Canadian Statistical Review

Data in this publication were retrieved from CANSIM® (Registered Trade Mark of Statistics Canada for its Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, tape or directly via terminal.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:

CANSIM Summary Reference Index, Catalogue 12-202 — \$8.

This index is a summary of the data in CANSIM. It provides a key to the Series Directory and is the first step in locating and ordering series from the CANSIM Main Base.

CANSIM Main Base Series Directory — \$60.

This Directory is a detailed guide to the data on the CANSIM Main Base. It gives the title, start date, source of the data, and other descriptive material. The Directory is published in three volumes.

CANSIM Mini Base Series Directory, Catalogue 12-204 — \$20.

This Directory is a detailed guide to the data on the CANSIM Mini Base — a standard subset of data

originating from the CANSIM Main Base which is available at various Secondary Distributors.

CANSIM-Cross Classified Data Base Index — \$7.

This index provides a summary of available data on the Cross Classified Data Base.

CANSIM-Cross Classified Data Base Directory — \$20.

This directory provides a detailed guide to the Cross Classified Data Base. It provides a description of the structure of each table.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series in MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following members:

G. Leclerc (Chairman) — Assistant Chief Statistician,
Economic Statistics Field
R.E. Drover — Director, User Services Division
B.J. Lynch — Director, Prices Division
R. Platek — Director, Methodology Division
M. Podehl — Director, CANSIM Division
— Director General, Content and Analysis Branch
— Director, Financial Flows and Multinational
Enterprises Division

L.O. Stone — Senior Advisor, Population Studies and
Statistics, Census

P.N. Triandafillou — Director, Industry Product Division
J.S. Wells — Director General, System of National
Accounts and Analysis Branch
Editor-Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at: CANSIM Division, 9th Floor, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

Subscriptions

The *Canadian Statistical Review* and other catalogued publications of Statistics Canada, may be ordered from Publications Distribution, Statistics Canada, Ottawa, K1A 0V7 and remittances made payable to the Receiver General for Canada.

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers.

Historical data for selected economic indicators, both adjusted and unadjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

Correspondence should be directed to the *Canadian Statistical Review* CANSIM Division, Statistics Canada, R.H. Coats Tower, Ottawa, Ontario, K1A 0T6.

An Analysis of Hospital Expenditures in Canada

*Douglas E. Angus, Louis A. Lefebvre and Claude Strohmenger

ABSTRACT

Problem Addressed

Health economists and researchers have devoted much time and effort to estimating health care sector costs in Canada. In recent years, the proportion of GNP consumed by health services (between 7-7½ % throughout the 1970s) has underscored and stressed interest in this sector. Present and future distribution and use of resources allocated to medical treatment and hospital care have already been the objects of several studies in Canada, all of which indicate the need for in-depth analyses of health service costs and for establishing control and planning mechanisms in order to meet the future needs of the population.

Study of the economic cost of the health sector is itself an attempt to rationalize the expenditures and advantages resulting from this type of service. Obviously, this task is highly difficult for not only must we estimate direct costs but also indirect ones such as loss of income, or certain social costs associated with the quality of life. A major American study by Dorothy Rice and Barbara Cooper (1976) has shown that indirect costs can be as high as, if not higher than, direct costs.

It is important to evaluate the aggregate cost of health in Canada, not only because of monetary considerations but more importantly because of questions of social priorities and human investment. Health service costs have often been perceived as an expenditure for the purpose of bringing a certain portion of the population to a satisfactory level of physical and mental well-being. With respect to medical services, Canada is one of the best equipped

nations in the world. However, to achieve this, Canadians have been spending a substantial part of their income to finance a pan Canadian medical and hospital regime. Nearly half of these funds are absorbed by the hospital sector. In 1976, Canadian hospital operating expenditures amounted to more than \$5.5 billion, representing 3.4% of GNP. These expenditures financed a variety of medical and paramedical services offered to the Canadian population.

In this study we examine the cost of medical services in terms of the principal categories of diseases treated in hospitals and as a function of the age group of medical service users. We attempt to determine what types of major illness occasioned the highest expenses and in what age groups the largest number of hospital service users were to be found. This allows us first to determine the treatment sectors in greatest "demand" and to identify the users' age groups, and, secondly, to present a complete table of the profile of use and relative significance of units of consumption.

Additional objectives of this study were: to estimate the short-run (1976-86) effects of demographic changes on total hospital expenditures; and, to attempt a calculation of the average hospital expenditures which might be generated during an individual's lifetime.

