Data in Many Forms..

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

CANSIM Division

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 990-8200, 990-8203) or to the Statistics Canada reference centre in:

St. John's	(772-4073)	Sturgeon Falls	(753-4888)
Halifax	(426-5331)	Winnipeg	(949-4020)
Montreal	(283-5725)	Regina	(359-5405)
Ottawa	(990-8116)	Edmonton	(420-3027)
Toronto	(966-6586)	Vancouver	(666-3691)

Toll free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional references centres.

Canadian Statistical Review

Data in this publication were retrieved from CANSIM† (Official Mark of Statistics Canada for its Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, tape or directly via terminal.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:

CANSIM Main Base Series Directory, 1984 — \$75.00 Canada, \$90.00 other countries

The Directory includes an index which serves to identify, at a fairly aggregative level, the contents of the CANSIM database. This index provides a key to the Series Directory and is the first step in locating series from the CANSIM Main Base.

This Directory is a detailed guide to the data on the CANSIM Main Base. It gives the title, start date, source of the data, and other descriptive material.

CANSIM Mini Base Series Directory, Catalogue 12-569 — \$16.70 Canada, \$20 other countries

This Directory is a detailed guide to the data on the CANSIM Mini Base — a standard subset of data originating from the CANSIM Main Base which is available at various Secondary Distributors.

CANSIM-Cross Classified Data Base Index — \$7

This index provides a summary of available data on the Cross Classified Data Base.

CANSIM-Cross Classified Data Base Directory — \$20

This directory provides a detailed guide to the Cross Classified Data Base. It provides a description of the structure of each table.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used is the Statistics Canada X-11-ARIMA seasonal adjustment method. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series in MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following members:

J.S. Wells (Acting Chairman) — Assistant Chief Statistician, National Accounts and Analytical Services Field
R.E. Drover — Director, Transportation Division
B.J. Lynch — Director General, Operations Branch
R. Platek — Director, Census and Household Survey Methods Division
Director, CANSIM Division
G.J. Brackstone — Director General, Methodology Branch

A. Meguerditchian — Director, International and Financial Economics Division
L.O. Stone — Senior Advisor, Population Studies
P.N. Triandafillou — Director, Agriculture/Natural Resources Division
K. Lal — Director General, System of National Accounts Branch
D. Bergeron — Editor, Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at CANSIM Division, 9th Floor, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

Subscriptions

The *Canadian Statistical Review* and other catalogued publications of Statistics Canada, may be ordered from Publication Sales and Services, Statistics Canada, Ottawa, K1A 0T6 and remittances made payable to the Receiver General for Canada.

Historical data for selected economic indicators, both adjusted and unadjusted for seasonal variation,

are distributed to subscribers in an Annual Supplement.

Correspondence should be directed to the *Canadian Statistical Review* CANSIM Division, Statistics Canada, R.H. Coats Tower, Ottawa, Ontario, K1A 0T6.

Note to Users

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

Section 5, Table 2: Consumer Price Indexes

The Consumer Price Index for January 1985 was compiled using updated weights obtained from the 1982 Family Expenditure Survey. These weights have replaced those derived from the 1978 Survey, which were used in the CPI during the period April 1982 to December 1984. To maintain the continuity of the series for the all-items index for Canada and for published urban centres as well as for other indexes representing levels of aggregation the indexes produced using the 1982 weights are linked (or chained) to their respective counterparts from the 1978 weights. December 1984 marks the link month in which comparable indexes are merged. The time reference continues to be 1981=100.

Monthly or quarterly data may not add to totals due to rounding.

Section 5, Table 3: Construction Price Indexes

This table has been re-structured. The official time base for the Residential and Non-Residential Construction Input Price Index has been converted to 1981=100. A new selection of series for Non-residential Output Price Indexes are presented with this issue.

The Value of Household Work in Canada, 1981

J.L. Swinamer*

1.0 Introduction

In 1978 Statistics Canada released a study by Oli Hawrylyshyn, *Estimating the Value of Household Work in Canada, 1971* (Catalogue 13-566 Occasional)¹. Hawrylyshyn tested three methods for deriving the value of household work (HW), and arrived at results which indicated the value of household work represented approximately 40% of the level of GNP in 1971.

This paper outlines the results of a similar study undertaken to derive estimates of household work in Canada for 1981. 1981 Census data and the 1981 Canadian Time Use Pilot Study (prepared by Education, Science and Culture Division, Statistics Canada) provided the bases from which the 1981 household work estimates were produced.

Section 2 of the paper summarizes the methodology followed in preparing the 1981 household work estimates and indicates the basic data sources used; Section 3 presents the 1981 household work estimates for Canada by type of estimation method, compares the value of household work for each province/territory, and examines the relative contributions of females and males to the 1981 household work value; Section 4 compares the 1981 household work estimates to the 1971 estimates; Section 5 examines the sensitivity of the

estimates to the accuracy of data; and Section 6 provides a general summary of the 1981 study.

2.0 Deriving the 1981 Estimates of the Value of Household Work

The purpose of this study is to provide estimates of the contribution of labour in non-market, household, economic activities to the value of production in 1981; that is, to attach a dollar value to all household activities which could be replaced by market activities. Eight types of household activity were identified for valuation: food preparation; cleaning; clothing care; repairs and maintenance; marketing and household management; physical child care; tutorial child care; and other child care. Two approaches were used to value the labour contribution to these household activities: the individual-function-cost (HFC) and the opportunity cost (HOC) methods².

The individual-function-cost approach seeks to value household work production by estimating the dollar amount that would be required to hire specific household-work-related occupations within the market economy to perform the various household activities (e.g. food preparation, child care) of all family or non-family units in Canada³. To derive this

* J.L. Swinamer, Research Economist, National Accounts Development Division

The reader should also consult Hawrylyshyn's work for more detailed explanations of the objectives and theoretical basis of such estimates as well as a more elaborate rationale of the various methods of estimation. The Hawrylyshyn paper also contains a good overview of estimates of this nature made in other countries and at other times.

¹ The 1971 estimates of HW also contained a value derived by the housekeeper-cost method. It was felt that the weakness of housekeeper wages data did not justify preparing an estimate by this approach. For more information on the housekeeper-cost approach refer to Hawrylyshyn's 1971 study, Catalogue 13-566.

³ A family unit refers to a census family (that is, husband-wife or lone parent families living in the same dwelling) while a non-family unit refers to a person living alone or a group of persons who live in the same dwelling but are not a census family.

estimate, the time spent on each household work function is multiplied by the average wage paid in these specific occupations (e.g. the time spent on food preparation is multiplied by the average wage received by those in food preparation occupations) and by the number of family and non-family units.

The opportunity cost approach seeks to value household work by estimating the opportunity cost of performing household work; that is, the value of labour production that is foregone by persons contributing time to non-market, economic household work activities. This estimate is prepared, then, by multiplying the total time spent on all household work activities by the average wage received by labour in market activities (the average wage of all occupations) and by the number of family and non-family units.

When the 1971 estimates of household work were prepared, the opportunity cost approach also contained a tax-netting factor. The resulting 1971 opportunity cost estimates, then, allowed for the notion that the *perceived* opportunity cost for time spent on household work is wages net of taxes and not gross wages. For the 1981 estimates, however, this tax-netting factor has not been applied because it is felt that for estimating the contribution of labour to the value of production in non-market activities, the gross market price should be used, as is done when valuing market activities.

The following sections summarize the estimation formulas used for the 1981 estimates and the sources of data.

