CANADIAN STATISTICAL REVIEW

Cette revue est disponible en édition française. Revue Statistique du Canada n° 11-003F au catalogue.

Series published in this Review are available from CANSIM, the computerized time series data bank of Statistics Canada, on printouts or in machine-readable form for use on computers. Identification numbers given as a reference at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada. It should be noted that all time series in CANSIM are regularly updated as new or revised data are released. Annual figures are also available from CANSIM; more information can be found in the *CANSIM Summary Reference Index* and the *CANSIM Series Directory*. Both the documents are available directly from CANSIM staff.

Seasonal Adjustment

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant.

Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation caused by the difference in the number of working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series still contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

SYMBOLS

The following standard symbols are used in this and other Statistics Canada publications:

- ... figures not available.
- ... figures not appropriate or not applicable.
- amount too small to be expressed.
- nil or zero.
- † advance estimates.
- c correction
- p preliminary figures.
- r revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.
- MCD months for cyclical dominance (see above).

NOTE TO USERS

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

New format for the Canadian Statistical Review

This issue is the last one to appear under this format.

The new *Canadian Statistical Review* will be introduced with the April issue in a format composed and printed by the newest methods offered. The most noticeable changes will be a new cover and different typography. Information on the technical changes will be available in the Observations of the April issue.

Section 4. Table 3 to 5 – Labour Force

These tables have not been updated with this issue. This block of data is currently being changed on CANSIM to reflect the new labour force survey, recently released.

Section 5. Table I – Industry Selling Price Index

This table has not been updated with this issue. Currently the data is being converted on CANSIM to the 1970 standard industrial classification.

This Review and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, Ont., K1A 0T6 Canada, and remittances made payable to the Receiver General for Canada. For further information, direct inquiries to:

NATIONAL INCOME AND EXPENDITURE ACCOUNTS

Fourth Quarter and Preliminary Annual 1975

Introductory Review

The economic recovery continued in the fourth quarter of 1975, but at a substantially slower pace than that experienced in the early stages of previous upswings, as Gross National Product, seasonally adjusted at annual rates, increased by 2.8 per cent to \$161.9 billion. In real terms – that is, after adjustment for price changes – Gross National Product increased by 0.4 per cent, which is well below what might be considered normal by historical standards for a post-recession period, and also less than the rates of growth achieved in the second and third quarters. Nevertheless, the fourth quarter displayed a number of characteristics typical of early recovery periods, as increases in personal expenditure and residential construction supplied most of the real growth, and imports grew faster than exports leading to a deterioration in the trade balance. Heavy inventory liquidation continued, and again, this is usual early in recoveries; however, the very large volume of stocks accumulated in 1974 and late 1973, which probably acted to delay the start of the recession in Canada, now appears to be exerting a stronger than normal restraint on recovery. Real final domestic demand, which excludes the value of the physical change in inventories and exports of goods and services, was much stronger than real Gross National Product and increased by 1.6 per cent.

Incomes

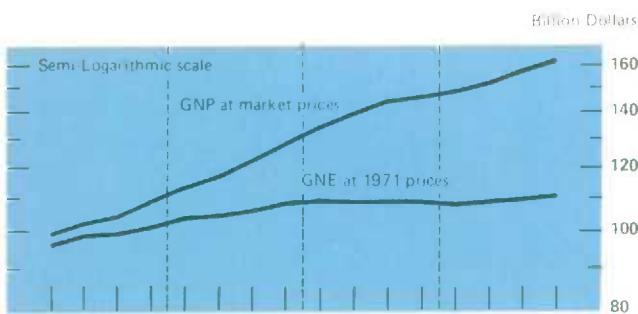

The fourth quarter weakness was reflected by a very moderate 1.6 per cent increase in wages, salaries and supplementary labour income, which is by far the largest component of Gross National Product. This rate of increase is considerably less than the average rate of growth in labour income through the recession and in fact, represents the lowest rate of increase since the second quarter of 1970. However, to some extent this weakness is misleading, since it follows the payment of large cost-of-living allowances in the third quarter; these

payments had the effect of raising the third quarter growth rate at the expense of the fourth, and, if they were excluded, the fourth quarter growth would have been a much more normal 3.5 per cent. The rise in labour income was concentrated in the goods-producing industries, as income in the service-producing industries was virtually unchanged, and was almost entirely a result of an increase in average earnings rather than employment. In terms of the distribution of Gross National Product, labour income's share fell slightly.

Profit's share of Gross National Product also declined very slightly in the fourth quarter, as corporation profits before taxes grew by 1.9 per cent to \$18.6 billion. Increases in most major industrial groups were marginal; within manufacturing, the largest gains occurred in wood, printing and publishing, metal fabricating, and non-metallic minerals. Of the non-manufacturing industries, communications and utilities recorded the largest increases. Corporate retained earnings were unchanged from the third quarter.

Accrued net income of farm operators from farm production was the only income component to decline in the fourth quarter, falling by over 20 per cent to \$3.3 billion; however, much of this decline was due to a drop in the accrued value of crop production, and net income received by farm operators increased by 4.7 per cent. Net income of non-farm unincorporated business grew by a very strong 5.2 per cent as there were large increases in the income of small retailers and unincorporated construction companies, and a somewhat smaller percentage increase in rents. There was also a substantial fourth quarter rise in interest and miscellaneous investment income. Together with a 2.8 per cent increase in government transfers to persons, the growth in these sources of income partially compensated for the weakness in wages and salaries and resulted in an increase of 2.3 per cent in personal income; as transfers to government decreased as a result of lower income tax collections, personal disposable income grew by 3.2 per cent to \$108.0 billion. This increase was accompanied

GNP in 1975 was \$154.8 billion, an increase of 9.8% from the level of the previous year. Real output in the economy increased by a mere 0.2%.

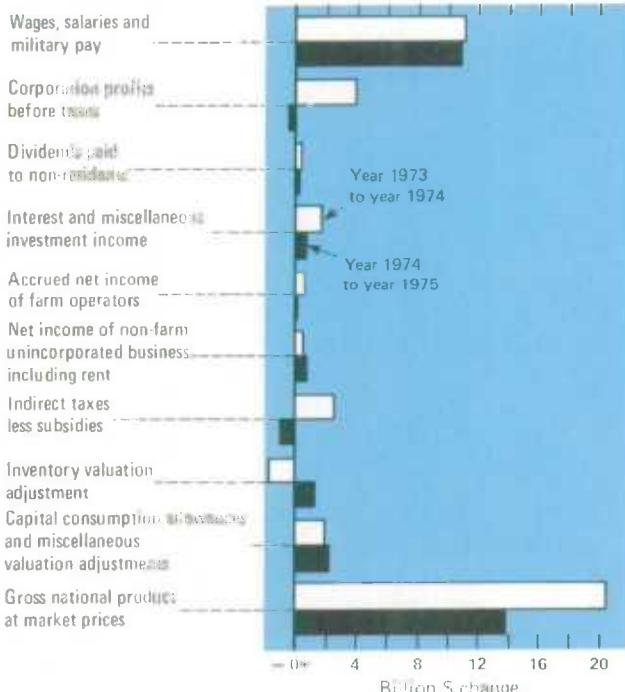

GNP in the fourth quarter in real terms increased by 0.4%, less than the rates of growth achieved in the second and third quarters.

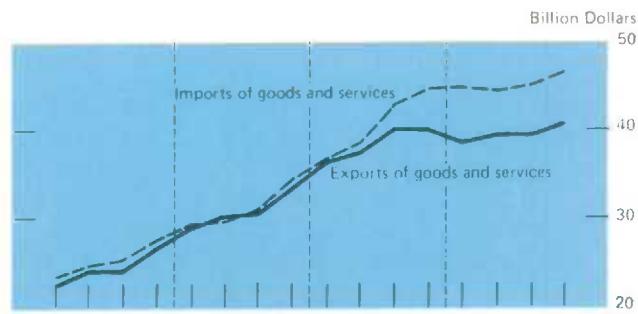

Labour income rose by 14.0% in 1975, compared with an increase of 16.9% in 1974. Corporation profits before taxes fell by 2.9%, the first decline since 1970.

Annual changes in GNP and components

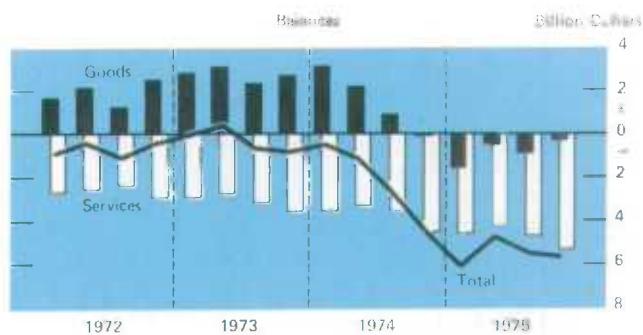

All quarterly data adjusted for seasonal variation and at annual rates.

The external sector was one of the major sources of weakness in 1975. Exports rose 3.0% while imports were up 11.0%, resulting in a \$3.3 billion deterioration in the trade balance.