Methodology

Using hospital admission/separation data for 1976, the total number of days accumulated during that year by patients separated from a given hospital were disaggregated according to sex, eight age groupings, and the 18 major chapters of the International Classification of Diseases (I.C.D.).

*Douglas E. Angus, Louis A. Lefebvre and Claude Strohmenger
Research and Analysis Section, Health Division, Statistics Canada

From the annual returns of hospitals submitted by all general and allied special hospitals for 1976, we obtained total operating expenditures for each hospital, as well as the total number of patient days during the year.

For each hospital, expenditures were allocated by sex and age groups to a diagnosis in proportion to the number of days of care attributable to the diagnosis. Thus we obtained an estimate of total hospital expenditures distributed by age and sex for the major I.C.D. classifications for hospitals where complete matches could be made. Data derived in this manner for each individual hospital were aggregated to provincial totals. Where information was not available, imputations using the provincial aggregates as a basis for distributing residual expenditures were made.

The projected hospital expenditures are based on a straight-forward calculation, i.e., for each age group the projected population for each year in the period 1976-86 was multiplied by the average expenses calculated in 1976 for the corresponding age group.

With respect to individual life-cycle hospital expenditures, we begin with a few basic assumptions. First, we assume a cohort of 100,000 people of each sex born in Canada in 1976. Next we assume that migration would not affect their number and that during different stages of their lives, they will be subject to the same risks of death as were observed at the corresponding ages during the period 1975-77.

What we have then is the framework of a model based on the longitudinal life table concept, which illustrates the life expectancy of a cohort subject to only one phenomenon: mortality, the level of which is that observed during the 1975-77 period. From this model we obtain the total number of years the members of the cohort group would live and, since everyone will not die at the same time, the distribution of these years lived $L_{x,x+a}$ according to the age intervals $x, x+a$.

The average hospital costs for these people, broken down by sex and age, is based on those which are used for the projection period 1976-86, and, of course, are based on the same assumptions. These average per capita expenditures $C_{x,x+a}$ are expressed in constant (1976) dollars and kept constant throughout the life of the cohort.

Since these average costs represent, in fact, mean life year expenditures for the age groups considered, total hospital expenditures are at the termination of the cohort:

$$H = \sum_{x=0}^{\bar{\omega}} (C_{x,x+a}) (L_{x,x+a})$$

where the average cost (\bar{C}) is:

$$\bar{C} = \left(\frac{1}{100,000} \right) H$$

The Results

We have found such things as:

- In 1976, less than 9% of the population (65+) was consuming more than one-third of hospital resources. The 0-24 age group, which represented over 45% of the total population, accounted for only 24% of total hospital expenditures.
- Diseases of the circulatory system, accounting for more than \$500 million each for males and females, are the most significant condition requiring hospitalization in Canada.
- The four most costly diseases/illnesses (circulatory system, accidents, poisonings and violence, digestive system, and neoplasms) account for almost one-half of total hospital expenditures.
- In 1976, slightly more than one-third of hospital expenditures were consumed by the 65+ age group; it is estimated that this group will utilize 40% of hospital resources in 1986. Costs for those 75 years of age and over will increase more rapidly than the total for all people 65 years and older.
- While population is expected to grow at an average annual rate of about 1%, the rate of increase in expenditures, everything else being equal, would be 1.5 to 2 times greater than population growth. This phenomenon is due primarily to changes in the age structure of the population.
- It is estimated that average hospital expenditures consumed in Canada during an individual's life cycle could be \$22,000 for a male vis-a-vis more than \$27,000 for a female, expressed in constant (1976) dollars.

Contribution

This analysis of hospital expenditures can be useful to planners and policy makers in the health care sector in determining priorities for health services and health research. Regarding the proportion of total hospital expenditures accounted for by the four leading disease categories (i.e., 46%), our study does comply with similar studies done in the United States (e.g., Rice and Cooper 1976). There also are similarities between this and the U.S. studies with respect to the effect that aging of the population can have on expenditures. Also of interest to policy makers is the observation that hospital expenditures for a given disease category can vary significantly by province. Finally, another interesting but relatively unexplored dimension of costs of illness presented in this study is the portrayal of lifetime hospital expenditures incurred by an individual.