2.1 The Estimation Formulas for the 1981 Study
 With the exception of the excluded tax-netting factor in the opportunity cost approach (see Section 2.0 above), the formulas used for estimating the 1981 value of household work by the individual-function-cost and opportunity cost methods are identical to those used in Hawrylyshyn's 1971 study and are contained in List 1. Lists 2 and 3, respectively, define the output and input variables contained in the formulas. The subscripts used with these variables are indicated in List 4 and are similar to those used by Hawrylyshyn, with the exception of the Yukon/Northwest Territories being added as subscript 11 for Provinces/Territories.

A comparison of the two methods of estimating household work (i.e., a comparison of equations (1) and (7) in List 1) indicates that there is one basic difference between the individual-function-cost and

opportunity cost methods; that is, the individual-function-cost method attaches a unique "individual" wage estimate to each household function whereas the opportunity cost method applies the same average provincial wage (by sex) to the total time spent on household functions. This difference between the individual-function-cost and opportunity cost formulas will be of significance when the 1981 estimates are analyzed in Section 3.

List 1. Formulas For Estimating the 1981 Value of Household Work

Individual Function Cost Method — HFC

$$(1) \text{HFCF}_i = 52 \sum_{j=1}^{10} \sum_{a=1}^8 \left[F_{ija} \cdot \sum_{f=1}^8 (TF_{jaf} \cdot WFF_{if}) \right]$$

$$(2) \text{HFCM}_i = 52 \sum_{j=1}^{10} \sum_{a=1}^8 \left[F_{ija} \cdot \sum_{f=1}^8 (TM_{jaf} \cdot WMF_{if}) \right]$$

$$(3) \text{HFC}_i = \text{HFCF}_i + \text{HFCM}_i$$

$$(4) \text{HFCF} = \sum_{i=1}^{11} \text{HFCF}_i$$

$$(5) \text{HFCM} = \sum_{i=1}^{11} \text{HFCM}_i$$

$$(6) \text{HFC} = \text{HFCF} + \text{HFCM} \text{ (or } = \sum_{i=1}^{11} \text{HFC}_i \text{)}$$

Opportunity Cost Method — HOC

$$(7) \text{HOCF}_i = 52 \sum_{j=1}^{10} \sum_{a=1}^8 (F_{ija} \cdot TF_{ja} \cdot WF_i)$$

$$(8) \text{HOCM}_i = 52 \sum_{j=1}^{10} \sum_{a=1}^8 (F_{ija} \cdot TM_{ja} \cdot WM_i)$$

$$(9) \text{HOC}_i = \text{HOCF}_i + \text{HOCM}_i$$

$$(10) \text{HOCF} = \sum_{i=1}^{11} \text{HOCF}_i$$

$$(11) \text{HOCM} = \sum_{i=1}^{11} \text{HOCM}_i$$

$$(12) \text{HOC} = \text{HOCF} + \text{HOCM} \text{ (or } = \sum_{i=1}^{11} \text{HOC}_i \text{)}$$

List 2. Definition of Output Variables in Household Work Estimates

Individual Function Cost Method

- HFC = Annual value of HW in Canada.
 HFC_i = Annual value of HW in province i.
 HFCF = Annual value of HW contributed by women in Canada.
 HFCM = Annual value of HW contributed by men in Canada.
 HFCF_i = Annual value of HW contributed by women in province i.
 HFCM_i = Annual value of HW contributed by men in province i.

Opportunity Cost Method

- HOC = Annual value of household work in Canada.
 HOC_i = Annual value of household work in province i.
 HOCF = Annual value of household work contributed by women in Canada.
 HOCM = Annual value of household work contributed by men in Canada.
 HOCF_i = Annual value of household work contributed by women in province i.
 HOCM_i = Annual value of household work contributed by men in province i.

2.2 Sources of Data for the 1981 Estimates

Three main types of data were required for the 1981 estimates: the number of family and non-family units, wages, and time spent on household work. The sources for each of these types of data are outlined below.

Number of Family and Non-Family Units — a special aggregation from the 1981 Census provided the number of family and non-family units, by province, by age of youngest child, number of children under 18, by type of family and non-family unit, and by female's market status (see List 3, in Section 2.1 for detail).

Wages — special aggregations from the 1981 Census provided (i) average incomes for females and males in specific occupations with functions similar to those performed for household work (for example, the average incomes of cooks, seamstresses, child care workers working in the market economy), by province (for the

List 3. Definition of Input Variables in Household Work Estimates

- F_{ija} = Number of family or non-family units in province i of size/age j, type/status a.
 TF_{jaf} = Weekly hours devoted by female in family or non-family unit size/age j, type/status a to function f.
 TM_{jaf} = Weekly hours devoted by male in family or non-family unit type j, status a to function f.
 TF_{ja} = Total weekly hours of household work by females in family or non-family unit j, type/status a.
 TM_{ja} = Total weekly hours of household work by males in family or non-family unit j, type/status a.
 WFF_i = Average hourly wage for females in "Occupation" f, province i.
 WMF_i = Average hourly wage for males in "Occupation" f, province i.
 WF_i = Average hourly wages for females in province i.
 WM_i = Average hourly wages for males in province i.

individual-function-cost method); and (ii) average income for females and males of all occupations, by province (for the opportunity cost method).

Time Spent on Household Work — special aggregations from the 1981 Canadian Time Use Pilot Study provided data on the average time spent by females and males on specific household functions. The time study is based on interviews with 2700 households in 14 Canadian cities/regions.

3.0 Estimates of the Value of Household Work for Canada, 1981

This section summarizes the 1981 estimates of the value of household work by: (1) presenting the estimates for Canada derived by the opportunity cost and individual-function-cost methods; (2) comparing the values of household work by province/territories; and (3) examining the relative contributions of females and males to the value of household work.

List 3. Definition of Subscripts in Household Work Formulas

Subscript	Province/Territory i	Size/Age- Number and Ages of Children j	Type/Status - Type of Family or Non-Family Units and Females's Market Status a	Household Work Functions f
1	Newfoundland	No children ¹	husband-wife census families wife not in market ²	Food Preparation
2	Prince Edward Island	YC ² <5, 1 child	husband-wife census families, wife in market	Cleaning
3	Nova Scotia	YC<5, 2-3 children	1 parent census families, female not in market	Clothing Care
4	New Brunswick	YC<5, 4+ children	1 parent census families, female in market	Repairs and maintenance
5	Québec	YC 5-12, 1 child	1 parent census families, male	Marketing and household management
6	Ontario	YC 5-12, 2-3 children	1 person non- family units, male	Physical child care
7	Manitoba	YC 5-12, 4+ children	1 person non- family units, female	Tutorial child care
8	Saskatchewan	YC 13-18, 1 child	Multi-person non-family units	Other child care
9	Alberta	YC 13-18, 2-3 children		
10	British Columbia	YC 13-18, 4+ children		
11	Yukon/Northwest Territories			

Note ¹ includes families or households where there are no children or all children are over the age of 18. ² refers to youngest child.
³ in market refers to persons who are either self-employed or employed by someone.

3.1 The Value of Household Work by the Opportunity Cost and Individual-Function-Cost Methods

The value of household work in Canada, in 1981, is estimated at \$138,956 million by the opportunity cost method and \$121,190 million by the individual-function-cost method. These estimates represent 41.0% and 35.7%, respectively, of the 1981 GNP for Canada.

The estimate of household work using the individual-function-cost method is significantly lower than that using the opportunity cost method. As

discussed in Section 2, any difference in the values obtained by the two methods is due to the use of an average wage for the opportunity cost method as opposed to a specific wage estimate for each household function with the individual-function-cost method. Thus, since the average wage received in household-function-related occupations (e.g. child care, food preparation, cleaning) are generally lower than the average wage of all occupations, the value of household work derived by the individual-function-cost approach is lower than that derived by the opportunity cost approach.

