Data in Many Forms..

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

CANSIM Division

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 990-8200)
or to the Statistics Canada reference centre in:

St. John's	(772-4073)	Sturgeon Falls	(753-4888)
Halifax	(426-5331)	Winnipeg	(949-4020)
Montreal	(283-5725)	Regina	(359-5405)
Ottawa	(990-8116)	Edmonton	(420-3027)
Toronto	(973-6586)	Vancouver	(666-3691)
Credit card only (973-8018)			

Toll free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional references centres.

Canadian Statistical Review

Data in this publication were retrieved from CANSIM† (Official Mark of Statistics Canada for its Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, tape or directly via terminal.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:

CANSIM Main Base Series Directory, 1984 — \$75.00 Canada, \$90.00 other countries

The Directory includes an index which serves to identify, at a fairly aggregative level, the contents of the CANSIM database. This index provides a key to the Series Directory and is the first step in locating series from the CANSIM Main Base.

This Directory is a detailed guide to the data on the CANSIM Main Base. It gives the title, start date, source of the data, and other descriptive material.

CANSIM Mini Base Series Directory, Catalogue 12-569 — \$45.00 Canada, \$54.00 other countries

This Directory is a detailed guide to the data on the CANSIM Mini Base — a standard subset of data originating from the CANSIM Main Base which is available at various Secondary Distributors.

CANSIM-Cross Classified Data Base Index — \$7

This index provides a summary of available data on the Cross Classified Data Base.

CANSIM-Cross Classified Data Base Directory — \$20

This directory provides a detailed guide to the Cross Classified Data Base. It provides a description of the structure of each table.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used is the Statistics Canada X-11-ARIMA seasonal adjustment method. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series in MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following members:

- J.S. Wells (Acting Chairman) — Assistant Chief Statistician, National Accounts and Analytical Services Field
- R.E. Drover — Director, Transportation Division
- B.J. Lynch — Director General, Operations Branch
- R. Platek — Director, Census and Household Survey Methods Division
- J.G. Stinson — Director, CANSIM Operations Division
- G.J. Brackstone — Director General, Methodology Branch

- A. Meguerditchian — Director, International and Financial Economics Division
- L.O. Stone — Director, Population Studies Division
- P.N. Triandafillou — Director, Agriculture/Natural Resources Division
- K. Lal — Director General, System of National Accounts Branch
- D. Bergeron — Editor, Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at: CANSIM Division, 9th Floor, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

Subscriptions

Note to Users

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

Section 4 — Table 6: Unemployment insurance statistics

Monthly or quarterly data may not add to totals due to rounding.

This table has been re-structured. We have removed the series "Trainees" (D730353) and have added the series "Beneficiaries receiving regular benefits" Unadjusted (D730603), and Seasonally Adjusted (D736531). Please note that the footnotes have been revised.

Structure, Trends and Fluctuations on the Balance Sheets of the Major Sectors in the Economy, 1961-1984. *

Introduction

The National Balance Sheet Accounts provide the stock dimension to the existing flows in the National Income and Expenditure Accounts and the Financial Flow Accounts. As such, the data are an additional set of indicators on the position of the economy, and the sectors within the economy, both at any given point or over time¹. A cursory examination of the data in the National Balance Sheet Accounts reveals that the relative position of the various sectors has shifted over the period 1961-1984.

Reference to Text Table I will reveal the relative magnitude, and changes in magnitude, of the sectors' proportions of assets between 1961 and 1984. While all sectors have shown growth in their assets in absolute terms at rates faster than GNP, there has been a relative shift towards the corporate sector. Persons and unincorporated business have registered quite a large drop, with governments also showing a decline. Most of the countervailing increase has been assumed by financial institutions in the form of financial assets. (Part of the explanation of this growth has been due to the increased sophistication, competition and innovation of these institutions in responding to demands for financial services). Most of the change in the relative importance in ownership of tangible assets has been from persons and unincorporated business to non-financial corporations. On the other hand, if financial institutions are excluded, a comparison of the non-financial sectors indicates that there was a modest shift of domestically-held financial assets from governments to non-financial corporations and persons and unincorporated business.