Observations

The Health of Canadians

Introduction

Relatively adequate Canadian statistics have been available for many years to describe the principal causes of institutional morbidity and mortality as well as the utilization and costs of health care services. Much of this information is a by-product of the record-keeping by provincial health insurance plans, supplemented occasionally by special surveys on specific topics. Except for the occasional population survey, the information has focussed on only one part of the total health scene - the more extreme illness which comes to the attention of the health care system. While important, this perspective leaves significant areas untouched.

The Canada Health Survey (CHS) was intended to fill these gaps by providing statistics required for planning and evaluating health policies and programs which were not available in a comprehensive way from any other source. The CHS looked at three facets of health: (1) risk factors, (2) health status, and (3) consequences of ill health.

Three main types of risks to future health are probed in the CHS. These are lifestyle, biomedical and environmental. Lifestyle, in particular, lends itself to measurement in a household survey.

Health status, only partially the outcome of earlier risk exposure, has positive and negative dimensions which were measured for both physical and emotional health.

Because morbidity statistics have customarily been derived from health records which report single episodes rather than entire histories, it has been impossible to assess the personal burden of ill-health, especially for problems not reaching the health care system. The CHS rectifies this by identifying health problems and their consequences for each sampled individual, and using these to evaluate the impact of ill-health.

The CHS covered the civilian, non-institutionalized Canadian population, excluding residents to the territories, Indian reserves and remote areas. The survey field work began in May 1978 in the eastern provinces, the central provinces in June, the remaining provinces in July, and was terminated in March 1979.

Summary of Findings

More men than women are exposing themselves to the risk of heart attack, lung cancer and accidents by indulging in heavy smoking and drinking. Four times as many men as women are heavy drinkers and twice as many are heavy smokers. This data is consistent with the known fact of higher mortality rates for men. However, with changing social mores, it has become increasingly acceptable for women to drink alcohol and to smoke. This is reflected in the figures that demonstrate that, for the population under 25 years of age, there is little difference in consumption between the sexes. Should this trend continue, there may be important changes in patterns of illness in the future.

Although the combination of birth control pills and smoking presents a much advertised risk of heart attack and stroke, women who take the pill are somewhat more likely to be smokers than those who do not take the pill.

On the positive side, the majority of the population does not smoke and nearly 4 million Canadians have been able to "kick the habit". Of those who do smoke, nearly one-third have made a real attempt to reduce their smoking in the previous year.

The study also measured fitness and levels of physical activity. Only one-third of Canadians are as active as they should be (based on Fitness Canada's "Prescription for Physical Activity") and only 40% enjoy

a recommended level of fitness. Women are not as active as men, at all ages. The survey indicated those who are fit are more likely to have lower blood pressure and their emotional health is generally much more positive.

Other positive health practices are also ignored or neglected by Canadians. Motor vehicle accidents are a major cause of hospitalization and premature mortality. Even though it has been proven that wearing seatbelt reduces the risk of death or serious injury, only 50% of the population uses them all or most of the time. A significant fact for policy makers to consider is that legislation does make a difference. In provinces with mandatory seat belt legislation, 60% of drivers and passengers report wearing their seatbelts. This figure is only 16% elsewhere.

Immunization is an effective means of preventing many serious illnesses and yet more than 4.5 million Canadians are susceptible to polio. While the survey did not provide the reasons, the proportion of the population which is susceptible is nearly twice as great in Québec as in the other regions.

Rubella or "German measles" is not a serious illness in itself, but it does have the potential to cause birth defects. The 237,000 women in their prime childbearing years (15-34 years) who are inadequately protected against rubella, therefore, are of concern.

The Pap smear and breast self-examination, are two accepted preventive measures for women. Only 42% of women report having had a Pap smear during the previous year, and 21% have never had one. Sixty percent of women conduct breast self-examinations, although only 21% do so on a monthly basis. Almost half the women over 65 do not do this despite the fact that the risk of breast cancer increases with age. Women with a higher education are more likely to have both these tests indicating that health promotion and education efforts should be focussed on women with secondary school education or less.

One of the purposes of the survey was to determine the prevalence of health problems in the population and the impact that these have on the lives of Canadians. Heart disease, cancer, stroke, respiratory disease and accidents are well known as the major causes of death. The problems Canadians live with on a day to day basis, rather than die from, are quite different. They are, in order of prevalence: arthritis and rheumatism; back, limb and joint disorders; hay fever and other allergies; skin allergies and skin disorders; and dental trouble. Not surprisingly, the proportion of the population with at least one health problem increases with age; over 85% of the elderly (65 and over) report at least one problem.