Table 1. Estimates of Value of Household Work, Canada, 1981

	Provincial Gross Domestic Product (at market prices)			as a percentage of Provincial Gross Domestic Product	
	(1)	Opportunity cost method (2)	Individual-function-cost method (3)	Opportunity cost method (4)	Individual-function-cost method (5)

Source: *Provincial Economic Accounts, experimental data, 1967-1982* (Catalogue 13-213), and *National Income and Expenditure Accounts, 1968-1982* (Catalogue 13-201).

3.2 Values of Household Work by Province

The provincial/territorial estimates of the value of household work in 1981, by the opportunity cost and individual-function-cost methods, are contained in Table 1 (note that an estimate has been prepared for the Yukon/Northwest Territories). Column 1 of Table 1 presents the level of Gross Domestic Product (at market prices) for each of the provinces/territories. Columns 2 and 3, respectively, provide the value of household work as estimated by the two methods. Columns 4 and 5 indicate the ratio of these household work values to provincial Gross Domestic Product.

Generally, the differences which exist between the household work values of the provinces/territories as a percentage of Provincial Gross Domestic

Product are due to the varying family structures between provinces (in terms of type/ status of family and non-family units, age of youngest child, number of children) and related variations in the time contributions to household work according to these structures. Of particular significance is the level of market participation of married women: in those provinces where the market participation rate of married females is low, the value of household work as a percentage of Provincial Gross Domestic Product is higher than the Canadian average (and vice versa). This can be explained through reference to Table 2 which indicates that the time contributed to household work by married females who are in the market, on average, is significantly lower than the time spent on household work by married females who are not in the market.

Table 2. Time Use Data for Married Females by Market Status

Market status of married females	Range of time use (hrs./wk)		Average (unweighted) time use (hrs./wk)
in market	22.28	- 41.13	30.06
not in market	33.09	- 68.97	48.70

Thus, it follows that in the Atlantic provinces, where the market participation of married females is low and the time contributed to household work is therefore relatively high, the value of household work as a percentage of Provincial Gross Domestic Product is higher than the Canadian average. Alternatively, in Alberta, where the market participation of married females is high and the time contributed to household work is therefore relatively low, the value of household work as a percentage of provincial Gross Domestic Product is lower than the Canadian average.

For all provinces/territories, the value of household work derived by the individual-function-cost approach is significantly lower than the estimate derived by the opportunity cost method. This is due to the effect of attaching a specific wage estimate to the time spent on household functions in the individual-function-cost approach as opposed to attaching an average wage of all occupations to the total time spent on household work with the opportunity cost method. Generally, the wages for the individual household functions (e.g. child care, food preparation) tend to be lower than the average wage of all occupations.

3.3 The Relative Contribution of Females to Household Work

Table 3 summarizes the contribution of females to household work by province as obtained by the two estimation methods. The average contribution of females to the value of household work was 60.1% by the opportunity cost method and 60.7% as estimated by the individual-function-cost approach.

The variation in the contribution of females to the value of household work between the provinces/territories is due to a number of inter-related factors: (1) the differing family and non-family unit type/status between provinces/territories — particularly the market participation rates of married females. Thus, in the Atlantic provinces and Québec, where the market participation of married females is low, the contribution of females to the value of household work is higher than the Canadian average. In the western provinces, where the market participation of married females is high, the contribution of females to the value of household work is generally lower than the Canadian average; and (2) differences in wage structures between provinces/territories — especially the ratio of male to female wages in each

Table 3. Contribution of Females to Household Work by Province, Individual-function-cost and Opportunity-cost Methods, 1981

	Percent of Value Produced by Females	
	Individual-function-cost method	Opportunity cost method
Newfoundland	61.6	61.7
Prince Edward Island	62.6	61.0
Nova Scotia	61.3	61.3
New Brunswick	61.3	61.7
Québec	61.9	62.4
Ontario	59.6	60.1
Manitoba	60.0	59.2
Saskatchewan	60.8	59.9
Alberta	57.1	58.9
British Columbia	58.6	60.6
Yukon/Northwest Territories	60.7	62.7
Canada	60.1	60.7

province. In provinces/territories where the male/female wage ratio was lower than average (that is, the disparity between male and female wages was relatively low), the contribution of males to household work was lower because high male wage rates were not able to compensate for relatively less time contributed to household work by males. An illustration of this is the Yukon/Northwest Territories where, despite extremely high market participation by married females, the contribution of females to the value of household work is higher than the Canadian average. This anomaly exists since the very low disparity between male and female wages in the Yukon/Northwest Territories means that the greater time contribution of females (whether in market or not in market) relative to males is not significantly diminished in the final value of household work by male wages which are much greater than female wages.

4.0 A Comparison of the 1981 and 1971 Estimates of the Value of Household Work

This section compares the 1981 individual-function-cost estimate of the value of household work with that of 1971. To facilitate comparison between the two years, Table 4, below, contains figures pertaining to 1981 and 1971, specifically: (1) the value of household work (individual-function-cost approach) — dollar value

and as a proportion of GNP; (2) the growth in the value of non-market, household work production per family and non-family unit and the growth in the value of market production per unit; and (3) the relative contribution of females to household work.

As a percentage of market production (GNP), the value of non-market, household work production has decreased significantly from 1971 to 1981 — from 40.9% in 1971 to 35.7% in 1981. Thus, although the value of non-market, household work production per family and non-family unit increased by 135.1% between 1971 and 1981 (from \$6,231 per unit in 1971 to \$14,648 per unit in 1981), the growth of market production per unit was greater — with a 168.7% increase between 1971 and 1981 (from \$15,243 per unit in 1971 to \$40,980 per unit). Also during the 1971 to 1981 period, the relative contribution of females to the value of household work declined significantly — from 67.3% in 1971 to 60.7% in 1981.

These trends between 1971 and 1981 are due to changes in the structure of one or more of the three basic components of the household work formula: that is: (1) changes in the *time* use patterns of the individual family and non-family units by type (husband-wife, one parent, single person, etc.), status (in market or not in market females), and number/age of children; (2) changes in the *wages*

Table 4. Comparison of Results of the 1981 and 1971 Household Work Studies

All-Canada Comparisons (using individual-function-cost value of HW)		1981	1971
1.	(a) Value of HW (\$,000,000)	\$ 121,190	\$ 38,447
	(b) Value of GNP (at market prices (\$,000,000))	\$ 339,055	\$ 94,115
	(c) HW as a percentage of GNP	35.7%	40.9%
2.	(a) Number of family and non-family units	8,273,649	6,170,435
	(b) Value of HW per unit (1(a) - 2(a))	\$ 14,648	\$ 6,231
	(c) Growth of non-market production per unit (2(b) 1981 - 2(b) 1971)	135.1%	
	(d) Value of GNP per unit (1(b) - 2(a))	\$ 40,980	\$ 15,253
	(e) Growth of market production per unit (2(d) 1981 - 2(d) 1971)	168.7%	
3.	Relative Contribution of females to household work	60.7%	67.3%

received for carrying out individual household functions in relation to the average wage of all occupations; and/or (3) changes in the *structure of family and non-family units* by type, status, and the number/age of children.

To determine how much of the 1981 decline in the value of household work (as compared to GNP) is attributable to each of the three components, the following analysis was carried out: (1) a "dummy set of data" was created by applying the 1971 patterns for time, wage, and structure of family and non-family units to 1981 levels (for example, the 1971 structure of family and non-family units by type, status and number/age of children was applied to the 1981 number of family and non-family units); and (2) four distinct "dummy estimates" of the 1981 value of household work were made — estimates which substituted: (i) 1971 time patterns for 1981 time patterns; (ii) 1971 wage structures (applied to 1981 levels) for 1981 structures; (iii) 1971 family and non-family unit structures (applied to 1981 levels) for the 1981 structures; and (iv) 1971 time, wage, and family and non-family unit structures (applied to 1981 levels) for all 1981 data.