Persons and Unincorporated Business

In the National Balance Sheet Accounts, as in the Canadian System of National Accounts, what is often referred to as the household or personal sector is Persons and Unincorporated Business. Persons and Unincorporated Business accounts, on average, for about 60% of GNE through purchases of consumer goods and services. Income aside, the sector's financial position — wealth, debt and holdings of tangible assets — exert an important influence on such expenditure. What is leftover from income, after expenditure (including non-financial capital acquisition) accumulates as saving in the form of financial assets or is used to reduce outstanding debt.

Table II illustrates the changes in the sector's balance sheet by showing the percentage distribution of the various components for selected years over the period 1961-1984. The sector's total assets grew 10.5 times, from 1961 to 1984. There is just about an even split between financial and tangible assets on the sector's balance sheet, although there have been some significant year to year fluctuations in their relative shares. The growth in liabilities outpaced that of assets over most of the period, resulting in a slower growth of net worth. Liabilities rose thirteen-fold, while net worth increased ten-fold, declining from 86.6% of total assets in 1961 to 83.5% at the end of 1984. Inflation has had a marked effect on the growth of the assets and thus the net worth of this sector, and its effect is clearly evident in the case of the tangible assets.

* Enquiries regarding this article should be addressed to Patrick O'Hagan, International and Financial Economics Division, Statistics Canada. For the detailed statistical tables (covering all sectors and subsectors of the economy), as well as an overview of the concepts, data sources and methodology, the reader is referred to the National Balance Sheet Accounts, 1961-1984 (catalogue 13-214, annual) released June 1985.

¹ The detailed sectoring presented in the National Balance Sheet Accounts is compressed here to correspond to the more aggregated sectors in the National Income and Expenditure Accounts, except that the corporate sector is split between non-financial enterprises and financial institutions.

(1) Components may not balance due to rounding

The tangible assets of this sector, excluding land, consist largely of residential structures (51.7% at the end of 1984) and consumer durables (30.2% at the end of 1984). The relative importance of the various tangible assets on the sector's balance sheet has not shifted significantly in the period under analysis. Housing's share in tangible assets excluding land, grew most rapidly from 1971 (49.0%) to 1978 (57.0%), roughly the latter part of the period associated with the maturing of the post-war baby boom generation. The growth rate of the tangible assets as measured by the year over year change, is uneven. The strongest growth in current dollar tangible assets was clear during both periods of double-digit inflation.

The other reproducible tangible assets (excluding land) are inventories (mostly farm inventories) and capital stock (non-residential structures and machinery and equipment) associated with unincorporated business and, to a lesser extent, non-profit institutions. Together, inventories and capital stock account for approximately 18.1% of these tangible assets at the end of 1984, as compared to 24.7% at the end of 1961, reflecting a relative decline in the importance of unincorporated business.

The household sector is the major surplus sector in the economy. It is thus a net supplier of funds in the economy, with the result that financial assets outweigh liabilities by an average ratio of 3.0 to 1.0 over the 24 years. This ratio has declined steadily, however, from 3.76 in 1961 to a low of 2.53 in 1976 only to recover to 3.24 in 1984. The growth of the financial assets of this sector, as measured by the annual rate of change, advanced from 7.0% in 1962 to 21.0% in 1979 but then fell sharply to 7.0% again in 1983.

Fluctuations in the ratio of financial assets to personal disposable income (PDI) do not appear, *prime facie*, very consistent with changes in the personal savings rate, and the two series appear to be somewhat contradictory from 1970-1975 (see Chart 1). In fact, while there has been a long-term rising trend in the saving ratio, the ratio of financial assets to PDI was about the same at the end of 1983 as in 1961. It is often assumed that the relatively high levels of the personal savings rate that have been wit-

nessed since 1971 can lay the basis for substantial increases in consumer spending at some point. However, what remains as savings after deducting current expenditure² from current income can be used to accumulate financial assets, but also to liquidate outstanding debts or acquire tangible assets'. These two alternatives are not inconsistent with increases in the personal savings rate.