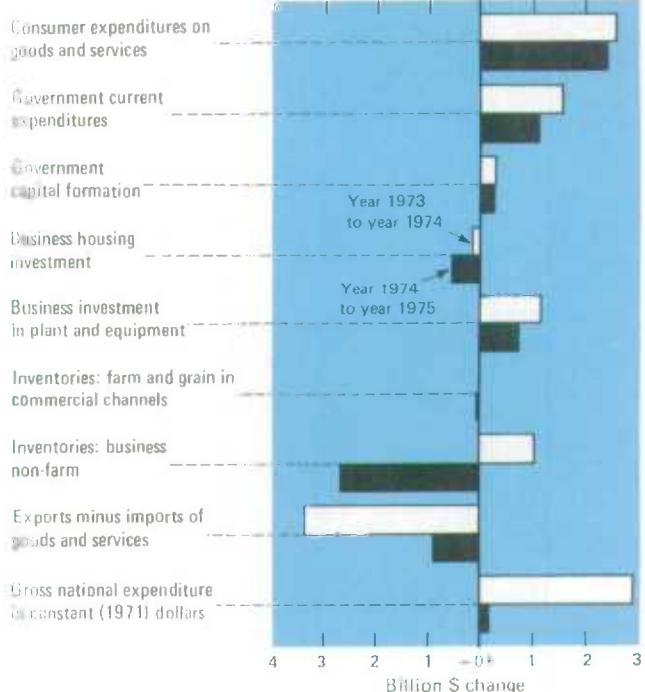

In the fourth quarter, an improvement on the goods account was offset by a deterioration of \$0.7 billion in the services deficit, resulting in a slight deterioration in the overall trade balance.

Investment in residential construction and exports of goods and services both declined in real terms in 1975; there was a dramatic swing in inventories of \$2.8 billion, and personal expenditure recorded its smallest real growth since 1970.

Annual changes in GNE and components in constant (1971) dollars

by a 3.9 per cent rise in expenditure on consumer goods and services, which reached a level of \$97.5 billion in the fourth quarter; because consumption grew faster than income, personal saving fell to 8.0 per cent of personal disposable income from 8.6 per cent in the third quarter. The largest increases in personal expenditure occurred in spending on durables and non-durables, which grew by 6.9 per cent and 5.5 per cent, respectively; the growth in durables was largely a result of strong demand for automobiles and a more moderate demand for household appliances (which no doubt reflects the large growth in residential construction in the last half of 1975), while the increase in non-durables was broadly based but was particularly strong in food. Expenditure on services¹ grew by 2.6 per cent, and on semi-durables, coming off a very strong third quarter, by 0.3 per cent. In real terms, total consumption increased by 1.7 per cent and the relative performance of the individual components was similar to the current dollar pattern; spending on semi-durables declined by 0.7 per cent, expenditure on services was unchanged, and durable and non-durable spending increases by 4.9 per cent and 3.2 per cent, respectively.

Fixed Capital Formation

Total gross fixed capital formation in the fourth quarter was \$39.9 billion, an increase of 5.0 per cent from the third quarter level; in real terms, investment increased by 1.6 per cent. All of the real growth occurred in the business sector. By far the largest increase was in the extremely volatile residential construction component, which is recovering from a decline of over 25 per cent from its second quarter 1974 peak; the fourth quarter rise of 12.7 per cent, the third increase in a row, contributed about one third of the total growth in real final domestic demand and left residential construction only slightly below its previous high. Business real investment in plant and equipment fell by a marginal 1.1 per cent, roughly equal to the third quarter increase. Business non-residential investment grew by 4.4 per cent, while investment in machinery and equipment fell by 5.5 per cent, as both domestic shipments and imports declined.

Inventory Investment

Inventory liquidation increased in the fourth quarter, as the value of the physical change in inventories declined to -\$2.7 billion from -\$2.1 billion in the third; the major portion of the fourth quarter liquidation occurred in business non-farm inventories. Of this, \$0.3 billion (that is, value of physical change of -\$0.3 billion) came in retail trade and a further \$1.5 billion in wholesale trade. The value of the physical change in manufacturing inventories was virtually zero following a

¹ The weakness in spending on services largely reflected a deceleration in net expenditure abroad; excluding this component, expenditure on services increased by 3.0 per cent in the fourth quarter, compared with 3.0 per cent and 3.5 per cent in the second and third quarters.

large third quarter inventory liquidation, but within manufacturing, there was an accumulation of about \$0.3 billion in non-durable inventories and a roughly equal decumulation in inventories of durable goods. Stock-to-shipments ratios declined in both retail trade, where the ratio is now below the historical average, and in wholesale trade, where it was more in line with the historical average; however, the stock-to-shipments ratio was still well above the historical average in manufacturing. In constant dollar terms, the value of physical change in the fourth quarter was -\$1.8 billion compared with -\$1.1 billion last quarter; again, most of this occurred in business non-farm inventories.

The External Sector

Total exports of goods and services grew in the fourth quarter by 3.4 per cent. The largest increase occurred in merchandise exports particularly in wheat, crude petroleum and natural gas. Decreases in imports of a large number of commodities were more than offset by increases in coal, textiles, chemicals and motor vehicles as total imports increased by 3.3 per cent; merchandise imports increased in real terms for the first time since the third quarter of 1974. Because imports increased more than exports, the balance of trade in goods and services worsened to a deficit of \$5.7 billion at annual rates. An improvement on the goods account was offset by a deterioration of \$0.7 billion in the services deficit.

The Government Sector

Government current expenditure on goods and services declined by 1.2 per cent, in part reflecting the payment of cost-of-living allowances in the third quarter. Total expenditures of all levels of government (excluding inter-government transfers) increased by a marginal 1.1 per cent, the smallest increase in several years. Total government revenues increased at about the same rate, and as a result the government deficit on a National Accounts basis was unchanged at approximately \$5.1 billion at annual rates. Personal income tax collections declined, possibly as a result of the postal strike, while indirect taxes less subsidies grew by 5.6 per cent.

Prices decelerated slightly in the fourth quarter, as the implicit Gross National Expenditure price index slowed to a 2.5 per cent increase from 2.9 per cent in the previous quarter. The decline in the rate of change was even more noticeable in the final domestic demand implicit index – the price index most representative of the cost of goods and services purchased by Canadians – which increased by a moderate 1.5 per cent compared with 3.1 per cent in the third quarter, and the implicit indices for government current expenditure and imports of goods and services declined by 2.2 per cent and 1.0 per cent, respectively. The personal expenditure implicit index increased by 2.1 per cent, the largest increase occurring in services and the smallest, in semi-durables. The strong 12.7 per cent increase in real output in

OBSERVATIONS

REVISION OF THE LABOUR FORCE SURVEY

During the past three years, Statistics Canada has been developing a number of substantial modifications to the Labour Force Survey, the monthly household survey which is the source of the employment, unemployment and other labour force estimates published monthly by Statistics Canada. These changes have now been implemented and the data relating to January 1976 and thereafter will be based on the revised survey.¹ This note summarizes the background, nature and effect of the revisions, and provides comparisons of some of the more important data series. More detailed data and descriptions of the changes are available from the Labour Force Survey Division, Statistics Canada.

The main purpose of revising the survey has been to provide a much more comprehensive range of information on employment and unemployment in Canada. The Labour Force Survey was introduced in 1945, and has collected essentially the same information since that time. While the survey had continued to meet its basic objective of providing timely aggregate measures of labour market conditions, it has not been able to meet the growing information requirements of the far more complex economy of the present day and the years ahead. In order to meet the known requirements for new information, and to develop the survey capacity to meet other new requirements as they are expected to emerge in future, a major project to revise the LFS was begun late in 1972.

Following extensive consultation with data users throughout 1973 and early 1974 to determine exact data requirements and priorities, a revised questionnaire and associated survey materials and procedures were developed and introduced in a separate survey carried out

¹ In addition, a substantial amount of published historical data will be adjusted to be consistent with data produced by the revised survey. The method of deriving these revised historical statistics is briefly described at the conclusion of this note.

in parallel with the former survey throughout 1975. The parallel operation was designed to provide a full year's data to enable analysis of differences between the surveys over all months of the year and to provide the basis for the adjustment of historical data to make them consistent with the new survey. Following the December survey, the old survey was discontinued and the revised survey became the source of the monthly labour force estimates.

Nature of revisions – In addition to a number of substantial enhancements of an operational or statistical nature,² there are two major aspects of the revisions which contribute significantly to the survey data:

(i) Collection of new data – In response to the identified data requirements, a wide range of new data on labour force activities and characteristics is now collected in the survey. The additional information is used to determine more precisely the labour force status (employed, unemployed or not in the labour force) of survey respondents, and to provide previously unavailable data of the composition and characteristics of these three groups.

In the area of employment, for example, new information is collected on such topics as usual and actual hours of work, overtime, time lost, reasons for time lost, multiple job-holding, duration of employment, absences from work and efforts made to find another job. For persons not at work, a large amount of new information is gathered on previous work history, including industry and occupation, duration of employment and main reason for leaving the last job held. With respect to job seeking activities the new survey collects such information as methods used to find work, duration of unemployment, activity prior to job search, the kind of work

² Including a major revision of sample frame, the introduction of refinements in sampling techniques, the incorporation of updated population estimates for weighting the sample data, and substantial improvements in data collection, quality control and data processing methods.

being sought (i.e., full-time or part-time, and whether to last more than or less than six months), and availability for work in the survey reference week. It also identifies persons on layoff and persons waiting to start a new job. For all persons covered by the survey additional information is obtained on family status and on educational levels and activities.

