PREFACE.

The Canada Year Book had its origin in the first year of the Dominion, when the "Year Book and Almanac of British North America"—being (to quote its sub-title) "an Annual Register of political, vital and trade statistics, customs tariffs, excise and stamp duties, and all public events of interest in Upper and Lower Canada, New Brunswick, Nova Scotia, Prince Edward Island, Newfoundland, and West Indies"—was founded. Subsequently the title was changed to "The Year Book and Almanac of Canada,—an annual statistical abstract of the Dominion and a register of legislation and of public men in British North America" It was published annually from 1867 to 1879.

In 1886, after the passing of a general Statistics Act, the "Statistical Abstract and Record of Canada" was instituted as an official book of reference respecting the institutions, population, finance, trade and general conditions of the Dominion, "with comparative data for the United Kingdom, British Possessions and foreign countries". The work was prepared in the General Statistical Office of the Department of Agriculture, and was continued annually until 1904, under the direction of Dr. George Johnson, F.S.S. In 1905 the General Statistical Office was amalgamated with the Census Office (which was at the same time made a permanent organization), and the Year Book was remodelled by Dr. Archibald Blue, Chief Officer, and continued under the title "The Canada Year Book, Second Series".

In the reorganization and centralization of statistics which followed the report of the Royal Commission on Statistics of 1912, and the establishment of the Dominion Bureau of Statistics in 1918, the improvement of the Year Book, both in content and method of presentation, was made a primary object, and this improvement has been continued down to the present time.

A feature of the Year Book has been the inclusion of special articles from time to time dealing more fully than is possible in the regular material, with some phase of science or art or of the social or economic development of Canada. Thus, in the present edition there appears a special article prepared in the Department of External Affairs dealing with the Imperial Economic Conference of 1932. Attention may also be drawn to the inclusion in Chapter I of a special study on Droughts in Western Canada, contributed by the Climatologist of the Meteorological Service. Additional census analyses becoming available from the census of 1931 have facilitated a more extensive and up-to-date treatment of Population. The chapter on Internal Trade has been extended to present summary statistics of the first comprehensive census of wholesale and retail trade and services to be taken in Canada; this census is also one of the first of its kind in any country. The chapter on Transportation and Communications includes a description of the new Canadian National-Canadian Pacific Act implementing the report of the Duff Commission, together with a description of the aims and objects of the Radio Broadcasting Commission. A special article on the Growth of Life Insurance in Canada, which appeared in the 1925 edition, has been revised in consequence of recent changes in insurance legislation. The Public Health chapter has also been improved by the inclusion of the new annual statistics of institutions. Finally, all parts of the volume have received a careful revision by competent authorities in each branch of the national activities.

A list of the special articles appearing in earlier volumes of the Year Book and not repeated in this edition is presented at page ii of this Introduction, immediately preceding the map. The latest available data on immigration, trade, and from the 1931 Census of Agriculture will be found in the Appendices.

The present volume has been edited by S. A. Cudmore, B.A. (Tor.), M.A. (Oxon.), F.S.S., F.R. Econ. Soc., assisted by A. E. Millward, B.A., B. Com., W. H. Lanceley, and R. F. Clarke, M.C., D.L.S., of the editorial staff of the General Statistics Branch of the Bureau. Grateful acknowledgments are hereby tendered to the numerous officials of the Dominion and Provincial Governments who have assisted in the collection of information. An effort has been made to apportion due credit to the various individuals and services concerned by means of footnotes to those chapters and sections which have been contributed, or in the compilation of which co-operation has been received.

While the greatest care has been taken in the preparation of the volume, there are doubtless imperfections and, with a view to the improvement of future editions, the Editor will be glad to hear of any errors which may have escaped his notice, and to receive any suggestions with regard to omissions or to method of treatment.

DOMINION BUREAU OF STATISTICS,
OTTAWA, Sept. 1, 1933.

R. H. COATS,
Dominion Statistician.

SYNOPSIS.

CHAPTER I.—PHYSIOGRAPHY.

	PAGE.
Part I.—Geographical Features	1-18
1. Land and Fresh Water Area of Canada, by Provinces and Territories, as in 1933.....	7
Section 1. <i>Orography</i>	7-12
2. Mountain Peaks over 11,000 feet in elevation, with Latitude and Longitude.....	11-12
Section 2. Rivers and Lakes.....	12-17
3. Drainage Basins of Canada.....	13
4. Lengths of Principal Rivers and Tributaries in Canada.....	14
5. Areas, Elevations and Depths of the Great Lakes.....	15
6. Areas of Principal Canadian Lakes, by Provinces.....	15-17
Section 3. <i>Islands</i>	17-18
Part II.—Geology	18-37
Section 1. <i>Geology of Canada</i>	18
Subsection 1. Topography.....	18-23
Subsection 2. Geology.....	23-28
Section 2. <i>Economic Geology of Canada, 1931</i>	28-37
Part III.—Seismology in Canada	37
Part IV.—The Flora of Canada	38
Part V.—Faunas of Canada	38
Part VI.—The Natural Resources of Canada	38-46
7. Areas of Occupied and Estimated Potential Agricultural Lands in the Nine Provinces of Canada, 1931, with Estimated Land Area, 1933.....	39
8. Classification of Forest Land in Canada, 1932.....	42
8A. Canadian National Parks and Reserves, 1933.....	46
Part VII.—Climate and Meteorology	46-59
Section 1. <i>The Climate of Canada</i>	46
Section 2. <i>The Factors which Control Canadian Weather</i>	47
Section 3. <i>The Distribution of Precipitation in Canada</i>	47
Section 4. <i>The Temperature and Precipitation of Northern Canada</i>	47
Section 5. <i>The Meteorological Service of Canada</i>	47
Section 6. <i>Meteorological Tables</i>	47
Section 7. <i>Droughts in Western Canada</i>	47-59
9. Precipitation in Crop Years and Temperature in the Growing Period at Certain Western Points, together with Quotients, when Precipitation is divided by Temperature, 1883-4-1932.....	52-56
10. Weighted Quotients, where Precipitation in Crop Years is divided by Temperature in Growing Period, expressed as a percentage of Averages, 1886-1932.....	50-58
11. Values of Quotients, where Precipitation is divided by Temperature in Growing Period, related to Sun-spot Maxima.....	59

CHAPTER II.—HISTORY AND CHRONOLOGY.

Part I.—History	60
Part II.—Chronology, 1497 to 1932	60-60

CHAPTER III.—CONSTITUTION AND GOVERNMENT.

Part I.—Constitution and General Government	71
Part II.—Provincial and Local Government	71
Part III.—Legislative and Executive Authorities	71-95
Section 1. <i>Dominion Parliament and Ministry</i>	71-89
Subsection 1. The Governor General of Canada.....	72
1. Governors General of Canada, 1867-1933.....	72
Subsection 2. The Ministry.....	72-76
2. Ministries since Confederation and Members of the Fifteenth Ministry.....	73
3. Members of the King's Privy Council for the Dominion of Canada, according to Seniority Therein, Dec. 31, 1932.....	74
4. Duration and Sessions of Dominion Parliaments, 1867-1932.....	75-76
Subsection 3. The Senate.....	76-79
5. Growth of Representation in the Senate, 1867-1933.....	78
6. Representation in the Senate of Canada, by Provinces, as at Mar. 31, 1933.....	78-79
Subsection 4. The House of Commons.....	79-88
7. Representation in the House of Commons as at Dominion General Elections, 1867-1930.....	81
8. Representation of the Provinces and Territories of Canada in the House of Commons, as determined by the Censuses of 1931, 1921 and 1911.....	82
9. Electoral Districts, Voters on Lists and Votes Polled, Names and Addresses of Members of the House of Commons, as Elected at the Seventeenth General Election.....	84-88
Subsection 5. The Dominion Franchise.....	88-89
10. Number of Voters and Votes Polled in the General Elections of 1921, 1925, 1926, and 1930.....	89

CHAPTER III.—CONSTITUTION AND GOVERNMENT—concluded.

	PAGE.
Part III.—Legislative and Executive Authorities—concluded.	
Section 2. <i>Provincial Governments</i>	90-95
11. Provinces and Territories of Canada, with Present Areas, Dates of Admission to Confederation and Legislative Process by which Admission was Effected.....	90
12. Lieutenant-Governors of Provinces, 1867-1932 and present Ministries.....	91-95
Part IV.—Canadian Representatives in Other Countries	96-99
Section 1. Representatives within the Empire.....	96-97
Section 2. Representatives outside the Empire.....	97-99
Part V.—Canada and The League of Nations	99-100

CHAPTER IV.—POPULATION.

Section 1. <i>Census Statistics of General Population</i>	101-109
1. Population of Canada by Provinces and Territories, in the Census Years 1871 to 1931.....	102
2. Percentage Distribution of Canadian Population, by Provinces and Territories, 1871 to 1931.....	102
3. Population of Canada, by Provinces and Territories, in 1871 and 1931, Numerical Increase in each Decade from 1871 to 1931, and Total Increase.....	102
4. Population of Canada, by Provinces and Territories, in 1871, and Increase Per Cent, by Decades, from 1871 to 1931.....	103
5. Density of Population in Canada, by Provinces and Territories, 1911, 1921 and 1931.....	106
6. Movement of Population, including Estimated Natural Increase, Recorded Immigration and Estimated Emigration, for the Inter-Censal Periods 1901-11, 1911-21 and 1921-31.....	107
Subsection 1. Population of Canada, by Provinces and Electoral Districts.....	107-109
7. Population of Canada, by Provinces and Electoral Districts, 1931 Compared with 1921.....	107-109
Section 2. <i>Sex Distribution</i>	109-111
8. Sex Distribution of the People of Canada, by Provinces, 1871-1931.....	110
9. Proportion of Sexes per 1,000 Population in Canada, by Provinces, 1871-1931.....	111
10. Masculinity of the Populations of Various Countries in Recent Years.....	111
Section 3. <i>Conjugal Condition</i>	112-114
11. Conjugal Condition of the Population, by Numbers and Percentages, as Shown by Censuses of 1871, 1881, 1891, 1901, 1911, 1921 and 1931.....	112
12. Conjugal Condition of the People of Canada Classified as Single, Married, Widowed, Divorced and Not Given, by Provinces and Sex, 1931.....	113
13. Conjugal Condition of the People, 15 Years of Age and Over, 1931.....	113-114
Section 4. <i>Age Distribution</i>	114-116
14. Proportion per 1,000 of the Population by Age Periods, 1871, 1881, 1891, 1901, 1911, 1921 and 1931.....	115
15. Proportion per 1,000 of the Population by Age Periods, by Provinces, 1931, with Totals for 1921.....	115
16. Male and Female Population of Canada by Age Periods, 1881, 1891, 1901, 1911, 1921 and 1931.....	116
Section 5. <i>Racial Origins</i>	117-120
17. Origins of the People according to the Censuses of 1871, 1881, 1901, 1911, 1921 and 1931.....	118
18. Percentage which the People of Each Origin Formed of the Total Population, according to the Censuses of 1871, 1881, 1891, 1901, 1911, 1921 and 1931.....	119
19. Racial Origins of the Population, by Provinces and Territories, Census of 1931.....	120-121
Section 6. <i>Religions</i>	120-125
20. Religions of the People at each Decennial Census, 1871-1931.....	122
21. Percentages of Specified Religions at each Decennial Census, 1871-1931.....	123
22. Religions of the People, by Provinces, Census of 1931.....	124-125
Section 7. <i>Birthplaces</i>	126-127
23. Birthplaces of the Population of Canada according to the Censuses of 1871-1931.....	126
24. Population Classified by Sex and Nativity, by Provinces and Territories, according to the Census of 1931, with Totals for 1911 and 1921.....	127
Section 8. <i>Citizenship of the Foreign Born</i>	127-129
25. Naturalized and Alien Persons among the Foreign-Born Residents of Canada, by Countries of Birth, Numbers and Percentages, 1901, 1911, 1921 and 1931.....	128-129
Section 9. <i>Rural and Urban Population</i>	129-139
26. Rural and Urban Populations, by Provinces and Territories, 1891, 1901, 1911, 1921 and 1931.....	131
27. Percentage Distribution of Rural and Urban Populations, by Provinces and Territories, 1891, 1901, 1921 and 1931.....	132
28. Urban Populations of Canada, Divided by Size of Municipality Groups, 1911, 1921 and 1931.....	132
29. Populations of Cities and Towns having over 5,000 inhabitants in 1931, Compared with 1871-81-91-1901-11-21.....	133-135
30. Populations of Towns and Villages having between 1,000 and 5,000 Inhabitants in 1931, as Compared with 1901, 1911 and 1921.....	135-138
31. Urban and Rural Farm Populations, by Provinces, 1931.....	138

CHAPTER IV.—POPULATION.

	PAGE.
Section 10. <i>Literacy</i>	139-142
37. Ability to Read and Write of the Population 5 Years of Age and Over, by Provinces, 1901, 1911, 1921 and 1931.....	139-140
38. Literacy of the Population of 10 Years and Over, by Sexes and Provinces, 1931.....	141
39. Literacy of the Populations of 10 Years of Age and Over in Cities and Towns of 30,000 and Over, by Numbers and Percentages, 1931.....	142
Section 11. <i>School Attendance</i>	143-144
35. School Attendance of the Total Population 5-19 Years of Age Inclusive, by Sexes, for all Canada, 1911, 1921 and 1931.....	143
36. Percentages of School Attendance of Total Population 5-19 Years of Age Inclusive, by Sexes, for all Canada, 1911, 1921 and 1931.....	144
Section 12. <i>Annual Estimates of Population</i>	144-145
37. Estimates of the Population of Canada for Inter-Censal Years, by Provinces, 1867-1932.....	145

CHAPTER V.—VITAL STATISTICS.

Section 1. <i>Natural Increase</i>	148-153
1. Summary of Births, Marriages, Deaths and Natural Increase, by Provinces, for the calendar years 1926-31, with Averages 1921-25 and 1926-31.....	150-151
2. Summary of Births, Marriages, Deaths and Excess of Births over Deaths in Cities of 10,000 Population and Over, for the calendar year 1930.....	151-152
3. Births, Deaths and Excess of Births over Deaths in Canada, by Provinces and for Each Sex, 1930, with Totals for 1921-30.....	153
Section 2. <i>Births</i>	153-161
4. Number of Living Births and Birth Rates, by Provinces, 1926-31 with Averages, 1921-25 and 1926-30.....	153-161
5. Living Births in Cities of 10,000 Population and Over, 1927-31.....	154
6. Percentages of Legitimate Children Born Alive to Canadian-Born, British-Born or Foreign-Born Mothers, by Provinces, 1930.....	156
7. Births (Exclusive of Stillbirths) by Sex and Ratio of Males to Females, for Canada and by Provinces, 1926-31, with Averages for 1921-25 and 1926-30.....	156-157
8. Quartile and Decile Ages of Married Fathers and Mothers, 1926, 1928-30.....	158
9. Number and Percentage of Births (Exclusive of Stillbirths) in Canada to Fathers and Mothers Born in Specified Countries, 1930.....	158
10. Number and Percentage of Births (Exclusive of Stillbirths) in Canada to Fathers and Mothers of Specified Origins, 1930.....	159
11. Number of Illegitimate Births, Classified by Age of Mother, with the Percentage to Total Living Births, by Provinces, 1930 with Totals for 1931.....	160
12. Stillbirths by Age of Mother and Legitimacy of Child in 1930, with Totals for 1931.....	160
13. Crude Birth Rates of Various Countries in Recent Years.....	161
Section 3. <i>Marriages and Divorces</i>	161-166
Subsection 1. <i>Marriages</i>	161-165
14. Number of Marriages and Marriage Rates, by Provinces, 1921-31.....	162
15. Differences in Ages of Bridegrooms and Brides, 1930.....	162
16. Average Ages of Parties Contracting Marriages, by Provinces, 1930.....	163
17. Nativity of Persons Married in the Registration Area, by Provinces, 1926-30.....	163-164
18. Crude Marriage Rates of Various Countries in Recent Years.....	165
Subsection 2. <i>Divorces</i>	165-166
19. Statistics of Divorces Granted in Canada, 1901-32.....	166
Section 4. <i>Deaths</i>	166-184
Subsection 1. <i>General Mortality</i>	167-176
20. Deaths and Death Rates, by Provinces, 1926-31, with Averages, 1921-25 and 1926-30.....	167
21. Distribution of Deaths in Canada, by Sex and Certain Age-Groups, Numbers and Percentages, 1930-31.....	168
22. Quartile and Decile Ages of Decedents by Sex, 1928-30.....	169
23. Crude and Adjusted Death Rates in Canada, by Provinces, 1921-31.....	170-171
24. Deaths in Canada, by Principal Causes, 1926-31.....	172
25. Death Rates per 100,000 Population in Canada, by Principal Causes, 1926-31.....	172-174
26. Total Deaths (exclusive of Stillbirths) in Cities of 10,000 Population and Over, 1927-31.....	174-175
27. Crude Death Rates of Various Countries in Recent Years.....	176
Subsection 2. <i>Infantile and Maternal Mortality</i>	176-184
28. Infantile Mortality by Provinces, together with the Rate per 1,000 Living Births, 1926-31, with Averages for 1921-25 and 1926-30.....	177
29. Infantile Mortality in Canada, by Principal Causes of Death, 1926, 1929-31.....	177-178
30. Proportion per 1,000 Deaths of Infants under 1 Year of Age occurring at each Age-Period, 1930.....	179
31. Deaths and Death Rates of Children Under One Year of Age (Exclusive of Stillbirths) in Cities and Towns of 10,000 and Over, 1928-31.....	179-180
32. Infantile Mortality per 1,000 Living Births in Various Countries of the World in Recent Years.....	181
33. Infantile Mortality per 1,000 Living Births in Great Cities of the World, 1930 or the Most Recent Year.....	182
34. Maternal Deaths in Canada, by Age Groups, with Rates per 1,000 Living Births, 1926-31.....	183
35. Maternal Deaths in each Province, by Age Groups, 1931, with Totals and Rates per 1,000 Living Births for 1926-31 and Averages for 1921-25 and 1926-30.....	183
36. Maternal Deaths in each Province, by Causes of Death, 1931.....	184

CHAPTER VI.—IMMIGRATION.

	PA CE.
Section 1. <i>Statistics of Immigration</i>	185-202
1. Number of Immigrants Settling in Canada in each of the calendar years 1867-80.....	186
2. Number of Immigrant Arrivals in Canada from the United Kingdom, the United States and Other Countries, calendar or fiscal years ended 1881-1932.....	187
3. Sex and Conjugal Condition of Immigrants into Canada, by Age Groups, fiscal year ended Mar. 31, 1932.....	187
4. Sex Distribution of Immigrants as Adult Males, Adult Females and Children, fiscal years ended Mar. 31, 1911-32.....	188
5. Racial Origins of Immigrants into Canada, Arriving <i>via</i> Ocean Ports and from the United States, fiscal years ended Mar. 31, 1931 and 1932.....	188-189
6. Languages of Immigrants Ten Years Old and Over, Arriving <i>via</i> Ocean Ports and from the United States, fiscal years ended Mar. 31, 1931 and 1932.....	190
7. Nationalities of Immigrants Arriving <i>via</i> Ocean Ports and from the United States, fiscal years ended Mar. 31, 1931 and 1932.....	191
8. Countries of Birth of Immigrants Arriving <i>via</i> Ocean Ports and from the United States, fiscal years ended Mar. 31, 1931 and 1932.....	192
9. Immigrants Arriving in Canada, by Chief Ports of Arrival, fiscal years ended Mar. 31, 1926-32.....	193
10. Destination of Immigrants into Canada, by Provinces, fiscal years ended June 30, 1901-06 and Mar. 31, 1907-32.....	193-194
11. Occupations and Destinations of Immigrants Arriving in Canada, fiscal years ended Mar. 31, 1931 and 1932.....	194-195
12. Rejections of Immigrants upon Arrival at Ocean Ports, by Principal Cause and Nationalities, fiscal years ended 1903-32, with Totals 1903-21 and 1903-32.....	196
13. Deportations of Immigrants after Admission by Principal Causes and by Nationalities, fiscal years ended 1903-32 with Totals 1903-21 and 1903-32.....	196
14. British Juvenile Immigrants, fiscal years 1901-32.....	197
15. Record of Oriental Immigrants, fiscal years ended 1901-32.....	197
16. Record of Chinese Immigrants, fiscal years ended 1912-32.....	198
17. Expenditures on Immigration in the fiscal years ended 1868-1932.....	199
18. Canadians Returned from the United States, fiscal years ended Mar. 31, 1925-32.....	200
19. Returning Canadians and Other Non-Immigrants entering Canada <i>via</i> Ocean Ports, by Class of Travel, fiscal years ended Mar. 31, 1932, with Totals for fiscal years 1926-31.....	201
Section 2. <i>Immigration Policy</i>	202

CHAPTER VII.—SURVEY OF PRODUCTION.

Section 1. <i>The Leading Branches of Production in 1930</i>	205-209
1. Gross and Net Values of Production in Canada, by Industries, 1926-30.....	207
2. Detailed Itemized Statement of the Net Values of Production in Canada during 1928, 1929 and 1930.....	208-209
Section 2. <i>The Provincial Distribution of Production</i>	209-211
3. Gross and Net Values of Production in Canada, by Provinces, 1926-30.....	210
Section 3. <i>Leading Branches of Production in each Province, 1930</i>	211-214
4. Gross and Net Values of Production in Canada, by Industries and Provinces, 1930.....	212-213
5. Percentage of the Value of the Net Production in each Industry to the Total Net Production of each Province, 1930.....	213-214

CHAPTER VIII.—AGRICULTURE.

Section 1. <i>The Government in Relation to Agriculture</i>	215-225
Subsection 1. The Dominion Department of Agriculture.....	215-217
Subsection 2. Provincial Departments of Agriculture.....	217-219
Subsection 3. Dominion and Provincial Agricultural Experimental Stations.....	219-225
(A) Dominion Experimental Farms and Stations.....	220-226
(B) Provincial Agricultural Colleges and Experimental Stations.....	225
Section 2. <i>Statistics of Agriculture</i>	226-277
Subsection 1. <i>Agricultural Revenue and Wealth</i>	227-230
1. Estimated Gross Annual Agricultural Revenue of Canada, Itemized by Provinces, 1928-32.....	227-228
2. Estimated Gross Agricultural Wealth of Canada, by Provinces, 1932.....	229
Subsection 2. <i>Acreage, Yield and Value of Field Crops</i>	230-243
3. Areas, Yields and Values of Principal Crops Grown in Canada, 1923-32.....	230-232
4. Total Areas and Values of Field Crops in Canada, 1927-32.....	232
5. Field Crops of Canada, Compared as to Quantity and Value, 1931 and 1932.....	233
6. Areas, Yields and Values of Principal Field Crops in Canada, Itemized by Provinces, 1931-32.....	233-239
7. Estimated Acreages under Pasture in Canada, 1926-32.....	240
8. Annual Average Yields per Acre of Field Crops for Canada, 1925-32, with Long-time Averages.....	241
9. Areas and Yields of Wheat, Oats, Barley, Rye and Flaxseed in the Prairie Provinces, 1930-32.....	241
10. Stocks of Grain in Farmers' Hands on July 31, 1932, as Compared with July 31, 1931 and 1930, with Total Production for the Previous Years.....	242
11. Stocks of Grain in Canada on July 31, 1930, 1931 and 1932.....	242
12. Distribution of the Canadian Wheat Crops, by crop years 1930-31 and 1931-32.....	243
13. Distribution of the Canadian Oat Crops, by crop years, 1930-31 and 1931-32.....	243

CHAPTER VIII.—AGRICULTURE—concluded.

	PAGE.
Subsection 3. Farm Live Stock and Poultry.....	244-248
14. Summary Statistics of the Numbers of Live Stock and Poultry on Farms in the Dominion of Canada, Censuses of 1871-1931.....	244
15. Estimated Numbers and Values of Farm Live Stock in Canada, by Provinces, 1929-32.....	245
16. Average Values per Head of Farm Live Stock in Canada, as Estimated by Crop Correspondents, 1921-32.....	246
17. Estimated Numbers and Values of Farm Poultry in Canada, 1931-32.....	247
18. Estimated Quantities and Values of Canadian Wool Clip, 1915-32.....	248
19. Annual Production and Value of Farm Eggs in Canada, 1923-32.....	248
Subsection 4. Fur Farming.....	248-251
20. Numbers of Fur-bearing Animals on Fur Farms in Canada, at Dec. 31, 1923-31.....	249
21. Values of Fur-bearing Animals on Fur Farms in Canada, at Dec. 31, 1923-31.....	250
22. Values of Fur-bearing Animals Sold from Fur Farms in Canada, 1923-31.....	250
23. Values of Pelts Sold from Fur Farms in Canada, 1923-31.....	251
24. Numbers of Fur Farms, Values of Land and Buildings and Values of Fur-bearing Animals, by Provinces, 1929-31.....	251
Subsection 5. Dairying Statistics.....	251-254
25. Quantities and Values of Creamery Butter, by Provinces, 1929-31.....	252
26. Quantities and Values of Factory Cheese, by Provinces, 1929-31.....	252
27. Quantities and Values of Miscellaneous Products of Dairy Factories, 1929-31.....	253
28. Total Values of All Products of Dairy Factories, by Provinces, 1927-31.....	253
29. Values of the Dairy Production, by Provinces, 1931, with Dominion Totals for 1925-31.....	254
Subsection 6. Fruit Farming.....	254-256
30. Estimated Quantities and Values of Commercial Fruit Production in Canada, 1931-32.....	255
31. Numbers and Values of Fruit Trees, Bushes and Plants, Sold by Nurserymen in Canada, years ended May 31, 1929-32.....	255
32. Production and Value of Floricultural and Decorative Plants Grown in Canada and Sold during the year ended May 31, 1932.....	256
Subsection 7. Special Agricultural Crops.....	256-259
33. Estimated Quantities and Values of Maple Sugar and Maple Syrup Produced in Canada, by Provinces, 1930-32.....	256
34. Acreages, Yields and Values of Sugar Beets in Canada and Quantities of Refined Beetroot Sugar Produced, 1921-31.....	257
35. Acreages and Yields of Tobacco in Canada, by Provinces, 1900, 1910, 1911 and 1920-32.....	258
36. Acreages, Yields and Values of Flax Fibre, etc., in Canada, 1915-32.....	258
Subsection 8. Farm Labour and Wages.....	259-260
37. Average Wages and Board of Farm Help in Canada, as Estimated by Crop Correspondents, 1914, 1920, 1925, 1930-32.....	259-260
Subsection 9. Prices of Agricultural Produce.....	260-267
38. Monthly Average Cash Prices per Bushel at Winnipeg of Representative Grades of Canadian Wheat, Oats, Barley, Flax and Rye—basis, in store at Fort William and Port Arthur—1930-32, and Yearly Average Prices for crop years ended July 31, 1926-32.....	261
39. Yearly Average Price of Home-Grown Wheat, Barley, and Oats in England and Wales, 1902-32.....	262
40. Monthly Average Prices of Flour, Bran and Shorts at Principal Markets, 1932.....	262-263
41. Yearly Average Prices per Cwt. of Canadian Live Stock at Principal Markets, 1931.....	263
42. Monthly Average Prices per Cwt. of Canadian Live Stock at Principal Markets, 1932.....	264
43. Index Numbers of Producers' Prices of Agricultural Commodities, 1913-32.....	265
Subsection 10. Agricultural Statistics of the Census.....	267
Subsection 11. Miscellaneous Agricultural Statistics.....	267-268
44. Major Irrigation Projects in Southern Alberta, 1931.....	267
45. Average Values per Acre of Occupied Farm Lands in Canada, as Estimated by Crop Correspondents, 1910, 1915-32.....	268
Subsection 12. International Agricultural Statistics.....	268-277
46. Acreages and Yields of Cereals and Potatoes in Countries of the World, 1931 and 1932, with Five-Year Averages for 1926-30.....	270-274
47. Exports of Wheat and Flour from the Principal Wheat-Exporting Countries and Imports of Wheat and Flour to the Principal Wheat-Importing Countries, crop years ended July 31, 1931 and 1932.....	275-276
48. Numbers of Live Stock in Principal Countries, circa, 1931.....	276-277

CHAPTER IX.—FORESTRY.

Section 1. <i>Physiography, Geology and Climate as Affecting the Forests</i>	279-280
Section 2. <i>Main Types of Forest Growth</i>	281-283
Section 3. <i>Important Tree Species</i>	283
Section 4. <i>Forest Resources</i>	284-286
1. Estimate of Total Accessible Stand of Timber in Canada, by Regions and Classes, with Estimate of Grand Total Stand, 1932.....	286
Section 5. <i>Forest Administration</i>	289-291
Subsection 1. <i>Administration of Dominion and Provincial Timber Lands</i>	286-288
Subsection 2. <i>Forest Fire Protection</i>	288-290
Subsection 3. <i>Scientific Forestry</i>	290-291

CHAPTER IX.—FORESTRY—concluded.

	PAGE.
Section 6. <i>Forest Utilization</i>	292-309
Subsection 1. <i>Woods Operations</i>	293-295
2. <i>Value of Woods Operations, by Products, 1926-30</i>	294
3. <i>Quantity of Wood Cut in Woods, Operations in Canada, Equivalent in Standing Timber and Total Value, by Chief Products, 1930</i>	294
4. <i>Equivalent Volumes of Standing Timber Cut in Canada, and Values of Products of Woods Operations, by Provinces, 1929 and 1930</i>	295
Subsection 2. <i>The Pulp and Paper Industry</i>	296-305
5. <i>Production, Consumption, Export and Import of Pulpwood, calendar years 1920-31</i>	297
6. <i>Pulp Production, Mechanical and Chemical, calendar years 1920-31</i>	299
7. <i>Production of Wood-Pulp in Canada, by the Chief Producing Provinces, 1926-31</i>	299
8. <i>Exports of Wood-Pulp from Principal Wood-Pulp Producing Countries of the World, calendar years 1913, 1930 and 1931</i>	300
9. <i>Summary of Paper Production in Canada, calendar years 1917-31</i>	302
10. <i>Production of Paper in Canada, by Provinces, 1931</i>	302
11. <i>Estimated Quantities of Newsprint Produced in 23 Leading Countries, 1930 and 1931, and the Five-Year Averages, 1927-31</i>	303
12. <i>Exports of Newsprint Paper from Principal Paper-Producing Countries of the World, 1913, 1929, 1930 and 1931</i>	304
Subsection 3. <i>The Lumber Industry</i>	305-306
13. <i>Quantities and Values of Lumber, Lath and Shingles Produced in Canada, calendar years 1920-31</i>	305
14. <i>Quantity and Value of Lumber and Value of Other Sawmill Products made in Canada, by Provinces, 1931</i>	306
Subsection 4. <i>Summary of Primary Forest Production</i>	306-307
Subsection 5. <i>Other Forest Industries</i>	307
Subsection 6. <i>Manufactures of Wood and Paper</i>	307-308
Subsection 7. <i>Forest Depletion and Increment</i>	308-309

CHAPTER X.—THE FUR TRADE.

1. <i>Summary of the Numbers and Values of Pelts of Fur-bearing Animals Taken in Canada, years ended June 30, 1930-32</i>	313
2. <i>Numbers and values of Pelts of Fur-bearing Animals Taken in Canada, years ended June 30, 1931 and 1932</i>	313
3. <i>Kinds, Numbers, Total Values and Average Values of Pelts of Fur-bearing Animals Taken in Canada, years ended June 30, 1931 and 1932</i>	314

CHAPTER XI.—THE FISHERIES.

Section 1. <i>The Early Fisheries</i>	315
Section 2. <i>The Canadian Fishing Grounds</i>	315-317
Section 3. <i>The Government and the Fisheries</i>	317-320
1. <i>Government Bounties Paid to Fishermen for the calendar years 1928-31</i>	320
Section 4. <i>The Modern Fishing Industry</i>	320-331
1. <i>Total Values of Products of the Fisheries of Canada, 1870-1931</i>	321
2. <i>Total Values of the Products of Fisheries, by Provinces, calendar years 1926-31</i>	322
3. <i>Quantities and Values of the Chief Commercial Fishes, calendar years, 1927-31</i>	322-323
4. <i>Quantities and Values of Sea Fish and Products Marketed, calendar years 1930 and 1931</i>	323-325
5. <i>Quantities and Values of Inland Fish Marketed, calendar years 1930 and 1931</i>	326
6. <i>Yields of the Fisheries of Canada, Compared as to Quantity and Value, for 1930 and 1931</i>	326
7. <i>Numbers of Fish-Canning and Curing Establishments, by Provinces, 1930 and 1931</i>	327
8. <i>Values of Materials used and of Products of Fish-Canning and Curing Establishments, 1927-31</i>	327
9. <i>Numbers and Capital Values of Fishing Vessels, Boats, Nets, Traps, etc., Used in the Fisheries of Canada, 1930 and 1931</i>	328
10. <i>Numbers of Persons Employed in the Fisheries of Canada, 1929-31</i>	329
11. <i>Employees and Salaries and Wages in Fish-Canning and Curing Establishments, 1920-31</i>	329
12. <i>Values of Exports and Imports of Fish and Fish Products, fiscal years 1902-32</i>	330
13. <i>Exports of the Fisheries, the Produce of Canada, by Principal Countries, fiscal years ended Mar. 31, 1931 and 1932</i>	330
14. <i>Exports of the Fisheries of Canada, in Quantities and Values, calendar years 1929-31</i>	331

CHAPTER XII.—MINES AND MINERALS.

Section 1. <i>Mineral Lands Administration and Mining Laws</i>	334-339
Subsection 1. <i>Dominion Mining Laws and Regulations</i>	334-335
Subsection 2. <i>Provincial Mining Laws and Regulations</i>	335-339
Section 2. <i>Summary of General Production</i>	339-348
Subsection 1. <i>General Statistics of Mineral Production</i>	340-344
1. <i>Value of Mineral Production in Canada, calendar years 1886-1932</i>	340
2. <i>Mineral Production of Canada, calendar years 1930 and 1931</i>	341-342
3. <i>Mineral Production of Canada, Compared as to Quantity and Value, calendar years 1930 and 1931</i>	343-344
Subsection 2. <i>Provincial Distribution of Mineral Production</i>	344-348
4. <i>Mineral Production of Canada, by Provinces, calendar years 1899-1932</i>	345
5. <i>Mineral Production of Canada, by Provinces, calendar year 1931</i>	346-348

CHAPTER XII.—MINES AND MINERALS—concluded.

	Page.
Section 3. <i>Industrial Statistics of Mines and Minerals—Capital, Labour, Wages, etc., in Principal Industries</i>	348-353
6. Summary of Principal Statistics of the Mineral Industries in Canada, by Groups, 1921-31, and by Provinces, 1931.....	351
7. Summary of Principal Statistics of the Mineral Industries of Canada, by Industries, 1930 and 1931.....	352-353
Section 4. <i>Production of Metallic Minerals</i>	354-371
Subsection 1. Gold.....	354-359
8. Quantities of Gold Produced in Canada, by Provinces, calendar years 1911-32.....	356
9. Values of Gold Produced in Canada, by Provinces, calendar years 1911-32.....	356-357
10. Quantities and Values of World Production of Gold, 1891-1931.....	358
11. Quantities and Values of the World Production of Gold and Silver, by Countries, calendar years 1930 and 1931.....	358-359
Subsection 2. Silver.....	359-363
12. Quantities and Values of Silver Produced in Canada during the calendar years 1887-1932.....	361
13. Quantities and Values of Silver Produced in Canada, by Provinces, during the calendar years 1911-32.....	362
14. Quantities and Values of World Production of Silver, with Annual Average Prices, 1890-1931.....	363
Subsection 3. Copper.....	363-366
15. Quantities of Copper Produced in Canada, by Provinces, with Total Values, calendar years 1911-32.....	365
16. Copper Production of the Leading Countries and of the World, 1913-31.....	366
Subsection 4. Lead.....	366-367
17. Quantities and Values of Lead Produced from Canadian Ores, calendar years 1901-32.....	367
Subsection 5. Nickel.....	368
18. Quantities and Values of Nickel Produced in Canada during the calendar years 1901-32.....	368
Subsection 6. Cobalt.....	369
Subsection 7. Zinc.....	369-370
19. Production of Zinc in Canada, calendar years 1911-32.....	370
Subsection 8. Iron.....	370-371
20. Iron Ore Shipments and Production of Pig Iron and of Steel Ingots and Castings, calendar years 1909-32.....	371
Section 5. <i>Production of Non-Metallic Minerals</i>	371-379
Subsection 1. Fuels.....	371-377
21. Coal Resources of Canada, by Provinces and Classes of Coal.....	372
22. Production of Coal in Canada, by Provinces, calendar years 1911-32.....	373
23. Imports into Canada of Anthracite, Bituminous and Lignite Coal for Home Consumption, calendar years 1911-32.....	373
24. Exports of Coal, the Produce of Canada, calendar years 1911-32.....	374
25. Annual Consumption of Canadian and Imported Coal in Canada, calendar years 1911-31.....	374
26. Coal Output, Exports, Receipts from Other Countries and Coal Made Available for Consumption in Canada during 1931.....	375
27. Coal Production in the Principal Countries of the World, 1913, 1921-31.....	375
28. Quantity and Value of Natural Gas Produced in Canada, by Provinces, calendar years 1920-32.....	376
29. Production of Crude Petroleum in Canada, calendar years 1886-1932.....	377
Subsection 2. Other Non-Metallic Minerals.....	377-379
30. Production of Asbestos in Canada, calendar years 1909-32.....	378
Section 6. <i>Production of Clay Products and Other Structural Materials</i>	379-381
31. Production, Imports, Exports and Apparent Consumption of Portland Cement, by Quantities and Values, calendar years 1910-32.....	380
32. The Production of Sand, Gravel and Stone in Canada, showing the Principal Purposes, calendar years 1929-31.....	381
CHAPTER XIII.—WATER POWERS.	
Section 1. <i>The Water Powers of Canada</i>	383-386
1. Available and Developed Water Power in Canada, by Provinces, Jan. 1, 1933.....	384
2. Hydraulic Turbine Horse Power Installed in Canada, by Provinces, as at Dec. 31, 1900-32.....	385
3. Developed Water Power in Canada: Distribution by Provinces and Industries, and per 1,000 Population, as at Jan. 1, 1933.....	386
Section 2. <i>Central Electric Stations</i>	386-389
4. Summary of Statistics of Central Electric Stations, calendar years 1917-31.....	387
5. Equipment of Central Electric Stations, 1931.....	388
6. Electrical Energy Generated in Central Electric Stations, by Provinces, calendar years 1927-31.....	389
7. Electrical Energy Generated or Produced for Export under Authority of the Electricity and Fluid Exportation Act, fiscal years ended Mar. 31, 1929-32.....	389
Section 3. <i>Public Ownership of Hydro-Electric Power</i>	390-399
Subsection 1. The Hydro-Electric Power Commission of Ontario.....	390-396
8. Summary Statistics Representative of the Growth of the Ontario Hydro-Electric Power Commission's Undertaking, 1910-31.....	391
9. Distribution of Power to Systems of the Ontario Hydro-Electric Power Commission, 1927-31.....	392

CHAPTER XIII.—WATER POWERS—concluded.

	PAGE.
10. Capital Investments in Ontario's Hydro Undertakings, 1927-31.....	392
11. Accumulated Reserves of the Ontario Hydro-Electric Power Commission and of the Local Electric Utilities of the Co-operating Municipalities, 1927-31....	393
12. Consolidated Statement of Assets, Liabilities, Reserves and Surplus of Electric Departments of Urban Municipalities Served by the Hydro-Electric Power Commission of Ontario, calendar years 1927-31.....	394
13. Statement of Earnings and Expenses of Electric Departments of Urban Municipalities Served by the Ontario Hydro-Electric Power Commission for the calendar years 1927-31.....	395
14. Statistics Relating to Electrical Service in Rural Power Districts Operated by the Hydro-Electric Power Commission of Ontario, years ended Oct. 31, 1927-31.....	396
Subsection 2. Hydro-Electric Power Commission in Other Provinces.....	396-399

CHAPTER XIV.—MANUFACTURES.

Section 1. <i>The Evolution of Canadian Manufacturing Industries</i>	400-417
Subsection 1. Growth of Manufacturing Production in the Dominion and the Provinces since 1870.....	404-411
1. Historical Summary of Statistics of Manufactures for the Dominion, 1870-31....	406
2. Summary of Statistics of Manufactures, by Provinces, 1920, 1922 and 1925-31....	407-408
3. Summary of Statistics of Manufactures, by Industrial Groups, 1920, 1922 and 1925-31.....	408-410
4. Summary Statistics of Manufactures, 1922 and 1924-30.....	411
Subsection 2. Summary Statistics of Manufacturing Production.....	412-417
5. Indexes of the Volume of Manufacturing Production, According to Component Material and Purpose Classifications, 1923-30.....	416
6. Consumption of Manufactured Products, by Groups, 1930, with Totals for 1922-29.....	417
Section 2. <i>Production of Industrial Groups and Individual Industries</i>	417-440
Subsection 1. Manufactures Grouped by Chief Component Materials.....	418-429
7. Statistics of the Numbers, Capital, Employees, Salaries and Wages, Cost of Materials and Value of Products of Canadian Manufacturing Industries, 1930.....	424-429
Subsection 2. Manufactures Classified by the Purpose of the Products.....	430-432
8. Principal Statistics of the Manufacturing Industries of Canada, Classified According to the Purpose of the Principal Product, by Main Groups for 1926-30 and in Detail for 1930.....	430-432
Subsection 3. Manufactures Classified by Origin of the Materials.....	432-435
9. Principal Statistics of the Manufacturing Industries of Canada, Classified According to the Origin of the Material Used, 1926-30.....	432-435
Subsection 4. The Forty Leading Manufacturing Industries.....	435-440
10. Principal Statistics of Forty Leading Industries, Classified According to the Gross Value of the Products, 1930.....	435-436
11. Principal Statistics of Forty Leading Industries, Classified According to the Net Value of the Products, 1930.....	437
12. Principal Statistics of Forty Leading Industries, Classified According to Salaries and Wages Paid, 1930.....	438
12A. Principal Statistics of the Forty Leading Industries, Classified According to Gross Value of Products, 1931.....	439-440
Section 3. <i>Provincial Distribution of Manufacturing Production</i>	441-447
Subsection 1. The Manufactures of the Maritime Provinces, 1930.....	441-442
13. Statistics of Ten Leading Industries of each of the Maritime Provinces, 1930....	441-442
Subsection 2. The Manufactures of Quebec, 1930.....	442-443
14. Statistics of Forty Leading Industries of the Province of Quebec, 1930.....	443
Subsection 3. The Manufactures of Ontario, 1930.....	444-445
15. Statistics of Forty Leading Industries of the Province of Ontario, 1930.....	444-445
Subsection 4. The Manufactures of the Prairie Provinces, 1930.....	445-446
16. Statistics of Ten Leading Industries of Manitoba, Saskatchewan and Alberta, 1930.....	446
Subsection 5. The Manufactures of British Columbia, 1930.....	447
17. Statistics of Twenty-Five Leading Industries of British Columbia, 1930.....	447
Section 4. <i>Principal Factors in Manufacturing Production</i>	448-465
Subsection 1. Capital employed.....	448-449
18. Provincial Distribution of Capital Employed in the Manufacturing Industries of Canada, in Percentages, 1921 and 1923-30.....	448
19. Distribution of Capital Employed in the Manufacturing Industries of Canada, by Industrial Groups and Percentages, 1923-30.....	449
20. Forms of Capital Employed in the Manufacturing Industries of Canada, by Provinces and by Groups of Industries, 1930.....	449
Subsection 2. Employment in Manufactures.....	449-453
21. Salaried Employees and Wage-Earners in the Manufacturing Industries of Canada, with Volume of Manufacturing Production and Comparative Efficiency of Production, 1917-30.....	451
22. Percentages of Male and Female Employees on Salaries and Wages and Percentages of Total Salaries and Wages, by Provinces and Groups of Industries, 1930.....	452
23. Total Number of Wage-Earners Employed in the Manufacturing Industries of Canada, by Months, 1929 and 1930.....	453

CHAPTER XIV.—MANUFACTURES—concluded.

	PAGE.
Subsection 3. Salaries and Wages in Canadian Manufacturing Industries, 1930.....	443-458
24. Employees on Salaries and Wages in Manufacturing Industries, 1930, and Average Salaries and Wages, by Provinces, 1929 and 1930.....	454
25. Statistics of Salaries and Wages Paid in Forty Leading Industries, 1930, together with Comparative Figures of Average Salaries and Wages Paid in 1929.....	455-456
26. Average Yearly Earnings and Real Wages of Wage-Earners in Manufacturing Industries, 1917-30.....	457
27. Percentages of Salaries Paid to Total Net Value of Manufacturing Production, 1917-30.....	458
Subsection 4. Size of Manufacturing Establishments.....	458-461
28. Manufacturing Establishments Grouped According to Gross Values of Products, with Total and Average Values of Products in each Class, for Canada, 1922 and 1930.....	459
29. Manufacturing Establishments, Grouped According to Gross Values of Products, with Total Values of Products in each class, by Provinces, 1930.....	460
30. Number of Establishments and of Employees in Canadian Manufactures, Grouped According to the Number of Employees per Establishment, 1923 and 1930.....	461
31. Number of Establishments and of Employees in Canadian Manufactures, by Provinces, and Average Number of Employees per Establishment, 1930.....	461
Subsection 5. Power and Fuel.....	462-465
32. Totals, for Canada, of Power Installed in the Manufacturing Industries, other than Central Electric Stations and in Central Electric Stations, 1921-30, with Details by Provinces and Groups of Industries for 1930.....	463-464
33. Total Fuel Used in the Manufacturing Industries of Canada, 1921-30, with Details by Provinces and Groups, 1930.....	465
Section 5. <i>Manufacturing Industries in Cities and Towns</i>	466-473
34. Cities and Towns with a Gross Manufacturing Production of over \$1,000,000 each, Number of Establishments and Total Gross Production in such Cities and Towns as a Percentage of the Grand Total, by Provinces, 1930.....	466
35. Principal Statistics of the Manufacturing Industries of Five Leading Manufacturing Cities of Canada, 1922-30.....	467
36. Statistics of Manufactures of Municipalities with a Gross Production of \$200,000 or over, and with Three or more Establishments, 1930.....	469-473

CHAPTER XV.—CONSTRUCTION.

1. Summary of the Value of Construction Contracts Awarded in Canada, 1911-32, as Compiled by MacLean Building Reports, Ltd.....	475
2. Construction Contracts Awarded in Canada, 1927-32, by Provinces and Types of Construction, as Compiled by MacLean Building Reports, Ltd.....	476
3. Value of Building Permits Taken Out in 61 Cities for the calendar years 1927-32.....	477-478
4. Value of Building Permits Issued by 35 Cities in the calendar years 1910-32 and Index Numbers of the Construction Industries.....	479

CHAPTER XVI.—EXTERNAL TRADE.

Section 1. <i>The Development of Tariffs</i>	480-489
Subsection 1. Historical Sketch of External Trade and Tariffs.....	480-482
Subsection 2. Present Tariffs.....	483-489
Section 2. <i>The Commercial Intelligence Service</i>	489-491
Canadian Government Trade Commissioners.....	490-491
Section 3. <i>Statistics of External Trade</i>	492-596
Subsection 1. Historical Statistics of Canadian Trade.....	493-494
Subsection 2. General Analysis of Current Import and Export Trade.....	494-497
Summary of the Trade of Canada by Main Groups, fiscal years ended Mar. 31, 1914, 1921 and 1932.....	496
Summary of Trade of Canadian Trade, 1914-32.....	497
Subsection 3. Trade with the United Kingdom and the British Empire.....	498-499
Trade of Canada with the British Empire.....	499
Subsection 4. Trade with the United States and Other Foreign Countries.....	500-502
Trade of Canada with the United States and Other Foreign Countries.....	502
Subsection 5. Geographical Distribution of Canadian Trade by Continents and Countries.....	502-506
Trade of Canada, by Continents, 1926, 1931 and 1932.....	503
Canada's Imports from Thirty-Five Leading Countries, 1932.....	504
Canada's Domestic Exports to Forty Leading Countries, 1932.....	505
Subsection 6. Principal Commodities Imported and Exported.....	506-510
Canada's Leading Imports, fiscal years 1899, 1900, 1910, 1920, 1930 and 1932.....	507-508
Canada's Leading Domestic Exports, fiscal years, 1890, 1900, 1910, 1920, 1930 and 1932.....	509-510
Subsection 7. Trade in Raw and Manufactured Products.....	510-512
Statement showing Proportion of Raw Materials and Partly and Fully Manufactured Goods Imported into and Exported from Canada and the United States, 1900, 1914 and 1920-32.....	511
Canada's Imports and Exports, by Continents and Leading Countries, According to Degree of Manufacture, year ended Mar. 31, 1932.....	512
Subsection 8. Canada's Position in International Trade in the calendar years 1913 and 1932.....	513-514
Comparison of the Trade of the Principal Countries of the World, calendar year 1932.....	513

CHAPTER XVI.—EXTERNAL TRADE—concluded.

	PAGE.
Subsection 9. Main Historical Tables and Tables showing Current Trends in External Trade.....	514-593
1. Aggregate External Trade of Canada, fiscal years 1868-1933.....	516
2. Ratio of Exports to Imports and Value per Capita of Exports, Imports and Total Trade, fiscal years 1868-1933.....	517
3. Movement of Coin and Bullion, fiscal years 1868-1933.....	518
4. Duties Collected on Exports, 1868-92, and on Imports for Home Consumption, 1868-1932, with Percentages of Expense of Collection to Gross Customs Revenue Collected, fiscal years 1868-1932.....	519
5. Exports to the United Kingdom, to the United States and to Other Countries, of Merchandise the Produce of Canada, fiscal years 1868-1933.....	520
6. Imports from the United Kingdom, from the United States and from Other Countries, of Merchandise Entered for Home Consumption, fiscal years 1868-1933.....	521
7. Percentage Proportions of Imports from United Kingdom and United States respectively, to Totals of Dutiable and Free in the 26 fiscal years 1907-32....	522
8. Average <i>ad valorem</i> Rates of Duty Collected on Dutiable and Total Imports from United Kingdom, United States and All Countries in the 65 fiscal years 1868-1932.....	522
9. Imports for Home Consumption of certain Raw Materials Used in Canadian Manufactures, fiscal years 1911-33.....	523
10. Exports to the United Kingdom, to the United States, and to All Countries, by Classes of Merchandise, the Produce of Canada, by Values and Percentages, fiscal years 1929-32.....	524
11. Imports from the United Kingdom, from the United States, and from All Countries, by Classes of Merchandise Entered for Home Consumption, by Values and Percentages, fiscal years 1929-32.....	525
12. Principal Exports of Canadian Produce from Canada to United Kingdom, United States and All Countries, fiscal years 1929-32.....	526-545
13. Principal Imports into Canada for Consumption from United Kingdom, United States and All Countries, fiscal years 1929-32.....	546-577
14. Imports (Dutiable and Free) and Exports of Canadian and Foreign Produce, by Main Classes, during the fiscal years ended Mar. 31, 1928-32.....	578-579
15. External Trade of Canada, by Main Groups and Degree of Manufacture According to Origin, fiscal year ended Mar. 31, 1932.....	580-581
16. Summary of the External Trade of Canada, by Main Groups, Compiled on a Classification According to Purpose, fiscal year ended Mar. 31, 1932.....	582-586
17. Values of Total Exports, Imports Entered for Consumption, and Duty Collected thereon, at certain Ports and by Provinces, during the fiscal years ended Mar. 31, 1931 and 1932.....	586-588
18. Dutiable Imports of Canada, by Values Entered for Consumption, from British Empire and Foreign Countries, under the General, Preferential and Treaty Rate Tariffs, in the fiscal years ended Mar. 31, 1931 and 1932.....	588-589
19. Values of Imports into Canada of Merchandise Entered for Consumption, from the British Empire and from Foreign Countries, in the five fiscal years ended Mar. 31, 1928-32.....	589-590
20. Values of Exports of Canadian Produce, from Canada to the British Empire and to Foreign Countries, in the five fiscal years ended Mar. 31, 1928-32.....	591-592
21. Value of Merchandise Imported into, and Exported from, Canada through the United States during the fiscal years ended Mar. 31, 1931 and 1932.....	592-593
Subsection 10. Comparison of the Volume of Imports and Exports.....	593-596
22. Comparison of the Values and Volumes of the External Trade of Canada, by Main Groups, for the fiscal years ended Mar. 31, 1926-32.....	595-596
Section 4. <i>The Tourist Trade of Canada</i>	597-598
23. Tourist Expenditures in Canada and of Canadians Abroad, 1920-32.....	598
Section 5. <i>Balance of International Payments, 1920-32</i>	598-601
24. Estimated Balance of International Payments, 1929-32.....	601

CHAPTER XVII.—INTERNAL TRADE.

	PAGE.
Section 1. <i>Interprovincial Trade</i>	602-604
1. Railway Revenue Freight Traffic Movement in Canada and the Provinces, for the calendar years 1931 and 1932.....	604
Section 2. <i>Grain Trade Statistics</i>	604-611
2. Summary of the Distribution of Grain in Canada, crop year ended July 31, 1932.....	607
3. Number and storage Capacity of Canadian Grain Elevators, licence years 1932 and 1933.....	608
4. Quantities of Canadian Grain Inspected during the crop years ended July 31, 1927-32.....	609
5. Shipments of Grain by Vessels from Fort William and Port Arthur for the navigation seasons 1931 and 1932.....	610
6. Shipments of Grain by Lake and All-Rail Routes from Fort William and Port Arthur for the crop years ended July 31, 1931 and 1932.....	610
7. Canadian Grain Handled at Eastern Elevators, by crop years ended July 31, 1924-32.....	610
8. Canadian Grain Handled at Eastern Elevators, by Classes of Ports, during the crop year ended July 31, 1932.....	611
9. Flour Mills of Canada, with their Equipment and Capacity, 1931, with Totals for 1930.....	611
Section 3. <i>Marketing of Live Stock and Animal Products</i>	612-619
10. Animals in Canada and Animals Killed or Sold by Farmers in Canada, by census years, 1871-1931.....	612
11. Index Numbers of Animals on Farms in Canada, calendar years 1921-32.....	612
12. Total Receipts of Live Stock and Disposition of Slaughter and Store Stock at Principal Markets in Canada, calendar years 1930 and 1931.....	613
13. Live Stock from Several Provinces of Canada, Marketed through Stockyards, Packers, etc., calendar year 1931.....	614
14. Grading of Live Stock from several Provinces of Canada, Marketed at the Stockyards, calendar year 1931.....	615
15. Principal Statistics of the Slaughtering and Meat-Packing Industry of Canada, decennially 1871-1931, annually 1926-31.....	616
16. Live Stock Slaughtered at Canadian Inspected Establishments, by months, 1931 and 1932.....	616
17. Total and Per Capita Consumption of Meats and Live-Stock Products in Canada, calendar years 1927-31.....	617-618
18. Provincial Shipments of Meat Products, with Total Interprovincial and Export Shipments, calendar year 1931.....	619
Section 4. <i>Cold Storage</i>	619-621
19. Cold Storage Warehouses in Canada, by Provinces, 1932.....	619
20. Stocks of Food on Hand in Cold Storage and in Process of Cure, by Months and Commodities, 1931 and 1932.....	620
Section 5. <i>Bounties, Patents, Copyrights and Trade Marks</i>	621-624
21. Number of Canadian Patentees, by Province of Residence, for the fiscal years ended Mar. 31, 1921-32.....	622
22. Statistics of Patents Applied for, Granted, etc., fiscal years ended Mar. 31, 1927-32.....	623
23. Statistics of Copyrights, Trade Marks, etc., fiscal years ended Mar. 31, 1927-32.....	624
24. Receipts, Expenditures and Surplus on Account of Patents, Copyrights and Trade Marks, fiscal years ended Mar. 31, 1921-32.....	624
Section 6. <i>Weights and Measures, Electricity and Gas Inspection</i>	624-626
25. Inspections by the Weights and Measures Service, fiscal year ended Mar. 31, 1932.....	625
26. Number of Electricity Meters in Use, fiscal years ended Mar. 31, 1915-32.....	626
27. Number of Gas Meters in Use, fiscal years ended Mar. 31, 1916-32.....	626
28. Number of Cubic Feet of Gas Sold in Canada, fiscal years ended Mar. 31, 1920-32.....	626
Section 7. <i>Census of Merchandising and Service Establishments</i>	627-641
Subsection 1. Wholesale and Other Bulk or Non-Retail Merchandising.....	627-629
29. Bulk Merchandising (Wholesale and Other Non-Retail) in Canada, by Provinces, 1930.....	628
30. Bulk Merchandising (Wholesale and Other Non-Retail) in Canada, by Type of Distributor, 1930.....	629
Subsection 2. Retail Merchandising and Services.....	629-641
31. Summary Statistics of Retail Merchandising and Service Establishments in Canada, by Provinces and Business Groups, 1930.....	630-631
32. Retail Merchandise Trade in Canada, by Provinces, 1930.....	632
33. Retail Merchandise Trade in Canada, by Group and Kind of Business, 1930.....	633-635
34. Types of Operation of Stores Engaged in Retail Merchandising in Canada, 1930.....	636-637
35. Retail Merchandise Trade in Cities of 10,000 Population and over, 1930.....	638
36. Retail Services in Canada, by Provinces, 1930.....	639
37. Retail Services in Canada, by Group and Kind of Business and Type of Operation, 1930.....	640-641

CHAPTER XVIII.—TRANSPORTATION AND COMMUNICATIONS.

Part I.—Government Control Over Agencies of Transportation and Communication.....	643-645
The Board of Railway Commissioners for Canada.....	644-645
Part II.—Steam Railways.....	645-674
Section 1. <i>Historical Sketch</i>	645-650

CHAPTER XVIII.—TRANSPORTATION AND COMMUNICATIONS—continued.

	PAGE.
Section 2. <i>Statistics of Steam Railways</i>	650-664
1. Record of Steam Railway Mileage as at June 30, 1835-1919, and Dec. 31, 1919-31.....	651
2. Operated Steam Railway Mileage, by Provinces, Dec. 31, 1923-31.....	651
3. Capital Liability of Steam Railways, June 30, 1901-19, and Dec. 31, 1919-31.....	652
4. Mileage, Capital Liability, Earnings and Operating Expenses of Individual Steam Railways for the calendar year 1931.....	652-653
5. Capital Invested in Road and Equipment of Canadian Steam Railways, calendar years 1926-31.....	654
6. Summary of Steam Railway Statistics of Freight and Passenger Traffic, and Ratio of Expenses to Earnings, years ended June 30, 1911-19, and calendar years 1919-31.....	655
7. Distribution of Operating Expenses of Steam Railways for the calendar years 1928-31.....	655
8. Earnings and Operating Expenses of Steam Railways per Mile of Line and per Train Mile for the years ended June 30, 1915-19, and the calendar years 1919-31.....	656
9. Summary Analysis of Statistics of Passenger and Freight Services and Receipts, for the years ended June 30, 1915-19, and the calendar years 1919-31.....	656-657
10. Numbers of Steam Railway Employees, Totals and Averages of Salaries and Wages, and Ratios of the Latter to Gross Earnings and Operating Expenses, for years ended June 30, 1911-19, and for calendar years 1919-31.....	658
11. Rolling Stock of Steam Railways, calendar years 1925-31.....	659
12. Commodities Hauled as Freight on Steam Railways during the calendar years 1927-31.....	659-660
13. Areas of Land Granted to Steam Railways by the Dominion and Provincial Governments up to Dec. 31, 1931.....	661-662
14. Analysis of the Total Financial Aid Given to Steam Railways up to Dec. 31, 1931.....	662
15. Railway Bonds Guaranteed by Dominion and Provincial Governments, as at Dec. 31, 1931.....	663
16. Numbers of Passengers, Employees and Others Killed and Injured on Steam Railways, years ended June 30, 1915-19, and calendar years 1919-31.....	663
17. Numbers of Persons Killed and Injured on Steam Railways in the calendar years 1929-31.....	664
Section 3. <i>Origin and Growth of Government-owned Railways</i>	664-674
18. Government Investments in Railways to Mar. 31, 1932.....	665-666
19. Canadian National Railways (Canadian and U.S. Lines) Train Traffic Statistics, for the calendar years 1930 and 1931.....	667-668
20. Gross Revenues, Operating Expenses, Net Revenues, Interest on Funded Debt and Deficits of the Canadian National Railways, for the calendar years 1923-32.....	669
21. Long-Term Debt of Canadian National Railways (Including Appropriation for Canadian Government Railways), showing Principal Outstanding at end of calendar years 1922-32, and New Funds Raised, calendar years 1923-32.....	671
22. Capital Raised and Expended by Canadian National Railways, calendar years 1923-32.....	672
23. Adjustments Accounting for Difference in Railway Obligations as shown by Public Accounts, Mar. 31, 1932, and by Canadian National Railways Balance Sheet, Dec. 31, 1931.....	673
24. Assets of the Canadian National Railway System, Dec. 31, 1922 and 1932.....	674
Part III.—Electric Railways	674-679
25. Summary of Statistics of Electric Railway Operation, years ended June 30, 1901-19, and calendar years 1919-31.....	676
26. Mileage and Equipment of Electric Railways in the calendar years 1928-31.....	676
27. Capital Liability of Electric Railways, years ended June 30, 1908-19, and calendar years 1919-31.....	677
28. Mileage, Capital, Earnings, Operating Expenses, Employees and Salaries and Wages of Electric Railways in Canada, year ended Dec. 31, 1931.....	677-678
29. Numbers of Passengers, Employees and Others, Killed and Injured on Electric Railways, calendar years 1919-31, with Totals from 1894 to June 30, 1919.....	679
Part IV.—Express Companies	679-681
30. Summary Statistics of Revenues and Expenses of Express Companies, calendar years 1919-31.....	680
31. Revenues, Expenses and Operating Mileage of Express Companies, by Companies, calendar year 1931.....	680
32. Business Transacted by Express Companies in Financial Paper, calendar years 1928-31.....	681
Part V.—Roads and Highways	681-684
33. Classification of Canadian Highways, by Provinces, Dec. 31, 1931.....	682
34. Capital and Maintenance Expenditures on Provincial Highways or Provincially subsidized Highways in Canada, calendar years 1928-31.....	683
35. Provincial Government Funded Highway Debt and Annual Charges thereon, Dec. 31, 1931.....	684
Part VI.—Motor Vehicles	684-686
Section 1. <i>Statistics of Motor Vehicle Operation</i>	685-686
36. Number of Motor Vehicles Registered in Canada, by Provinces, calendar years 1907-32.....	686

CHAPTER XVIII.—TRANSPORTATION AND COMMUNICATION—continued.

