## Canadian Statistical Review

Data in this publication were retrieved from CANSIM® (Registered Trade Mark of Statistics Canada for its Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, tape or directly via terminal.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:

*CANSIM Summary Reference Index* (Annual with periodic amendments) — Free on request.

This index is a summary of the data in CANSIM. It provides a key to the Series Directory and is the first step in locating and ordering series from the CANSIM Main Base.

*CANSIM Main Base Series Directory* (Annual with periodic amendments) — \$27.

This Directory is a detailed guide to the data on the CANSIM Main Base. It gives the title, start date, source of the data, and other descriptive material. The Directory is published in three volumes.

*CANSIM Mini Base Series Directory* (Annual with periodic amendments) — \$10.

This Directory is a detailed guide to the data on the CANSIM Mini Base — a standard subset of data originating from the CANSIM Main Base which is available at various Secondary Distributors.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series in MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

## **Editorial Board**

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following Statistics Canada staff members:  
G. Leclerc (Chairman) — Assistant Chief Statistician,  
Economic Statistics Field

R.E. Drover — Director, User Advisory Services Division  
B.J. Lynch — Director, Prices Division  
R. Platek — Director, Methodology Division  
J.R. Podoluk — Director General, Content and Analysis Branch

J. Randall — Director, Financial Flows and Multinational Enterprises Division  
L.O. Stone — Senior Advisor, Population Studies and Statistics, Census  
P.N. Triandaillou — Director, CANSIM Division  
J.S. Wells — Director General, System of National Accounts and Analysis Branch  
N. Cholette — Editor, Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at: CANSIM Division, 9th Floor, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

## **Subscriptions**

The *Canadian Statistical Review* and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, K1A 0T6 and remittances made payable to the Receiver General for Canada.

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers.

Historical data for selected economic indicators, both adjusted and unadjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

Correspondence should be directed to the *Canadian Statistical Review* CANSIM Division, Statistics Canada, R.H. Coats Tower, Ottawa, Ontario, K1A 0T6.

### Note to Users

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

Monthly or quarterly data may not add to totals due to rounding.

Section 5, Table 4 — Raw Materials Price Indexes  
(1977 = 100)

These indexes have been revised and updated to May 1980 due to recent weight changes. Complete information can be found by referring to CANSIM matrices 2892 and 2893.

# Calculating the Cost-Push Effects of Increasing the Domestic Price of Crude Oil Towards the International Price Using the Statistics Canada Price Model

\*R.B. Hoffman, K. Hamilton, R. Rioux

## NOTE

The Statistics Canada price models belong to the family of cost-push models traditionally associated with input-output models. These models are in effect the dual of the output determination models. Instead of analysing the propagation of demand throughout the economic system the price model serves to analyse the propagation of factor prices throughout the system.

The characteristic common to all price models of this family is the assumption of cost-push behaviour. It is assumed that, when an industry is faced with a change in the costs of its raw material or primary inputs, it will adjust its product price in such a way as to offset the increase in costs. To the extent that an industry's product is an intermediate input into other industries, the other industries must adjust their product prices as well.

The model is based on a set of proportionality assumptions. It makes use of the same accounting identities and the same structural relationships as the input-output model.

These relationships have the following implications concerning price formation behaviour:

1. The price of each domestically produced commodity is a weighted combination of the output prices of the industries which produce the commodity.

\*Mr. R.B. Hoffman is Director Structural Analysis Division. Mr. K. Hamilton and Mr. R. Rioux are both Research Analyst in that Division. This paper was presented at the "Congrès de la Société canadienne des sciences économiques" held in Quebec City, May 14-16, 1980.

2. The price of an industry's output is determined by the cost of its inputs, i.e., intermediate inputs of goods and services domestically produced and imported, indirect taxes, wages and salaries, and profits. This means that an industry, faced with a change in the costs of its inputs, will adjust its output prices in such a way as to cover its costs and maintain its profit margins. In other words, increases in costs are passed on to the purchasers of goods. This assumption gives the model 'cost-push' prices setting behaviour.
3. There is no price substitution. Neither industries nor consumers will substitute one product for another when relative prices of products change.
4. Each industry will change the prices of all the commodities it produces in the same proportion when confronted with a change in cost.
5. For each commodity the price is a weighted combination of the domestically produced supply and the price of the imported supply of the commodity.