The results from the above analysis indicated that the decline in the relative importance of household work between 1971 and 1981 is due

overwhelmingly to changes in the structure of family and non-family units by type, status, and number/age of children. The most predominant aspect of these changes in unit structure between 1971 and 1981 is the increase in the proportion of females who are "in market" — particularly in terms of married females. Census figures indicate that the labour force participation rate of married females increased from 36.9% in 1971 to 52.0%⁴ in 1981. Thus, for the 1981 household work estimates, an increased proportion of the female contribution to the value of household work is contributed by "in market" females for which there is a lower time contribution relative to females not participating in the market (see Section 3.2 for a comparison of time contributions of "in market" females). This, then, explains the decline in the value of household work relative to the level of GNP: that is, higher "in market" participation by females results in less contribution to the growth of non-market, household work, production and in more contribution to the growth of market production. The above factors also explain the decline in the relative contribution of females to the value of household work.

* Unpublished 1981 Census figure — adjusted for comparability to 1971 figures.

The results of the 1981 "dummy variables" analysis also indicated that changes between 1971 and 1981 in time and wage rate structures were not significant. It would seem, then, that despite the increase in popularity of time saving devices (dishwashers, washers, dryers, microwaves, etc.) and habits (fast food outlets and restaurant meals) over this period, the amount of time devoted to performing household functions remained basically invariant.

5.0 Sensitivity of Household Work Estimates to the Accuracy of Data

Three basic types of data form the basis of the household work estimates: time use, wage rate, and number of family units data. The 1981 sources for each type of data are thought to be fairly reliable; the wage rate and number of family units data are from the 1981 Census, and the time-use figures are from the 1981 Canadian Time Use Pilot Study which provides time-use data from across Canada and for all family types. Despite the reliability of these data, however, a number of sensitivity tests were run to discern the effect on the total value of household work of altering each of the three data types.

Varying the time spent on each household work function by 10% had no significant effect on the total value of household work. The functions which were most effected by a 10% increase in time use were, for example: marketing (a 10% increase in the time spent on marketing functions resulted in a 2.9% increase in the level of household work), food (2.7%), cleaning (1.3%), and maintenance (1.3%). The differences in the effect of the time variations are due to the particular function's relative importance in total time use and the level of wage rate for the specific function as compared to the average of all household work wage rates.

Wage data variations had a more significant impact on the level of household work. Two main tests were run in this area: (1) assuming that female wages were .9 of male wages increased the value of household work by 14.4%; and (2) assuming that female wages were equivalent to those of males resulted in a 22.7% increase in the household work value. When compared to results from the 1971 sensitivity analysis, these tests indicated that, between 1971 and 1981, the disparity between male and female wages decreased in household work occupations since similar tests for 1971 resulted in increases of 19.5% and 29.1%, respectively, in the value of household work⁵.

Varying individual components of the number of family and non-family units data was found to have no significant effect on the value of household work.

6.0 Summary

The purpose of this study has been to derive estimates of the value of household work, by the individual-function-cost and opportunity cost methods, for the year 1981, similar to those for 1971 derived by Hawrylyshyn. The 1981 individual-function-cost estimate uses the same methodology as Hawrylyshyn used for his 1971 individual-function-cost value. In the 1981 opportunity cost estimate of household work, however, the tax-netting factor found in the 1971 opportunity cost formula for household work was removed. This is felt to be an improvement of the opportunity cost estimate of household work since it provides a value of household work at market prices.

The value of household work in Canada was, for 1981, estimated as between \$121 billion (individual-function-cost approach) and \$139 billion (opportunity cost approach). Compared to GNP for 1981 of \$339 billion, these estimates represent between 35.7% and 41.0% of GNP. The value of household work by the opportunity cost approach (in total and in all provinces) is higher than that obtained using the individual-function-cost method. This is because the average wage rates used for the former approach are generally higher than the individual household function wage rates applied in the latter approach.

In comparison with the 1971 estimates of the value of household work as a percentage of GNP, the 1981 estimates are significantly lower; by the individual-function-cost approach, as a percentage of GNP, the value of household work has declined from 40.9% in 1971 to 35.7% in 1981. This decline is due to the combined effect of increased market participation by females and lower time contributions to household work by females in the market versus those not in the market.

⁵ Despite the lessening of disparities between female and male wages between 1971 and 1981, however, the value of HW as a proportion of GNP has declined rather than increased as would be expected. This is because the greater equalization of female and male wages has contributed to the increased rate of market participation of women which has brought with it lower time contributions to HW by females and higher levels of GNP.

Gross National Product Fourth Quarter and Preliminary Annual 1984 Advance Information

Gross National Product rose 1.4% in the fourth quarter of 1984 to a level of \$429.9 billion, seasonally adjusted at annual rates. After allowing for a 0.8% increase in prices, the volume of GNP rose 0.6% in the fourth quarter, after a strong 1.6% gain in the third. For the year as a whole, Gross National Product increased 7.8%. Discounting a moderate 3.0% price increase, real GNP rose 4.7%, compared to 3.3% in 1983. On a domestic basis the growth rate was closer to 5%; on either basis, the increase is the largest since 1976.

Much of the increase in economic activity in 1984 originated in sales of motor vehicle products. Half of the increase in export demand was in these commodities. Higher car purchases continued to drive sales of durable goods upward at a rapid rate, and purchases of commercial vehicles rose strongly. Aside from the gains in motor vehicle sales, demand rose slowly in most sectors of the economy. Consumer spending on semi-durable goods and on services rose at rates similar to 1983. Business investment in plant and equipment changed little in 1984 following two years of steep decline, and housing construction fell. By year end, overall, final domestic demand had only just regained its 1981 peak.

Following the substantial contribution to growth in output in 1983 by post-recession stock rebuilding, inventories grew in line with sales through most of 1984. Price inflation continued to moderate, as the GNE implicit price index decelerated from a 5.5% increase in 1983 to 3.0% in 1984, the smallest annual increase since 1971.

In real terms, the strongest rates of growth during the year were recorded in the external sector.

Exports of goods and services rose nearly 20% while imports rose over 15%. In nominal terms, both merchandise exports and imports rose by nearly 25%, resulting in an increase in the merchandise trade balance of \$3.1 billion.¹ This was largely offset by a deterioration in the non-merchandise deficit, mainly due to a higher net outflow of interest and dividend payments, so that the overall balance of trade in goods and services rose slightly to \$1.2 billion.

Consumer demand rose 3.4% in volume, about the same rate as in 1983. A surge in demand for durable goods early in 1984 helped to boost purchases for the year as a whole by 11.0%, almost the same rate as in 1983. The gain in durable goods was concentrated in vehicle sales, as in 1983, while demand for furniture and appliances levelled off at a time of weak housing activity.

Residential construction declined 3.8% in 1984, following a strong recovery in 1983. Weakness in housing demand was particularly evident in western Canada. The softness in demand conditions for housing was reflected in only a 1% gain in prices; in 1984 the implicit price index for residential construction was still slightly below its 1982 level.

Business investment in plant and equipment rose marginally in volume to \$18.3 billion. Following two years of substantial decline, this left the share of GNE devoted to plant and equipment at 13% in 1984, compared to a peak of 17% in 1981. The restraint in capital spending coincided with

¹ These estimates will be presented in greater detail in the Balance of Payments information bulletin to be released March 4th, 1985.

substantial excess capacity in most industries and with the efforts of firms to restructure balance sheets.