	PAGE.
37. Types of Motor Vehicles Registered in Canada, by Provinces, calendar years 1931 and 1932.....	686
38. Provincial Revenues from the Taxation of the Distribution and Operation of Motor Vehicles, for the years 1931 and 1932.....	687
39. Imports and Exports of Motor Vehicles, fiscal years ended Mar. 31, 1908-32.....	688
Section 2. <i>Motor Vehicle Acts and Regulations</i>	688-692
Part VII.—Air Navigation	692-694
49. Statistical Summary of Civil Aviation in Canada, 1927-32.....	694
Part VIII.—Canals	694-703
Section 1. <i>Canal Systems</i>	695-696
41. Canals of Canada, Length and Lock Dimensions, 1932.....	695
42. Expenditures and Revenues of Canals for Periods Before Confederation, 1868-1910, and fiscal years ended Mar. 31, 1911-32.....	696
43. Capital Expenditures for Construction and Enlargement of Canals to Mar. 31, 1932.....	696
Section 2. <i>Canal Traffic</i>	697-703
44. Total Traffic through Canadian Canals, navigation seasons 1900-32, by Nationality of Vessels and Origin of Freight.....	697
45. Distribution of Total Freight Traffic on Canals, by Months, navigation seasons 1926-32.....	698
46. Tonnage of Canal Traffic, by Canals and Classes of Products, navigation seasons 1931 and 1932.....	698
47. Principal Articles Carried through Canadian Canals, navigation seasons 1929-32.....	698-699
48. Canal Traffic by Direction and Origin, navigation seasons 1931 and 1932.....	699-700
49. Traffic through individual Canadian Canals, navigation seasons 1927-32.....	700-701
50. Traffic to and from the East and West Coasts of Canada via the Panama Canal, years ended June 30, 1921-32.....	702
51. Summary of Commercial Traffic through the Panama Canal, years ended June 30, 1915-32.....	703
Part IX.—Shipping and Navigation	703-721
52. Sea-going and Inland Vessels (exclusive of Coasting Vessels and Ferriage) Arrived at and Departed from Canadian Ports, fiscal years ended June 30, 1901-06 and Mar. 31, 1907-32.....	704
Section 1. <i>Ocean Shipping</i>	704-707
53. Sea-going Vessels Entered and Cleared at Canadian Ports, with Cargo and in Ballast, fiscal years ended June 30, 1901-06, and Mar. 31, 1907-32.....	705
54. Details, by Nationality, of Sea-going Vessels (exclusive of Coasting Vessels) Entered and Cleared at Canadian Ports, fiscal years ended Mar. 31, 1931 and 1932.....	706
55. Sea-going Vessels Entered and Cleared, by Principal Countries, fiscal year ended Mar. 31, 1932.....	707
Section 2. <i>Inland Shipping</i>	708-709
56. Canadian and United States Shipping on Rivers and Lakes between Canadian and United States Ports, exclusive of Ferriage, fiscal years ended Mar. 31, 1928-32.....	709
Section 3. <i>Coasting Trade</i>	709-710
57. British and Foreign Vessels, Employed in the Coasting Trade of Canada, fiscal years ended Mar. 31, 1928-32.....	710
Section 4. <i>Grand Total Shipping Trade</i>	710-713
58. Total Number and Tonnage of All Vessels Entered and Cleared at Canadian Ports, by Provinces, during the fiscal year ended Mar. 31, 1932, with Totals for the fiscal years 1923-32.....	711
59. Number and Tonnage of Sea-going and of all Vessels Entered and Cleared at the Principal Ports of Canada, fiscal year ended Mar. 31, 1932.....	712-713
Section 5. <i>Shipping Constructed and on the Registry</i>	713-714
60. Vessels Built and Registered in Canada and Vessels Sold to Other Countries, fiscal years ended Mar. 31, 1911-32.....	714
61. Number and Net Tonnage of Vessels on the Registry of Shipping of Canada, by Provinces, Dec. 31, 1923-32.....	714
Section 6. <i>The Department of Marine</i>	715-719
62. Total Revenues and Expenditures of the Department of Marine, fiscal years ended June 30, 1868-1906, and Mar. 31, 1907-32.....	715
63. Revenue of the Department of Marine, by Sources, fiscal years ended Mar. 31, 1927-32.....	715
64. Expenditure of the Department of Marine, fiscal years ended Mar. 31, 1927-32.....	716-717
65. Steamboat Inspection, fiscal year ended Mar. 31, 1932.....	717-718
66. Numbers of Seamen Shipped and Discharged at Canadian Ports, calendar years 1908-31.....	718
67. Canadian Wrecks and Casualties, years ended June 30, 1901-17, and calendar years 1918-31.....	719
68. Comparative Statement of Marine Danger Signals, fiscal years ended Mar. 31, 1921-32.....	719
Section 7. <i>Merchant Marine Services Operated by the Dominion Government</i>	720-721
Part X.—Telegraphs	721-723
69. Summary Statistics of All Canadian Telegraphs for calendar years 1920-31.....	722
70. Statistics of Chartered Telegraph Companies for the calendar years 1926-31.....	723

CHAPTER XVIII.—TRANSPORTATION AND COMMUNICATIONS—concluded.

	PAGE.
Part XI.—Telephones	724-727
71. Progress of Telephones in Canada, years ended June 30, 1911-18, and Dec. 31, 1919-31.....	725
72. Number of Telephone Companies in Canada, by Provinces, Dec. 31, 1931.....	726
73. Number of Telephone Companies in Canada, 1911-31.....	726
74. Telephones in Use, Mileage of Wire and Number of Employees, by Provinces, Dec. 31, 1931.....	726
75. Telephones in Use, Mileage of Wire and Number of Employees, 1911-31.....	727
76. Financial Statistics of Canadian Telephone Companies, 1912-31.....	727
Part XII.—Radios	728-733
Section 1. <i>Radiotelegraphy</i>	728-730
77. Government-Owned Radio Stations in Canada, fiscal year ended Mar. 31, 1932.....	729
78. Business and Cost of Maintenance of Radiotelegraph Stations for the fiscal years ended Mar. 31, 1931 and 1932.....	730
Section 2. <i>Radiotelephony</i>	730-731
79. Wireless and Radio Stations in Operation in Canada, Mar. 31, 1928-32.....	731
Section 3. <i>The Canadian Radio Broadcasting Commission</i>	731-733
Part XIII.—The Post Office	734-742
80. Number of Post Offices in Operation, by Provinces, Mar. 31, 1927-32.....	735
81. Statistics of Gross Postal Revenue of Offices Collecting \$10,000 and upwards, fiscal years ended Mar. 31, 1931-32.....	736-737
82. Revenue and Expenditure of the Post Office Department for the quinquennial fiscal years 1890-1910, and for the fiscal years ended Mar. 31, 1911-32.....	738
83. Operations of the Money Order System in Canada, fiscal years ended Mar. 31, 1911-32.....	739
84. Money Orders, by Provinces, and Total Postal Notes, fiscal years ended Mar. 31, 1928-32.....	739-740
85. Mileage Flown and Weight of Mails Carried by Air, fiscal year ended Mar. 31, 1932.....	741
86. Mail Subsidies and Steamship Subventions, fiscal years ended Mar. 31, 1930-32.....	742

CHAPTER XIX.—LABOUR AND WAGES.

Part I.—Labour	743-791
Section 1. <i>Occupations of the People</i>	743-744
1. Persons Engaged in Gainful Occupations in Canada, by Sex and Occupation, 1931.....	744
Section 2. <i>The Dominion Department of Labour</i>	744-747
Section 3. <i>Provincial Labour Departments and Bureaus</i>	748-750
Section 4. <i>Canada and the International Labour Organization</i>	750-752
Section 5. <i>Organized Labour in Canada</i>	752-757
2. Membership of Trade Unions in Canada, 1911-31.....	755
3. International Trade Unions Operating in Canada.....	755-756
4. Canadian Central Labour Bodies Operating in Canada.....	757
Section 6. <i>Fatal Industrial Accidents</i>	757-758
5. Fatal Industrial Accidents in Canada, by Industries, 1928-32.....	757
Section 7. <i>Workmen's Compensation in Canada</i>	758-762
6. Compensation Paid and Accidents Compensated by the Nova Scotia Workmen's Compensation Board, 1917-31.....	758
7. Compensation Paid by the New Brunswick Workmen's Compensation Board, 1920-31.....	759
8. Compensation Paid and Accidents Compensated by the Quebec Workmen's Compensation Commission, 1928-32.....	759
9. Benefits Awarded and Accidents Reported by the Ontario Workmen's Compensation Board, 1915-32.....	760
10. Compensation Paid and Accidents Compensated by the Manitoba Workmen's Compensation Board, 1917-31.....	761
11. Compensation Paid and Accidents Compensated by the Saskatchewan Workmen's Compensation Board, 1930-32.....	761
12. Compensation Paid and Accidents Compensated by the Alberta Workmen's Compensation Board, 1921-32.....	762
13. Compensation Paid and Accidents Compensated by the British Columbia Workmen's Compensation Board, 1917-31.....	762
Section 8. <i>Strikes and Lockouts</i>	763-766
14. Strikes and Lockouts in Canada by years, 1901-32.....	763-764
15. Strikes and Lockouts, by Provinces, Number of Workers Involved and Time Lost, 1931 and 1932.....	764
16. Strikes and Lockouts, by Industries, 1931 and 1932.....	765
Section 9. <i>Employment and Unemployment</i>	766-780
Subsection 1. <i>Operations of the Employment Service of Canada</i>	766-768
17. Applications for Employment, Positions Offered and Placements Effected by the Employment Service of Canada, by Provinces, 1931-32, and for Canada, 1920-32.....	768
Subsection 2. <i>Unemployment as Reported by Trade Unions</i>	768-769
18. Percentages of Unemployment in Trade Unions, by Provinces, half-yearly, 1915-31, and by months, 1932.....	769
Subsection 3. <i>Employment as Reported by Employers</i>	770-773
19. Index Numbers of Employment as Reported by Employers in Economic Areas, as at the First of each month, January, 1931, to December, 1932, with Yearly Averages since 1921.....	771

CHAPTER XIX.—LABOUR AND WAGES—concluded.

PAGE.

20. Index Numbers of Employment as Reported by Employers in Leading Cities, as at the First of each Month, January, 1931, to December, 1932, with Yearly Averages since 1922.....	772
21. Index Numbers of Employment as Reported by Employers, by Industrial Groups, as at the First of each Month, January, 1931, to December, 1932, with Yearly Averages since 1921.....	773
Subsection 4. Unemployment Relief.....	774-775
Subsection 5. Employment and Unemployment Statistics of the Census.....	775-780
22. Wage Earners of Canada At Work and Not At Work on Monday, June 1, 1931, by Sex and Province, with Numbers Not At Work for Various Causes.....	778
23. Wage Earners 10 Years of Age and Over, by Sex, Showing Number Unemployed and Weeks Lost, by Sex and Provinces, in the Census Year Ended June 1, 1931.....	779-780
Section 10. <i>Old Age Pensions</i>	780-782
24. Financial Summary of Old Age Pensions in Canada, by Provinces, as at Dec. 31, 1932.....	782
Section 11. <i>The Co-operative Movement in Canada</i>	783-785
Subsection 1. Consumers' Co-operation.....	783
25. Statistics of Co-operative Societies, Affiliated with the Co-operative Union of Canada, 1900-31.....	784
26. Number and Membership of Co-operative Associations in Canada, by Provinces and Types, 1932.....	784
Subsection 2. Co-operative Credit in Quebec.....	784-785
27. Progress of Co-operative People's Banks in Quebec, 1915-31.....	785
Subsection 3. Producers' Co-operation.....	785-786
Section 12. <i>Labour Legislation in Canada</i>	787-789
Section 13. <i>Legislation Respecting Combinations in Restraint of Trade</i>	789-791
Part II.—Wages and Cost of Living	791-799
Section 1. <i>Wage Rates</i>	791-793
1. Index Numbers of Rates of Wages for Various Classes of Labour of Canada, 1913-32.....	792
2. Rates of Wages and Hours of Labour in Various Trades in Certain Cities of Canada, 1932.....	793
Section 2. <i>Wages and Hours of Labour Under Minimum Wage Boards in Canada</i>	793-796
Subsection 1. Minimum Wages for Females.....	794-796
3. Minimum Wages and Maximum Hours of Labour for Female Employees, under Orders of Minimum Wage Boards in Canada, 1932.....	794-795
Subsection 2. Minimum Wages for Male Employees.....	796
Section 3. <i>Cost of Living of Wage Earners</i>	796-797
4. Changes in the Cost of Living in Canada from 1914 to 1932.....	797
Section 4. <i>Earnings in the Census Year, 1931</i>	797-799
5. Wage Earners Ten Years of Age and Over, by Sex and Industries, with Total and Average Earnings and Number of Weeks Worked, in the Twelve Months Preceding June 1, 1931.....	798-799

CHAPTER XX.—PRICES.

Section 1. <i>Wholesale Prices of Commodities</i>	801-809
Subsection 1. Historical Review of Canadian Prices.....	801-802
1. Annual Index Numbers of Wholesale Prices in Canada, 1867-1932.....	802
Subsection 2. The New Index Number on a Post-War Base (1926).....	802-809
2. Weighted General Wholesale Price Index Numbers, by Months, 1924-32.....	803
3. Annual Weighted Index Numbers of Wholesale Prices of Commodities, by Groups (Chief Component Material Classification), 1913-32, with Monthly Figures for 1930-32.....	803-804
4. Index Numbers of Wholesale Prices of Commodities, Classified According to Purpose, by Yearly Averages, 1914-32, and by Months, 1930-32.....	804-805
5. Weighted Index Numbers of Wholesale Prices of Commodities, Classified According to Origin and Degree of Manufacture, by Yearly Averages, 1915-32.....	806
6. Weighted Index Numbers of Wholesale Prices of Commodities, Classified According to Origin and Degree of Manufacture, by Months, 1926-32.....	806-809
Section 2. <i>Retail Prices of Commodities</i>	809-813
7. Index Numbers of Canadian Retail Prices, 1914-32, Changed to New Base. (1926=100).....	810
8. Index Numbers of Retail Prices, Rents and Costs of Services, by Months, 1930, 1931, 1932, and January-May, 1933. (1926=100).....	811
9. Prices of a Family Budget of Staple Foods, Fuel and Lighting, and Rent, for Sixty Cities in Canada, 1920, 1923-32.....	812
10. Index Numbers of a Family Budget of Staple Foods, Fuel and Lighting, and Rent, in Canada, by Provinces, 1923-32.....	813
Section 3. <i>Index Numbers of Security Prices</i>	813-817
11. Investor's Index Numbers of Common Stocks, by Months, 1932.....	815
12. Traders' Index Numbers of Prices and Volume of Sales, Monthly Averages, January, 1929—May, 1933.....	816
13. Weighted Index Numbers of Mining Stocks, by Months, 1931-32.....	817
Section 4. <i>Prices of Services</i>	817-818
14. Average Daily Hospital Charges in Canada, and Index Numbers thereof, 1913 and 1917-31.....	818
Section 5. <i>Index Numbers of Interest Rates</i>	818-819
15. Index Numbers of Interest Rates in Canada, Calculated from Yields of Ontario Bonds, 1900-33.....	819
Section 6. <i>Index Numbers of Import and Export Valuations</i>	820
16. Index Numbers of Export and Import Valuations, calendar years 1923-32.....	820

CHAPTER XXI.—PUBLIC FINANCE.

	PAGE.
Section 1. <i>Dominion Public Finance</i>	821-851
Subsection 1. The Current Balance Sheet of the Dominion.....	825
1. Balance Sheet of the Dominion of Canada, as at Mar. 31, 1932.....	825
Subsection 2. Receipts and Disbursements.....	826-834
2. Details of Revenue Receipts, fiscal years ended Mar. 31, 1928-32.....	827
3. Details of Expenditure, fiscal years ended Mar. 31, 1928-32.....	827-828
4. Principal Items of Dominion Expenditure, 1868-1932.....	829-831
5. Principal Items of Receipts of Canada on Consolidated Fund Account, 1868-1932.....	832
6. Per Capita Figures of Taxation, Total Revenue Receipts, Expenditure on Consolidated Fund Account and Total Expenditure, 1868-1932.....	833
7. Per Capita Revenue Receipts and Expenditure, by Principal Items, 1926-32.....	834
Subsection 3. War Tax Revenue.....	834-837
8. War Tax Revenue Received by the Receiver-General, fiscal years ended Mar. 31, 1915-32.....	835
9. Summary of Excise War Taxes Collected by the Department of National Revenue (formerly the Department of Customs and Excise), fiscal years ended Mar. 31, 1927-32.....	835
10. Excise War Taxes Collected by the Department of National Revenue, by Provinces, fiscal year ended Mar. 31, 1932.....	836
11. Amounts Collected under the Income War Tax Act and the Business Profits War Tax Act, by Provinces, fiscal years ended Mar. 31, 1931 and 1932.....	837
Subsection 4. Inland Revenue.....	837-840
12. Details of Excise Duties Collected, fiscal years ended Mar. 31, 1927-32.....	838
13. Number of Excise Licences Issued, fiscal years ended Mar. 31, 1926-32.....	839
14. Statistics of Distillation, fiscal years ended Mar. 31, 1927-32.....	839
15. Quantities of Spirits, Malt Liquor, Malt and Tobacco Taken Out of Bond for Consumption in the fiscal years ended June 30, 1901-06, and Mar. 31, 1907-32.....	840
Subsection 5. Provincial Subsidies.....	840-841
16. Subsidies of Dominion to Provincial Governments, fiscal years ended 1927-32.....	841
17. Total of Subsidy Allowances from July 1, 1867, to Mar. 31, 1932.....	841
Subsection 6. National Debt.....	841-861
18. Summary of the Public Debt of Canada and Interest Payments thereon, July 1, 1867 to Mar. 31, 1932.....	845
19. Details of the Assets of the Public Debt of Canada, March, 1921-32.....	846
20. Details of the Gross Liabilities of Canada, Mar. 31, 1921-32.....	846-847
21. Funded Debt of the Dominion Payable in London, New York and Canada, as at Mar. 31, 1932.....	847-848
22. The Interest-Bearing Debt, the Annual Interest Charge Thereon and the Average Rate of Interest, as at Mar. 31, 1913-32.....	849
23. Guaranteed Securities of the Dominion Government (Amount Held by the Public), as at Mar. 31, 1923-32.....	850
24. Securities Guaranteed by the Dominion Government as at Mar. 31, 1932.....	850-851
Section 2. <i>Provincial Public Finance</i>	851-868
Subsection 1. Provincial Revenues and Expenditures.....	853-858
24. Ordinary Revenues of the Provincial Governments for their respective fiscal years ended 1930 and 1931.....	854-855
25. Ordinary Expenditures of Provincial Governments for their respective fiscal years ended 1930 and 1931.....	855-856
26. Statement Showing the Ordinary Revenues and Expenditures of the Provincial Governments for their respective fiscal years ended in the census years 1871-1911 and in each year from 1916-31.....	856-857
27. Ordinary Receipts and Expenditures of Provincial Governments per head of Population for their respective fiscal years ended in the census years 1871-1911 and in each year from 1916-31.....	858
Subsection 2. Provincial Debts and Assets.....	859-863
28. Direct Liabilities of the Provincial Governments, by Provinces, for their respective fiscal years, 1896, 1911, 1916-32.....	860
29. Bonded Debt (Exclusive of Treasury Bills) of Provincial Governments, by Provinces, fiscal years 1916-31.....	861
30. Assets of the Provincial Governments at the close of their respective fiscal years ended 1932, or their latest fiscal years.....	862-863
Section 3. <i>Municipal Public Finance</i>	864-868
31. Number of Municipalities in Canada, by Provinces and Classes, 1931.....	864
32. Summary Statement Showing Total Assessment Valuations of Municipalities, by Provinces, for 1929, 1930 and 1931.....	865-866
33. Total Bonded Indebtedness of All Classes of Municipalities, by Provinces, 1919-31.....	867
34. Principal Financial and Other Statistics of Canadian Cities and Towns with Populations of 10,000 and over, 1931.....	867-868
Section 4. <i>National Wealth and Income</i>	869-874
Subsection 1. National Wealth.....	869-874
35. Provincial Distribution of the National Wealth of Canada, with Percentage and Per Capita Analyses, 1928 and 1929.....	870
36. An Estimate of the National Wealth of Canada, with Percentage and Per Capita Distribution of Component Items, 1929.....	872
37. Estimate of National Wealth of Canada, 1929, by Provinces and Classes.....	873-874
Subsection 2. National Income and Income Tax Statistics.....	874-877
38. Amount of Income Assessed for the Purposes of the Income War Tax, by Individuals and Corporations, fiscal years ended Mar. 31, 1921-32.....	875
39. Amount of Income Assessed for the Purposes of the Income War Tax, by Provinces, fiscal years ended Mar. 31, 1928-32.....	875

CHAPTER XXI.—PUBLIC FINANCE—concluded.

	PAGE.
40. Amount of Income Tax Collected, by Provinces, fiscal years ended Mar. 31, 1928-32	876
41. Number of Individual and Corporate Tax Payers, by Size of Income and Amount of Taxes Paid under the Income War Tax Act, fiscal years ended Mar. 31, 1929-32	876-877
42. Income Tax Paid, by Occupations of the Tax Payers, fiscal years ended Mar. 31, 1929-32	877
Subsection 3. Outside Capital Invested in Canada and Canadian Capital Invested Elsewhere	878-880
43. Estimated British and Foreign Investments in Canada, Jan. 1, 1927-31	879
44. Estimated Total Investments of Canadian Capital in British and Foreign Countries, as at Jan. 1, 1928-31	880

CHAPTER XXII.—CURRENCY AND BANKING; LOAN AND TRUST COMPANIES.

Section 1. <i>Canada's Monetary System</i>	881-889
1. Value of Gold Bullion Received for Treatment and Value of Gold Coin and Bullion Issued from the Ottawa Mint, 1908-32	883
2. Statement of Coinage (in Dollars' and Cents' Denominations) Issued to the Dominion of Canada, 1858-1932	883
3. Composition of Canadian Gold Reserves on Dec. 31, 1905-32	884
4. Circulation in Canada of Silver and Bronze Coin, Dec. 31, 1901-32	884-885
5. Dominion Notes Outstanding and Reserves as at June 30, 1890-1932	886
6. Gold Held by the Minister of Finance, calendar years, 1919-32	887
7. Denominations of Dominion Notes in Circulation, Mar. 31, 1927-32	887
8. Statistics of Bank Note Circulation, calendar years 1900-32	888
9. Circulating Media in the Hands of the General Public, calendar years 1900-32	889
Section 2. <i>Banking in Canada</i>	889-915
Subsection 1. <i>The Canadian Banking System in General</i>	890-904
10. Historical Summary Showing Development of the Canadian Banking Business, calendar years 1857-1932	896-897
11. Assets of Chartered Banks in the calendar years 1929-32	899
12. Liabilities of Chartered Banks in the calendar years 1929-32	900
13. Deposits in Chartered Banks in Canada and elsewhere, for the calendar years 1928-32	901
14. Loans of Chartered Banks in Canada and elsewhere, for the calendar years 1928-32	901
15. Bank Reserves in Detail with Total Net Liabilities, calendar years 1901-32	902-903
16. Ratio of Bank Reserves to Net Liabilities, calendar years 1901-32	904
Subsection 2. <i>The Individual Chartered Banks of Canada</i>	904-909
17. Number of Branches of Chartered Banks in Canada, by Provinces, Dec. 31, 1808, 1902, 1905, 1916, 1920, 1926, 1929-32	906
18. Number of Branches of Individual Canadian Chartered Banks in Canada and Other Countries as at Dec. 31, 1932	905
19. Number of Branches of each of the Canadian Chartered Banks in Other Countries, with their Locations, Dec. 31, 1932	906
20. Net Profits of Canadian Banks and Rates of Dividend Paid, for their business years ended 1927-32	906-907
21. Principal and Total Assets of each of the Chartered Banks of Canada, Dec. 31, 1932	907
22. Principal and Total Liabilities of each of the Chartered Banks of Canada, Dec. 31, 1932	908
23. Bank Insolvencies in Canada since 1857	908-909
24. Bank Absorptions in Canada since 1867	909
Subsection 3. <i>The Volume of Business Transacted through the Banks</i>	910-912
25. Amount of Exchanges of the Clearing Houses of Chartered Banks in Canada for the calendar years 1928-32	911
26. Bank Debits at the Clearing-House Cities of Canada, by Individual Cities, calendar years 1928-32	912
Subsection 4. <i>Government and other Savings Banks</i>	912-915
27. Deposits with Dominion Government Savings Banks, June 30, 1868-1906, and Mar. 31, 1907-32	913
28. Total Combined Financial Business of Post Office and Dominion Government Savings Banks, Mar. 31, 1927-32	914
29. Deposits in the Montreal City and District Bank and the Caisse d'Economie de Notre-Dame de Québec, as at June 30, 1868-1906, and Mar. 31, 1907-32	915
Section 3. <i>Loan and Trust Companies</i>	915-919
30. Summary Statistics of the Operations of Dominion and Provincial Loan and Trust Companies in Canada, 1931	916
31. Liabilities and Assets of Loan Companies Chartered by the Dominion Government, 1914-31	917
32. Liabilities and Assets of Trust Companies Chartered by the Dominion Government, 1914-31	918-919
Section 4. <i>Sales of Canadian Bonds</i>	919-921
33. Sales of Canadian Bonds, by Class of Bond and Country of Sale, calendar years 1904-32	921
Section 5. <i>Foreign Exchange</i>	922-924
34. Monthly Average Exchange Quotations at Montreal, 1931 and 1932	923-924

CHAPTER XXIII.—INSURANCE.

Section 1. <i>Fire Insurance</i>	926-937
1. Summary Statistics of Fire Insurance, in Companies Operating under Dominion Licences, calendar years 1869-1932	928-929

CHAPTER XXIII.—INSURANCE—concluded.

	PAGE.
2. Fire Insurance Business Transacted in Canada, by Companies, 1931	929-933
3. Assets of Canadian Companies Selling Fire Insurance, or Fire Insurance and other classes of Insurance, and Assets in Canada of Companies other than Canadian Transacting such Business in Canada, 1927-31	933-934
4. Liabilities of Canadian Companies Selling Fire Insurance, or Fire Insurance and other classes of Insurance, and Liabilities in Canada of Companies other than Canadian Transacting such Business in Canada, 1927-31	934
5. Income and Expenditure of Canadian Companies Selling Fire Insurance, or Fire Insurance and other classes of Insurance, and Income and Expenditure in Canada of Companies other than Canadian Transacting such Business in Canada, 1927-31	935
6. Amount of Net Premiums Written and Net Losses Incurred in Canada, by Provinces, by Canadian, British and Foreign Companies Transacting Fire Insurance Business, 1930 and 1931	936
7. Dominion and Provincial Fire Insurance in Canada, 1931	936
8. Fire Insurance Carried on Property in Canada in 1929 under Section 129 of the Insurance Act, 1917, by Companies, Associations, or Underwriters not Licensed to Transact Business in Canada	937
Section 2. <i>Life Insurance</i>	937-955
Subsection 1. The Development of Life Insurance in Canada	937-944
Subsection 2. Life Insurance Statistics	944-955
9. Life Insurance in Force and Effected in Canada, calendar years, 1869-1932	946
10. Life Insurance in Force and Effected in Canada, by Companies, 1931	947-948
11. Progress of Life Insurance in Canada, calendar years, 1927-31	948
12. Ordinary and Industrial Life Insurance Policies in Force and Issued in Canada, 1931	949
13. Insurance Death-Rate in Canada, 1928-31	949
14. Assets of Canadian Life Companies and Assets in Canada of Life Companies other than Canadian Companies, 1927-31	950
15. Liabilities of Canadian Life Companies and Liabilities in Canada of Life Companies other than Canadian Companies, 1927-31	951
16. Total Cash Income and Expenditure of Canadian Life Companies, and Cash Income and Expenditure in Canada of Life Companies other than Canadian Companies, 1927-31	951-952
17. Statistics of Fraternal Benefit Societies Insurance, 1927-31	953-954
18. Dominion and Provincial Life Insurance in Canada, 1931	955
Section 3. <i>Miscellaneous Insurance</i>	955-958
19. Insurance other than Fire and Life, in Canada, 1931	956
20. Income and Expenditure, and Assets and Liabilities of Canadian Companies doing only Insurance Business other than Fire and Life, 1931	956
21. Income and Expenditure in Canada of Companies, other than Canadian, doing only Insurance Business other than Fire and Life, 1931	957
22. Dominion and Provincial Insurance in Canada, other than Fire and Life, 1931	958
Section 4. <i>Government Annuities</i>	959-960
23. Government Annuities Contracted for, and Purchase Money Received, fiscal years ended Mar. 31, 1909-32	959
24. Government Annuities Fund Statements, fiscal years ended Mar. 31, 1929-32	960
25. Valuation, on Mar. 31, 1931 and 1932, of Annuity Contracts Issued pursuant to the Government Annuities Act, 1908	960

CHAPTER XXIV.—COMMERCIAL FAILURES.

1. Commercial Failures in Canada, with their Assets and Liabilities, According to Bradstreet's and Dun's Records, for the calendar years 1900-32	961
2. Commercial Failures in Canada and Newfoundland, by Branches of Business, calendar years 1930-32 (Dun)	962
3. Commercial Failures in Canada and Newfoundland, by Provinces and Classes, for the calendar year 1932, with Totals for 1915-31 (Dun)	963
4. Commercial Failures in Canada, by Provinces, for the calendar years 1931 and 1932 (Bradstreet)	964
5. Commercial Failures in Canada, by Provinces, calendar years 1922-32	964
6. Commercial Failures in Canada, by Branches of Business, calendar years 1924-32	964
7. Estimated Assets and Liabilities of Commercial Failures in Canada, calendar years 1922-32	965
8. Commercial Failures in Canada, by Provinces and Branches of Business, calendar year 1932 with Totals for 1931	965

CHAPTER XXV.—EDUCATION.

Section 1. <i>Schools, Colleges and Universities</i>	966-969
1. Summary of Educational Institutions in Canada, by Provinces, 1931, or Latest Year Reported	968-969
Subsection 1. The Provincially-Controlled Schools	970-979
2. Provincially-Controlled Schools in Canada: Distribution of 1,416,667 Pupils in Seven Provinces, by Age and Grade, 1931	970
3. Historical Summary of Enrolment and Average Attendance in Schools in Canada, by Provinces, 1901-31	971-972
4. Total Pupils Enrolled and in Average Attendance, and Total in High School Grades in Cities of 10,000 or over, by Sex, 1931, or Latest Year Reported	972-973

CHAPTER XXV.—EDUCATION—concluded.

	PAGE.
5. Provincially-Controlled Schools in Canada: Comparative Numbers of Boys and Girls Doing Work of Secondary Grade in each of Seven Provinces, 1901-31.	974
6. Enrolment in Publicly-Controlled Vocational Schools in Canada, by Provinces, School Year ended June 30, 1931.	975
7. Average Annual Salaries of School Teachers, by Provinces, 1930-31 or Latest Year Reported.	975
8. Provincially-Controlled Schools in Canada: Number of Teachers in Training in Normal Schools and Colleges, by Provinces, 1902-31.	976
9. Canadian Provincially-Controlled Schools: Receipts and Expenditures, by Provinces, 1927-31.	976-979
Subsection 2. Higher Education.	980-983
10. Universities and Colleges of Canada: Summary of Degrees and Diplomas Granted, 1930-31.	981
11. Universities and Colleges of Canada: Full Time Students of the Regular Session by Faculties, 1930-31.	982-983
12. Universities and Colleges of Canada: Financial Statistics, 1930-31.	986-988
Section 2. <i>Scientific and Industrial Research in Canada</i> .	990

Section 4. <i>Art in Canada</i> .	991

CHAPTER XXVI.—PUBLIC HEALTH AND BENEVOLENCE.

Section 1. <i>Administration</i> .	992-993
Section 2. <i>Institutional Statistics</i> .	903-1009
Subsection 1. Hospitals, other than Mental.	994-1005
1. Summary Statistics of Hospitals in Canada, not including Mental Hospitals and Homes for Incurables, 1931.	995
2. Bed Capacities of Hospitals, by Provinces, 1931, not including Mental Hospitals and Hospitals and Homes for Incurables.	996
3. Hospital Statistics by Provinces, with Movement of Hospital Population and Financial Statistics for the calendar year 1931.	996-1004
4. Out-Patient Departments in connection with Hospitals, together with Number of Patients Treated, for the calendar year 1931.	1006
Subsection 2. Mental Hospitals.	1005-1008
5. Statistics of Capacity, Staff and Finances of Mental Institutions in Canada by Provinces, 1932.	1006
6. Movement of Patient Population in Mental Hospitals of Canada, by Provinces, 1932.	1007-1008
Subsection 3. Child-Caring Institutions, Refuges for Adults, Homes for Incurables, etc.	1008-1009
7. Summary Statistics of Homes and Hospitals for Incurables, 1931.	1009

CHAPTER XXVII.—JUDICIAL AND PENITENTIARY STATISTICS.

Section 1. <i>General Tables</i> .	1012-1015
1. Convictions for Criminal Offences, by Classes, and Total Convictions for Minor Offences, years ended Sept. 30, 1900-31, with Proportions to Population.	1013
2. Convictions for Criminal and Minor Offences, by Class of Offence, Compared as to Numbers and Ratios, years ended Sept. 30, 1927-31 (Including Juveniles).	1013-1014
3. Convictions and Sentences for All Offences, by Provinces, years ended Sept. 30, 1925-31.	1014-1015
Section 2. <i>Indictable Offences</i> .	1015-1019
4. Convictions of Persons 16 years of age and upwards for Indictable Offences, by Provinces, years ended Sept. 30, 1900-31.	1016
5. Charges, Convictions and Percentages of Acquittals for Indictable Offences, by Provinces, years ended Sept. 30, 1920-31.	1016
6. Indictable Offences, by Classes, years ended Sept. 30, 1920-31.	1017-1018
7. Charges, Acquittals, Convictions and Sentences in respect of Indictable Offences, years ended Sept. 30, 1925-31.	1018
8. Occupations, etc., of Persons Convicted of Indictable Offences, years ended Sept. 30, 1928-31.	1019
Section 3. <i>Summary Convictions</i> .	1019-1023
9. Summary Convictions, by Provinces, years ended Sept. 30, 1900-31.	1020
10. Summary Convictions, by Offences, years ended Sept. 30, 1928-31.	1020-1021
11. Convictions for Drunkenness, by Provinces, years ended Sept. 30, 1900-31.	1021
12. Convictions for Offences against the Liquor Acts, years ended Sept. 30, 1900-31.	1022
13. Convictions for Breaches of Traffic Regulations, years ended Sept. 30, 1900-31.	1023
Section 4. <i>Juvenile Delinquency</i> .	1023-1024
14. Juvenile Delinquents Convicted of Major and Minor Offences, by Provinces and Sex, 1930 and 1931.	1024
15. Juvenile Delinquents Convicted of Major Offences, by Offences, 1925-31.	1024
Section 5. <i>Police Statistics</i> .	1025
16. Police Statistics of Canadian Cities and Towns, by Provinces, year ended Sept. 30, 1931.	1025
Section 5. <i>Penitentiary Statistics</i> .	1025-1028
17. Population of Penal Institutions, 1929-31.	1026
18. Movement of Convicts, fiscal years ended Mar. 31, 1925-32.	1027
19. Ages of Convicts, as at Mar. 31, 1925-32.	1027
20. Convicts in Penitentiaries, Classified by Race, Nationality, Religion, etc., as at Mar. 31, 1925-32.	1027-1028

CHAPTER XXVIII.—MISCELLANEOUS ADMINISTRATION.

	PAGE.
Section 1. <i>Public Lands</i>	1029-1034
Subsection 1.—Dominion Public Lands.....	1029-1033
1. Character and Disposition of Lands in Canada (circa) 1933.....	1032-1033

relate to the fiscal years ended June 30 up to 1906, and from then on to the years ended Mar. 31. Agricultural, dairying, fisheries (1922-26), mineral, manufacturing, banking, insurance, loan and trust companies statistics relate to the calendar years and railway statistics to the years ended June 30, 1871-1916, and to the calendar years 1921 and 1924-28. Canal statistics are those of the navigation seasons. The telegraph statistics relate to the fiscal years for Government lines and to the calendar years for other lines.

ERRATA.

- P. 2. Total land and fresh water area of Cape Breton Island should be given as 3,970 square miles in line 9 of the second paragraph. This correction applies also to page 18, line 2.
- P. 34. Line 11. "Pardo" should be "Pardoe".
- P. 72. Table 1. "The Earl of Minto, K.C.M.G." should read "G.C.M.G."
- P. 84. Table 9. The population of the electoral district of Argenteuil is 18,976, not 78,976.
- P. 174. Middle Paragraph. Deaths in the 9 provinces in 1927 numbered 105,292 instead of 105,136 as given in the text.

CHAPTER I.—PHYSIOGRAPHY.

PART I.—GEOGRAPHICAL FEATURES.¹

Situation.—The Dominion of Canada comprises the whole northern half of the North American continent except the United States territory of Alaska, and the Coast of Labrador, a dependency of the Colony of Newfoundland. It also includes the Arctic archipelago between Davis strait and the 141st meridian.

The Dominion is bounded on the west by the Pacific ocean and Alaska; on the south by the 49th parallel, the Great Lakes, the St Lawrence river and additional lines set out by the Ashburton Treaty, signed Aug. 9, 1842; and on the east by the Atlantic ocean, the gulf of St. Lawrence, the territory of the Coast of Labrador (as defined by the award of the Privy Council, Mar. 1, 1927), and Davis strait. As regards the far north, Canada includes all the lands in the area bounded on the east by a line passing midway between Greenland and Baffin, Devon and Ellesmere islands to the 60th meridian of longitude, following this longitude to the pole, and on the west by the 141st meridian of longitude, following this longitude to the pole. The southernmost point is Middle island in lake Erie, in north latitude $41^{\circ} 41'$, while from east to west the Dominion extends from about west longitude 57° —at the southernmost point of the boundary with the Coast of Labrador—to west longitude 141° , the boundary with Alaska. Canadian territory thus extends over 84° of longitude and 48° of latitude.

Area.—The area of the Dominion (as revised on the basis of the results of recent explorations in the north) is 3,684,463 square miles, a figure which may be compared with that of 3,738,395 square miles for the United States and its dependent territories, 3,776,700 the total area of Europe, 2,974,581 the total area of Australia, 4,277,655 the total area of China inclusive of dependencies, 3,275,510 the area of Brazil, 1,805,332 the area of India, 121,633 the area of the British Isles and 13,355,426 the area of the British Empire. By comparison with the last two figures, Canada is seen to be over 30 times as large as the British Isles and to comprise over 27 p.c. of the total area of the British Empire.

Political Subdivisions.—Canada is divided from east to west into the following provinces: the Maritime Provinces of Prince Edward Island, Nova Scotia and New Brunswick, all three comparatively small in area; Quebec, covering a strip south of the St. Lawrence and the whole territory north of the St. Lawrence and east of the Ottawa to Hudson strait, less the territory of the Coast of Labrador; Ontario, extending northward from the Great Lakes to Hudson bay; Manitoba, Saskatchewan and Alberta, the provinces of the interior continental plain, extending from 49° to 60° north latitude; and British Columbia, the province of the western mountain and Pacific Coast region, also extending from 49° to 60° . North of the 60th parallel of latitude, the country is divided into the Yukon Territory and the Northwest Territories, the latter area composed of the provisional districts of Mackenzie, Keewatin and Franklin.

Prince Edward Island.—This, the smallest province of the Dominion, lies in the southern bend of the gulf of St. Lawrence and is separated from the mainland by Northumberland strait. It is about 120 miles in length and, with an average width of 20 miles, covers an area of 2,184 square miles, approximately 200 square

¹ Revised by F. H. Peters, Director of the Topographical Survey, Department of the Interior, Ottawa.

miles more than the State of Delaware. The island is almost trisected by the deep indentations of Malpeque bay north of Summerside and by the mouth of the Hillsborough river at Charlottetown, which nearly meets Tracadie bay on the north side. Its rich red soil and red sandstone formations are a distinct feature, and no point in the island attains a greater altitude than 336 feet above sea-level. A climate tempered by the surrounding waters of the gulf and yet free from the rigours of Atlantic storms, combined with a fertile soil and sheltered harbours, offers great inducements to the pursuits of agriculture and fishing. The province is noted for its relative predominance in the fox-farming industry, its lobster canneries, and its production of oats and potatoes.

Nova Scotia.—The province of Nova Scotia is 381 miles in length by from 50 to 105 miles in width, a long, narrow strip of land lying parallel to the Maine and New Brunswick coast and joined to the latter province by the isthmus of Chignecto. It includes at the north the island of Cape Breton, which is separated from the mainland by the narrow strait of Canso. The total area of the province is 21,063 square miles, a little over 2,000 square miles less than the combined area of Belgium and Holland. Cape Breton island, south of the main entrance to the gulf of St. Lawrence and sheltering Prince Edward island from the Atlantic, is roughly 100 miles in length with an extreme breadth of 87 miles. Its area of 3,120 square miles encloses the salt-water lakes of Bras d'Or, connected with the sea at the north by two natural channels and at the south by the St. Peters ship canal. The ridge of low mountainous country running through the centre of the Nova Scotia mainland, the highest altitude of which is less than 1,500 feet, divides it roughly into two slopes. That facing the Atlantic is generally rocky and open to the sweep of Atlantic storms, but the other, facing the bay of Fundy and Northumberland strait, consists for the most part of fertile plains and river valleys noted for the general farming and fruit-farming districts which produce the famous Nova Scotian apples. The Atlantic coast is deeply indented with numerous excellent harbours many of which provided splendid homes and refuges for the old sail fishing fleets.

New Brunswick.—With a total area of 27,985 square miles, New Brunswick may be compared in size to Scotland with its area of 30,405 square miles. The province is very compact and in shape nearly rectangular, with its depth not greatly exceeding its width. The conformation is in general undulating and of low relief. In the southeastern half of the province the ground elevation does not generally exceed 500 feet above sea-level except for a narrow strip in the south which produces the highlands bordering the bay of Fundy east of Saint John. In the northwestern half the ground elevation is in general from 500 to 1,000 feet above sea-level and reaches its greatest elevation of over 2,700 feet in Northumberland county northeast of Grand Falls. The St. John, rising in the sister province of Quebec and the bordering State of Maine, is a river with many distinctive beauties, while its length of nearly 400 miles makes it quite noteworthy as to size. In the northeastern half of the province there are very extensive areas of Crown lands still carrying valuable stands of merchantable timber. While New Brunswick is essentially a part of the mainland, the bay of Chaleur at the north, the gulf of St. Lawrence and Northumberland strait at the east, the bay of Fundy at the south and Passamaquoddy bay at the southwest, provide the province with a very extensive sea-coast. To its southwest is a group of islands belonging to the province, the most important of which are Grand Manan, Campobello, and the West Isles. New Brunswick has

been called the best watered country in the world; numerous rivers provide access to extensive lumbering areas in its interior and to many of the most attractive hunting and fishing resorts in the Dominion.

Quebec.—Quebec might with considerable accuracy be included among the Maritime Provinces, for the gulf of St. Lawrence is really a part of the Atlantic, and altogether salt water washes the coasts of the province for a length of over 2,700 miles. Besides including a narrow strip of land between the St. Lawrence and the International and New Brunswick boundaries, Quebec extends northward from the St. Lawrence and Ottawa rivers to Labrador and Hudson strait, covering over 17° of latitude and an area of 594,534 square miles, about 38 p.c. of which lies south of the isotherm of 60° F. mean July temperature.¹ The combined areas of France, Germany and Spain are about 2,600 square miles less than the area of Quebec. The conformity of the surface of Quebec is in general that characteristic of the Precambrian rocks, being quite even in general but much diversified by minor hills and hollows. North of the St. Lawrence the land takes the form of a ridge, parallel to the river and rising from sea-level to the Height of Land at an elevation of from 1,000 to 3,000 feet and then descending gently again to the sea-level of Hudson bay to the northwest; but to the northeast the ridge carries its height to end abruptly in the high headlands of Labrador. South of the river, the area is comprised of the St. Lawrence Lowlands between Montreal and Quebec which, rising to the east, produce the highest elevation in the province, of about 4,200 feet, in the Gaspé peninsula. With the exception of the treeless zone extending somewhat south of Ungava bay the whole of the province supports a valuable tree growth varying from the mixed forest in the southwest to the eastern and northern coniferous in the areas of higher latitude. Apart from its importance as the threshold of Canada and the gateway through which ocean vessels must pass on their way to the interior of the continent Quebec is also noted for its natural resources. The extensive timber limits of its northern areas form the basis for the great pulp and paper industry of the present and the future. Its rivers, many of them as yet comparatively unknown, may be harnessed to supply over one-third of the electric power available in Canada. Its mineral deposits, particularly those of asbestos, have long been known for their quality and extent, while more recent developments of copper and gold deposits in Rouyn and the neighbouring townships in the western part have brought the province up to second place in mineral production in Canada. The fisheries of the St. Lawrence river and gulf are well known. Agriculturally, the climate and soil of the upper St. Lawrence River valley and the plains of the Eastern Townships are eminently adapted to general farming operations.

Ontario.—The province of Ontario is the section of the Dominion contained between the great international lakes and Hudson bay and between the western boundary of Quebec and the eastern limits of Manitoba. Although generally regarded as an inland province, Ontario has a fresh-water shore line on the Great Lakes of more than 2,362 miles and on the north a salt-water shore line of about 680 miles with a tidal port at Moosonee at the southern end of James bay. The southernmost point of Ontario, which is also the southernmost point of the Dominion, is in north latitude 41° 41'—a little further south than the northern boundary of the State of California—and its most northern, in north latitude 56° 48'. The total area comprised within its limits, of which about 82 p.c. lies south of the isotherm of 60° F. mean July temperature,¹ is 412,582 square miles, of which its fresh-water area

¹ The isotherm of 60° F. mean July temperature is generally considered as the northern limit for the economic production of cereals.

of 49,300 square miles forms the unusually large proportion of 12 p.c. The province is over 17,000 square miles greater in area than are France and Germany together, and when compared with the States to the south, Ontario is found to be almost equal in extent to the combined areas of the six New England States, together with New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Michigan and Wisconsin. Excepting in the southwestern part, the surface conformity of Ontario is influenced by the characteristics of the Precambrian rocks. In northern Ontario a large area with elevations of 1,000 feet or over adjoins the north shore of the Great Lakes and going north a short distance over the Height of Land the slope descends very gently to Hudson bay, which has a wide marginal strip less than 500 feet above sea-level. The highest point in Ontario is 2,120 feet, on the promontory at the northeastern corner of lake Superior. The whole province supports a valuable covering of trees, varying from south to north, from the mixed forest to the eastern and northern coniferous. Many varieties of climate and soil are encountered, from the distinctively southern conditions found along the shores of lake Erie to the very different ones of Hudson and James bays. Ontario, of all the provinces of Canada, is the centre of the country's manufacturing life, owing to its abundant water-power resources and its proximity to the coal fields of Pennsylvania, but the many resources of its rural districts are not on this account neglected. Mining is an important industry in the Sudbury, Porcupine, and Kirkland Lake districts, the nickel coming from the Sudbury field amounting to 90 p.c. of the world production, while, as regards gold production the province ranks first in Canada. Fruit farming in the Niagara district and general farming throughout the entire southern part of the province are carried on extensively under unusually favourable conditions, while timber, pulp and furs are among the most important products of more northern parts.

Manitoba.—Manitoba, the most easterly of the Prairie Provinces, and also the oldest of them in point of settlement, includes the area between Ontario on the east and Saskatchewan on the west. Its southerly limit is the International Boundary, while its northerly boundary is the 60th parallel of latitude and Hudson bay, where its coast of over 400 miles includes the harbour and port of Churchill. The total area of Manitoba, of which about 56 p.c. lies south of the isotherm of 60° F. mean July temperature,¹ is 246,512 square miles—3,246 square miles greater than twice the total area of the British Isles. The conformity of the surface of Manitoba is quite even; commencing on the north with a strip bordering on Hudson bay perhaps 100 miles wide and less than 500 feet in elevation, the surface rises gradually towards the west and south. The bulk of the province has an elevation of between 500 and 1,000 feet, with the greatest height of 2,727 feet attained in Duck mountain, north-west of lake Dauphin. East and north of lake Winnipeg the Precambrian formation intrudes, producing a rock formation, but the remainder of the province is overlain by very fertile soil of great depth. The treeless prairie belt extends into the south-west corner of the province, but the greater portion of the developed area is in the grove belt, characterized by groves of poplar interspersed with open prairie patches; to the north there are great areas of northern mixed forest, blending into the northern coniferous, which thin again to some treeless areas along the coast line farther north. The province has been regarded as typically agricultural, its southern lands being specially adapted to this form of industry. Its northern districts, however, are of importance in the production of timber and also contain large mineral deposits particularly of copper-gold ore. About three-fifths of the area of this province is underlain by the Precambrian rocks which have been found so rich in minerals in northern Ontario and Quebec.

¹See footnote, p. 3.

Saskatchewan.—The central prairie province lies between Manitoba and Alberta; it reaches to the International Boundary on the south and its northerly limit is the 60th parallel of latitude, which divides it from the Northwest Territories. The area, of which about 89 p.c. lies south of the isotherm of 60° F. mean July temperature,¹ is 251,700 square miles, approximating that of Manitoba, and greater by 5,000 square miles than the combined areas of the British Isles and Norway. With the exception of a point of the Precambrian rocks jutting in from the east at the Height of Land, well to the north, and again covering a narrow strip along the northern boundary, the whole of the province is overlain by generally fertile soil of great depth. The greater part of the developed area in the south is comprised in the great treeless prairie belt, fringed to the north with a zone of poplar, interspersed with open prairie, which gradually changes into the northern mixed forest covering all the northerly parts. Apart from the southern prairies, which are extraordinarily smooth, the surface topography is generally of low relief and with a general rising slope towards the west. The bulk of the province has a general elevation of between 1,000 and 2,000 feet, with the maximum elevation of about 4,500 feet on the eastern point of the Cypress hills in the southwest corner. The climate is quite different from that of Eastern Canada, with less precipitation and perhaps slightly more severe features than are encountered in many other parts of the country, but is nevertheless most favourable to plant and animal growth. The northern districts, abundantly watered by lakes and rivers, are rich in timber resources and have prospective mineral wealth, while the southern plains include a large portion of the wonderful western wheat fields.

Alberta.—Lying between Saskatchewan on the east, and the Rocky mountains and the 120th meridian on the west, and bounded on the north and south by the Northwest Territories and the United States respectively, is the province of Alberta. Its area is slightly greater than that of Saskatchewan or Manitoba, comprising a total of 255,285 square miles, of which about 90 p.c. lies south of the isotherm of 60° F. mean July temperature.¹ The area of the province is over 8,600 square miles greater than the combined areas of the British Isles and Norway. Like Saskatchewan, the southern part of the province is comprised in the dry treeless prairie belt, changing to the north into a zone of poplar interspersed with open prairie, which again gives way to the northern mixed forest covering the northerly parts. The Precambrian rocks just touch Alberta at its northeast corner, so that excepting the fringe of mountainous country on its western border the whole of the province is overlain by arable soil of great depth. Alberta has two marked features: (1) the great valley of the Peace river, which has already resulted in the extension of settlement farther north than in any other part of Canada, and (2) the wonderful grazing lands in the foothills district, which, rising sharply on the west, commences the ascent which continues to the very peaks of the Rocky mountains. The southern half of the province, rising toward the west, lies at a general elevation of from 2,000 to 4,000 feet; but in the northern half the slope descends until elevations of well under 1,000 feet are reached at lake Athabaska in the northeast corner. Mount Columbia, with an elevation of 12,294 feet, is the highest point in the province. Considerable coal and oil mining are carried on, lumbering is important in the more mountainous western parts and in the north, while some ranching is still pursued in the less populous sections. The climate of Alberta is a particularly pleasant one, cooler in summer than more eastern parts of the country and tempered in winter by the "Chinook" winds.

¹See footnote, p. 3.

British Columbia.—British Columbia, the most westerly province of the Dominion, comprises an area of 355,855 square miles, slightly less than three times the area of the British Isles. The predominant feature of the province is the parallel ranges of mountains which cover all of it except the northeast corner and produce a conformation characterized by high mountain ranges interspaced with valleys, many of which are extremely fertile, with climatic conditions well adapted to mixed agriculture or fruit growing. Apart from the smoother area in the northeast corner which extends up from the "Peace River Block" there is another notably large area of smoother terrain in the Stuart Lake district traversed by the Canadian National Railway running west from Fort George to Prince Rupert. The highest point in the province is Mount Fairweather (15,287 feet). The shore line of the Pacific is deeply indented with many inlets ideal for harbourage and with wonderful scenic aspects. With two ocean ports served by transcontinental railways British Columbia is well situated and equipped to carry on trade with the Orient, while its great stands of fir, spruce and cedar timber constitute a natural resource of great value. The province includes many islands of the Pacific, notably the Queen Charlotte group and Vancouver island; the latter, with an area of about 13,500 square miles, is noted for its temperate climate and abundant natural resources. The mines, timber, fisheries and agricultural resources of the province are remarkable for their quality and extent. The boundaries of the province extend from Alberta on the east to the Pacific ocean and Alaska on the west, and from the International Boundary northward to the Yukon.

Yukon and Northwest Territories.—The vast area of 1,516,758 square miles is included within the boundaries of Canada's northern subdivisions, the Yukon Territory and the three provisional districts of the Northwest Territories. This is over twelve times the area of the British Isles, nearly half the area of the United States, and more than the combined areas of the Argentine Republic and Chile in South America. The northern territories are as yet, in parts, unexplored and excepting the main through water routes are still in many places unmapped in any accurate way. The territories are known to include mighty rivers like the Mackenzie and the Yukon and great inland bodies of water such as Great Slave and Great Bear lakes; but with the present paucity of accurate knowledge the potentialities of this great area are at present unknown. The many general indications of mineral wealth in the country together with the recent mineral discoveries in the Great Bear Lake-Coppermine River area suggest that the future may well reproduce the great gold rush to the Yukon in 1897. Because a large portion lies within the Arctic circle the tendency has been to associate with the Northwest Territories thoughts of ice and snow, but as our knowledge is increased the argument steadily gains more weight that what have been regarded in the past as the great 'barren lands' of the north are more appropriately described as our great northern prairies. The opening of the port of Churchill, making the Hudson Bay coast of the district of Keewatin readily approachable, adds considerably to the transportation facilities, which previously have been confined to a regular steamboat summer route down the Mackenzie river. In the future it is likely that travel and transport by air will have a great influence in the further development of these territories, while a net of established radio stations already brings a large area within the realm of quick communication. The production of minerals in the Yukon in 1931 was valued at \$2,145,347, while the value of the production of furs in the Northwest Territories and Yukon in the 1930-31 season was \$2,090,961.

Summary of Land and Water Area.—The total land and fresh-water area of the Dominion, together with its distribution by provinces and territories, is shown in Table 1.

1.—Land and Fresh-Water Area of Canada, by Provinces and Territories, as in 1933.¹

¹The salt-water areas of Canada are excluded. ²Approximate.

Section 1.—Orography.

The conformation of the present surface of the North American continent admits of its apportionment, in Canada, into several orographic divisions. The exposed surface of the old Precambrian continent forms one of the largest divisions and has been called the Canadian Shield, the Archæan Penepain and in its southern portion, the Laurentian Highland. The mountainous country of the west constitutes the Cordilleras, while the mountains of eastern United States, in their continuation across the border, form the Appalachian Highland of Eastern Canada. The Great Plains, with various subdivisions, occupy the area between the mountainous area of the west and the great roughened surface of the Canadian Shield. The St. Lawrence Lowlands lie between the Laurentian and Appalachian Highlands. Within the borders of the Canadian Shield an area on the southern margin of Hudson bay has been referred to as the "clay belt" It occupies a part of the basin that during the glacial period was submerged and covered with a coating of clay which smoothed over its inequalities and concealed most of the underlying rocks. Since its emergence the surface has been but slightly altered by drainage channels cut across it.

Orographical maps of Eastern and Western Canada, showing elevations above sea-level, will be found on pp. 8 and 10 of this volume.

Canadian Shield.—The portion of the Precambrian continent whose exposed surface still forms a large part of Canada has an area of about two and a half million square miles. Its northern border crosses the Arctic archipelago and the eastern lies beyond Baffin island and Labrador and reaches the depressed area occupied by

OROGRAPHY OF EASTERN CANADA AND LABRADOR.

Prepared by
Nat. Res. Invtl. Ser.
Dept. Interior

the St. Lawrence river, a short spur or point crossing this valley at the outlet of lake Ontario to join the Adirondack mountains in New York. The southern boundary runs from this spur west to Georgian bay, skirts the north shore of lake Huron and sweeps almost around the ancient depressed area occupied by lake Superior. The western edge, from the lake of the Woods and lake Winnipeg, bears northwest to the western end of lake Athabaska, and passes through the basins occupied by Great Slave and Great Bear lakes, reaching the Arctic ocean east of the Mackenzie River delta. In detail, the surface features of the Canadian Shield are irregular, but, viewed broadly, it has the conformation of a great plain, depressed toward the centre and in the north and slightly elevated along the eastern and southern borders where it presents a rather steep outward slope. The general elevation in the eastern portion is under 2,000 feet and over the larger part of the plain is about 1,000 feet. The highest portion is along the northeastern margin, where it presents a steep face to the sea, rising to a maximum altitude of about 6,000 feet.

Appalachian Region.—The continuation of the Green mountains of Vermont into Canada may be traced in the Notre Dame mountains, which approach the St. Lawrence northeast of Quebec and, continuing with more easterly trend, form the highland of the Gaspé peninsula. Over a large part of the region, these hills hardly attain the dignity of mountains, but peaks rising more than 3,500 feet above the nearby coast are found in the Gaspé peninsula. The continuation of the White mountains of New Hampshire is found in the highlands of Maine and New Brunswick, the continuity being shown quite plainly by the rock-folding and other evidences of the great earth movements which caused the topography. An additional ridge apparently forms the present province of Nova Scotia, and although the highlands of that province do not attain elevations of even 1,500 feet, the rock structure indicates that it was a mountainous country at no very remote geological period.

St. Lawrence Lowlands.—The southern interior of the continent consists of a plain of low relief, bordered on the east by the Appalachian mountains, on the west by the Cordilleran Mountain systems, and on the north by the Laurentian plateau. This plain, in its Canadian portion, is known as the St. Lawrence Lowlands, and extends from a short distance below Quebec city to lake Huron, south of Georgian bay, having a length of 600 miles and an area of 35,000 square miles. To the northeast it becomes reduced in width, and in the vicinity of Quebec is represented by a narrow plateau or shelf on each side of the St. Lawrence river.

Great Plains.—A great area, including diverse features, lies to the east of the Cordilleras. The portion that is included under the term Great Plains extends from the southwestern edge of the ancient surface, forming the Canadian Shield, to the eastern edge of the mountainous region of the Cordilleras. This area is characteristically different from other parts of Canada in that any exposure of surface rock is rare. Generally, it is overlain by great depths of soil, through which the streams have cut themselves down into deep couleés and the rivers into deep wide valleys. Lakes of any considerable extent are infrequent and usually quite shallow; in the dry prairie section there are many places where the absorption from the broad and shallow bodies of water is so great that they have little or no outflowage and consequently the concentration of mineral salts in the water makes it unfit for domestic use. The terrain is generally smooth or gently undulating and with elevations of from 600 to 3,500 feet has a general upward slope toward the south and west where, rising more sharply in the foothills, the real ascent to the high mountains commences.

OROGRAPHY OF WESTERN CANADA.

Cordilleran Region.—The western part of the American continent is more or less mountainous. The Andean chain, which extends throughout the length of South America and broadens out in the United States has, in Canada, an average width of about 475 miles. This region, covering about 530,000 square miles, is the most elevated in the Dominion, many of the summits reaching heights of 10,000 feet, with occasional peaks over 13,000 feet above sea-level. The mountainous tract forming the Cordilleras can be divided broadly into three parallel bands: a series of plateaus and mountains, comprised in the Columbia, Interior, Cassiar, and Yukon systems, forming the central part, referred to as the Central Belt; another series of parallel ridges east of the central plateaus, formed of fault rocks and folds and including the Rocky and Arctic systems, known as the Eastern Belt; and a third division between the plateau country and the Pacific, composed of the Pacific and Insular systems, called the Western Belt.