- (ii) More specific survey questions — The second aspect of the revisions having a significant impact on the survey data relates to the introduction of much more direct and specific questions on the monthly questionnaire. The former survey used two very general questions ("What did this person do mostly last week?" and "Did this person do anything else last week?") to identify labour force activities. Such indirect questions generally required further explanation on the part of the survey interviewer, who, on the basis of the response to these questions, was required to mark the questionnaire according to one of several general categories — "Worked", "Looked for work", "Went to school", "Kept house", etc.

The revised survey replaces the two general questions with a series of specific, direct questions designed to provide much more precise and comprehensive information about labour force activities and characteristics. The following questions taken from the questionnaire illustrate the more precise style of data collection: "Did . . . do any work at all last week, not counting work around the house?", "How many hours did . . . actually work last week?", "Last week, did . . . have a job at which he/she did not work?", "In the past six months has . . . looked for work?", "In the past four weeks what has . . . done to find work?", "Was there any reason why . . . could not take a job last week?".

Impact of revisions — In addition to providing a wide range of new labour market information, the revision of the survey has resulted in changes in the levels and patterns of certain existing data series.

- (i) Changes in employment estimates — Comparison of the data collected during the parallel run of the two surveys in 1975 shows that the revised survey provides slightly higher estimates of employment. The level is slightly more than 2 per cent higher in terms of the annual average employment (see Table A), and is attributable to the more precise identification of employment activities in the revised survey. The use of direct questions results in more complete reporting of part-time employment and identifies more persons who had a job but were not at work during the survey reference week.

The increase in employment levels is concentrated among women of all age groups (+ 4.4 per cent) and men 15 to 24 (+ 2.8 per cent) — groups for which employment involving short hours is most

common. The revised survey shows no change in employment for men 25 years of age and over. Higher female employment occurs in all provinces, with increases somewhat less than the national average in Newfoundland and Quebec, and above the average in Nova Scotia, Saskatchewan and Alberta. In the latter two provinces and to a lesser extent in Manitoba, increases in unpaid farm work by wives of farm operators account for a substantial proportion of the increase in the estimates of female employment.

- (ii) Changes in unemployment estimates: As shown in Table A, the annual average unemployment rate in 1975 was 6.9 per cent based on the revised survey, compared with 7.0 per cent in the former survey. While this difference is very slight, there are, however, substantial differences in the estimates for men and for women, and in the data for the various provinces. In particular, the revised survey shows substantially higher unemployment levels for women, and a decrease in the level of unemployment among men.

The higher level of female unemployment (an annual rate of 8.1 compared to 6.4) is the result of the much better identification of job search activities among women in the revised survey. In the former survey, there was a tendency on the part of women not to report looking for work in response to the general questions "What did . . . do mostly last week?" and "Did . . . do anything else last week?". Rather, they tended to respond in terms of household or other non-labour force activities, which account for a much greater proportion of the time of many women. Hence while the old survey accurately indicated trends and changes in female unemployment, it understated the levels and rates. The difference in the revised survey data are consistent with the higher female unemployment levels indicated by the 1971 Census which used a more direct question about looking for work than did the former labour force survey.

The increase in female unemployment occurs in all provinces, with greater than average increases in Newfoundland, Manitoba and Alberta, and a less than the average increase in Quebec. No pronounced differences in seasonal patterns are shown, and higher levels occur in both the 15 to 24 and 25 and over age groups. In both age groups, the increases are greatest for married women.

In contrast to the higher estimates for women, unemployment levels and rates for men based on the revised survey are lower than the comparable estimates derived from the former survey. As shown in Table A, the revised 1975 annual average unemployment rate for men was 6.2 per cent, compared to 7.4 per cent in the old survey. Differences in the estimates are greatest during the winter months (see Table B), especially for men 15 to 24.

OBSERVATIONS

REVISION OF THE LABOUR FORCE SURVEY

During the past three years, Statistics Canada has been developing a number of substantial modifications to the Labour Force Survey, the monthly household survey which is the source of the employment, unemployment and other labour force estimates published monthly by Statistics Canada. These changes have now been implemented and the data relating to January 1976 and thereafter will be based on the revised survey.¹ This note summarizes the background, nature and effect of the revisions, and provides comparisons of some of the more important data series. More detailed data and descriptions of the changes are available from the Labour Force Survey Division, Statistics Canada.

The main purpose of revising the survey has been to provide a much more comprehensive range of information on employment and unemployment in Canada. The Labour Force Survey was introduced in 1945, and has collected essentially the same information since that time. While the survey had continued to meet its basic objective of providing timely aggregate measures of labour market conditions, it has not been able to meet the growing information requirements of the far more complex economy of the present day and the years ahead. In order to meet the known requirements for new information, and to develop the survey capacity to meet other new requirements as they are expected to emerge in future, a major project to revise the LFS was begun late in 1972.

Following extensive consultation with data users throughout 1973 and early 1974 to determine exact data requirements and priorities, a revised questionnaire and associated survey materials and procedures were developed and introduced in a separate survey carried out

¹ In addition, a substantial amount of published historical data will be adjusted to be consistent with data produced by the revised survey. The method of deriving these revised historical statistics is briefly described at the conclusion of this note.

in parallel with the former survey throughout 1975. The parallel operation was designed to provide a full year's data to enable analysis of differences between the surveys over all months of the year and to provide the basis for the adjustment of historical data to make them consistent with the new survey. Following the December survey, the old survey was discontinued and the revised survey became the source of the monthly labour force estimates.

Nature of revisions – In addition to a number of substantial enhancements of an operational or statistical nature,² there are two major aspects of the revisions which contribute significantly to the survey data:

(i) **Collection of new data** – In response to the identified data requirements, a wide range of new data on labour force activities and characteristics is now collected in the survey. The additional information is used to determine more precisely the labour force status (employed, unemployed or not in the labour force) of survey respondents, and to provide previously unavailable data of the composition and characteristics of these three groups.

In the area of employment, for example, new information is collected on such topics as usual and actual hours of work, overtime, time lost, reasons for time lost, multiple job-holding, duration of employment, absences from work and efforts made to find another job. For persons not at work, a large amount of new information is gathered on previous work history, including industry and occupation, duration of employment and main reason for leaving the last job held. With respect to job seeking activities the new survey collects such information as methods used to find work, duration of unemployment, activity prior to job search, the kind of work

² Including a major revision of sample frame, the introduction of refinements in sampling techniques, the incorporation of updated population estimates for weighting the sample data, and substantial improvements in data collection, quality control and data processing methods.

being sought (i.e., full-time or part-time, and whether to last more than or less than six months), and availability for work in the survey reference week. It also identifies persons on layoff and persons waiting to start a new job. For all persons covered by the survey additional information is obtained on family status and on educational levels and activities.

- (ii) More specific survey questions — The second aspect of the revisions having a significant impact on the survey data relates to the introduction of much more direct and specific questions on the monthly questionnaire. The former survey used two very general questions ("What did this person do mostly last week?" and "Did this person do anything else last week?") to identify labour force activities. Such indirect questions generally required further explanation on the part of the survey interviewer, who, on the basis of the response to these questions, was required to mark the questionnaire according to one of several general categories — "Worked", "Looked for work", "Went to school", "Kept house", etc.

The revised survey replaces the two general questions with a series of specific, direct questions designed to provide much more precise and comprehensive information about labour force activities and characteristics. The following questions taken from the questionnaire illustrate the more precise style of data collection: "Did . . . do any work at all last week, not counting work around the house?", "How many hours did . . . actually work last week?", "Last week, did . . . have a job at which he/she did not work?", "In the past six months has . . . looked for work?", "In the past four weeks what has . . . done to find work?", "Was there any reason why . . . could not take a job last week?".

Impact of revisions — In addition to providing a wide range of new labour market information, the revision of the survey has resulted in changes in the levels and patterns of certain existing data series.

- (i) Changes in employment estimates — Comparison of the data collected during the parallel run of the two surveys in 1975 shows that the revised survey provides slightly higher estimates of employment. The level is slightly more than 2 per cent higher in terms of the annual average employment (see Table A), and is attributable to the more precise identification of employment activities in the revised survey. The use of direct questions results in more complete reporting of part-time employment and identifies more persons who had a job but were not at work during the survey reference week.

The increase in employment levels is concentrated among women of all age groups (+ 4.4 per cent) and men 15 to 24 (+ 2.8 per cent) — groups for which employment involving short hours is most

common. The revised survey shows no change in employment for men 25 years of age and over. Higher female employment occurs in all provinces, with increases somewhat less than the national average in Newfoundland and Quebec, and above the average in Nova Scotia, Saskatchewan and Alberta. In the latter two provinces and to a lesser extent in Manitoba, increases in unpaid farm work by wives of farm operators account for a substantial proportion of the increase in the estimates of female employment.