The change in non-farm business inventories was about \$1 billion in constant dollars, contributing substantially less to the growth of real GNP in 1984 than in 1983. Moderate stock accumulation was evident in virtually all industries with the result that the aggregate stock-to-sales ratio was essentially unchanged during the year.

Wages, salaries, and supplementary labour income increased by 6.1% in 1984, up slightly from the gain in 1983. Over the past two years, the share of labour income has eased from 57.9% to 55.2%. The slower growth of labour income reflects a marked deceleration of negotiated wage settlements and continued restraint in demand for full-time employees, notably in goods-producing industries where employment has not returned to pre-recession levels.

Corporate profits before taxes rose 21.3% in 1984 to a level of \$39.7 billion. The share of profits in GNP continued to recover slowly and now stands at 9.4% compared to 8.4% in 1983 and 5.9% in 1982.

The total government sector deficit, on a national accounts basis, rose \$2.6 billion, to a level of \$26.9 billion in 1984. Total government revenue increased by 10.1%, as a result of higher indirect taxes, investment income and corporate taxes. Total expenditures rose by 10.1%, as it did in 1983, with slower rates of increase in spending on goods and services and transfer payments to persons offsetting rapidly growing interest payments on the public debt.

Fourth Quarter Detail

A slowdown of real GNP growth in the fourth quarter to 0.6%, from the rapid gain of 1.6% in the third, reflected a slowing of export demand and inventory accumulation. Much of the upsurge in growth in the third quarter had originated in exports, particularly in the motor vehicle sector. Strikes in the auto industry limited its contribution to growth in the fourth quarter, after dominating growth through most of 1984. Higher consumer spending led a 0.9% increase in final domestic demand, while housing expenditures slackened and business investment in plant and equipment remained weak.

Following exceptional growth over the first three quarters of the year, the volume of total exports declined by 2.2% in the fourth quarter. Most of the

decline reflected lower exports of motor vehicle products, as well as slowing American industrial demand for many fabricated materials. The real balance of trade in goods and services continued to rise however, as import demand declined by 3.5% in the quarter. The drop reflected weak demand for machinery and equipment as well as lower imports of motor vehicle parts.

In real terms, consumer demand rebounded from a weak third quarter to post a 1.4% gain in the fourth, the largest quarterly gain of the year. Spending on durable goods led the upturn, as car sales recovered from a decline in the third quarter and as numerous price reductions continued to stimulate demand for a number of the other durable components. Demand for semi-durable goods also recovered from a dip in the previous quarter, rising 1.1%. The growth of consumption of non-durable goods and services picked up slightly to 0.8% and 1.3% respectively.

Residential construction expenditures declined by 2.4% in the fourth quarter. This drop offset the slow gains earlier in the year, and left the level of residential construction little changed from the fourth quarter of 1983. The decline reflected lower work-put-in-place, as total housing starts dropped by 17.4% in the quarter.

The volume of business investment in plant and equipment was little changed in the fourth quarter, after a marginal gain in the third. The level of business investment was essentially unchanged from a year earlier, as outlays for both non-residential construction and machinery and equipment remained weak.

The hesitancy of firms to increase capital spending also was evident in the change in non-farm business inventories, which was \$256 million, the smallest accumulation in over a year. The restraint in stock accumulation was most evident in the retail and manufacturing industries, particularly in reduced holdings of raw materials.

Corporate profits before taxes rose 4.4% in the fourth quarter, the first increase since the first quarter. Much of the increase appears to have originated in windfall inventory gains, notably in the petroleum industry where price increases resulted, in part, from an increase in the petroleum compensation charge.

Wages, salaries and supplementary labour income slowed to 1.5% growth from close to 2.0% in the previous two quarters. Most of the slowdown

originated in lower employment growth. Personal disposable income grew 1.3% in the fourth quarter, less rapidly than consumer outlays, resulting in a decline in the personal savings to 12.5%.

The government sector deficit, on a national accounts basis, decreased \$2.5 billion to a seasonally adjusted rate of \$27.2 billion in the fourth quarter. Government revenues advanced 4.6%, as a result of increases in corporate taxes,

indirect taxes (reflecting a rise in the manufacturer's sales tax rate in October and in the petroleum compensaion charge in November) and personal direct taxes. The increase of 2.7% in total expenditure was widespread.

For the year as a whole, Gross National Product, at market prices increased 7.8% to a level of \$420.8 billion. Real GNP rose 4.7% compared to 3.3% in 1983.

Gross National Product rose 1.4% in the fourth quarter of 1984 to a level of \$429.9 billion, seasonally adjusted at annual rates. After allowing for a 0.8% increase in prices, real GNP rose 0.6%.

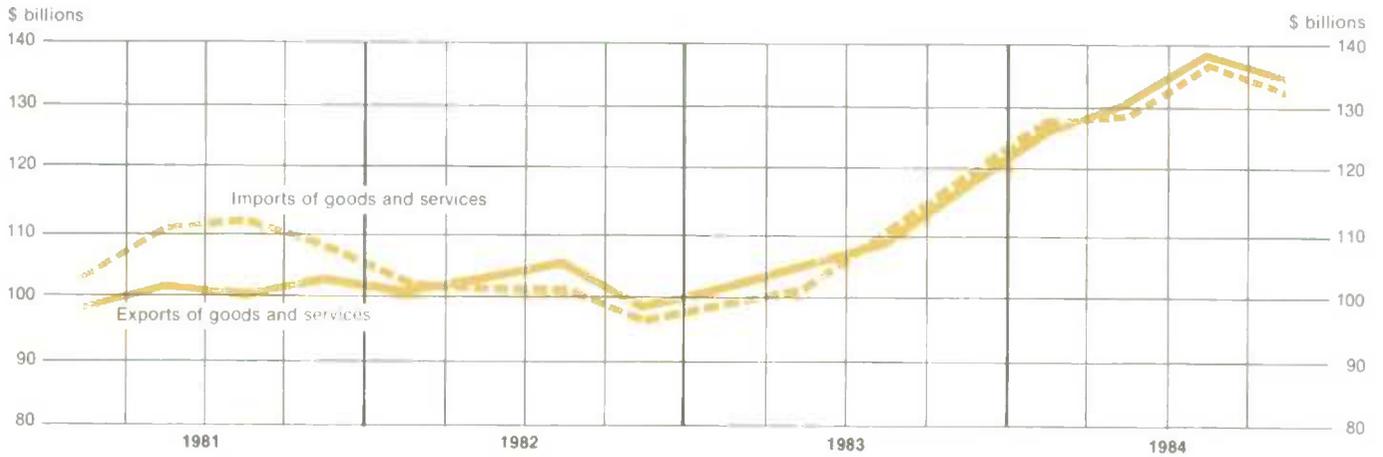

Wages, salaries and supplementary labour income and military pay and allowances increased by 6.2% in 1984, up slightly from the gain in 1983. Corporate profits before taxes rose 21.3% to a level of \$39.7 billion. Interest and miscellaneous investment income rose 8.5% over the 1983 level.