Table 2 shows the principal named Canadian Cordilleran peaks exceeding 11,000 feet in elevation.

¹This peak is on the international boundary between British Columbia and Alaska.²The enumerated peaks in Yukon are on or near the Yukon-Alaska boundary.

Note.—The highest mountain east of the Rockies, with the exception of the Torngata in Labrador, peaks of which exceed 6,000 feet, is Tabletop mountain (recently re-named Mount Jacques Cartier by the Geographic Board of Canada) in N. lat. 48° 59', W. long. 65° 56', Gaspé district, Quebec, the summit of which is 4,350 feet above sea-level.

Section 2.—Rivers and Lakes.

General.—The waterways of Canada constitute not only one of its most remarkable geographic features, but one of the most vital elements of its national existence. The fresh-water area of 226,979 square miles is unusually large, constituting over 6 p.c. of the total area of the country. The Great Lakes, with the St. Lawrence river, form the most important system of waterways on the continent and one of the most notable fresh-water transportation routes in the world. Their value in facilitating the cheap and speedy shipment of grain from the Prairie Provinces cannot be overestimated. These lakes never freeze over, but usually most of their harbours are closed by ice about the middle of December and remain frozen over until the end of March or the beginning of April.

Drainage Basins.—The great drainage basins of Canada are the Atlantic (524,900 square miles), the Hudson Bay (1,486,000 square miles), the Pacific (387,300 square miles), the Arctic (1,290,000 square miles) and the Gulf of Mexico (12,365 square miles). Table 3 indicates the drainage areas of the more important rivers.

3.—Drainage Basins of Canada.

NOTE.—Owing to overlapping and to the fact that minor basins are omitted, the totals of each drainage basin do not represent an addition of the drainage areas as given. Tributaries and sub-tributaries are indicated by indentation of the names. The Gulf of Mexico basin is that part of the southern area of the Prairie Provinces drained by the Missouri and Mississippi rivers and their tributaries.

The St. Lawrence River System.—Most important of the lakes and rivers of Canada is the chain of the Great Lakes with their connecting rivers, the St. Lawrence river and its tributaries. This chain is called the St. Lawrence River system. The Great Lakes, separating the province of Ontario from the United States and connected by a series of canals with the St. Lawrence river, allow vessels to proceed from the Atlantic ocean to the interior of the Dominion as far as Fort William and Port Arthur, twin cities situated on lake Superior, practically half way across the continent. The present waterway provides a draught of 30 feet as far as Montreal, 14 feet through the remainder of the St. Lawrence river and 20 feet on the Great Lakes.

Other River Systems.—Apart from the St. Lawrence, the great waterway of the eastern half of the Dominion, other systems also merit some attention. The Saskatchewan river, for example, flowing eastward from the Rocky mountains to lake Winnipeg and thence northward by the Nelson river into Hudson bay, drains a great part of the plains of the western provinces. In the north, the Mackenzie river, with its tributaries the Slave, Liard, Athabaska and Peace rivers, follows the northerly slope of the Great Plain and empties into the Arctic ocean, its waters having traversed in all a distance of 2,514 miles. The Yukon river, after draining a

great part of the Yukon Territory, flows northward through Alaska into the Behring sea after a course of 1,765 miles. The Fraser, Columbia, Skeena and Stikine rivers flow into the Pacific ocean after draining the western slopes of the mountains of British Columbia. Table 4 gives the lengths of the principal rivers with their tributaries, classified according to the course taken by their waters.

4.—Lengths of Principal Rivers and Tributaries in Canada.

NOTE.—In this table the tributaries and sub-tributaries are indicated by indentation of the names. Thus the Ottawa and other rivers are shown as tributary to the St. Lawrence, and the Gatineau and other rivers as tributary to the Ottawa.

The Great Lakes.—Table 5 shows the length, breadth, area, elevation above sea-level and maximum depth of each of the Great Lakes. Particularly notable are the depth of lake Superior and the shallowness of lake St. Clair and lake Erie.

5.—Areas, Elevations and Depths of the Great Lakes.

Lake.	Length.	Breadth.	Maximum Depth.	Area.	Elevation above Sea-level.
	miles.	miles.	feet.	square miles.	feet.
Superior.....	383	160	1,180	31,810	602-29

Erie.....	241	57	210	9,940	573-52
Ontario.....	180	53	738	7,540	246-17

Lake Superior, with its area of 31,810 square miles, is the largest body of fresh water in the world. As the International Boundary between Canada and the United States passes through the centre of lakes Superior, Huron, St. Clair, Erie and Ontario, only a part of the areas of these lakes given in the above statement is Canadian, while the whole of lake Michigan is within United States territory. The total length of the St. Lawrence waterway, from the head of the St. Louis river in Minnesota to Pointe-des-Monts at the entrance of the gulf of St. Lawrence, is 1,900 miles. The tributaries of the St. Lawrence, several of which have themselves important tributaries, include the Ottawa river, 696 miles long, the St. Maurice river, 325 miles long, and the Saguenay (to head of Peribonka), 405 miles long.

Other Inland Waters.—In addition to the Great Lakes, there are large bodies of inland water in other parts of Canada. Of these only the following principal lakes, with their respective areas, need be mentioned: in Quebec, lake Mistassini (840 square miles); in Ontario, lake Nipigon (1,590 square miles); in Manitoba, lake Winnipeg (9,398 square miles), lake Winnipegosis (2,086 square miles) and lake Manitoba (1,817 square miles); in Manitoba and Saskatchewan, Reindeer lake (1,765 square miles); in Saskatchewan and Alberta, lake Athabaska (2,762 square miles). All these are within the boundaries of the provinces as at present constituted and are exclusive of lakes situated in the Northwest Territories, the largest of which are Great Bear lake (11,660 square miles) and Great Slave lake (11,170 square miles) in the district of Mackenzie.

Table 6 gives a list of the principal lakes of Canada by provinces, with the area of each in square miles. The table corresponds with the delimitation of the provinces as altered by the Boundary Extension Acts, 1912 (2 Geo. V, cc. 32, 40 and 45).

Section 3.—Islands.

The islands of Canada are among its most remarkable geographic features. They include the numerous unsurveyed and little known areas of the Arctic regions, the fringe of both large and small islands off the Pacific coast, those of the Maritime Provinces and Quebec in the Atlantic ocean and the gulf of St. Lawrence, together with the islands of the Great Lakes and other inland waters. Of the Arctic islands, but little need be said. They are known to be of vast extent, Baffin, Victoria and Ellesmere, the three largest, being approximately 199,610, 80,450 and 78,400 square miles in area respectively, but Banks, Devon, Southampton, Somerset, Prince of Wales, Melville and Axel Heiberg are also of considerable size. Their economic possibilities, beyond scattered deposits of coal and other minerals, have not been established. The Pacific Coast islands, with the exception of Vancouver island and the Queen Charlotte group, are small and dot the western coast of British Columbia from Dixon entrance to the southern boundary of the province. Vancouver island is 285 miles long and from 40 to 80 miles broad, covering an area of about 13,500 square miles; the mountain range which forms its backbone rises again to form the Queen Charlotte islands farther north. These islands figure largely in the mining, lumbering and fishing industries of the West.

On the eastern coast of the Dominion are the island province of Prince Edward Island, the island of Cape Breton (an integral part of Nova Scotia), Anticosti and the Magdalen group (included in the province of Quebec) and the islands of Grand

Manan and Campobello (part of the province of New Brunswick) in the bay of Fundy. Prince Edward island is 2,184 square miles in area, Cape Breton 3,120 and Anticosti of about the same extent. Fishing activities in these eastern islands are important, while agriculture on Prince Edward island and mining on Cape Breton are among the chief occupations of the inhabitants.

Manitoulin island in lake Huron and the Thousand Islands group in the St. Lawrence river, at its outlet from lake Ontario, are the more important islands of the inland waters.

PART II.—GEOLOGY.

Section 1.—Geology of Canada.¹

The outstanding feature of Canadian geology is the vast area underlain by formations of Precambrian age. These occupy nearly the whole of Canada east of a line joining lake Winnipeg and Great Bear lake with the exception of the Maritime Provinces, the extreme southern parts of Ontario and Quebec, and a part of Ontario adjacent to the southern coast of Hudson bay. The Precambrian rocks are the oldest rocks exposed on the earth's surface, and the vast area which they underlie is one that has probably existed as a land mass throughout longer periods than any other part of Canada.

These ancient formations extend, with gentle sloping surface, in almost all directions beneath a mantling series of nearly flat-lying sedimentary rocks of Palæozoic, Mesozoic and Cenozoic age. These little disturbed sediments occupy southern Quebec, southern Ontario, the Prairie Provinces and the Northwest Territories. Some of them were at one time of much wider extent and covered part or all of the Precambrian area.

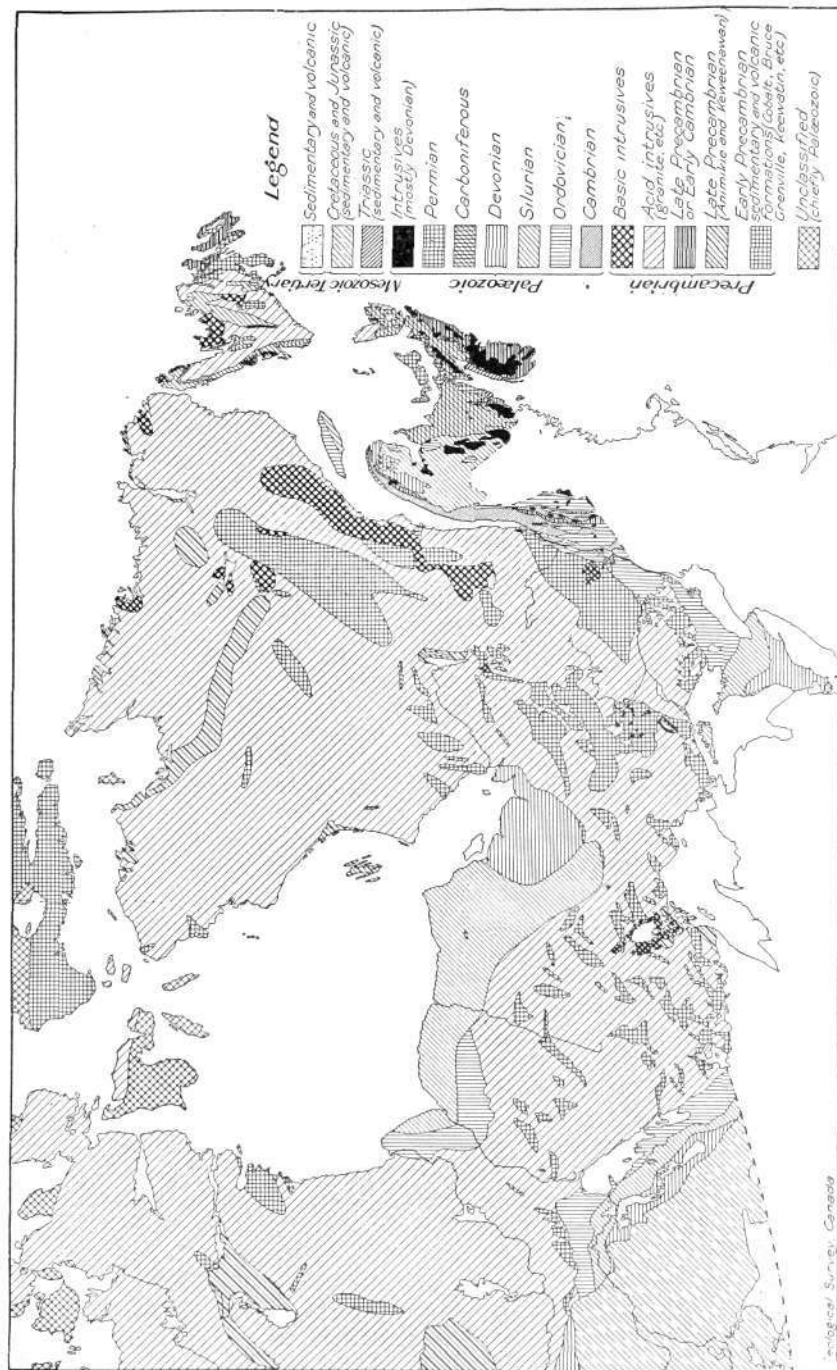

Towards the Atlantic and Pacific coasts the Palæozoic and later sediments, together with the older rocks on which they rest and assemblages of volcanic rock, are intensely folded and faulted, forming the Appalachian system of mountains on the east and the great Cordillera, comprising nearly all of British Columbia and Yukon, on the west.

Subsection 1.—Topography.

The present topography of Canada is the temporary outward expression of a half continent which is subject to unceasing change. It is the result of the operation of geological processes at the surface of the earth or at depth throughout hundreds of millions of years. It derives from the injection of igneous rock masses in liquid form beneath the surface, the ejection of lavas and volcanic fragmental material, the deposition of sediments, the folding and faulting of rock formations, and the disintegration of solid rocks and transportation of the products of disintegration by surface agencies. The slow rising and sinking of broad continental land masses and the upheaval and subsequent gradual levelling of mountain ranges are involved.

The great area in Eastern Canada underlain by rocks of Precambrian age is known as the Canadian (or Precambrian) Shield or the Laurentian Plateau. It may be regarded as a subdued plateau or perhaps, more strictly speaking, a peneplanated surface that has been rejuvenated by Pleistocene glaciation and uplift.

¹ By Wyatt Malcolm, M.A., Geological Survey, Ottawa.

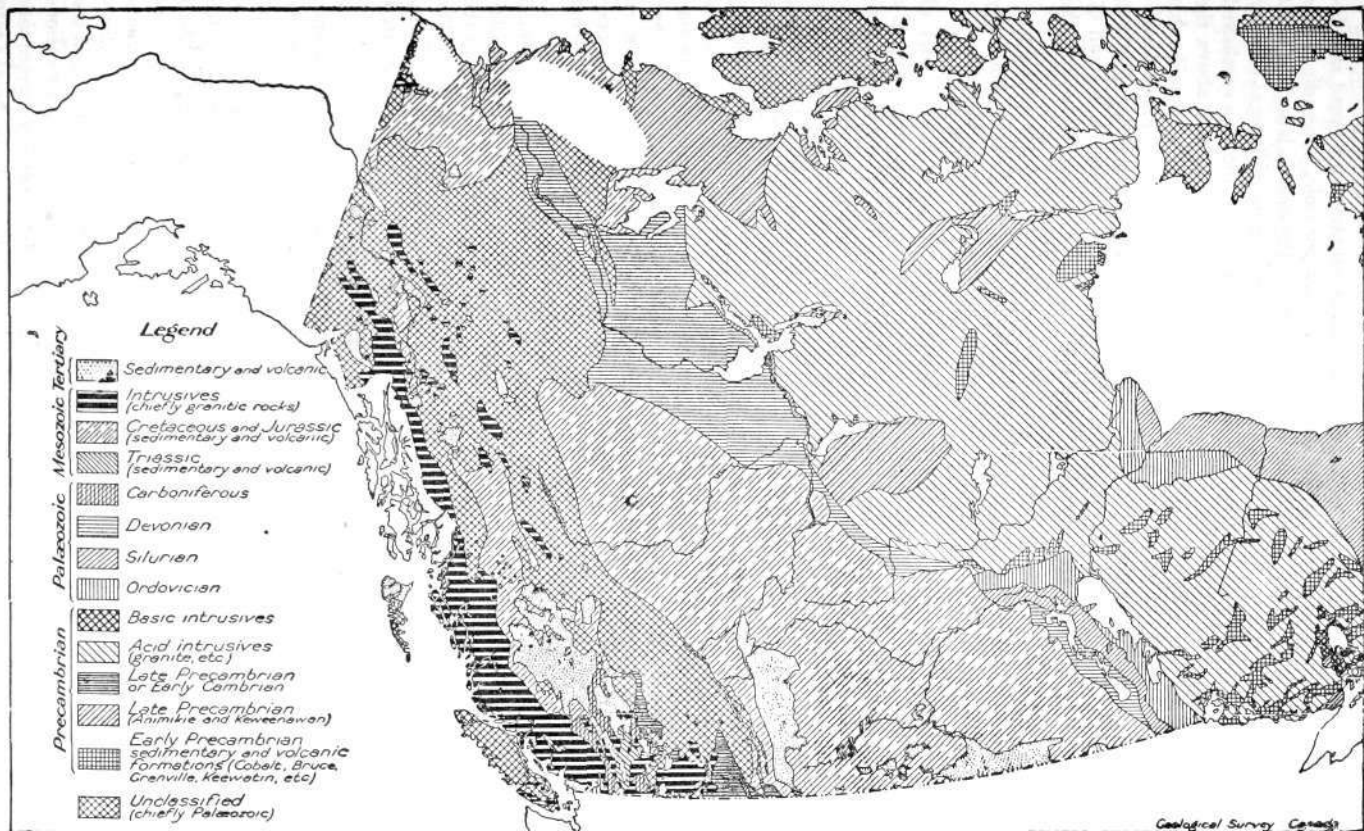

Its average elevation probably does not exceed 1,500 feet, and, except in the north-east, there are few areas that exceed 2,000 feet. In general, the surface slopes gently to the surrounding plain and there are long stretches of the boundary in which there is no marked difference of elevation between the Precambrian Shield and the adjacent Palæozoic plain; there are other long stretches in which there is an abrupt rise of several hundred feet above the plain or the sea. The greatest known elevations are in the eastern part of Baffin island and along the coast of northern Labrador. A peak of the Torngat mountains of Labrador is estimated to have an elevation of 7,000 feet. The coast is one of the boldest and most rugged of the world, with nearly vertical cliffs rising 1,000 to 2,000 feet in height. Though the Canadian Shield is an area of low relief and has a remarkably even sky line, the surface is generally rugged with successions of rocky hills 100 to 200 feet high. Occasional exceptions occur in which there is a relief of several hundred feet, as in the hills on the north shores of lake Huron and lake Superior. The area is dotted with lakes, large and small, of irregular outline and with numerous islands. They are rock basins that spill their waters from one to another by streams with rapids and falls. In an area of 250 square miles in western Ontario that cannot be considered exceptional, aerial surveys have shown that there are 700 lakes. There are well-defined deep trenches like that occupied by lake Timiskaming, related to faulting or other structural features. The Saguenay river flows in a trench that descends to more than 800 feet below sea-level, and lake Superior, the largest body of fresh water on the face of the earth, fills a basin in the Canadian Shield that reaches about 400 feet below sea-level.

Extending south and west from the Canadian Shield and limited on the east by the Appalachian Mountain system and on the west by the western Cordillera of America, is the great North American plain. The northeastern part of this plain occupies southern Ontario south of a line extending from Georgian bay to the east end of lake Ontario, that part of eastern Ontario lying between the Ottawa and St. Lawrence rivers, and the part of Quebec lying adjacent to the St. Lawrence between Montreal and Quebec. The part of the plain west of the Canadian Shield is of wide extent, and stretches northward to the Arctic ocean between a line approximately joining lake Winnipeg, lake Athabaska, Great Slave lake and Great Bear lake on the east, and the foothills of the Rocky mountains on the west.

Although these areas are but parts of one great plain and are disconnected in Canada only because the Canadian Shield happens to project across the International Boundary in a narrow belt east of lake Ontario and in a wide zone between lake Huron and the lake of the Woods, they will, for convenience of treatment, be considered separately. Those parts lying in the basin of the St. Lawrence and the Great Lakes have been designated the St. Lawrence Lowlands, while the western area has been named the Interior Plains.

The part of the St. Lawrence Lowlands lying in the eastern angle of Ontario and in Quebec south of Montreal, and extending down the St. Lawrence, is comparatively flat and lies less than 500 feet above sea-level. On the lower St. Lawrence it is greatly narrowed by the near approach of the Appalachian system to the Canadian Shield. The part lying adjacent to lakes Ontario, Erie and Huron is of less even surface, has its greatest elevation of over 1,700 feet south of Georgian bay, and slopes rather gently to the Great Lakes. A striking topographical feature is the Niagara escarpment. This is an eastward-facing escarpment having a height of 250 to 300 feet and extending from the Niagara peninsula northwest to Bruce peninsula.

GEOLOGY OF WESTERN CANADA

The Interior Plains region is in general a rolling country with broad undulations and a slope eastward and northward of a few feet per mile, descending from an elevation of 3,000 to 5,000 feet near the mountains on the west to less than 1,000 feet at its eastern border. The elevation of the Canadian Pacific Railway at Calgary is 3,439 feet and at Winnipeg 772 feet. The rolling character of the area is relieved by several flat-topped hills—erosion remnants rising hundreds of feet above the surrounding country—by flat areas that formed the beds of lakes of considerable extent, and by deeply incised river valleys. A striking feature is the broken escarpment of western Manitoba and eastern Saskatchewan, marking the rise of 400 to 1,000 feet from the Manitoba lowland to the upland of the west. A lowland of considerable extent stretches for some distance into Ontario and Manitoba from the south shore of Hudson bay.

The Arctic archipelago consists of large islands, many of which rise prominently from the sea as sloping table lands while others are comparatively low.

The Appalachian and Acadian regions occupy practically all that part of Canada lying east of the St. Lawrence, with the exception of the lowland west of a line joining Quebec city and lake Champlain. The Appalachian region is a continuation northward into the province of Quebec of three chains of the Appalachian system of mountains. The most westerly of these ranges stretches northeast into Gaspé peninsula, where it forms flat-topped hills over 3,000 feet high. Mount Jacques Cartier on Tabletop mountain has an elevation of 4,350 feet. The Acadian region, which includes New Brunswick, Nova Scotia, and Prince Edward Island, is an alternation of uplands and lowlands. The northwest part of New Brunswick is an upland with hills and ridges rising to 2,500 feet or higher. Adjacent to the bay of Fundy is a series of ridges rising in places to an elevation of 1,200 feet or more. Between these two New Brunswick uplands is a lowland forming the whole eastern part of the province and converging towards the southwest. This lowland extends east so as to include Prince Edward island, the western fringe of Cape Breton island and the mainland of Nova Scotia north of the Cobequid mountains, which have an elevation of 800 to 1,000 feet. South of them lies a long narrow lowland stretching from Chedabucto bay to Minas basin and along the Cornwallis-Annapolis valley between North and South mountains. South of this is a highland sloping to the Atlantic coast and having an elevation at its highest part of about 700 feet. The northern part of Cape Breton island is a tableland 1,200 feet high, with its central part rising to an elevation considerably in excess of this, one point at the headwaters of Clyburn and Cheticamp rivers being 1,747 feet above sea-level.

The Cordilleran region, the mountainous area bordering the Pacific, extends northward from the United States through Canada into Alaska, and embraces nearly all of British Columbia and the Yukon, and the western edge of Alberta and the Northwest Territories. The eastern part of the Cordillera is occupied by the Rocky mountains. They consist of overlapping chains with peaks rising to heights of 10,000 to 12,000 feet. They extend northwest and fall away towards the Liard river. North of this river the mountains with a similar trend lie 100 miles farther east and are known as the Mackenzie mountains. The western part of the Cordillera is occupied by the Coast range and the mountains of Vancouver and Queen Charlotte islands. The Coast range rises to heights of 7,000 to 9,000 feet. Between the Rocky mountains and the Coast range lies a vast plateau system having elevations of 3,000 to 4,000 feet, and cut by deep river valleys. The plateau region merges into rugged mountain ranges as it approaches the Rocky mountains; it also breaks into

mountains in northern British Columbia, but becomes subdued to a plateau again in the Yukon. A striking feature of the Cordillera is the deep trench that lies immediately to the west of the Rocky mountains, extends northwesterly from the International Boundary into Yukon and is occupied by the head waters of the Kootenay, Columbia and Fraser rivers, and tributaries of the Peace and Liard rivers.

Subsection 2.—Geology.

Canadian Shield.—The Canadian Shield is underlain by rocks of Precambrian age. These consist of series of sedimentary and volcanic formations and igneous intrusives of great variety. They were subjected to mountain-building processes, folded, crushed and metamorphosed, and the mountains were reduced nearly to their present level before the earliest Palæozoic sediments were deposited. The Precambrian period was probably of greater duration than all the subsequent geological periods taken together.

Geologists do not agree on the main subdivisions of the Precambrian formations. There is one great unconformity, which represents a long period of erosion, and which divides the stratified rocks into two groups, the earlier group consisting of a great mass of volcanics with associated sedimentary rocks and the later group consisting more fully of sediments. The earlier group is greatly folded and altered; the later group has in general been less disturbed and altered.

In the earlier group the most important series is the Keewatin. The Keewatin consists essentially of lava flows accompanied in many places by tuffs and basic intrusives, and includes iron formation, which frequently is made up of thin layers of chert-like quartz, alternating with quartzose layers holding magnetite or hæmatite or both. Sedimentary rocks consisting of conglomeratic, sandy and slaty strata are frequently associated with the volcanics and are, in places, of considerable thickness and extent. They may underlie the volcanics, like the Couchiching of the Rainy Lake area; they may be interbedded with the volcanics, like the Doré formation of Michipicoten; or they may overlie the volcanics, like the Timiskaming formation of northeastern Ontario and western Quebec. Between the volcanics and overlying sediments of northeastern Ontario and western Quebec there is an unconformity that is regarded by some geologists as of major importance. The early Precambrian formations occupy numerous areas of various sizes up to several hundred square miles in western Quebec, northern Ontario, eastern and central Manitoba, and to a less degree in Saskatchewan and the Northwest Territories.

The later Precambrian formations consist in a large measure of sedimentary rocks—conglomerates, quartzites and slates. In an area lying immediately north of lake Huron and stretching northeast to beyond lake Timiskaming lies a succession of sediments known as the Huronian. These consist of : (a) the Bruce series, made up of conglomerates, quartzites and impure dolomitic limestone with an aggregate thickness of 2,700 to 12,000 feet; and (b) the Cobalt series, made up of boulder conglomerate and other materials probably of glacial origin, overlain by quartzite and calcareous quartzite, with an aggregate thickness of 12,000 feet. An erosion interval of considerable time intervened between these two series. These strata are undulating with gentle dips except on the north shore of lake Huron and eastward, where they stand at high angles and represent the core of an ancient mountain range that probably flanked the southern edge of the continent.

North of lake Superior the later Precambrian rocks are represented by a group of nearly flat-lying sediments known as the Kaministikwan group. This group embraces the Animikie series of conglomerate, iron formation, and shale; the Sibley series of conglomerate, sandstone, limestone, and tuff; and the Osler series of lavas, conglomerate, sandstone and tuff.

In northwestern Manitoba the Precambrian formations are separated by an unconformity into an earlier Wekuskoan group of lavas and sediments and a later group of Missian sediments.

Strata, presumably of late Precambrian age, are known to occur on lake Athabaska, Great Slave lake, east of Great Bear lake, on Belcher islands, on the east of Hudson bay and at other points in the Ungava peninsula. In the southern part of Ungava peninsula sediments are found that bear a resemblance to the Grenville-Hastings group of southern Quebec and southeastern Ontario.

The Grenville-Hastings group consists of closely folded, highly altered sediments intruded by, and in places interleaved with, granite. They are in general rusty-weathering banded gneisses, quartzose gneisses grading into quartzites, crystalline limestones, amphibolites, pyroxene-rich rocks and volcanic schists. Pegmatite dykes are common and anorthosite occupies large areas. The Grenville-Hastings group forms a belt in the southern part of the Canadian Shield, extending east from Georgian bay. The formations have not as yet been indubitably correlated with the Keewatin and Huronian rocks to the north.

The Precambrian sediments have suffered intrusion at various times by granites. These have been unroofed at different stages in the history of the Precambrian, and pebbles of granite are found in the conglomerates as early as those of Keewatin age. So complete has been the unroofing of the granites that they are exposed over the greater portion of the Canadian Shield. Basic intrusives were common in later Precambrian times. Sills and dykes of diabase cut the late Precambrian sediments around lake Nipigon, to the west of lake Timiskaming and at many other points. A thick laccolith of norite and micropegmatite is found in the Sudbury district.

The Canadian Shield was intensely glaciated during Pleistocene times, with the exception of the more elevated parts of the northern Labrador coast, and in general only a scant amount of soil was left, sufficient partially to conceal the rocks and maintain a forest growth. In some areas, as in part of northern Ontario and Quebec, adjacent to the Canadian National Railway, stratified fine sediments were deposited in lakes formed in front of the retreating glacier.

The Precambrian formations are prolific of mineral deposits of great number, variety and extent. These latter occur generally at or near the contact of the intrusives and the intruded rocks. Among them are the gold deposits of Porcupine and Kirkland Lake, associated with intrusions of porphyry, the silver deposits of Cobalt, South Lorrain and Gowganda, associated with diabase sills, the enormous nickel-copper deposits of Sudbury, associated with norite of a thick laccolithic intrusion, the auriferous copper sulphides of western Quebec, the copper-zinc sulphides of Manitoba, and the iron ores and iron pyrites of many localities of Ontario; in the Grenville-Hastings area are found deposits of galena, mica, graphite, feldspar, magnesite, fluorite, kaolin, molybdenite, talc and apatite.

St. Lawrence Lowlands.—The St. Lawrence Lowlands are divided into two parts by an arm of the Laurentian Plateau that extends southward into New York State, crossing the St. Lawrence between Kingston and Brockville. They are

underlain by nearly horizontal Palæozoic sediments dipping gently away from the Canadian Shield and resting on the sloping surface of Precambrian rocks which, prior to the deposition of the Palæozoic strata, had been reduced to a physiographic condition similar to that existing on the Canadian Shield to-day.

The sediments are almost wholly of marine origin, consist mainly of limestone, magnesian limestone and shale, and range in age from late Cambrian to late Devonian.

In the Ottawa-Montreal division the latest strata are Ordovician; these, together with the Potsdam sandstone (Cambrian), have a thickness of about 6,000 feet. In the Great Lakes region of southern Ontario the Ordovician formations are succeeded upward by those of Silurian age and these in turn by strata of Devonian age. The Ordovician formations form a zone extending from Kingston to the Niagara escarpment and stretching northwest to Georgian bay and into Manitoulin island. The Silurian formations are exposed in the Niagara escarpment and westward in a belt 25 to 50 miles wide stretching northwest from Niagara peninsula into Manitoulin island. West of this nearly the whole of the area between lake Erie and lake Huron is underlain by Devonian limestones and shales. Each in turn is exposed over an area farther to the southwest than the older and underlying formation, so that in travelling westward from Kingston to Sarnia one passes over the bevelled edges of successively younger strata. Borings made at Courtright, in the township of Moore, show a thickness of nearly 4,260 feet of sedimentary rocks.

It is probable that the seas in which some of these sedimentary rocks were formed extended northward over the Precambrian rocks through Hudson bay into the Arctic ocean. The presence of outliers on lake St. John, lake Nipissing, and lake Timiskaming in the south, and on lake Nicholson west of Hudson bay, of broad areas of Ordovician, Silurian and Devonian formations south of Hudson bay, and of Cambrian, Ordovician, Silurian and Devonian formations on the islands of the northern part of Hudson bay and of the Arctic seas, is clearly indicative of wide submergence. On the Arctic islands formations of Carboniferous (with coal seams) and Triassic ages are widespread, and there are patches of Tertiary sediments (with lignite). There is also evidence of the occurrence of rocks of Mesozoic age in Moose River basin.

The St. Lawrence Lowlands were covered by the glaciers of Pleistocene time, and the bedrock is to a great extent concealed by thick deposits of glacial till. In places are found stratified deposits that formed in lakes at the edge of the retreating ice sheet. Marine deposits were laid down in an arm of the sea that extended up the St. Lawrence and Ottawa valleys to a point above Ottawa.

The only intrusives worthy of mention are the igneous rocks of alkali types that form the Monteregian hills in southern Quebec, Mount Royal and seven others to the east. They are circular or oval hills that rise 600 to 1,200 feet above the plain and appear to be stock-like bodies or conduits that may have led to volcanic vents or larger masses of intrusives.

The mineral deposits are such as are usually found in the less altered sedimentary rocks. Petroleum has been produced in southern Ontario for 70 years; natural gas has been produced for 40 years in the counties bordering on lake Erie; salt has been obtained for a great many years from thick beds lying at a depth of about 1,000 feet in the counties bordering on lake Huron and lake St. Clair; gypsum

is produced in the Grand River valley; limestone and dolomite, utilized in chemical and metallurgical industries, are widespread; materials for construction, for brick, tile and cement manufacture are abundant.

Appalachian and Acadian Regions.—The Appalachian and Acadian regions are composed of geological formations ranging from Precambrian through Palæozoic to Mesozoic. The Palæozoic sediments pass upward from dominantly marine formations into dominantly continental formations. A complete succession is not found and there are several breaks in sedimentation.

Sediments, probably of Precambrian age, occur in southeastern Quebec, southern New Brunswick, northern Cape Breton island and on the Atlantic coast of the mainland of Nova Scotia. The thick series of slates and quartzites, known as the Gold-bearing series, forms a belt occupying a very considerable part of the mainland of Nova Scotia, faces the Atlantic coast and is probably of late Precambrian age.

During the Palæozoic period numerous disturbances took place in sedimentation; there were periods of uplift, of folding, and of erosion. Cambrian formations are found in southeastern Quebec, Ordovician formations are of extensive development in the Appalachian region from Vermont to Gaspé, Silurian and Devonian are well developed in Gaspé and the northwestern part of New Brunswick. Patches of Cambrian, Ordovician, Silurian and Devonian rocks are found in other parts of the Appalachian and Acadian regions.

The system of sediments most widely distributed in the Maritime Provinces is the Carboniferous. The formations are mainly of continental deposition although during Mississippian time a part of the area was submerged and received marine sediments. Towards the close of Devonian time there was a period of intense mountain building and igneous activity. Granite masses of large size were intruded in Nova Scotia and New Brunswick and of smaller size in Gaspé and southeastern Quebec. The upheaval was succeeded by intense erosion, and in early Carboniferous time granite masses were exposed by the removal of the overlying rocks.

The Carboniferous system occupies the triangular lowland forming much of the southeastern half of New Brunswick, the part of Nova Scotia north of Cobequid mountains, part of the lowland to the south of these mountains, southwestern and northeastern Cape Breton island and Prince Edward island. On Prince Edward island the Carboniferous may pass upward into the Permian. In the Carboniferous system are found the coal measures of Sydney and Glace bay, of Inverness, Pictou and Cumberland counties, Nova Scotia; and of the Minto coal field, New Brunswick. The extensive gypsum deposits and the salt beds of Nova Scotia and New Brunswick are found in a formation of Mississippian age, and the bituminous shales of New Brunswick and Nova Scotia are also of early Carboniferous age. The Carboniferous system has in places been subjected to folding and faulting, but considerable areas have suffered little disturbance since these sediments were laid down.

Sandstone and lava flows of Triassic age are exposed on the bay of Fundy, particularly on the south coast. North Mountain is composed of basic lava flows capping Triassic sandstone. During the Pleistocene period the whole of the Appalachian and Acadian regions, with the exception of the higher parts of Gaspé, was subjected to glaciation.

The most important economic minerals of the Appalachian and Acadian regions are coal, asbestos, and gypsum. Reference has already been made to the occurrence of coal and gypsum. Asbestos occurs in altered peridotite in southeastern Quebec. These are the most productive deposits of the world. Chromite also occurs in the

peridotite. Auriferous quartz veins, mainly of the interbedded type, are found on domes and pitching anticlines of the gold-bearing series of Nova Scotia. Zinc-lead deposits occur in the Devonian shales and limestones of Gaspé peninsula, zinc-lead-copper sulphides in the southern part of Cape Breton island in a series of lava flows, and copper deposits in southern Quebec.

Interior Plains.—The Interior Plains are underlain by a series of nearly horizontal sedimentary rocks of Palæozoic, Mesozoic and Tertiary ages. The Palæozoic rocks, consisting mainly of limestone, dolomite and shale of Ordovician, Silurian and Devonian ages, form a belt extending north through Manitoba and northwest through Saskatchewan and northeastern Alberta down the basin of the Mackenzie river. East of the Mackenzie, rocks of Cambrian age are exposed in an area of limited extent. The Palæozoic formations rest upon the gently-sloping shelf of the Canadian Shield and pass westward with a dip of a few feet a mile beneath the shales and sandstones of Cretaceous age. The Cretaceous formations occupy nearly the whole of the plain from western Manitoba to the Rocky mountains and extend northward nearly to the Mackenzie river. There are also large parts of the Mackenzie basin, particularly of the lower half, in which the Devonian limestones are overlain by Cretaceous sediments. The Cretaceous sediments vary from shales predominantly of marine origin in the east to sandstones predominantly of continental origin in the west. Between the two are alternations of shales of marine origin with sandstones of brackish-water or fresh-water origin.

The Cretaceous beds are overlain in places by sediments of Tertiary age. The most extensive Tertiary formations are found in the hills of southern Saskatchewan and in a belt running north through central Alberta, where they lie in a broad syncline. Glacial till is widespread and clays were deposited in large lakes formed on the retreat of the ice-sheet. A large part of southern Manitoba formed the bed of glacial lake Agassiz.

The Interior Plains region is the great wheat-producing area of Canada. The mining of coal is one of the important industries; bituminous coal and lignite are produced in large quantities in Alberta and lignite in smaller quantities in Saskatchewan. The Cretaceous sediments are the reservoirs of great quantities of natural gas, and these and underlying formations are the source of the oil of the Turner Valley and other oil fields of Alberta. Oil has also been struck in the Devonian rocks north of Norman on the Mackenzie river. Gypsum is obtained from the Palæozoic rocks of Manitoba and also occurs in northern Alberta.

Western Cordillera.—In the western Cordillera is a very thick complete succession of sediments of Precambrian, Palæozoic, Mesozoic and Tertiary ages.

The Rocky mountains consist of a series of great fault blocks in which an enormous thickness of Palæozoic and Mesozoic sediments is exposed. Many thrusts of great extent have resulted in an over-riding of the Mesozoic sediments by the Palæozoic, and the erosion of the softer strata of the former has produced longitudinal valleys between the harder Palæozoic blocks. The Palæozoic formations consist mainly of limestones with less amounts of sandstone and shale. A succession with few breaks from the Cambrian through the Ordovician, Silurian, Devonian and Carboniferous is found, and probably extends with certain deviations throughout the length of the Rocky mountains and Mackenzie mountains. Between the Cambrian and Precambrian beds there is apparently little angular unconformity, but the variation horizontally in the Precambrian strata, on which the Cambrian formations rest, and a similar variation in the ages of the over-lying Cambrian strata

furnish evidence of a long period of erosion. The Mesozoic strata consist of soft shales and sandstones some of which are coal-bearing. Strata of Triassic, Jurassic, and Cretaceous ages are represented.

The mountains to the west of the Rocky Mountain trench in southern British Columbia are composed of a series of late Precambrian quartzites, slates and magnesian limestones of great thickness. There are wide areas in the vicinity of granitic intrusives in which intensive alteration of these sediments has taken place. The Precambrian rocks extend west as far as Upper Arrow and Shuswap lakes and north from the International Boundary probably half the length of the province. Quartzites, mica schists and crystalline limestones with interbands and broad areas of schists of various kinds, and intrusive granite gneiss are found over a wide stretch of the Yukon plateau and are probably of Precambrian age. Slates, quartzites and conglomerates, also probably of the same age, occur along the northern part of the Alaska-Yukon boundary, in the Ogilvie range and in the Kluane district.

On the interior plateau of British Columbia, limestones, quartzites and argillites of Carboniferous age and known as the Cache Creek group are of wide distribution. These are succeeded upward by argillites and limestones and a great mass of volcanic intrusives and effusives of Triassic age, and these are succeeded by sediments and volcanics of Jurassic age. The Triassic and Jurassic formations are widely distributed, are found on the islands to the west, and some at least extend into the Yukon.

Formations of Cretaceous age are found on Vancouver and Queen Charlotte islands and in a belt extending up the Fraser and along the eastern edge of the Coast range into the Skeena valley. They are mainly formations of continental origin and carry coal seams, but also include sediments of marine origin and volcanics.

Very early Tertiary times were characterized by widespread orogenic disturbances in the Cordillera. The Rocky mountains were formed and there was much folding and faulting in places in the interior, followed by intense erosion. Tertiary sediments, partly of continental deposition with seams of lignite and partly of marine deposition, occur at many points throughout the interior of the Cordillera and on Vancouver island. Lava flows capping some of these sediments cover broad stretches of the interior plateau.

In Pleistocene time, nearly the whole of the Cordillera with the exception of a large area in the Yukon was subjected to glaciation, and glaciation still persists in the mountainous regions. Volcanics of recent age are found in areas of limited extent.

An episode of great economic importance in the geological history of the West was the intrusion of the granitic rocks of the Coast Range batholith and of acid rocks at different points in the interior, particularly in the southern part of British Columbia in Mesozoic times. Many of the more important mineral deposits of British Columbia, such as the copper deposits of Hidden Creek, Britannia and Allenby mountain, the gold-silver deposits of Salmon River district and the silver-lead deposits of the Slocan, had their origin in solutions given off by the magmas of these acid intrusives.

The lead-zinc deposit of the Sullivan mine lies in sedimentary rocks of Precambrian age. The Cretaceous and Tertiary formations carry seams of coal and lignite of great importance. There are economic deposits of other minerals in great variety throughout the Cordillera, and British Columbia is one of the leading mineral-producing provinces of Canada. The gold of the once famous Klondike region was found in placers of an unglaciated area and the gold of the Cariboo district occurs mainly in Tertiary placers that were unaffected or little affected by glaciation.

Section 2.—Economic Geology of Canada, 1931.*

The purpose of this paper is to call attention to the most important reports and articles treating of the economic geology of Canada and published during 1931. The particular articles referred to, although recently published, do not necessarily contain the best and most complete information on the subjects treated. For further information it is advisable to consult the Dominion and Provincial Departments of Mines. The reference numbers appearing through the text indicate the publishers as listed at the end of this paper.

Antimony.—A description is given by W. J. Wright of the Lake George antimony deposits of York county, New Brunswick.⁵ Palaeozoic interbedded shales and quartzites are intruded by granite and basic dykes. Quartz veins, carrying stibnite and minor amounts of pyrite, arsenopyrite, and dolomite, cut both the sediments and dykes.

Chromite.—A report is made by A. R. Graham upon the Obonga Lake chromite area, Thunder Bay district, Ontario.^{4,5} Precambrian volcanic and sedimentary schists, serpentine, talc-carbonate schist, granite and associated rocks, and diabase sills and dykes occupy the area. The chromite occurs in the serpentine as disseminated grains and as segregated deposits in form of irregular and vein-like bodies. All chromite observed is below commercial grade at the present time.

Clay.—Howells Frechette and J. F. MacMahon describe the clay and shale deposits of Prince Edward Island.² The prevailing rocks of the province are soft red sandstones and arenaceous shale probably of Permian or upper Carboniferous age. The sandstones generally contain a considerable percentage of clay matter and in some horizons may be regarded as sandy shales which are gritty. All shales, even those containing sandy matter, develop good plasticity. Marine clay, boulder clay, and clay resulting from the weathering of shales do not offer such good promise as do some of the shales.

Coal.—The stratigraphy and structure of the Corbin coal field, British Columbia,⁵ is described by B. R. MacKay. This field, of Cretaceous age, is one of the smallest and at the same time one of the principal producing bituminous coal areas in southeastern British Columbia. It is unique on account of the great thickness of one of its coal seams and the remarkable concentration of coal in a small area that has occurred through intense folding and faulting of the measures. The coal is of bituminous rank and with a low sulphur content.

The results of further investigations of the Onakawana lignite deposit, Moose River basin, Ontario,³ is published by W. S. Dyer. Numerous drill holes indicate a series of nearly flat-lying seams with a total thickness varying from 10 to 64 feet. Analysis of the lignite together with logs of bore holes are incorporated.

Copper.—Forrest A. Kerr presents a paper outlining the mineralization of northern British Columbia.⁵ Highly altered Palaeozoic sediments capped by a thick series of Permo-Carboniferous limestone and Mesozoic volcanics are intruded by the coast range multiple batholith. Upper Cretaceous sediments in considerable thickness, and masses of Tertiary and recent lava flows, occur locally. The

*Contributed by P. J. Moran, B. Sc., Geological Survey, Ottawa.

earlier "grey granite" is known to have extensive associated mineralization and the "brown granite" is believed to have little. Mineralization is found in the granite, in "roof pendants" in the granite, and in the sediments and volcanics adjacent to the contact.

Prospecting attention is lately focused upon the Great Bear Lake and Coppermine River areas, Northwest Territories, where interesting finds of silver, pitchblende and copper have been made. J. P. Norrie,⁵ Gordon G. Duncan^{5 4} and G. Gilbert⁷ submit reports upon these areas. Granite, sandstone containing thin layers of carbonaceous shale, dolomitic limestone, basalt interbedded with sandstone shale, and limestone exist in the Coppermine River area. Disseminated native copper is found in the basalt, amygdaloidal copper occurs in the tops of some of the flows along joint cracks and slips, sheets of native copper are common, high grade chalcocite and bornite occur in fissure veins and replacement deposits and chalcopyrite is found in cracks and disseminations in minor amounts. (See radium).

John Drybrough describes a nickel-copper deposit on the north shore of Rankin inlet, Hudson bay.^{5 6} Precambrian volcanics, sediments, and intrusive granite and associated rocks occupy the area. The deposit is associated with a sill of pyroxenite, intrusive between the sediments and upper volcanics, which can be traced for three quarters of a mile. Mineralization consists of pyrrhotite and traces of pyrite. The nickel probably exists as pentlandite finely divided in the pyrrhotite.

An article upon prospecting in northwestern Manitoba⁵ is written by J. F. Wright. The bed rocks of the area consist of Precambrian volcanics, sediments, sedimentary gneisses, granite gneiss, and intrusive granite and allied rocks. The known mineral deposits of importance are in the lavas, sedimentary gneisses, bodies of quartz gabbro, and granodiorite phases of the granite intrusives. The main type of deposits is sulphide replacement bodies containing copper and zinc. Gold-bearing quartz veins are also found. No reason is known why the mineralization at some localities will not continue in depth below the levels explored at present.

Robert S. Moehlman presents a paper upon the geology of the Opemiska district, Quebec, in the *Pan American Geologist*. The rocks of the region are Precambrian. Between two large masses of granite on the north and south, lies a thick body of volcanic flows with some interbedded sediments extending east and west. These flows and sediments are intruded by numerous basic dykes, sills, and stocks, and by a few acid dykes. Mineralization consists of chalcopyrite, magnetite, pyrite, pyrrhotite, and in places quartz.

Rodgers Peale describes the geology of the Waite-Ackerman-Montgomery ore deposit, in the townships of Duprat and Dufresnoy, Quebec.⁵ Precambrian volcanics are intruded by Keeweenawan diabases and quartz porphyry. Mineralization consisting of pyrite, pyrrhotite, sphalerite, and chalcopyrite occurs as replacement deposits in crushed zones in andesite.

During the past nine years, various members of the Geological Survey of Canada have made geological studies of portions of that area in Quebec extending from the Ontario-Quebec provincial boundary line east to Bell river and south of the National Transcontinental railway to latitude 48 degrees. The results of these investigations are incorporated in a report entitled "Geology and ore deposits of Rouyn-Harricaw region, Quebec",¹ by H. C. Cooke, W. F. James and J. B. Mawdsley. Keewatin volcanics, pre-Huronian sediments and intrusives, Huronian sediments and later diabase dykes form the bed rocks of the area. Copper-zinc deposits are found in rocks of the Keewatin series; considerable quantities of silver

and gold are found in some of the copper-zinc deposits, as well as in vein deposits of the ordinary type; gold deposits are known both in the Keewatin and Timiskaming formations. Both gold and copper-zinc deposits appear to have been localized by structural factors. Molybdenite deposits are found only in two small areas in the eastern part of the region. They are formed apparently with the silicious end-product of the differentiation of biotite granite.

The sedimentary deposits of New Brunswick and Nova Scotia are described by W. J. Wright⁶ and E. B. Papenfus.⁷ Pyrite and chalcocite and their oxidation products occur as nodules and concretions or replacements of the cementing material of sandstone and conglomerates of Carboniferous age. The minerals are also found associated with and sometimes replacing plant remains that have turned to coal.

Gold.—Ira B. Joralemon, in the *Engineering and Mining World*, described the geology and recent developments at the Pioneer mine, Bridge River district, British Columbia. Augite diorite is intrusive at the contact of the Pennsylvania Bridge River series and upper Triassic Cadwallader series. Narrow but persistent gold quartz veins are found in the diorite and albitite. The development of the mine during the past few years has been very encouraging.

The gold, copper-nickel, and tin deposits of southeast Manitoba¹ are reported upon by J. F. Wright. In the Beresford-Rice Lake area, Precambrian sediments, volcanics, gabbro, diorite, granodiorite, granite, granite gneiss, pegmatite and diabase are found. Gold-bearing quartz veins, lenses and stringers occur along shear zones, irregularly scattered throughout the schistose and jointed volcanics. The Maskwa and Oiseau copper-nickel deposits lie in shear zones in vertical dipping andesite, pillow lava, and associated quartzose tuffs, close to the contacts of bodies of peridotite-gabbro and granite. The country rocks in the vicinity of Shatford and Bernic lakes, Oiseau area, consist of volcanics, peridotite, gabbro, granite, granodiorite and pegmatite. The known tin deposits are in the pegmatites characterized by abundant albite feldspar. Cassiterite occurs in small grains and crystals. No cassiterite-quartz veins have yet been located. Lithium-bearing pegmatites also occur in the area.

The geology of the San Antonio gold mine, Rice Lake area, Manitoba,⁷ is outlined by J. A. Reid. Consequent on the granite intrusion, stresses fractured the greenstone, and schistified other rocks. The fracturing was accompanied or followed by mineralization solutions, emanating from the granite, which deposited quartz, gold, pyrite, rarely chalcopyrite and other minerals in the fissures.

The results of studies of a few areas in the vicinity of lake of the Woods and immediately north are presented by D. R. Derry³, G. G. Suffel,³ L. Greer,³ J. G. Cross,⁴ and E. M. Burwash.³

Derry describes the geology of the area from Minaki to Sydney lake as composed of Precambrian volcanics, sediments, and intrusions of granite and associated rocks. Veins of the replacement type consisting of pyrrhotite with a small amount of pyrite and molybdenite occur in the sedimentary gneiss along the granite contact; veins of the replacement type consisting of pyrite with chalcopyrite occur in the volcanic and quartzite sediments. The latter type is thought to be more favourable for the occurrence of economic deposits.

Precambrian volcanics, schists and intrusive rocks of various types including granite and diabase are described by G. G. Suffel as occurring in the Bigstone Bay area, Lake of the Woods. Narrow, lenticular quartz veins lie at or near the contact

between the granite and the basic schists. Many showings are in the schist but some are in the granite itself. Visible gold and silver, pyrite, arsenopyrite, chalcopyrite, sphalerite, galena and tellurides have been reported.

The geology of Shoal Lake (west) area, Lake of the Woods, is indicated by L. Greer as consisting of Precambrian volcanics, sediments and granite and related intrusives. Gold occurs in rather narrow quartz veins in greenstones. Some sulphide-bearing fracture zones also carry gold.

A description of the geology of Kakagi Lake area, Lake of the Woods, is given by E. M. Burwash. Precambrian volcanics, sediments, gneisses, intrusive granite and associated dykes, and diabase occur in the area. Gold-quartz veins are found in schistified areas close to the granite and also in the granite.

J. G. Cross describes in detail the geology of the Sultana mine, Lake of the Woods, as consisting of Precambrian greenstones and basic Keewatin rocks intruded by an almost circular boss of granite with a central core of porphyry. The contact between the granite and porphyry is very decided and abrupt although it is apparent that both have a common origin. Along the westerly contact, in shear zones in the porphyry, gold-quartz veins containing pyrite, galena and zinc blende are found.

Preliminary reports are made upon Pipestone Bay section³ and MacKenzie Island area,³ Red Lake, Kenora district (Patricia portion), Ontario, by H. G. Young and E. L. Bruce. Gold-quartz veins carrying variable amounts of pyrite and occasional streaks and needles of tourmaline are found by Young in the Pipestone Bay area. In the MacKenzie Island area, E. L. Bruce reports gold-quartz veins as being found in sheared and altered granodiorite which is considered a marginal phase of the Howey granite boss.

North of the Albany River the Shonia Lake area,^{5, 3} the Pickle Lake-Crow River area,³ and the Fort Hope gold area³ are described by H. C. Laird, M. E. Hurst, and L. F. Kindle. The rocks of the Shonia Lake area are found by Laird to consist of Precambrian volcanics, sediments and intrusives. Native gold occurs in a stockwork of quartz veins in altered granite. Hurst's study of the Pickle Lake-Crow River area reveals Precambrian volcanics, sediments, iron formation, and various intrusives including granite and allied rocks, and also diabase. Mineralization is associated with openings formed as a consequence of the folding and buckling of Keewatin rocks. Deposits so far discovered consist of gold-bearing quartz veins or silicified zones carrying auriferous sulphides. According to L. F. Kindle, the bed rocks of the Fort Hope gold area comprise Precambrian volcanics, sediments, quartz biotite, garnetiferous schist, and two ages of granite. Mineralization, consisting of pyrite, pyrrhotite, chalcopyrite, sphalerite and galena, is found in sheared greenstones usually where there is crystalline limestone.

Precambrian greenstones and sediments bordered on the north and south by extensive areas of granite and gneiss are found in the Sioux Lookout-Hudson area, Kenora district, Ontario,³ by M. E. Hurst. Quartz veins carrying sphalerite, pyrite, and in some cases arsenopyrite and yielding interesting values in gold and silver were observed.

The results of an examination of the geology of the Sturgeon Lake gold area, Kenora and Thunder Bay districts, Ontario³, are presented by A. R. Graham. Precambrian volcanics, sediments and intrusives occupy the area. Gold-quartz veins occur along lines of weakness in greenstones near the contact with and also in the granite.

A paper by Ellis Thompson upon tellurides at the Moss mine, Thunder Bay district, Ontario, appears in the University of Toronto Studies. The rocks in the immediate vicinity of the mine consist of basic and acid volcanics of Keewatin age intruded by feldspar lamprophyre and diabase. A mile to the east is the westerly end of a large boss of syenite with which the porphyry dykes are presumably genetically connected. The gold-quartz veins occur in shear zones striking northeast in the basic volcanics, in intimate association with narrow feldspar porphyry dykes. The gold is accompanied by petzite.

The geology of the Heron Bay area, Thunder Bay district, Ontario,³ is described by J. E. Thomson. Precambrian volcanics are intruded by a number of rock types, including granite and diabase. Gold associated with sulphides in quartz veins occurring in schist has been reported to occur in the area.

A. R. Graham reports upon the Groundhog-Kamiskotia area, Cochrane district, Ontario.³ Precambrian volcanics and various intrusives of different ages occupy the area. Gold-bearing quartz veins are found in Algoman porphyry dykes or in greenstone and gabbro adjacent to them. Pyrrhotite lenses containing chalcopyrite and nickel are found in the gabbro masses.

An account of the geology of Germain-Currie area, Cochrane district, Ontario,³ is presented by H. C. Laird. Precambrian volcanics, sediments and intrusive dykes of different ages are found in the area. Gold-quartz veins mineralized with zinc blende, galena, chalcopyrite, bornite and garnet are found in shear zones in volcanics and in dykes of albite, syenite porphyry and quartz and feldspar porphyries. The gold mineralization appears to be connected with some phase of the Algoman intrusive. Nickeliferous pyrrhotite occurs along the contact between serpentine and andesite.

In the *Engineering and Mining World*, R. D. Hoffman outlines geological indications at Kirkland Lake, Ontario. Hoffman states that the "main break" of the area is a pivotal fault hinged at great depth to the west and dying out and coming to the surface at the Tough Oakes mine. This accounts for the rich ore at the surface at Tough Oakes mine, with subsequent impoverishment at depth and lack of real ore at the Teck Hughes until below the 500 foot level. The same idea of pitching of Kirkland Lake ore to the west in depth was advanced by J. B. Tyrrell.

Following a discovery of gold in Swayze township, Sudbury district, Ontario, examination of the locality and vicinity is made by H. C. Rickaby³ and G. D. Furse.³ In the area are found Precambrian volcanics, iron formation, sediments, granite diorite, porphyry and diabase. Deformation and faulting have taken place in part of the area rendering it more favourable prospecting ground. Gold-quartz veins have been found along fractures in the greenstones.

H. A. Laird describes the geology and economic possibilities of Chester and adjoining townships, Sudbury district, Ontario.³ A strong belt of Keewatin sediments is flanked on either side by Keewatin volcanics. The continuity of this assemblage is interrupted by later intrusives of economic importance. Gold-quartz veins are found in fracture zones in quartz-porphyry. A noticeable feature of the veins carrying gold is the presence on the hanging wall or the foot wall of a mica lamprophyre.

A preliminary report on the gold deposits of Tyrrell and Knight townships, Sudbury district, Ontario,³ is made by A. R. Graham. Keewatin volcanics, Huronian conglomerate, greywacke and quartzite, Nipissing diabase sills, and Algomian intrusives occupy the area. Gold-quartz veins are found in shear zones adjacent to lamprophyre and quartz-porphphy dykes.

A description of the Moose Mountain-Wanapitei gold area³ is given by L. F. Kindle. Precambrian volcanics, sediments, granite and basic intrusives are found in the area. Gold-quartz veins occur in quartzites and impregnated greywacke-quartzite near diabase intrusions.

A preliminary report is presented by E. L. Bruce upon the geology of Janes, McNeish, Pardo and Dana townships, Ontario.³ Precambrian sedimentary schist, gneisses, quartzite, conglomerate, diorite, granite, quartz-porphphy and diabase are found in the area. Gold-quartz veins occur in the diabase and quartzite.

In the Annual Report of the Quebec Bureau of Mines, J. A. Retty describes the geology of the Gaboury-Blondeau Townships map-area, Timiskaming county, Quebec, as consisting of Keewatin volcanics, pre-Timiskamian intrusives, altered Timiskamian sediments, Algomian granite and associated rocks and Keeweenawan intrusives. Those parts of the area that are occupied by Keewatin volcanics offer possibilities for the occurrence of gold, copper and asbestos.

L. V. Bell, in the Annual Report of the Quebec Bureau of Mines, provides a few reports upon certain portions of the eastern part of the Rouyn-Harricanaw area, Quebec, where interest in gold prospects prevails.

The geology of the Clericy-Joannes map-area is described by Bell as consisting of Keewatin volcanics, Timiskaming sediments, and post-Cobalt intrusives. The gold deposits are of two types: quartz veins and lenses paralleling the schistosity of the enclosing rocks, and networks of quartz stringers in carbonated rocks.

The rocks of the Central-Cadillac map-area, described by L. V. Bell, consist essentially of Timiskamian sediments and volcanics together with granite and allied intrusives. Gold deposits occur chiefly in narrow quartz veins which correspond in strike and dip with the schistosity of the enclosing rocks, which are intensely sheared volcanics lying within the sediments and intruded by dykes of aplite.

The vicinity of the Venus gold mine, Barraute township, is also described by Bell as being underlain by Keewatin volcanics. Gold-bearing quartz veins in which tourmaline, pyrite and chalcocopyrite are present are found in shear zones in the greenstones.

Gold Placer.—J. D. Galloway and others, in a special bulletin of the British Columbia Bureau of Mines, summarize the placer-mining possibilities of the province. The section by R. W. Brock upon an appraisal of the placer resources of the Pacific Great Eastern Railway lands is of especial interest.

Iron.—C. K. Leith presents a paper upon secondary concentration of Lake Superior iron ores.⁷ This paper is a critical examination of an article by J. W. Gruner in which the contention is advanced that the Lake Superior iron ores owe their secondary concentration to hydrothermal solutions emanating in the main

from Keeweenawan basic intrusives. In concluding Leith states that the general hypothesis of concentration of iron ores by downward moving waters from the surface still seems to be adequate to cover the main body of the facts yet known.

Lead-Zinc.—J. MacIntosh Bell summarizes the genesis of the lead-zinc deposits at Pine Point, Great Bear lake, Northwest Territories.⁷ The rocks in the vicinity are middle Devonian, comprising Slave Point shaly limestone, Presqu'ile dolomite and dolomitic limestone, and Pine Point limestone. The ore appears to occupy zones of intense jointing along anticlinal crests or domes in the Presqu'ile formation.

Ralph Tuck describes a lead-zinc deposit at Geneva Lake, in the northern part of Hess township, Sudbury district, Ontario.⁷ Keewatin volcanics, Algoman granite, Bruce and Cobalt sedimentary series, and Keeweenawan granite and basic intrusives occupy the area. The ore body consists of an irregular tabular vein within greywackes and quartzites that contain injections of granite and alaskite.

Limestone.—A preliminary report on the limestones of British Columbia² is made by M. F. Goudge, giving descriptions of limestones at properties now being worked. Owing to the action of igneous intrusions and of mountain building agencies most of the limestones are highly metamorphosed. Along the coast and throughout the interior of the province are many deposits of limestone, some of which are of great size and many of which are very pure.