Personal sector saving in financial assets is concentrated in bank and other deposits, Canada Savings Bonds, life insurance and pensions, and equity of corporations³. The relative shares of these forms of saving have shifted over the last twenty-four years, showing that the nature by which this sector supplies funds to the rest of the economy has changed (see Chart 2).

The most significant change in the structure of the financial assets over the period has been the pronounced increase in deposits and the relative decline in other assets, especially bonds. Currency and deposits have grown from 25.2% of total financial assets in 1961 to 34.9% at the end of 1984. This shift away from bonds and into deposits also reflects the growth in, and increased competition among, the deposit-taking institutions, which has resulted in an increase in the amount of savings/funds channelled through these financial institutions. Total bonds have declined from 18.4% to 10.4% of financial assets. Declines are most apparent in corporate bonds and in the largest component, federal government bonds (of which Canada Savings Bonds average 85%). Despite a decline in

² Consumer durables can either be included in current expenditure and excluded from tangible assets (NIEA concepts) or excluded from current expenditure and included in tangible assets (NBSA concepts).

³ The financial assets of persons can be viewed as being understated in their present form. Some analysts are of the opinion that the assets of the Canada and Quebec Pension Plans (whose relative shares in National Assets are not negligible) should be also included. The rationale for their inclusion is that such funds constitute saving and are available for future consumption.

the demand for life insurance⁴, the "life insurance and pensions" component has maintained its share in the financial assets of this sector. This is due in part to the effect of the increase in the amount of saving through Registered Retirement Savings Plan in segregated funds of life insurance companies (the result of tax incentives) and is also in line with the general aging of the population⁵. Corporate shares have remained as a consistent proportion of the sector's asset portfolio.

The two largest items on the liability side of the sector's balance sheet are consumer credit and mortgages. Together, they account for between 81.5% (1961) and 87.3% (1984) of total liabilities for the sector. Consumer credit relates directly to the household's share, while mortgages in this sector are largely accounted for by households. The remainder of the liabilities consist mostly of bank loans from other financial institutions to unincorporated business and non-profit institutions. The ratio of liabilities to net worth rose sharply through the 1960's to reach a high in 1978, only to decline steadily to the end of 1982. As might be expected this ratio has generally tended to decline during periods of slowdown in economic activity and rise in periods of economic expansion.

⁴ For a discussion of this phenomenon, the reader is referred to the article by Randy Geehan, "The Life Insurance Industry in Canada, 1961-1979", Canadian Statistical Review, July 1981.

⁵ Census data indicate that the median age of the population has risen from 25.4 years in 1966 to 29.6 years in 1981.

Consumer credit is credit extended to persons to finance the purchase of consumer goods and services, largely consumer durables⁶. This suggests that changes in the level of consumer debt outstanding is related to changes in the stock of consumer durables. The annual rate of change of consumer credit debt exhibits roughly similar movements as the corresponding series for consumer durables. Differences between the two series are accounted for largely by the fact that the consumer debt series is also affected by changes in the rate of repayments. The ratio of consumer credit debt to personal disposable income grew from 16.1% in 1961 to a high of 22.9% in 1979 only to fall sharply to 18.0% at the end of 1982 (see Chart 3). One of the single most important factors in fostering the growth of consumer credit over most of the period was the evolution of attitudes regarding credit purchases and debt in general. Moreover, inflation and the resulting low "real" cost of borrowing in the early 1970's seemed to have encouraged the accumulation of tangible assets and a greater proportion of borrowing in the acquisition of such assets. The ratio of consumer credit debt outstanding to the stock of consumer durables owned by persons mirror the variations in the consumer credit to personal disposable income ratio.

⁶ For a more detailed discussion of consumer credit, the reader is referred to the article by Patrick O'Hagan "Consumer Credit Demand in Canada, 1961-1982", Canadian Statistical Review, February 1983.