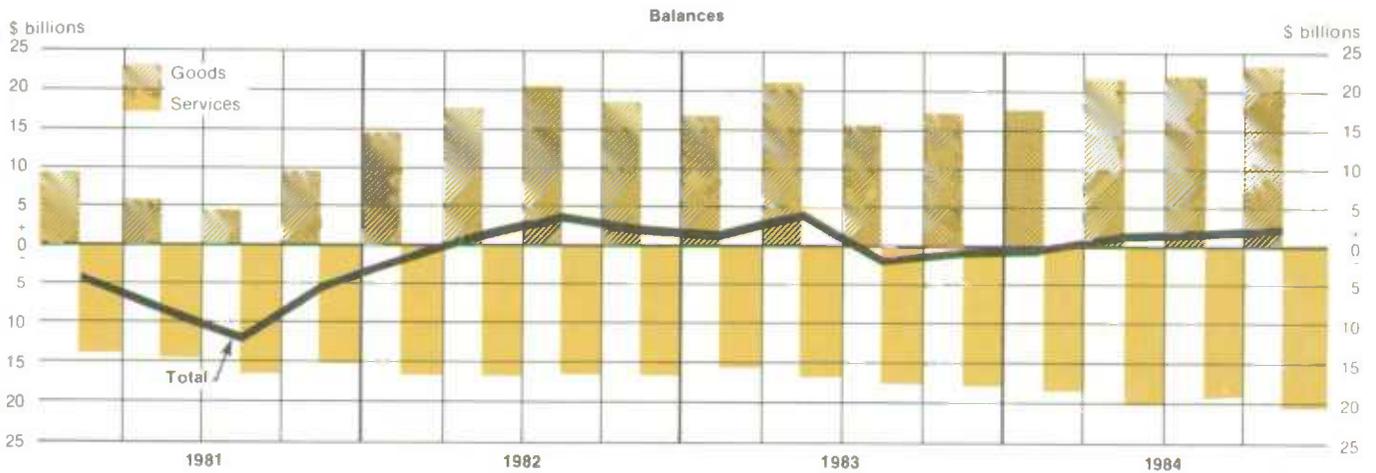

Note: All quarterly data adjusted for seasonal variation and at annual rates

In 1984, both exports and imports of goods and services rose by 21.9% following 6.3% and 6.8% increases in 1983 respectively resulting in an increase in the surplus of goods and services of \$1.2 billion in 1984, up from \$0.9 billion in 1983.

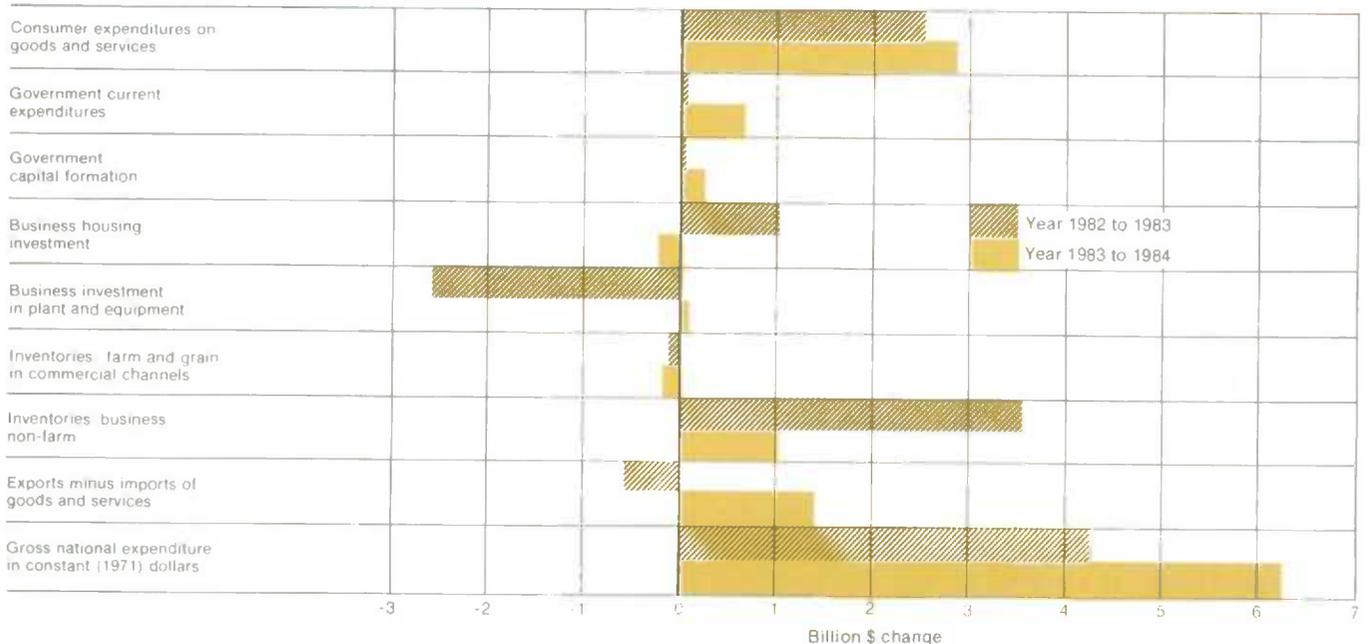

In the fourth quarter of 1984, exports and imports of goods and services fell 2.3% and 3.1% respectively following third quarter increase of 6.3% and 6.1% respectively.

The growth of consumer expenditure and net exports of goods and services provided the major source of strength in real GNP in 1984. Business investment in plant and equipment changed little and residential construction fell. Following a substantial contribution to growth in 1983 by stock rebuilding, inventories grew in line with sales in 1984.

Annual changes in GNE and component in constant (1971) dollars

Note: All quarterly data adjusted for seasonal variation and at annual rates

Observations

Language in Canada

Canada is an officially bilingual country but many languages, other than English or French, are also present. Native languages were used across the continent centuries before the first European settlers brought French and English to the eastern seaboard. Later, immigrants from all over Europe settled in city neighbourhoods and in rural areas, bringing with them a wide variety of different languages. More recent immigrants from India, China and Vietnam have added their mother tongues to the mosaic. In 1981, besides publications in English and French, over 150 Canadian newspapers and magazines were published in close to 40 languages.

English is the mother tongue of six out of ten Canadians. It is not only the most common language but it is also largely adopted, even in Quebec, by people who first learned a non-official language in their childhood. In 1981, however, 11% of the Quebec population reported English as their mother tongue; less than in 1971. On the other hand, one quarter of the Canadian population have French as their mother tongue. About a third of those with French mother tongue living outside Quebec use English as their main home language.

Retention of languages also varies among other mother tongue groups. Persons whose mother tongue is Chinese, Portuguese, Italian or a native language are more likely to retain their mother tongue than those whose mother tongue is German or Ukrainian.

During the last decade, bilingualism in Canada has been increasing at more than twice the rate of population growth; and there are signs of change in the Anglophone/Francophone composition of the bilingual population.

Language in Canada shows where the various linguistic groups are located. It examines the maintenance of mother tongue by the English in Quebec, the French in and outside of Quebec, and by various other mother tongue groups. It also looks at changes in official bilingualism.

This publication is part of the Census Content Series of non-technical publications featuring many charts and tables.

This publication will be of interest to the federal, provincial, and municipal governments, school boards, educators, publishers, librarians and all branches of the media.

You can purchase your copy of *Language in Canada* (Catalogue No. 99-935, \$5.50 in Canada, \$6.60 elsewhere) by sending a cheque or money order payable to the Receiver General of Canada, to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0T6.

Canada, the Provinces and the Territories: A Statistical Profile

Many users of statistics — planners, policy analysts, teachers, consultants, the media — need to be able to quickly compare the status and evolution of Canada's provinces and territories. Yet directly comparable province-by-province indicators on topics like population age distributions, social and cultural expenditures per capita, pension coverage, insitutional care and industrial structure can require considerable time and legwork to compile.

To answer the need for a concise, comprehensive national overview, Statistics Canada has released an experimental new publication entitled *Canada, the Provinces and the Territories: A Statistical Profile*.

Drawing together a wide array of social economic and demographic data and indicators, this reference is an important tool for one-stop comparisons between the provinces, the territories and Canada as a whole. Based on the most up-to-date data available, the statistics allow readers to summarize today's most important trends without turning a page.