Oil and Gas.—A paper upon the Alberta syncline is presented by Theodore A. Link in the Bulletin of the American Association of Petroleum Geologists. Failure to encounter productive horizons in the Palæozoic limestones of the plains may be caused by the progressively lower bevelling of the older rocks to the east before the deposition of the Jurassic beds. The Turner Valley productive horizon has evidently been eroded away in the plains area prior to deposition of the Mesozoic beds.

Overthrust faulting and oil prospects of the eastern foothills of Alberta between the Bow and Highwood rivers, Alberta,⁷ is the title of a paper written by G. S. Hume. The foothills are characterized by numerous nearly parallel reverse faults often of great length and mostly of unusual steepness. The faults dip 65 degrees to 75 degrees or more at the surface. Wells drilled in certain areas indicate two faults which although steep at the surface become low angle faults at depth with westerly dips of not more than 20 degrees. One of these faults underlies Turner Valley and has been penetrated by a few wells which after passing through a considerable thickness of Palæozoic limestone cut the fault and the Cretaceous strata beneath.

Phosphate.—Some problems of the Rocky Mountain phosphate field, Canada and the United States,⁷ are indicated by G. R. Mansfield. At Banff, Alberta, and in the various British Columbian occurrences the beds corresponding with the phosphoria formation are part of a group included in the so-called Rocky Mountain quartzite.

Radium.—H. S. Spence gives a description of the occurrences of pitchblende and silver ores at Great Bear Lake, Northwest Territories.² Pitchblende is found in persistent vein systems within or along the contacts of highly sheared and brecciated greenstone bands which vary from ten to fifty feet in width. The mineral has

been observed at points two miles apart on the veins. Beyond question these deposits constitute a valuable source of radium. Native silver in wire, leaf and dendritic forms occurs in quartz gangue and in calcite fillings in the sheared greenstone bands.

The Wilberforce radium occurrence, Ontario,³ is described by H. S. Spence and R. K. Carnochan. The rocks in the area consist of crystalline limestone, sedimentary gneiss, amphibolite, gabbro, diorite, gneissic granite, and nepheline syenite and associated alkali-syenite. Uraninite is found in miarolitic cavities in coarse-grained feldspar pegmatite enclosed in gneiss.

Silver.—C. E. Cairnes describes the geology of Lightning Peak camp, Monaskee mountains, at the headwaters of the Granby river, Osoyoos district, British Columbia,¹ as consisting of crystalline limestone and altered volcanics intruded by granite batholiths and soaked with granite material from the batholith. Deposits of galena, sphalerite, pyrite, chalcocopyrite, ruby silver, argentite, and native silver in a quartz calcite gangue are developed along shear zones, in the limestone and volcanics, striking east and west. Numerous quartz veins striking north and south and following along narrow dykes of quartz-porphyrity carry pyrite, galena, sphalerite, chalcocopyrite, grey copper and other high grade silver minerals, and low values in gold.

A comprehensive report is made by T. L. Tanton upon the Fort William-Port Arthur and Thunder Bay area, Thunder Bay district, Ontario.¹ Precambrian schists, sediments, granite, granite gneiss and diabase occupy the area. Silver is the chief economic feature. The known deposits of this metal are exhausted but many veins of silver-bearing type have not been thoroughly explored and it is possible silver concentrations occur in them. Numerous deposits of lead and zinc and some deposits of barite, molybdenum, iron and copper occur in the area.

Geological structure disclosed in the Keeley mine, Ontario,⁵ is the subject of a paper by C. H. Boydell. The geological setting of the property consists of Keewatin basaltic and possibly andesitic flows showing pillow structure in places, intruded by lamprophyre dykes and a diabase sill. These rocks are intersected by faults which became the *loci* of silver-bearing copper-nickel veins with their attendant suite of essentially arsenide minerals and native silver. The author suggests further exploratory work in search of ore at the upper and lower contacts of the diabase. (See radium).

Sodium Sulphate.—A description of the sodium sulphate deposits of Saskatchewan is afforded by J. P. deWet.⁴ Deposits of the salt are quite common throughout the province. A demand for a large tonnage of this mineral comes from the International Nickel Co., Sudbury, Ontario. Here nitre cake is used as a flux in separating copper and nickel.

Tin-Silver.—A tin-silver vein at the Snowflake mine, British Columbia, is described by H. C. Gunning.⁷ Contorted, sheared and altered Precambrian quartzitic argillites and impure calcareous beds are cut by granite and granite gneiss of Mesozoic age. Following the bedding of carbonaceous argillites are a number of quartz veins. In one of these veins, irregularly distributed shoots, bunches, lenses or disseminations of pyrite, sphalerite, galena, stannite, chalcocopyrite, tetrahedrite, ruby silver, scheelite and wolframite are found.

Zinc.—W. A. Parks in the Bulletin of the Geological Society of America describes the geology of Gaspé peninsula, Quebec. Cambrian to Carboniferous strata are excessively folded and much affected by igneous activity. Sulphides of zinc and lead occur in a zone of brecciated lower-Devonian strata near Brandy brook. Chalcopyrite occurs in Mount Serpentine region on Dartmouth river. Serpentinized peridotite of Mount Serpentine and Mount Albert shows in places small grains of chromite and stringers of asbestos. Oil has been found in the Gaspé sandstones but no wells at present are producing.

Miscellaneous.—A comprehensive monograph upon chrysolite asbestos in Canada² is presented by J. G. Ross.

V. L. Eardley-Wilmot presents papers upon diatomite^{2, 4, 5} describing its structure, types, composition, uses, Canadian consumption and future requirements, and world's occurrences and production.

Feldspar, its occurrence and uses in modern practice,⁴ is the subject of an article written by Oliver Bowles and C. V. Lee.

The Amaranth gypsum deposit, northeast of Winnipeg, Manitoba,⁵ which within the past year has been opened up and brought into production, is described by A. M. Brownell. At the present time, the gypsum appears to be giving a satisfactory product and gypsum plasters from the Winnipeg mill are being regularly supplied to the Western building trade.

J. P. Messervey in the Nova Scotia Report on Mines described manganese in Nova Scotia. The minerals of manganese are found as thin beds and irregular masses in superficial clay deposits and as metalliferous veins in granite and sediments.

A study of raw materials for the manufacture of "rock wool", in the Niagara peninsula of Ontario,³ is made by M. F. Goudge.

PART III.—SEISMOLOGY IN CANADA.

An article on Seismology in Canada, by Ernest A. Hodgson, M.A., appeared at p. 37 of the Canada Year Book, 1931.

PART IV.—THE FLORA OF CANADA.

Under the above heading the Canada Year Book, 1922-23, contained an article prepared by the late J. M. Macoun, C.M.G., F.L.S., and M. O. Malte, Ph.D., and revised by the latter. See p. 25 of the 1922-23 edition or p. 73 of the 1921 edition.

PART V.—FAUNAS OF CANADA.

The Canada Year Book, 1922-23, contained an article under the above heading by P. A. Taverner of the Department of Mines, Ottawa. See p. 32 of the 1922-23 edition or p. 82 of the 1921 edition.

PART VI.—THE NATURAL RESOURCES OF CANADA.

The economic life of new countries must at first depend entirely, and later mainly, upon their natural resources. Older countries, after exhausting their most easily obtained resources, turn for a livelihood to manufacturing and similar pursuits, conserving their remaining resources and utilizing those of less developed areas as far as practicable.

Canada is distinctly a new country and her resources are for the most part in the early stages of development. The fur, fishery and forest resources have, it is true, been the basis of trade for two or three hundred years but exploitation on the present commercial scale is of relatively recent growth. A notable feature, especially in so young a country, has been the effort directed to conservation and, in the cases of those resources which admit of such methods, the actual replenishment or augmentation of the sources of supply by the practice of reforestation, silviculture, fur-farming or the establishment of fish hatcheries.

In recent years numerous surveys and investigations of the extent and value of the resources have been made. A short summary of important details regarding them follows. Fuller information will be found in the introductions to later chapters—Agriculture, Furs, Fisheries, Forestry, Minerals, Water Powers—of this volume.

Agricultural Lands.—Of the total land area of the nine provinces (1,276,109,440 acres), it is estimated that approximately 352,157,190 acres are potential agricultural lands, including grazing lands associated with farm lands. The estimate is based on the best information available which, for the more northerly parts, is uncertain; the total is made up by adding to the area now occupied by agriculturists all lands considered to be possible of devotion to similar purposes. The area at present under cultivation is but a fraction of this total, the extent under field crops in 1932 being 59,633,500 acres, while the total area under pasture in the same year was 8,264,700 acres. Statistics of farm lands at the census of 1931 place the area then occupied at 163,254,959 acres; the area of what may be considered as agricultural land still available for occupation was, therefore, 188,902,231 acres. Details are given by provinces in Table 7.

7.—Area of Occupied and Estimated Potential Agricultural Lands in the Nine Provinces of Canada, 1931, with Estimated Land Area, 1933.

¹ These figures are from the 1931 census and are subject to revision.

² These estimates have been made by the Topographical Survey, Department of the Interior.

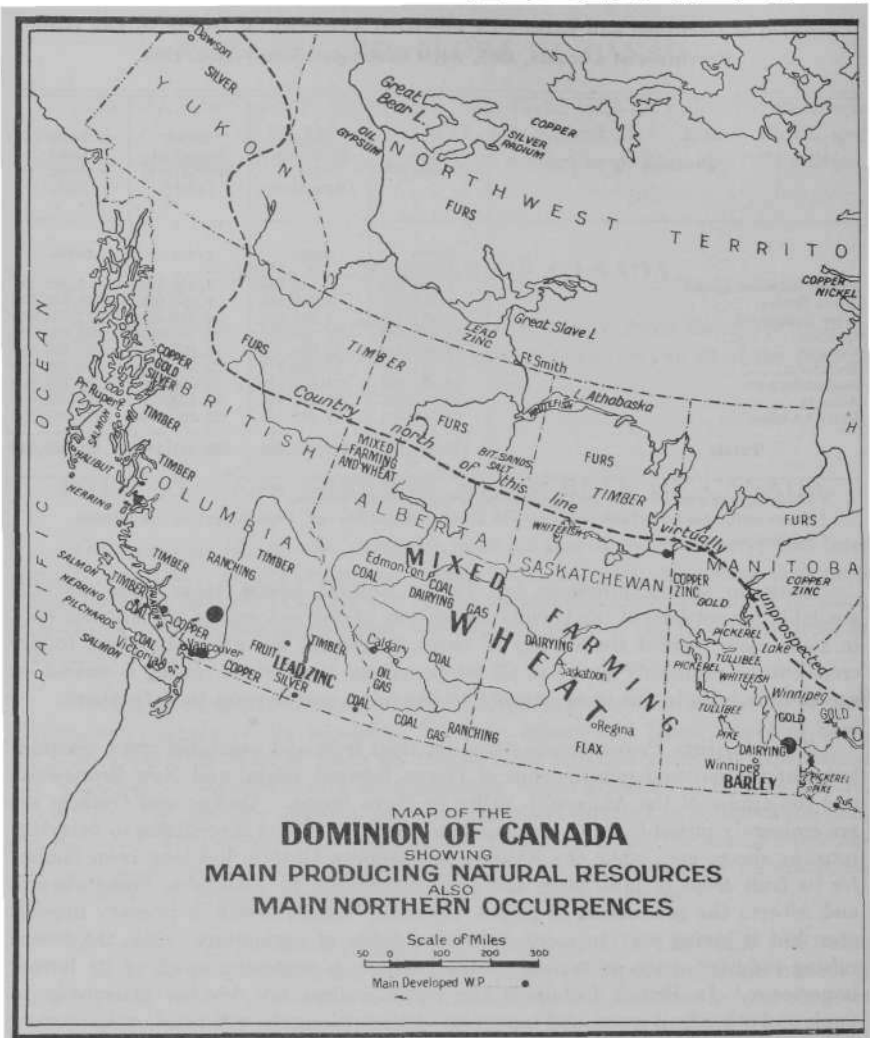

³ Subject to revision.

Thus, in all the provinces but Prince Edward Island, large areas are still available for settlement, and while the nature of the soil and of the climate may in some cases restrict the variety of crops, in general the grain, root and fodder crops can be profitably grown in all the provinces, while stock raising is carried on successfully both in the more densely settled areas and beyond their frontiers.

The Maritime Provinces are noted for their fruit and vegetable crops, particularly for the oat and potato crops of Prince Edward Island and New Brunswick, and the apples of the Annapolis valley in Nova Scotia. Quebec and Ontario are pre-eminently mixed-farming communities, various districts specializing in dairying, tobacco, sheep, etc., while the Niagara peninsula in Ontario has long been famous for its fruit crops of both large and small varieties. In Manitoba, Saskatchewan and Alberta the production of grains, especially wheat, is still of primary importance but is giving way to more diversified types of agriculture, while the stock-raising industry, once so typical of the prairies, is regaining much of its former importance. In British Columbia the fertile valleys are devoted principally to apple and other fruit crops, and numerous districts along the coast and on Vancouver island are given over to general farming and market gardening.

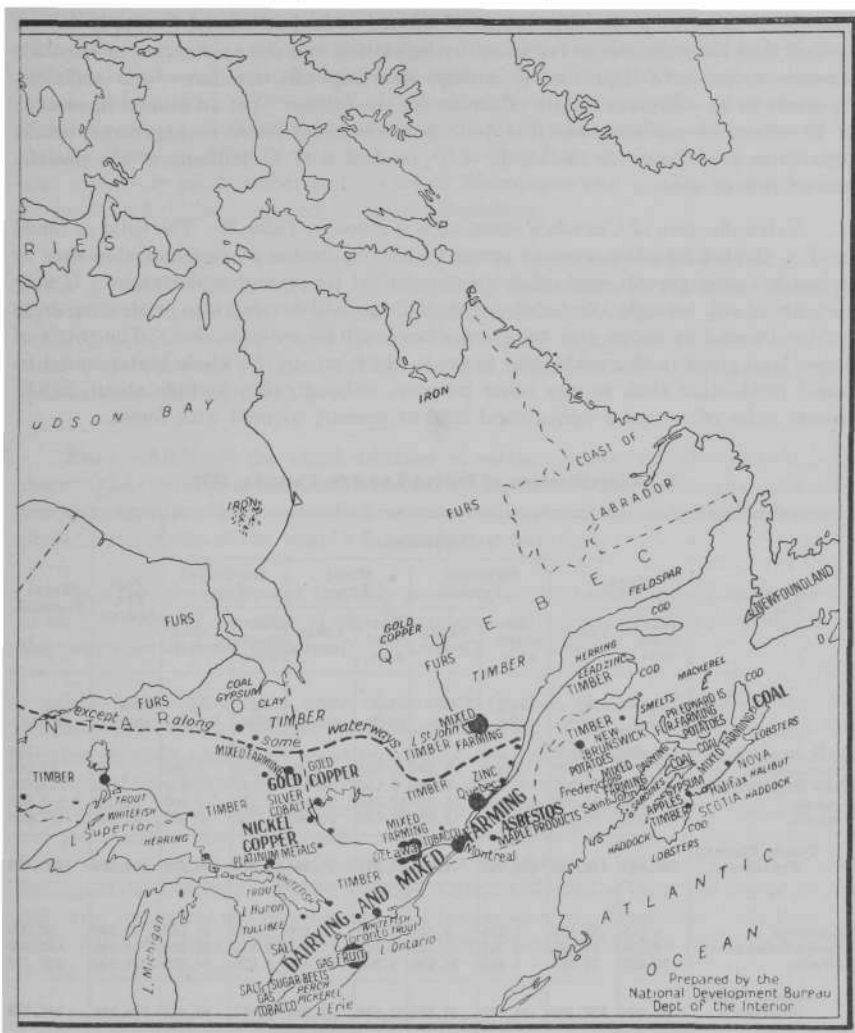

Of the larger areas of land still available for settlement, the clay belt of northern Ontario and Quebec, which is suited to the growing of splendid crops, is to a large extent undeveloped, and even larger areas in northern Saskatchewan and Alberta await cultivation.

Forests.—The forests of Canada rank second only to agriculture in their contribution to the national income. It is estimated that forest products make up about 20 p.c. of all the freight hauled on Canadian railways, and the heavy excess of exports over imports which the wood and paper group provides, amounting to \$143,732,101 for the fiscal year ended March, 1932, constitutes an important factor in Canada's balance of international trade.

Canada's forest area may be roughly divided into three main parts: (1) the great coniferous forest of the Pacific slope, (2) the northern forest, principally coniferous, which stretches from the east slopes of the Rockies, north of the prairies and of the Great Lakes to Labrador, and (3) the mixed softwood and hardwood forests extending from lake Superior through southern Ontario and Quebec to the Maritime Provinces.

Canada's forest area is estimated at 1,153,000 square miles, or 32.8 p.c. of the land area. Some of this is agricultural land, but it is considered that about 1,100,000 square miles is essentially forest land which can best be utilized in the production of wood. Not all of this area can be considered as capable of producing

timber at the present time, only some 791,670 square miles being regarded as accessible and productive, of which 412,725 is young growth, leaving 378,945 square miles of land carrying timber of merchantable size. With regard to quantity of timber, the accessible stand has been estimated at 165,846 million cubic feet, or 290,230 million feet board measure of saw timber and 920,335,000 cords of pulpwood, cordwood, etc. The stands in Eastern Canada make up 64.3 p.c. of the total, those in British Columbia account for 24.2 p.c., leaving 11.5 p.c. of the accessible timber in the Prairie Provinces. During recent years the annual cut (estimated at 4,102,000,000 cubic feet in 1932) has generally exceeded the new growth, and enormous losses have been caused by fire and other destructive

agencies. In spite of the vast extent of the uncut and unburned forests it cannot be said that the measures so far taken by legislation and the application of scientific forestry to preserve them and encourage their reproduction have been sufficient to assure us an adequate supply of timber for the future. Yet an annual increment of 10 cubic feet per acre, which is quite possible under forest management, would provide in perpetuity for the needs of a population of 17 millions at the present annual rate of use.

A classification of Canada's forest area is given in Table 8. The total of forest land is divided into the areas at present carrying timber of merchantable sizes or valuable young growth, and other areas unsuited for present exploitation. It may be pointed out, however, that many of these latter will develop into productive areas as the demand increases and transportation facilities are extended. The totals of forest land given in this table refer to areas which are on the whole better suited to forest production than to any other purpose, although they include about 26,652 square miles of occupied agricultural land at present covered with forest.

Forest products have always formed a large part of the raw material used in all kinds of industrial activity. At the present time products of forest origin form a quarter of our total exports, being exceeded only by the products of the farm.

Because of our climate, coniferous trees form over 80 p.c. of our forest resources and over 95 p.c. of our forest products as at present exploited. Because of their universal use in industry, the softwoods are in greatest demand, not only in Canada but in the markets of the world. Canada enjoys the reputation of holding the Empire's reserve of softwood timber, being rivalled in her coniferous forests only by Asiatic Russia and the United States. The Canadian species of both hardwoods and softwoods yield lumber and timber of dimensions and quality that are equal or superior to those produced by forests elsewhere.

Statistics of forest production (operations in the woods) in 1930 place its total value at \$206,853,494, with a corresponding equivalent in standing timber of 3,056,930,373 cubic feet. The most important items are logs for sawing, valued at \$75,563,041, and pulpwood for use and export, valued at \$67,529,612. The total value of sawmill products in 1930 was \$121,142,985 and that of pulp and paper-mill products \$215,674,246.

Furs.—Although the rapid advance of settlement has greatly restricted the reservoir of fur-bearing animal life cradled in the vast expanses of northern Canada, yet Canada, after three and a half centuries of exploitation, still holds a foremost place in the ranks of the world's fur-producing countries.

Raw furs are at present the only economic return from hundreds of thousands of square miles of the area of the Dominion and are an important product in all the provinces and territories.

The large uninhabited areas of northern Quebec, Ontario, Manitoba and the Northwest Territories furnish subsistence for many of the most highly prized fur-bearing animals, among the most important of which are the beaver, fisher, various varieties of fox, marten and others. The animals are usually caught in traps during the winter months, when the country is more accessible than during the summer and the pelts are in the best condition. The successful breeding of the fox on fur farms came with the period of rising prices after 1890, and has since developed into an important industry. Prince Edward Island has always been the centre of the industry, but farms are now found in all provinces of the Dominion. On Dec. 31, 1930, 5,070 fox farms were in operation with a total of 114,066 foxes, principally of the "silver" variety.

Although the fox has proved the most suited to domestication, other kinds of fur-bearing wild animals are being raised in captivity—mink, raccoon, skunk, lynx, coyote, rabbit, marten and fisher. Karakul sheep, from which are obtained the furs known as "Persian lamb", "astrachan" and "broadtail" are also being raised successfully in Canada. In 1930 the number of farms engaged in the raising of fur-bearing animals other than foxes was 1,454. Mink farms are the most numerous of the miscellaneous class, muskrat farms coming second and raccoon third. Over 425 of the fox farms also raise miscellaneous fur-bearing animals in addition to the foxes.

The total value of the raw fur production of Canada for the season 1930-31 was \$11,681,221. This total comprises the value of pelts of fur-bearing animals taken by trappers and of those raised on fur farms. Pelts sold from fur farms in the calendar year 1930 were valued at \$3,096,270 and animals sold at \$1,828,546.

Fisheries.—The first of Canada's resources to be exploited by Europeans was the fishing banks of the Atlantic coast. It is believed that, for many years before the actual discovery and settlement of North America, the cod banks south of Newfoundland and east of Nova Scotia had attracted French fishermen by their abundance of fish. These fishing grounds alone extend along a coast line of more than 5,000 miles, comprising an area of not less than 200,000 square miles, and are in the course of the cold Arctic current, a fact which tends greatly to improve the quality of the fish. The most important fishes of the off-shore fisheries are the cod, halibut, haddock, herring and mackerel, while the inshore and inland fisheries number the lobster, oyster, salmon, gaspereau, smelt, trout and maskinonge among their catches. Other fishing grounds include the inshore expanses of the St. Lawrence river; the Great Lakes, where whitefish and herring form perhaps the most valued catches, and innumerable other inland water areas abounding with trout, pike, bass and other game fish; and the Pacific coast. The fisheries of British Columbia, with its coast line of 7,000 miles, have in recent years shown a rapid development, and the products of the estuarian salmon fisheries of the Fraser, Skeena and other rivers now make up two-fifths of the value of fish products of the Dominion, while in addition large catches of halibut, herring and whales are made off the western coast. The total value of the fisheries in the calendar year 1931 was \$30,517,306.

The above statistics give a general survey of the commercial aspects of the fisheries but do not indicate the advantages which Canada has to offer to those who fish for sport. This too has its economic features in a country of such famous game fish as the salmon of the Restigouche, the black bass of the Quebec and Ontario highlands and the trout of the Nipigon. A considerable public revenue is derived from the leasing of waters in sparsely settled districts to clubs and individuals for sporting purposes.

Minerals.—The numerous and varied mineral deposits of the Dominion form another of her most important resources. Mining is an old industry, coal having been produced in Nova Scotia and iron ore in Quebec early in the eighteenth century. The main development in the industry has taken place, however, in the twentieth century, during which there has been a great increase in the total and per capita production of minerals and mineral products.

There is a great variety of mineral products, metallic and non-metallic. Coal was for long the leading mineral, but in 1931 coal was exceeded in value by gold and in 1932 the preliminary figures for gold (\$63,061,103) again exceeded those of coal (\$37,045,272). Coal will probably remain in second place for some time although Canada's reserves of this fuel are known to be very great. The other leading non-metallic minerals were natural gas, asbestos, petroleum, salt and gypsum. Others that were produced to the annual value of over \$100,000 each in 1932 were quartz, magnesite, sulphur, sodium sulphate, and talc and soapstone. In quantity of asbestos produced Canada leads the world, all of the production being from Quebec. Natural gas is produced in Alberta and Ontario and to a less extent in New Brunswick. The production of petroleum comes principally from Alberta, although there is also a small output in Ontario and New Brunswick.

The value of the metallic minerals was in 1932 nearly double that of the non-metallic minerals. Those amounting to more than \$1,000,000 in the year were: gold, copper, nickel, silver, lead, zinc, and platinum and similar precious metals. Canada has now definitely taken second place among gold-producing countries.

Lead and zinc mining has made rapid progress in recent years although production is much curtailed at present owing to the low prices of these metals. Ontario meets about 90 p.c. of the world's requirements in nickel, and has reserves to last for centuries. Platinum and palladium are recovered in the process of refining the copper-nickel ores. Ontario, British Columbia, Quebec and Manitoba are the main copper-producing provinces; in the latter province large bodies of copper-zinc-sulphides are under development. The total mineral production for 1929 reached a record value of \$310,850,000, while preliminary figures of the 1932 production were \$182,320,150, prices having fallen seriously in the past two years.

Water Powers.—Canada's fresh water area of 226,979 square miles, distributed as it is throughout all parts of the country, provides a large amount of potential electric energy. It is estimated that 20,347,400 h.p. are available at a minimum yearly flow, 33,617,200 at ordinary six-months flow and that a turbine installation of 43,000,000 h.p. is possible. The installation at Jan. 1st, 1933, was 7,045,260 h.p., which represents only about 16.4 p.c. of the possible installation. Perhaps the greatest use to which these resources have yet been put has been in the pulp and paper industry, and to a lesser degree in the mining, the electro-chemical, the electro-metallurgical and the flour-milling industries. The water power utilized in the pulp and paper industry alone amounted on Jan. 1, 1933, to 1,608,000 h.p. Over 94 p.c. of the power available is in Quebec, Ontario, Manitoba and British Columbia; Quebec with 8,459,000 h.p. available at ordinary minimum flow, has the largest resources in the Dominion.

Game and Scenery.—Canada's resources as a country for the sportsman and tourist are both unique and varied. Owing to the growth of tourist travel and its demands, great areas of uninhabited land have become accessible, and hitherto almost unknown parts may now be reached and traversed with ease. The valleys of Nova Scotia and New Brunswick, the broken lake country of northern Ontario and Quebec, as well as the mountain districts of British Columbia, offer to the tourist, the hunter and the fisherman new scenic effects and innumerable game preserves, and have won for the Dominion a reputation as a paradise for sportsmen and campers. And not only is this possible for those who travel by land; the series of lakes and rivers which form a network over the eastern part of the country particularly, has made water travel in smaller craft both feasible and attractive. Further, facilities for winter sports, the unusual attractions of winter scenery and the bracing though rigorous winter climate, have done much to add to the reputations of resorts formerly noted for their advantages in the summer season.

The Dominion Government maintains, as the medium through which some of the most outstanding natural beauties of the country may be preserved and popularized, the National Parks Branch of the Department of the Interior, administering the scenic parks set aside for this purpose. Under the supervision of this same body are numerous animal reserves and historic sites which have been preserved throughout the country. Several of the provinces also maintain parks for similar purposes; among these the Algonquin park (2,741 square miles) in Ontario and the Laurentides park (3,565 square miles) in Quebec are the most important. In both Dominion and provincial parks, the hunting of game is forbidden, and the wild-life resources preserved. Elsewhere, however, there is available for the hunter and angler, at proper seasons, a wealth of game species. The deer and moose of Eastern Canada, the bear and mountain sheep of the Rockies, game animals, birds and fishes in unusual variety, have given the Dominion exceptional advantages for this means of recreation.

A list of the Dominion national parks and reserves is given in Table 9.

9.—Canadian National Parks and Reserves, 1933.

Park.	Location.	Date of Establishment.	Area.

¹ Reserved by order in council and became a Dominion reserve by agreement with the province of Alberta in 1931. ² Administered by the Dominion Lands Administration of the Department of the Interior.

PART VII.—CLIMATE AND METEOROLOGY.

Section 1.—The Climate of Canada.

An article on this subject by Sir Frederic Stupart, Director of the Dominion Meteorological Service, Toronto, appeared in the 1929 edition of the Year Book at pp. 42-51.

Section 2.—The Factors which Control Canadian Weather.

Under the above heading, Sir Frederic Stupart, Director of the Dominion Meteorological Service, Toronto, contributed an article which appeared at pp. 26-31 of the 1924 edition of the Year Book, also at pp. 36-40 of the 1925 edition.

Section 3.—The Distribution of Precipitation in Canada.

An article on "The Distribution of Precipitation in Canada", contributed by A. J. Connor, Climatologist, Dominion Meteorological Office, Toronto, appeared at pp. 42-46 of the 1926 edition of the Year Book.

Section 4.—The Temperature and Precipitation of Northern Canada.

An article on the climate of northern Canada, accompanied by meteorological tables showing the normal temperature and precipitation at selected northern stations, was contributed by A. J. Connor, of the Meteorological Service of the Department of Marine, Toronto, to the 1930 edition of the Year Book, where it will be found at pp. 41-56.

Section 5.—The Meteorological Service of Canada.

Under the above heading Sir Frederic Stupart contributed a short article descriptive of the growth and present activities of the Meteorological Service, to the 1922-23 edition of the Year Book (pp. 43-47); to it the interested reader is referred.

Section 6.—Meteorological Tables.

Tables showing the normal temperature and precipitation at selected Canadian stations in each of the provinces, together with the recorded extremes, also the averages of sunshine, wind and weather at such stations, will be found at pp. 51-63 inclusive of the 1927-28 edition of the Year Book. The 1931 edition of the Year Book contains at pp. 48-76 additional and more comprehensive tables, contributed by A. J. Connor, of monthly average temperatures and precipitation throughout Canada, as well as of normal snowfall and duration of bright sunshine.

Section 7.—Droughts in Western Canada.¹

The scarcity of rainfall in Western Canada in recent years has been the reason for frequent requests that the Meteorological Service should supply the figures of annual rainfall and snowfall for a long period of years. Some of our correspondents have suggested that there was some law of periodicity governing the precipitation

¹Contributed by A. J. Connor, Climatologist, Meteorological Service of Canada.

of Western Canada. Several of our correspondents have also objected to annual figures which are the totals of the twelve calendar months of each year. To meet the needs of those who wish to inquire into possible periodicities, there are supplied on the following pages tables of the annual precipitation, arranged to cover the crop year from Aug. 1 to the 31st of the following July. These are to be found in Table 9 under the heading "P₁₂". In a parallel column is given the average temperature of the months of May, June and July of the corresponding year. Since the mean temperature of the actual growing period (which is nearly that of May, June and July) gives a fairly reliable indication of the temperature of the soil, it was thought that these would be the most useful temperature data. Dividing the figures in the first column by those in the second column and multiplying by a constant, we obtain a quotient listed under the heading "Q". The soil moisture varies directly as the precipitation and inversely as the temperature of the soil. The figures listed under "Q" should, therefore, give some indication of the average soil moisture during the growing season of each year. Since there are no actual observations of soil moisture available (except those made at a few scattered points several years ago under the supervision of Dr. F. T. Shutt, Dominion Chemist), we can assign no absolute meaning to these quotients. All we can say is that they afford some reasonable basis for the inter-comparison of the individual years. In the diagrams the yields of wheat for a few recent years have been plotted alongside the values of "Q" for the nearest representative station.

It has also been urged by our correspondents that the success of western crops was not totally dependent upon the weather of the current year but also upon the weather of the immediately preceding years. Although several suggestions of this nature have been propounded, they may be briefly summarized by saying that two dry years in succession have a more detrimental effect upon the crop of the second year than a single contemporary dry season and that a good third year does not compensate for two previous dry years. For the benefit of those who would like the data arranged to suit this viewpoint, a second table has been included in which the quotients are arranged by progressive means and described as "weighted quotients" (Q_w). These means were obtained by the following formula:—

$$\frac{a + 2b + 3c}{6}$$

The mean so obtained is credited to the year *c*. For the year *d* the figure is obtained from the formula:—

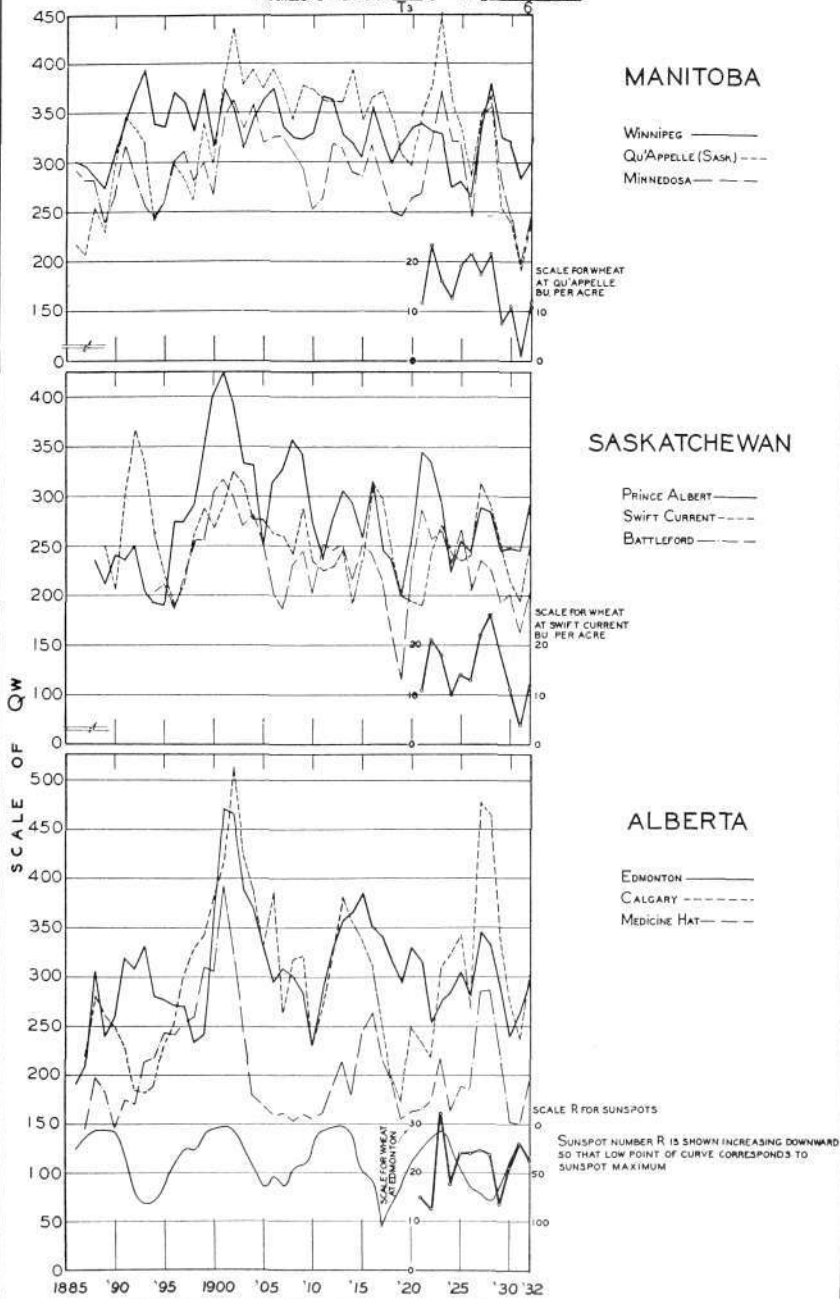

$$\frac{b + 2c + 3d}{6}$$

and so on up to the year 1932. In the accompanying diagrams these progressive quotients have been arranged to show the graphic history of western weather from this standpoint.

During the last fifty years there have been many meteorological stations established on the prairies but few of them have lasted very long. To obtain reliable district values for each year, using a shifting station network, we must submit the crude figures to considerable statistical transformations. It was, therefore, considered better for the present purpose to give the actual figures for a representative station of long continued record in each section of the west. The stations

VARIATIONS IN WEIGHTED QUOTIENTS (QW) FOR CERTAIN STATIONS IN EACH OF THE PRAIRIE PROVINCES (SEE TABLES 9 AND 10 FOR FIGURES.) WHEAT YIELDS AT TYPICAL STATIONS AND GENERAL SUNSPOT CURVE

PROGRESSIVE MEANS OF $\frac{P_{12}}{T_3} - QW = Q + 2Q_2 + 3Q_3$

chosen, Edmonton, Calgary, Medicine Hat, Swift Current, Battleford, Prince Albert, Qu'Appelle, Minnedosa and Winnipeg, are each in the approximate centre of a district of fairly distinct rainfall and temperature characteristics. In the diagram they have been arranged in related groups of threes. In the first diagram for the Alberta group the weighted "Q" informs us strikingly that:—

(1) At Edmonton the variation throughout the period has remained within narrower amplitudes than at Calgary or Medicine Hat.

(2) The Calgary climate can be, agriculturally, much better or much worse than the Edmonton climate.

(3) Medicine Hat, although subject to violent variations, is always at a lower level than the other two districts.

(4) Despite all these peculiarities there have been major pulsations which are recognizably prominent in all three. From the late '80's the general average of soil moisture (if this interpretation of Qw is sound) gradually improved to reach a peak shortly after 1900; in 1901 at Edmonton and Medicine Hat and in 1902 at Calgary.

(5) From 1902 the general average slips downward, steadily at Medicine Hat but with occasional slight recoveries at Edmonton and Calgary. The bottom was reached in 1910 at Edmonton and Calgary but Medicine Hat had already bottomed in 1905 and stayed down till Edmonton and Calgary reached the lowest point.

(6) Thereafter some force seems to have rapidly pulled values upwards to a peak, in three years at Calgary, five at Edmonton, and six at Medicine Hat. Thence the trend is downwards to 1919. After irregular fluctuations there is a peak in 1927 followed by a plunge downward to the very poor annual values of recent date. The curve in 1932, although upward, may indicate only that we are starting a period of irregular fluctuations. The assumption that the values will be gradually mounting on the average is by no means certain but would appear probable.

If there are uniformly recurring periodicities in western weather, the smooth values given by the progressive method which produced Qw should make these periodicities very evident. We have seen that there have been long period pulsations affecting Alberta. Pulsations are periodic if they recur at regular intervals. If the intervals are irregular, there is no periodicity. This does not, however, preclude the possibility that the pulsations are due to the beats or interactions caused by simultaneous forces whose periods are mutually incommensurable. This latter possibility is, of course, beyond inquiry at the present time. All that our correspondents had in mind was simply a period such as the sun-spot period. Examining the curve we may take the intervals between peaks and between valleys.

The peak at Edmonton in 1893 appears anomalous but there is a common peak in 1888, one in 1901 or 1902, one in 1913, 1915 or 1916 and another in 1927 or 1928. Intervals are 13 or 14 years, then 11 or 14 or 15 according to the station considered, while the last interval is 11, 12 or 14. The average for the three stations is slightly more than thirteen years. The valleys are not certain at the beginning of the record but we recognize major ones in 1910, 1919 and 1930 or 1931. These give intervals of 9 and 11 or 12 years. If we consider the early one as having occurred in 1889 or 1890, we have another interval of 10 or 11 years. Medicine Hat and Edmonton, however, started with a valley in 1885 or 1886 so that the first interval is doubtful. All these intervals are so sufficiently close to the sun-spot intervals that one may say that a force going through approximately the same cycle as the sun-spot frequency affects prairie weather. This, however, becomes apparent only when the weather values are thoroughly smooth. Reference to Table 9 shows

that the individual annual values are subject to very large fluctuations of much shorter intervals than the sun-spot period. These shorter fluctuations are of such violence that they have a very large immediate effect upon the crops of the corresponding year.

Turning now to the group of three stations in Saskatchewan, we find minima in 1890, 1895, 1905, 1914, 1919 and 1931. These give intervals of 5, 10, 9, 5 and 12 years. It must be admitted, however, that major minima are more difficult to recognize than in Alberta. From 1895 to 1919 is approximately twice the sun-spot period and that from 1919 to 1931 is very close to a sun-spot interval. Looking at the maxima we find them in 1892, 1901, 1916, 1921 and 1927. All three stations do not come to a major maximum in the same year, so that the actual intervals between peaks are somewhat doubtful. On the whole the case for solar influence in Saskatchewan is rather weak.

The last group of three consists of Qu'Appelle in southeastern Saskatchewan and two stations in Manitoba. At these three stations the smooth curves on the whole do not show such large fluctuations. The maxima are in about 1891, 1901, 1923, with somewhat doubtful peaks about 1912 and 1927. It is possible to pick the peaks so as to get intervals approximating those of the sun-spot intervals but the result is not very satisfactory. There are minima about 1889, 1900, 1910, 1920 and 1930, so that if we neglect the fairly well marked minima about 1894 and 1926 we have a rather better case for solar influence.

Since visual examination of the curves is rather unsatisfactory the figures were subjected to a statistical analysis. That for Q and the sun-spot numbers is given in Table 11. Qw was treated in the same way. The averages of both Q and Qw for each year of the sun-spot cycle are plotted on the diagram. The period was taken as 12 years (since the actual time, although variable, is greater than 11 years). The height of the curve at both ends (corresponding to sun-spot minima) is therefore not identical.

Four sun-spot maxima have occurred during the time for which we have data. The data, thus analyzed, indicate that the weather in the Canadian West from the farmers' standpoint may be expected to reach a peak of beneficence about sun-spot minimum; to fall sharply in the two succeeding years; then rise to a secondary peak one year before the sun-spot maximum; fall steeply at maximum sun spots and the following year; thereafter to rise slowly to a peak at the next sun-spot minimum.

A few figures of district yields of wheat are plotted on the diagrams. Enough evidence to show that weighting the weather data of one year by those of the two preceding years is not generally good practice is seen by the comparative failure of the wheat yields at Edmonton and Qu'Appelle to parallel the weighted weather figures. The parallelism for Swift Current is, however, surprisingly good. In fact, although there is a very good positive correlation in the West between annual rainfall and wheat yields and a good negative one between summer temperature and yields, yet the annual figures got by combining temperature and rainfall are far from exactly paralleling the yield figures. Undoubtedly the distribution of heat and moisture throughout the period of growth is a very important factor, of which we have taken no account in our tables or curves.

The relation of sun-spot numbers to wheat weather and to wheat yields is therefore of no value for predicting the yield of any particular year, but does appear to indicate an irregularly cycloidal march of these variables through the years.

Since we have given the annual values of both precipitation and summer temperature, there are sufficient data for those who wish to consider this matter further.

AVERAGE FLUCTUATIONS OF Q AND QW FOR 6 DISTRICTS SINCE BEFORE THE SUNSPOT MAXIMUM OF 1893 THROUGH 4 MAXIMA TO 1932 (SEE TABLE II FOR FIGURES)

¹ These figures are plotted in the diagram shown on p. 52 and indicate that on the average we may expect poorer weather from the agricultural viewpoint in the years immediately following that of maximum sun spots. There is then a sharp rise to be expected at the time of minimum sun spots. This is followed by a drop and then a rise just before sun-spot maximum. The individual figures indicate, however, that this cycle is followed only in a very halting manner. The cyclic averages can not be used to predict the character of an individual year.

CHAPTER II. HISTORY AND CHRONOLOGY.

PART I.—HISTORY.

In the 1922-23 edition of the Canada Year Book, pp. 60-80, will be found an outline of the history of Canada, not reprinted here for lack of space.

A select bibliography of historical works relating to Canada was contributed by the late Adam Shortt, C.M.G., LL.D., F.R.S.C., Chairman of the Historical Documents Publication Board, Ottawa, to the 1925 edition of the Canada Year Book, where it appears on pp. 53-55.

PART II.—CHRONOLOGY, 1497 to 1932.

1497. June 24, Eastern coast of North America discovered by John Cabot.
1498. Cabot discovers Hudson strait.
1501. Gaspar Corte Real visits Newfoundland and Labrador.
1524. Verrazano explores the coast of Nova Scotia.
1534. June 21, Landing of Jacques Cartier at Esquimaux bay.
1535. Cartier's second voyage. He ascends the St. Lawrence to Stadacona (Quebec), (Sept. 14) and Hochelaga (Montreal), (Oct. 2).
1541. Cartier's third voyage.
1542-3. De Roberval and his party winter at cape Rouge, and are rescued by Cartier on his fourth voyage.
1557. Sept. 1, Death of Cartier at St. Malo, France.
1592. Straits of Juan de Fuca discovered by de Fuca.
1603. June 22, Champlain's first landing in Canada, at Quebec.
1605. Founding of Port Royal (Annapolis, N.S.)
1608. Champlain's second visit. July 3, Founding of Quebec.
1609. July, Champlain discovers lake Champlain.
1610-11. Hudson explores Hudson bay and James bay.
1611. Brûlé ascends the Ottawa river.
1612. Oct. 15, Champlain made Lieutenant-General of New France.
1613. June, Champlain ascends the Ottawa river.
1615. Champlain explores lakes Nipissing, Huron and Ontario (discovered by Brûlé and Le Caron).
1616. First schools opened at Three Rivers and Tadoussac.
1620. Population of Quebec, 60 persons.
1621. Code of laws issued and register of births, deaths and marriages opened in Quebec. Nova Scotia granted to Sir William Alexander by King James I.
1622. Lake Superior discovered by Brûlé.
1623. First British settlement of Nova Scotia.
1627. New France and Acadia granted to the Company of 100 Associates.
1628. Port Royal taken by Sir David Kirke.
1629. April 24, Treaty of Susa between France and England. July 20, Quebec taken by Sir David Kirke.
1632. Mar. 29, Canada and Acadia restored to France by the Treaty of St. Germain-en-Laye.
1633. May 23, Champlain made first Governor of New France.
1634. July 4, Founding of Three Rivers.
1634-35. Exploration of the Great Lakes by Nicolet.
1635. Dec. 25, Death of Champlain at Quebec.
1638. June 11, First recorded earthquake in Canada.
1640. Discovery of lake Erie by Chaumonot and Brébeuf.
1641. Resident population of New France, 240.
1642. May 17, Founding of Ville-Marie (Montreal).
1646. Exploration of the Saguenay by Dablon.
1647. Lake St. John discovered by de Quen.
1648. Mar. 5, Council of New France created.
1649. Mar. 16-17, Murder of Fathers Brébeuf and Lalemant by Indians.
1654. Aug., Acadia taken by an expedition from New England.
1655. Nov. 3, Acadia restored to France by the Treaty of Westminster.
1659. June 16, François de Laval arrives in Canada as Vicar-Apostolic.
1660. May 21, Dollard des Ormeaux and sixteen companions killed at the Long Sault, Ottawa river.
1663. Company of 100 Associates dissolved. Feb. 5, Severe earthquake. April, Sovereign Council of New France established. Population in New France, 2,500, of whom 800 were in Quebec.
1664. May, Company of the West Indies founded.
1665. Mar. 23, Talon appointed Intendant.
1666. Feb.-Mar. First census. Population of New France, 3,215.
1667. July 21, Acadia restored to France by the Treaty of Breda. Sept.-Oct., Second census: white population of New France, 3,918.

1668. Mission at Sault Ste. Marie founded by Marquette.
1670. May 13, Charter of the Hudson's Bay Company granted.
1671. Population of Acadia, 441.
1672. Population of New France, 6,705. April 6, Comte de Frontenac, Governor.
1673. June 13, Cataragui (Kingston) founded.
1674. Oct. 1, Laval becomes first Bishop of Quebec.
1675. Population of New France, 7,832.
1678. Niagara Falls visited by Hennepin.
1679. Ship *Le Griffon* built on Niagara river above the falls by La Salle. Third census; population of New France, 9,400; of Acadia, 515.
1681. Fourth census; population of New France, 9,677.
1682. Frontenac recalled.
1683. Population of New France, 10,251.
1685. First issue of card money. Fifth census, population of New France, 12,263, including 1,538 settled Indians.
1686. Population of New France, 12,373; of Acadia, 885.
1687. Mar. 18, La Salle assassinated.
1688. Sixth census; population of New France, 11,562, including 1,259 settled Indians.
1689. June 7, Frontenac re-appointed Governor. Aug. 5, Massacre of whites by Indians at Lachine.
1690. May 21, Sir William Phips captures Port Royal, but is repulsed in an attack on Quebec (Oct. 16-21).
1692. Seventh census; population of New France, 12,431. Oct. 22, Defence of Verchères against Indians by Madeleine de Verchères.
1693. Population of Acadia, 1,009.
1695. Eighth census; population of New France, 13,639, including 853 settled Indians.
1697. Sept. 20, By the Treaty of Ryswick, places taken during the war were mutually restored. D'Iberville defeats the Hudson's Bay Co.'s ships on Hudson bay.
1698. Nov. 28, Death of Frontenac. Ninth census; population of New France, 15,355.
1701. La Motte Cadillac builds a fort at Detroit.
1703. June 16, Sovereign Council of Canada becomes Superior Council and membership increased from 7 to 12.
1706. Tenth census; population of New France, 16,417.
1709. British invasion of Canada.
1710. Oct. 13, Port Royal taken by Nicholson.
1711. Sept. 1, Part of Sir H. Walker's fleet, proceeding against Quebec, wrecked off the Seven Islands.
1713. April 11, Treaty of Utrecht; Hudson bay, Acadia and Newfoundland ceded to Great Britain. Aug., Louisbourg founded by the French. Population of New France, 18,119.
1719. Census population of New France, 22,530.
1720. Population of New France, 24,234; of Isle St. Jean (P.E.I.), about 100. April 25, Governor and Council of Nova Scotia appointed.
1721. June 19, Burning of about one-half of Montreal. Census population of New France, 24,951.
1727. Population of New France, 30,813.
1728. Population of Isle St. Jean (P.E.I.), 330.
1731. Population of the north of the peninsula of Acadia, 6,000.
1734. Road opened from Quebec to Montreal. Census population of New France, 37,716.
1737. Iron smelted on St. Maurice. French population of the north of the Acadia peninsula, 7,598.
1739. Census population of New France, 42,701.
1743. De la Vérendrye discovers the Rocky mountains.
1745. June 17, Taking of Louisbourg by Pepperell and Warren.
1748. Oct. 13, Treaty of Aix-la-Chapelle. Louisbourg restored to France in exchange for Madras.
1749. June 21, Founding of Halifax—British immigrants brought to Nova Scotia by Governor Cornwallis, 2,544 persons. Fort Rouillé (Toronto) built.
1750. St. Paul's church, Halifax (oldest Anglican church in Canada), built.
1752. Mar. 25, Issue of the Halifax "Gazette", first paper in Canada. British and German population of Nova Scotia, 4,203.
1754. Census population of New France, 55,009.
1755. June 16, Surrender of Fort Beauséjour on the isthmus of Chignecto to the British. Sept. 10, Expulsion of the Acadians from Nova Scotia.
1756. Seven Years' War between Great Britain and France begins.

1814. Mar. 30, Americans repulsed at La Colle. May 6, Capture of Oswego by the British. July 5, American victory at Chippawa. July 25, British victory at Lundy's Lane. July, British from Nova Scotia invade and occupy northern Maine. Sept. 11, British defeat at Plattsburg on lake Champlain. Dec. 24, Treaty of Ghent ends the war. Population—Upper Canada, 95,000; Lower Canada, 335,000.
1815. July 3, Treaty of London regulates trade with the United States. The Red River settlement destroyed by the Northwest Company but restored by Governor Semple.
1816. June 19, Governor Semple killed. The Red River settlement again destroyed.
1817. July 18, First treaty with the Northwest Indians. Lord Selkirk restores the Red River settlement. Opening of the Bank of Montreal; first note issued Oct. 1. Population of Nova Scotia, 81,351. Rush-Bagot Convention with the United States, limiting naval armament on the Great Lakes, is signed.
1818. Oct. 20, Convention at London regulating North American fisheries. Dalhousie College, Halifax, founded. Bank of Quebec founded.
- 1819-22. Franklin's overland Arctic expedition.
1820. Oct. 16, Cape Breton re-annexed to Nova Scotia.
1821. Mar. 26, The Northwest Company absorbed by the Hudson's Bay Company. Charter given to McGill College.
1822. Population of Lower Canada, 427,465.
1824. Population of Upper Canada, 150,066; of New Brunswick, 74,176.
1825. Oct. 6, Great fire in the Miramichi district, N.B. Opening of the Lachine canal. Population of Lower Canada, 479,288.
1826. Founding of Bytown (Ottawa).
1827. Sept. 29, Convention of London relating to the territory west of the Rocky mountains. Population of Nova Scotia, including Cape Breton, 123,630.
1828. The Methodist Church of Upper Canada separated from that of the United States.
1829. Nov. 27, First Welland canal opened. McGill University opened. Upper Canada College founded.
1831. June 1, The North Magnetic Pole discovered by (Sir) James Ross. Population—Upper Canada, 236,702; Lower Canada, 553,131; Assiniboia, 2,390.
1832. Outbreak of cholera in Canada. Incorporation of Quebec and Montreal. Bank of Nova Scotia founded. May 30, Opening of the Rideau canal.
1833. Aug. 18, The steamer *Royal William*, built at Quebec, crosses the Atlantic from Pictou to England.
1834. Feb. 21, The Ninety-two Resolutions on public grievances passed by the Assembly of Lower Canada. Mar. 6, Incorporation of Toronto. Population of Upper Canada, 321,145; of New Brunswick, 119,457; of Assiniboia, 3,356.
1836. July 21, Opening of the first railway in Canada from Laprairie to St. John's, Que. Victoria University opened at Cobourg (afterwards moved to Toronto).
1837. Report of the Canada Commissioners. Rebellion in Lower Canada (Papineau) and Upper Canada (W. L. Mackenzie). Nov. 23, Gas lighting first used in Montreal.
1838. Feb. 10, Constitution of Lower Canada suspended and Special Council created. Mar. 30, The Earl of Durham Governor in Chief. April 27, Martial law revoked. June 28, Amnesty to political prisoners proclaimed. Nov. 1, Lord Durham, censured by British Parliament, resigns. Population—Upper Canada, 339,442; Assiniboia, 3,966; Nova Scotia, 202,575.
1839. Feb. 11, Lord Durham's report submitted to Parliament. John Strachan ordained first Anglican Bishop of Toronto.
1840. July 23, Passing of the Act of Union. First ship of the Cunard line arrives at Halifax. July 28, Death of Lord Durham.
1841. Feb. 10, Union of the two provinces as the province of Canada, with Kingston as capital. Feb. 13, Draper-Ogden administration. April 10, Halifax incorporated. June 13, Meeting of the first United Parliament. Sept. 19, Death of Lord Sydenham. Population of Upper Canada, 455,668; of P.E.I., 47,042.
1842. Mar. 10, Opening of Queen's University, Kingston. Aug. 9, The Ashburton Treaty. Sept. 16, Baldwin-Lafontaine administration.
1843. June 4, Victoria, B.C., founded. Dec. 12, Draper-Viger administration. King's (now University) College, Toronto, opened.

1844. May 10, Capital moved from Kingston to Montreal. Knox College, Toronto, founded. Population of Lower Canada, 697,084.
1845. May 28 and June 28, Great fires at Quebec. Franklin starts on his last Arctic expedition.
1846. May 18, Kingston incorporated. June 15, Oregon Boundary Treaty. June 18, Draper-Papineau administration. First telegraph line, operated by the Toronto, Hamilton, Niagara and St. Catharines Telegraph Co., opened.
1847. May 29, Sherwood-Papineau administration. Nov. 25, Montreal-Lachine Railway opened.
1848. Mar. 11, Lafontaine-Baldwin administration. May 30, Fredericton incorporated. Responsible government granted to Nova Scotia and New Brunswick.
1849. April 25, Signing of the Rebellion Losses Act; rioting in Montreal and burning of the Parliament buildings. Nov. 14, Toronto made the capital. Vancouver island granted to the Hudson's Bay Company. Population of Assiniboia, 5,391.
1851. April 6, Transfer of the postal system from the British to the Provincial Government; uniform rate of postage introduced. April 23, Postage stamps issued. Aug. 2, Incorporation of Trinity College, Toronto. Sept. 22, Quebec becomes the capital. Oct. 28, Hincks-Morin administration. Responsible government granted to Prince Edward Island. Population—Upper Canada, 952,004; Lower Canada, 890,261; New Brunswick, 193,800; Nova Scotia, 276,854.
1852. July 8, Great fire at Montreal. Dec. 8, Laval University, Quebec, opened. The Grand Trunk Railway chartered.

1932. Feb. 4-May 26, Third session of the seventeenth Parliament of Canada. June 16, General election in Manitoba; the Bracken Government retains power. July 18, Treaty between Canada and the United States, providing for the construction of the St. Lawrence seaway, signed at Washington. July 21-Aug. 20, Imperial Economic Conference at Ottawa. Aug. 6, Official opening of the Welland Ship Canal. Oct. 6, Fourth session of the seventeenth Parliament of Canada begins. Dec. 15, The one-year moratorium on war debts granted by the United States in 1931, not having been extended, debt payments were conditionally resumed by the United Kingdom following a diplomatic exchange of notes. (For further details regarding principal events of 1932 see Chapter XXX.)

CHAPTER III.—CONSTITUTION AND GOVERNMENT.

The Dominion of Canada is the largest in area and the most populous of the great self-governing Dominions of the British Empire, which also include the Irish Free State (Saorstát Éireann), the Commonwealth of Australia, the Union of South Africa, the Dominion of New Zealand, the island colony of Newfoundland (with the Labrador coast), and the colony of Southern Rhodesia. These Dominions enjoy responsible government of the British type, administered by Executive Councils (or Cabinets), acting as advisors to the representatives of the Sovereign, the Executive Councils being themselves responsible to, and possessing the confidence of, the representatives elected to Parliament by the people, and giving place to other persons more acceptable to Parliament whenever that confidence is shown to have ceased to exist. The Imperial Conference of 1926 defined the group of self-governing communities consisting of Great Britain and the Dominions as "autonomous Communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their domestic or foreign affairs, though united by a common allegiance to the Crown, and freely associated as members of the British Commonwealth of Nations". The Conference further laid down that, as a consequence of this equality of status, the Governor General of a Dominion "is the representative of the Crown, holding in all essential respects the same position in relation to the administration of public affairs in the Dominion as is held by His Majesty the King in Great Britain", and that "it is the right of the Government of each Dominion to advise the Crown in all matters relating to its own affairs". The Conference also recognized certain treaty-making rights as appertaining to the Dominion. At the Imperial Conference of 1930 the constitutional status of the Dominions was further strengthened by the decisions to repeal the Colonial Laws Validity Act and to establish a voluntary Empire judicial tribunal. It was also definitely laid down that the King appoints his Governors General through the Dominion Governments. An Address of the Parliament of Canada to His Majesty was adopted by the House of Commons on June 30, and by the Senate on July 6, 1931, praying for the enactment by the Parliament of the United Kingdom of the Statute of Westminster removing the remaining legal limitations under the Colonial Laws Validity Act of 1895, the Merchant Shipping Act of 1894 and the Colonial Courts of Admiralty Act of 1890 on the legislative autonomy of the Dominions. In compliance with this Address and similar Addresses from the Parliaments of other Dominions, the Parliament of the United Kingdom having enacted legislation to this effect, the Royal Assent was given thereto on Dec. 12, 1931.

Of the Dominions, Canada, Australia and South Africa extend over enormous areas of territory, each of the first two approximating in area to Europe, and including great provinces or states larger than most of its great Powers. Each province or state has its own problems and its own point of view, so that local Parliaments for each section, as well as the central Parliament for the whole country, are required. These local Parliaments, established when transportation and communication were more difficult and expensive than at present, were chronologically prior to the central body, to which on its formation they either resigned certain powers, as in the case of Australia, or surrendered all their powers with certain specified exceptions, as in Canada and South Africa. Of such local Parliaments, Canada at the present time has nine, Australia six, and South Africa four.

Besides the Dominions above enumerated, the great Empire of India has internationally been accepted as a member of the League of Nations, and in its internal administration has been placed on the road, formerly traversed by the Dominions which are now fully self-governing, towards responsible government. India proved her loyalty to the Empire in the Great War and, as the result of the work of Royal Commissions and conferences, a constitution is now being worked out for India along Dominion lines. Although the steps so far taken do not meet the demands of the more radical elements, the result will probably mark as great an advance as the country is now prepared to make. The whole evolution of the Empire, throughout all its parts which are more than mere fortresses like Gibraltar or trading stations like Hong Kong, is in the direction of responsible government, to be attained in the dependencies as it has been in what used to be called the colonies, by the gradual extension of self-government in proportion to the growing capacities of their respective populations. It is the recognized aim of British administrators, by the extension of educational facilities and by just administration to develop these capacities to the utmost, so that in the dependencies, as well as in the Dominions and in the Mother Country, the constitutional history of the future may be a record of "freedom slowly broadening down from precedent to precedent"

A conference on the operation of Dominion legislation and merchant shipping legislation, arising out of the report of the Imperial Conference of 1926, was held in London from Oct. 8 to Dec. 4, 1929. This conference dealt with the power of disallowing or reserving Dominion legislation, the extra-territorial operation of Dominion legislation and merchant shipping legislation, on all which subjects its report was generally in the nature of giving effect to the definition of the equal status of the Dominions as made by the Imperial Conference of 1926.

PART I.—CONSTITUTION AND GENERAL GOVERNMENT.

Under the above heading a brief historical and descriptive account of the evolution of the general government of Canada was given on pp. 89-100 of the Canada Year Book, 1922-23.

PART II.—PROVINCIAL AND LOCAL GOVERNMENT.

Under the heading "Provincial and Local Government in Canada", a brief account of the government of each of the provinces of Canada and of its municipal institutions and judicial organization was published on pp. 101-115 of the 1922-23 edition of the Year Book.

PART III.—LEGISLATIVE AND EXECUTIVE AUTHORITIES.

Section 1.—Dominion Parliament and Ministry.

The Dominion Parliament is composed of the King, represented by the Governor General, the Senate and the House of Commons. The Governor General is appointed by the King on the advice of the Government of Canada. Members of the Senate are appointed for life by the Governor General in Council and members of the House of Commons are elected by the people. As a result of the working out of the democratic principle, the part played by the King's Representative and the Upper Chamber of Parliament in the country's legislation has been, in Canada as in the Mother Country, a steadily decreasing one, the chief responsibilities involved in legislation being assumed by the House of Commons.