The prevalence of health problems varies with income level. Those in the lowest income group experience a markedly higher proportion of mental disorders, heart disease, bronchitis and emphysema, whereas those in the highest income group are more likely to suffer from hay fever and other allergies.

Twelve per cent of Canadians experience long term disability as measured by a limitation of activity. The

proportion of the population with long term disability increases with age, with the result that nearly 40% of the elderly report at least some functional limitation. Two per cent of the population, or nearly half a million Canadians, are so severely disabled that they cannot carry out a major activity such as work, school or housework. Of these, over 300,000 are in the 15-64 year-old age group.

With respect to short term illness, Canadians experience an average of 15.7 disability days per person per year. A disability day represents a day of short term illness during which an individual restricts his/her activities. Women have higher rates of disability days than men for all age groups. As is the case with long-term disability, the number of disability days increases with age, the elderly (aged 65 and over) reporting an average of 35 disability days per person per year.

On average, working persons miss 4.3 days a year because of ill health. For Canada, this amounts to 37 million working days per year. To put this in perspective, the total number of days lost because of strikes and lockouts in 1978 was 7.4 million.

In terms of mental health, those who report psychological distress are less often in good general health, are less likely to be physically active in their leisure time and more likely to use tranquilizers and sleeping pills.

During any given two day period 48% of the population take at least one drug (medicines, pills or ointments, birth control pills or vitamins). Of those taking drugs, 60% take at least one drug on the advice of a medical doctor, but 25% do not have an associated health problem. One quarter of women aged 65 and over take three or more different kinds of drugs simultaneously.

Although 76% of the population consults a medical doctor at least once a year, those with higher incomes are more likely to consult a health professional on a routine basis for check-ups and consultations.

The Canada Health Survey has given us a much clearer picture of the risks to which Canadians expose themselves and the lack of preventive measures taken, especially by some groups in our society. Thus it has identified target groups for future health promotion and prevention programs. Further, the health care system appears to be doing a good job overall in treating existing health problems in that the primary reasons given for not consulting a health professional about a specific health problem are that the problem is not considered serious enough or is thought to be under control. However, the survey has also identified the presence of chronic and degenerative health problems particularly among the elderly. This will have an increasing impact on demand for a wide variety of health and social services in light of the aging of the Canadian population.

Additional Information

The information presented in this article can do little more than hint at the wealth of detail that can be gleaned from the CHS database. Over one hundred

tables, together with accompanying analysis and discussion, are presented in the *Health of Canadians* (Statistics Canada catalogue number 82-538). Special