Mortgage credit in this sector covers mortgage loans secured almost exclusively by residential buildings (and the land associated with such buildings). The demand for mortgage financing is derived from both the demand for new housing and the refinancing of existing units. The trend in the annual growth rate of mortgage credit in this sector bears a close relationship to its counterpart in the tangible assets, residential structures, with the highest rates of growth in both series in the period 1970 to 1977. The ratio of mortgage debt to housing stock rose

from 38.3% in 1961 to 57.5% in 1984. Mortgage credit outstanding as a proportion of personal disposable income also increased through the 1960's and 1970's (see Chart 4). Demographic factors affecting the demand for housing have contributed to the growth in mortgage credit. Factors affecting the demand for consumer credit have likely played a part in the demand for mortgages — double-digit inflation in the early 1970's and the associated historically low "real" rates of interest.

Non-Financial Corporations

Non-financial corporations include private corporations as well as government business enterprises. Non-financial private corporations earn the largest share of total corporate profits, on average, and account for the largest percentage of gross fixed capital formation in the economy. This sector, by virtue of its size, is thus of considerable interest by itself. This section will deal first with trends in non-financial private corporations in isolation and then extend the analysis to include government business enterprises.

Non-financial private corporations hold the largest portion of the economy's fixed capital stock. The sector accounts for 64.5% of all share capital, 68.0% of the non-government bond debt and 70.5% of the bank loans outstanding at the end of 1984. Trends in the balance sheet can be seen from a translation of the data to percentage form (see Table III). Total assets have increased nine-fold from 1961 to 1984. Tangible assets make up the major portion of this total, averaging 71.0% of total assets over the period. The annual rate of change of total assets is correlated with inflation, notably during the double-digit inflation of 1973-75 and 1979-81.

The largest tangible asset on the sector's balance sheet, excluding land, is fixed capital stock, ranging from 74.3% of tangible assets in 1961 to 79.8% at the end of 1984. Inventories' share in tangibles has declined from 19.0% to 12.4% over this period, reflecting, in part, improved methods of inventory management, in the light of higher costs in recent years. The housing stock portion of tangible assets has risen slightly from 6.7% in 1961 to 7.8% in 1984.

The composition of financial assets — that average 29.0% of total assets — has shifted in the period under review. There has been some substitution of currency and deposits for short-term marketable securities (short-term paper and Treasury bills). The sector's share of lending via consumer credit has declined, reflecting both the separation of selling and financing operations in the retail trade industry as well as the growth of consumer financing by chartered banks and other financial institutions.

There have also been declines in the relative proportions of corporate shares and bonds, held as assets, in favour of an increase in corporate claims. This last development is in line with the growth of large corporations, and their investment in their subsidiaries and/or affiliates.

The structure of the debt of non-financial private corporations has also changed (see Chart 5). Long-term financing via bond issues has slowed relative to other forms of borrowing, particularly since 1971. Bonds have declined as a proportion of outstanding debt from 24.4% in 1961 to a low of 10.9% in 1980 only to recover moderately to 13.1% by 1984. The major offset of this decline is a pronounced increase in the share of bank loans, and, to a lesser extent, loans from other financial institutions and short-term paper. Bank loans have risen from 11.4% of outstanding debt in 1961 to a high of 25.6% in 1981, before falling rather sharply to 21.4% in 1983 following substantial repayment of this instrument in that year. These changes in the composition of debt can be viewed as an overall shift away from long-term to short-term debt. It is likely that a significant portion of the changes in the composition of the liabilities since 1979 was related to interest rates and inflation.

The long-term trend to external debt financing is reflected in the debt to equity ratio for non-financial private corporations (see Chart 6). Debt to equity (or leverage ratio) is the relationship of borrowed funds to funds contributed by the owners either through share issues or retained earnings. The ratio of debt to book value equity⁷ exhibits a long-term upward trend. This ratio has risen from 0.99 in 1961 to a high of 1.57 in 1982 only to decline to 1.37 in 1984. The sharpest growth in the debt to equity ratio occurred in 1980-81, coinciding with substantial takeover activity, financed to a significant extent from bank loans. However, these corporations have re-structured their balance sheets in 1983-84 by replacing short-term debt with long-term debt and expanding the equity base, through the issuance of shares and growth in retained earnings.