- (ii) Changes in unemployment estimates: As shown in Table A, the annual average unemployment rate in 1975 was 6.9 per cent based on the revised survey, compared with 7.0 per cent in the former survey. While this difference is very slight, there are, however, substantial differences in the estimates for men and for women, and in the data for the various provinces. In particular, the revised survey shows substantially higher unemployment levels for women, and a decrease in the level of unemployment among men.

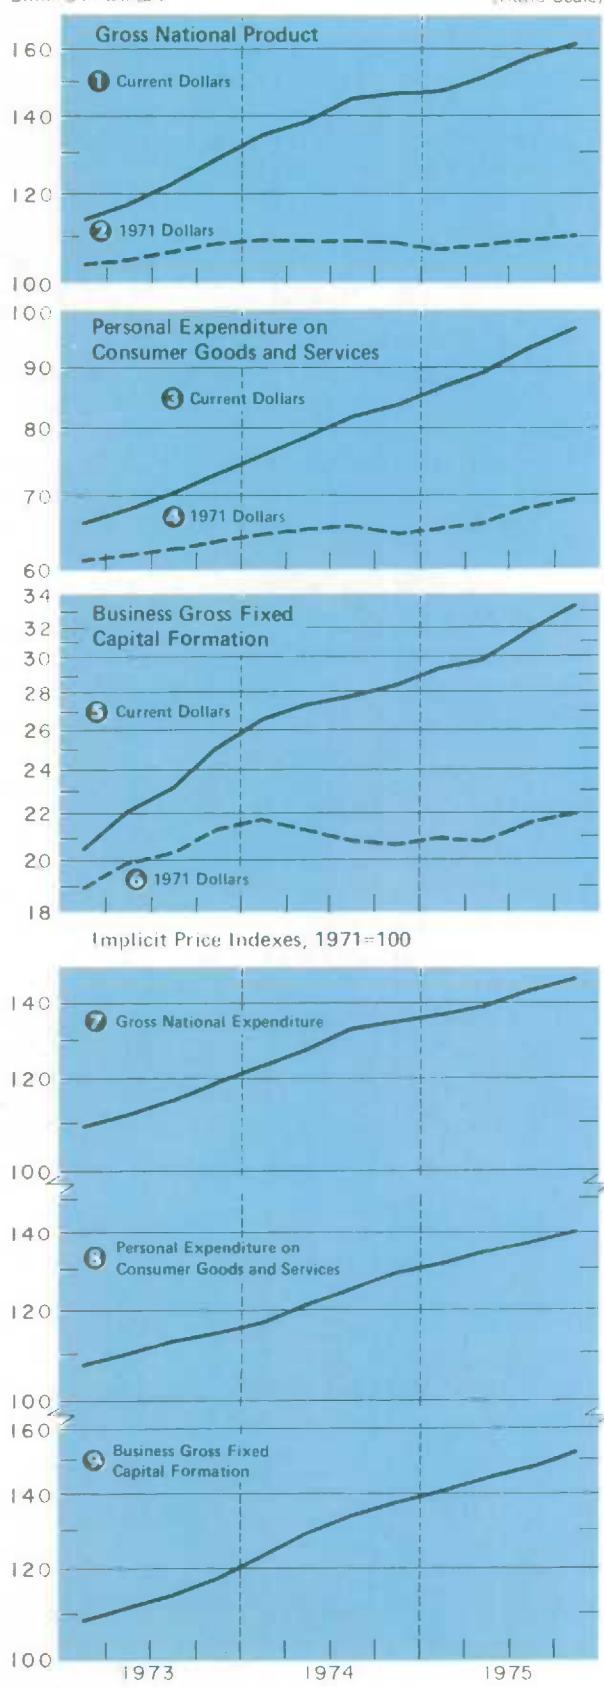

The higher level of female unemployment (an annual rate of 8.1 compared to 6.4) is the result of the much better identification of job search activities among women in the revised survey. In the former survey, there was a tendency on the part of women not to report looking for work in response to the general questions "What did . . . do mostly last week?" and "Did . . . do anything else last week?". Rather, they tended to respond in terms of household or other non-labour force activities, which account for a much greater proportion of the time of many women. Hence while the old survey accurately indicated trends and changes in female unemployment, it understated the levels and rates. The difference in the revised survey data are consistent with the higher female unemployment levels indicated by the 1971 Census which used a more direct question about looking for work than did the former labour force survey.

The increase in female unemployment occurs in all provinces, with greater than average increases in Newfoundland, Manitoba and Alberta, and a less than the average increase in Quebec. No pronounced differences in seasonal patterns are shown, and higher levels occur in both the 15 to 24 and 25 and over age groups. In both age groups, the increases are greatest for married women.

In contrast to the higher estimates for women, unemployment levels and rates for men based on the revised survey are lower than the comparable estimates derived from the former survey. As shown in Table A, the revised 1975 annual average unemployment rate for men was 6.2 per cent, compared to 7.4 per cent in the old survey. Differences in the estimates are greatest during the winter months (see Table B), especially for men 15 to 24.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. ²Includes logging, fishing, trapping and hunting. ³Includes mechanical and construction. ⁴Includes a small number in non-specified occupations. ⁵Does not include students entering Canada on students' visas. ⁶Includes also retired persons, elderly dependents, fiancées or fiancées and other unspecified persons not intending to enter the labour force. ¹Excludes profits (net of losses) of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. ⁴Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given to the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2. Source: National Income and Expenditure Accounts (13-001), Statistics Canada.

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. ⁴The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment (as shown in Table 1.1). ⁵See footnote 4, Table 1.1. Source: National Income and Expenditure Accounts (13-001), Statistics Canada.

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarterly movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. ²Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. ³Withholding taxes.

*The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. For source see Table 1.9.

)

¹These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. For source see Table 1.9.

¹The labour force as a percentage of the population 14 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. Seasonally-adjusted participation rates are obtained by direct adjustment (i.e. by dividing the unadjusted participation rate by the seasonal factor). ²The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex, etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

See footnotes, Table 3.

*In addition to the selected Labour Force information published here, there are approximately 2,100 Labour Force series available on CANSIM. The series provide basic labour force characteristics, by geographic area, age, sex and marital status.

Table 4: selected series by sex and main age group (thousands of persons)

¹A vacancy rate is obtained by expressing the number of vacancies per thousand existing jobs (sum of vacant and filled jobs) in all industries, except agriculture, fishing and trapping, domestic service and the non-civilian component of public administration and defence. Both full-time and part-time jobs are included. ²Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. ³Due to postal strike the mail sample was reduced. These est. should be used with caution due to their reduced reliability. Source: Quarterly Report on Job Vacancies (71-002), Statistics Canada.

¹In calculating time lost, only the workers directly affected by the strike or lockout are taken into account; time lost by workers indirectly affected, such as those laid off as a result of a work stoppage, is not included. ²The industry groups prior to January 1973 are based on the 1960 Standard Industrial Classification. From January 1973 forward, the 1970 S.I.C. is used. ³The number of man-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. ⁴The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; however, the total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. In addition, the total is revised quarterly whereas the individual categories are revised annually. ⁵Includes miscellaneous manufacturing industries. ⁶Includes publishing and allied industries. ⁷Includes storage and communication industries. Source: Research Bulletin, Labour Canada.

¹The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. ²Excludes agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households, public administration and defence. ³Includes storage, electric power, gas and water utilities. ⁴Excludes domestic service. ¹The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. The Industrial Composite is the sum of all industries except agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households and public administration and defence. Source: Employment Earnings and Hours (72-002), Statistics Canada.

¹See footnote 1 and source in Table 10. ²Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 9. In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. ⁴Except machinery and transportation equipment industries.

¹The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. ²In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. Source: Employment Earnings and Hours (72-002), Statistics Canada.

¹These rounded weights, provided as a general guide, show the relative importance of the major components of the C.P.I., on average, during the year 1974.
²Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. ²Total new orders received during the period of estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. ³Total manufacturing inventory owned by manufacturers including warehouse stocks. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufactures values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

¹Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. ²Intended for cigarettes. ³Prior to March 1973 included smoking, chewing and twist. From March 1973 on, includes tobacco intended for pipe smoking only. ⁴Includes sales to wholesalers or retailers. ⁵Subject to Excise Tax. ⁶Includes sales for ships' stores and for export. ⁷End of period. Sources: Tobacco and Tobacco Products Statistics Quarterly (32-014), Production and Disposition of Tobacco Products Monthly (32-022), Statistics Canada; and Department of National Revenue.

¹100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. ²Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp.

³Customs exports.

⁴Mill shipments destined for export. Sources: Pulpwood and Wood Residue Statistics (25-001), Trade of Canada, Exports (65-004), Statistics Canada; Bulletins of Canadian Pulp and Paper Association and Newsprint Association of Canada.

¹Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to semi finished and railed steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ²Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. ³Includes appliances and utensils. ⁴Excluding shipments for re-processing at maker's own plant.

¹Production plus imports less re-exports, minus exports.²Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. Supply and disposition for both Crude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc. ²Includes crude oil, condensate and pentanes plus. ³Gross new production by field less field flared and waste. Sources: Crude Petroleum and Natural Gas Production (26-006), Gas Utilities (55-002), Statistics Canada.

¹Supply and disposition for both Crude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc.

²Includes crude oil, condensate and pentanes plus.

