 1963 and 1964 nor the monthly averages for 1964 have been revised to agree with the Canada total. Sources: Monthly Survey of Life Insurance Sales in Canada, Life Insurance Agency Management Association, Hartford, Conn.

¹The definition of profits before taxes is based mainly on the accounting definition used by corporations. However, depletion charges are added back to net profits while Canadian dividends received are excluded from profits in order to avoid duplication. The term "profits" as used here means the total profits of all companies earning profits less the losses of all companies incurring losses. Estimates are based on profits as reported by sample of all companies incorporated in Canada (excluding government-owned companies). ²As is evident from the above footnote, the data reporting unit is the company; the data are therefore not entirely comparable with data where the establishment is the reporting unit. ³Includes also the furniture and furnishings industry. ⁴Includes the primary metal, the metal fabricating, the machinery and the transportation equipment industries. ⁵Includes tobacco products, leather and miscellaneous manufacturing industries. ⁶Includes also storage and communication industries. ⁷Includes agriculture, forestry, fishing and construction. Source: Corporation Profits (61-003), D.B.S.