⁷ Equity includes the book value of shares, contributed surplus, retained earnings and revaluations from recognized capital gains.

(1) Components may not balance due to rounding.

(2) Net worth is defined here as total assets less liabilities.

A second debt to equity ratio can be constructed, where equity is derived as total assets less liabilities — i.e., net worth with tangible assets at current values. On this basis, the debt to equity ratio does not have a rising trend, though there was a spike in 1980 which was largely reversed in 1983 (see Chart 6). This measure of net worth contains not only shares and accumulated earnings but also the substantial unrealized capital gains from holding tangible assets over an inflationary period. This measure of net worth with assets at current values is often taken as the equity base that affects the decision-making process of corporations. This derived net worth can be broken down between (i) the book value of equity and (ii) the revaluation of tangible assets, and it can be seen that the latter component has grown relative to the former component (see Chart 7).

The inclusion of non-financial government business enterprises with non-financial private corporations to produce a total of non-financial corporate sector changes the size but not the overall structure of the balance sheet we have considered thus far in this section (see Table IV).

Measured by total assets, it can be seen that non-financial government business enterprises have grown relative to non-financial private corporations. Total assets of the former grew at a compound annual rate of 12.4% from 1961 to 1982, as compared to 11.6% for the latter. The ratio of non-financial private corporations to non-financial government business enterprises assets has increased from 19.0% in 1961 to 22.1% at the end of 1984.

Financial Institutions⁸

A developed financial system is a characteristic of any modern western economy. This section will examine some broad trends in the financial system over the period 1961 to 1984.

An appropriate indicator of the growth and the size of the financial system is the financial intermediation ratio — the ratio of the financial assets of financial institutions to total (economy-wide) financial assets. This ratio has increased steadily in the period under review (see Chart 8). The sharpest growth occurred in the period 1971 to 1976. Evidence of a marked increase in intermediation was apparent when examining the change in the composition of the financial assets of persons and unincorporated business — the largest surplus sector in the economy. The ratio of financial assets of financial institutions to GNP also indicates substantial growth in financial institutions over this same period (see Chart 9).

The combined balance sheet of the financial sectors (in percentages) can be used as a basis for highlighting some of the structural changes in the financial system from 1961 to 1984 (see Table V). Liabilities have largely shifted from life insurance and pensions into currency and deposits, indicating

⁸ The Bank of Canada, sector V-1, is excluded in this aggregation of sectors because of the nature of its operations.

a more rapid growth of deposit-taking institutions relative to the insurance industry. Financial assets dominate the asset side of the balance sheet, averaging 96.0% of total assets. Consumer credit, loans and mortgages have increased their share in assets from 40.9% in 1961 to 50.1% in 1981. Excluding short-term paper and shares, marketable securities' share in total assets has declined sharply from 34.3% in 1961 to 13.7% in 1984. In this group, the sharpest drop was in Government of Canada bonds, 12.1% to 2.6%.

It is evident that the growth of the insurance industry has been considerably less than that of the other financial institutions, resulting in a significant loss of market share. The strongest growth has occurred in the other deposit-taking institutions — the near-banks (trust companies, credit unions and caisses populaires, mortgage loan companies). This result is in line with the trend toward term deposits and Registered Retirement Savings Plans and the relative decline in the amount of personal saving through life insurance. Among the near-banks, trust companies recorded the most rapid growth. Chartered banks asset growth was also substantial, resulting in an increase in their relative share. Other private financial institutions recorded declines in their shares due to relatively slow growth, with the exception of holding companies which grew significantly. The share of public financial institutions rose in line with the strong growth in provincial financial institutions.

⁽²⁾ Net worth is defined here as total assets less liabilities.

Government⁹

This section will first examine the balance sheet of the federal government and then extend the analysis to include all levels of government.