The price models are traditionally used to determine the impact on all industry selling prices and commodity prices of a change in primary factor or import prices. The Statistics Canada price models have been extended so that they may be used to determine the impact of a change in commodity and industry prices as well.

## 1. Introduction

The purpose of this note is twofold: to explain how the Statistics Canada price model can be used to simulate the cost-push effects of increasing the domestic price of crude petroleum towards the international price taking into consideration the subsidy paid to refiners of imported crude petroleum, and to present some sample simulations which will serve to illustrate the results that can be obtained from the model.

In recent years, the Canadian domestic price of crude petroleum has been less than the international price. Canadian refiners of imported crude petroleum have been subsidized in such a way that the effective price per barrel of imported crude is equal to the Canadian domestic price. For example, at the present time the domestic price of crude petroleum is \$16.60 per barrel delivered in eastern Canada and the international price is \$32.00. Accordingly Canadian refiners of imported crude petroleum receive a subsidy of \$15.40 per barrel.

In the Canadian input-output tables, imports of crude petroleum are valued at the international price. The subsidies paid to Canadian refiners of imported crude are shown as negative primary inputs into the refinery industry.

## 2. Methodological Implications for Price Model Simulations

This treatment of crude petroleum in the Canadian Input-Output tables has implications for users of the Statistics Canada price model who wish to simulate the cost-push effect of increasing the domestic price of crude petroleum relative to the international price.

Because an increase in the price of domestic crude oil relative to the import price would entail a concomitant decrease in the import subsidy, any simulation of the cost-push effects of raising domestic prices must alter both the domestic relative price and that of the subsidy. The latter may be calculated using the following information:

$C$  = the total value of Canadian oil production for domestic consumption (i.e. total value of production less the value of exports).

$Q_c$  = the quantity (in barrels) of Canadian oil production for domestic consumption.

$P_c$  = the domestic oil price.

$M$  = the total value of imported oil for domestic consumption

$Q_m$  = the quantity of imported oil for domestic consumption

$P_m$  = the price of imported oil

This data is related by the following identities:

$$(1) C = Q_c \cdot P_c$$

$$(2) M = Q_m \cdot P_m$$

The subsidy  $S$  on imported oil required to maintain an average price  $P_c$  for domestic consumption crude oil is therefore given by:

$$\frac{M - S + C}{Q_c + Q_m} = P_c$$

Using relationships (1) and (2) we see that:

$$S = Q_m (P_m - P_c)$$

Therefore, if  $P_c^1$  and  $S^1$  are the "current" domestic price of crude petroleum and import subsidy respectively, and the domestic price to be simulated is  $P_c^2$ , the relative prices to be used in the cost-push price model run are,

$$\frac{P_c^2}{P_c^1} \text{ for the domestic price of crude petroleum;}$$

and

$$\frac{Q_m (P_m - P_c^2)}{S^1} \text{ for import subsidies to the refiners.}$$

Table 1 displays the refinery industry data as it appears (or would appear) in the input-output accounting framework. The first column of this table is a resumé of petroleum refinery statistics from the 1976 I-O tables. The second column shows the same statistics for the year 1980 but using 1979 data to modify the input structure of petroleum refineries. The value of production is calculated from cost changes of the main input i.e., crude oil. (Crude oil represents more than 90% of the inputs of petroleum refineries).

The other data in volume or in values used in the new input structure are the subsidies, taxes and wages and salaries. We assume that the profit margins are constant.

The subsidy is calculated as the product of the difference between the import and domestic prices and the difference between total imports in volume and the quantity of crude oil which will be exported as refined products. A quantity of 20,179,808 barrels of imported crude oil used by the refineries is exported as refined products. The well-head price on January 1st, 1980 is \$14.75. The import price for the same period is \$32.00. Hence the subsidy calculated is \$3,130,974,000. Taxes are modified by a new tax (Syncrude Levy) since the first of July 1978. This tax is now of \$0.85/barrel. It represents an amount of \$604,228,000. The other costs are calculated proportionally to the 1976 inputs (See Appendix 1, a list of inputs of petroleum refineries).