¹Barrels of 35 Canadian gallons. ²Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. ³Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. ⁴Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. ⁵Includes inventories at end of period being held at gas plants and in storage caverns. ⁶Includes stove oil, kerosene. ⁷Includes aviation gasoline and aviation turbo fuel. ⁸Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. ⁹Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products. Sources: Refined Petroleum Products (45-004), Statistics Canada.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

¹In this context, "softwood" refers to wood from coniferous trees, and hardwood to wood from broadleaved species. ²Includes export shipments; the softwood lumber column includes estimates for Manitoba, Newfoundland and P.E.I. ³Shipments by principal manufacturers. Total domestic shipments are somewhat higher. ⁴Production for these items. As reported by principal manufacturers. Total production is somewhat higher. ⁵Building contractors, public and utility construction and structural steel fabricators. Sources: Peeler Logs, Veneers, and Plywoods (35-001), Production, Shipments and Stocks on Hand of Sawmills East of the Rockies (35-002), Production, Shipments and Stocks on Hand of Sawmills in B.C. (35-003), Quarterly Shipments of Flush Type Doors (wood) by Canadian Manufacturers (35-004), Hardboard (36-001), Rigid Insulating Board (36-002), Particle Board (36-003), Primary Iron and Steel (41-001), Stoves and Furnaces (41-005), Steel Wire (35-006), and Specified Wire Products (41-006), Domestic Refrigerators and Freezers (43-001), Cement (44-001), Concrete Products (44-002), Gypsum Products (44-003), Mineral Wool (44-004), Products made from Canadian Clay (44-005), Asphalt Roofing (45-001), Sales of Paints, Varnishes, and Lacquers (46-001), Statistics Canada.

Note: Components may not add to totals due to rounding. ¹The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. ²Excluding trucks. ³The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e., farmers, values are stated at wholesale prices, i.e., cost to dealers. Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.

¹Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. ²1973 and 1974 price indexes are subject to revision. ³1974 price indexes are subject to revision. ⁴Form shore only of motor vehicles. ⁵In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. ⁶In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

Sources: Prices and Price Indexes (62-002), Index Numbers of Farm Prices of Agricultural Products (62-003), Statistics Canada.

¹Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted.
²Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. ³Includes baking and frying oils and fats. ⁴Includes stocks held by manufacturers and other warehouses. ⁵Includes fresh sausage, frankfurters, weiners and all other sausage. ⁶Includes solid, coated, bulk, packages and novelties. ⁷The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales.

Note: Components may not add to totals due to rounding and partial revisions.
¹Fully secured by marketable bonds and stocks. Excludes loans to finance the purchase of Canada Savings Bonds.
²Includes loans on the security of household property.
³Not available on a monthly basis.
⁴Includes loans to finance companies which are affiliates of retail merchandisers.
⁵Religious, educational, health and welfare institutions.
⁶Differs from general loans in Section 13, Table 2 by the exclusion of loans to instalment finance companies.

Note: Components may not add to totals because of rounding.

¹Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data exclude consumer indebtedness arising from residential mortgages, home-improvement loans and bank loans fully secured against marketable securities. Figures do not include statistics on interpersonal loans, bills owing to doctors, dentists, lawyers, and other personal service credit. ²Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. Amounts shown exclude unearned finance charges. ³Personal cash loans of up to \$1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. ⁴Personal cash loans over \$1,500, usually repaid in instalments. Amounts shown exclude unearned finance charges. ⁵Includes bank-sponsored credit card balances. ⁶The data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present: this series is repeated in the unadjusted form. ⁷Amount owed by personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms, and international travel and entertainment credit card issuing companies. ⁸Bills due for non-commercial use of telephones, gas and electric power. ⁹Personal cash loans only. The data for mortgage and trust companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality: this series is repeated in the unadjusted form. Sources: Consumer Credit (61-004), Statistics Canada; Bank of Canada; and Department of Insurance.

¹Column numbers refer to tables 3 and 4 section 11. ²Includes special transaction-trade, not shown separately. ³The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ⁴Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. Source: Trade of Canada, Exports (65-004), Statistics Canada.

Table 4: merchandise imports, by commodity, based on the standard commodity classification¹ (million dollars)

¹Column numbers refer to tables 3 and 4, section 11. ²The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ³Includes special transaction-trade, not shown separately. ⁴Includes scrap. ⁵Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. ⁶Sources: Trade of Canada Imports (65-007), Statistics Canada.

Table 1: carloadings of revenue freight on Canadian railways¹ (thousand cars)

year and month	total railway revenue freight loadings (carload and non-carload) ('000 tons)		farm products and food								mine products		
			total revenue cars loaded (carload only)	other grain and grain products	fresh fruits and vege- tables	other agri- culture products	ani- mals and their products	prepared food products	iron ore and concen- trates	other metal ores and concen- trates	potash	coal, sand, cement and other mine products

¹Data for 1970 through 1972 refer to 24 class 1 and 2 carriers whose gross annual revenues totalled \$500,000 or more. Commencing January 1973, only 6 major railways (accounting for 95 per cent or more of the total operating revenues) are shown. Source: Railway Operating Statistics (52-003), Statistics Canada.

¹Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. ²Cargo includes air freight and express but excludes mail and excess baggage. Sources: Air Carrier Operations in Canada (51-002) Statistics Canada Air Carrier Financial Statements (51-206) Statistics Canada Aviation Statistics Centre (51-004) Statistics Canada.

NOTE: Components may not add to totals because rounding. **¹**This series was designed to cover 50 clearing house centres. With the advent of centralized data processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; however, this comparison may not remain valid through time. Discussions are underway in an attempt to establish boundaries which would be more precisely defined.

²Seasonally adjusted data for Saskatchewan have been deleted because current data could not be satisfactorily adjusted. **Source: Cheques Cashed in Clearing Centres (61-001), Statistics Canada.**

Note: Components may not add to totals due to partial revisions.

¹End of period. ²Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. ³Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. ⁴Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C.P.P. Investment Fund. ⁵Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors. ⁶Allowance for the take-over of Nova Scotia Light & Power common shares. Source: Bank of Canada Review.

¹The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. ²The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. ³Combines the industrials, utilities and finance common stocks. ⁴Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. ⁵Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. ⁶Stocks included in the mining index are for producing mines. ⁷Source: Prices and Price Indexes (62-002), Statistics Canada.

¹This statement includes only receipts relating to budgetary revenue. Excluded are non-budgetary revenues such as Old Age Security Fund taxes, Prairie Farm Assistance Act levies, employer and employee contributions to government-held funds (Unemployment Insurance, Superannuation etc.), interest on government-held funds, and taxes collected on behalf of and transferred to other governments. ²Beginning in December 1973, this category includes oil export tax. ³March includes supplementary payments arising from the closing of the accounts. SOURCE: FINANCIAL FLOW ACCOUNT (13-002), STATISTICS CANADA.

(Continued from page 7)

residential construction in the fourth quarter was accompanied by a mild quarterly rate increase in prices of 0.4 per cent.

Gross National Product – Annual 1975

Gross National Product in 1975 was \$154.8 billion, an increase of 9.9 per cent from the level of the previous year; however, this growth includes an increase in prices of over 9.5 per cent. The recession that began in 1974 bottomed out early in 1975, but because the subsequent recovery proved to be relatively weak, the total level of real output in the economy increased by a mere 0.2 per cent. The performances of individual expenditure aggregates reflected the basic recessionary character of the year: investment in residential construction and exports of goods and services both declined in real terms in 1975, there was a dramatic swing in inventories of more than \$2.8 billion, and personal expenditure on consumer goods and services recorded its smallest real growth since 1970. There was a modest increase in the current dollar value of exports, but this was outweighed by a substantial increase in imports, and the balance of trade in goods and services worsened by \$3.3 billion. The slight increase in real Gross National Expenditure was accompanied by a significant deceleration in prices, but the overall Gross National Expenditure implicit price index nevertheless increased by 9.7 per cent.

Consumer Outlays

Current dollar expenditure on consumer goods and services grew by 14.8 per cent in 1975, but this represents an increase of only 3.7 per cent in real terms. For the year, the largest real increase in both absolute and percentage terms was in expenditure on semi-durable goods, which grew by 7.3 per cent; this increase was accompanied by a relatively modest price increase of 5.9 per cent. Expenditure on durables was also fairly strong, growing by 14.8 per cent in current dollars and 5.7 per cent in real terms, as spending on new and used automobiles grew by 20.6 per cent. Spending on services and non-durable goods increased by 14.7 per cent and 15.6 per cent, respectively, in current dollars, but by only 2.2 per cent and 2.8 per cent in real terms; there were large price increases during the year in both of these expenditure categories.

Fixed Capital Formation

Total gross fixed capital formation grew to \$37.3 billion, an increase of 13.5 per cent; this is a considerable slowdown from the increases of the previous two years, and, in real terms, capital formation grew by only 1.6 per cent. The weakness was concentrated in residential construction which declined by 10.7 per cent in real terms as a result of a precipitous drop in housing starts in late 1974 and early 1975. There was a significant shift in the composition of residential construction during the year, as starts of duplexes and row housing

increased by 40 per cent, while single detached housing starts rose by only 1.5 per cent and apartments starts declined by 4.9 per cent. Business investment in plant and equipment grew by 4.7 per cent in constant dollars, as non-residential construction increased by 7.4 per cent and investment in machinery and equipment, by 2.5 per cent; within non-residential construction, the increase was stronger in engineering (that is, construction of highways, pipelines, utilities, etc.) than in building construction.