Subsection 1.—The Governor General of Canada.

The Governor General is appointed by the King as his representative in Canada, usually for a term of five years, with a salary fixed at £10,000 sterling per annum and forming a charge against the consolidated revenue of the country. The Governor General is bound by the terms of his commission and can exercise only such authority as is expressly entrusted to him. He acts under the advice of his Ministry, which is responsible to Parliament, and, as the acting head of the Executive, summons, prorogues, and dissolves Parliament and assents to or reserves bills. In the discharge of these and other executive duties, he acts entirely by and with the advice of his Ministry (the Governor General in Council). The royal prerogative of mercy in capital cases, formerly exercised on the Governor General's own judgment and responsibility, is now exercised pursuant to the advice of the Ministry. The practice whereby the Governor General served as the medium of communication between the Canadian and the British Governments has been given up; since July 1, 1927, direct communication between His Majesty's Government in Canada and His Majesty's Government in Great Britain has been instituted.

A list of the Governors General from the time of Confederation, with the dates of their appointment and assumption of office, is given in Table 1.

1.—Governors General of Canada, 1867-1932.

Name.	Date of Appointment.	Date of Assumption of Office.
Viscount Monck, G.C.M.G.	June 1, 1867	July 1, 1867
Lord Lisgar, G.C.M.G.	Dec. 29, 1868	Feb. 2, 1869
The Earl of Dufferin, K.P., K.C.B., G.C.M.G.	May 22, 1872	June 25, 1872
The Marquis of Lorne, K.T., G.C.M.G.	Oct. 5, 1878	Nov. 25, 1878
The Marquis of Lansdowne, G.C.M.G.	Aug. 18, 1883	Oct. 23, 1883
Lord Stanley of Preston, G.C.B.	May 1, 1888	June 11, 1888
The Earl of Aberdeen, K.T., G.C.M.G.	May 22, 1893	Sept. 18, 1893
The Earl of Minto, K.C.M.G.	July 30, 1898	Nov. 12, 1898
Earl Grey, G.C.M.G.	Sept. 26, 1904	Dec. 10, 1904
Field Marshal H.R.H. the Duke of Connaught, K.G.	Mar. 21, 1911	Oct. 13, 1911
The Duke of Devonshire, K.G., G.C.M.G., G.C.V.O.	Aug. 19, 1916	Nov. 11, 1916
General the Lord Byng of Vimy, G.C.B., G.C.M.G., M.V.O.	Aug. 2, 1921	Aug. 11, 1921
Viscount Willingdon of Raton, G.C.S.I., G.C.I.E., G.B.E.	Aug. 5, 1926	Oct. 2, 1926
The Earl of Bessborough, G.C.M.G.	Feb. 9, 1931	April 4, 1931

Subsection 2.—The Ministry.

A system of government based upon the British, by which a Cabinet or Ministry (composed of members of the House of Commons or the Senate), responsible to Parliament, holds office while it enjoys the confidence of the people's representatives, is found in Canada. The Cabinet is actually a committee of the King's Privy Council for Canada. Without enlarging upon the features of the system, it may be sufficient to note that the Cabinet is responsible to the House of Commons, and, following established precedent, resigns office when it becomes evident that it no longer holds the confidence of the people's representatives. Members of the Cabinet are chosen by the Prime Minister; each of them generally assumes charge of one of the various Departments of the Government, although one Minister may hold two portfolios at the same time, while other Ministers may be without portfolio.

The Prime Ministers since Confederation and the dates of their tenures of office, together with the members of the fifteenth Ministry are given in Table 2. The complete list of the members of the King's Privy Council for Canada, as at Dec. 31, 1932, is added as Table 3.

2.—Ministries since Confederation and Members of the Fifteenth Ministry.

NOTE.—A complete list of the members of Dominion Ministries from Confederation to 1913 appeared in the Year Book of 1912, pp. 422-429. A list of the members of Dominion Ministries from 1911 to 1921 appeared in the Year Book of 1920, pp. 651-653. A list of the members of the twelfth and thirteenth Ministries appeared on pp. 76-77 of the 1927-28 Year Book. Members of the fourteenth Ministry are listed at p. 65 of the 1929 Year Book and p. 69 of the 1930 Year Book.

1. Rt. Hon. Sir John A. Macdonald, Prime Minister. From July 1, 1867, to Nov. 6, 1873.
2. Hon. Alexander Mackenzie, Prime Minister. From Nov. 7, 1873, to Oct. 16, 1878.
3. Rt. Hon. Sir John A. Macdonald, Prime Minister. From Oct. 17, 1878, to June 6, 1891.
4. Hon. Sir John J. C. Abbott, Prime Minister. From June 16, 1891, to Dec. 5, 1892.
5. Hon. Sir John S. D. Thompson, Prime Minister. From Dec. 5, 1892, to Dec. 12, 1894.
6. Hon. Sir Mackenzie Bowell, Prime Minister. From Dec. 21, 1894, to April 27, 1896.
7. Hon. Sir Charles Tupper, Prime Minister. From May 1, 1896, to July 8, 1896.
8. Rt. Hon. Sir Wilfrid Laurier, Prime Minister. From July 11, 1896, to Oct. 6, 1911.
9. Rt. Hon. Sir Robert L. Borden, Prime Minister. (Conservative Administration). From Oct. 10, 1911, to Oct. 12, 1917.
10. Rt. Hon. Sir Robert L. Borden, Prime Minister. (Unionist Administration). From Oct. 12, 1917, to July 10, 1920.
11. Rt. Hon. Arthur Meighen, Prime Minister. (Unionist—"National Liberal and Conservative Party.") From July 10, 1920 to Dec. 29, 1921.
12. Rt. Hon. William Lyon Mackenzie King, Prime Minister. From Dec. 29, 1921, to June 23, 1926.
13. Rt. Hon. Arthur Meighen, Prime Minister. From June 29, 1926, to Sept. 25, 1926.
14. Rt. Hon. William Lyon Mackenzie King, Prime Minister. From Sept. 25, 1926, to Aug. 6, 1930.
15. Rt. Hon. R. B. Bennett, Prime Minister. From Aug. 7, 1930.

FIFTEENTH DOMINION MINISTRY.

(According to precedence of the Ministers as at the formation of the Cabinet.)

Office.	Occupant.	Date of Appointment.
Prime Minister, President of the Privy Council, Secretary of State for External Affairs.....	Right Hon. R. B. Bennett, K.C.	Aug. 7, 1930
Minister of Finance.....	Right Hon. R. B. Bennett, K.C.	Aug. 7, 1930
Minister without Portfolio.....	Hon. E. N. Rhodes, K.C.	Feb. 3, 1932
Minister without Portfolio.....	Rt. Hon. Sir Geo. H. Perley, G.C.M.G.	Aug. 7, 1930
Minister of Labour.....	Right Hon. Arthur Meighen (Senator).....	Feb. 3, 1932
Minister of Justice and Attorney-General.....	Hon. Gideon D. Robertson (Sen- ator).....	Aug. 7, 1930

A brief résumé of the history of parliamentary representation follows. Attention may be drawn to the growth in the number of members of both the Senate and the House of Commons since Confederation and to the greatly increased unit of representation in the Lower House.

Subsection 3.—The Senate.

The British North America Act, 1867, provides in sections 21 and 22 that "the Senate shall consist of seventy-two members, who shall be styled Senators. In relation to the constitution of the Senate, Canada shall be deemed to consist of three divisions—(1) Ontario; (2) Quebec; (3) The Maritime Provinces, Nova Scotia and New Brunswick; which three divisions shall be equally represented in the Senate as follows: Ontario by twenty-four senators; Quebec by twenty-four senators; and the Maritime Provinces by twenty-four senators, twelve thereof representing New Brunswick and twelve thereof representing Nova Scotia. In the case of Quebec, each of the twenty-four senators representing the province shall be appointed for one of the electoral divisions of Lower Canada specified in schedule A to Chapter I of the Consolidated Statutes of Canada". Further, under section 147 of the same Act, it is provided that "in case of the admission to Confederation of Newfoundland or Prince Edward Island, each shall be entitled to a representation in the Senate of four members" "Prince Edward Island when admitted shall be deemed to be comprised in the third of the three divisions into which Canada is divided by this Act" and on its admission "the representation of Nova Scotia and New Brunswick shall, as vacancies occur, be reduced from twelve to ten members respectively" In case of the admission of Newfoundland, the normal membership of the Senate of 72 members was to be increased to 76, while the maximum number of 78 (sec. 28) was to be 82, sec. 26 containing a provision for the appointment of three or six additional members in certain cases, to represent equally the three divisions of Canada.

By 33 Vict., c. 3, an Act to establish and provide for the government of the province of Manitoba, passed in 1870, the newly formed province was given representation of two members in the Senate, provision being made at the same time for increases in representation to three and four on increases of population, according to the decennial census, to 50,000 and 75,000 respectively. In the following year, British Columbia, on being admitted to the Union by an Imperial Order in Council of May 16, 1871, was given representation by three senators. Two years later, when Prince Edward Island was admitted to Confederation by an Imperial Order in Council of June 26, 1873, it was granted representation in the Senate of four members under the terms of the British North America Act, as cited above. Thus, in 1873, the seven provinces of Ontario, Quebec, Nova Scotia, New Brunswick, Manitoba, British Columbia and Prince Edward Island were represented by a total of 77 members in the Senate, their individual representation at the time being 24, 24, 10, 10, 2, 3 and 4 members respectively.

In 1882, following the 1881 census and an increase of population in Manitoba to 62,260 persons, the representation of this province was increased to three members under authority of the Manitoba Act, 1870. Later, by 50-51 Vict., c. 38, an Act of 1887, the representation of the Northwest Territories in the Senate was fixed at two members. A subsequent increase resulted from the growth of population in Manitoba to 152,506, as shown by the census of 1891, the province being granted a fourth senator under the terms of the Manitoba Act of 1870. An Act passed in the session of 1903, 3 Edw. VII, c. 42, provided for an increase in the representation of the Northwest Territories from two to four members, bringing the total representation at this date to 83 members.

On the establishment of the provinces of Alberta and Saskatchewan out of the former Northwest Territories in 1905, under 4-5 Edw. VII, cc. 3 and 42, provision was made for their representation in the Senate by 4 members each, which might be increased by Parliament to 6 on the completion of the next decennial census. This change in representation brought the membership of the Upper Chamber to a total of 87.

In 1915, by an amendment to the British North America Act (5-6 Geo. V, c. 45), an important change was made with regard to the constitution of the Senate. The number of divisions provided for by section 22 of the original Act was increased from three to four, the fourth comprising the four western provinces of Manitoba, Saskatchewan, Alberta and British Columbia. Each of these provinces was to be represented by 6 members under the Act, the division being thus represented by 24 members and placed on an equality with the others with respect to membership. A corresponding change was made in the number of additional senators provided for by the original British North America Act, by substituting increases of four or eight members for the three or six cited in section 26 of the Act of 1867. Normal representation, therefore, is at present fixed at 96, which number may be increased if necessary to 100 or to a maximum of 104.

The entry of Newfoundland to the Union is still provided for by the above Act, subsection 6 of sec. 1 of which sets out its representation as six members instead of the four granted by the Act of 1867. If Newfoundland were admitted to the Dominion, the normal number of senators would be 102 with a maximum of 110.

In Table 5 the growth of membership in the Senate is shown by divisions and provinces from 1867 to 1915, since when no change has taken place. The names and addresses of the senators from each province are given as at Mar. 1, 1933, in Table 6.

Subsection 4.—The House of Commons.

In section 37 of the original British North America Act of 1867 (30 Vict., c. 3), it was provided that "The House of Commons shall consist of one hundred and eighty-one members, of whom eighty-two shall be elected for Ontario, sixty-five for Quebec, nineteen for Nova Scotia, and fifteen for New Brunswick" Further, under section 51, it was enacted that after the completion of the census of 1871 and of each subsequent decennial census, the representation of the four provinces should be readjusted by such authority, in such manner, and from such time, as the Parliament of Canada provided, subject to and according to the following rules:—

- "(1) Quebec shall have the fixed Number of Sixty-five Members;
- "(2) There shall be assigned to each of the other Provinces such a Number of Members as will bear the same Proportion to the Number of its Population (ascertained at such Census) as the Number Sixty-five bears to the Number of the Population of Quebec (so ascertained);
- "(3) In the Computation of the Number of Members for a Province a fractional Part not exceeding One Half of the whole Number requisite for entitling the Province to a Member shall be disregarded; but a fractional Part exceeding One Half of that Number shall be equivalent to the whole Number;
- "(4) On any such Re-adjustment the Number of Members for a Province shall not be reduced unless the Proportion which the Number of the Population of the Province bore to the Number of the aggregate Population of Canada at the then last preceding Re-adjustment of the Number of Members for the Province is ascertained at the then latest Census to be diminished by One Twentieth Part or upwards;
- "(5) Such Re-adjustment shall not take effect until the Termination of the then existing Parliament"

Again, in section 52, it was enacted that "the number of members of the House of Commons may be from time to time increased by the Parliament of Canada, provided the proportionate representation of the Provinces prescribed by this Act is not thereby disturbed".

Later on, by the British North America Act of 1886 (49-50 Vict., c. 35), provision was made in section 1 that "the Parliament of Canada may from time to time make provision for the representation in the Senate and House of Commons of Canada, or in either of them, of any territories which for the time being form part of the Dominion of Canada, but are not included in any province thereof"

Again in 1915, an amendment to the British North America Act (5-6 Geo. V, c. 45) was passed by the Imperial Parliament, providing that "notwithstanding anything in the said Act, a province shall always be entitled to a number of members in the House of Commons not less than the number of senators representing such province"

Readjustments in Representation.—As set out in the above-mentioned provisions of the British North America Act, the first Dominion Parliament of 1867 consisted at its commencement of 181 members, 82 for Ontario, 65 for Quebec, 19 for Nova Scotia and 15 for New Brunswick. To this number were added, under the Manitoba Act of 1870 (33 Vict., c. 3), 4 members to represent the newly created province of Manitoba; also, according to the agreement under which British Columbia entered Confederation, ratified by Imperial Order in Council of May 16, 1871, 6 members were added to represent the new province, making a total of 191 members at the end of the first Parliament of Canada.

Arising out of the first census of the Dominion in 1871, a readjustment of representation took place in 1872 (c. 15 of 1872), increasing the representation of Ontario from 82 to 88, of Nova Scotia from 19 to 21 and of New Brunswick from 15 to 16 members, the 9 additional members bringing the total number of representatives up to 200. To these were added in 1874, as a result of the agreement under which Prince Edward Island entered Confederation (ratified by Imperial Order in Council of June 26, 1873), 6 members representing that province—bringing the membership of the House of Commons to 206.

Results of the second census, that of 1881, necessitated the passage of a new Representation Act (45 Vict., c. 3), increasing the representation of Ontario from 88 to 92 and that of Manitoba from 4 to 5, thus bringing the membership of the House of Commons to 211 members. To these were added, under the provisions of 49 Vict., c. 24, passed in 1886, 4 members for the Northwest Territories (2 for the then provisional district of Assiniboia and 1 each for the then provisional districts of Alberta and Saskatchewan), bringing the total membership to 215.

The third census, of 1891, was followed by another readjustment of representation, reducing the representation of Nova Scotia from 21 to 20, of New Brunswick from 16 to 14, of Prince Edward Island from 6 to 5, and increasing the representation of Manitoba from 5 to 7, the representation of the other provinces remaining as before. The net result was a reduction in the number of members of the House from 215 to 213.

The fourth census, of 1901, resulted in a readjustment in 1903, reducing the representation of Ontario from 92 to 86, of Nova Scotia from 20 to 18, of New Brunswick from 14 to 13, of Prince Edward Island from 5 to 4. On the other hand, the representation of Manitoba was increased from 7 to 10, of British Columbia from 6 to 7, of the Northwest Territories from 4 to 10. By chapter 37 of the Statutes of 1902, a member had been added for Yukon Territory, so that the net effect of the changes was to keep the membership at 214 in the early years of the present century. The extremely rapid growth of the Northwest Territories, however, led to their division and the admission to Confederation in 1905 of the provinces of Alberta and Saskatchewan. In the Acts admitting them—the Alberta Act (4-5 Edw. VII,

c. 3) and the Saskatchewan Act (4-5 Edw. VII, c. 42)—it was provided that their representation should be readjusted on the basis of the results of the quinquennial census of 1906. The Representation Act of 1907, implementing this pledge, increased the representation of Saskatchewan from 6 to 10 and of Alberta from 4 to 7 members, thus raising the total membership of the House of Commons to 221.

The census of 1911, with its very large but very unevenly distributed increase of population, led to considerable changes in representation, enacted by the Representation Act of 1914. The representation of Ontario was reduced from 86 to 82, of Nova Scotia from 18 to 16, of New Brunswick from 13 to 11, of Prince Edward Island from 4 to 3. On the other hand, the representation of Manitoba was raised from 10 to 15, of Saskatchewan from 10 to 16, of Alberta from 7 to 12 and of British Columbia from 7 to 13. The net result was an increase of 13 members in the total membership of the House of Commons, bringing the figure to 234. However, in the following session the amendment to the British North America Act, already referred to, resulted in the retention by Prince Edward Island of her fourth member (since she had 4 senators). (See also 5 Geo. V, c. 19). The total membership, therefore, of the House of Commons in the thirteenth and fourteenth Parliaments (elected in 1917 and 1921 respectively) was 235.

As a result of the smaller increase of population shown by the census of 1921, the changes in representation were less far-reaching. Nova Scotia lost 2 members and the West gained 12, 2 of these being added to Manitoba, 5 to Saskatchewan, 4 to Alberta and 1 to British Columbia. The representation of the remaining four provinces was unchanged. Prince Edward Island retained its 4 members because of the provisions of the British North America Act of 1915, to the effect that the members of the House of Commons returned by a province shall never be fewer than its senators. Ontario, again, retained its 82 members because under subsection 4 of section 51 of the British North America Act (quoted p. 79), the proportion which its population bore to the aggregate population of the Dominion had not declined by one-twentieth. Further, by the Quebec Boundaries Extension Act of 1912, it had been stipulated that the population of the added area (Ungava) should not be included for the purpose of determining the unit of representation, so that the 1921 population of Quebec, within its 1911 boundaries, *viz.*, 2,358,412, divided by the fixed number of 65 seats for that province, became the new unit of representation, 36,283.

The number of representatives of each province elected at each of the seventeen general elections since Confederation is given in Table 7.

7.—Representation in the House of Commons as at Dominion General Elections, 1867-1930.

¹ The representation at the general elections of 1926 and 1930 was the same as in 1925.

The Unit of Representation.—While the number of members of the House of Commons has been growing fairly steadily since Confederation, the unit of representation—one-sixty-fifth of the population of Quebec within its 1911 boundaries—has also been increased after each census in consequence of the growth of the population of Quebec. The units of representation, as determined by the decennial censuses taken since Confederation, are as follows: 1871, 18,331 persons; 1881, 20,908; 1891, 22,901; 1901, 25,368; 1911, 30,819; 1921, 36,283; 1931, 44,186, being one-sixty-fifth of the population of Quebec exclusive of Ungava.

The 1931 Redistribution Problem.—The population of Quebec in 1931, exclusive of the population (2,177) of the territory added to Quebec by the Boundaries Extension Act of 1912, was 2,872,078, which, divided by 65, gives a unit of representation of 44,186. The quotient obtained by dividing the population of each province as shown at the date of the census by 44,186 indicates (except where subsection 4 of section 51 of the British North America Act and the Amending Act of 1915 apply) the number of members to which each province is entitled. These numbers as determined by the census of 1931 and the two preceding censuses are shown in Table 8.

¹ Represents the population in the area added to Quebec by the Quebec Boundaries Extension Act, 1912, the population of which by sec. 2, ss. "A" of said Act, is to be excluded from the population of the province in ascertaining the unit of representation.

The application of the provisions of subsection 4 of section 51 of the British North America Act (quoted on p. 79) to Prince Edward Island, Nova Scotia,

New Brunswick, Ontario, Manitoba (the provinces in which a decrease in the rate of growth of population as compared with the rate of Canada as a whole, has taken place), is shown in the following statement:—

Province.	Proportion which Population of each Province Bears to the Total Population in Canada.		Decrease in Proportion from 1921-1931.	Ratio of Decrease in Proportion from 1921 to 1931 to Proportion in 1921.	Decrease greater than, equal to or less than One-Twentieth of Proportion in 1931.
	1921.	1931.			
Prince Edward Island.....	-01008426	-00848412	-00160014	-1587	greater
Nova Scotia.....	-05961197	-04942243	-01018954	-1709	greater
New Brunswick.....	-04413965	-03933963	-00480002	-1087	greater
Ontario.....	-33594627	-33070769	-00313858	-0094	less
Manitoba.....	-06943053	-06747160	-00195887	-0282	less

The above table shows that no reduction should take place in the representation of Ontario or Manitoba, since the proportion which the number of the population of these provinces bore to the number of the aggregate population of Canada at the readjustment of the number of members for the province based on the census of 1921 is ascertained at the census of 1931 to be diminished by less than one-twentieth part.

Nova Scotia.—The proportion for Nova Scotia having diminished by more than one-twentieth part, the provisions of subsection 4 of section 51 do not apply and the representation of Nova Scotia should be reduced, in accordance with the provisions of section 51, subsections 2 and 3 of the Act, by two members.

Prince Edward Island.—Prince Edward Island would only have two members on the strict basis of population but its representation remains unchanged at 4 under the B.N.A. Act of 1915 referred to above.

New Brunswick.—The representation of New Brunswick if fixed by the unit of representation (44,186) would be reduced from 11 to 9; but as the B.N.A. Act of 1915 provided that "a province shall always be entitled to a number of members in the House of Commons, not less than the number of senators representing such province", the representation of New Brunswick will be 10 instead of 9, corresponding with the number of senators from that province.

Yukon.—The representation of Yukon is not determined by the B. N. A. Act, but is within the competence of Parliament to decide. In the following statement it is presumed it will continue to be represented.

The representation, therefore, to which each province is entitled as a result of redistribution based upon the 1931 census will be as follows: Prince Edward Island 4; Nova Scotia 12; New Brunswick 10; Quebec 65; Ontario 82; Manitoba 17; Saskatchewan 21; Alberta 17; British Columbia 16; Yukon 1; total 245.

Constituencies and Representatives in the Seventeenth Parliament.—A complete list of the constituencies, with their 1931 populations, the voters on the list and votes polled at the general election of July 28, 1930, together

with the names and addresses of those then elected to the House of Commons of the seventeenth Parliament of Canada, will be found in Table 9. Changes occurring at subsequent by-elections to Mar. 1, 1933, are indicated in the footnotes.

¹ Mr. M. D. McLean having accepted an office of emolument under the Crown, Hon. H. H. Stevens was elected by acclamation, Aug. 25, 1930.

Subsection 5.—The Dominion Franchise.¹

It was provided by the B.N.A. Act, 1867, that, until otherwise directed by Parliament, elections to the House of Commons should be governed by the electoral laws of the several provinces. The qualifications of electors throughout the Dominion consequently remained the same for both Dominion and provincial elections until, in 1885, Parliament legislated on the subject by passing the Electoral Franchise Act (1885, c. 40). That Act defined a uniform qualification for voters throughout Canada for Dominion purposes, the basis of this new franchise being the ownership or occupation of land of a specified value, although the sons of owners, and particularly farmers' sons, were given the right to vote on special conditions; each province, of course, continued separately to define the qualifications of voters at provincial elections. This Dominion franchise remained in force for thirteen years, but between 1898 and 1920, under the Franchise Act of the former year (1898, c. 14), the provincial franchises were again made applicable at Dominion elections, except that on the constitution of the provinces of Alberta and Saskatchewan it was provided that manhood suffrage, which had already been adopted for the Northwest Territories under an Act to amend the N.W.T. Act (1895, c. 16), should continue in force for Dominion purposes independently of any action that might be taken by the newly elected Legislatures of these two provinces (R.S.C. 1906, c. 6, ss. 31-65). In the other provinces the rules as to the qualifications of voters varied from time to time. In Manitoba manhood suffrage had been adopted in 1888 (1888, c. 2), and the franchise was extended to women on the same terms as to men in 1916 (1916, c. 36). Alberta and Saskatchewan, on their establishment as provinces, continued the previously existing manhood suffrage and both extended the franchise to women on the same terms as to men in 1916 (Alta. 1916, c. 5; Sask. 1916, c. 37). British Columbia adopted manhood suffrage in 1904 (1903-1904, c. 7), Ontario in 1907 (7 Edw. VII, c. 5), and New Brunswick in 1916 (6 Geo. V, c. 16); in British Columbia (1917, c. 23) and in Ontario (7 Geo. V, c. 5), the franchise

¹ Contributed by Oliver Mowat Biggar, K.C., formerly Chief Electoral Officer.

was extended equally to women in 1917, and in New Brunswick this was done in 1919 (9 Geo. V, c. 63). In Quebec and Prince Edward Island the provincial franchises throughout the period in question were not so wide; in neither were women admitted to vote and certain property or other special qualifications were required in each. A property qualification was also required in Nova Scotia until 1920 (10-11 Geo. V, c. 49), but between 1918 and 1920 men and women had voted on equal terms (9 Geo. V, c. 3). The adoption of the provincial franchise laws for Dominion purposes was temporarily modified by the War Times Elections Act (1917, c. 39), which admitted certain near female relatives of serving soldiers and sailors to vote at Dominion elections, and three years later, on the adoption of a New Dominion Elections Act (1920, c. 46), the provincial franchises were again wholly abandoned and a new electoral qualification was established for Dominion elections throughout Canada. Subject to a modification of the usual rules as to changes of nationality, which was amended in 1921 (1921, c. 29, s. 3) and repealed in 1922 (1922, c. 20, s. 1), the right to vote was conferred by the new Act upon all British subjects, male and female, of 21 years and upwards, who had resided in Canada for a year, and for two months in the electoral district in which they desired to vote, this last restriction having been removed two years later (1922, c. 20), so far it as applied to general elections. The only adult British subjects who now are denied the right to vote are prisoners undergoing punishment, lunatics in institutions, Indians within the meaning of the Indian Act and not having served in the Great War, judges appointed by the Dominion Government, persons paid for work on behalf of a candidate in relation to the election, persons expressly disfranchised for corrupt or illegal practices and certain persons who by reason of their race are not permitted, under the law of the province in which they live, to vote at a provincial election in that province. The effect of this last exception is to exclude from the franchise only such Chinese, Japanese and East Indians as reside in British Columbia and did not serve in the Canadian forces during the Great War, and such Chinese as reside in the province of Saskatchewan and did not so serve. (See also R.S.C. 1927, c. 53, The Dominion Elections Act, as amended by c. 40 of 1929 and c. 16 of 1930.)

The Use of the Franchise.—The number of voters on the lists and the number of votes polled at the general elections of 1921, 1925, 1926 and 1930, are given in Table 10.

10.—Number of Voters and Votes Polled in the General Elections of 1921, 1925, 1926 and 1930.

¹ The area of Ontario was extended by the Ontario Boundaries Extension Act, 1912 (2 Geo. V, c. 40).

² Extended by Quebec Boundaries Extension Act, 1912 (2 Geo. V, c. 45), and diminished in consequence of the award of the Judicial Committee of the British Privy Council (Mar. 1, 1927), whereby some 112,400 square miles of territory, formerly considered as part of Quebec, were assigned to Newfoundland.

³ Extended by Extension of Boundaries of Manitoba Act, 1881, and Manitoba Boundaries Extension Act, 1912 (2 Geo. V, c. 32).

⁴ Alberta and Saskatchewan now cover approximately the area formerly comprised in the districts of Assiniboia, Athabaska, Alberta and Saskatchewan, established May 17, 1882, by minute of Canadian P.C., concurred in by Dominion Parliament and Order in Council of Oct. 2, 1895.

⁵ By an Order in Council of June 23, 1870, Rupert's Land, acquired under the Rupert's Land Acts of 1867 and 1868, and the undefined Northern Territories were admitted in to the Confederation. The original Northwest Territories, mentioned in the Manitoba Act, 1870, were established by the Northwest Territories Act, 1880 (43 Vict., c. 25), the district of Keewatin having been previously defined by an Act of the Dominion Parliament (39 Vict., c. 21). The provisional districts of Yukon, Mackenzie, Franklin and Ungava were defined in an Order in Council of Oct. 2, 1895, their boundaries being changed by Order in Council of Dec. 18, 1897. By Order in Council of July 24, 1905, the area of Keewatin, not included in the Northwest Territories, was annexed to the latter from Sept. 1, 1905. By the Extension of Boundaries Act, 1912, Ungava was made a part of the province of Quebec, and the remaining area of the Northwest Territories south of 60° N. latitude was divided between Manitoba and Ontario.

In each of the provinces the King is represented by a Lieutenant-Governor appointed by the Governor General in Council, and governing with the advice and assistance of his Ministry or Executive Council, which is responsible to the Legislature and resigns office when it ceases to enjoy the confidence of that body. The Legislatures of all the provinces with the exception of Quebec are now unicameral,¹ consisting of a Legislative Assembly elected by the people. In Quebec there is a Legislative Council as well as a Legislative Assembly. For detailed description of the Provincial Governments, the reader is referred to pp. 101-115 of the 1922-23 edition of the Year Book.

The Lieutenant-Governors of the provinces, together with the names of the Ministers of the present administrations, are given in Table 12. Details regarding Provincial Legislatures and Ministries from Confederation to 1924 were given on pp. 75-84 of the 1924 Year Book.

¹ The Legislative Council of Nova Scotia ceased to exist in 1928.

12.—Lieutenant-Governors of Provinces, 1867-1932, and Present Ministries.

NOTE.—The Lieutenant-Governor of a province is styled "His Honour" and is also styled "Honourable" throughout his life.

THE TERRITORIES.

NOTE.—In 1888 the districts of Alberta, Assiniboia, Athabaska and Saskatchewan, then called the Northwest Territories, with their capital at Regina, were given local responsible government, and the old Northwest Council was replaced by the Northwest Legislature, which existed until Aug. 31, 1905. When the area included in these districts was formed into the provinces of Alberta and Saskatchewan, on Sept. 1, 1905, these provinces were given systems of government similar to the other provinces of the Dominion. The remaining areas (Yukon and the provisional districts of Franklin, Keewatin and Mackenzie) are now administered by the North West Territories and Yukon Division, Dominion Lands Administration, Department of the Interior. The Deputy Minister of the Department is, *ex officio*, the Commissioner of the Northwest Territories which comprises the three provisional districts.

PART IV.—REPRESENTATIVES IN OTHER COUNTRIES.

Section 1.—Representatives within the Empire.

The policy of the early North American colonies, of maintaining in London accredited representatives for business and diplomatic purposes, was recognized in the eighteenth century as being a more satisfactory means of communication with the British Government than that provided by occasional official visits or by correspondence. Edmund Burke, the noted British statesman, held the position of agent for the colony of New York for some years following 1771. Of the Canadian colonies, Nova Scotia was the first to adopt this plan, its Legislature having appointed an agent in London in 1761. New Brunswick was similarly represented in 1786, Upper Canada as early as 1794, Lower Canada in 1812 and British Columbia in 1857. For some years after 1845, several of the colonies were represented in London by Crown agents, appointed by the Secretary of State, and paid by the colonies themselves. This system, however, was of but short duration.

The older provinces of Quebec, Ontario and British Columbia still adhere to the practice of former days and are represented in London by Agents-General, as is also the province of Alberta. These officials are appointed by the Legislatures of the provinces under general authority given in the British North America Act and act for their Governments in capacities very similar to that of the High Commissioner, with the exception, perhaps, that their duties have tended to become of a business rather than a diplomatic nature.

The High Commissioner for Canada.—With the federation of the provinces of British North America in 1867, a new political entity which could not avail itself of the services of the provincial agents was brought into existence. To supplement the ordinary method of communication between the Canadian and British Governments (which at that time was by correspondence between the Governor General and the Secretary of State for the Colonies, and is now between the Secretary of State for External Affairs of Canada and the Secretary of State for Dominion Affairs in London), the position of High Commissioner for Canada was created in 1880 (see R.S.C. 1927, c. 92). The duties of the office are defined in the Act as follows:—

“The High Commissioner shall—

- “(a) act as representative and resident agent of Canada in Great Britain and in that capacity, execute such powers and perform such duties as are, from time to time, conferred upon and assigned to him by the Governor in Council;
- “(b) take the charge, supervision and control of the immigration offices and agencies in Great Britain, under the Minister of Immigration and Colonization;
- “(c) carry out such instructions as he, from time to time, receives from the Governor in Council respecting the commercial, financial and general interests of Canada in Great Britain and elsewhere”

Sir Alexander Galt was the first Canadian High Commissioner, holding office from May 11, 1880, until May, 1883; in 1884 he was succeeded by Sir Charles Tupper. Lord Strathcona and Mount Royal was appointed in 1896. Sir George H. Perley took charge of the High Commissioner's Office in 1914 but was appointed High Commissioner only on Oct. 12, 1917. The Hon. P. C. Larkin was appointed in February, 1922, and after his decease (Feb. 3, 1930) the Hon. G. Howard Ferguson was appointed on Nov. 28, 1930. The office of the High Commissioner for Canada is in the Canadian Building, Trafalgar Square, London, S.W. 1.

His Majesty's Government in Great Britain appointed in April, 1928, a High Commissioner for Great Britain in Canada, Sir William H. Clark, who resides in Ottawa, and whose position corresponds to that of the High Commissioner for Canada in Great Britain. This appointment was made in consequence of discussions at the Imperial Conference of 1926. The relevant passage in the report of the Inter-Imperial Relations Committee runs as follows:—

"A special aspect of the question of consultation which we considered was that concerning the representation of Great Britain in the Dominions. By reason of his constitutional position, as explained in section IV (b) of this report, the Governor General is no longer the representative of His Majesty's Government in Great Britain. There is no one therefore in the Dominion capitals in a position to represent with authority the views of His Majesty's Government in Great Britain.

"We summed up our conclusions in the following resolution which is submitted for the consideration of the Conference:—

" 'The Governments represented at the Imperial Conference are impressed with the desirability of developing a system of personal contact, both in London and in the Dominion capitals, to supplement the present system of intercommunication and the reciprocal supply of information on affairs requiring joint consideration. The manner in which any new system is to be worked out is a matter for consideration and settlement between His Majesty's Governments in Great Britain and the Dominions, with due regard to the circumstances of each particular part of the Empire, it being understood that any new arrangements should be supplementary to, and not in replacement of, the system of direct communication from Government to Government and the special arrangements which have been in force since 1918 for communications between Prime Ministers.' "

Section 2.—Representatives outside the Empire.

The Canadian Minister to the United States.—For many years the diplomatic business between Canada and the United States has been steadily increasing, as the natural result of the proximity of the two countries and the closeness of the business relationships between their citizens. Before the Great War a former British Ambassador at Washington, Lord Bryce, said that between two-thirds and three-quarters of the work of the British Embassy in the United States was occasioned by Canadian affairs.

In January, 1918, a temporary Canadian War Mission was established at Washington under the chairmanship of Mr. Lloyd Harris, and was maintained for some years after the close of the War. Though not a formal diplomatic mission, its duties extended to questions usually dealt with through diplomatic channels. After the retirement of this mission Canada was represented in Washington by Mr. M. M. Mahoney, who acted as agent of the Department of External Affairs, and, through the courtesy of the British Government, occupied an office at the British Embassy.

In 1920, following discussions between the British and Canadian Governments, it was announced that agreement had been reached upon the appointment of a Canadian Minister at Washington, who would act for the British Ambassador in the latter's absence. No appointment was made until Nov. 26, 1926, when, after decision to omit the arrangement that the Canadian Minister should substitute

for the British Ambassador, Hon. Charles Vincent Massey was appointed as His Majesty's Envoy Extraordinary and Minister Plenipotentiary in the United States of America to represent the interests of the Dominion of Canada (P.C. 1780 of Nov. 10, 1926). Mr. Massey took up his duties in February, 1927 and held office until July 23, 1930. Major W. D. Herridge, K.C., D.S.O., M.C., was appointed Minister to the United States on Mar. 7, 1931. The Canadian Legation in Washington is situated at 1746 Massachusetts Ave.

The United States Government reciprocated in 1927 by appointing Hon. William Phillips its first Minister to Canada; his successor, Lt.-Col. the Hon. Hanford MacNider, was appointed in August, 1930, and resigned in September, 1932. The office has since been vacant, pending an appointment by the Roosevelt Administration.

The Canadian Minister to France.—For many years the Canadian Government maintained an agency at Paris. The post was first occupied in 1882 by Hon. Hector Fabre, who also represented for a time the Government of Quebec. After his death Hon. Philippe Roy was appointed in May, 1911, with the title of Commissioner-General of Canada in France. In 1928 an exchange of Ministers was agreed upon between Canada and France, and in September of that year Hon. Philippe Roy was appointed as His Majesty's Envoy Extraordinary and Minister Plenipotentiary in France to represent the interests of the Dominion of Canada. The Canadian Legation in Paris is situated at No. 1, rue François premier.

The French Government appointed M. Georges Jean Knight as its first Minister in Canada in 1928. On July 1, 1930, he was reappointed to the French Foreign Office, and on Mar. 12, 1931, M. Charles Arsène Henry was appointed his successor.

The Canadian Minister to Japan.—In 1928 an exchange of Ministers was agreed upon between the Governments of Canada and Japan, and Hon. H. M. Marler was appointed in 1929 as His Majesty's Envoy Extraordinary and Minister Plenipotentiary in Japan to represent the interests of the Dominion of Canada.

The Japanese Government appointed Mr. Iyemasa Tokugawa as its first Minister in Canada in 1929.

Canadian Advisory Officer, League of Nations.—The precedent of appointing permanent representatives at Geneva accredited to the League of Nations was set, it is understood, by Japan, and has found favour especially among those nations which are situated at a distance from Geneva. It was found that, while countries adjacent to the seat of the League were able without difficulty to include in the personnel of their delegations to the Assembly and Council various advisors and assistants at a minimum of expense, distant countries were at a disadvantage in this respect. Canada's duties as a member of the Assembly and of the International Labour Conference, and as one of the eight countries represented on the Governing Body of the International Labour Office, made this disadvantage especially felt. Accordingly, the position of Dominion of Canada Advisory Officer, League of Nations, was created by Order in Council P.C. 2174 of Dec. 17, 1924, and Dr. W. A. Riddell was appointed to the post on Jan. 1, 1925.

The duties of the Canadian Advisory Officer are "to establish and maintain as close relations as possible with the Secretariats of the League of Nations and the International Labour Office", to "communicate with the Government of Canada as to all matters arising and requiring its attention", and to "act in all such matters

in an advisory capacity to the Government of Canada and to delegates from the Government of Canada to conferences arising out of the organizations before-named". The office of the Canadian Advisory Officer is situated at 41, Quai Wilson, Geneva.

PART V.—CANADA AND THE LEAGUE OF NATIONS.¹

The League of Nations is an association of States which have pledged themselves, in accepting the Covenant (*i.e.*, the constitution of the League), not to go to war before submitting their disputes with each other or States not Members of the League to arbitration or inquiry and a delay of from three to nine months. Furthermore, any State violating this pledge is automatically in a state of outlawry with the other States, which are bound to sever all economic and political relations with the defaulting member. The States Members of the League have pledged themselves to co-operate over a wide range of economic, social, humanitarian and labour questions.

The League of Nations came formally into existence on Jan. 10, 1920, through the coming into force of the Treaty of Versailles. The two official languages of the League are English and French. The seat of the League is Geneva, Switzerland. Canada, as a signatory of the Treaty of Versailles, has been a Member of the League from the beginning.

The Organs of the League.—The primary organs of the League are: (1) The Council; (2) The Assembly; (3) The Secretariat; (4) The International Labour Organization (see Chap. XIX); (5) The Permanent Court of International Justice.

The Council.—The Council now consists of five permanent Members (the British Empire, France, Italy, Japan² and Germany), together with nine non-permanent Members elected for three years (three retiring each year) from among the fifty-four States which are Members of the League. The non-permanent Members of the Council are at present as follows: Guatemala, Irish Free State and Norway, terms expiring 1933; Panama, China and Spain, terms expiring 1934; Czechoslovakia, the United States of Mexico and Poland, terms expiring 1935. Canada was a Member of the Council of the League from 1927 to 1930.

The Assembly.—Every State Member of the League is entitled to be represented by a delegation to the Assembly of not more than three delegates, but has only one vote. The Assembly normally meets at the seat of the League (Geneva) on the first Monday in September. In 1930, the Canadian delegation was headed by Rt. Hon. Sir R. L. Borden; in 1931, by the Hon. Hugh Guthrie and in 1932, by the Hon. C. H. Cahan. At the extraordinary Assembly in March, 1932, Rt. Hon. Sir G. H. Perley was the senior delegate.

The Secretariat.—The Secretariat is a permanent organ composed of the Secretary-General and a number of officials selected from among citizens of all Member

¹A fuller article on Canada and the League of Nations, contributed by N. A. Robertson of the Department of External Affairs to the 1931 Year Book, gave the names of the States Members of the League, information regarding the budget of the League, mandates, minorities, the economic and financial organization, the organization for communications and transit, the health organization and social and humanitarian work of the League, in addition to fuller treatments of the subjects here dealt with. This article appeared at pp. 115-23 of the 1931 Year Book. The text of the Covenant of the League of Nations, and the General Act for the Pacific Settlement of International Disputes, may be obtained from the King's Printer, Ottawa, price 25 cents.

²Japan gave formal notice of intention to withdraw from the League on March 27, 1933.

States and from the United States of America. The Secretary-General appointed by the Peace Conference was the Hon. Sir James Eric Drummond, K.C.M.G., C.B., who has submitted his resignation; his successor, M. Joseph A. Avenol, has been appointed by the Council with the approval of the majority of the Assembly. The other officials are appointed by the Secretary-General with the approval of the Council.

Permanent Court of International Justice.—The Permanent Court of International Justice was established by the Protocol of Dec. 16, 1920, in accordance with Article 14 of the Covenant of the League of Nations. It is composed of a body of fifteen judges elected by the Assembly and Council of the League of Nations for a term of nine years, and sits at the Hague. The Court is competent to hear and determine any dispute of an international character which the parties thereto submit to it; it may also give an advisory opinion upon any dispute or question referred to it by the Council or the Assembly. Article 36 of the Statute of the Court provides that any State may recognize as compulsory the jurisdiction of the Court in all or any classes of legal dispute concerning:—

- (a) The interpretation of a Treaty.
- (b) Any question of international law.
- (c) The existence of any fact which, if established, would constitute a breach of an international obligation, and the nature and extent of the reparations to be made for the breach of the international obligation.

Canada has been a Member of the Court from its establishment, and in 1929 accepted, subject to certain reservations, the compulsory jurisdiction of the Court in the cases contemplated in Article 36.

CHAPTER IV.—POPULATION.¹

The Population chapter of the Year Book is a *précis* of the results of investigations into the number and the constitution of the population made in the seven censuses of Canada since Confederation, summarizing the growth and distribution of population between 1871 and 1931, as shown by the successive decennial censuses, in regard to the chief matters investigated at the censuses.

The modern census, now established in all civilized countries as the chief method of measuring periodically the population and its social and economic condition, has been described by a modern United States writer as the greatest single peace-time activity in which a government engages, both in respect of the physical extent of its organization and the important part which its results play in the general administration of public affairs.

Under the Canadian constitution, the legal *raison d'être* of the census is to determine representation in the House of Commons; after each decennial census a redistribution of seats in the House, following the course of the movement of population, is made in the manner described on pp. 80-83 of this volume. But the census, especially since the introduction of methods of mechanical tabulation, has become far more than a mere counting of heads. It is a great periodical stock-taking of the people and their affairs, designed to show as fully as possible the stage which has been reached in the progress of the nation. Thus the numbers, local distribution, age, sex, racial origin, nationality, language, religion, education, housing and occupations of the people, severally constitute investigations of enormous importance, to which all the continuous and routine statistics collected in the ordinary course of administration must be related if their importance is to be realized. The census, in fine, rounds out and completes the scheme of information upon which the Government relies in conducting the business of the country.

On account of the requirements as to parliamentary representation and the payment of provincial subsidies, which are based on population, the Canadian census is taken on the *de jure* principle; *i.e.*, each person is counted as belonging to the locality in which he is regularly domiciled, irrespective of where he may be at the date of the enumeration. Under the *de facto* method, adopted in the United Kingdom, each individual is counted as belonging to the locality where he is found on the census date. The *de facto* method is undoubtedly simpler, but the *de jure* plan better portrays the permanent condition of the population. The chief difficulty in the application of the latter method is found in connection with holiday resorts, in the segregation of "visitors" and the tracing of "absentees". A date prior to the opening of the holiday season is accordingly chosen for the date of the census. In the Canadian census, students and inmates of hospitals are assigned to their home localities, while inmates of prisons, jails, lunatic asylums, etc., are counted where found.

Section 1.—Census Statistics of General Population.

Since the creation of the Dominion of Canada, in 1867, decennial censuses have been taken on the *de jure* plan as of the dates April 2, 1871, April 4, 1881, April 5, 1891, April 1, 1901, June 1, 1911, 1921, and 1931. The population of Canada and its percentage distribution as on each date, together with the absolute and percentage increases from decade to decade, are given in Tables 1 to 4 immediately following.

¹This chapter has been revised by E. S. Macphail, Chief, Demography Branch, Dominion Bureau of Statistics. A list of the publications of this branch will be found in Chapter XXIX, Section I, under "Population".

¹The decreases shown in the population of the Northwest Territories since 1891 are due to the separation therefrom of immense areas to form Yukon and the provinces of Alberta and Saskatchewan as well as to extend the boundaries of the older provinces of Quebec, Ontario and Manitoba.

²Revised in accordance with the Labrador award of the Privy Council, Mar. 1, 1927.

Early Censuses.—The credit of taking the first census of modern times belongs to Canada. The year was 1666, the census that of the colony of New France. Still earlier records of settlement at Port Royal (1605) and Quebec (1608) are extant; but the census of 1666 was a systematic "nominal" enumeration of the people, taken on the *de jure* principle on a fixed date, showing age, sex, occupation and conjugal and family condition. A second census in 1667 included the areas under cultivation and the numbers of sheep and cattle. When it is recalled that in Europe the first census dates only from the eighteenth century (those of France and England from the first year of the nineteenth) and that, in the United States, the census begins only with 1790, the achievement of the primitive St. Lawrence colony, in instituting what is to-day one of the principal instruments of government throughout the civilized world, may call for more than passing appreciation.

The census of 1666 (the results occupy 154 pages in manuscript, and are still to be seen in the Archives in Paris, or in a transcript at Ottawa) showed some 3,215 souls. It was repeated at intervals more or less regularly for a hundred years. By 1685 the total had risen to 12,263, including 1,538 Indians settled in villages and living a civilized life under the supervision of the missionaries. By the end of the century it had passed 15,000, and this was doubled in the next twenty-five years. Not to present further details, some of which will be found in the Chronology on pp. 60-69, it may be said that at the time of the cession (1763) the population of New France was nearly 70,000 (69,810 in 1765), whilst another 10,000 French (thinned to these proportions by the expulsion of the Acadians) were scattered through what are now Nova Scotia, New Brunswick and Prince Edward Island. The British population of Nova Scotia was 8,104 in 1762, thirteen years after the foundation of Halifax in 1749.

Our chief sources of statistics for half a century and more after the cession are the reports—more or less sporadic—of colonial governors though censuses of the different sections under British rule were taken at irregular intervals. British settlement on a substantial scale in the Gulf provinces and in Ontario dates only from the Loyalist movement which followed the American Revolution, at the end of which, *i.e.*, about the year of the Constitutional Act (1791), the population of

Lower Canada was approximately 163,000, whilst the newly constituted province of Upper Canada, under Lieutenant-Governor Simcoe, numbered perhaps 15,000, and the addition of the maritime colonies brought the total to well over 200,000. A decade later Canada began the nineteenth century with a population of probably not less than 250,000 or 260,000. Subsequent censuses gave the populations of the different colonies as follows: Upper Canada (1824) 150,066, (1840) 432,159; Lower Canada (1822) 427,465, (1844) 697,084; New Brunswick (1824) 74,176, (1840) 156,162; Nova Scotia (1817) 81,351, (1838) 202,575; Prince Edward Island (1822) 24,600, (1841) 47,042.¹

The policy of desultory census-taking was ended in 1847 by an Act of the Canadian Legislature creating a "Board of Registration and Statistics" with instructions "to collect statistics and adopt measures for disseminating or publishing the same" and providing also for a decennial census. The first census thereunder was taken in 1851 and, as similar censuses were taken by New Brunswick and Nova Scotia in the same year, we have a regular measure of population growth in Canada over the past 80 years. The 'fifties saw a very rapid development, especially in Ontario, whilst the 'sixties showed only less substantial gains. In the years following Confederation there was a spurt, the increase between 1871 and 1881 (which included several lean years towards the end) being 635,553, or 17·23 p.c. In neither of the last two decades of the nineteenth century, however, was this record equalled either absolutely or relatively, the gains in each being under 550,000, or 12 p.c. With the end of the century the population of Canada had reached approximately five and a third millions, or twenty times that of 1800. It has increased by five millions in the past thirty years.

Expansion in the Twentieth Century.—It is within the present century that the most spectacular expansion of the population of Canada has taken place. The outstanding feature was, of course, the opening to settlement of the "last best West". The unorganized territories of British North America had been ceded to the Dominion soon after Confederation, and the West had been tapped and traversed by the Canadian Pacific Railway in the 'eighties and 'nineties. But though western population was doubled in each of these decades, it was only with the launching of a large-scale immigration movement after 1900 that western settlement and production became a first-rate economic factor. Simultaneously an almost equally striking development occurred in the industrial centres of Eastern Canada, forming the immediate basis for the move upon the West. At the back, of course, was the heavy inflow of British and other capital—a total of \$1,500,000,000 between 1900 and 1912—which went to finance the large constructive undertakings (chiefly railway, municipal and industrial) which characterized the movement and which represented at bottom the traditional policy of England in search of cheap and abundant food for her workshop population. The years 1901 to 1911, in brief, form the *decas mirabilis* of Canadian expansion. The immigration movement just mentioned, which had previously run well under 50,000 per annum, rose rapidly to over five times that volume, eventually passing 400,000 in a single year. In the ten years between 1901 and 1911 it exceeded 1,800,000 and, though at least a third of these were lost (partly in the return to Europe of labour temporarily attracted by the railway and other developments in progress, and partly in the never-ceasing and natural "drag" of the United States upon a virile and less wealthy people), it formed the chief factor in the gain of 34 p.c. which the total

¹A résumé of the results of all the censuses taken in Canada between 1666 and 1861 was published as Vol. IV of the census of 1871.

population of Canada registered in that decade, and which was larger than the relative growth of any other country during the same period. The movement was continued and even intensified in the first three years of the second decade of the century, after which a recession set in to which the outbreak of war gave a new and wholly unexpected turn. Nevertheless, the decade which closed with the census of 1921 showed over 1,700,000 immigrant arrivals in Canada, and, though the proportionate loss of these was very heavy (probably as much as two-thirds), Canada's relative gain for the decade was again among the largest in the world.

Results of the Census of 1931.—According to the final results of the 1931 census, the total population of the Dominion on June 1, 1931, was 10,376,786, as compared with 8,787,949 on June 1, 1921, an increase of 1,588,837 or 18·08 p.c. in the decade, as compared with 21·94 p.c. and 34·17 p.c. during the decades 1911 to 1921 and 1901 to 1911 respectively.

During the decade 1911-21 the countries which comprise the British Empire, and more especially the United States which was in the Great War for only nineteen months as against Canada's fifty-two, suffered less in actual loss of life from the War and its consequences than the continental countries of Europe. None of them declined in population during the period, as many continental European countries did. Their percentage increases, however, were in almost all cases lower than in the previous decade. Thus the population of England and Wales increased between 1911 and 1921 only from 36,070,492 to 37,885,242, or 5·0 p.c., as compared with an increase of 10·9 p.c. in the previous decade; Scotland, again, increased only from 4,760,904 to 4,882,497, or 2·6 p.c., as compared with 6·5 p.c. between 1901 and 1911. Nor has this situation been much improved in the post-war decade 1921-31, for the increase in England and Wales during these years was but 5·4 p.c. and Scotland actually showed a decrease of 0·8 p.c. Of the overseas Dominions, New Zealand, according to the latest official estimate (the census of 1931 was postponed), increased her population from 1,218,913 to 1,510,940 or by nearly 24 p.c. for the decade ended 1931, as compared with 20·9 p.c. and 30·5 p.c. respectively for the decades ended 1921 and 1911. In the case of the white population of South Africa, much the same condition obtained. The Commonwealth of Australia, the only Dominion to grow more rapidly in the second decade of the twentieth century than in the first, increased from 4,455,005 in 1911 to 5,435,734 in 1921 or by 22·01 p.c. as compared with 18·05 p.c. for the previous decade and 19·4 p.c. for the most recent decade 1921-31 (based on the latest official population estimate of 6,488,707 for 1931¹). The population of the continental United States increased between 1920 and 1930 from 105,710,620 to 122,775,046, an increase of 16·1 p.c., as compared with 14·9 p.c. in the decade 1910-20 and 21 p.c. in the decade 1900-10.

Considering now the movement of population within the Dominion of Canada itself, it is evident from Table 1 that in this country, as formerly in the United States, there is a distinct movement of population from east to west. In the decade from 1911 to 1921 this was clearly apparent, for the four western provinces then increased their population by no less than 44 p.c. and for the decade 1921-31 the increase was from 2,480,664 to 3,047,792, or 22·86 p.c. From 1921 to 1931 the five eastern provinces increased from 6,294,655 to 7,315,041, an increase of 1,020,386 persons, which, though absolutely larger than the figure for the West, constitutes an increase of only 16·2 p.c. over the 1921 population. The same conclusion may be deduced from Table 2, which shows that while in 1871 only 2·96 p.c. and in

¹As in the case of New Zealand the census of 1931 was postponed

1881 only 3.88 p.c. of the population of the country dwelt west of the lake of the Woods, the percentage in 1891 was 7.24; in 1901, 12.02; in 1911, 24.09; in 1921, 28.37; and in 1931, 29.50.

On the other hand, the Maritime Provinces, which in 1871 contained 20.80 p.c. of the total population of the Dominion, had in 1881 20.14 p.c., in 1891 18.22 p.c., in 1901 16.64 p.c., in 1911 13.01 p.c., in 1921 11.38 p.c., and in 1931 only 9.72 p.c. of the population. Ontario and Quebec—the old pre-Confederation Province of Canada—still remain the chief centre of population. Their proportion of the total was 60.77 p.c. in 1931, as compared with 76.24 p.c. in 1871, 75.98 p.c. in 1881, 74.54 p.c. in 1891, 71.34 p.c. in 1901, 62.90 p.c. in 1911 and 60.25 p.c. in 1921. In other words, the net result of the sixty years has been that in 1931 three-fifths of the population of the Dominion lived in these provinces as compared with more than three-fourths in 1871.

In 1881 the "centre" of population east and west was in the county of Prescott, Ontario, not far from Caledonia village. In 1891 it had moved west to the vicinity of Ottawa, where it remained in 1901. In 1911 the county of Victoria, Ontario, contained the centre, and it was probably in the Parry Sound district of Ontario in 1921 and at the present time is somewhat west of this locality.

Density of Population.—The density of population in 1931 (*i.e.*, the number of persons per square mile of the land area as in that year), as compared with 1921 and 1911, is shown by provinces and for the country as a whole in Table 5. Generally speaking the density of population decreases as one travels westward, but the enormous area of the province of Quebec unduly reduces the density of its population, which was 5.49 in 1931. As among the nine provinces, the density of population is greatest in Prince Edward Island and least in British Columbia.

5.—Density of Population in Canada, by Provinces and Territories, 1911, 1921 and 1931.

Note.—Densities are for revised land areas as in 1933 (see p. 7).

Province.	1911.	1921.	1931.	Province or Territory.	1911.	1921.	1931.

Manitoba	2.10	2.78	3.19	Canada	2.68	2.54	3.00

Elements of Growth.—The former lack of comprehensive and comparable vital statistics for the whole of Canada, together with the lack of statistics of emigration, makes it difficult to determine how far the growth of population since the commencement of the twentieth century is due to natural increase and how far to immigration. The following estimate (Table 6) may, however, be of interest. During the decade 1911-21, in addition to 60,000 Canadians who died overseas and nearly 20,000 who took their discharge in the United Kingdom, there were also great numbers of residents of Canada—most of them recent immigrants—who left Canada to join the forces of the Mother Country and her allies in the Great War and did not return.

6.—Movement of Population, including Estimated Natural Increase, Recorded Immigration and Estimated Emigration, for the Inter-Censal Periods 1901-11, 1911-21 and 1921-31.

Decade and Item.	No.
Decade 1901-1911—	
Population, Census of April 1, 1901	5,371,315
Natural increase (1901-1911), estimated	853,566
Immigration (April 1, 1901, to May 31, 1911)	1,847,651
Total	8,072,532
Population, Census of June 1, 1911	7,209,643
Emigration (April 1, 1901, to May 31, 1911), estimated	865,889
Decade 1911-1921—	
Population, Census of June 1, 1911	7,206,643
Natural increase (1911-1921), estimated	1,150,125
Immigration (June 1, 1911, to May 31, 1921)	1,728,921
Total	10,085,689
Population, Census of June 1, 1921	8,787,949 ¹
Emigration (June 1, 1911, to May 31, 1921) estimated	1,297,740 ²
Decade 1921-1931—	
Population, Census of June 1, 1921	8,787,949 ¹
Natural increase (1921-1931), partly estimated for the years 1921-25 in the case of Quebec	1,325,256
Immigration (June 1, 1921, to May 31, 1931), including 288,874 returned Canadians	1,509,136
Total	11,622,341
Population, Census of June 1, 1931	10,370,786
Emigration (June 1, 1921 to May 31, 1931), estimated	1,245,555
Net gain in population, 1901-1911	1,835,328
Net gain in population, 1911-1921	1,581,305
Net gain in population, 1921-1931	1,588,837

¹Revised in accordance with the Labrador award of the Privy Council, Mar. 1, 1927.

²This figure includes also the 60,000 Canadian lives lost at the front and the soldiers (about 20,000) enlisting in the Canadian forces and receiving their discharge in the United Kingdom.

Subsection 1.—Population of Canada by Provinces and Electoral Districts.

The populations of the several provinces and electoral districts of Canada in 1931 as compared with 1921 are given in Table 7.

7.—Population of Canada, by Provinces and Electoral Districts, 1931, Compared with 1921.

Province and Electoral District.	Population.		Province and Electoral District.	Population.

Section 2.—Sex Distribution.

Throughout the older countries of the world there is usually found an excess of female over male population, more especially as in most of these countries the census is taken on a *de facto* instead of, as in Canada, on a *de jure* basis. The causes of this excess of female population are: (1) the normally higher rate of mortality among males; (2) the greater number of males who travel; (3) the effects of war; (4) the employment of males in the army, navy and merchant marine; and (5) the preponderance of males among emigrants. In the newer countries of the world, however, the preponderance of males among immigrants results in a general excess of male over female population. These phenomena are exemplified for both the older and the newer countries in Table 10.

In Canada there has been an excess of male population from the commencement of its history, the first census of 1666 showing 2,034 males to only 1,181 females. As the colony increased in numbers, the disproportion between the sexes became smaller, more especially since the French-Canadian population, after about 1680, was not reinforced by immigration from the old world. In 1784, when the English-speaking immigration to Canada for purposes of settlement was com-

mencing, there were 54,064 males and 50,759 females in the colony. At the middle of the nineteenth century, there were 449,967 males to 440,294 females in Lower Canada, and 499,067 males to 452,937 females in the more newly-settled Upper Canada, and since Confederation the same phenomenon of considerable excess of males has occurred throughout the growing Northwest. The great immigration of the first decade of the present century resulted in raising what is called the "masculinity" of the Canadian population (*i.e.*, the excess of males over females per 100 of population) to the highest point in recent history, *viz.*, 6.07 p.c. in 1911. The Great War, however, both checked immigration and took about 60,000 young Canadian male lives as its toll, with the result that at the census of 1921 the masculinity of our population was only 3 p.c.— 515 males to 485 females per 1,000 of population.

In 1931 there were 518 males to 482 females for Canada as a whole. It is interesting to note that the masculinity of the population has increased in the eastern provinces and decreased in the western ones, where it was formerly greatest. In Table 8 statistics are presented, showing the number of males and females in each of the provinces and territories at each census since 1871, while Table 9 shows the proportions of the sexes and excess of males per 1,000 of population. The statistics of Table 10 show the position of Canada among other countries of the world in regard to masculinity.

Section 3.—Conjugal Condition.

In Table 11 are given, in summary form together with percentages, the statistics of the conjugal condition of the population, as single, married, widowed, divorced and legally separated, for 1871 and subsequent censuses. Especially notable is the larger percentage of married in the more recent years. This is mainly attributable to the larger percentage of adults to total population in our own time. Noteworthy also is the larger percentage of divorced and legally separated in recent years. The reader is referred to p. 166, Table 19, for details of divorces granted in the years 1901-32.

The conjugal condition of the 1931 population is shown by provinces in Table 12 and by age-groups in Table 13.