## 3. Sample Simulations

In the following simulations we change the input structure of petroleum refineries by applying the new crude oil input coefficient and the new subsidy coefficient as calculated in column 3. (See Table 1)

In these simulations we make the assumption that the industries keep their profit margins constant.

For each simulation we run two versions of the Price Model. In the open version wages and salaries are considered as exogenous variables. In the closed version wages and salaries are indexed to the consumer price index which is calculated internally. And for this type of experiment we assume that the cost-push effect of the CPI to Wages and Salaries is fully passed to all industries.

The first run simulates a \$5.00 increase in the price of domestic crude petroleum from the present well-head price of \$14.75 per barrel and the assumed Petroleum Refineries structure is as in Column 2.

The import coefficient for crude petroleum used is 0.4987.

The relative change in the domestic price of crude petroleum used in the cost-push price model is

$$\frac{P_c^2}{P_c^1} = \frac{19.75}{14.75} = 1.3389$$

The new subsidy price is calculated as:

$$\frac{Q_m (P_m - P_c^2)}{S_1} = \frac{203,310(32 - 19.75)}{3,130,974} = 0.7954$$

The second run simulates an increase in the domestic price of \$17.25 which brings the domestic price to parity with the import price i.e. \$32.00. The percent increase in the domestic price is 117% and the new subsidy price for petroleum refineries is zero.

In the third run we assume that the domestic and the import prices of crude petroleum rise to \$40.00 per barrel. This means that the relative change for domestic and imported crude petroleum are respectively 171% and 25%, and the subsidy price is down to zero.

To calculate the effects on the purchaser's price of motor gasoline we use the actual cost structure for motor gasoline i.e. the producers' price and tax, the other margins being distributed using the 1976

proportions. The proportions for the producers price and the margins are multiplied by their respective changes in simulations which gives a total percentage change for motor gasoline.

The results are summarized in Table 2.

#### 4. Concluding Remarks

These price simulations represent a "worst case" measure of the inflationary impact of pushing up domestic oil prices in at least three senses:

(1) The simulations assume that the quantity of oil consumed per unit of economic activity does not change in response to the price change; in other words, they assume a total negation of one of the stated goals of increasing oil prices, which is the decreased consumption of oil through substitution and conservation measures.

The inflationary effects should in fact decrease in direct proportion to the expected decrease in oil consumption associated with a price hike.

(2) The simulations assume that the total direct and indirect price increases in input costs are passed along in output prices.

In fact the market situation may dictate absorbing some of this increase in decreased profits, or decreases in real wages in the case of the simulations closed to labour income.

(3) The simulations suggest single-year inflationary effects whereas in reality the dynamics of the Canadian economy (dictated by current market conditions, inventories, and the timing of labour contracts) will spread these effects over a longer period of time.

With these caveats in mind, the enclosed oil price simulations can perhaps be viewed as giving an upper bound on the hypothetical inflationary impacts owing to cost-push effects.

TABLE 1  
SELECTED INPUT-OUTPUT REFINERY DATA

	1974 (x 1,000)	1979 (x 1,000)
Value of output	\$6,893,571	\$14,565,138
Value of crude petroleum used

## Observations

### 1981 CENSUS CONTENT APPROVED

Sequential lynchpins in the massive 1981 Census preparations are falling into place.

- The content of the 1981 Census of Population and Housing was given final approval by Cabinet on March 8, 1980.
- Two questionnaires will be used.
- A short one will contain questions to be asked of all Canadians.
- A longer one asking additional questions will be sent to a randomly-selected 20% of households.