Measured by total assets this sector's growth has been one of the weakest. Total assets increased 5.7 times from 1961 to 1984. Financial assets accounted for 62.0% of total assets in 1984 compared with 73.9% in 1961. The growth in liabilities was substantially greater than that of assets over the entire period. Liabilities grew 11.9 times from 1961 to the end of 1984. For most of the period net worth has been negative, and there is a pronounced downward trend to this series. Changes in the structure of the federal government's balance sheet can be seen from a translation of the data to percentage terms (see Table VI).

Tangible assets increased 8.3 times over the period under analysis. The main tangible asset of the federal government is fixed capital stock, ranging from 82.2% in 1961 to 83.6% in 1984 of tangible assets. This increase is due to a decline in the relative share of inventories. Financial assets rose 4.8 times from 1961 to 1984. The major financial asset is the federal government's investment in its government business enterprises. In 1961, the two largest financial assets were government claims (64.1%) and loans (14.8%). In 1984, the relative proportions had not shifted significantly (at 63.3% and 18.6%, respectively).

Net financial assets (i.e., financial assets less liabilities) are consistently negative over the period, but the magnitude changes with the variations in the federal government's budgetary balance. Liabilities were 3.4 times financial assets at the end of 1984, compared to 1.7 times in 1961.

The total liabilities of the federal government is a consequence of past budget deficits, and has increased since 1961 due to the predominance of such deficits, relative to surpluses, over the period. Liabilities can be broken down to show the changing proportion of marketable securities held by the Bank of Canada as well as the increasing share of such securities held by non-residents. While the debt has increased consistently in absolute terms it decreased as a proportion of GNP until 1975, but has been on a rising trend since (see Chart 10).

Between 1961 and 1984, the structure of the federal government's liabilities has changed although Government of Canada Bonds and Government of Canada Treasury bills remain the principal components (see Chart 12). At the end of 1984, bonds accounted for 62.4% (including Canada Savings Bonds which amounted to 23.6%) and Treasury bills for 27.3%. In 1961, bonds comprised 79.2% (with CSB's 21.4%) and Treasury bills at 9.9%. There has been a marked shift to marketable and shorter term debt with varying dependence on Canada Savings Bonds, and it would seem that many of the more significant shifts that occurred since 1979 were in response to the high nominal rates of interest.

The picture of government changes radically when we combine all levels of government and add provincial and municipal governments and hospitals. In terms of total assets, the other levels of government have grown much faster than the federal government. Total assets increased ten-fold over the period. This is composed of a thirteen-fold increase in tangible assets and an eight-fold increase in financial assets. Liabilities, on the other hand, grew 10.2 times, producing a faster rate of growth of net worth, which increased 11.2 times. The addition of the other levels of government reverses the negative net worth of the federal government.

⁹ The Canada and Quebec Pension Plans are excluded from government in this analysis.

The structure of the combined balance sheet of governments is also somewhat different (see Table VII). Since provincial and municipal governments invest more heavily in fixed (social) capital, than does the federal government, tangible assets of total government ranged from 49.7% in 1961 to 58.3% at the end of 1984. Government claims were the main financial assets, but more recently provincial, municipal and federal bonds, have assumed increased

importance, the result of holdings by other levels of government. Governments combined produce an aggregated domestic non-financial sector where liquidity (defined here as currency plus all marketable debt securities as a proportion of total assets) has increased over time. The major liabilities are federal, provincial and municipal bonds, and Treasury bills.

Rest of the World

The level of foreign investment in Canada and Canada's level of investment abroad are measured by the financial assets and liabilities of the Rest of the World (ROW) in the balance sheet accounts. Results at the National Balance Sheet level indicate that, whereas in absolute terms Canada's net liability abroad has grown rapidly, relative to the economy as a whole the position of the rest of the world declined up to 1975 but rose thereafter (see Charts 13 and 14). These results are now examined in more detail, in the balance sheet of ROW¹⁰.