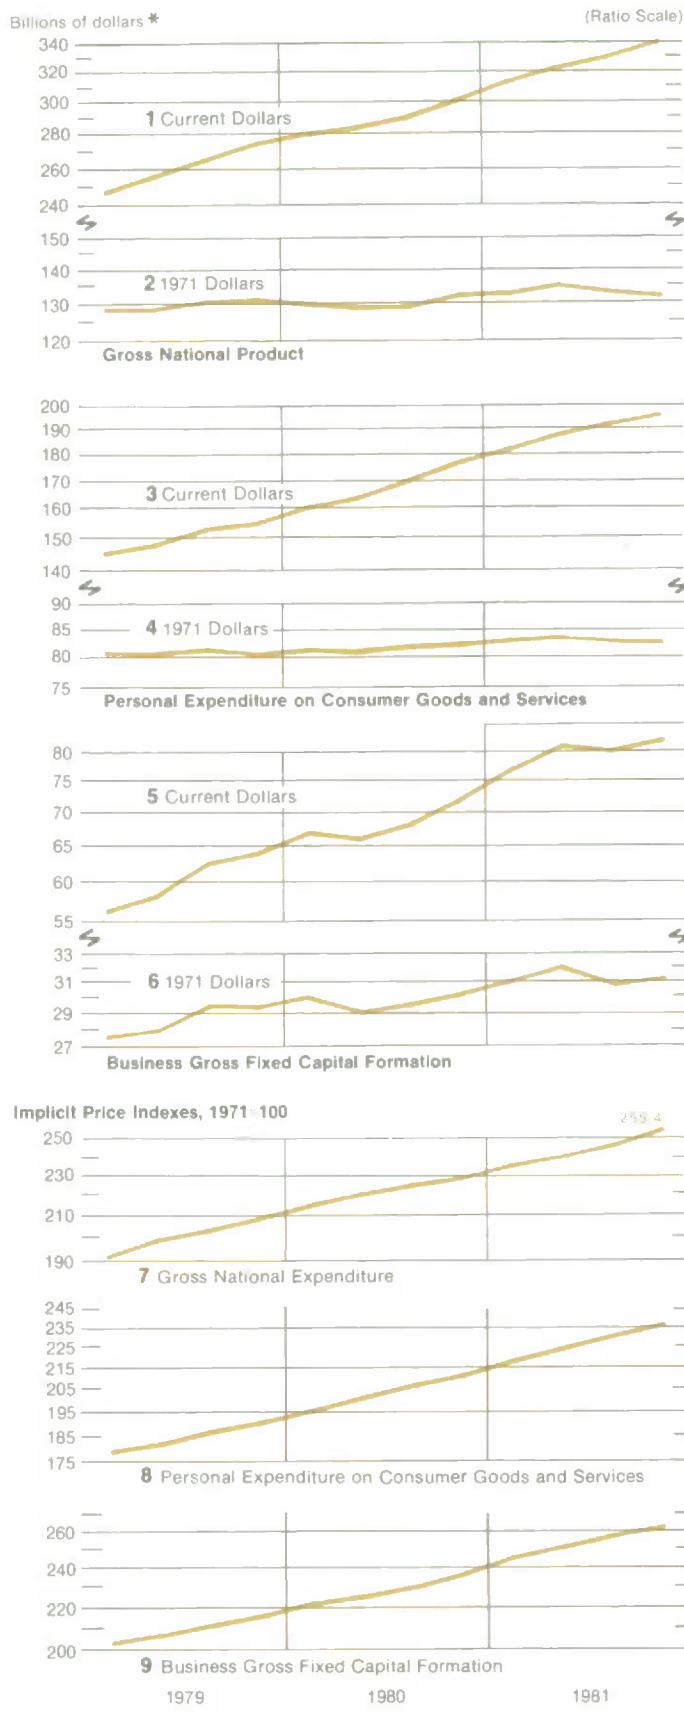

tabulations can be obtained through the Health Division of Statistics Canada or by purchase of the CHS public use tape.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506.

²Beginning with 1978, this is subdivided into entrepreneurs and managers-administrators. For breakdown refer to CANSIM main base.

³Includes logging, fishing, trapping and hunting.

⁴Includes mechanical and construction.

⁵Includes a small number in non-specified occupations.

⁶Beginning with 1978 includes fiancés and fiancées.

⁷Does not include students entering Canada on students' visas.

Beginning with 1978, fiancés and fiancées are included with spouses.

¹Excludes profits (net of losses) of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. ⁴Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given to the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2.

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. ⁴The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). ⁵See footnote 4, Table 1.1.

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. ²Tax liabilities. ³Withholding taxes. ⁴The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series.

For source see Table 1.9.

¹These implicit indexes are current weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

For source see Table 1.9.

¹The labour force as a percentage of the population 15 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. ²The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

^aStatistics on work stoppages include all strikes and lockouts whether legal or illegal, which last for one-half day or more and amount to 10 or more person-days of time lost. Time lost by workers indirectly affected, such as those laid off because of a work stoppage by other employees, is not included. Data is published 45 days after the end of reference month.

^bThe industry groups from January 1976 forward, are based on the 1970 Standard Industrial Classification. ^cThe number of person-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. ^dThe total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. ^eIncludes publishing and allied industries. ^fIncludes storage and communication industries.

^aSee footnote 1 and source in Table 10. ²Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 9. ³In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing.

⁴Except machinery and transportation equipment industries.

^aThe data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater Industrial and area detail and more explanatory notes are given in the source publication named below.

^bIn addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing.

¹These weights, provided as a general guide, show the relative importance of the major components of the C.P.I. They are based on expenditure values derived from quantities and prices of year 1974.

²With the introduction of 1974 weighting pattern in October 1978, city indexes were revised from January 1971 onwards. The revision was largely the result of making the procedures used in the compilation of city indexes conform to those of the Canada indexes.

¹Estimates of manufacturers' shipments, inventories and orders are based on a monthly survey of a sample of manufacturing establishments, benchmarked to the annual census of manufacturers. ²Shipments of goods manufactured within the establishments. ³Total new orders received during the period at estimated selling value, net of cancellations. ⁴Total manufacturing inventory owned by manufacturing establishments. Other inventory such as that of goods purchased for resale is not included.

Note: All series are subject to revision each year when more recent Census of Manufactures data become available.

¹Estimates of manufacturers' shipments are based on a monthly survey of a sample of manufacturing establishments benchmarked to the annual Census of Manufactures.