The 45 pages of tables, presented in readily understandable formats, portray: the population and its characteristics; the provincial economy; industrial growth and structure; labour, earnings and social security; and income, expenditure and prices. The social environment — health, education, justice, housing and culture, and target groups — women, youth, the elderly and native peoples — are also covered. Some tables provide a longer-term view of changes since the 1970s.

To allow meaningful comparisons between the provinces, absolute numbers are presented alongside standardized formats such as average annual growth rates, per capita figures, percentages and incidence per 1,000 population. Related indicators are grouped to provide the fullest possible perspective on each topic.

Besides providing a statistical overview, *Canada, the Provinces and the Territories* is a valuable guide to Statistics Canada's wealth of data on the provinces and territories. References to the publications and other sources used to construct the indicators, and listings of contact divisions within Statistics Canada, provide useful starting points for further research into any of the topics covered.

Order *Canada, the Provinces and the Territories: A Statistical Profile* (Catalogue 17-X-501, price \$25) from Sales Unit, Central Inquiries Services, Statistics Canada, Ottawa, Ontario K1A 0T6, or from the Statistics Canada Regional Reference Centre nearest you.

A Product of the Small Area Data Program

For Further Information on Comprehensive Data Profiles Canada, the Provinces and the Territories: a Statistical Profile is a product of Statistics Canada's Small Area Data Program, a wide-ranging initiative to increase the organization, accessibility and scope of statistics on subprovincial areas. Although this publication presents data at the provincial, rather than the subprovincial level, its presentation accords with the Small Area Data Program's emphasis on providing a range of social, economic and demographic data for particular geographical areas.

The Small Area Data Program has already produced profiles of the 282 Federal Electoral Districts, containing a wide range of demographic, social, and economic data. Similar profiles of Census Divisions will be available in July on a new small area data base, or in printed form on demand.

Multiple Jobholders

A multiple jobholder is a worker simultaneously employed in two or more jobs. A wide variety of incentives motivate persons to holding a second job, the main one being undoubtedly financial. For instance, workers in occupations which provide low income or short hours of work, such as artists, writers and actors, frequently need to supplement their income from their chosen careers in order to support themselves. Multiple jobholding is also common among seasonal workers, such as farmers, who work at a second job during those months when their main job's hours of work are minimal or non-existent.

Little is known about the industry and occupation of these workers' second job. Due to lack of data, for analytical purposes it has normally been assumed that the industry and occupation distributions of the second job resemble that of the first. A study was recently carried out, however, which sheds light on this issue. It focuses on a descriptive analysis of the class of worker, industry and occupation data for multiple jobholders derived from the Survey of 1981 Work History. This survey, conducted as a supplement to the Labour Force Survey in January 1982, collected information on each job held over the course of the reference year (1981) up to a maximum of four jobs. For each job reported, the months during which some work was done were identified, as were the job tenure, class of worker, industry and occupation associated with each job.

For paid jobs only, a work schedule was requested from the respondent, as were data on earnings and unionization.

Two characteristics appear to be widely shared by multiple jobholders: most of them had at least one part-time job and, the vast majority of them had at least one paid worker position with either the government or private industry.

A relatively small proportion of multiple jobholders, 30.9%, held both their jobs in the same industry. The industry which did provide a large number of workers with both their jobs was community services. Just over four in ten multiple jobholders worked in the same occupation in both their jobs.

Over one quarter of private paid workers who were multiple jobholders combined their paid jobs with

self-employment; one third of government workers with two jobs were also self-employed.

The three major service industries offered the largest proportion of second jobs for multiple jobholders. The percentages ranged from 65.8% of second jobs for workers in community services to 40.7% for those in manufacturing and construction.

The above is drawn from the forthcoming Labour Force Activity Section Research Paper No. 44 entitled "Multiple Jobholders, by Industry and Occupation." In addition to providing data, the research paper describes the methodology used to select multiple jobholders from the Survey of 1981 Work History data file. It also contains a quality evaluation of the data.

CANSIM MINI BASE, 1985 EDITION

The new CANSIM Mini Base will be available on April 1, 1985.

The Mini Base Series Directory which depicts the contents of this base will be released on April 1, 1985. For further information please contact Applications Consulting Services, CANSIM Division at (613) 990-8200 or 990-8203.

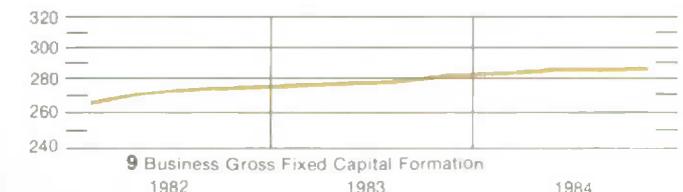

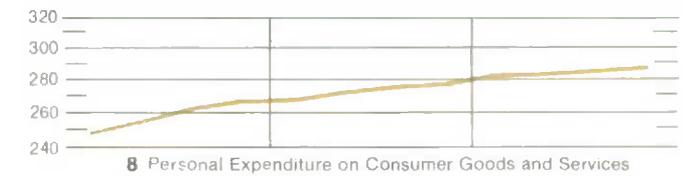

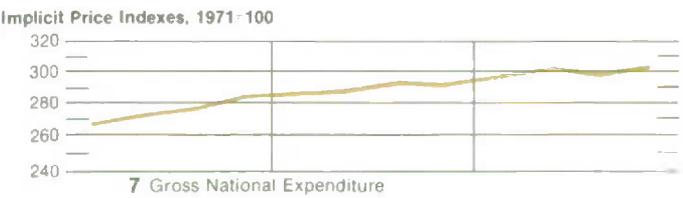

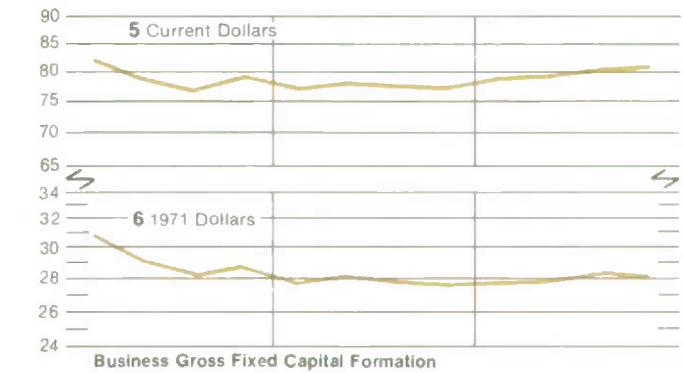

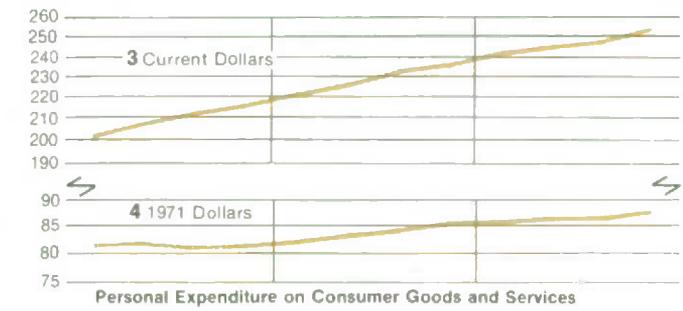

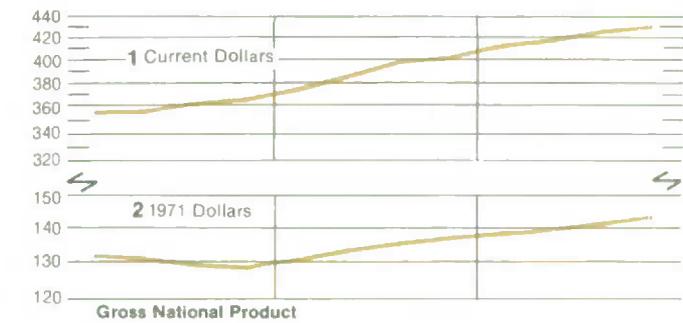

To order the 1985 Mini Base Series Directory (Catalogue 12-569E or 12-569F, \$45.00 in Canada \$54.00 other countries), contact Publication Sales and Services, Statistics Canada Ottawa K1A 0T6 (613) 993-5078.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1971 Census; see Occupational Classification Manual, Census of Canada, 1971, Catalogue Number 12-536E, Vol. I. ²Beginning with 1978, this is subdivided into entrepreneurs and managers-administrators. For breakdown refer to CANSIM main base. ³Includes logging, fishing, trapping and hunting. ⁴Includes mechanical and construction. ⁵Includes a small number in non-specified occupations. ⁶Beginning with 1978 includes fiancés and fiancées. ⁷Does not include students entering Canada on students' visas. ⁸Includes also retired persons, elderly dependents, and other unspecified persons.