The actual variables (subject items) that will be contained in this Census are summarized as follows:

- **Items for which information will be sought in every household.**

**Population:** Household relationship, Age (date of birth), Sex, Marital status, Mother tongue.

**Housing:** Household maintainer, Tenure (owned or rented), Type of dwelling.

- **Items for which information will be sought in 20% of households.**

**Population:** Birthplace, Citizenship, Year of immigration, Ethnic group, Religion, Home language, Official language, Level of schooling (elementary, secondary, university, other), Degrees, certificates or diplomas obtained, School attendance, Place of residence 5 years ago (mobility status), Fertility (children ever born), Date of first marriage, Hours worked last week, Temporary lay-off or absent status, Arrangements to start new job, Looked for work in last four weeks, Reasons unable to start work, When last worked, Place of work, Industry, Occupation, Class of worker, Weeks worked, Weeks worked full-time or part-time, Amount of income in 1980 by source.

**Housing:** Period of construction, Length of occupancy, Number of rooms, Number of bathrooms, Type of heating (equipment), Fuels used (for dwelling heating), Fuels used (for water heating), Need of repairs, Costs of fuels and municipal services, Cash rent, Owner costs for mortgage and property taxes, Market value, Condominium status.

<sup>1</sup>The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. <sup>2</sup>Beginning with 1978, this is subdivided into entrepreneurs and managers/administrators. For breakdown refer to CANSIM main base. <sup>3</sup>Includes logging, fishing, trapping and hunting. <sup>4</sup>Includes mechanical and construction. <sup>5</sup>Includes a small number in non-specified occupations. <sup>6</sup>Beginning with 1978 includes fiancés and fiancées. <sup>7</sup>Does not include students entering Canada on students' visas. <sup>8</sup>Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. Beginning with 1978, fiancés and fiancées are included with spouses.

<sup>1</sup>Excludes profits (net of losses) of government business enterprises. <sup>2</sup>Includes the withholding tax applicable to this item. <sup>3</sup>Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. <sup>4</sup>Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given to the seasonally adjusted figures. <sup>5</sup>Includes net income of independent professional practitioners. <sup>6</sup>See footnote 4, Table 1.2.

<sup>1</sup>Includes defence expenditures. <sup>2</sup>Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. <sup>3</sup>Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. <sup>4</sup>The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment, (as shown in Table 1.1). <sup>5</sup>See footnote 4, Table 1.1.

<sup>1</sup>The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

<sup>1</sup>Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. <sup>2</sup>Tax liabilities. <sup>3</sup>Withholding taxes. <sup>4</sup>The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series.

For source see Table 1.9

<sup>1</sup>These implicit indexes are current weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

For source see Table 1.9.

Table 1.9: Relation between gross national product at market prices and gross domestic product at factor cost (millions of dollars)

<sup>1</sup>The labour force as a percentage of the population 15 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. <sup>2</sup>The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

Source: The Labour Force (71-001), monthly.

<sup>1</sup>Statistics on work stoppages include all strikes and lockouts whether legal or illegal, which last for one-half day or more and amount to 10 or more person-days of time lost. Time lost by workers indirectly affected, such as those laid off because of a work stoppage by other employees, is not included. Data is published 45 days after the end of reference month. <sup>2</sup>The industry groups from January 1976 forward, are based on the 1970 Standard Industrial Classification. <sup>3</sup>The number of person-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. <sup>4</sup>The total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. <sup>5</sup>Includes publishing and allied industries. <sup>6</sup>Includes storage and communication industries.

<sup>1</sup>The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. <sup>2</sup>Excludes agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households, public administration and defence. <sup>3</sup>Includes storage, electric power, gas and water utilities. <sup>4</sup>Excludes domestic service.

<sup>1</sup>The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. The Industrial Composite is the sum of all industries except agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households and public administration and defence.

<sup>1</sup>The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. <sup>2</sup>In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing.

<sup>1</sup>These weights, provided as a general guide, show the relative importance of the major components of the C.P.I. They are based on expenditure values derived from quantities and prices of year 1974. <sup>2</sup>With the introduction of 1974 weighting pattern in October 1978, city indexes were revised from January 1971 onwards. The revision was largely the result of making the procedures used in the compilation of city indexes conform to those of the Canada indexes.