Note: All series are subject to revision each year when more recent Census of Manufactures data become available.

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

Table 3: Manufacturing inventories¹ by industry based on the 1970 standard industrial classification (million dollars)

Annual average and month	Total inventories owned	Non-durables	Durables	Foods and beverages	Tobacco products	Rubber	Leather	Textile	Knitting mills	Clothing	Wood

¹Separate industries series combined for the Supplementary Classification automotive products, are also components of other classifications. Other economic use classification groups are mutually exclusive and except for rounding differences add to relevant Canada totals in section 6, table 1.

Note: All series are subject to revision each year when more recent Census of Manufactures data become available.

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

Table 5: Estimated value of inventories owned and raw materials in manufacturing industries, by economic use classification, based on the 1970 standard industrial classification (million dollars)

Annual average and month	Inventories owned						Inventories held: raw materials							
	Consumer goods		Machinery and equipment	Construction materials and components	Other intermediate goods & supplies	Export-based industries	Supplementary classification: automotive products	Consumer goods		Machinery and equipment	Construction materials and components	Other intermediate goods and supplies	Export based industries	
	Non-durable	Durable						Non-durable	Durable			Supplementary classification: automotive products

¹Pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. ²Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. ³Customs exports. ⁴Mill shipments destined for export.

¹Data compiled according to the Steel Distribution Index revised January, 1964. ²Figures on net shipments relate to semi finished and rolled steel products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ³Excluding shipments for re-processing at maker's own plant. ⁴Data compiled as submitted by the steel producers according to the steel industry distribution code.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

¹Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. ²1977 and 1978 price indexes are subject to revision. ³1978 price indexes are subject to revision. ⁴Farm share only of motor vehicles. ⁵The major groups include additional components than the selected ones shown.

Note: Components may not add to totals due to rounding and partial revisions.

¹Fully secured by marketable bonds and stocks. Excludes loans to finance the purchase of Canada Savings Bonds.

²Includes loans on the security of household property.

³Not available on a monthly basis.

⁴Includes loans to finance companies which are affiliates of retail merchandisers.

⁵Religious, educational, health and welfare institutions.

⁶Differs from general loans in Section 13, Table 2 by the exclusion of loans to instalment finance companies.

¹Column numbers refer to Tables 3 and 4, Section 11.²Includes special transaction-trade, not shown separately.

*The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months.

*Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc.

Source: Exports by Commodities (65-004), Summary of External Trade (65-001).

¹Column numbers refer to Tables 3 and 4, Section 11. ²The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ³Includes special transaction-trade, not shown separately. ⁴Includes scrap. ⁵Some series such as general purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp. Drilling, excavating and mining (68) now include oil and gas field machinery. Mechanical power transmission equipment (72) now exclude special industry machinery.

¹Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. ²Cargo includes air freight and express but excludes mail and excess baggage.

Note: Components may not add to totals because of rounding. Cheques drawn on the Receiver General or cheques drawn on bank deposit accounts held in the name of the Receiver General are not included in the data.

¹This series covers 50 clearing house centres. With the advent of centralized data processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; however, this comparison may not remain valid through time. ²Seasonally adjusted data for Saskatchewan is not available.

¹This statement includes only receipts relating to budgetary revenue. Excluded are non-budgetary revenues such as Old Age Security Fund taxes, Prairie Farm Assistance Act levies, employer and employee contributions to government-held funds (Unemployment Insurance, Superannuation etc.), interest on government-held funds, and taxes collected on behalf of and transferred to other governments.

²Beginning in December 1973, this category includes oil export tax.

³March includes supplementary payments arising from the closing of the accounts.

1. Data are for public sector only.

2. Full-time equivalent educators are head counts for full-time teachers plus number of part-time teachers times the portion of the year that they teach. Teachers not reporting full-time equivalency are assumed to be of full-time status.

3. The number of full-time equivalent educators, for 'elementary', 'secondary' and 'elementary and secondary' schools include full-time and part-time educators excluding board staff but the total figures include board staff.

4. Data on teachers and students in Prince Edward Island for 1976-77 were arrived at using different definitions of school level. As such, pupil-teacher ratios based on these data are not valid.

5. Full-time equivalent students are head counts for students or students in grades 1 through the end of secondary, plus one-half the number of students in pre-elementary (except in Nova Scotia where pre-elementary students are full time).

6. Only total figures are available in Quebec for full-time equivalent students and educators.