Section 3 · System of National Accounts

1. Income and Expenditure Accounts

- 18 1.1 National Income and Gross National Product
- 18 1.2 Gross National Expenditure
- 19 1.3 Gross National Expenditure, Constant Dollars
- 19 1.4 Sources of Personal Income
- 20 1.5 Disposition of Personal Income
- 20 1.6 Sources and Disposition of Gross Saving
- 21 1.7 Government Revenue, Expenditure, and Surplus or Deficit, by Level of Government
- 25 1.8 Implicit Price Indexes, Gross National Expenditure
- 25 1.9 Relation between Gross National Product at Market Prices and
Gross Domestic Product at Factor Cost

2. Domestic Product by Industry

- 26 2.1 Gross Domestic Product by Industry of Origin, Quarterly
- 27 2.2 Gross Domestic Product by Industry of Origin, Monthly

3. Balance of International Payments

- 32 3.1 Canadian Balance of International Payments, Current Account, All Countries
- 33 3.2 Canadian Balance of International Payments, Current Account, Area Distribution
- 34 3.3 Canadian Balance of International Payments, Capital Account, All Countries

1—Income and expenditure accounts

Table 1.1: National income and gross national product (millions of dollars)

Year and quarter	Wages, salaries, and supplementary labour income	Military pay and allowances	Corporation profits before taxes ¹	Deduct dividends paid to non-residents ²	Interest & misc. investment income ³	Accr'd net income of farm operators from farm prod. ⁴	Net income of non-farm un-incorp. business incl. rent ⁵	Inventory valuation adjust. ⁶	Net national income at factor cost	Indirect taxes less subsidies	Capital consump. allowances & misc. val. adj.	Residual error of estimate	GNP at market prices	GNP at market prices excl. accrued net income of farm operators

¹Excludes profits (net of losses) of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. ⁴Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. ⁴The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). ⁵See footnote 4, Table 1.1

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. ²Tax liabilities. ³Withholding taxes. ⁴The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. For source see Table 1.9.

¹These implicit indexes are current weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarterly-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

¹The labour force as a percentage of the population 15 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. ²The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

Source: The Labour Force (71-001), monthly.

¹"Beneficiaries" refer to the number of persons receiving \$1.00 or more in unemployment insurance benefit during a specific week each month. ²Annual figures are averages of 12 months. ³Prior to July 1971, includes adjustments for cancellation of warrants and collection of overpayments. ⁴Trainees on courses approved by Canada Employment and Immigration Commission. ⁵Total benefits paid. ⁶Trainees on courses approved by Canada Employment and Immigration Commission.

¹Statistics on work stoppages include all strikes and lockouts whether legal or illegal, which last for one-half day or more and amount to 10 or more person-days of time lost. Time lost by workers indirectly affected, such as those laid off because of a work stoppage by other employees, is not included. Data is published 45 days after the end of reference month.
²The industry groups from January 1976 forward, are based on the 1970 Standard Industrial Classification. ³The number of person-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. ⁴The total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. ⁵Includes publishing and allied industries. ⁶Includes storage and communication industries.

¹These weights, provided as a general guide, show the relative importance of the major components of the C.P.I. They are based on expenditure values derived from quantities and prices of year 1982. ²Includes water, fuel and electricity and traveller accommodation. ³Excludes water, fuel and electricity. ⁴For further information on the weights and methodology associated with the Consumer Price Index, see "The Consumer Price Index Reference Paper, updating based on 1982 expenditures," cat 62-553, occasional. Source: Consumer Prices and Price Indexes (62-010), Statistics Canada.

¹Estimates of manufacturers' shipments, inventories and orders are based on a monthly survey of a sample of manufacturing establishments, benchmarked to the annual census of manufacturers. ²Shipments of goods manufactured within the establishments. ³Total new orders received during the period at estimated selling value, net of cancellations. ⁴Total manufacturing inventory owned by manufacturing establishments. Other inventory such as that of goods purchased for resale is not included. Note: All series are subject to revision each year when more recent Census of Manufactures data become available. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001). Statistics Canada.

^aSeparate industries series combined for the Supplementary Classification automotive products, are also components of other classifications. Other economic use classification groups are mutually exclusive and except for rounding differences add to relevant Canada totals in section 6, table 1.

Note: All series are subject to revision each year when more recent Census of Manufactures data become available.

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

Table 5: Estimated value of inventories owned and raw materials in manufacturing industries, by economic use classification, based on the 1970 standard industrial classification (million dollars)

Annual average and month	Inventories owned							Inventories held: raw materials						
	Consumer goods		Machinery and equipment	Construction materials and components	Other intermediate goods & supplies	Export-based industries	Supplementary classification: automotive products	Consumer goods		Machinery and equipment	Construction materials and components	Other intermediate goods and supplies	Export-based industries	Supplementary classification: automotive products

¹Pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. ²Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. ³Customs exports. ⁴Mill shipments destined for export.

¹Data compiled according to the Steel Distribution Index revised January, 1964. ²Figures on net shipments relate to semi finished and rolled steel products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ³Excluding shipments for re-processing at maker's own plant. ⁴Data compiled as submitted by the steel producers according to the steel industry distribution code.

¹Gas types are included. ²Includes producers' shipments for export. ³In some cases these shipments are not at the factory level, and stocks at beginning of month plus production less shipments do not equal stocks at end of month. ⁴End of period. ⁵Electric and other. ⁶Excludes apartment type machines. ⁷Excludes other than electric.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision.
¹Supply and disposition for both Crude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc.
²Gross new production by field less field flared and waste.
³Includes crude oil, condensate and pentanes.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. Source: Housing Starts and Completions (64-002), Statistics Canada.

¹Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of input. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. The price indexes for the last two years are subject to revision. ²The major groups include additional components than the selected ones shown.

¹Total exports includes domestic exports and re-exports, for further information please refer to Summary of External Trade (65-001). ²The figures reflect a number of adjustments applied to the customs totals to make them consistent with the concepts and definitions used in the system of national accounts. For more information about these adjustments, please refer to Quarterly Estimates of the Canadian Balance of International Payments (67-001). ³For definition of major trading areas and sections, please refer to Summary of External Trade (65-001).

¹Data for 1970 through 1972 refer to class 1 and 2 carriers whose gross annual revenues totalled \$500,000 or more. Information for the period January 1973-December 1978 refers to only 6 major railways. Commencing January 1979, data for 7 major railways (accounting for 95 per cent or more of the total operating revenues) are shown.

Note: Components may not add to totals because rounding. Cheques drawn on the Receiver General or cheques drawn on bank deposit accounts held in the name of the Receiver General are not included in the data.

¹This series covers 50 clearing house centres. With the advent of centralized data processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres, however, this comparison may not remain valid through time. ²Seasonally adjusted data for Saskatchewan is not available.