Inventory Investment

Investment in inventories swung from an accumulation of \$2.7 billion in 1974 to a decumulation of \$0.8 billion in 1975, all of which took place in business non-farm inventories. There was strong liquidation in both manufacturing and wholesale trade after accumulations in 1974, and in both sectors, the run-down was largely in durable goods. Retail trade was virtually flat for the year (close to zero value of physical change) after an accumulation of approximately \$0.2 billion in 1974.

The External Sector

The external sector was one of the major sources of weakness in 1975. Exports rose 3.0 per cent while imports were up 11.0 per cent, resulting in a \$3.3 billion deterioration in the trade balance to a record deficit of \$5.5 billion. The traditional deficit on service transactions worsened by \$1.0 billion, but the swing in merchandise trade from a surplus of \$1.5 billion in 1974 to a deficit of \$0.8 billion accounted for about 70 per cent of the overall swing in the trade balance. The increase in exports was due to a very large increase in natural gas exports, together with substantial increases in iron ore, coal, agricultural and industrial machinery, and motor vehicles and parts, while the rise in imports was accounted for by increases in energy goods, most notably petroleum, and by strong increases in machinery and equipment and motor vehicles and parts. On the service account, the deterioration resulted from a larger travel deficit and higher interest and dividend payments abroad.

Government Sector

Total revenue of all levels of government (excluding intergovernment transfers) rose by 7.7 per cent in 1975, the lowest rate of increase in several years. All major tax categories showed considerably lower rates of growth than in 1974, which reflects both lower tax rates and the slowdown in business activity. On the other hand, total government expenditures continued the strong growth of the previous year, although at a slightly lower rate, and increased by 20.0 per cent. Outlays on goods and services rose by about 16 per cent, as wage and salary payments, which account for over 50 per cent of total government expenditure on goods and services, increased by about 18 per cent. Transfer payments to persons grew by 23 per cent with higher unem-

ployment benefits an important factor in the increase. Thus, with expenditure rising more rapidly than revenues, the government sector as a whole registered a deficit, on a National Accounts basis, of \$4.6 billion in 1975, the first large deficit since the early sixties.

Incomes

Labour income rose by 14.0 per cent in 1975, compared with an increase of 16.9 per cent in 1974. A major factor in the lower rate of growth was the effect of larger lay-offs and more man-days lost in industrial disputes. There were only marginal increases in employment during 1975, and most of the increase in labour income reflected higher average earnings. Wages and salaries in the goods-producing industries increased by 10.0 per cent compared with 14.0 per cent in 1974, as the industries in this group were particularly affected by strikes and layoffs. Wages and salaries in the service-producing industries rose by 16.3 per cent after a 17.7 per cent increase the year before, with a slower rate of employment growth the major reason for the deceleration.

Corporation profits before taxes fell by 2.9 per cent in 1975, the first decline since 1970 and only the second in fifteen years. It follows four years of substantial increases. Profits in both mining and manufacturing decreased, while profits in trade were virtually unchanged and finance profits increased substantially.

Accrued net income of farm operators was unchanged over the year, with an 8 per cent increase in gross income being offset by higher operating costs. The value of grain production was up by about 10 per cent,

due mainly to larger crop production, but the value of livestock production declined marginally. Net income of non-farm unincorporated business was up 9 per cent year over year, the largest increases occurring in retail trade, and community and personal services.

The shares of Gross National Product held by labour income and profits followed their normal cyclical patterns and reflected the marginal increase in real output in 1975, as labour's share rose to 56.0 per cent from 53.9 the year before, and profits' share fell to 11.5 per cent from 13.0 per cent. Farm income's share of Gross National Product fell slightly, while that of non-farm unincorporated business was unchanged.

Some price deceleration was evident in 1975, as the Gross National Expenditure implicit price index increased by 9.7 per cent compared with 13.8 per cent in 1974, and the increase in the final domestic demand index fell to 10.9 per cent from 11.9 per cent the year before. However, the indices for personal expenditure and gross fixed capital formation both showed larger increases than the Gross National Expenditure index because of the influence of import prices, which were up by 13.9 per cent. The implicit price indices for personal expenditure on services and non-durable goods both increased at relatively high rates, growing by 12.2 per cent and 12.4 per cent, respectively, while durables and semi-durables rose at more moderate 8.5 per cent and 5.9 per cent rates. Overall, the implicit price index for personal expenditure increased by 10.7 per cent. The index for total fixed capital formation grew by 11.7 per cent; the rate of change of prices declined in both the public and private sectors for every major class of construction.

¹ Excludes profits of government business enterprises.

² Includes the withholding tax applicable to this item.

³ Includes profits (net of losses) of government business enterprises and other government investment income.

⁴ Includes an arbitrary smoothing of crop production, and standard seasonal adjustment for withdrawals of grain from farm stocks and for the changes in farm-held livestock and other inventories. Because of the arbitrary element, too precise an interpretation should not be given to the seasonally adjusted figures of accrued net income of farm operators.

⁵ Includes net income of independent professional practitioners.

⁶ See footnote 4, Table 2.

Change in other farm-held inventories	- 40	308	532	160	240	364	64	92	176	40
Grain in commercial channels	- 76	356	372	- 144	127	- 48	- 624	512	296	34

¹ Includes defence expenditures. Details are shown in line 45, Table 16 of the forthcoming publication *National Income and Expenditure Accounts*, Catalogue 13-001.

² Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which are defined as current expenditure.

³ Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of the existing land and buildings.

⁴ The book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. (See line 8, Table 1.)

⁵ In the seasonally adjusted series, the value of grain crop production in each quarter is taken as one fourth of the estimated value of crop production for the year as a whole (see footnote 4, Table 1). All other items in the farm inventories series are seasonally adjusted by standard techniques.

¹ The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

The lower unemployment estimates for men result mainly from differences in the manner in which the revised survey identifies, and subsequently classifies, persons who have not actively looked for work. The revised survey uses a series of specific questions³ to identify persons who are looking for work and are available for work during the survey reference week. Anyone without work who has carried out any job search activities at all during the previous four weeks, and who is available in reference week for the work he is seeking, is classified as unemployed. In addition, persons on layoff for less than six months, or who have a new job to begin within four weeks of the reference week, are classified as unemployed whether or not they have actively looked for work during the past four weeks, provided they are available for work during the reference week. In the former survey, as noted earlier only two general questions were used to determine labour force status - "What did this person do mostly last week?" and "Did this person do anything else last week?". Persons were classified as unemployed if in response to these questions, they reported that they actively looked for work during the reference week, or would have actively looked for work except for their own temporary illness, indefinite layoff (i.e., did not actively look for another job because they expected to be called back to their old job) or the belief that no work was available (i.e., they reported that they would have looked except for their belief that no work was available).

Since no information on job search activities or availability for work was collected in the former survey, and with only very limited information on layoffs and persons with jobs to start in the future, direct comparisons of these components of the unemployment estimates are not possible. However, the comparisons which can be made indicate that in the former survey, particularly during the winter months, substantial numbers of men who were not actively seeking work were being reported as "looking for work" and therefore included in the unemployment estimates, while in the revised survey, such persons would be shown as not in the labour force. Because the revised survey was designed to collect new information on persons not in the labour force, particularly on their work history (including data on industry, occupation, duration of employment and reason for leaving last job) and job search activities over an extended period, it will be possible over time to develop much more comprehensive information about the characteristics and

³ The main questions in this series being "In the past six months has . . . looked for work?", "In the past four weeks what has . . . done to find work?", "About how many hours of work per week has . . . been looking for?", "Was there any reason why . . . could not take a job last week?".

labour force activities of persons whose attachment to the labour force may change frequently.

- (iii) New data - In addition to using its wider range of information for purposes of determining labour force status, the revised survey provides a much more comprehensive range of information describing the composition and characteristics of the employed, unemployed and non-labour force categories. Some of this new data (e.g., information on multiple job holding, layoffs, persons with jobs to start in the future) was published in the *January Release* (Statistics Canada, Catalogue 71-001P). Other new information will be added to the Monthly Bulletin as the data series are developed in the months ahead. The revised survey also will facilitate the development of important new measures relating to the flows or movements between the various labour force categories, information which is of considerable value in analysing the changes in levels shown by the survey each month.
- (iv) More detailed data - As the final major step in the revision of the survey, an increase in the sample size (from approximately 32,000 to 55,000 households) is planned for late 1976 to enable the provision of more detailed and more accurate estimates, especially for provincial data. In Prince Edward Island, the sample size is being expanded at the present time, which should enable estimates of unemployment and unemployment rates to be published for the first time following the April survey.

Historical Statistics

As mentioned previously, the old and new surveys were run in parallel through the 12 months of 1975. The data from this operation have been used to derive ratios expressing the relative levels of certain employment and unemployment estimates from the two surveys for each month of the year. These ratios were applied to the estimates from the former survey for the period 1970 to 1974. The result is an historically consistent time series which for the 1970 to 1975 period estimates what the data would have been at that time had the revised survey been in operation. This historically revised time series (or linked data) coupled with the revised survey data for 1975 and beyond can be used for time series analysis and seasonal adjustment.