11.—Conjugal Condition of the Population, by Numbers and Percentages, as Shown by Censuses of 1871, 1881, 1891, 1901, 1911, 1921 and 1931.

Section 4.—Age Distribution.

The same causes which have in the past rendered the sex distribution of population in Canada somewhat unusual have also affected its age distribution. In the first stages of the settlement of a new colony, men in the prime of life constitute the bulk of the population, and women and children are conspicuous by their absence, so that there will be a disproportionately large male population between the ages of 20 and 50, together with a low birth rate. Later on in the settlement of a new country where there is land and food for all and where the early disproportion of the sexes has been overcome, there is a very high rate of natural increase, and an extraordinarily large proportion of children among the population. Thus in 1871

(see Table 14), 286.91 out of every 1,000 of the population of Canada were children under 10 years of age and over half the total population (526.76 out of every 1,000) were under 20 years of age. But with the growing urbanization of population, the average age at marriage increased and children came to be regarded as a liability rather than an asset. Thus in 1911, out of every 1,000 of the population, only 231.83 were under 10 years of age and 423.42 under 20 years of age. In 1921, however, 239.67 per 1,000 of the population were under 10 years of age and 434.81 per 1,000 under 20 years. In 1931, the number of children under 10 years of age had dropped to 212.51 per 1,000 of the population, and of persons under 20 to 416.20 per 1,000.

Table 15 shows the varying age distribution of the population of the different provinces, while Table 16 gives details of the age distribution of the population of the Dominion, by sex, for the census years 1881 to 1931.

14.—Proportion per 1,000 of the Population by Age Periods, 1871, 1881, 1891, 1901, 1911, 1921 and 1931.

Section 5.—Racial Origins.

In six out of the seven censuses of Canada since Confederation the racial origin of each person has been secured, the exception being in 1891. The object of this information is to ascertain from what basic ethnic stocks the Canadian population, more particularly the recently immigrated population, is derived. The answer "Canadian" is not accepted under this heading, as the purpose of the question is to obtain, in so far as possible, a definition of "Canadian" in terms of racial derivation. Of this procedure of the census, criticism has been received on two main grounds: (a) that there are Canadians whose family is of several generations residence in the country who may not know their ultimate racial origin, or who may be of very mixed racial origin; and (b) that the practice tends to perpetuate racial distinctions which it is desirable to obliterate. As against these criticisms the following three points must be considered: (a) that the Canadian whose family is of three or more generations residence is enumerated and differentiated through the question on the birth place of parents above described; (b) that notwithstanding the desirability of racial assimilation, there are special features in connection with the process that require appraisal and study; for example, 271 children of Chinese fathers and 842 of Japanese fathers were born in Canada in 1931. Again, the fact that the constitution of Canada is based on the presence of two dominant races points to the desirability of a measurement of these factors; only recently it has been widely pointed out that the original French colony, numbering 75,000 at the date of the Conquest, has expanded to over three millions to-day; measurements of this kind would be impossible if the answer "Canadian" instead of "French" were accepted under the heading of racial origin, yet undoubtedly if the descendants of the original French colonists are not "Canadians", no one is; (c) finally, racial origin is an important subject for study in a "new" country like Canada from a scientific standpoint, *i.e.*, from the standpoint of the student of ethnology, criminology, and the social and "biometric" sciences in general.

To accept the answer "Canadian" to the question on racial origin would confuse the data and defeat the purpose for which the question is asked.

Racial Distribution.—The total increase in population over the decade 1921-31 was 1,588,837. The population of English origin increased by only 196,061 compared with 722,208 in the previous decade; that of Scottish origin by 172,725 compared with 175,745; and that of Irish origin by 123,005 compared with 57,419. The population of British origin, taken together, increased from 4,868,738 to 5,381,071, or by 512,333, between 1921 and 1931. This represented 32 p.c. of the total increase as compared with 61 p.c. of the total increase for the previous decade. On the other hand the population of French origin increased from 2,452,743 in 1921 to 2,927,990 in 1931, or by 475,247 (slightly under 30 p.c. of the total increase for the decade) and showed the greatest absolute increase for any decade since 1871. Figures for the minor racial groups which make up the nation (see Table 17) would indicate that the people of Scandinavian, German and Ukrainian origins increased between 1921 and 1931 by 36 p.c., 61 p.c. and 111 p.c., respectively. Owing to the new national and racial alignments in Central and Southeastern Europe following the Great War, comparison of the post-war numerical strength of certain ethnic stocks in Canada with pre-war returns cannot be made with any certainty. For example a number of people reported as of Ukrainian stock in the seventh census were described in the censuses of 1921 and 1911 as Galician, Bukovinian, Ruthenian or Russian.

A perspective of the actual relationship of the origin groups to the population as a whole is obtained by a study of Table 18 where the proportion which the people of each origin bear to total population is given for each census for which the figures are available. Here it is clearly seen that the relative position of the English group showed substantial improvement up to 1921 (when for the first time it superseded the French) but, for 1931, there was a decided check. The French group, on the other hand, which showed a gradual decline between 1871 and 1901 and a more pronounced one in 1911 and 1921, has improved its relative position considerably and in 1931 is once again the foremost single racial group.

Together the British and French groups now constitute 80 p.c. of the total population, compared with 83 p.c. in 1921 and 1911, 88 p.c. in 1901, 89 p.c. in 1881 and no less than 92 p.c. in 1871.

The pronounced decline after 1901 in the combined proportion of the two major racial groups, *viz.*, British and French, with a corresponding increase in ethnic stocks of minor importance, has in the main been due to the immigration of continental Europeans to Canada during the past thirty years. Altogether, the percentage of the total population of European racial origin, other than British and French, increased from 8.50 p.c. of the total in 1901, to 12.82 p.c. in 1911, to 14.16 p.c. in 1921, and to 17.59 p.c. in 1931.

Oriental immigration to Canada in the past thirty years has been responsible for the relative increase of the Chinese and Japanese racial groups from 0.41 p.c. in 1901 to 0.67 p.c. in 1931. In the same period the population of Negro origin has declined from 0.32 p.c. to 0.19 p.c. of the total, and that of Indian and Eskimo origin from 2.38 p.c. to 1.24 p.c.

The racial origin of the population of Canada, by provinces and territories, is given in Table 19 for the census of 1931.

17.—Origins of the People according to the Censuses of 1871, 1881, 1901, 1911, 1921 and 1931.

Section 6.—Religions.

At each of the censuses from 1871 to 1931 every inhabitant of Canada has been asked to state the religious body of which he is a member or an adherent. During the sixty-year period there have been various fluctuations in the proportions of the population belonging to the leading religious bodies, and these fluctuations are, in a new country like this, largely occasioned by the religious affiliations of immigrants.

From Table 21, it will be seen that throughout the sixty-year period something like two-fifths of the population of Canada has been of the Roman Catholic faith, the 1931 percentage, inclusive of Greek Catholics, being 41.30. Methodists were 16.27 p.c. of the population in 1871 but fell to 13.19 p.c. in 1921, while Presbyterians increased from 15.63 p.c. in 1871 to 16.04 p.c. in 1921, being reinforced by a considerable immigration from Scotland after the beginning of the century. The fusion of the Methodists and Congregationalists in 1925 with a large section of the Presbyterians, as the United Church of Canada, left that body the second largest religious body in the Dominion in 1931 with 19.44 p.c. of the population. The Presbyterians who did not adhere to the United Church of Canada numbered 8.39 p.c. of the population in 1931. The proportion of Anglicans in the population of Canada fell from 14.17 p.c. in 1871 to 12.69 p.c. in 1901 but thereafter the large immigration from the British Isles raised it to 16.02 p.c. in 1921, followed by a

sight falling off to 15.76 p.c. in 1931. The Baptists have shown a fairly steady decline from 6.87 p.c. in 1871 to 4.27 p.c. in 1931.

The immigration from non-English-speaking countries during the first three decades of the twentieth century has led to a great growth of the religious bodies whose members come from the continent of Europe. Thus the Lutherans, who were only 1.09 p.c. of the population in 1871 and 1.72 p.c. in 1901, have risen to 3.80 p.c. in 1931. The Jews again, who were only 0.03 p.c. in 1871 and 0.31 p.c. in 1901, were 1.50 p.c. in 1931. The adherents of the Greek Orthodox Church, who in earlier years were not distinguished from Greek Catholics (the two together being only 0.29 p.c. in 1901) were 0.99 p.c. in 1931.

Of the total population in 1931 (10,376,786), 16,042 or 0.15 p.c. did not state their religion while 54,164 or 0.52 p.c., persons belonging to small sects, were classed as "various" and 21,071 or 0.20 p.c. as "no religion". Of the non-Christian sects, 155,614 or 1.50 p.c. were Jews, 24,087 or 0.23 p.c. were Confucians, 15,784 or 0.15 p.c. were Buddhists and 5,008 or 0.05 p.c. were pagans. The figures in the following tables are revised and final. In Table 20 the totals for each religion are brought together for all censuses since Confederation; Table 21 gives the same information as Table 20 in the form of percentages to total populations for the census years; Table 22 gives the 1931 census figures of the numbers of persons accredited to each of 31 specified religions, by provinces.

¹Including Tunkers. ²Practically all Methodists and Congregationalists and a large number of Presbyterians united to form the United Church of Canada in 1925, although a relatively small number reported themselves as "United Church" in 1921, chiefly in Western Canada where the movement towards union began. ³In earlier censuses only small numbers were involved, and Greek Catholics and Greek Orthodox were included under the general term "Greek Church". A rapid increase of both Greek Catholics and Greek Orthodox has been shown for recent censuses and, since the former owe obedience to the Pope in matters of faith, they have been included with the Roman Catholics for 1931.

⁴Including 186,654 Greek Catholics, see footnote 3. ⁵Included with "All other" religions for 1891. ⁶The figures for 1871 cover the four original provinces of Canada only.

Section 7.—Birthplaces.

The birthplaces of the population of Canada, as at each of the seven censuses, are shown by Canadian born, British born, and foreign born, (United States born and other foreign born) in Table 23. The table shows that in 1871, 97.29 p.c. of the population was born under the British flag, while sixty years later the percentage had declined to 89.18. The proportion of Canadian born increased steadily until the opening of the century, but has declined as a result of the increase of immigration after 1900. The 1931 census shows declines in the proportions of British born and United States born as compared with 1921 but a substantial increase in the percentage of "other foreign born". The proportion of Canadian born has remained practically unchanged.

Worthy of note is the fairly steady increase of the United States-born population from 1.85 p.c. in 1871 to 4.26 p.c. in 1921, and the subsequent decline to 3.32 p.c. in 1931. Other foreign born increased from 0.92 p.c. in 1871 to 6.23 p.c. in 1911, declined to 5.87 p.c. of the total population by 1921 but, as already noted, increased substantially to 7.50 p.c. by 1931.

The birthplaces of the 1931 population are indicated by sex in Table 24, for the various provinces and territories. In the Maritime Provinces, the population is shown by the census to be about 93 p.c. native born, and in Quebec about 91 p.c. In Ontario, however, the proportion sinks to about 77 p.c., in Manitoba to about 66 p.c., in Saskatchewan to about 65 p.c., in Alberta to about 58 p.c., and in British Columbia to about 54 p.c. The general tendency over the past decade has been for the proportion of the native-born population to remain stationary or show a slight decrease in Eastern Canada, but in Western Canada increases are everywhere shown; thus, the percentages in 1921 were: Maritime Provinces 93, Quebec 92, Ontario 78, Manitoba 64, Saskatchewan 60, Alberta 54 and British Columbia about 50. The proportion of foreign born has naturally decreased in the western provinces as a result of the limited immigration of recent years.

About 44 p.c. of the total British-born population is in Ontario, but the greatest proportion of British-born population in any one province is in British Columbia, viz., 27 p.c. which compares with 31 p.c. for 1921. The foreign-born element reaches its maximum percentage in the rapidly growing provinces of Saskatchewan and Alberta, where it constitutes about 24 p.c. and 27 p.c. of the respective populations as compared with 26 p.c. and 30 p.c. respectively for 1921.

Section 8.—Citizenship of the Foreign Born.

At the last four decennial censuses, those of 1901, 1911, 1921 and 1931, inquiry has been made into the citizenship of the foreign-born population. The relevant instructions to enumerators at the 1931 census were as follows:—

“The term ‘Canadian’ should be used as descriptive of every person whose home is in the country and who has rights of citizenship in Canada. Every person born in Canada should be entered as ‘Canadian’ unless he or she has subsequently become the citizen of another country. Similarly any person born in the United Kingdom or in any of the British Dominions or dependencies, who has not subsequently become the citizen of another country, and who is now permanently domiciled¹ in Canada, should be entered as ‘Canadian’. Similarly also, any person born in the United States, France, Germany or any other foreign country, but whose home is now in Canada, and who has become a naturalized citizen of Canada, should be entered as ‘Canadian’.

“An alien person should be classed as of the nationality or citizenship of the country to which he or she professes to owe allegiance.

“A married woman is to be reported as of the same citizenship as her husband.

“A foreign-born child under 21 years of age is to be reported as of the same citizenship as the parents

“The law of Canada relating to nationality is contained in the Immigration Act, (Chapter 93, Revised Statutes of Canada, 1927) under which a ‘Canadian’ by nationality is defined as—

“(I) A person born in Canada who has not become an alien;

“(II) A British subject who has Canadian domicile;¹

“(III) A person naturalized under the laws of Canada who has not subsequently become an alien or lost Canadian domicile.¹

¹Canadian domicile can only be acquired for the purposes of the Immigration Act by a person having his domicile for at least five years in Canada after having been landed therein.

... Following the participation of Canada in the Treaty of Versailles and in membership of the League of Nations, Canadian nationality was defined by Act of Parliament ('An Act to define Canadian Nationals and to provide for the Renunciation of Canadian Nationality', Chapter 21, Revised Statutes of Canada, 1927), as including:—

"(a) any British subject who is a Canadian citizen within the meaning of the Immigration Act, Chapter 27 of the Statutes of 1910 as heretofore amended.

"(b) the wife of any such person;

"(c) any person born out of Canada, whose father was a Canadian National at the time of that person's birth, or with regard to persons born before the passing of this Act, any person whose father at the time of such birth possessed all the qualifications of a Canadian National as defined in this Act.

"In connection with the last paragraph it should be noted that a child of Canadian parents domiciled in a foreign country retains Canadian nationality up to the age of 21 years, and should he become domiciled in Canada prior to that age does not require to be naturalized.

"It is proper to use the term 'Canadian' when the information furnished by the individual conforms to the foregoing definitions and explanations."

The Progress of Naturalization.—The foreign-born residents of Canada numbered 1,122,695 in 1931 as compared with 890,277 in 1921, 752,732 in 1911 and 278,449 in 1901; among these the naturalized numbered 614,971 in 1931, 514,179 in 1921, 344,557 in 1911 and 153,908 in 1901, or 54.78 p.c., 57.75 p.c., 45.77 p.c. and 55.27 p.c. respectively. Alien residents in Canada showed an absolute decline between 1911 and 1921 of from 408,175 to 376,098, i.e., from 5.66 p.c. of the population to 4.28 p.c. Between 1921 and 1931, they increased to 507,724, or 4.89 p.c. of the 1931 population. Among the foreign-born residents of Canada the United States born exceed those born in any other country, although by continental groups the Europeans are more numerous. Between 1921 and 1931 the U.S. born declined from 374,022 to 344,574, but there was a substantial net increase in the total foreign born due to the large increase of Europeans. On the other hand, the percentage of the U.S. born who are naturalized to total U.S. born has increased from 63.63 in 1921 to 72.44 in 1931, whereas the percentage of Europeans who are naturalized has fallen from 57.88 in 1921 to 49.13 in 1931.

Table 25 gives details of the naturalized and alien persons among the foreign-born residents of Canada. The table is divided into pre-war and post-war sections and, while the general totals are comparable throughout the thirty years, the individual totals for those European countries whose boundaries underwent change following the War are not comparable as between the 1901-11 and 1921-31 periods.

Section 9.—Rural and Urban Population.

In Table 26 are given statistics showing the growth of rural and urban population respectively, by provinces, since 1891. For the purposes of the census the population residing in cities, towns and incorporated villages has been defined as urban, and that outside of such localities as rural. Thus the distinction here made between 'rural' and 'urban' population is a distinction of provincial legal status rather than of size of aggregations of population within limited areas. Since the laws of the various provinces differ in regard to the population necessary before a municipality may be incorporated as urban (the laws of Saskatchewan, for example, making provision that 50 people actually resident on an area not greater than 640 acres may claim incorporation as a village, while the Ontario law now requires that villages asking for incorporation shall have a population of 750 on an area not exceeding 500 acres), the line of demarcation between rural and urban population is not at all uniformly drawn throughout the Dominion, as far as comparable aggregations of population are concerned. To a limited extent, however, Table 28 will permit the student of population statistics to make, at least for Canada as a whole, his own line of demarcation between rural and urban populations.¹

¹In the United States, urban population prior to 1930 was classified by the Census Bureau as that residing in cities and other incorporated places having 2,500 inhabitants or more with certain minor qualifications, but in 1930 the definition was slightly modified to include townships and other political divisions, not incorporated as municipalities, having a total population of 10,000 or more, and a population density of 1,000 or more per square mile each. The direct result of this modification has been to slightly increase the proportion of urban population.

While a summary comparison between urbanization in Canada in 1931 and in the United States in 1930 would lead us to the conclusion that our country, though far less densely peopled than the United States, had an almost equally large percentage of its population in urban communities, *viz.*, 53.70 p.c. in Canada as compared with 56.2 p.c. in the United States, the fact that in the United States inhabitants of places having under 2,500 population are included with rural population must be taken into account. A fairer basis of comparison is secured if the same population limits are taken for both countries, as may be done by using Table 28. Thus, at the census of 1930, the United States had 29.5 p.c. of its population resident in cities of 100,000 and over, while Canada in 1931 had only 22.44 p.c. of its population in such places. The United States had an additional 18 p.c. of its population residing in cities of between 10,000 and 100,000 population, and 4.8 p.c. in cities and towns of 5,000 to 10,000, while Canada had in cities of these categories only 14.87 p.c., and 4.42 p.c. respectively of its population. Thus, taking all places of 5,000 and over—the lowest population for which comparative figures are readily available—52.3 p.c. of the population of the United States resided in such places as compared with 41.73 p.c. of the population of Canada, showing the much higher degree of urbanization which has been reached in the United States—a natural thing in an older settled and more densely peopled country.

On the basis of the census classification, it is apparent from Table 26 that in the last decade, as in the previous one, urban communities absorbed somewhat over two-thirds of the total increase in population, with the result that the urban population of Canada in 1931 exceeded the rural by 767,330. Out of every 1,000 persons in the country, 463 were resident, on June 1, 1931, in rural and 537 in urban communities, as compared with 505 in rural and 495 in urban communities on June 1, 1921; 546 in rural and 454 in urban communities in 1911; 625 in rural and 375 in urban communities in 1901; and 682 in rural and 318 in urban communities in 1891.

From Table 28, showing the distribution of urban population in Canada by size of cities and towns, it is seen that Canada possesses two cities of more than half a million population. These are Montreal and Toronto, with 818,577 and 631,207 inhabitants respectively. Two other cities, Vancouver and Winnipeg, have attained the 200,000 mark and Hamilton, Quebec and Ottawa each have populations of over 100,000. The two western cities of Calgary and Edmonton are now in the 75,000 to 100,000 class. In this respect London, which excelled Edmonton in 1921, now takes the next lower place with a population of 71,148. Details of the population of these and other smaller cities and towns of 5,000 and over, are given by censuses from 1871 to 1931 in Table 29, while the populations of urban communities having in 1931 a population of from 1,000 to 5,000 each, are given for 1901, 1911, 1921 and 1931 in Table 30.

All the larger cities have in their neighbourhoods growing "satellite" towns or other densely settled areas in close economic relationship with the central municipality. This phenomenon is to-day of increasing importance largely as a result of the greater ease and speed of transportation by motor vehicle. It has therefore been considered advisable to calculate the total populations resident in what the United States census authorities call the "metropolitan areas" dependent upon each of the cities with 100,000 population or over. On this basis the total populations of the larger cities at the census of 1931 were as follows: "Greater Montreal", 1,000,157; "Greater Toronto", 808,864; "Greater Vancouver", 308,340; "Greater Winnipeg", 280,202; "Greater Ottawa" (including Hull), 175,988; "Greater Quebec", 166,435; and "Greater Hamilton", 163,710.

¹The population (93,931) in territory now comprised in the provinces of Alberta, Saskatchewan and in Yukon and the Northwest Territories was classified as rural in the census of 1891. ²Vol. 1, Census 1911, places the urban population of Alberta for that year at 141,937. Included in this figure was the population (5,250) of twelve places which, according to the Report of the Municipal Commissioner for Alberta, were not then incorporated. The places so included were Aetna, Bankhead, Bellevue, Bickerdike, Canmore, Cardiff, Exshaw, Hillcrest, Passburg, Queenston and Elmpark. The correction resulting from this and from other small adjustments consequent upon more definite knowledge as to incorporated areas, places the urban population for 1911 at 137,662. Similar corrections have been made in the urban and rural figures for the census of 1901. ³As corrected in Census Report, Prairie Provinces, 1916. ⁴As changed by Extension of Boundaries Act, 1912. ⁵As changed by Extension of Boundaries Act, 1912. ⁶The urban population of 970,791, shown in Volume 1, Census 1911, is reduced to 966,842 by the transfer of the populations of Maniwaki, Martinville, Moisie, St. Bruno, St. Martin and St. Vincent de Paul from urban to rural by adjustments in area of the villages of Ste. Anne and Ste. Genevieve; and Extension of Boundaries Act, 1912. ⁷Urban and rural populations for 1911 and 1931 are as corrected in Census Report, Prairie Provinces, 1916. ⁸As reduced by Extension of Boundaries Act, 1912. ⁹Members of the Royal Canadian Navy were counted at their homes in the census of 1931. ¹⁰This includes South Vancouver and Point Grey, with 1921 populations of 32,267 and 13,736 respectively, which were then classified as 'rural'.

27.—Percentage Distribution of Rural and Urban Populations, by Provinces and Territories, 1891, 1901, 1911, 1921 and 1931.

NOTE.—In using this table, reference should be made to the notes appended to the preceding table showing rural and urban population by numbers.

¹ The population in the territory now comprised in Alberta, Saskatchewan, Yukon and the Northwest Territories was classified as rural in the census of 1891.

² South Vancouver and Point Grey, with populations in 1921 of 32,267 and 13,736 respectively, were then 'rural', but are 'urban' in 1931.

28.—Urban Populations of Canada, Divided by Size of Municipality Groups, 1911, 1921 and 1931.

Population is shown in Table 28 to be increasingly attracted to the larger cities. Thus not only have cities of over 500,000 population (Montreal and Toronto) increased their proportions to the total, but cities of from 100,000 to 500,000 have increased their aggregate population from 5.90 p.c. of the total to 8.46 p.c., and cities of between 5,000 and 100,000 from 17.68 p.c. to 19.29 p.c. in the decade 1921-31. The classes below 5,000 show slight proportional reductions.

28.—Populations of Cities and Towns having over 5,000 Inhabitants in 1931, Compared with 1871-81-91-1901-11-21.

NOTE.—The cities and towns in which a Board of Trade exists are indicated by an asterisk (*), and those in which there is a Chamber of Commerce by a dagger (†). In all cases the population for previous censuses has been rearranged as far as possible to cover the same area as in 1931.

Rural and Urban Farm Populations.—Of the 10,362,833 people who form the population of the nine provinces of Canada, exclusive of the Territories, only 3,289,507 or 31.7 p.c. live on farms.

There are 728,623 farms within the nine provinces and, considering the 14,056 farms (see Table 31) which are located within the limits of incorporated cities, towns or villages as "urban", the farm population is classified as 3,224,241 living on rural farms and 65,266 on urban farms. More than one half (50.5 p.c.) of the people on urban farms are in Quebec and only 23.6 p.c. in Ontario. Alberta ranks third with 6.4 p.c. and Nova Scotia fourth with 5.7 p.c. This is in contrast with the distribution on rural farms where 24.4 p.c. are in Ontario, 23.1 in Quebec, 17.4 in Saskatchewan and 11.5 in Alberta; these four provinces therefore have 76.4 p.c. of the rural farm population. The rural and urban farm populations bear a very close relationship to the number of farms of each class in the individual provinces but the distribution of rural farms follows more closely than that of urban farms the distribution of total population (see Table 1). Among the provinces, Quebec has the greatest number of persons per farm on farms of both the rural and urban classes.

Table 31 gives the number of farms and the farm populations, urban and rural, by provinces as recorded at the 1931 census.

31.—Urban and Rural Farm Populations, by Provinces, 1931.

Of the 728,623 farms in Canada, 281,044 or 38.5 p.c. employed hired labour for 7,368,671 weeks at a cost for wages and board of \$100,425,980. On the average, therefore, each farm engaging help employed a hired man for 26.2 weeks at a cost of \$13.62 per week.

Section 10.—Literacy.

Literacy in Canada has shown most encouraging progress since the opening of the twentieth century.

In 1901, 14.38 p.c. of the population of five years of age and over could neither read nor write; the corresponding percentage for 1911 was 10.50; for 1921, 9.25; and for 1931 it was only 7.18. (See Table 32.)

32.—Ability to Read and Write of the Population 5 Years of Age and Over, by Provinces, 1901, 1911, 1921 and 1931.

Literacy of Population over Ten Years of Age, by Age-Groups and Sex.—

Experience has shown that statistics of literacy among children under ten years of age are practically meaningless. A truer test of progress has been made by taking the statistics for the population of ten years of age and over, but unfortunately this comparison cannot be made for earlier censuses than that of 1921. Table 33 shows literacy, by sex and province, of persons ten years of age and over in 1931, and the percentage of illiterates in this significant section of the population was 3.79 p.c. in 1931, as compared with 5.10 p.c. in 1921. It will be noticed that illiteracy is very definitely greater among males than among females. In 1931, 4.32 p.c. of the male population and 3.21 p.c. of the female population were recorded as unable to read or write, as compared with 5.73 p.c. and 4.43 p.c. respectively for 1921. Manitoba, Saskatchewan and Alberta, alone among the provinces, show a higher percentage of female illiteracy; this condition existed also in 1921, although the corresponding percentages for both males and females were then substantially greater, being: Manitoba, males 6.48, females 7.78; Saskatchewan, males 5.00, females 7.08; Alberta, males 4.62, females 5.92.

The figures show that New Brunswick is in the most unfavourable position, though there has been an improvement since 1921. No less than 6.91 p.c. of the population of that province — 8.75 p.c. of the males and 4.97 p.c. of the females — could neither read nor write in 1931. For 1921 the figures were: total illiterate, 7.61 p.c.; males 9.24; females 5.90. On the other hand the province of Quebec, which in 1921 recorded the high percentage of 6.20 (7.85 males and 4.54 females) as illiterate, had reduced this proportion to 4.76 (6.21 males and 3.29 females) by 1931.

Literacy among Urban Populations.—Table 34 shows the literacy of persons residing in cities with populations of 30,000 and over in 1931. The final three columns give percentage figures for persons ten years of age and over, and a comparison with figures for 1921 shows that very definite changes have taken place in the literacy of urban populations. Toronto had, in 1921 as in 1931, a very low percentage of illiteracy — 1.68 p.c. in 1921 and 1.26 p.c. in 1931 — and the larger cities of Ontario, generally, made a comparatively good showing in 1921. Other large cities of Canada had in 1921 fairly high percentages of illiteracy, the figures being: Montreal, 3.60 p.c.; Winnipeg, 3.54 p.c.; Vancouver, 3.54 p.c.; Quebec, 3.27 p.c.; Ottawa 2.69 p.c.; and Hamilton, 2.12 p.c. Comparison of 1921 figures¹ with those for 1931 in Table 34 brings out the great improvement in the western cities. Marked betterment is evident throughout the list, but the exceptional progress in the west has put Three Rivers, Quebec, Montreal and Halifax in a relatively less favourable position as regards illiteracy. While Three Rivers has still the highest percentage of persons who can neither read nor write, the proportion has been reduced from 7.03 p.c. in 1921 to 3.45 p.c. in 1931.

The city of Saskatoon, Saskatchewan, had the lowest percentage of illiteracy in 1931, viz., 0.71, London, Ontario, being next with 0.88 p.c. In the cities of Windsor, Ontario, and Regina, Saskatchewan, both of which had low percentages of illiterates in 1921 (1.53 p.c. and 1.44 p.c. respectively), slight increases to 1.78 p.c. and 1.68 p.c., respectively, are shown in 1931.

Section 11.—School Attendance.

The census statistics of school attendance for the population between the ages of 5 and 19 years are presented for 1911, 1921 and 1931 in Tables 35 and 36 for Canada as a whole. In comparing the statistics of school attendance for the census of 1931 with those of 1921 and 1911, it is necessary to take into account the fact that in 1931 and 1921, the question as to school attendance covered the nine months ended May 31, while in 1911 the question covered the calendar year 1910. For this reason the figures are not quite comparable, although the general trends as shown by the percentages of Table 36 are probably not materially affected.

In 1931 the population of school age, 5-19 years, numbered 3,246,391 or 31·3 p.c. of the total population, as compared with 31·4 p.c. in 1921 and 30·0 p.c. in 1911. The proportion of the total group 5-19 years actually in attendance at school shows progress. In 1911 only 52·88 p.c. of the population of this age were in attendance at school; the proportion rose to 61·33 p.c. in 1921 and 65·59 p.c. in 1931. The proportion of males between these ages attending school increased from 52·15 p.c. in 1911 to 60·80 p.c. in 1921 and 65·12 p.c. in 1931; that of females from 53·63 p.c. in 1911 to 61·86 p.c. in 1921 and 66·08 p.c. in 1931.

The tables show the school attendance and percentage of school attendance respectively of the population 5-19 years of age for the census years 1911, 1921 and 1931.

Section 12.—Annual Estimates of Population.

While the populations in different countries are actually counted at decennial or quinquennial censuses, annual estimates of populations are required by modern States for many purposes, such as the calculation of birth, death and marriage rates, and of per capita figures of production, trade, finance, consumption, etc. In different countries various methods of obtaining annual figures of post-censal populations are adopted. For example, it is possible, with good vital statistics and records of arrivals and departures, to obtain the actual population at any particular date with approximate accuracy by the simple method of adding births and arrivals and subtracting deaths and departures during the period elapsed since the census. This method is impracticable for Canada, on account of her 4,000 miles of common boundary line with the United States, crossed every day by many thousands of people in both directions. In almost all civilized countries, the actual methods of making the estimates vary. Thus, the method of arithmetical progression is widely used in estimating the populations in the older countries of the world; this method involves the annual addition to the population of the country and of particular areas within it of one-fifth or one-tenth of the numerical increase in the last quinquennial or decennial inter-censal period. In the case of Canada annual figures of population have been purely estimates, made on the basis of past increases, prior to the 1931 census. They have now been worked out on a basis which takes into consideration collateral data back to 1867, and the resulting figures are believed to more accurately state the populations at inter-censal periods than any before published.

The new method upon which calculations are based was described at p. 108-9 of the 1932 Year Book.¹

¹The table of estimates on p. 145 and the description of the method upon which calculations are based were the work of M. C. MacLean, M.A., F.S.S., Chief of Census Analysis, Dominion Bureau of Statistics.

CHAPTER V.—VITAL STATISTICS.¹

The collection of vital statistics commenced in Canada, as in England, with the registration of baptisms, marriages and burials by the ecclesiastical authorities. These registers, maintained by the priests from the first settlement of the country, have made it possible for the vital statistics of the French colony to be compiled from the year 1610.² In the beginning only one copy of such records was made, but in 1678 the Sovereign Council of Quebec ordered that in future such records should be made in duplicate, and that one copy, duly authenticated, should be delivered to the civil authorities. This arrangement was continued after the cession of the country to the British, and was extended to the newly-formed Protestant congregations of Lower Canada by an Act of 1795, but the registration among these latter remained seriously defective, both in Lower Canada and in the new province of Upper Canada.

In English-speaking Canada vital statistics were from the commencement incomplete, the pioneer settlers often going out into the wilds far from the authority of government and the ministrations of religion. Although from 1847 a law existed in Upper Canada requiring ministers of religion to deposit duplicates of their registers of baptisms, marriages and deaths with the clerks of the peace for transmission to the Provincial Secretary, this law remained practically a dead letter. Again, the efforts made to secure records of births and deaths at the censuses of 1851 and 1861 produced most unsatisfactory and even ridiculous results, as was pointed out by Dr. J. C. Taché, Secretary of the Board of Registration and Statistics, in a memorial published in the report of the Canadian Minister of Agriculture for 1865. Nevertheless, in spite of the inherent unsoundness of securing, at a point of time in a decennial census, a record of births and deaths occurring over a considerable period of time, this method was followed down to 1911, when the obviously untrustworthy character of the results led to the discarding of the data obtained at the inquiry.

The Dominion Government instituted in the early '80's a plan for compiling the annual mortuary statistics of cities of 25,000 population and over, by subsidizing local boards of health to supply the information under special regulations. A beginning was made with the five cities of Montreal, Toronto, Hamilton, Halifax and Saint John. By 1891 the list had grown to 25, at a time when, in most of the provinces, the only birth and death statistics were those of the municipalities. Upon the organization of provincial bureaus of vital statistics, however, this work was abandoned, though a conference of Dominion and provincial officials, held in 1893, passed a resolution calling upon the provincial and Dominion authorities to cooperate in the work of collecting, compiling and publishing the vital statistics of the Dominion. This resolution had no immediate practical results in securing accurate or comparable vital statistics.

Following Confederation each of the provinces of the Dominion had enacted its own legislation on vital statistics, where such existed, and administered this legislation according to its own individual methods. While the vital statistics of Ontario were published in considerable detail annually from 1871, the arrangements for the

¹ This chapter has been revised by E. S. Macphail, Chief, Demography Branch, Dominion Bureau of Statistics. A list of the publications of this Branch will be found in Chapter XXIX, Section 1, under "Population".

² For a summary of the vital statistics of the Roman Catholic population from 1610 to 1883, see the Statistical Year Book of Quebec, 1921, English or French edition, p. 51. For details, by years, of this movement of population, see Vol. V of the Census of Canada, 1871, pp. 160-265, and Vol. IV of the Census of Canada, 1881, pp. 134-145.

collection of data were unsatisfactory. Only in 1906 was the publication of vital statistics begun in Prince Edward Island (no report for 1912 was ever issued). In Nova Scotia no vital statistics were published between 1876 and 1908 and in New Brunswick no vital statistics were available until 1920. Because of the *lacunæ*, and even more because of the incomparability of information collected, of methods of collection and of standard of enforcement, Canadian vital statistics remained extremely unsatisfactory and impossible of compilation on a national basis, as was pointed out by the 1912 Commission on Official Statistics, which recommended that "for the Dominion, now engaged in building up its national unity, it is important that uniform data should render possible to statisticians the institution of true interprovincial and international comparisons. By effective co-operation of the provinces with the Dominion, this object should be capable of attainment without sacrificing the liberty of each province to satisfy its own special statistical requirements"

The scheme of co-operation thus outlined was brought into effect as a consequence of the establishment of the Dominion Bureau of Statistics under the Statistics Act of 1918, which specifically provided that the Bureau should publish an annual report on vital statistics. A scheme was first drawn up in the Bureau and submitted to the various provinces; then Dominion-Provincial conferences on vital statistics were held in June and December, 1918, when comprehensive and final discussions took place.

At the conferences of 1918, it was agreed: (1) that the model Vital Statistics Act prepared by the Dominion Bureau of Statistics, when accepted by the Legislatures, should form the basis of the vital statistics legislation of the several provinces, thus securing uniformity and comparability; (2) that the provinces should undertake to obtain the returns of births, marriages and deaths on the prescribed forms as approved and adopted at the conference, the Dominion Bureau of Statistics to supply the forms free of charge; (3) that the provinces should forward to the Dominion Bureau of Statistics, at such times as might be agreed upon, either the original returns of births, marriages and deaths, or certified transcriptions of the same; the Bureau of Statistics to undertake the mechanical compilation and tabulation.

Under the scheme outlined above, the vital statistics for all the provinces except Quebec were secured and compiled on a uniform basis for the years 1921 to 1925. The annual reports for these years may be obtained on application to the Dominion Statistician.

Quebec has been included in the registration area as from Jan. 1, 1926, from which date her statistics are on a comparable basis with those of the other provinces. The final reports for 1926 to 1930, including the statistics of all the nine provinces, have appeared and may be procured from the Dominion Statistician.

The vital statistics of Yukon and the Northwest Territories have been collected and compiled since 1924. They are not, however, presented with those of the nine provinces in the tables of this chapter because the figures are not regarded as complete, the details are in many cases not available, and the small and varying population is not known with sufficient accuracy for each year to enable the rates to be calculated. As these territories contain less than 1/700th of the population of Canada, their vital statistics are a negligible factor in the total. Births, marriages and deaths in Yukon and the Northwest Territories, for the years 1924-30, are summarized in the statement herewith:—

VITAL STATISTICS OF YUKON AND THE NORTHWEST TERRITORIES, 1924-30.

Year.	Yukon.			The Northwest Territories.		
	Births.	Marriages.	Deaths.	Births.	Marriages.	Deaths.
	No.	No.	No.	No.	No.	No.
1924.....	31	5	38	95	39	47
1925.....	22	17	63	57	35	32
1926.....	27	12	68	75	3	51
1927.....	29	19	33	126	29	133
1928.....	30	13	46	222	30	367
1929.....	35	10	54	133	29	198
1930.....	45	17	69	232	36	206

Two important considerations should be borne in mind by the students who use either the tables which follow or the detailed reports issued by the Bureau of Statistics for comparative purposes. First, in spite of the improvements of the past decade, registration generally, and the registration of births in particular, is not universally carried out. The great extent of the country and the isolation of many of its inhabitants partly account for this unsatisfactory situation. Secondly, the very considerable differences in the age and sex distribution of the population in different provinces make comparisons of crude birth rates and crude death rates as among the provinces unfair and misleading.

All rates in this chapter have been recalculated on the basis of the revised estimates of population given on p. 145.

The natural increase of the population of Canada is first dealt with, followed by detailed tables of births, marriages and deaths in the order named.

Section 1.—Natural Increase.

Summary statistics of the births, marriages, deaths and natural increase per 1,000 of population are given for the years 1921 to 1931, by provinces, in Table 1.

The province of Quebec is regarded as having one of the highest rates of natural increase per 1,000 population of any civilized area, but for each year since 1926 with the single exception of the latest year 1931, Saskatchewan has outranked Quebec in this respect, owing to its younger population and lower crude death rate. In 1930, for similar reasons, Alberta also surpassed Quebec in rate of natural increase. The high rates for these provinces brought the averages for Canada up to 13.3 in 1926, 13.4 in 1927, 13.0 in 1928, 12.2 in 1929, 13.2 in 1930 and 13.1 in 1931. The rate of natural increase in 1931 was 9.5 per 1,000 in Australia, 10.1 in New Zealand, 3.5 in England and Wales, 5.7 in Scotland and 4.8 in the Irish Free State, so that Canada compares quite favourably with other British countries.

BIRTH RATES, DEATH RATES AND RATES OF NATURAL INCREASE IN CANADA AND ITS PROVINCES

1930

PER 1,000 POPULATION

	BIRTH RATE	DEATH RATE	NATURAL INCREASE
CANADA	23.9	10.7	13.2
PRINCE EDWARD ISL.	19.9	10.9	9.0
NOVA SCOTIA	22.1	12.1	10.0
NEW BRUNSWICK	25.9	12.3	13.6
QUEBEC	29.6	12.7	16.9
ONTARIO	21.0	11.0	10.0
MANITOBA	20.9	8.3	12.6
SASKATCHEWAN	24.4	7.0	17.4
ALBERTA	24.9	7.8	17.1
BRITISH COLUMBIA	16.1	9.5	6.6

The rates of natural increase per 1,000 of mean population for other countries in the latest years are as follows, the figures being for 1930: Denmark, 7.9; Japan, 14.2; Netherlands, 13.9; Norway, 6.5; Finland, 7.4; Italy, 12.6; Switzerland, 5.6; Sweden, 3.7; Spain, 11.6; France, 2.4; Belgium, 5.6; United States (registration area), 7.6; Union of South Africa (whites), 16.9.

It will be noticed that the rate of natural increase of the population of Canada showed a tendency to decline between the years 1927 and 1929, while the 1926 rate of 13.3 was a very sharp drop from that of 17.8 recorded for the census year 1921. The rate for 1930 however showed a decided betterment over 1929 and the improvement was practically maintained in 1931.

Statistics of the births, marriages, deaths and natural increase in cities and towns of 10,000 and over are given for the calendar year 1930 in Table 2, but these are not worked out as rates per 1,000 of population, though the census population in 1931, which is also given, furnishes some guide to the rate of natural increase. Particularly notable in this table is the larger proportionate number of births in such cities as Montreal and Quebec, as compared with Toronto, Hamilton, Ottawa, Winnipeg and Vancouver. This higher birth rate is in part counterbalanced by a considerably higher death rate, but the natural increase in Quebec cities is still considerably higher than in the cities of other provinces.

1.—Summary of Births, Marriages, Deaths and Natural Increase, by Provinces, for the calendar years 1926-31, with Averages 1921-25 and 1926-30.

NOTE.—For other than census years birth, marriage and death rates are calculated on estimated populations (see p. 145). Figures for 1921-25 will be found at p. 160 of the 1927-28 Year Book.

Province.	Births	Birth Rate per 1,000 Population.	Marriages.	Marriage Rate per 1,000 Population.	Deaths.	Death Rate per 1,000 Population.	Excess of Births over Deaths.	Rate of Natural Increase per 1,000 Population.

Natural Increase by Sex.—According to Table 3, the number of male children born in 1930 in Canada exceeded the total male deaths for the year by 65,743, while the gain in the female population during the same period was 68,446. Thus, while the number of male children born exceeded the females by 6,209, the higher mortality among males, *viz.*, 59,109 as compared with 50,197, resulted in a net excess of the natural increase of the females amounting to 2,703. Figures for 1931 are as follows: males, births 123,622, deaths 56,529, natural increase 67,093; females, births 116,851, deaths 47,988, natural increase 68,863.

Section 2.—Births.

Throughout almost the whole of the civilized world the birth rate has in the past generation been on the decline, though the consequent reduction in the rate of natural increase has been partly offset by the synchronous decline in the death rate.

The crude birth rate of England and Wales, for example, was 35.4 per 1,000 population on the average of the decennium 1871-80, 32.5 in 1881-90 and 29.9 in 1891-1900. In 1913 the birth rate was 24.1, and, though it rose to 25.5 in 1920, it fell again to 22.4 in 1921, 19.7 in 1923, 18.8 in 1924, 18.3 in 1925, 17.8 in 1926, 16.6 in 1927, 16.7 in 1928, 16.3 in 1929 and 1930, and 15.8 in 1931.

Similarly, in France the crude birth rate declined from an average of 25.4 per 1,000 population in the 1870's, 23.9 in the 1880's and 22.2 in the 1890's to 21.4 in 1920 and 19.1 in 1923, rising slightly to 19.0 in 1925 and falling to 18.8 in 1926, 18.1 in 1930 and 17.4 in 1931. In Germany, again, the crude birth rate was 39.1 in the 1870's, 36.8 in the 1880's, 36.1 in the 1890's, 25.9 in 1920, 20.7 in 1925, 17.5 in 1930 and 16.0 in 1931.

In Canada the crude birth rate still stands at a comparatively high figure, being 23.2 per 1,000 in 1931. This, however, was largely due to the influence of Quebec, where the birth rate stood at the high figure of 29.1 per 1,000 in 1931, as compared with 20.2 per 1,000 in Ontario. In the other provinces the figures varied from 15.0 and 20.5 per 1,000 in British Columbia and Manitoba to 23.6 and 26.5 in Alberta and New Brunswick respectively.

Statistics of births and birth rates for the years 1926-31 with averages for 1921-25 and 1926-30 are given by provinces in Table 4. The averages for the former period are exclusive of the province of Quebec which was not then in the registration area.

4.—Numbers of Living Births and Birth Rates, by Provinces, 1926-31, with Averages, 1921-25 and 1926-30.

¹ Quebec was not included in the registration area prior to 1926.

Table 5 gives the number of living births in cities and towns of 10,000 population and over for the years 1927 to 1931 inclusive. The number of births reported shows in most cases an increase in recent years up to 1930 but the decreases in 1931 outnumbered the increases.

†Living births in cities of 40,000 population and over, except Montreal and Quebec, are given for 1921-28 on p. 137 in the Canada Year Book of 1930.

‡Though Point Grey and South Vancouver were not incorporated into Vancouver until Jan. 1, 1929, their statistics are included in the figures for Vancouver for the years 1927 and 1928 for purposes of comparison.

Legitimate Births.—In Table 6 will be found for each of the provinces the percentages of legitimate children born alive to Canadian-born, British-born and foreign-born mothers respectively in 1930. It is noteworthy that children born to foreign-born mothers outnumbered children born to Canadian-born mothers in the province of Alberta. For the Dominion as a whole, 72.7 p.c. of the children of mothers whose birthplaces were known had Canadian-born mothers, 12.0 p.c. British-born mothers and 15.2 p.c. foreign-born mothers.

It is also significant that the percentage of legitimate children born alive to Canadian-born mothers increased between 1921 and 1930 from 42.3 p.c. to 55.3 p.c. in Manitoba, from 36.1 p.c. to 47.2 p.c. in Saskatchewan, from 30.0 p.c. to 39.4 p.c. in Alberta, and from 29.7 p.c. to 43.2 p.c. in British Columbia. Thus more and more of the children of the West are coming within the class of third generation Canadians.

6.—Percentages of Legitimate Children Born Alive to Canadian-Born, British-Born, or Foreign-Born Mothers, by Provinces, 1930.

Sex of Living Births.—Table 7 shows the number and proportion of living male and female births reported for each province in Canada during the calendar years 1926 to 1931, with averages for the five-year periods 1921-25 and 1926-30. The figures for Quebec commence only with the year 1926 when that province entered the registration area, and the totals for Canada are limited in the same manner in consequence. Of the figures listed, the only case of an excess of female births is in British Columbia in 1928. The table shows that among every 1,000 born in 1931 in the whole of Canada, 514 were males and 486 females. In other words, there were 1,058 males born to every 1,000 females.

7.—Births (Exclusive of Stillbirths) by Sex, and Ratio of Males to Females, for Canada and by Provinces, 1926-31, with Averages for 1921-25 and 1926-30.

NOTE.—For corresponding figures for 1921-25, see p. 165, Canada Year Book for 1927-28.

Ages of Parents.—Table 8 shows the age distribution of married fathers and mothers in the year 1926 (the first year for which the figures are available for the whole of Canada) and for 1928-30. The fathers and mothers in each of these years are arranged according to age and then divided into four equal groups. Each point of age at which a separation comes is called a quartile. To obtain these points of age it is assumed that those in the same year of age are evenly distributed from its lower to its upper limit. In similar manner the deciles divide fathers or mothers in each year into ten equal groups.

In 1930 one-quarter of the married fathers were under 27.84 years of age, one-half under 32.73 years and three-quarters under 38.76 years. One-quarter of the married mothers were under 24.03 years of age, one-half under 28.42 years and three-quarters under 33.89 years. Nine-tenths of the fathers were under 44.09

years and nine-tenths of the mothers under 38.48 years. It will be noted that the general tendency of the quartile and decile points over the five years is in a downward direction. In other words, parents are gradually becoming younger.

8.—Quartile and Decile Ages of Married Fathers and Mothers, 1926, 1928-30.

Nativity of Parents.—Table 9 classifies the children born in 1930 by country of birth of parents, and furnishes some idea to what extent the coming generation of Canadian-born will be the offspring of Canadian-born, British-born or foreign-born parents. The term "country not specified", under country of birth, includes for the father illegitimate births and births of incomplete record, while for the mother it includes births of incomplete record only.

9.—Number and Percentage of Births (Exclusive of Stillbirths) in Canada to Fathers and Mothers Born in Specified Countries, 1930.

Country of Birth of Parents.	Numbers of Births with Father, Mother or Both Parents Born in Specified Country.			Percentages of Births with Father, Mother or Both Parents Born in Specified Country.

¹ Less than one-tenth of one per cent. ² This figure gives the number of children whose fathers and mothers have the same origin. The difference between this figure (178,291) and the total number of births (243,495) represents the number of children (65,204) whose fathers and mothers are of different origins.

³ This excludes the percentage (26.8) of mixed parentage, i.e., where the parents were not of the same origins.

⁴ Including Galician and Bukovinian.

Illegitimacy.—The ratio of illegitimate to total births is, generally speaking, low in Canada as compared with other countries.

Out of 243,495 living births in the nine provinces of Canada in 1930, 8,059, or 3.3 p.c., were returned as the issue of unmarried mothers. Figures for 1931 show a total of 240,473 living births, of which 8,365, or 3.5 p.c., were returned as the issue of unmarried mothers. Out of this number 4,359 were males and 4,006 females—a ratio of 1,088 males to every 1,000 females, as compared with 1,049 males per 1,000 females in 1930, and a general 1931 rate for all births of 1,058 males to 1,000 females.

Section 3.—Marriages and Divorces.

Subsection 1.—Marriages.

About a century ago it was observed in the United Kingdom that the number of marriages tended to be high when the price of wheat was low and to be low when the price of wheat was high. This was quite naturally the case among a population, the majority of which was living at a comparatively low standard of comfort, and where the staple food was thus the chief factor in the cost of living.

More recently, the curve showing marriage rates in the United Kingdom and other English-speaking countries has ceased to bear any constant relation to the price of the staple food of the people, though it still does so in poorer countries. Its place in influencing the marriage rate has, however, been taken by the general level of prosperity. Marriages in such countries as the United Kingdom, the United States, Canada and Australia tend to increase in "good times" and to diminish in "hard times", when great numbers of those who are contemplating marriage are led to postpone such marriage until the advent of better industrial conditions. Thus marriages in Canada showed a considerable decline in 1931.

Summary statistics of marriages contracted in 1921-31 appear in Table 14.

14.—Number of Marriages and Marriage Rates, by Provinces, 1921-31.

A.—NUMBER OF MARRIAGES.

¹Quebec was not included in the registration area prior to 1926.

Age at Marriage.—The average age of all bridegrooms in the Dominion in 1930 was 29.2 years and that of all brides 25.0 years. The average excess of the bridegroom's age was thus 4.2 years. It may be noted in Table 15 that when the contracting parties are grouped by age of bridegroom, the average difference in age is less for the younger groups, grooms under 20 being 0.3 years younger than the brides, while the excess of the average bridegroom's age was 1.5 years in the group 20-24, and steadily increased for each quinquennial age group until it was 11.2 years for the bridegrooms 50 years and over. On the other hand, when the parties are grouped by the age of the bride, it is found that there is no such regularity as is shown in the table by age of grooms. In the case of brides in the age group 25-29 years the bridegrooms approximate most closely to their own (the brides') ages. Since these tables are based upon all marriages contracted during the year, the figures given should not be understood to signify the average ages at first marriage.

15.—Differences in Ages of Bridegrooms and Brides, 1930.

Out of each 1,000 bridegrooms in 1930, 905 were bachelors, 85 widowers, 10 divorced men; out of each 1,000 brides 932 were spinsters, 59 widows, 9 divorced women. Nineteen twenty-eight was the first year in which as many as 1 p.c. of those

marrying had previously been divorced. There is a fairly close resemblance between the figures of divorces granted, as shown in Table 19 of this chapter, and the number of divorced persons re-married, more particularly in the case of males. Thus 875 divorces were granted in 1930, while 759 divorced males and 668 divorced females married again. This of course does not mean that these were the same persons.

Nativity of Brides and Bridegrooms.—The majority of marriages contracted in the western provinces in past years have been between persons born outside Canada. This condition however is being gradually changed and, although in Manitoba, Saskatchewan, Alberta and British Columbia, the majority of the bridegrooms in the marriages contracted in 1930 were born outside of Canada, as a rule the percentages show a general reduction over the past few years. Canadian-born brides were in the majority, in 1930, in all the provinces except British Columbia, where Canadian-born and foreign-born brides were about equally divided. In the Maritime Provinces and Quebec, the Canadian-born brides and grooms showed a marked predominance, varying between 83 p.c. and 94 p.c., and in Ontario over 61 p.c. of grooms and 67 p.c. of brides were Canadian-born in 1930. Taking Canada as a whole, 64.5 p.c. of all grooms and 71.1 p.c. of all brides were born in Canada. Table 17 gives the number of marriages per 1,000 population in each province, as well as the percentage distribution of brides and grooms according to nativity.

Subsection 2.—Divorces.

For many years subsequent to Confederation the number of divorces granted in Canada was very small, 1883, with 13 divorces, being the first year in which the number attained two figures, while 1903, with 21 divorces, was the record year up to that time. Thereafter the numbers grew more rapidly, 1909 showing 51 divorces and 1913, the last pre-war year, 60 divorces. This number was, however, less than one per 1,000 of the marriages contracted in Canada in these years.

The effect of the war was to increase very greatly the number of divorces granted in Canada. The causes may be found in the generally unsettling psychological effect of the war period, and the long separations between men on active service and their wives. The provision of new facilities for divorce is also to be considered; owing to a decision of the British Privy Council, divorces in the Prairie Provinces have, subsequently to 1918, been granted by the courts of these provinces, so that Ontario and Quebec have since then been the only provinces in which the applicant for divorce must secure a special Private Act of Parliament. In 1930, however, an Act of the Dominion Parliament (20-21 Geo. V, c. 14) gave jurisdiction in divorce cases to the Supreme Court of Ontario.

The above-mentioned causes have tended to produce the recent increase in the numbers of divorces granted in Canada, which grew steadily from 114 in 1918 to 875 in 1930, these numbers being those of final decrees, which alone really constitute divorces. In 1931 the number decreased to 684, this being largely due to the transfer of jurisdiction in Ontario divorces from the Parliament of Canada to the Supreme Court of the province, with the consequent delay between the granting of the decree *nisi* and the decree absolute. In 1932 the number rose to 887, this figure being greater than the total divorces granted in the 48 years from 1868 to 1915. The statistics of divorces granted in the years from 1901 to 1932 inclusive will be found in Table 19. (For divorces in each year prior to 1901 see the 1921 Year Book, p. 825.)

19.—Statistics of Divorces Granted in Canada, 1901-32.

NOTE.—In Prince Edward Island only two divorces have been granted since Confederation, one in 1913 and one in 1931. In consequence of a decision of the British Privy Council, divorces in Manitoba, Saskatchewan and Alberta have, subsequently to 1918, been granted by the courts of these provinces.

Section 4.—Deaths.

Within the past century and more especially within the past generation there has occurred throughout the countries of the white world a notable decline in the death rate, except where man has brought death upon himself through wars and the aftermath of wars. How far this decline has been due to advances in medical science, how far to better sanitation and how far to the improvement in the general conditions of living, as a result of the increase in the productive power of humanity, is in dispute, but concerning the facts there is no doubt.

Perhaps the most impressive testimony regarding this decline in the death rate is furnished by the mortality statistics of Sweden, where vital statistics have been kept with great accuracy for the whole nation ever since 1750. There the crude death rate declined from an average of 27.4 per 1,000 in the decade 1751-60 to 14.3 in the decade 1911-20 and to 11.7 in 1930.

Similarly, in England, the crude death rate, which was 22.5 per 1,000 in the 60's, 21.4 in the 70's and 18.2 in the 90's of the last century, declined to 15.4 in the first decade of the present century and 12.1 in the third, rising to 12.3 in 1931. In Scotland, again, the average rate was 22.1 in the '60's, 21.8 in the '70's, 18.6 in the '90's, 13.9 in 1921-25, 13.6 in 1926-30, and 13.3 in 1931.

Of course the preceding statements are not to be taken to mean that every year will show a decline in the death rate as compared with the preceding year. There will always be years of specially high mortality, for instance 1918, when the death rate in Ontario, the most populous of the provinces of Canada, was 15.3 per 1,000, owing to the influenza-pneumonia epidemic, as against 12.0 in 1917 and 11.9 in 1919. Over a period, however, these idiosyncrasies of individual years are reduced to negligibility, and it remains true that from decade to decade there is, under normal conditions, a decline in the crude death rates of the countries of the white man's world.

As for Canada, while the period elapsed since the introduction of complete and comprehensive vital statistics in 1920 has been too short to establish a definite downward trend, the rate of 12.4 per 1,000 for that year, in the eight provinces then included in the registration area, was substantially higher than in any subsequent year. From 1926 Quebec, which has a higher death rate than any other province, has been included in the registration area and its influence is reflected in the totals for Canada shown in Table 20. A decided improvement is shown in the deaths and death rate of Quebec for the years 1930 and 1931, but the proportionate improvement in all the other provinces is also pronounced and in some cases even greater than that in Quebec.

Subsection 1.—General Mortality.

Total deaths and crude death rates in recent years are given in Table 20 for Canada, by provinces. There was a smaller absolute number of deaths in 1931 than in any other year since the record became available for all the nine provinces.

20.—Deaths and Death Rates, by Provinces, 1926-31, with Averages 1921-25 and 1926-30.

¹ Quebec was not included in the registration area prior to 1926.

² Exclusive of the Territories.

Age Distribution of Decedents.—The numbers of males and females dying in the nine provinces in 1930 and 1931 are given by single years of age up to 5 and by quinquennial age groups from 5 to 90 years and over in Table 21, together with the percentage of deaths occurring in each group in each of these years. In the eight provinces that have been in the registration area since 1921, the number of males under 1 year dying in 1931 was only 16.3 p.c. of the total number of male deaths, as against 23.6 p.c. in 1921, and of females, 14.8 p.c. as against 20.3 p.c. Similarly, deaths under 5 years of age among males fell from 29.8 p.c. of the total number of deaths in 1921 to 19.9 p.c. in 1931 and among females, from 26.5 p.c. number of deaths in 1921 to 19.9 p.c. in 1931 and among females, from 26.5 p.c. to 18.8 p.c.

The quartile and decile ages of decedents for the years 1928-30 are given for each sex and for the two sexes combined in Table 22. The fifth decile and second quartile (or the median) both mark the middle points of the arrays, and the deciles, dividing each half into five groups, give a more detailed picture of the age distribution in each half than do the quartiles. An examination of the arrays over the three-year period shows that both the quartile and decile distributions have been singularly free from irregularity. This was true in all three categories of males, females, and both sexes.

22.—Quartile and Decile Ages of Decedents, by Sex, 1928-30.

Adjusted Death Rates.—While the crude death rate gives the actual mortality per 1,000 of population, the differing age constitution of the population in different communities and the high mortality among infants and elderly people make the crude death rate no true test of the relative expectation of life in such communities. Where the age and health constitution of a particular group is particularly favourable to low mortality, for example among the selected lives of soldiers in peace time, the crude and the adjusted death rates will be lower than elsewhere.

When comparisons of the rates of mortality in several communities are made by age groups the effects of differences in age constitution between these communities are eliminated, but by a rather cumbersome process which does not bring together and express as a single figure the facts of the situation. It has therefore been considered desirable to adopt a particular community as a standard, and to find what the death rates of other communities would have been if the age and sex constitution of their population had corresponded to those of the community taken as a standard. The "standard" population chosen for this purpose in England and Wales and the United States is the "standard million", based on the age and sex distribution per million of the population of England and Wales at the census of 1901. That age and sex distribution was as follows:—

Age Group.	Both Sexes.	Males.	Females.
All ages.....	1,000,000	483,543	516,457
Under 5 years.....	114,262	57,039	57,223
5-9 years.....	107,209	53,462	53,747
10-14 years.....	102,735	51,370	51,365
15-19 years.....	99,796	49,420	50,376
20-24 years.....	95,946	45,273	50,673
25-34 years.....	161,579	76,425	85,154
35-44 years.....	122,849	59,294	63,456
45-54 years.....	89,222	42,924	46,298
55-64 years.....	59,741	27,913	31,828
65-74 years.....	33,080	14,691	18,389
75 years and over.....	13,581	5,632	7,949

Regarding the standard million of England and Wales the Registrar General says: "As the population of this country in 1901 included relatively few infants and old people it forms a standard exceptionally favourable to low mortality" The relative fewness of old people in the population is presumably due to the great increase in English population during the 19th century; the relative fewness of infants, to the marked reduction of the birth rate between the 1870's and the end of the century.

The process above described has been applied to the population of the eight provinces, the former registration area of Canada, for the years 1921-31 and to the population of Quebec for the years 1926-31 in Table 23. Of the rates there given, those for 1921 and 1922 have been calculated directly, the proportion of the population in each sex and age group according to the census of 1921 being assumed to hold true for 1922 also; similarly the rates for 1930 and 1931 have been calculated directly from the proportions shown in each sex and age group at the census of 1931. For the intervening years 1923-29, for which estimates of total population but not of population by age groups were available, the following method was adopted. The proportions which the adjusted rates of 1921 and 1922 (correct to three decimal places) bore to the crude were averaged, similarly those of 1930 and 1931, and the change was assumed to have taken place in an arithmetical progression during the intervening seven years. Quebec not having been in the registration area in the year 1921, an adjusted rate was not available for that year or for 1922, but an adjusted rate for 1926 was calculated on the assumption that the sex and age distribution of 1921 remained unchanged. As the proportion of the adjusted rate to the crude depends primarily on this sex and age distribution, the proportion thus obtained for Quebec in 1926 was used instead of the missing averages for 1921 and 1922. The same course was followed for the total of the nine provinces.