## Section 5—Table 3

July 1980

Table 3: Construction price indexes

Year and month	Residential building construction input (1971 = 100)							Non-residential building construction inputs (1971 = 100)			Construction Union Wage (1971 = 100)

<sup>1</sup>Estimates of manufacturers' shipments, inventories and orders are based on a monthly survey of a sample of manufacturing establishments, benchmarked to the annual census of manufacturers. <sup>2</sup>Shipments of goods manufactured within the establishments. <sup>3</sup>Total new orders received during the period at estimated selling value, net of cancellations. <sup>4</sup>Total manufacturing inventory owned by manufacturing establishments. Other inventory such as that of goods purchased for resale is not included.

Note: All series are subject to revision each year when more recent Census of Manufactures data become available.

<sup>1</sup>Data compiled according to the Steel Distribution Index revised January, 1964. <sup>2</sup>Figures on net shipments relate to semi finished and rolled steel products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. <sup>3</sup>Excluding shipments for re-processing at maker's own plant. <sup>4</sup>Data compiled as submitted by the steel producers according to the steel industry distribution code.

<sup>1</sup>Gas types are included. <sup>2</sup>Includes producers' shipments for export. <sup>3</sup>In some cases these shipments are not at the factory level, and stocks at beginning of month plus production less shipments do not equal stocks at end of month. <sup>4</sup>End of period. <sup>5</sup>Electric and other. <sup>6</sup>Excludes apartment type machines. <sup>7</sup>Excludes other than electric.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision.

<sup>1</sup>Supply and disposition for both Crude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc. <sup>2</sup>Includes crude oil, condensate and pentanes plus.<sup>3</sup>Gross new production by field less field flared and waste.

<sup>1</sup>A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

<sup>1</sup>Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. <sup>2</sup>1977 and 1978 price indexes are subject to revision. <sup>3</sup>1978 price indexes are subject to revision. <sup>4</sup>Farm share only of motor vehicles. <sup>5</sup>The major groups include additional components than the selected ones shown.

<sup>1</sup>Column numbers refer to Tables 3 and 4, Section 11. <sup>2</sup>Includes special transaction-trade, not shown separately. <sup>3</sup>The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. <sup>4</sup>Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc.

Table 4: Merchandise imports, by commodity, based on the standard commodity classification<sup>1</sup> (million dollars)

<sup>1</sup>Column numbers refer to Tables 3 and 4, Section 11. <sup>2</sup>The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. <sup>3</sup>Includes special transaction-trade, not shown separately. <sup>4</sup>Includes scrap. <sup>5</sup>Some series such as general purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp. Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery.

<sup>1</sup>Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers.

<sup>2</sup>Cargo includes air freight and express but excludes mail and excess baggage.

Sources: Air Carrier Operations in Canada (51-002), Statistics Canada, Air Carrier Financial Statements (51-206), Statistics Canada, Aviation Statistics Centre Service Bulletin (51-004), Statistics Canada.

Note: Components may not add to totals because rounding. Cheques drawn on the Receiver General or cheques drawn on bank deposit accounts held in the name of the Receiver General are not included in the data.

<sup>1</sup>This series covers 50 clearing house centres. With the advent of centralized data processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; however, this comparison may not remain valid through time.

<sup>2</sup>Seasonally adjusted data for Saskatchewan is not available.

<sup>1</sup>Excluding revivals, increases, dividend additions, reinsurance acquired, credit insurance and pension bonds without insurance. Value totals are estimates projected from the sales reported by companies operating in Canada representing over 80% of new ordinary and of new group contracts. <sup>2</sup>Total new settled-for ordinary sales in Canada. Total sales figure does not include sales for Northwest Territories. <sup>3</sup>Under new or amended contracts.

<sup>2</sup>This statement includes only receipts relating to budgetary revenue. Excluded are non-budgetary revenues such as Old Age Security Fund taxes, Prairie Farm Assistance Act levies, employer and employee contributions to government-held funds (Unemployment Insurance, Superannuation etc.), interest on government-held funds, and taxes collected on behalf of and transferred to other governments.

<sup>3</sup>Beginning in December 1973, this category includes oil export tax. <sup>1</sup>March includes supplementary payments arising from the closing of the accounts.