The main labour force time series, that is, employment, unemployment, labour force, unemployment and participation rates have already been revised. These series are available by age (15-24, 25 and over) and sex at the Canada level but generally only as totals at the provincial level. While it will not be possible to historically revise all of the time series previously published from the former survey, Statistics Canada will continue to examine the results of the parallel run to determine which series can be linked to the revised survey estimates.

TABLE A. Comparison of Selected Labour Force Characteristics – Former and New Surveys
 Annual Averages, 1975

	Employed			Unemployed			Unemployment rate		
	Former survey	New survey	Dif-ference	Former survey	New survey	Dif-ference	Former survey	New survey	Dif-ference
Canada	9,171	9,363	+ 192	694	697	+ 3	7.0	6.9	- 0.1
Newfoundland	150	152	+ 2	32	25	- 7	17.5	14.2	- 3.3

British Columbia	997	1,009	+ 12	91	94	+ 3	8.4	8.5	+ 0.1

Note: All data is based on 1971 Census population projections and includes persons 15 years of age and over.

TABLE B. Comparison of 1975 Monthly Unemployment Rates, Canada – Actual Data Former and New Surveys

	Total			Male			Female		
	Former survey	New survey	Dif-ference	Former survey	New survey	Dif-ference	Former survey	New survey	Dif-ference
January	8.4	7.9	- 0.5	9.4	7.6	- 1.8	6.5	8.4	+ 1.9
February	8.6	7.7	- 0.9	9.7	7.3	- 2.4	6.6	8.3	+ 1.7
March	8.5	7.6	- 0.9	9.5	7.4	- 2.1	6.9	8.1	+ 1.2
April	8.1	7.2	- 0.9	9.0	6.9	- 2.1	6.3	7.8	+ 1.5
May	7.0	6.8	- 0.2	7.6	6.1	- 1.5	6.0	8.0	+ 2.0
June	6.8	6.6	- 0.2	6.8	5.8	- 1.0	6.7	8.2	+ 1.5
July	6.2	6.7	+ 0.5	6.1	5.7	- 0.4	6.4	8.5	+ 2.1
August	6.0	6.6	+ 0.6	5.7	5.5	- 0.2	6.4	8.6	+ 2.2
September	5.9	6.2	+ 0.3	5.6	5.3	- 0.3	6.4	7.7	+ 1.3
October	5.8	6.3	+ 0.5	5.6	5.3	- 0.3	6.1	8.1	+ 2.0
November	6.4	6.8	+ 0.4	6.3	5.8	- 0.5	6.6	8.4	+ 1.8
December	7.0	6.9	- 0.1	7.7	6.5	- 1.2	5.8	7.5	+ 1.7

Note: All data is based on 1971 Census population projections and includes persons 15 years of age and over.

It should be noted that since the seasonal adjustment process requires several years of monthly data as input, only those time series which can be historically revised will be seasonally adjusted.

As for the wealth of new information generated by the revised surveys, most data will be available only from January 1975 onwards with seasonal adjustment

commencing as soon as enough monthly observations have been obtained.

Additional Information

The Labour Force Survey Division of Statistics Canada would be pleased to provide additional information relating to the revision of the survey. Simply write to the Director, Mr. D.B. Petrie or phone (613) 996-3990.

CHANGES IN WORKING LIFE OF CANADIAN MALES

K.S. Gnanasekaran*

The term "working life" refers to the average number of years of life that a person may spend in the labour force. The duration or length of working life in conjunction with the total years of life reveals the average number of years spent outside the labour force or in "dependence". Both measures, the number of years spent in productive life or in dependence, bear important implications for the individual, the family and the nation as a whole, and in consequence, are considered valuable indicators of social and economic conditions within a country. Working life may be regarded as a good indicator of the economic-demographic situation in a country in the sense that it reflects the potential contribution of a person to the national economy. In contrast, dependency life serves as a useful indicator of a given socio-demographic situation in that it has a close bearing on the nation's social cost for education, child-care, care of the disabled, and the provision made for elderly persons during their retirement. Actuaries, economists and demographers have long been drawn toward the importance of the length and pattern of working life and in recent years, the length and pattern of dependency life, particularly of retirement, have taken on a new importance in the industrialized low-mortality countries.

Direct information on working life, however, is rarely collected. Consequently, working life is measured indirectly through the construction of working life tables. Tables of working life, in addition to providing measures of the length and pattern of working life, also yield valuable information related to labour force dynamics, that is, the rates of entry into and withdrawal from the labour force due to death or retirement.

Efforts to construct working life tables for Canada based upon the results of the 1961 Census, were first

* Dr. K.S. Gnanasekaran is Chief of the Population Projections Section, Census Field, Statistics Canada. The author only is responsible for the analysis and views expressed in this paper.

attempted by Frank Denton and Sylvia Ostry.¹ Closely following their efforts, the present paper attempts to examine briefly the recent changes in working life and to compare patterns of working life that have emerged over the intercensal period 1961 - 71,² as published recently in *Working Life Tables for Males in Canada and Provinces, 1971*, by K.S. Gnanasekaran and G. Montigny. At a given time, the working life and its pattern are the result of the combined influences of mortality and labour force behaviour. Without going into great detail, it may be useful to summarize briefly the developments in these two variables over the past decades with a view to providing a background for the study of changes in working life of males in Canada.

For many years, Canada has experienced a low mortality of less than 10 deaths per 1,000 population.³ Thus, as early as the expectation of life at birth was approximately 60 years for males as shown by Table I and 62 years for females.⁴ Further reduction in mortality continued and the current expectation of life at birth averages about 69 years for males and 76 years for females,⁴ that is, an increase of nine and fourteen years respectively in four decades. A significant aspect of this historical trend is that the bulk of the increase had occurred between 1931 and 1956, averaging an increase of 0.3 years per annum for males and 0.4 years for females. The improvement though not halted in later decades, did, however, relent considerably in the period 1956 - 71.

Chart 1

Labour Force Participation Rates by Age, Males, Canada, 1961 and 1971

Source: K.S. Gnanasekaran, "The Labour Force", in C.I.C.R.E.D., *The Population of Canada* (Ottawa: Statistics Canada, 1974), p. 100.

With respect to labour force trends, the participation rates of men have been steadily declining in most age groups since 1921 as shown in Chart 1. Males in the young age groups appear to continue their education in larger numbers than did their brothers 10 years ago. The rising levels of family income and the greater number of scholarships and/or loans available are among the factors which now enable students to continue their higher education. The downtrend in labour force participation among the older males was particularly pronounced.⁵

Changes in Working Life

Against the background of the foregoing trends in mortality and male labour force participation, Table 1 presents the changes in the working life of males in Canada since 1931. In comparing these trends, it should be kept in mind that the estimates, particularly those for the earlier periods when the concept followed was not of the labour force but one of the gainful worker, may be relatively poor and, notwithstanding the adjustments made, may still suffer from errors due to qualitative differences in concepts.

During the period 1931-71, the length of working life changed considerably; at the beginning of this period, that is, in 1931, a man of 15 years could, on the average, expect to live another 53.4 years of which 48.0 years might be spent in the labour force and the remaining 5.4 years, outside the work force. By 1971, the life expectancy at age 15 had gone up by 2.9 years to 56.3 while the working life had declined to 47.3 years, thus leaving an average of 9.0 years spent outside the labour force. It should be stressed here, at the risk of repetition, that these figures are averages and a young person may never enter the labour force at all owing to disability or any other reasons and, in consequence, he may spend all his lifetime outside the labour force. Or, a person may die while employed and thus spend no time in retirement. Considering the recent decade 1961-71 which witnessed, on the one hand, a rapid decline in the participation rates of young men and, on the other, a rise in accident mortality occurring at the young ages, it may seem that the average life expectancy remained more or less the same in this period (see Table 1), while the working life declined from 48.0 years in 1961 to 47.3 years in 1971, thereby increasing the average number of years spent in retirement.

An examination of recent changes shows that the expectation of total life for males at age 15 was 56.3 years in 1971 as compared to 55.4 years in 1951, implying a slight increase of 0.9 years. For the same period, the expectation of working life declined for Canadian males from 47.9 years in 1951 to 47.3 years or by 0.6 years. This trend may be attributed to causes other than death. Indeed, had other factors remained un-

changed, the expectation of working life would average about 49.0 years in 1971 indicating an increase of approximately one year owing to the mortality reductions that took place during these two decades.

This decline in working life expectancy became apparent in 1971. The downtrend, in fact, began after 1951. Thus, from 1951 to 1961, while the expectation of life increased by almost 0.8 years, the increase in work life expectancy was far less, about 0.1 year. This may be ascribed to the opposite trend in the labour force participation of men, a trend which has been consistently downward due to the increased enrolment of the young in higher education and to the lower rate of participation of the old in the labour force. Consequently, during 1961-71, when the mortality rates showed little improvement from ages 15 onwards, the negative impact of the changes in participation rate outweighed any positive influence of mortality thereby causing a decline in the working life expectancy. The labour force effect *per se* turns out at approximately minus 0.9 years in 1951-61 and minus 0.7 years in 1961-71 as shown in Table 2.