In all of the eight provinces for which 1921 figures are given the proportion of the adjusted rate to the crude was higher in 1921 than in 1931; in other words, the age distribution had become more unfavourable in the later year. In the Maritime Provinces and Ontario the process of "standardizing" or "adjusting" the death rate results in a reduced rate. This is particularly true of Prince Edward Island, which has the largest proportion of aged persons of all Canadian provinces. In the western provinces, on the other hand, the adjusted rates are higher than the crude. So much is this so, that in the case of Saskatchewan, while the crude rate in 1931 was only 6.6, as compared with 10.4 in Prince Edward Island, the adjusted rate was actually slightly higher than that of the island province.

¹Quebec was not included in the registration area prior to 1926.

Causes of Death.—More than 85 p.c. of deaths recorded in the present registration area in the years 1929 to 1931 were due to the 32 causes specified in Tables 24 and 25.

Total deaths in 1931 were the lowest they have been since statistics for the whole of Canada were made possible by Quebec coming into the registration area in 1926. The influenza epidemic of 1929 accounted for an increase in the total, but the deaths from this cause were below normal in 1931. It is significant, however, that cancer and diseases of the heart are increasingly important causes of death in spite of all efforts to control these diseases. Suicides did not vary much in 1931 from the high level reached in 1930, but violent deaths apart from suicides show improvement.

Deaths in Canadian Cities.—Table 26 gives the number of deaths in Canadian cities and towns of 10,000 population and over in each of the years from 1927 to 1931. Generally speaking, 1929 was a year of high death rates, the total number of deaths reported for the Dominion being 113,515 as compared with 105,136 in 1927. The 1929 figures for most cities show a corresponding increase in the number of deaths. It is probable that these cities contained a larger proportion of the total population in 1929 than in 1927 and it is quite likely that the number of non-residents dying in the hospitals of the cities is also on the increase. Deaths for 1930 and 1931 showed a decrease in most cities from the high levels of 1929.

*Though Point Grey and South Vancouver were not incorporated into Vancouver until Jan. 1, 1929, their statistics are included in the figures for Vancouver for the years 1927-28.

Comparative Crude Death Rates of Different Countries.—In Table 27 will be found a comparative statement of the crude death rates of various countries and provinces for the latest available year. It is worthy of note that three Canadian provinces show the lowest death rates in the list and that Canada has a lower death rate than most other leading countries. The low death rates in the Prairie Provinces are in all three cases due in part to a favourable age distribution of population.

Subsection 2.—Infantile and Maternal Mortality.

In recent years a great part of the energy devoted by the medical profession and sanitarians to effect a decline in the death rate has gone to reduce infantile mortality, and in this field a large measure of success has been attained. In Canada, the Dominion, provincial and municipal health authorities have all taken part in the struggle to reduce infantile mortality, and usually, in the absence of epidemics, each year is showing an improvement. In the ten years for which the figures are available there is evident a very considerable decline in infantile mortality. In 1921 the infant death rate for Canada (using figures from provincial sources for Quebec) was 102 per 1,000 living births. This rate has been reduced to 84.7 in 1931. Table 28 gives figures for the whole of Canada for the years 1926 to 1931 and averages for the five-year periods 1921-25 and 1926-30. As in the case of general mortality, the infant mortality in Quebec exceeds that in any other province, although a study of the rates shows that steady improvement has been made in the six-year period during which the province has been included in the registration area. In Canada as a whole, over 4,000 infant lives were saved in 1931 which would have been snuffed out in 1926.

28.—Infantile Mortality, by Provinces, together with the Rate per 1,000 Living Births, 1926-31 with Averages for 1921-25 and 1926-30.

¹Quebec was not included in the registration area prior to 1926.

²Exclusive of the Territories.

Infantile Mortality by Causes of Death.—Twenty-one principal causes of death accounted in the years 1926 to 1931 for between 91 and 93 p.c. of the infantile mortality experienced in the Dominion, as is shown in Table 29. It is noteworthy that four causes present at birth, viz., premature birth, injuries at birth, congenital debility and congenital malformations, accounted for over 43 p.c. of the infant deaths of 1931. In the year 1930, 47 p.c. of all infants dying were less than one month old and 34 p.c. less than one week old, as is shown in Table 30.

29.—Infantile Mortality in Canada by Principal Causes of Death, 1926, 1929-31.

Note.—Figures for the former registration area for the years 1921 to 1924 will be found at pp. 182-3 of the 1927-28 Year Book and for 1925 to 1927 at pp. 177-8 of the 1929 Year Book. Figures for the whole of Canada for the years 1927 and 1928 will be found at pp. 138-40 of the 1932 Year Book.

Infantile Mortality in Canadian Cities and Towns.—Table 31 shows for the cities and towns of 10,000 population and over, the numbers of infant deaths and the death rates per 1,000 living births for the years 1928-31. In the latest year Outremont, Que., had the lowest infant death rate, namely, 20.2, with Sydney, 24.9, the next lowest. St. Hyacinthe, Quebec, Three Rivers, Lévis, Sorel, Joliette, Hull, Shawinigan Falls, Timmins and Montreal have all very high infant death rates for 1931, but it is noteworthy that in the cases of St. Hyacinthe, Quebec, Shawinigan Falls and Montreal there is substantial improvement over the preceding year.

*Though Point Grey and South Vancouver were not incorporated into Vancouver until Jan. 1, 1929, their statistics are included in the figures for Vancouver for the year 1925 for comparative purposes.

Infantile Mortality in Various Countries.—The rate of infantile mortality to living births has been greatly reduced in civilized countries by the recent advances in medical science and in sanitation. The low record is held at the present time by New Zealand, where in 1931 the rate of infantile mortality was only 32.2 per 1,000 living births as compared with 68 in 1905. Norway, the Netherlands and Switzerland, with rates of 45.6, 49.6 and 49.4 in the latest available years, were the lowest among European countries.

As showing the improvement in recent years, it may be stated that the rate of infantile mortality in England and Wales has been reduced from 128 per 1,000 living births in 1905 to 66.4 in 1931, while the rate in Germany has declined from 196 in 1904 to 82.8 in 1930. In the Netherlands, again, the rate has declined from 131 per 1,000 living births in 1905 to 49.6 in 1931. Statistics are given in Table 32 by leading countries and by provinces.

Infantile Mortality in Great Cities of the World.—In former times cities were considered to be "the graveyards of population". Deaths, consequent upon the rapid spread of infectious diseases, were generally more numerous than births, and it was the prevailing opinion that cities would naturally come to an end if they were not being constantly reinforced by fresh young life from the prolific countryside. The unhealthiness of cities was especially destructive of infant life, and it is one of the greatest triumphs of our time that city life is in our day, if not as healthy, yet not necessarily more dangerous to human nor to infant life than the average living conditions in the country as a whole.

To give particular examples, the rate of infantile mortality in London, England, was 59 per 1,000 living births in 1930, as compared with a rate for England and Wales of 60 per 1,000. In 1930 New York experienced an infantile mortality of 58 per 1,000, as against a rate of 64 per 1,000 for the birth registration area of the United States. Paris, on the other hand, had in 1929 an infantile mortality of 99 per 1,000 living births, as compared with 96 for France. Again, Berlin in 1930 had an infant mortality of 73 per 1,000 living births, as compared with 84 in Germany, and Vienna an infant mortality in 1929 of 79 per 1,000 living births, as compared with 112.3 for Austria in the same year.

In Canada, Montreal had in 1931 an infantile mortality of 114.1 per 1,000 living births as compared with 112.9 for the province of Quebec. Toronto, too, had in 1931 an infantile mortality rate of 69.8 per 1,000 living births as against

69.8 for the province of Ontario, while Winnipeg and Vancouver had much lower infantile mortality rates than their respective provinces. Vancouver, indeed, has one of the lowest infantile mortality rates in the world.

The infant mortality in the cities of Canada has been greatly reduced in the years since the inauguration of Dominion vital statistics. Thus the rate for Toronto has fallen from 90 in 1921 to 70 in 1931, that for Winnipeg from 78 to 48, for Vancouver from 56 to 42, for Hamilton from 88 to 59, for Ottawa from 130 to 97, for London from 92 to 52, for Edmonton from 89 to 61, for Halifax from 135 to 81, for Saint John from 147 to 91. Altogether, in the 13 cities of 40,000 population and over in the former registration area of Canada, there were 41,923 living births in 1921 and 3,833 infant deaths, being a rate of 91 per 1,000 living births. In 1931 in these same cities there were 39,758 living births but only 2,510 infant deaths, or a rate of 63 per 1,000 living births.

Maternal Mortality.—Of cognate interest with infantile mortality is the maternal mortality arising out of child-birth. This maternal mortality is shown by Table 34 to be at its lowest among mothers in their twenties and to increase with mothers of more advanced years. The mortality among mothers of different ages per 1,000 living births in the nine provinces is shown for the years 1926-31, with totals for all ages. The maternal mortality is shown by age groups for 1931 and by totals for earlier years in Table 35, also by causes for 1931 in Table 36.

As compared with the previous year, the number of maternal deaths shows a decrease of 190 or about 13 p.c. All provinces except Prince Edward Island, New Brunswick and British Columbia show substantial decreases compared with 1930. In fact, for the first time since 1921, when statistics covered the provinces other than Quebec, and since 1926, when figures were made available for all provinces, a significant decrease of such deaths is shown. An analysis by causes is not possible, since the 1929 "Revision of the International List of Causes" was used in 1931 and comparability with previous years has thereby been disturbed.

CHAPTER VI.—IMMIGRATION.

While the great majority of French-Canadians can trace their descent to ancestors who left the Old World 250 years ago or even longer, most English-speaking Canadians are comparative newcomers both to Canada and to this continent, though a considerable number of the United Empire Loyalist families had been resident in the old colonies for generations before they moved north to establish English-speaking settlements in what is now the Dominion of Canada. During the middle third of the nineteenth century a great English-speaking migration entered the province of Ontario and made it for the first time more populous than the sister province of Quebec, thus bringing about the agitation for representation by population. Thereafter immigration slackened until the dawn of the twentieth century brought another flood of settlers to the newly opened territories of the great Northwest, resulting in an increase of population between the censuses of 1901 and 1911 greater than the combined increase of the three decades from 1871 to 1901.

Immigration during the second decade of the twentieth century promised at its commencement to be even greater than during the first. In its first three years no fewer than 1,141,547 persons entered Canada for purposes of settlement, but the Great War, which commenced for Canada on Aug. 4, 1914, dried up the sources of our immigration in Great Britain and Continental Europe, where every able-bodied man was needed for the defence of his country. Immigrant arrivals from the United Kingdom in 1918 numbered only about 3,000, as compared with 150,000 in 1913; immigrant arrivals from Continental Europe numbered less than 3,000 in 1916, as compared with approximately 135,000 in 1914. Since the War, immigration to the Dominion has never approached that of the pre-war period.

Section 1.—Statistics of Immigration.

Immigration to Canada, as to other new countries, is generally greatest in "boom" periods, when capital as well as labour is leaving the older countries for the newer in order to secure the more remunerative investments generally to be found in virgin territories where the natural resources are still unexploited. In periods of depression, however, the sending abroad of both capital and labour is diminished, both preferring at such times to endure the ills which they know at home rather than take the risks of a new adventure at a distance. Indeed, the depression which began about the close of 1929, with its accompanying unemployment and unsold surplus of farm products, raised the question whether it was desirable that Canada should accept immigrants in any considerable number. Therefore the Government, on Aug. 14, 1930, passed an Order in Council whereby immigrants, except Britishers coming from the Mother Country or self-governing Dominions and United States citizens coming from the United States, were allowed to come in only if they belonged to one of two classes—(a) wives and unmarried children under eighteen years of age, joining family heads established in Canada and in a position to look after their dependants; (b) agriculturists with sufficient money to begin farming in Canada. This limitation applies to the whole continent of Europe as well as to many other countries. Regulations affecting immigration from the British Isles, the British Dominions or the United States have not been changed but a policy of no solicitation has been rigidly adopted. In harmony with

this policy the Department of Immigration and Colonization during 1931 closed all its Canadian Government Information Bureaus in the United States and reduced its representation in the British Isles.

For many years the Immigration Regulations have contained a general provision that immigrants coming to Canada must have sufficient funds to look after themselves until employment is secured. Naturally, when employment is readily available a sum would be considered sufficient which would be insufficient in periods of unemployment, and the enforcement of this regulation is an important factor in reducing immigration at the present time. There is also in effect an Order in Council (Aug. 7, 1929), prohibiting the landing in Canada of any immigrant coming under contract or agreement, expressed or implied, to perform labour or service of any kind in Canada, but this regulation does not apply to farmers, farm labourers, or houseworkers. Under the Order, the Minister of Immigration and Colonization may admit any contract labourer if satisfied that his labour or service is required in Canada.

The relationship of prosperity and adversity to immigration is illustrated by Table 2, which shows that during the past thirty-five years immigration was at its minimum in the year of deepest depression, 1897; that it steadily increased from that time until 1908; that a decline took place in the fiscal year ended Mar. 31, 1909, on account of the short depression of 1908; and that thereafter immigration steadily increased till 1913. In the fiscal years 1915 to 1919, political rather than economic conditions restricted immigration but, with the expansion of business at the end of the War, our immigration was more than doubled, while the depression which characterized 1921 and 1922 is reflected in the declining immigration of the fiscal years ended Mar. 31, 1922 and 1923. An improvement in business conditions in 1923 was reflected in an increase of immigration during the fiscal year ended Mar. 31, 1924, when 148,560 settlers entered Canada as compared with less than half that number in the preceding year. The fiscal years ended Mar. 31, 1925 and 1926, showed declines of 24.4 and 35.3 p.c. respectively from the 1924 level, but the fiscal years ended 1927 to 1929 showed increases in harmony with the general upward trend of business. The fiscal year ended Mar. 31, 1930, showed a slight falling off, and the restrictions on immigration imposed since August, 1930, referred to on p. 185, have been mainly instrumental in reducing the total of immigrant arrivals from 163,288 in 1930 to 88,223 and 25,752 for the fiscal years 1931 and 1932 respectively.

The number of immigrant settlers in Canada is shown by calendar years from 1867 to 1880 in Table 1, and the number of immigrant arrivals in Canada from the United Kingdom, the United States and other countries, is given by years from 1881 in Table 2.

¹The figures of immigration from the United States for the years 1881 to 1891 do not distinguish between immigrants and non-immigrants. As the U.S.-born population of Canada, according to the census, increased only from 77,753 to 80,915 between 1881 and 1891, it would appear that the number of permanent immigrants from the United States in these years must have been comparatively small. No statistics of immigrants from the U.S. were collected for the years 1892 to 1896. ²Calendar year. ³Six months, January to June, inclusive. ⁴Nine months ended March 31.

Sex and Conjugal Condition of Immigrants.—As shown by Table 3, the 25,752 immigrants who came to Canada in the fiscal year ended Mar. 31, 1932, included 11,988 males and 13,764 females, males constituting only 46.5 p.c. of the total. Male immigrants normally exceed female immigrants as is shown in Table 4.

Racial Origins of Immigrants.—Where there is any considerable immigration into a democratic country, the racial and linguistic composition of the immigrants is of great importance. Canadians prefer that settlers should be of a readily assimilable type, already identified by race or language with one or other of the two great races now inhabiting this country and prepared for the duties of Canadian citizenship. Since the French are not, to any great extent, an emigrating people, this means in practice that the great bulk of the preferable settlers are those who speak the English language—those coming from the United Kingdom or the United States. Next in order of readiness of assimilation are the Scandinavians, Dutch and Germans, who readily learn English and are already acquainted with the working of democratic institutions. Settlers from Southern and Eastern Europe, however desirable from a purely economic point of view, are less readily assimilated, and the Canadianizing of the people who have come to Canada from these regions in the present century is a problem both in the agricultural Prairie Provinces and in the cities of the East. Less assimilable still, are those who come to Canada from the Orient. On the whole the great bulk of Canadian immigration of the past generation has been drawn from the English-speaking countries and from those continental European countries where the population is ethnically nearly related to the British, though for some years there was an increasing immigration of Slavs.

The racial origins of the immigrants who arrived in Canada in the fiscal years ended Mar. 31, 1931 and 1932 are shown in Table 5. In the latter year the British races contributed 59 p.c. of the immigrants, French 11 p.c., and Germans 9 p.c.

Ports of Arrival of Immigrants.—Throughout the greater part of our history, Quebec has been the port at which the greatest number of our immigrants have landed. In the past ten years, up to 1932, there was a great increase in the percentage of immigrants arriving at the port of Halifax. This would appear to be due to increasing immigration in the early spring months before the St. Lawrence is open for traffic. Figures for recent years are given in Table 9.

Destinations of Immigrants.—The immediate destinations of the immigrants arriving in Canada are given for the years from 1901 to 1932 in Table 10, which may be compared with the census tables on pp. 102 and 103 showing the increase of population in the decades between 1901 and 1931.

While immigration to the Maritime Provinces during the first 32 years of the twentieth century was comparatively small, totalling 211,147, that to Quebec and Ontario was very large. From 1905 to 1928 Ontario received a larger number of immigrants annually than any other province of the Dominion, while Manitoba was usually second in this respect. In 1929 immigration to Manitoba exceeded that to Ontario by 10,000 persons, but in 1930, 1931 and 1932 the positions were again reversed. The immigration to Eastern Canada (Maritime Provinces, Quebec and Ontario) has almost equalled that to Western Canada (Manitoba, Saskatchewan, Alberta and British Columbia) in the 32-year period.

¹ Includes immigrants destined for the Northwest Territories: 3 in 1927, 39 in 1928, 1 in 1929, 8 in 1930, 3 in 1931 and 11 in 1932.

Occupations of Immigrant Arrivals.—The settlers most universally acceptable to Canadians are those who settle on the land or those females who enter domestic service. In Table 11 will be found statistics of the occupations of immigrants arriving in Canada during the fiscal years ended Mar. 31, 1931 and 1932.

¹Includes domestics under 18 years of age.

Prohibited Immigrants.—The following is a summary of the classes whose admission to Canada is prohibited under the existing regulations. These regulations, however, do not apply to Canadian citizens or persons having Canadian domicile:—¹

(1) Imbeciles, feeble-minded persons, epileptics, insane persons, persons of constitutional psychopathic inferiority, persons suffering from chronic alcoholism and those mentally defective to such a degree as to affect their ability to earn a living.

(2) Persons afflicted with tuberculosis or with any loathsome, contagious or infectious disease or a disease which may be dangerous to public health; immigrants who are dumb, blind or otherwise physically defective.

(3) Prostitutes and women and girls coming to Canada for any immoral purpose, pimps, procurers and persons who have been convicted of any crime involving moral turpitude.

(4) Professional beggars or vagrants, charity-aided immigrants and persons who are likely to become public charges.

(5) Anarchists, persons who disbelieve in or are opposed to organized government or who belong to any organization teaching disbelief in or opposition to organized government, persons who have been guilty of espionage or high treason and persons who have been deported from Canada.

(6) Persons over fifteen years of age unable to read. The literacy test, however, does not apply to a father or grandfather over 55 years of age, or to a wife, mother, grandmother or unmarried daughter or widowed daughter.

The Immigration Act provides for the rejection and deportation of immigrants belonging to the prohibited classes, and also for the deportation of those who become undesirables within five years after legal entry.

The operation of the above regulations is illustrated in Tables 12 and 13, which give the numbers of immigrants rejected or deported after admission, the causes of such rejection or deportation, and the nationalities of those deported, for each of the 11 fiscal years ended 1922 to 1932, together with the totals for the 19 fiscal years 1903-21 and the 30 fiscal years from 1903 to 1932 inclusive.

¹ See also pp. 185 and 186.

Juvenile Immigrants.—Among the most generally acceptable immigrants are the juveniles of both sexes, many of whom have been trained by highly accredited British organizations for Canadian life before coming to Canada, the boys being taught the lighter branches of farm work, and the girls instructed in domestic occupations. On arrival in Canada the boys are placed on farms, while the girls are placed either in town or country, but the organizations remain the guardians of the children until they have reached maturity, and in addition the children are subject to efficient and recurrent government inspection until they reach their nineteenth year. This inspection is under the control of the Supervisor of Juvenile Immigration.

Under the British Empire Settlement Agreement the term "children" was applied to boys from 14 to 19 years of age and girls from 14 to 17 migrating to Canada under provincial or approved society auspices. These organizations were assisted by the Oversea Settlement Agreement, which provided free transportation for the boys and girls from the British Isles migrating to Canada under their auspices. On September 23, 1931, the societies concerned were notified that the Dominion Government had decided to withdraw from any further assistance of that nature.

The number of juvenile immigrants to Canada in each year since 1901 is given in Table 14.

14.—British Juvenile Immigrants, fiscal years ended 1901-32.

Oriental Immigration.—The immigration to Canada of the Asiatic races, able because of their low standard of living to underbid the white man in selling his labour, is fundamentally an economic rather than a racial problem, affecting most of all those parts of the country which are nearest to the Orient and the classes which feel their economic position threatened. A record of Oriental immigration since the commencement of the century is given in Table 15.

15.—Record of Oriental Immigrants, fiscal years ended 1901-32.

Chinese Immigrants.—Oriental immigration to the Pacific Coast of North America appears to have commenced with the coming of Chinese immigrants about the time of the discovery of gold in California in 1849, and British Columbia is thought to have received its first Chinese immigrants some time before 1870. The original occupations of these immigrants were as laundrymen and domestic servants. As early as 1872 Chinese were employed in the coal mines of the province and the Legislature was already considering the imposition of a poll tax on Chinese, the same proposition coming up later in the Dominion Parliament with the design of preventing the employment of Chinese labour in railway construction. A Royal Commission was appointed by the Dominion Government in 1884 to investigate

Chinese immigration, and this Commission recommended the imposition of a head tax of \$10 upon Chinese entering Canada, together with registration and special legislation regulating Chinese domestic servants. This led to the passage of legislation in 1885 (48-49 Vict., c. 71), providing that thereafter Chinese of the labouring class should be required, as a condition of entering into Canada, to pay a head tax of \$50 each. On Jan. 1, 1901 (63-64 Vict., c. 32) this tax was increased to \$100, and on Jan. 1, 1904 (3 Edw. VII, c. 8), after another Royal Commission had reported on this matter, the head tax was further increased to \$500. This tax was paid by all Chinese immigrants except consular officers, merchants and clergymen and their families, tourists, men of science, students and teachers. In spite of this restrictive legislation, the number of Chinese enumerated at the decennial censuses rose from 4,383 in 1881 to 17,312 in 1901, to 27,774 in 1911, to 39,587 in 1921 and 46,519 in 1931. Of this latter number, 43,051 were males and only 3,468 females. Over 58 p.c. of all the Chinese in Canada, *viz.*, 27,139 were residents of British Columbia.

16.—Record of Chinese Immigrants, fiscal years ended 1912-1932, with Totals 1886-1900 and 1901-11.

The Chinese Immigration Act of 1923 (13-14 Geo. V, c. 38)¹ restricts the entry to or landing in Canada of persons of Chinese origin or descent, irrespective of allegiance or citizenship, other than government representatives, Chinese children born in Canada, merchants (defined by what regulations the Minister of Immigration and Colonization may prescribe) and students—the last two classes to possess passports issued by the Government of China and endorsed by a Canadian immigration officer. As a result no Chinese were admitted to the country as immigrants in the fiscal years ended 1925, 1926 and 1927; three are shown by the above table to have been admitted in 1923, one in 1929, but none in 1930, 1931 or 1932.

¹ R.S.C. 1927, c. 95.

Japanese Immigrants.—Japanese immigration to Canada commenced about 1896, and a total of some 12,000 came in between then and 1900, but at the census of 1901 the total number enumerated as domiciled in the Dominion was only 4,738; in 1911, 9,021; in 1921, 15,868—15,006 of these latter being domiciled in British Columbia. The immigration of Japanese was especially active in the fiscal years 1906 to 1908, in which three years a total of 11,565 entered the country. In the latter year an agreement was made with the Japanese Government, under which the latter undertook to limit the number of passports issued to Japanese immigrants to Canada. The statistics of Table 15 show that Japanese immigration to Canada has been restricted to about 200 per annum in the three latest years.

In 1931 Japanese in Canada numbered 23,342, of whom 22,205 were in British Columbia.

East Indian Immigrants.—East Indian immigration to Canada, like Japanese, is shown by Table 15 to have been negligible down to 1907, when no fewer than 2,124 East Indian immigrants arrived. However, as a consequence of the operation of a regulation under section 38 of the Immigration Act of 1910, East Indian immigration has since that date been comparatively small. A resolution of the Imperial War Conference of 1918 declared that "it is the inherent function of the Governments of the several communities of the British Commonwealth that each should enjoy complete control of the composition of its own population by means of restriction on immigration from any of the other communities". However, it was recommended that East Indians already permanently domiciled in other British Countries should be allowed to bring in their wives and minor children, a recommendation which was confirmed, so far as Canada was concerned, by Order in Council of Mar. 26, 1919. However, in the ten fiscal years ended Mar. 31, 1921 to 1930, only 10, 13, 21, 40, 46, 62, 60, 56, 52 and 58 East Indian immigrants respectively were admitted, or 418 in the decade. In 1931 and 1932 the numbers were 80 and 47 respectively.

Expenditures on Immigration.—The sums expended by the Dominion Government on immigration in each of the fiscal years ended 1868 to 1932 inclusive, as stated in the Public Accounts issued annually by the Department of Finance, are shown in Table 17.

17.—Expenditures on Immigration in the fiscal years ended 1868-1932.

Recent Emigration from Canada.—An important factor tending to offset our immigration activities in the past was a movement from Canada to the United States which attained considerable proportions at certain periods. The quota system of immigration regulation, applied by the United States Government against immigrants generally, but not against the Canadian born, had the effect of limiting immigration to the United States and thereby encouraging Canadians to enter the United States. No record of this movement had ever been kept by the Canadian Government, and, while its seriousness was recognized, its magnitude, as indicated by the United States returns, was questioned on the ground that these returns did not make allowance for Canadians returning to Canada after a more or less extended period of residence in the United States. The Canadian Department of Immigration and Colonization was convinced that a very considerable return movement was taking place, but until 1924 no attempt was made to ascertain the exact magnitude of that movement. In that year immigration officers were instructed to take note of Canadians returning to Canada from the United States after having left Canada to reside in that country. The results are tabulated in Table 18.

Another circumstance which has in the past occasioned a considerable movement from Canada to the United States has no doubt been the practice of Europeans to enter Canada and declare themselves *bona fide* immigrants, with the real intention of entering the United States as soon as the quota restrictions would permit them to do so. The tightening-up of the American regulations concerning persons entering the United States from Canada and the active co-operation of the Canadian Department of Immigration and Colonization in discouraging this traffic, seem to have effectually met this situation.

Table 18 shows the number of Canadians returned from the United States from April 1, 1924, to Mar. 31, 1932.

18.—Canadians Returned from the United States, fiscal years ended Mar. 31, 1925-32.

Fiscal Year ended Mar. 31—	Canadian-born Citizens.	British Born who had acquired Canadian Domicile.	Naturalized Canadian Citizens.	Total.
1925.....	36,473	4,487	2,815	43,775
1926.....	40,246	4,102	2,873	47,221
1927.....	49,235	5,326	2,376	56,957
1928.....	35,137	3,280	1,470	39,887
1929.....	30,008	2,795	995	33,798
1930.....	26,959	2,030	841	29,830
1931.....	26,811	2,111	1,287	30,209
1932.....	17,691	1,069	651	19,411

Official returns indicate that the movement of population between the two countries is now definitely toward Canada. According to the official returns of the United States Government immigration to that country from Canada in the twelve months ended Mar. 31, 1931, amounted to 32,137. Table 2 shows that the movement of immigrants from the United States to Canada in the same period amounted to 24,280, and Table 18 shows a return movement of 30,209 Canadians—a total of

54,489, or a net balance in favour of Canada of 22,352. For our fiscal year ended Mar. 31, 1932, the record is as follows: Emigrants to U.S. (U.S. figure of immigrants), 8,422; immigrants from U.S., 14,297; returning Canadians, 19,411. There was thus a net inward movement of 25,236.

In Table 19 will be found the number of transoceanic passengers entering Canada during the fiscal year ended Mar. 31, 1932, by description and classes, together with totals by classes for the years 1926 to 1931. It will be seen that the fiscal year ended 1930 showed the largest number of transoceanic passengers and the 1932 figures are lower than for any other year of the record.

19.—Returning Canadians and Other Non-Immigrants Entering Canada via Ocean Ports, by Class of Travel, fiscal year ended Mar. 31, 1932, with Totals for fiscal years 1926-31.

NOTE.—Figures in this table cover transoceanic passengers only. Details for 1926 to 1931 will be found in previous editions of the Year Book.

Colonization Activities.—Contemporaneously with the sharp reduction in immigration disclosed by preceding tables, due to the policy of limiting immigration in accordance with the requirements of the country, a new and important development has occurred in the form of colonization activities within Canada. It was found that there were in the cities of the Dominion many families and individuals with farm experience who had been attracted to industrial centres in more prosperous times and would now regard with favour the opportunity of an assured subsistence on the land. In many cases families were still in possession of some capital but were in fear of its gradual depletion through unemployment. It was believed that many such families and individuals would return to the land without financial

assistance if they could be guided to suitable opportunities. In order to promote such settlement, co-ordination of the activities of the Land Settlement Branch of the Department of Immigration and Colonization and branches of the Canadian National and Canadian Pacific Railways doing similar work was arranged, a committee was organized with representatives of the three interests mentioned, and an active program of land settlement within the Dominion was undertaken. To establish contact with families or individuals desiring to return to the land, a small campaign of classified advertising in the daily press was conducted by the committee. There was no suggestion of financial assistance but there was the offer of dependable and disinterested advice and service in placing such families and individuals in touch with opportunities for farm settlement or farm employment. From Oct. 1, 1930, to Sept. 30, 1932, these activities resulted in the recorded placement in farm employment in Canada of 20,689 single men, and in the settlement on farms of 9,493 families, all of this without any expenditure of public funds in the form of financial assistance to such settlers. On the basis of five persons to the family the total landward movement resulting from these activities represented more than 68,000 persons. In addition to the co-ordinated activities of the two railways and the Department of Immigration and Colonization, several of the provinces carried on effective land settlement movements.

Section 2.—Immigration Policy.

An article prepared by R. J. C. Stead, Director of Publicity, Department of Immigration and Colonization, appeared under this heading in the 1931 edition of the Year Book at pp. 189 to 192 inclusive.

CHAPTER VII.—SURVEY OF PRODUCTION.

The Definition of "Production".—The term "production" is used here in its popular acceptation, i.e., as including such processes as the growing of crops, extraction of minerals, capture of fish, conversion of water power into electrical current, manufacturing, etc.—in economic phrase, the creation of "form utilities". It does not include various activities which are no less "productive" in a broad and strictly economic sense, such as (a) transportation, refrigeration, merchandising, etc., which add to commodities already worked up into form the further utilities of "place", "time" and "possession", and (b) personal and professional services, such as those of the teacher and the doctor, which are not concerned with commodities at all, but are nevertheless essential to any civilized society—representing, in economic language, the creation of "service utilities".

As showing the importance of these latter activities, it may be pointed out, for comparison with the figures in the accompanying tables, that steam railway gross earnings in 1930, the latest year for which complete statistics of production are available, amounted to \$454,231,650, street railway gross earnings to \$54,719,259, and telephone and telegraph earnings to \$83,685,456, all of which, from a broad point of view, may be considered as "production". It may be further noted that, according to preliminary figures of the census of 1931, out of 3,924,474 persons of ten years of age and over recorded as gainfully occupied, 306,209 were engaged in transportation activities, 386,881 in trade, 92,293 in finance and 766,256 in service occupations. While 81,042 of the latter were engaged in custom and repair work, the value of which is included in the survey of production, the value of the "production" of the remaining 1,470,597 gainfully occupied persons in the four occupational groups just mentioned would not appear to be included to any extent in the survey of production. Then, on the assumption that 1,470,597 gainfully occupied persons whose production is not included in the survey were no less "productive" in the broad sense of the term than the remaining 2,453,877¹ gainfully occupied persons (of whom they amounted to practically 60 p.c.), 60 p.c. should be added to our total net production to arrive at an estimate of the grand total value of the "production" of all gainfully occupied Canadians. Since the net value of production of commodities as stated in the survey was \$3,217,000,000 in 1930, the grand total money value of the productive activities of the gainfully occupied population of Canada in the same year may be estimated at 160 p.c. of the above figure or \$5,147,000,000 or say \$5,150,000,000 in round figures.

The Relation of "Production" to National Income.—The above figures of total production are necessarily larger than the national income, since a considerable deduction must be made therefrom for the purpose of keeping the national capital engaged in production unimpaired, before the remainder can be placed at the disposal of individuals. Machinery that is either obsolete or obsolescent must be replaced, buildings and other equipment kept in a good state of repair, etc. In other words, full and adequate provision must be made out of the year's products for the annual depreciation of the equipment used in their production before

¹ This figure includes 189,310 gainfully occupied persons whose industries were not specified but who were mainly general labourers and office clerks. The products of the labour of these persons were probably mainly included in the survey of production but here it is assumed that they were all so included.

any part of that product can be allocated to individuals. On this basis, probably not more than 92 p.c. of the annual value of the productive activities of the Dominion is annually available for consumption as the national income. The national income of the people of Canada in 1930 may therefore be estimated as having been somewhere in the neighborhood of \$4,750,000,000.

(See also entry "National Income" in the index.)

"Gross" and "Net" Production.—The values of products are shown under two headings, namely, "gross" and "net". "Gross" production shows the total value of all the individual commodities produced under a particular heading. "Net" production represents an attempt to eliminate the value of materials consumed in the productive process. For purposes of ordinary economic discussion, the net figures should be used in preference to the gross, because of the large amount of duplication which the latter includes on account of the necessity of making the individual items self-contained. The tables show the total values of all commodities produced in Canada in the latest years; the values are given as in the producers' hands.

Difficulties in Differentiating between the Branches of Production.—

There is an increasing demand for a survey of production that will differentiate as between the more important branches and at the same time give a purview of the whole which will be free from overlapping. This is somewhat difficult to present with clearness, in view of the varying definitions that attach to industrial groups from different points of view. For example, brick, tile and cement are frequently included in "mineral production" as being the first finished products of commercial value resulting from the productive process; frequently, however, they are regarded as "manufactures" in view of the nature of the productive process—either allocation being correct according to the point of view. In the summing up, production in such industries is regarded as primary production and a total for other manufacturing industries is given under the description "manufactures, *n.e.s.*"

Interpretation of Items.—The primary industries of agriculture, fishing, forestry, mining, etc., are separated in this statement from the secondary or manufacturing processes. The close association between the two and the overlappings that are apt to occur have already been pointed out. As further explaining the procedure that has been followed in drawing up the tables, the following notes are appended:—

Agriculture.—Dairy factories are included under this heading; farm dairy products (gross) include the milk consumed whole and sold to dairy factories, and the butter, etc., made on the farm.

Forestry.—Forestry production is understood to consist of the operations in the woods as well as those of sawmills and pulp-mills, the latter being limited to the making of first products such as lumber, lath, shingles, pulp and cooperage stock.

Fur Production.—The item of fur production is limited to the wild-life production. To obtain a total of the peltries produced in Canada, it would be necessary to add to the wild-life output the production of pelts on fur farms, which is included in the total for "agriculture"

Mineral Production.—Under mineral production many items are included that are also allocated to "manufactures". Considerable overlapping exists as between "mineral production" on the one hand and "manufactures" on the other. The Bureau presents the detailed statistics of these groups (the chief of which are smelters, brick, cement, lime, etc.) in its reports on mineral production, since their product is the first to which a commercial value is ordinarily assigned.

Total Manufactures.—The figure given for this heading is a comprehensive one including the several items listed with the extractive industries above, though also frequently regarded as "manufactures", viz., dairy factories, fish-canning and curing, sawmills, pulp-mills, shipbuilding and certain mineral industries. This duplication is eliminated from the grand totals as well as from "manufactures, *n.e.s.*", listed in Table 5.

Manufactures, n.e.s.—The figures given for manufactures, *n.e.s.*, are exclusive of the value of the products of all manufacturing processes closely associated with the extractive industries that are frequently included under this heading; hence it is obvious that the grand total is equivalent to an amount obtained by adding the values for manufactures, *n.e.s.*, and for the other eight divisions.

Section 1.—The Leading Branches of Production in 1930.

The total net value of production, as estimated for 1930 by the Dominion Bureau of Statistics, on the basis of statistics compiled by its various branches, was \$3,216,700,000. This was less than for any year since 1924. Decreases were shown in every branch of production except the electric power industry and were especially heavy for agriculture, trapping and construction work. Farm yields were slightly above normal in 1930 but the average price of farm products was less than in any year in the two preceding decades. The resulting values of farm crops produced in 1930 were less than in any year since 1914.

Manufacturing plants operated at a comparatively high level of capacity during the first half of the year, but there was a pronounced decline later. The value added by the manufacturing process showed a decline of nearly 12 p.c. from the 1929 level.

Total production was 18 p.c. less than in 1929, 22 p.c. less than in 1928, 17 p.c. less than in 1927, nearly 12 p.c. less than in 1926, 4 p.c. less than in 1925 and 6 p.c. greater than in 1924.

The Main Branches of Production in 1930.—Confining our analysis to the net production of commodities, "net" production signifying the value left in the producers' hands after the elimination of the value of the materials consumed in the production process, it is noteworthy that, as already pointed out, electric power, alone of the nine branches of production, showed increased production in 1930. The reason lay chiefly in the many projects already planned or begun which were being carried to completion. These included the Beauharnois project and the Rapide Blanc development on the Upper St. Maurice river, in Quebec; the Abitibi Canyon project and the Chats Falls development, in Ontario; the Seven Sisters development in Manitoba; and the Stave River project in British Columbia. The decline in agricultural production, after deducting the cost of materials such as seed, feed and nursery stock, was 26.6 p.c. Forestry, comprising woods operations and the value added by the manufacturing process in the sawmilling and pulp industries, showed a drop of 10.2 p.c., while mineral production at \$279,873,000 showed a decline of 10 p.c. The revenues of the fisheries and of trapping showed declines of 10.7 p.c. and 39.6 p.c., respectively.

Among the branches of secondary production, construction showed the heaviest proportional decline of 23.2 p.c. Custom and repair production was down by 14.5 p.c. compared with 1929 and manufactures was reduced by 11.8 p.c.

Relative Importance of the Several Branches of Production.—Owing to the more rapid decline in agricultural revenue in 1930, the lead of manufactures over agriculture, which was 93 p.c. in 1929, increased to 132.2 p.c. in 1930. Agricultural production in 1930 represented 23.6 p.c. of the net output of all branches, while the total value added by the manufacturing processes was 54.8 p.c. of the total net production. However, a number of industries listed under manufactures are also included in the several extractive industries with which they are associated. Eliminating this duplication, the output of the manufacturing industries not elsewhere included was 40.7 p.c. of the total net production. Forestry held third place in 1930 with a percentage of 9.4. Construction was in fourth place, with a percentage of 9.2, followed by mining, with a percentage of 8.7; in 1929 mining represented 7.9 p.c. and forestry 8.6 p.c. The electric power group in 1930 had an output of 3.9 p.c. of the total net production. Repair work, fisheries and trapping followed with percentages in 1930 of 2.7, 1.5 and 0.3, respectively.

A summary of gross and net production is given by industries for the years from 1926 to 1930 in Table 1; a detailed itemized statement of the net value of production in 1928, 1929 and 1930, is given in Table 2.

1.—Gross and Net Values of Production in Canada, by Industries, 1926-30.

¹ The gross value of agricultural production here exceeds that given in Chapter VIII, Agricultural Statistics, of this edition of the Year Book, by the amount paid to patrons of dairy factories for milk and cream.

² Statistics of custom and repair industries were not collected after 1922, and the totals for that year were repeated in 1923 and 1924. The totals for 1926 to 1930 were estimated according to the percentage change in the data for manufacturing.

³ The item "manufactures" includes dairy factories, sawmills, pulp-mills, fish-canning and curing, shipbuilding, electric power and certain mineral industries also included under other headings. This duplication, amounting in 1926 to a gross of \$650,369,405 and a net of \$315,083,730, in 1927 to a gross of \$677,458,550 and a net of \$345,247,482, in 1928 to a gross of \$780,780,507 and a net of \$382,078,720, in 1929 to a gross of \$777,954,427 and a net of \$412,456,114 and in 1930 to a gross of \$757,439,326 and a net of \$453,015,547 is eliminated from the grand totals.

⁴ The proportion of manufactures, freed from all duplication (as explained in note 3) to the grand total of net production was 40.69 p.c., and under like conditions the proportion of all secondary production to the grand total of net production was 52.57 p.c.

⁵ This figure exceeds by \$26,534,207 that given in the Manufactures chapter as the net production of manufactures in 1926. This difference is due to certain duplications in the central electric station industry not having been eliminated when the 1926 figures were first compiled.

Totals, Manufactures (duplications eliminated).....	1,436,967,305	1,584,894,251	1,308,971,179

Section 2.—The Provincial Distribution of Production.

The trend of net production has exhibited considerable variation in the different provinces. In Prince Edward Island, the lowest point was reached in 1922, followed by substantial recovery from 1924 to 1926, with a pronounced decline in 1927 and moderate fluctuations until 1930 when a further pronounced decline was recorded. The depression in Nova Scotia was maintained from 1920 to 1925 but net production in 1926 showed a marked reversal of the trend in preceding years. For 1928 a record level of \$144,000,000 was attained. For 1929 this was reduced to \$129,000,000 and for 1930 to \$114,000,000. The trend in New Brunswick showed increases in 1925 and 1926, followed by a recession extending to 1930 with the exception of 1929.

In Quebec the decline in 1921 was very severe. During the subsequent period the chief features were a substantial gain in 1923, a minor recession in 1924, and a marked recovery in 1925 continued in 1926, 1927, 1928 and 1929. The total in 1930 was \$892,000,000 compared with \$1,049,500,000 in the preceding year, a

decline of 15 p.c. The decline of 1921 was also very severe in Ontario, but since that year continuous increases have been recorded with the exception of 1930 when a decline of 16.8 p.c. from the 1929 level was recorded.

The special feature in the case of Manitoba was the marked increase in 1924 over 1923. There were substantial increases in 1926 and 1928, when the maximum production of \$235,000,000 was reached. The decrease since 1928 has been most pronounced. The 1929 and the 1930 figures are the lowest since 1923. For Saskatchewan, a decline was shown in 1921, but the total of 1920 was exceeded in 1922 and again in 1925. There was a temporary decline in 1926, followed by a good recovery during the next two years. The 1929 figure, however, reached approximately the 1924 level and the 1930 figure was the lowest recorded since the study was commenced in 1921. High points in the net value of production in Alberta were attained in 1923 and 1927, since when there has been a rather rapid decline, the 1930 level approximating that of 1922. In British Columbia, steady increases were shown during the recovery from 1922 to 1926, the upward trend being fairly continuous to 1929. For 1930, a decline of nearly 19 p.c. was shown from the preceding year.

The values of gross and net production are given by provinces for the years 1926 to 1930 in Table 3.

Relative Production in Different Provinces, 1930.—It will be seen from Table 3 that Ontario and Quebec held first and second places among the provinces in the net value of production in 1930. The percentage of production of each of these provinces to the total was higher than in 1929, when the net output in the two provinces represented 42.0 p.c. and 26.6 p.c. of the totals respectively. Third place in 1930, as in 1929, definitely goes to British Columbia with 8.4 p.c. of the total. Alberta and Manitoba are fourth and fifth respectively, replacing Saskatchewan and Alberta from these positions as in 1929. In 1930 Saskatchewan was in sixth place, followed by Nova Scotia, New Brunswick and Prince Edward Island in the order named.

Section 3.—Leading Branches of Production in each Province, 1930.

The Maritime Provinces.—Production in *Nova Scotia* in 1930 was principally in the manufacturing, mining, agricultural and fisheries industries, which were accountable for 36.1 p.c., 23.6 p.c., 22.5 p.c., and 9.1 p.c., respectively, of the net output of the province; the contribution of manufactures, aside from processes carried on in connection with the extractive industries, was 25.0 p.c. In *New Brunswick* manufacturing also took first place as a producer of new wealth, the proportion being 37.5 p.c. Agriculture was second with 29.8 p.c. and forestry a close third. If the manufacturing group be limited to exclude processes carried on in connection with the extractive industries, then it ranked third after agriculture and forestry. Agriculture including fur farming contributed 76.8 p.c. of the net output of *Prince Edward Island*. In the Maritime Provinces as a whole, the value of production was 12 p.c. less than in the preceding year. The generation of electrical energy and trapping industries alone showed gains in 1930.

Quebec.—The product derived from manufactures in Quebec was greater than that from any other industry. Manufactures, aside from the output of establishments associated with the extractive industries, contributed 45.2 p.c., while the net output of the entire manufacturing division, referred to the same base, was 62.8 p.c. Agriculture with 19.4 p.c., forestry with 12.4 p.c., and construction with 11.3 p.c., occupied second, third and fourth places. The increases over 1929 in forestry and in the generation of electrical energy were 5.1 p.c. and 3.5 p.c., respectively.

Ontario.—The net production from the manufactures of Ontario, when stripped of all duplication, was \$708,000,000 or 51.3 p.c. of the total, compared with \$278,000,000 or 20.2 p.c. from agriculture. Construction held third place with 8.3 p.c. of the total, and mining followed with 8.2 p.c. The forestry output was 5.4 p.c. of the net production of the province. Decreases from 1929 were shown in all the main divisions of production. The net output of manufactures decreased by \$146,600,000, while agriculture showed a decline of \$61,900,000 or 18.2 p.c. Except in forestry and fisheries, Ontario led the other provinces in the productiveness of the main branches of industry. The province yielded precedence in forestry operations to Quebec alone, while British Columbia, Nova Scotia and New Brunswick obtained a greater income than Ontario did from fisheries. About 49.7 p.c. of the net manufacturing output of the country was contributed by Ontario and 36.7 p.c. of the agricultural income was derived from the same province.

The Prairie Provinces.—About 57.9 p.c. of the output of *Saskatchewan* was obtained from farming, which industry was also a predominant producer of new wealth in *Manitoba* and *Alberta*, the proportions being 32.8 p.c. and 46.9 p.c., respectively. Mineral production, chiefly coal mining, held second place in *Alberta*, with an output of 16.6 p.c. of the provincial total. Manufacturing was first in importance in *Manitoba*, representing 36.9 p.c. of the value of the net output. Moderate grain yields and lower prices accounted mainly for the decreases in the net production of the three Prairie Provinces. In *Manitoba*, mining and electric power showed gains in 1930 over the preceding year. The forestry, mining and electric power industries of *Saskatchewan* showed gains in 1930, and the net revenue from the electric power industry of *Alberta* was somewhat greater.

British Columbia.—The net production from manufacturing in British Columbia during 1930 was about \$118,000,000, but more than half of this amount was derived from manufacturing processes closely associated with the primary industries, especially logging and fishing. The remainder, \$50,911,000, was 18.9 p.c. of the net output of the province. Aside from manufacturing, forestry constituted the chief source of new wealth, about 24.0 p.c. of the total output of the province being contributed by the forest. Mining and farming followed in order, with percentages of 20.4 and 12.8, respectively.

Details showing the gross and net values of production, by industries, in the various provinces in 1930, together with percentages, are given in Tables 4 and 5.

4.—Gross and Net Values of Production in Canada, by Industries and Provinces, 1930.

NOTE.—For Dominion totals, see Tables 1 and 2.

Totals.....	142,170,103	131,134,319	181,459,449	268,972,091	4,465,130

¹ The figures for "manufactures" involve duplicated amounts which were deducted in computing the totals for each province. The duplication arises from including in two places a number of industries which may be regarded as extractive or as manufacturing processes. Shipbuilding for example was included under both "construction" and "manufacturing" up to 1929 (see footnote 1, Table 2). The following statement gives the amount of the duplication by provinces: Prince Edward Island, gross \$2,033,757, net \$682,884; Nova Scotia, gross \$23,389,351, net \$12,685,024; New Brunswick, gross \$28,782,642, net \$14,644,750; Quebec, gross \$249,818,705, net \$156,702,888; Ontario, gross \$271,025,350, net \$168,069,656; Manitoba, gross \$23,261,637; net \$15,171,161; Saskatchewan, gross \$13,164,558, net \$8,264,795; Alberta, gross \$15,577,403, net \$9,714,617; British Columbia, gross \$130,384,923, net \$67,079,763.

² Includes the trapping industry of the Northwest Territories.

CHAPTER VIII.—AGRICULTURE.

Agriculture, including stock raising and horticulture, is the chief single industry of the Canadian people, employing, in 1931, 28.7 p.c. of the total gainfully occupied population and 33.9 p.c. or over one-third of the gainfully occupied males. In addition, it provides the raw material for many Canadian manufactures, and its products in raw or manufactured form constitute a very large percentage of Canadian exports. For a statement of the occupied and the available agricultural lands in Canada, see p. 39 of this volume.

This chapter of the present volume contains a statement of current governmental activities in connection with agriculture, including those of the Dominion and Provincial Experimental Stations. This is followed by statistics of agriculture, including agricultural revenue and wealth, field crops, farm live stock and poultry, fur farming, dairying, fruit, special crops, farm labour and wages, prices, miscellaneous, and, since Canadian exports of agricultural commodities are sold in the world market, a review of world statistics of agriculture, compiled from the publications of the International Institute of Agriculture.

The Canada Year Book, 1924, contained, on pages 186 to 191, an article on the "Development of Agriculture in Canada", by Dr. J. H. Grisdale, Deputy Minister, Department of Agriculture, Ottawa. To this the interested reader is referred.

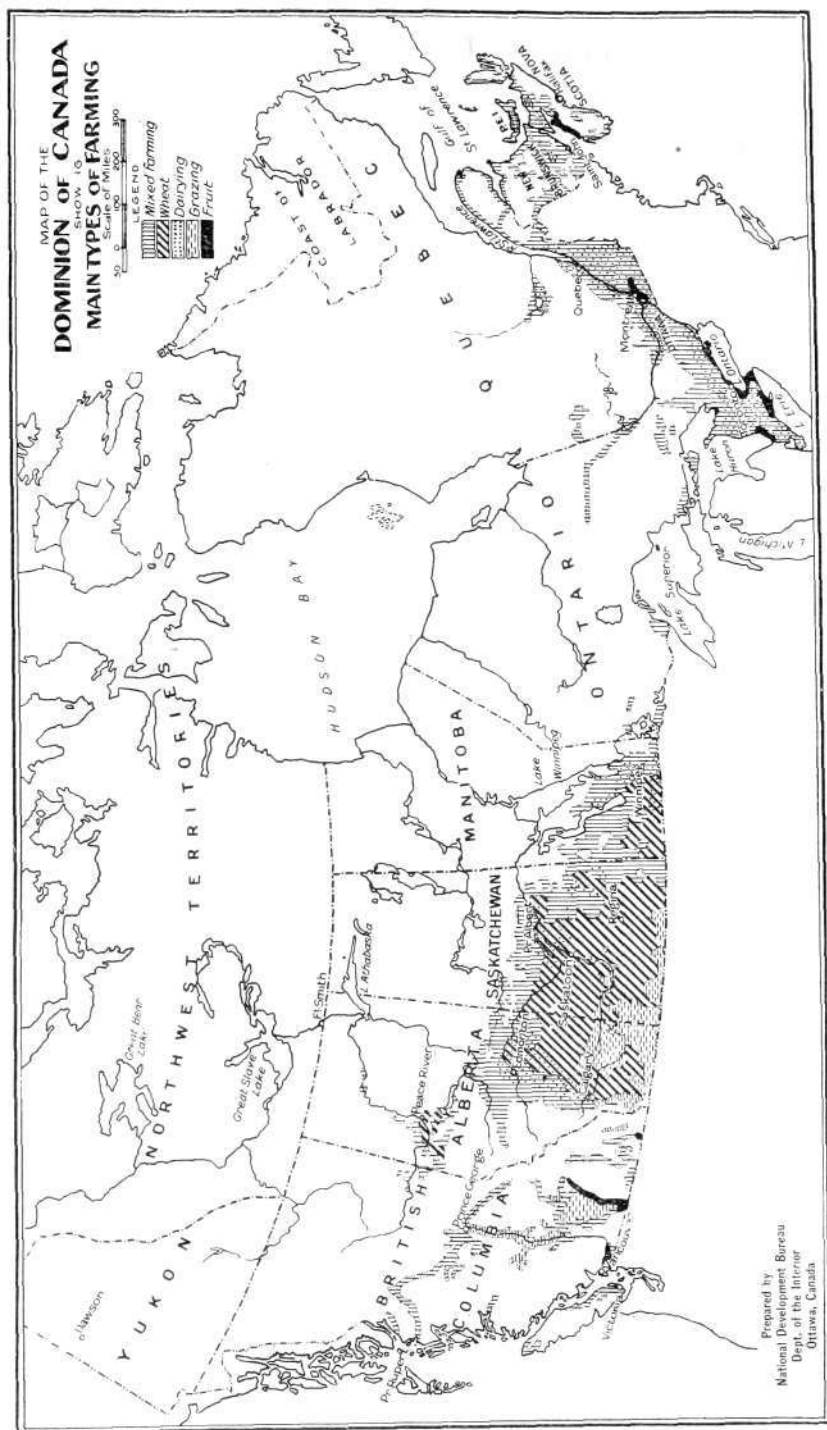

Section 1.—The Government in Relation to Agriculture.

It is provided in section 95 of the British North America Act that "in each province the Legislature may make laws in relation to agriculture in the province"; it is also "declared that the Parliament of Canada may from time to time make laws in relation to agriculture in all or any of the provinces; and any law of the Legislature of a province relative to agriculture shall have effect in and for the province as long and as far only as it is not repugnant to any Act of the Parliament of Canada"

As a result of this provision, there exist at the present time Departments of Agriculture, with Ministers of Agriculture at their heads, both in the Dominion and in each of the nine provinces, though in most provinces the portfolio of agriculture is combined with one or more other portfolios in the hands of a single Minister. A short sketch of the functions of the various Departments follows.

Subsection 1.—The Dominion Department of Agriculture.

The Dominion Department of Agriculture was constituted in 1868 under authority of 31 Vict., c. 53, with numerous functions that were by no means purely agricultural, including: (1) agriculture; (2) immigration and emigration; (3) public health and quarantine; (4) the marine and immigrant hospital at Quebec; (5) arts and manufactures; (6) the census, statistics and the registration of statistics; (7) patents of invention; (8) copyright; (9) industrial designs and trade marks.

MAIN TYPES OF FARMING IN CANADA

In the course of time the purely agricultural work of the Department came to demand greater attention; the non-agricultural functions were one by one entrusted to other Departments of the Government, while specialization became the order of the day within the Department of Agriculture itself. At the present time it includes the following branches: (1) Experimental Farms; (2) Dairy and Cold Storage; (3) Health of Animals; (4) Live Stock; (5) Seed; (6) Entomological; (7) Fruit; (8) Publications; (9) Agricultural Economics.

For the Acts of Parliament administered by the Dominion Department of Agriculture, see in the index "Acts of Parliament administered by Dominion Government Departments" For the publications of the Department, covering a wide field of information, see in the index the entry "Publications of Dominion Departments".

Subsection 2.—Provincial Departments of Agriculture.¹

Prince Edward Island.—The Department of Agriculture is presided over by a Minister, and the staff consists of a Deputy Minister, a Live Stock Superintendent, a Superintendent of Women's Institutes and a Dairy Superintendent. Assistance is given in co-operative marketing, promoting the live-stock industry and encouraging exhibitions, the formation of boys' and girls' clubs and the welfare of agriculture generally.

Nova Scotia.—Agriculture in the province of Nova Scotia is administered by the Department of Agriculture. The Department is divided into the following main divisions: (1) administration, (2) agricultural college, (3) demonstration farm, (4) demonstration poultry plant, (5) poultry, (6) government creameries, (7) dairying, (8) horticulture, (9) apiculture, (10) live stock, (11) entomology, (12) botany, (13) soils and fertilizers, (14) agricultural associations and societies, (15) exhibitions, (16) extension service, (17) women's institutes, (18) field crops, (19) marketing.

New Brunswick.—The branches of the Department of Agriculture of New Brunswick are as follows: (1) industry, immigration and farm settlement, (2) elementary agricultural education, (3) agricultural societies and live stock, (4) dairying, (5) horticulture, (6) soils and crops, (7) poultry, (8) bee-keeping, (9) women's institutes, (10) agricultural representatives.

Quebec.—The Quebec Department of Agriculture comprises a certain number of branches and sections as follows: *Agricultural Economics Branch*, including the following sections: publicity; co-operation, markets and statistics; demonstration farms; agricultural surveys; field husbandry; drainage; home economics; bee-keeping and sugar making; agricultural societies. *Live Stock Branch*, including the following sections: dairy; veterinary; swine; sheep; horses; poultry; farm buildings. *Horticulture Branch*, including the following sections: fruit growing; truck crops; vegetable canning; flower growing; phytopathology; entomology; botany. *Agricultural Representatives Branch*: 82 agricultural representatives' offices are now established in rural counties of Quebec and are under the supervision of 6 inspectors. The above organizations are all under one General Director of Branches.

There are other activities which are not included in the above organization, such as: agricultural education; agricultural merit competition; provincial dairy school.

¹For publications of provincial Departments of Agriculture, see in the index the entry "Publications of Provincial Governments".

Ontario.—The Ontario Department of Agriculture includes the following branches: agricultural and horticultural societies, live stock, institutes, dairy, fruit, crops, co-operation and markets, statistics and publications, agricultural representatives, colonization and immigration, Agricultural Development Board and the Ontario Marketing Board. The Department is responsible for the administration of the Ontario Agricultural College, the Ontario Veterinary College, the Kemptville Agricultural School, the experimental farms at Guelph, Ridgeway and Vineland, and the demonstration farms at New Liskeard and Hearst.

Manitoba.—The Manitoba Department of Agriculture includes an agricultural extension service, a dairy branch, a publications and statistics branch, a live-stock branch, a registrar of co-operative associations, and a weeds branch. It also conducts the Manitoba branch of the Employment Service of Canada.

Saskatchewan.—The work of the Department of Agriculture is chiefly administrative. It includes the following principal branches: live-stock, field crops, dairy, statistics, co-operation and markets, a bee division and a debt adjustment bureau. The Live Stock Branch provides the organization for examining and licensing stallions, purchasing and selling cattle, sheep and hogs to farmers on credit terms, and registering brands for live stock. Pure-bred sire areas are being created under statutory authority in order to eliminate undesirable sires and improve the quality of live stock. The poultry industry is promoted through the flock-culling service, the turkey-grading service and the approved hatchery policy. The Field Crops Branch aids in promoting better crops and providing control measures for suppressing insect and weed pests. The Dairy Branch directs the grading of cream at all the creameries, promotes herd improvement through cow-testing and administers the provisions of the Dairy Products Act with respect to licensing creamery operators, cream testers, and the bonding of creameries. The Statistics Branch, in co-operation with the Dominion Bureau of Statistics, maintains a crop-reporting service and gathers annual data respecting the crops and live stock of the province. The Co-operation and Markets Branch grants charters to co-operative associations under the Co-operative Associations Act, promotes co-operative stock shipping and poultry marketing and maintains an exchange service by a weekly news letter through which buyer and seller are brought together. An Apiary Division has been organized to assist bee-keeping, which is developing substantially. Agricultural societies are organized by the Department and grants are paid through the Department, while direction of the activities of societies is centered in the College of Agriculture of the University of Saskatchewan.

Alberta.—The Alberta Department conducts the following main services: agricultural schools and demonstration farms, field crops, dairy, live-stock, veterinary, poultry, apiaries, fairs and institutes, branding, game regulation, women's bureau service, provincial publicity bureau, crop reports and statistics, marketing services, district agriculturists and a branch looking after the fur farm leases of the province.

The attention of the Department has recently been given to the development of apiculture and a Provincial Apiarist is engaged in this work. Increased encouragement is being given to the live-stock industry through the "Pure-bred Bulls Purchase Act", and in giving supervision to the feeding plan for beef cattle now being carried out by the "Red Label" Beef Association. Increasing efforts are being made to cope with the weed menace and encouragement is being given to the sale and production of registered seed. The poultry industry is also receiving

increased attention. Money is expended each summer in connection with soil survey work, and special efforts are being directed to the development of forage crops and grasses and the improvement of pasturage.

British Columbia.—The Department of Agriculture consists of three main divisions which deal with general administration, animal industry and plant industry.

The extension service with representatives located in 15 agricultural districts is directly under General Administration, together with the Markets Branch. The Animal Industry Division includes: dairy, poultry, veterinary and general live-stock branches, as well as brands inspection and junior club work. The Plant Industry Division includes: plant quarantine, disease and pest control, pathology and entomology, apiary inspection, field crops and horticultural activities.

Particular attention has been given to the development of a live-stock policy, by which the favourable climatic conditions of the Coast districts of British Columbia will enable farmers to finish live stock ready for the market at seasons when weather conditions are not favourable in other parts of Canada. This policy has been devised with the aim of enabling the farmers of British Columbia to supplement the work of the prairie live-stock men in maintaining a continuous supply of well-finished animals for the market.

The British Columbia Department of Agriculture through its Dairy Branch has compiled its initial list of pure-bred sires (of the four dairy breeds) which have five or more daughters with records of production. Where known the records of the dams of these daughters are also given, offering opportunities for comparison. Although the full value of this service is not realized as yet, the breed associations have expressed approval of the undertaking. It enables them to recognize worthy sires in time and avoids their being lost or prematurely killed through ignorance of their value.