Structural changes in the balance sheet of ROW reveal some interesting trends (see Table VIII). The nature of the ROW claims on Canada has shifted from relatively less foreign direct investment to more portfolio investment accompanied by a rapid build-up of currency and deposits in domestic financial institutions. Corporate claims, which contain the

foreign direct investment¹¹, have declined a full 20 percentage points of total assets over the whole of the period. Shares have also fallen sharply in proportion to total less assets. With the exception of municipal government bonds, all components of marketable debt securities rose in relative terms — notably, provincial government bonds and corporate bonds. These trends in the assets have resulted in an increased proportion of domestic debt (including government debt) that is held by non-residents. While ROW's share of corporate claims declined from 56.2% to 34.6% over the period, there was a substantial increase in its market share of total bonds from 23.8% in 1961 to 44.4% at the end of 1984. Canada's claims on the ROW have also changed. In contrast to the asset side, corporate claims (which include Canadian direct investment abroad)¹² have grown relative to Canadian portfolio investment abroad. Liabilities of ROW have increased as a proportion of their total assets producing a relative decline in the net worth for this sector.

¹⁰ As presented in the National Balance Sheet Accounts — a narrowly-defined balance sheet of the rest of the world (i.e., as it relates directly to Canada, which is a re-statement of the International Investment Position).

¹¹ This result becomes even more striking when it is considered that the foreign direct investment component of corporate claims has declined, from 100.0 percent in 1977 to 69.1 percent for the asset and 61.0 percent for the liability in 1983, the result of the inclusion of the banks' transactions with their subsidiaries from 1978.

⁽¹⁾ Components may not balance due to rounding.

Overall, ROW assets (Canada's liabilities) have not grown as fast as ROW liabilities (Canada's assets). The net worth of ROW increased 9.3 times from 1961 to 1984. ROW assets (financial assets only) increased 12.4 times while liabilities rose 18.1 times over the period. It can be seen that in 1961 assets were roughly three times liabilities as compared to only two times liabilities in 1984. The compound annual growth rate of ROW assets over the period was 11.6% while that of ROW liabilities was 13.4%. This has resulted in a less rapid rise in the net worth of ROW (Canada's net liability abroad) relative to Canada's net worth, which increased twelve-fold over the last twenty-four years. The compound annual growth rate of ROW net worth was 10.2% as compared to 11.5% for Canada for the period 1961-1984.

It can be seen that while the extent of Canada's debt and indebtedness, vis à vis the Rest of the World has increased, the nature of the relationship has changed. Most striking is that the ratio of foreign direct investment in Canada relative to other investments in Canada has declined sharply over the whole of the period under analysis.

¹In general the term filtering refers to removing, or filtering out, movements of the data that repeat themselves with roughly the same frequency. For more information on filtering consult Quarterly Economic Summary, STC (Cat. 13-006). ²Composite Index of Housing Starts (units), Building Permits (dollars), and Mortgage Loan Approvals (number). ³Deflated by the Consumer Price Index. ⁴Toronto Stock Exchange (300 Stock Index excluding oil and gas component).

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1971 Census; see Occupational Classification Manual, Census of Canada, 1971, Catalogue Number 12-536E, Vol. I. ²Beginning with 1978, this is subdivided into entrepreneurs and managers-administrators. For breakdown refer to CANSIM main base. ³Includes logging, fishing, trapping and hunting. ⁴Includes mechanical and construction. ⁵Includes a small number in non-specified occupations. ⁶Beginning with 1978 includes fiancés and fiancées. ⁷Does not include students entering Canada on students' visas. ⁸Includes also retired persons, elderly dependents, and other unspecified persons.

¹Excludes profits (net of losses) of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. ⁴Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2.

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. ⁴The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment, (as shown in Table 1.1). ⁵See footnote 4, Table 1.1.

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. ²Tax liabilities. ³Withholding taxes. ⁴The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. For source see Table 1.9.

¹These implicit indexes are current weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

¹The labour force as a percentage of the population 15 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. ²The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation).
 Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

Source: The Labour Force (71-001), monthly.