Looking ahead 15 years into the future, the length of working life may be expected to lie between 47.7 and 46.8 years. If the 1971 labour force participation rates continue unchanged and mortality declines, although at a lesser pace as the available projections imply, it is anticipated that the working life will increase from 47.3 years to 47.7 years or about one-half a year during the next 15 years. At the same time, it appears that the total life expectancy at age 15 will increase very slightly to 56.5 years and consequently, the retirement period will shrink to 8.8 years. However, it is very unlikely that the pattern of economic activity will remain constant over this and the next decade. Past trends in participation rates have clearly shown a consistent downtrend in most ages although the extent of decline varied from one age to another. In general, the young and the old exhibited marked changes while the rates for the ages 30 to 54 dropped slightly. This declining pattern was also noticed during the recent decade 1961-71, and for the purpose of projections, it is assumed that the historical downturn will continue in the future, but that the pace will slow down to one-half the decline experienced during 1961-71. Under this assumption, the decline will still be considerable, from 7 per cent to 15 per cent in 15 years in the ages 65 to 69 and from 3 per cent to 5 per cent in the ages 55 to 59. In the ages 20 to 54, the total decrease will be slight or less than 3 per cent in the 15 years from 1971 to 1986. For the ages below 20, it is assumed that the present participation level will continue unchanged through 1986. Using these projected participation rates and projected life tables for 1986,⁶

Chart 2

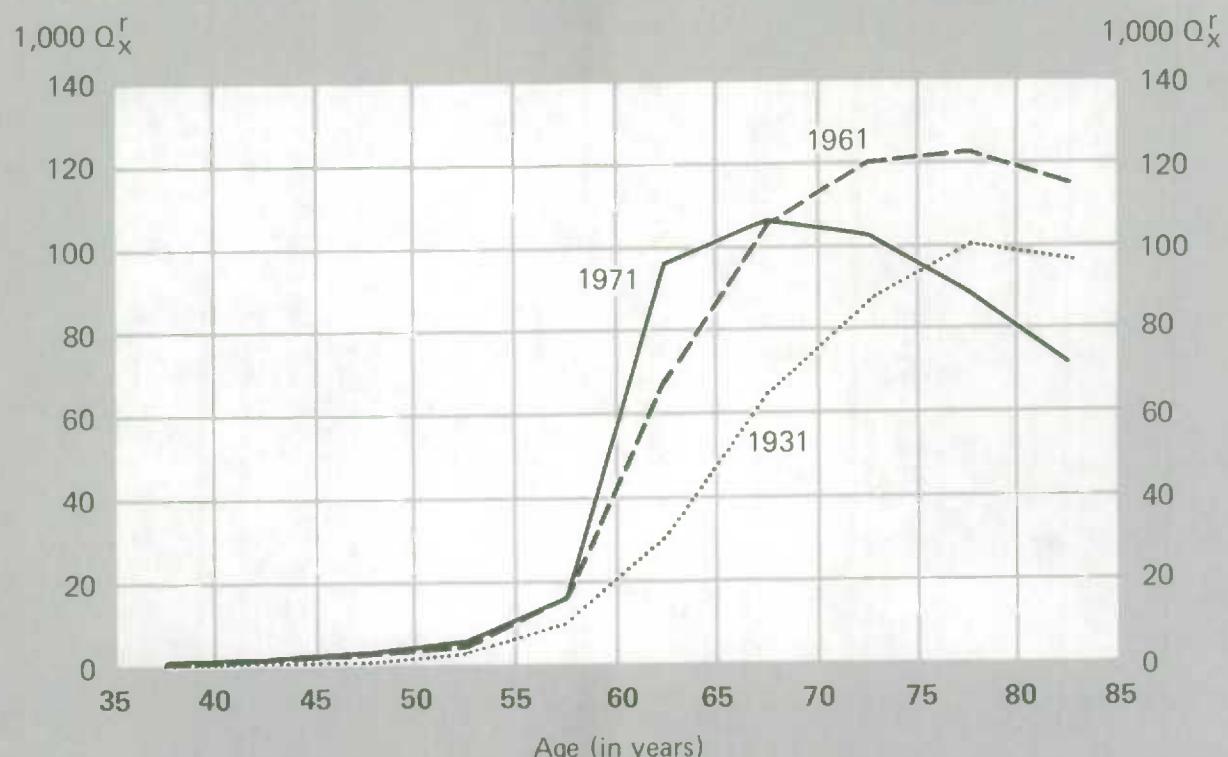

Trends in Annual Rates of Accession to Labour Force, Males, Canada, 1931, 1961 and 1971

Sources: Table 3.1 and Frank T. Denton and Sylvia Ostry
op. cit., pp 26 and 50.

Chart 3

Trends in Annual Rates of Retirement from the Labour Force by Age, Males, Canada, 1931-1971

Sources: Table 1 and Frank T. Denton and Sylvia Ostry,
op. cit. pp. 26 and 50.

the length of working life is anticipated to be 46.8 years in 1986. This implies a continuation of the downtrend observed in recent years (i.e., 1961-71) and a further decline of half a year in the length of working life between 1971 and 1986. In terms of components, the effect of future mortality may be seen to raise the working life by 0.4 years (i.e., from 47.3 to 47.7), but this will be more than offset by the negative effect of future trends in labour force participation which, as calculated in Table 2, will reduce the working life by 0.9 years (i.e., from 47.7 to 46.8). This decrease may mean earlier retirement in the future, and an increase in the average length of retirement life from 9.0 years in 1971 to 9.7 years by 1986 (see Chart 2).

Trend in Accession Pattern

Over the years, the pattern of labour force accession has changed markedly as is evident from Chart 2. In the 1930's, the rate of entry among males 14 to 16 years of age was relatively high. This pattern shifted in favour of higher ages in the following decades, resulting in a rise in the average age at entry into the labour force. Thus, the average age at entry into the labour

force was 16.2 years in 1931 in contrast to 18.6 years in 1961. The pattern of accession in 1971 differed considerably from the patterns in the 1950's and 1960's reflecting a peak accession rate at age 17 and a mean age of entry into the labour force of about 19.2 years.

Several factors are responsible for the uptrend in the average age at labour force entry. The foremost among them being increased school attendance. The new entrants are now more qualified in terms of skills and educational attainment. Changes in the labour market resulting from industrialization and modernization can be another reason.

Trend in Separation Pattern

Another great value of the working life table lies in the information it provides on the pattern of labour force separations. The annual rates of separation which are shown in Chart 3 reflect the pattern of mortality changes in this country, especially those occurring at the older ages and the trend in recent decades toward a lower age of retirement.

Rates of withdrawal due to death follow a regular pattern consistent with the mortality curve. This pattern represents a steady rise in separation rates with advancing age. Over the period under review, the rates have declined slightly at every age. Until the age of 54, mortality is the more important factor, accounting for approximately two out of three withdrawals from the labour force. From age 55, however, causes other than mortality, are responsible for a large proportion of losses from the work force. This becomes particularly pronounced in the age group 60-64 with an annual retirement rate of 96.4 per 1,000 in 1971, compared to a loss of 22.8 per 1,000 resulting from mortality. Comparison of these separation rates over the period 1931-71 reveals striking developments bearing great implications for society. In 1931, the annual retirement rate was 30.6 per 1,000. This rate has since more than doubled to 69.5 in 1961, and, in the last 10 years, increased sharply to 96.4 per 1,000, reflecting a substantially earlier average age of retirement. Thus the mean age at retirement decreased over the last 10 years from 65.1 years in 1961 to 60.1 years in 1971.

Summary

The 1971 working life table indicates an average expectation of 47.3 years for Canadian males in the

labour force, or in other words, about one-half year less than the length of working life anticipated in 1961. Considering that the total life expectation has remained virtually stable, the decline in the length of working life means an increase of approximately 0.8 years in the retirement life over the past 10 years. Looking ahead 15 years, it is likely that the working life expectancy could further decline to 46.8 years and the retirement life could rise to 9.7 years. The chief explanation for these changes, in the past as well as the future, lies in the changing pattern of labour force participation and in particular, the trend toward earlier retirement.

With regard to the dynamic aspects of the labour force, the 1971 working life table reveals that the average age of entry into the labour force has gone up over the past decade from 17.5 to 19.1. The retirement pattern has also undergone important changes. The mean age of retirement has decreased from 64.3 years in 1961 to 63.0 years in 1971.

For more details, see *Working Life Tables for Males in Canada and Provinces, 1971*, by K.S. Gnanasekaran and G. Montigny. Ottawa: Information Canada, 1975. This publication (Catalogue 71-524E, Occasional) is available at Publications Distribution, Statistics Canada.

Marketing Handbook

The 1975 edition of the *Market Research Handbook*, collecting in a single volume reference information necessary for those who analyze the many aspects of markets for a variety of goods and services, is now available.

The handbook pulls together information normally found in a score of different Statistics Canada publications. The result is a one volume work that gives a detailed picture of such things as trends in population growth, income, consumer consumption and shopping centre development, vital to any market analyst. The figures are applicable from the local right up to the national level.

For each of the volume's six subsections, a list of the specific publications from which primary figures were obtained is included.

For further information, order the 1975 edition of *Market Research Handbook* (Catalogue 63-224, \$3.50).