¹The number of persons covered by unemployment insurance is an estimate comprising armed forces personnel, beneficiaries and paid workers from the Labour Force Survey. ²Claimants who receive benefits through the Commission's computer pay system during the reference week. ³Benefits paid for adoption, training, work sharing and job creation claims are included in the total benefits paid. ⁴Annual figures are 12-month averages. Source: Unemployment Insurance Statistics (73-001), Statistics Canada. For further details, see introduction and technical notes in Cat. 73-2025, Annual Supplement to 73-001 Monthly.

¹Statistics on work stoppages include all strikes and lockouts whether legal or illegal, which last for one-half day or more and amount to 10 or more person-days of time lost. Time lost by workers indirectly affected, such as those laid off because of a work stoppage by other employees, is not included. Data is published 45 days after the end of reference month.

²The industry groups from January 1976 forward, are based on the 1970 Standard Industrial Classification. ³The number of person-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. ⁴The total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. ⁵Includes publishing and allied industries. ⁶Includes storage and communication industries.

¹These weights, provided as a general guide, show the relative importance of the major components of the C.P.I. They are based on expenditure values derived from quantities and prices of year 1982. ²Includes water, fuel and electricity, and traveller accommodation. ³Excludes water, fuel and electricity.

* For further information on the weights and methodology associated with the Consumer Price Index, see "The Consumer Price Index Reference Paper, updating based on 1982 expenditures," cat. 62-553, occasional.

¹Estimates of manufacturers' shipments, inventories and orders are based on a monthly survey of a sample of manufacturing establishments, benchmarked to the annual census of manufacturers. ²Shipments of goods manufactured within the establishments. ³Total new orders received during the period at estimated selling value, net of cancellations. ⁴Total manufacturing inventory owned by manufacturing establishments. Other inventory such as that of goods purchased for resale is not included.
 Note: All series are subject to revision each year when more recent Census of Manufactures data become available.

¹Total inventories owned by manufacturers including warehouse stocks.

Note: All series are subject to revision each year when more recent Census of Manufactures data become available.

Table 3: Manufacturing inventories¹ by industry based on the 1980 standard industrial classification (million dollars)/concluded

End of period and month	Non-durable goods (concl.)				Durable goods industries							
	Refined petroleum and coal products	Chemical and chemical products	Total	Wood	Furniture and fixture	Primary metal	Fabricated metal products	Machinery	Transportation equipment	Electrical & electronic products	Non-metallic mineral products	Other mfg.

¹Pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. ²Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. ³Customs exports. ⁴Mill shipments destined for export.
Sources: Pulpwood and Wood Residue Statistics (25-001), Exports by Commodities (65-004), Statistics Canada; Bulletins of the Canadian Pulp and Paper Association: "Monthly Pulp Summary" and "Monthly Newsprint Statistics".

¹Data compiled according to the Steel Distribution Index revised January, 1964. ²Figures on net shipments relate to semi finished and rolled steel products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ³Excluding shipments for re-processing at maker's own plant. ⁴Data compiled as submitted by the steel producers according to the steel industry distribution code.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision.

¹Supply and disposition for both Crude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc.²Gross new production by field less field flared and waste.³Includes crude oil, condensate and pentanes.

Sources: Crude Petroleum and Natural Gas Production (26-006), Gas Utilities (55-002), Statistics Canada.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. Source: Housing Starts and Completions (64-002), Statistics Canada.

¹Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of input. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. The price indexes for the last two years are subject to revision. ²The major groups include additional components than the selected ones shown.

¹Total exports includes domestic exports and re-exports. For further information please refer to Summary of External Trade (65-001). ²The figures reflect a number of adjustments applied to the customs totals to make them consistent with the concepts and definitions used in the system of national accounts. For more information about these adjustments, please refer to Quarterly Estimates of the Canadian Balance of International Payments (67-001). ³For definition of major trading areas and sections, please refer to Summary of External Trade (65-001).

¹Data for 1970 through 1972 refer to class 1 and 2 carriers whose gross annual revenues totalled \$500,000 or more. Information for the period January 1973-December 1978 refers to only 6 major railways. Commencing January 1979, data for 7 major railways (accounting for 95 per cent or more of the total operating revenues) are shown.