Subsection 3.—Dominion and Provincial Agricultural Experimental Stations.

Amongst the most important contributions of Canadian Governments to the development of agriculture throughout the country, is the maintenance of agricultural experimental stations, where research work in both plant and animal breeding and adaptation to climatic conditions is carried on. Already this work has had a profound effect in the improvement of Canadian agriculture. The introduction during recent years of Marquis wheat is an outstanding example, and it is of interest to note that other newer wheats, particularly Garnet, also originated by the experimental farms, may in the near future replace the Marquis in large areas. Among the earlier experiments undertaken, the results of which have passed permanently into good Canadian farm practice, may be mentioned those relating to early seeding, summer fallowing, the use of farmyard manure, the fertilizing value of clover crops and the introduction of suitable grasses and clovers. Both the common red clover and alfalfa now enter into rotations as the result of experiments and efforts to obtain hardy strains and to discover means of resistance to winter-killing. Further experiments with earlier-ripening and drought-resisting cereals are now being carried on, each new discovery increasing the cultivable area of Canada. Other researches relate to the production of frost-resisting fruit trees for the Prairie Provinces. This research work has already had a profoundly ameliorating effect upon Canadian agriculture. Statements regarding the work now under way at the Dominion Experimental Farms and Stations and at Provincial Agricultural Colleges and Experimental Stations follow.

(A) Dominion Experimental Farms and Stations.¹

Inaugurated in 1886 by Act of Parliament (49 Vict., c. 23), the Dominion Experimental Farms system was at first made up of the Central Farm at Ottawa and four branch farms: one at Nappan, Nova Scotia, for the Maritime Provinces; one at Brandon for Manitoba; one at Indian Head for the Northwest Territories; and one at Agassiz for British Columbia.

The opening up and rapid settlement of the Dominion have led to a corresponding increase in the number of experimental farms and stations.¹ These, with an experimental fox ranch, now total 28, with a total acreage of 15,577, as compared with the original five farms, with a total acreage of 3,472, established in 1886. The following list shows the present number of farms and stations, with the acreage of each and the date of establishment.

DOMINION EXPERIMENTAL FARMS AND STATIONS, 1932.

Farm or Station.	Province.	Acreage.	Date Established.

In addition there are 12 sub-stations, *viz.*, Regina and Rosthern, Sask.; Wainwright, Fort Vermilion and Beaverlodge, Alberta; Fort Smith, Resolution, Providence and Good Hope, Northwest Territories; Carmacks, Yukon; Horse Farm, St. Joachim (operated from Cap Rouge), and Harrington Harbour, Quebec. There is also the Dominion Range Experiment Station at Manyberries, Alberta, and a special Forage Crops Research Station at the University of Saskatchewan, Saskatoon. Experimental work under the Division of Illustration Stations is conducted on 13 farms in Prince Edward Island, 16 in Nova Scotia, 19 in New Brunswick, 58 in Quebec, 18 in Ontario, 15 in Manitoba, 30 in Saskatchewan, 22 in Alberta and 18 in British Columbia. Small experimental plots are also being operated at several points along the line of the Hudson Bay Railway.

¹The five original farms established in 1886 are known as "Experimental Farms"; those added since are styled "Experimental Stations". No distinction in the work is implied by these titles.

²Transferred in 1931 from the Forest Service, Department of the Interior, to the Department of Agriculture.

Organization of the System of Experimental Farms.—The Central Farm at Ottawa, as its name implies, is the centre or headquarters of the system. Thereat are stationed the Director, having control and general supervision of the whole, and the chief technical officers, each having charge of his special line of work, both at the Central Farm and the branch farms. At Ottawa, the policy to be pursued throughout the system is settled by agreement after discussion by the Director, the technical officers, and the superintendents on whose branch farms the work is to be conducted. The technical staff at Ottawa supervises the actual experimental work at the Central Farm. At the branches, the superintendents are in charge of the carrying out of the various lines of general experiment, and also conduct experiments of local importance.

The divisions at Ottawa, which represent the different lines of work carried on throughout the system, and have each a technical officer in charge, are as follows: (1) animal husbandry; (2) bacteriology; (3) bees; (4) botany; (5) cereals; (6) chemistry; (7) extension and publicity; (8) economic fibre production; (9) field husbandry; (10) forage plants; (11) horticulture; (12) illustration stations; (13) poultry and (14) tobacco. Briefly the main lines of the work of these divisions are as follows:—

Animal Husbandry.—This division is concerned mainly with projects relating to the economical production of live stock and live stock products on the farms of Canada. Demonstrational, experimental and research work in breeding, feeding, housing and management of beef cattle, dairy cattle, horses, sheep and swine and in the handling of the products of these classes of live stock on the farm constitute the main lines of work of the division.

Bacteriology.—The work of this division consists chiefly in research conducted in close co-operation with other divisions on problems having a bacteriological bearing. The main lines of investigation deal with questions of pure milk production and maintenance, soil fertility, the preparation and preservation of food-stuffs and fodders, bee diseases, etc. Assistance is given to farmers through the preparation and distribution of cultures of legume bacteria for seed inoculation. Further service is rendered through the bacteriological analysis of water, milk, foods and feeding stuffs, soils and many other materials.

Bees.—The work of the Bee Division is divided into three parts: (1) Experimental and research work related to the care and management of bees. This includes the investigation of such problems as swarm control, wintering, bee diseases, queen breeding, etc. (2) Honey investigations. In co-operation with other divisions a thorough examination of Canadian honeys is being made and projects relating to the storage of this commodity are being conducted. In addition the inspection of honey for export trade is being carried out. (3) The dissemination of information by means of bulletins, pamphlets, press articles, correspondence, lectures, etc., to the beekeepers throughout Canada.

Botany.—The work of this division deals with two main phases, economic botany and plant pathology. The former comprises a study of plants of use in agriculture, including medicinal and poisonous plants and plants of general economic value. Considerable attention is being given to a Dominion-wide survey of weeds and a study of the life history of the more important kinds. Many phases pertaining to this section of work are carried on co-operatively with other services in the Department. Pollination studies, pasture investigations, etc., are being carried on under a well-devised policy. A herbarium is maintained, which is be-

coming increasingly valuable as a reference collection not only for the use of the Department, but also for students and colleges. For reference purposes an extensive collection of seeds has been accumulated, and constitutes one of the most valuable in the Dominion. It comprises representative collections of seeds of plants occurring all over the globe.

The plant pathology section is devoted to research on diseases caused by fungi and bacteria occurring on each and every kind of plant, whether constituting our natural resources, including forestry, or grown for special purposes. Without a recognition of the most up-to-date and modern means used in plant pathology, immense national losses would result. Many instances might be quoted to indicate that modern methods of control and prevention have been responsible for a substantial reduction in the cost of production of all kinds of crop plants.

At Ottawa the Central Plant Pathological Laboratory serves as headquarters for the Dominion. At the same time, besides undertaking special phases of mycological research, the Central Laboratory directs the policy of a series (10) of branch laboratories extending from coast to coast and dealing with the important phases of work of local interest and importance. Among these laboratories, the Dominion Grain Rust Research Laboratory at Winnipeg may be specially mentioned, as an example of a centre of close co-operation between Dominion and Provincial agencies in the study and prevention of losses from grain rust. Three of the branch laboratories deal with the fruit industry, *viz.*: Kentville, N.S., St. Catharines, Ont. and Summerland, B.C. Field crop and potato diseases are dealt with mainly at Charlottetown, P.E.I. and Fredericton, N.B., while Edmonton, Saskatoon, and the Winnipeg laboratory already referred to, are concerned with the diseases of grain most important economically, *viz.*, smuts, rusts, foot and root rots, etc. Saanichton, B.C., serves the interests of Vancouver island and the Fraser valley.

The Central Laboratory directs a Dominion-wide plant disease survey, keeping a close watch on the progress of diseases and enabling steps to be taken without delay to prevent the unsuspected establishment of the insidious enemies of agriculture throughout the Dominion.

The seed potato certification service is also directed from these headquarters and its aggressive policy has secured most valuable export markets for the Dominion.

The National Mycological Herbarium and a unique collection of forest pathological and wood-destroying fungi, both of specimens and living cultures may be mentioned as outstanding among reference collections.

In addition to these more or less specialized research phases of work, the importation of plants and plant products is closely supervised to prevent entry of destructive plant diseases. Thus there exists a plant pathological service devoted to the maintenance of health and quality of every agricultural commodity produced in Canada.

Cereals.—The chief functions of the Cereal Division may be enumerated as follows: (1) the production of superior varieties of cereal and leguminous grains by a process of breeding and selection; (2) the importation and testing of promising varieties from other countries; (3) the production of *élite* stock seed of registerable varieties of grain for propagation by members of the Canadian Seed Growers' Association; (4) the evaluation of various crop combinations which may prove especially desirable for specific purposes; (5) the systematic descrip-

tion and study of leading varieties; (6) the verification of the genuineness and purity of seed stocks submitted for the purpose; (7) the investigation of varieties of grain for which a licence has been requested, in accordance with the Canada Seeds Act; (8) the identification of varieties submitted by farmers and others; (9) the encouragement of the use of good seed of adapted varieties through the use of exhibits, press articles and public addresses; (10) the investigation of special problems which have a bearing on cereal breeding and development work.

Probably the most important problem which the division has in hand at the moment is an attempt to develop for Western Canada a variety of hard red spring wheat capable of resisting the ravages of stem rust. This work, which is centralized chiefly at the Rust Laboratory at Winnipeg, appears to be progressing rapidly toward the goal desired.

Chemistry.—Investigations towards the solution of problems affecting Canadian agriculture and direct assistance to farmers, market gardeners, provincial agricultural representatives and others through correspondence and analysis, constitute the two chief phases of the division's activities. Further important work includes the official chemical examination of food products submitted by the Health of Animals Branch, the Dairy and Cold Storage Branch and the Fruit Branch—about 2,000 samples in all. The division also renders chemical assistance to a number of branches of the Government service, *e.g.*, the National Parks Branch, Department of the Interior; the Department of Marine and the Department of Fisheries.

Extension and Publicity.—This division edits and prepares for printing all publications issued by the Experimental Farms, prepares and stages educational exhibits at fairs and exhibitions throughout Canada, maintains and operates a lending bureau of educational lantern slides, issues annually to the press about 200 timely and seasonal articles, and in various other ways makes the work of the farms as widely known as possible.

Economic Fibre Plants.—Extensive field and mill experiments are carried out with the best varieties of fibre flax and hemp on the Experimental Farm plot fields at Ottawa and several of the branch farms. The division renders valuable marketing services to the Canadian flax growers by serving as a medium for trade with Ireland. Increasing amounts of fibre seed are being sold in the Irish market each year.

Field Husbandry.—Experiments are being conducted by this division in order to learn the most suitable crop rotations and crop sequences for various parts of Canada. Information is being secured on the newest and best methods of preparing the land for different crops, as well as on the most efficient methods of seeding and harvesting. Investigations are in progress in regard to drainage, to irrigation and learning the most efficient methods of conserving and utilizing soil moisture in the Prairie Provinces.

How to control the noxious weeds which cause such serious economic losses in many parts of Canada is an important problem studied by means of various cropping systems, cultivation methods and applications of chemicals. How to improve the carrying capacity of unproductive pasture land is another project under investigation. The cost of operating tractors, the value of new types of farm machinery, and the cost of producing various farm crops is being studied. Comprehensive trials with various silage crops are being continued in order to secure the most reliable information on the proper time and method of ensiling corn, sunflowers, red clover, sweet clover, alfalfa, buckwheat, cereals and other farm crops. To determine the most economical means of using farm manure and commercial fertilizers for farm crops is the object of another group of field husbandry experiments.

Forage Plants.—This division has for its work the improvement of forage plants by breeding, the technique of seed production, principles of compounding seeds mixtures, response of different species to grazing, the introduction and testing of new species, and related problems. These studies cover a wide range of crop plants including herbage grasses and legumes, corn, sunflowers, field roots, sugar beets, soya beans, and cereals for forage. Research work with crops that are adapted to Eastern Canada is centered at Ottawa. In Western Canada the Dominion Forage Crops Laboratory has been established at Saskatoon, Sask., in co-operation with the University of Saskatchewan, for the purpose of developing early maturing, hardy, and drought-resistant strains of herbage plants adapted to the Prairie Provinces. At the Dominion Range Experiment Station at Manyberries, Alberta, range investigations are in progress to study changes in the natural vegetation under different systems of grazing and other feed problems associated with range management.

Horticulture.—The Division of Horticulture deals with fruit growing, vegetable gardening and with ornamental plants. The breeding of new varieties has been an important feature of the work of this division. Some of the outstanding fruits originated there which are being planted in Canada are: apples—Melba, Joyce, Hume, Lobo, Linda and Sandow; raspberries—Brighton and Count; strawberries—Cassandra and Portia, and of vegetables: corn—Banting and Pickaninny; egg plant—Blackie; rhubarb—Ruby; tomato—Abel, Alacrity, Bestal and Herald.

Valuable research work in cider making is being done in this division and cold storage experiments with fruits are in progress. The division co-operates with farmers in orchard experiments and blueberry and cranberry investigations. Research in plant nutrition is also an important line of work.

Illustration Stations.—By comparative demonstration the Division of Illustration Stations is carrying forward a co-operative program of crop introduction and improvement on some 209 privately-owned farms. These stations are located in the different provinces, primarily in newly-settled agricultural communities, where the most suitable varieties and crops are not being grown, or in the older settled districts, which have developed acute problems in crop production, resulting from weed infestation, soil drifting, depletion of soil fertility, as well as many other varying factors, which limit crop growth. As centres for production of seed grain, seed potatoes, grasses and clover seeds from the most suitable and hardy varieties, the illustration stations have accomplished a great deal and have established leadership in the community in general farm improvement, including livestock, building and home beautification.

Poultry.—While past conditions called for work largely along practical demonstrational lines, the present demands more scientific investigation, particularly in the studies of nutrition, disease and breeding problems. To meet these requirements, trained men have been added to the staff and, through the co-operation of the Health of Animals Branch, additional assistance has been supplied for the study of disease, so that the division is equipped as never before to assist the industry as a whole and the individual poultryman in particular in solving the various problems that are continually arising in this rapidly growing field. In addition, the registration of poultry has increased throughout the whole Dominion.

Tobacco.—The Tobacco Division is concerned with investigational and research work in connection with the tobacco industry of Canada. This includes active research on problems of fertilizers and soils; breeding, selection and standardization

of varieties; cultural methods; curing and fermentation; diseases and insects; marketing; exhibitions and educational work. Through a closer co-ordination between Dominion, provincial and industrial agencies the industry has made great progress during the past five years, both in the domestic and export markets. The research work of the Dominion tobacco service was completely reorganized in 1929 and subsequently; a co-operative relationship has been developed with the Department of Trade and Commerce with a view to opening up new outlets for Canadian leaf; joint committees, consisting of Dominion and provincial officials, growers and members of the trade, have been set up in Ontario and Quebec to further the interests of the industry. In general, the Tobacco Division renders assistance in the development of Canadian tobacco production along sound economic lines.

In addition to the work done by the Divisions of Extension and Publicity and Illustration Stations, the results of the work of the Experimental Farms are made available to the farmer: (1) by correspondence; (2) by publications; and (3) by articles in the press. The farm officers devote considerable time each year to lecturing, demonstrating, judging at fairs and assisting at short courses in agriculture. Excursions to the various farms are also a valuable means of bringing the work to the attention of the farmer.

(B) Provincial Agricultural Colleges and Experimental Stations.

Under the above heading, outlines of the work done at provincial agricultural colleges and experimental stations were given by provinces at pp. 198-203 inclusive of the 1930 Year Book. The interested reader is referred to that volume, and to the following provincial publications for information concerning courses and programs of work at these institutions:—

Nova Scotia.—Annual Report of the Department of Natural Resources for Nova Scotia; College Prospectus of the College of Agriculture, Truro, N.S.

Quebec.—The Annual Report of Macdonald College, Ste. Anne de Bellevue, Quebec, and the prospectuses and annual announcements of the School of Agriculture, Ste. Anne de la Pocatière, and the Oka Agricultural Institute, Lake of Two Mountains, Quebec.

Ontario.—Annual Report of the Ontario Agricultural College and Experimental Farm, Guelph, Ont.

Manitoba.—Annual Report of the Manitoba Agricultural College, Winnipeg, Man.

Saskatchewan.—Annual Report of the College of Agriculture, University of Saskatchewan, Saskatoon, Sask.

Alberta.—Annual Report of the College of Agriculture, University of Alberta, Edmonton, Alberta.

British Columbia.—Annual Report of the Faculty of Agriculture, University of British Columbia, Vancouver, B.C.

Section 2.—Statistics of Agriculture.¹

Census Statistics.—In addition to the statistics collected annually, which are the subject of this section, additional information is published, following each decennial census, on such subjects as the total number of farms, their tenure, acreage, value, mortgage debt, etc. In this volume of the Year Book, the latest information compiled to date on these subjects will be found in Appendix II.

Crop-Reporting Service.—The voluntary crop-reporting service of the Dominion Government, which has been in operation since 1908, has for its object the issue of accurate, timely and independent reports on crop conditions throughout the Dominion: first, in the interests of the general body of Canadian farmers; secondly, for the information and guidance of other interests allied to and dependent upon agriculture (interests represented by statesmen, economists, bankers, grain dealers, transportation agents and others); and thirdly, for reporting to the Institute of Agriculture at Rome (to which Canada is an adhering country), in return for reports on the production of other countries and of world totals which influence prices and consequently affect the interests of Canada. Supplementing the monthly reports from crop correspondents, the Bureau issues telegraphic crop reports utilizing the services of agriculturists throughout the Dominion. For the Prairie Provinces, these are issued every week from the first of June to the first of September, while the reports on a Dominion-wide basis are issued every two weeks during the same period. The program of reports for 1933-34 is given in the Monthly Bulletin of Agricultural Statistics, January, 1933, pp. 34-36 and is also issued as a special leaflet.

Annual Statistics.—In addition to the crop-reporting service, statistics of the areas under field crops and of the numbers of farm live stock are collected. These arrangements have been in force since 1918, and are carried out by the Dominion Bureau of Statistics in co-operation with the Provincial Governments. The statistics are secured by simple schedules which are at present returned by about one-fifth of the farmers of Canada. They form the basis of the estimates for the whole of Canada. The results for wheat, oats, barley, rye and flax in the three Prairie Provinces are ready for publication in August, while the results for the remaining crops and for the numbers of farm live stock are published in November and December. The areas, thus determined, when multiplied by the average yields per acre as reported by crop correspondents, form the basis of the total estimated production for each crop.

The June schedule covers the areas sown to field crops, the numbers of live stock and poultry on hand and breeding and marketing intentions with regard to live stock and poultry. The December schedule contains the same items with the exception of field crop areas.

In 1932, in eight of the provinces, the schedules were distributed and collected through the agency of the rural schools, under plans which have been found effective in securing a larger sample of the farms of the country than could be obtained in any other way. In British Columbia the schedules were sent direct to the farmer through the mail.

¹ Revised under the direction of Dr. T. W. Grindley, Chief of the Agricultural Branch, Dominion Bureau of Statistics. This Branch is concerned with both primary and secondary statistics of agriculture, including statistics of the production and distribution of agricultural commodities. The primary statistics relate mainly to the reporting of crop conditions, crop and live-stock estimates, values of farm lands, wages of farm labour, and monthly and annual prices received by farmers for their products. The secondary statistics relate to the marketing of grain and live stock, and reports on the milling and sugar industries and cold-storage holdings. A list of the publications of this Branch is given in Chapter XXIX, Section I, under "Production".

Monthly Bulletin of Agricultural Statistics.—Originally established in 1908 as the "Census and Statistics Monthly", but changed to its present title in April, 1917, this publication is now in its twenty-sixth year. It is the official organ, not only for the monthly crop reports and annual statistics previously described, but also for statistics of dairying, fur farming, fruit, hives and honey, hops, tobacco, maple products, sugar beets, beet sugar, flax fibre, clover and grass seeds, exports, visible supplies, prices, values, foreign agriculture and other subjects in considerable variety.

Presentation of Agricultural Statistics.—In the current edition of the Year Book, statistics of agriculture are presented under the following headings: (1) Agricultural revenue and wealth; (2) Acreage, yield and value of principal field crops, distribution of the wheat and oat crops, etc.; (3) Farm live stock and poultry; (4) Fur farming; (5) Dairying; (6) Fruit production; (7) Special agricultural crops; (8) Farm labour and wages; (9) Prices of agricultural produce; (10) Agricultural statistics of the census; (11) Miscellaneous agricultural statistics; (12) Principal agricultural statistics of the world.

Subsection 1.—Agricultural Revenue and Wealth.

Revenue.—Table 1 shows under principal headings the gross agricultural revenue of Canada, by provinces, for the years 1928 to 1932. It is important to note that the figures represent gross values, as no distinction is made between crops used as materials for other kinds of production, such as the feeding of live stock, and no allowance is made for the costs of production.

1.—Estimated Gross Annual Agricultural Revenue of Canada, Itemized by Provinces, 1928-32. ("000" omitted.)

Table 1 shows that in 1932 the estimated agricultural revenue of Canada was \$711,898,000 as compared with \$314,930,000 in 1931, \$1,268,141,000 in 1930, \$1,631,081,000 in 1929 and \$1,806,020,000 in 1928. The total for 1932 shows a decrease of \$103,032,000 or 12.8 p.c. as compared with 1931. The upward movement of farm prices since the above valuations were made would suggest an upward revision for 1932 revenue when new figures are compiled in March, 1934.

Wealth.—Table 2 shows approximately, by provinces, the gross agricultural wealth of the Dominion in 1932.

2.—Estimated Gross Agricultural Wealth of Canada, by Provinces, 1932. ("000" omitted.)

In this table, full use is made of the recently published results of the census of 1931 giving the values of lands, buildings, and implements and machinery for 1930. The 1932 figures quoted for buildings and for implements and machinery correspond with the values quoted in the 1930 returns. These items change very little in value. The 1932 figures for value of lands are based on the 1930 census figures but are corrected to 1932 levels by the use of the annual estimates of farm land values. The other four items—live stock, poultry, animals on fur farms and agricultural production—are estimates for 1932.

The gross agricultural wealth of Canada for 1932 is estimated at approximately \$5,069,930,000 as compared with \$5,696,972,000, the revised estimate for 1931.

Subsection 2.—Acreage, Yield and Value of Field Crops.

The Chief Field Crops of the Last Twenty Years.—In Table 3 will be found a summary statement of the acreages, yields and values of wheat, oats, barley, rye, buckwheat, flaxseed, potatoes, hay and clover and alfalfa for the latest 10 years. Comparative figures back to 1908, given at pp. 230-232 of the 1929 Year Book, indicate the recent growth of Canadian agriculture. In particular may be noted the tripling of the wheat crop, the almost doubling of the oat crop, the tripling of the barley crop, the thirteenfold increase in the rye crop, the 40 p.c. addition to the hay and clover crop and the sevenfold increase in the alfalfa crop within the past 25 years, disregarding the 1931 and 1932 crops as not, by any means, representing maximum yields. On the other hand, the acreages and yields of the potato crop have not shown a wide variation throughout the period, presumably because this crop is produced mainly for home consumption. Those who desire figures for earlier years will find certain information on acreage, yield and value on page xxiv of the Statistical Summary of Progress at the beginning of this volume.

¹Comparative figures for the years 1908-20 are given in the Canada Year Book, 1929, pp. 230-232. The total value of wheat for 1912 should be \$139,090,000 instead of the \$19,090,000 shown on p. 230 of the 1929 Year Book, the error being due to the dropping out of a figure.

Total Areas and Values, 1927-1932.—Table 4 shows for Canada and the provinces, over stated years, the total estimated areas and values of field crops, Table 5 the field crops of Canada compared as to quantity and value for 1931 and 1932, and Table 6 the areas, yields and values of the principal field crops in Canada, by provinces, for the years 1931 and 1932.

Nova Scotia.....	870,305	843,786	866,100	866,204	866,818	866,500	704,100
New Brunswick.....	467,081	492,425	500,772	487,840	490,500	474,600	518,300
Quebec.....	3,672,360	3,745,807	3,858,181	3,944,443	3,950,000	3,686,100	2,669,600
Ontario.....	3,077,424	3,012,786	3,000,172	3,134,614	3,149,460	3,031,717	3,012,500
Manitoba.....	222,039	240,485	252,689	253,950	264,300	239,800	232,100
Saskatchewan.....	382,403	426,927	408,670	406,100	419,000	400,300	444,900
Alberta.....	288,963	285,719	289,973	319,338	336,409	384,900	350,500
British Columbia.....	53,719	56,141	62,192	63,865	66,604	69,272	76,500
Indian Reserves.....	31,980	36,601	39,202	47,337	39,839	39,913	46,000
Totals.....	9,368,449	9,399,294	9,528,043	9,768,329	9,889,513	9,428,182	8,264,790

The above figures are not entirely comprehensive since the figures for the four western provinces are "seeded pasture" only. Most of the area used for pasture in these provinces is "natural" and data on land used in this way can only be properly secured by the quinquennial census. At the 1926 census, the acres of improved and natural pasture in the three Prairie Provinces were as follows:—

Province.	Improved Pasture.	Natural Pasture.
	acres.	acres.
Manitoba.....	311,818	3,533,590
Saskatchewan.....	305,164	13,812,460
Alberta.....	302,417	12,210,315

The figures for the Maritime Provinces, Quebec and Ontario include all pasture, seeded and natural.

The areas under grazing leases in the Western Provinces as at Mar. 31, 1932, are reported by the Provincial Lands Administration Branches as follows:—

Province.	Leases.	Area.
	No.	acres.
Manitoba.....	245	103,314
Saskatchewan.....	86,923	3,731,683
Alberta.....	3,948	3,367,150
British Columbia.....	732	64,153
Totals.....	91,848	7,266,293

Average Yields per Acre.—Table 8 gives, for the years 1925 to 1932, the average yields per acre of the various field crops, together with the long-time average yields per acre.

8.—Annual Average Yields per Acre of Field Crops for Canada, 1925-32, with Long-time Averages.

Stocks of Grain in Canada.—Table 10 shows the quantities of grain in farmers' hands on July 31, 1932, as compared with July 31, 1931 and 1930. Adding the stocks in the elevators and flour mills, Table 11 shows the total quantities of grain in store at the close of each of the crop years ended July 31, 1930, 1931 and 1932.

¹ Changes in the designations of elevators and mills between the taking of the 1930 and 1931 stocks result in the stocks of grain in mills and mill elevators in the Western Inspection Division being reported under this heading in 1931 and 1932, whereas they appeared under "Flour mills" in 1930. ² Eastern Inspection Division only, estimated for 1932.

Distribution of Wheat and Oat Crops.—The distribution of the wheat crop of Canada for the years ended July 31, 1931 and 1932, is calculated in Table 12.

12.—Distribution of the Canadian Wheat Crops, by crop years, 1930-31 and 1931-32.

Note.—Flour is expressed as wheat on the basis of one barrel of flour, weighing 196 lb., being equal to 4½ bushels of wheat. For similar calculations extending over a series of years both for wheat and oats, see the Year Book, 1920, pp. 263-266, and the April issues of the Monthly Bulletin of Agricultural Statistics for each of the years 1920 to 1933.

Item.	Crop year ended July 31, 1931.	Crop year ended July 31, 1932.	Item.	Crop year ended July 31, 1931.	Crop year ended July 31, 1932.

Table 13 presents similar data for oats. The bulk of this crop is consumed as feed for live stock and the table shows approximately how the remaining portion of the crop is disposed of, including: the quantities exported as grain, oatmeal and rolled oats; the quantity retained for seed; and the quantity milled for home consumption, representing chiefly oatmeal and rolled oats used for human food. The carry-over represents grain in the elevators, in farmers' hands, in transit, etc., and the balance is the quantity used in Canada for feeding to live stock, this amount being estimated at 323,694,000 bushels in 1930-31 and 297,526,000 bushels in 1931-32.

13.—Distribution of the Canadian Oat Crops, by crop years, 1930-31 and 1931-32.

Per Capita Consumption of Wheat in Canada.—According to revised calculations, the average per capita consumption of wheat ground for human food in Canada during the ten years 1922 to 1931 was 4.4 bushels. The average range for the period was between 4.0 and 4.5 bushels. The average consumption in 1931 was estimated at 4.0 bushels. Details for the years 1919-27 were given at p. 241 of the 1929 Year Book, while annual estimates are published in the April number of the Monthly Bulletin of Agricultural Statistics.

Subsection 3.—Farm Live Stock and Poultry.

The growth of the live-stock and poultry industries in Canada from decade to decade is indicated in summary statistical form in Table 14, while some authoritative details will be found in the article "The Development of Agriculture in Canada", contributed by Dr. J. H. Grisdale to the 1921 Year Book, where it appears at pp. 202-210.

Production and Value of Wool.—The production of wool in Canada is placed at 20,518,000 lb. from 3,647,207 sheep and lambs in 1932, as compared with 20,365,000 lb. from 3,608,000 sheep and lambs in 1931. Table 18 gives the total estimated production and value of wool for the years 1915 to 1932.

Egg Production.—Table 19 gives the results of calculations indicating approximately the numbers and values of eggs produced on farms in Canada for the years 1923-32. The estimates relate only to hens' eggs produced on farms, and therefore do not include eggs of urban poultry, or eggs of farm turkeys, ducks, etc. In 1930 the production of eggs elsewhere than on farms amounted to 20,450,000 dozen, or 9.3 p.c. of the total production of eggs in that year, as ascertained at the census.

19.—Annual Production and Value of Farm Eggs in Canada, 1923-32.¹

Subsection 4.—Fur Farming.¹

Origin of Fur-Farming Industry.—A short account of the origin of the fur-farming industry in Canada was given on p. 249 of the 1929 edition of the Year Book. A fuller description of the rise of the industry in Prince Edward Island, its

¹Revised by Miss F. A. Brown, Chief, Fur Statistics Branch, Dominion Bureau of Statistics. A list of publications of this Branch will be found in Chapter XXIX. For further particulars regarding fur farming the reader is referred to the Report on Fur Farms, 1931, which may be obtained from the Dominion Statistician, Ottawa.

original home, was given in the Census and Statistics Monthly for May, 1914, at p. 110, while a still more detailed account of the earlier history of the industry was given in a publication of the Commission of Conservation, Ottawa, entitled "Fur Farming in Canada", by J. Walter Jones, B.A., B.S.A., the second edition of which was published in 1914.

Fur Farms of Canada.—The term "fur farm" includes farms devoted entirely to the raising of fur-bearing animals (principally silver foxes), together with parts of farms where the raising of fur-bearing animals is carried on as a distinct branch of the operations. Such farms increased in numbers from 429 in 1919 to 6,369 in 1931, or, if muskrat and beaver farms are included, to 6,541, and the industry is still growing in number of farms and varieties of fur-bearing animals on these farms, although its revenue has suffered from the effects of the low level to which prices for live animals and pelts of all kinds dropped in 1931. Although the fox has proved the most suited to domestication, other kinds of fur-bearing wild animals are being raised in captivity—mink, raccoon, skunk, marten, fisher and rabbit. Mink farms are now the most numerous of the miscellaneous class, raccoon farms coming second and muskrat third. A few of the fox farms also raise miscellaneous fur-bearing animals in addition to the foxes.

Capital Investment.—The earliest Dominion-wide statistics of fur farms were collected for the year 1919, and since then annual statistics have been obtained. Statistics showing the increasing numbers and values of fur-bearing animals on fur farms are given in Tables 20 and 21, the former showing an increase of 524 p.c. since 1923, and the latter an increase of 34 p.c. from \$6,325,718 to \$8,497,237. The capital investment in lands and buildings in 1931 was \$7,095,111, making a grand total investment of \$15,592,348 in the industry in that year.

¹Statistics not available.

²Based on estimates furnished by the operators of the farms.

Annual Revenue.—The annual revenue of the fur farmer arises from two sources, the sale of animals and the sale of pelts. Table 22 shows the sales of animals by kinds in the years 1923 to 1931 and Table 23 the sales of pelts. During the past two years the sales of pelts have exceeded the sales of live animals, while in former years the reverse was the case.

The Provincial Distribution of Fur Farming.—The statistics of Table 24, showing the capital investment in the industry by provinces, indicate that Prince Edward Island no longer holds its earlier margin of supremacy in the industry.

In value of fur-bearing animals Ontario ranks in first place with 22.1 p.c. of the total, Quebec is next with 21.6 p.c. and Prince Edward Island, Alberta, New Brunswick, Manitoba and Saskatchewan follow with 12.2 p.c., 10.9 p.c., 7.7 p.c., 7.4 p.c. and 6.8 p.c., respectively. As regards value of land and buildings, Ontario takes first place followed by Quebec and Prince Edward Island.

Subsection 5.—Dairying Statistics.¹

This subsection deals with the dairy industry under the following divisions: creamery butter; factory cheese; condensed milk and milk powder; total production of dairy factories; the production of butter and cheese on farms; and closes with a summary of the total value of dairy production in the years 1925-31.

¹For fuller particulars see the Bureau's Report on Dairy Factories, obtainable from the Dominion Statistician.

Creamery Butter.—Butter reached its maximum exportation in the year ended June 30, 1903, with 34,128,944 lb. The latest figures, for the year ended Dec. 31, 1932, show an export of 3,505,700 lb. The quantity of creamery butter made in Canada in 1931 was 225,955,246 lb. (Table 25), valued at \$50,198,878, an increase in quantity over the preceding year of 40,204,185 lb. or 21.6 p.c. but a decrease in value of \$6,471,626 or 11.4 p.c. The average price per lb. for the whole of Canada was 22.2 cents in 1931 compared with 30.5 cents in 1930.

Factory Cheese.—In 1868 the quantity of cheese exported from Canada was 6,141,570 lb. In 1904 cheese reached its maximum exportation with 233,980,716 lb., and the exports of cheese for the year ended Dec. 31, 1932, amounted to 86,939,900 lb. The production of factory cheese in 1931 totalled 113,956,639 lb. with a value of \$12,824,695, a decrease in quantity from the previous year of 4.3 p.c. and a decrease in value of 29.1 p.c. (Table 26). The average prices per lb. were 11.2 cents in 1931 and 15 cents in 1930.

Condensed Milk and Milk Powder.—The quantity of condensed milk made in Canada in 1931 was 15,485,643 lb., valued at \$1,562,710, a decrease in quantity of 7,874,812 lb. or 33.7 p.c., as compared with 1930. The quantity of evaporated milk made was 45,953,727 lb., valued at \$3,523,584, a decrease of 20.3 p.c. in quantity and of 29.5 p.c. in value compared with 1930. The quantity of milk powder and skim-milk powder made in 1931 was 15,391,049 lb., valued at \$1,566,356. Of the

26 condenseries in operation in Canada in 1931, 23 were situated in Ontario. The total value of products of condenseries in Canada was \$8,754,002. Table 27 shows the quantities and values of products other than butter and factory cheese for the years 1929-31.

Total Production of Dairy Factories.—In Table 28 are shown the total values of all products of dairy factories by provinces for the five years 1927 to 1931. For Canada as a whole, the figures show a decline in the latest year of 17.5 p.c. All of the provinces show decreases for 1931 as compared with 1930.

28.—Total Values of All Products of Dairy Factories, by Provinces, 1927-31.¹

¹The total values of dairy products in 1871 and various subsequent years are shown in the "Statistical Summary of the Progress of Canada", immediately following the Table of Contents.

Dairy Butter and Home-made Cheese.—The statistics of the foregoing tables relate entirely to the products of dairy factories. In addition, there is a large production of butter on farms, generally described as dairy butter, and a small production of home-made cheese. No annual statistics are collected of these products; the census of 1911, however, showed that the production of dairy butter in 1910 was 137,110,200 lb., value \$30,269,497, and of home-made cheese 1,371,092 lb., value \$154,088. According to preliminary figures of the census of 1931 the production of dairy butter in 1930 was 97,214,696 lb. The production of dairy

butter in 1931 is estimated at approximately 104,640,000 lb., with a value of \$21,723,000, thus making the total estimated production of butter, including dairy butter, in 1931, 330,595,246 lb., valued at \$71,921,878.

Total Values of Dairy Products.—The total value of the dairy products of Canada in 1931 is estimated at \$161,243,580, comprising: creamery butter \$50,198,878; dairy butter \$21,723,000, factory cheese \$12,824,695, home-made cheese \$108,500, miscellaneous dairy factory products \$17,082,507 and milk consumed fresh or whole \$59,306,000. Details by provinces are given for 1931 in Table 29, with Dominion totals for the six preceding years.

29.—Values of the Dairy Production by Provinces, 1931, with Dominion Totals for 1925-31.

Subsection 6.—Fruit Farming.

The native fruits of Canada, with the exception of the blueberry and the cranberry, are not cultivated on a commercial scale. Among the introduced fruits, the apple holds the premier place in Canadian fruit growing, the value of the commercial production of this fruit ranging between six and twenty-one million dollars in the last ten years. An important subsidiary of the grape-growing industry is the manufacture of native wines, which has increased from an estimated value of \$706,000 in 1921 to \$3,276,847 in 1931.

For a fuller discussion of fruit farming in Canada the reader is referred to pp. 242-7 of the 1931 edition of the Year Book.

Census Statistics.—Statistics of the number of bearing and non-bearing fruit trees in 1921 were published on p. 252 of the 1925 edition, together with comparative figures for 1911 which were summarized on p. 244 of the 1931 edition. The figures for 1931 were not available at the time of going to press.

Annual Statistics of Fruit Production.—Table 30 shows the estimated quantities and values of commercial fruits produced in Canada in 1931 and 1932

Owing to changes in the method of collecting these statistics, in some instances they cannot be considered as strictly comparable with those published in previous editions of the Year Book. Figures for the years 1923-31 on the old basis will be found at p. 1054 of the 1932 Year Book.

The Tree Nursery Industry.—The first Canadian commercial nursery was established near Fonthill, Ont., and it was followed within a few years by the establishment of a nursery in Toronto by a Rochester, N.Y., firm. Since that time the industry has steadily spread as the country has developed, until to-day there are approximately 170 firms growing or dealing in nursery stock of all kinds, including fruit trees.

Table 31 shows the total numbers and values of fruit trees, bushes and plants sold by nurserymen for the four years 1929-32. For 1919 and 1920, see the Canada Year Book of 1921, p. 257; for 1921 and 1923, see the Canada Year Book of 1926, p. 241; for 1924 and 1925, see the Canada Year Book of 1929, p. 257; for 1926 and 1927, see the Canada Year Book of 1931, p. 246 and for 1928, see the Canada Year Book of 1932, p. 1055.

Subsection 7.—Special Agricultural Crops.

Maple Syrup and Sugar.—The Canada Year Book, 1924, contained a description of the process of maple sugar-making on pages 247 and 248. Table 33 gives the production and value of maple sugar and syrup in Canada for the years 1930, 1931 and 1932 as estimated by the Dominion Bureau of Statistics.¹

33.—Estimated Quantities and Values of Maple Sugar and Maple Syrup Produced in Canada, by Provinces, 1930-32.

¹For details, see Monthly Bulletin of Agricultural Statistics for June, 1932, p. 185.

The table shows that for the whole of Canada there were estimated increases of 1,733,200 lb. of maple sugar and 429,779 gal. of maple syrup and a decrease of \$790,943 in the combined value of the two products in 1932 as compared with 1931.

Sugar Beets and Beetroot Sugar.—A brief account of the development of the beetroot sugar industry in Canada will be found in the Canada Year Book, 1925, pp. 255-256. At the present time two companies are operating in Canada: the Canada and Dominion Sugar Co., Ltd., with factories at Chatham and Wallaceburg in Ontario, and the Canadian Sugar Factories, Ltd., with a plant at Raymond, Alberta. Table 34 shows the area, yield and value of sugar beets grown in Canada in the years 1921-31.

34.—Acreages, Yields and Values of Sugar Beets in Canada and Quantities of Refined Beetroot Sugar Produced, 1921-31.

NOTE.—Corresponding figures for 1911-20 are given at p. 1057 of the 1932 Year Book.

The production in 1931 of the largest beet-growing countries, in thousands of short tons, was as follows: Russia, 13,411; Germany, 12,165; United States, 7,901; France, 6,828; Czechoslovakia, 5,775; Spain, 3,148; Poland, 3,043; Italy, 2,612; Great Britain and Northern Ireland, 1,860; Belgium, 1,615; Netherlands, 1,134; Austria, 1,077.

Tobacco.¹—In 1932, the commercial tobacco crop of Canada amounted to 54,094,000 pounds, the highest production on record, from 54,138 acres, as compared with 51,300,000 pounds from 55,000 acres in 1931. The farm value of the tobacco crop in 1932 is estimated at \$6,088,300 as compared with \$7,177,540 in 1931.

Table 35 lists the acreages, quantities produced and average yields per acre for 1900, 1910, and 1920 to 1932. The acreages for 1911, 1921 and 1931 are also the comprehensive figures of the census. For the inter-censal years, the acreage and production statistics quoted relate to the commercial crop only. This distinction is much more necessary in Quebec than in Ontario, since a considerable part of the tobacco production of Quebec comes from small plots.

¹ For further details, see Monthly Bulletin of Agricultural Statistics for March, 1933, pp. 62-64.

Hives and Honey.—A table on page 277 of the 1925 Year Book shows the production and value of honey and beeswax in 1920, according to the census of 1921. The principal honey-producing provinces were Ontario and Quebec, which between them produced in 1920 more than 94 p.c. of the recorded total of 6,461,450 lb., valued at \$1,633,251.

There are at present no uniform annual statistics of hives and honey for all the provinces, but a synopsis of the existing provincial estimates for recent years

was given in the Monthly Bulletin of Agricultural Statistics for March, 1933, pp. 64-68. These estimates show a large increase since 1920, the total estimated honey production in 1931 being about 20,628,934 lb., the average value per lb. 8 cents and the total value \$1,651,175.

Subsection 8.—Farm Labour and Wages.

Average Wages of Farm Help.—The average wages paid to farm helpers in Canada for the year 1932 again show a considerable decrease as compared with the previous year. The cost of farm labour reached its highest point in 1920. In the next two years there was a rapid drop so that the average of yearly wages including board for male help in 1922 was nearly 28 p.c. less than in 1920. From 1923 until 1929, no very wide fluctuation occurred. In 1930, 1931 and 1932 continuous marked reductions were registered in the average value of yearly wages and board, following the downward trend of the prices of farm produce.

In Table 37 the value of wages and board is given for the years 1914, 1920, 1925, 1930, 1931 and 1932, both for the summer season and for the year, distinction being made in all cases between wages and board.

37.—Average Wages and Board of Farm Help in Canada, as Estimated by Crop Correspondents, 1914, 1920, 1925 and 1930-32.

Subsection 9.—Prices of Agricultural Produce.

The average monthly cash prices of representative grades of Canadian wheat, oats, barley, flax and rye in the Winnipeg market—basis, in store at Fort William and Port Arthur—will be found for each month from January, 1930, to December, 1932, in Table 38. The average yearly prices of home-grown wheat, barley and oats in England and Wales are furnished in Table 39; in this table British currency is converted into Canadian currency at par rate of exchange (£=\$4.864). The average monthly prices of flour, bran and shorts at Montreal, Toronto, Winnipeg, Minneapolis and Duluth for 1932 are given in Table 40.

The yearly average prices per cwt. of Canadian live stock at Toronto, Montreal, Winnipeg and Edmonton are given for 1931 in Table 41 and the average yearly prices in 1932 at these centres and at Calgary in Table 42.

38.—Monthly Average Cash Prices per Bushel at Winnipeg of Representative Grades of Canadian Wheat, Oats, Barley, Flax and Rye—basis, in store at Fort William and Port Arthur—1930-32, and Yearly Average Prices for crop years ended July 31, 1926-32.

Index Numbers of Agricultural Prices.—Records of the average prices received by farmers for agricultural produce have been collected annually since 1909 through the crop correspondents of the Census and Statistics Office and the Dominion Bureau of Statistics. From these records, annual index numbers have been calculated for each crop and for the field crops as a whole. In calculating the index numbers in the present instance, the base period used is 1926. Index numbers have been calculated of the yields of the various crops from year to year. From these data index numbers of the value of all field crops, weighted according to the quantity produced in each case, have been obtained. The results of these calculations are presented in Table 43.

43.—Index Numbers of Producers' Prices of Agricultural Commodities, 1913-32.

Note.—Average Prices, 1926 = 100.

For the formulæ used in the calculation see Monthly Bulletin of Agricultural Statistics, March, 1928, p. 94.

¹Prices quoted are per bushel, except for potatoes and turnips, etc., which are per cwt., and the last five items, which are per ton. For details of index numbers by provinces, see Monthly Bulletin of Agricultural Statistics, January, 1933, pp. 13-20.

The general index number fell from 1924 to 1928, especially from 1926 to 1928, recovered strongly in 1929 but declined rapidly to reach the record low of 40.4 for

INDEX NUMBERS OF AVERAGE PRICES OF FIELD CROPS, 1913-1932

ANNUAL AVERAGE PRICES
1913 = 100

the period under review, in 1932. The commodities responsible for the decline from 1927 to 1928 were the cereals and potatoes. The root and forage crops held fairly steady and there were increases in peas, beans and buckwheat.

The severe decline of 1930 was accentuated in 1931 and marked by reductions in the prices obtained for all the agricultural commodities listed with the exceptions of oats, rye and barley. Reductions in the prices of wheat, flaxseed, corn and potatoes were again drastic; wheat, which has the greatest weight in the index, was mainly responsible for the decline of 55.4 points in the general index between 1924 and 1931, as well as for the temporary recovery in 1929. In 1932 prices of all crops continued to decline with the exceptions of potatoes, which showed a marked increase as compared with 1931, corn for husking and peas.

Subsection 10.—Agricultural Statistics of the Census

A selection of the more important agricultural statistics of the census of 1921 was published at pp. 269-271 of the 1929 edition of the Year Book. Further, certain agricultural statistics of the Prairie Provinces collected at their quinquennial census of 1926 were published at pp. 271-273 of the same volume. The complete agricultural statistics of the census of 1921 are published in Volume V of the publications of the census of that year, while the detailed agricultural statistics of the census of the Prairie Provinces of 1926 will be found in the reports of the census of that year, issued separately for the provinces of Manitoba, Saskatchewan and Alberta.

Such agricultural statistics of the census of 1931 as are available at the time of going to press will be found in Appendix II at the end of this volume.

Subsection 11.—Miscellaneous Agricultural Statistics.

Agricultural Irrigation.—The surface waters in Alberta are vested in the Crown and are administered by the Water Resources Office under the Water Resources Act. All matters affecting the control of water supply generally, as well as the inspection and authorization of works for the use of water for domestic, municipal, industrial, irrigation and other purposes and the granting of licences for such purposes are dealt with thereunder. The Director of Water Resources at Edmonton is responsible for all field administration. The Irrigation Districts Act of Alberta (R.S.A., 1922, c. 114) and amending statutes provide for the formation of irrigation districts, and authorize the raising of loans under by-laws adopted by the voters of the district. Table 44 gives statistics of the larger irrigation projects in Alberta for the year 1931.

44.—Major Irrigation Projects in Southern Alberta, 1931.

* Revised by L. C. Charlesworth, Director, Water Resources, Province of Alberta.

The Canadian Pacific Railway Co. has constructed, and is operating in Alberta, three large projects known as the Eastern, Western and Lethbridge sections, the last named being the oldest irrigation project in Alberta. The area irrigable by these projects is 707,980 acres. By agreement with the Canadian Pacific Railway Co., the Taber, Magrath and Raymond irrigation districts procure their water supply from the main canal of the Lethbridge section, a further 43,603 acres being served by the canals of these districts.

The total irrigable area served by the Canada Land and Irrigation Co.'s project is 130,000 acres, while the New West irrigation district, by agreement with the Canada Land and Irrigation Co., receives a water supply for a further irrigable area of 4,501 acres.

In addition to the irrigated tracts enumerated in the above table, there were, at Dec. 31, 1931 about 335 privately owned projects in Alberta, with a possible irrigable area of 56,019 acres.

Average Value of Farm Lands.—Statistics showing the average value of farm lands in Canada in 1910 and from 1915 to 1932, are given in Table 45. The values are as estimated by crop correspondents and show the rise in land values between 1915 and 1920, the general decline with moderate fluctuations since the latter date and the rapid fall since 1929 to a point below the 1910 level for the country as a whole.

45.—Average Values per Acre of Occupied Farm Lands¹ in Canada, as Estimated by Crop Correspondents, 1910, 1915-32.

¹ Orchards and fruit lands, 1932, with 1931 in brackets: Nova Scotia \$35 (\$94); Ontario \$33 (\$110); British Columbia \$275 (\$300).

² Actual returns were not collected from crop correspondents in Saskatchewan for 1924, and the estimate of 1924 is interpolated.

Subsection 12.—International Agricultural Statistics.

World Production of Cereals and Potatoes.—Table 46, constructed from data published by the International Institute of Agriculture, shows the areas and yields of wheat, oats, barley, rye, corn and potatoes for the years 1931 and 1932 in countries of the Northern Hemisphere, and for the years 1931-32 and 1932-33

in countries of the Southern Hemisphere. The annual average acreages and yields are also given for the five-year period, 1926-30 (1926-27 to 1930-31), and the areas and yields of 1932 (1932-33) are compared in percentages with those of the five-year period.

Wheat.—For 49 countries the production of wheat in 1932 was 3,677,411,000 bushels from 334,147,000 acres, as compared with 3,768,440,000 bushels from 340,693,000 acres in 1931 and 3,684,530,000 bushels from 319,148,000 acres, the five-year average, 1926-30 (1926-27 to 1930-31). Due to a decrease in wheat acreage between 1931 and 1932 the total production decreased 91,029,000 bushels or 2.4 p.c. As compared with the five-year average, the 1932 acreage was 4.7 p.c. greater and the production 0.1 p.c. less.

Oats.—The statistics of 38 countries show a total production in 1932 of 3,638,766,000 bushels from 137,264,000 acres, as compared with 3,269,816,000 bushels from 144,024,000 acres in 1931 and with 4,629,455,000 bushels from 146,508,000 acres, the five-year average. The 1932 area was 4.7 p.c. less and the production 11.3 p.c. greater than in 1931. As compared with the five-year average, the 1932 area was nearly 6.3 p.c. less and the production 21.4 p.c. less.

Barley.—In 45 countries, the total yield in 1932 was 1,478,091,000 bushels from 77,589,000 acres, as compared with 1,293,938,000 bushels from 79,728,000 acres in 1931 and 1,695,902,000 bushels from 79,995,000 acres, the five-year average. The area in 1932 was 2.9 p.c. less and the yield 14.2 p.c. greater than in 1931 and, compared with the five-year average, the acreage in 1932 was 3.0 p.c. less and the yield 12.8 p.c. less.

Rye.—The statistics available for 31 countries show that the production in 1932 was 1,069,235,000 bushels from 112,257,000 acres, as compared with 836,574,000 bushels from 115,428,000 acres in 1931 and 1,817,573,000 bushels from 113,457,000 acres, the five-year average. The area in 1932 was 2.7 p.c. less and the production 27.8 p.c. greater than in 1931. Compared with the five-year average, the 1932 acreage was 1.1 p.c. less and the production 41.2 p.c. less.

Corn.—In 23 countries, the production in 1932 was 3,802,216,000 bushels from 156,959,000 acres, as compared with 3,370,121,000 bushels from 156,060,000 acres in 1931 and 3,429,249,000 bushels from 146,943,000 acres, the five-year average. The area for 1932 was 0.6 p.c. more and the production 12.8 p.c. more than in 1931 and, compared with the five-year average, the 1932 area was 6.8 p.c. more and the production 10.9 p.c. greater.

Potatoes.—In 32 countries, the total yield in 1932 was 5,627,186,000 bushels from 44,586,000 acres, as compared with 5,425,816,000 bushels from 45,697,000 acres in 1931 and with 6,670,768,000 bushels from 43,149,000 acres, the five-year average. The 1932 acreage is 2.4 p.c. less and the production 3.7 p.c. greater than in 1931 while, as compared with the five-year average, the 1932 acreage was 3.3 p.c. more and the production 15.6 p.c. less.

World Exports and Imports of Wheat and Flour.—Statistics showing the exports and imports of wheat and wheat flour for the principal countries of the world in the crop year ended July 31, 1932, with comparative figures for the previous crop year, are shown in Table 47. This information is taken from data published by the International Institute of Agriculture. During the crop year 1931-32, a total of 705,799,000 bushels of wheat is shown as exported, as compared with 705,140,000 bushels in the previous year.

The four chief exporting countries made the following contributions during the crop year 1931-32, the figures for the previous year being shown within brackets, in bushels: Canada 182,803,000 (228,536,000); Argentina 136,725,000 (119,540,000); Australia 122,987,000 (127,506,000); United States 88,007,000 (77,175,000). Exports of flour amounted to 31,658,000 barrels and 37,154,000 barrels during the crop years 1931-32 and 1930-31. Shipments from the United States totalled 7,699,000 barrels in 1931-32 as compared with 11,786,000 barrels in 1930-31; from Australia 7,140,000 and 5,308,000 barrels and from Canada 5,383,000 and 6,702,000 barrels respectively. Canada was the largest exporter of wheat and of wheat and wheat flour combined, occupying third place as exporter of wheat flour in 1932.

The total imports of wheat by the leading importing countries for the crop year ended July 31, 1932, amounted to 637,971,000 bushels, as compared with 634,128,000 bushels for the previous year. Great Britain and Northern Ireland imported 229,435,000 bushels as compared with 207,580,000 bushels in 1930-31; France 88,566,000 bushels as against 77,660,000 bushels; Belgium 52,462,000 bushels as against 51,973,000 bushels; Italy 37,599,000 as against 83,524,000 bushels; Germany 35,009,000 as against 31,342,000 bushels. Great Britain and Northern Ireland imported 5,726,000 barrels of wheat flour as compared with 6,539,000 barrels in the previous year; Irish Free State was next with 2,034,000 barrels as compared with 1,883,000 barrels and Egypt 1,232,000 barrels as compared with 1,666,000 barrels.

World's Live Stock.—The Statistics of Table 48, compiled from data published by the International Institute of Agriculture, show as nearly as possible, the world situation with regard to live stock about 1931. For many countries, the figures are the result of careful enumeration, while for others, they represent only quite approximate estimates.

48.—Numbers of Live Stock in Principal Countries, circa 1931.

MAP OF THE
DOMINION OF CANADA
 SHOWING
FOREST BELTS

CHAPTER IX.—FORESTRY.¹

Section 1.—Physiography, Geology and Climate as Affecting the Forests.

The Dominion of Canada may be roughly divided into three main drainage areas—the Pacific slope west of the Rocky mountains; the Great Plains region draining into the Arctic ocean and Hudson bay; and the basin of the Great Lakes and the St. Lawrence, together with the Maritime Provinces. Each of these three regions supports a distinct type of forest growth.

The Pacific Slope.—The Pacific slope is characterized by several systems of mountains running approximately parallel and extending from the southeast to the northwest. The Rocky mountains vary in elevation from 5,000 to 13,000 feet above sea-level, with numerous peaks extending well above 10,000 feet. Between this system and the Pacific are: the Columbian system, comprising the Selkirk, Monashee and Caribou mountains; the Interior Plateau system; the Cassiar and Yukon systems; the Pacific system comprising the Cascade, Coast and lesser ranges, terminating with the sunken Insular system whose upper elevations form Vancouver island, the Queen Charlotte group and other coast islands. The chief rivers follow the valleys between these ranges, breaking through in some cases along the shorter cross valleys from east to west.

The Rocky mountains are formed chiefly of Palæozoic rocks, as are also the islands off the coast. The Coast range is almost entirely granitic and the Selkirks are Precambrian or Cambrian. The intervening ranges are of mixed formations, varying from rocks of sedimentary origin to granites. The best soil in British Columbia is concentrated in valley bottoms or alluvial deltas, and the purely agricultural area has been estimated at about 10 p.c. of the land area.

The climate along the coast is mild and humid, with a mean annual temperature varying from 44° to 49° F. The precipitation is the heaviest in Canada, varying from 40 to 120 inches. The greater part of this precipitation falls during autumn and winter, only 30 p.c. falling during the growing season, to which fact is sometimes ascribed the scarcity of deciduous-leaved forest growth, which requires more moisture during the growing season. In any case, coniferous tree growth in this region is the most luxuriant in Canada, and the forests have the most rapid rate of growth, the largest individual trees and the heaviest stands of timber extending from sea-level up to elevations of 3,500 or 4,000 feet. The Interior Dry belt of British Columbia has a low annual precipitation, varying from 10 to 20 inches. Extremes of temperature from 100° F. to -45° F. make this a region unfavourable to tree growth. The winds from the Pacific, which precipitate most of their moisture on the Coast and Cascade mountains, cross this interior plateau, leaving its southern part in a semi-arid state, and give up a large part of what moisture remains when they reach the Selkirk and Rocky mountains, forming what may be termed the Interior Wet belt, centred in the Columbia valley. Here the precipitation averages over 30 and sometimes reaches 60 inches, taking the form of snow in higher altitudes. Temperatures vary from 100° F. to -17° F. In the Rocky Mountain range itself the climate is more extreme and variable than to the westward.

¹ Material in this chapter has been prepared in co-operation with Roland D. Craig, F.E., of the Forest Service of the Department of the Interior, by R. G. Lewis, B.Sc.F., Chief of the Forest Products Branch of the Dominion Bureau of Statistics. This Branch collects and compiles statistics relating to forest production and publishes four annual printed reports covering the lumber industry, the pulp and paper industry and the wood-using and paper-using industries of Canada. These printed reports are usually preceded by a number of preliminary mimeographed reports, one for each important industry or group of industries. For detailed list of publications see Chapter XXIX.

The Great Plains.—East of the Rockies lies the Great Plains region, composed of a variety of topographical types. From the foothills of the Rockies, the country slopes gradually eastward and northward. The prairie country extends from the International Boundary to the 55th parallel along the foothills, gradually tapering down toward the east to a point near the lake of the Woods. Of this area, 105,000 square miles is now almost entirely treeless, with rich fertile soil, and is at present a purely agricultural or pastoral country. Whether its present treeless condition is due to climatic or other causes is problematical, but the presence of isolated patches of tree growth in situations well protected from fire, the ease with which these natural groves can be increased and new plantations established by artificial planting and protection from prairie fires, would seem to indicate that repeated burning accounts, at least in part, for its present treeless state. The underlying rocks are of the Cenozoic and Mesozoic eras. The climate of Alberta is extremely variable in winter, due to a warm, dry wind known as the *Chinook*, which blows from the south and southwest and extends its influence from the International Boundary to the Peace river and eastward to Regina in Saskatchewan. In summer the isotherms run almost due north and south in Alberta. Rainfall varies from 15 to 20 inches. The temperature in Manitoba has an absolute recorded range of 150° F., with a mean range of 71°. Saskatchewan and Alberta are more temperate, especially where they are affected by the *Chinook*. North of the treeless prairies is a region largely unexplored, covered at first by a comparatively light forest growth which toward the north and east gives way to the sub-Arctic "tundra"—a region of muskeg and bare, glacier-worn rocks of the Laurentian and Precambrian types.

These Laurentian rocks in Canada form the Archæan or Canadian Shield, with a distinct type of topography. This rock formation covers a huge irregular triangle with its apex near the Thousand islands in the St. Lawrence, from which point one arm extends northwesterly to the mouth of the Mackenzie river and the other northeasterly down the St. Lawrence valley to include the Labrador peninsula. This region has been reduced to a peneplained condition by repeated glacial action which has worn down the high elevations and scoured out most of the soil except in isolated depressions. It is covered with innumerable lakes, muskeg or bog, and rivers. The southern portion of the Shield is to a great extent agricultural land, actual or potential, much of which is still heavily forested. Toward the north tree growth becomes lighter and the climate as a rule becomes too severe for continuous successful agriculture. Still farther toward the north, tree growth ceases and the region merges into the same belt of sub-Arctic "tundra" already mentioned.

The St. Lawrence Basin and the Atlantic Slope.—The basin of the St. Lawrence and Great Lakes contains a variety of topographical and geological types. The north shores of lake Superior and Georgian bay, the upper Ottawa River valley and the southern part of Labrador, are part of the Laurentian Shield already described. Here the climate is tempered in part by the presence of the lakes and the gulf of St. Lawrence but is, nevertheless, severe and variable. To the south, soil and climate improve, and the southwestern peninsula of Ontario, the north shore of lake Ontario and the St. Lawrence valley are all essentially agricultural land. The rock here is of sedimentary origin, mostly of Palæozoic age.

The Maritime Provinces, with a general slope towards the Atlantic, are varied in topography and geology. The climate resembles that of southern Ontario, being modified by the presence of the ocean. Precipitation is above 35 inches annually. This region supports a type of forest similar to that of the southern portion of the Archæan Shield.

Section 2.—Main Types of Forest Growth.

Physiographic, climatic and soil conditions in Canada favour the coniferous type of forest. While the more fertile portions of Ontario, Quebec and the Maritime Provinces support a heavy virgin growth of hardwoods, the greater part of Canada's forest area is covered with spruce, pine, balsam, Douglas fir and other coniferous softwoods. Three main groups of forest growth in Canada follow the main physiographic divisions already mentioned. These groups are the Cordilleran, the Great Plains and the Eastern forests.

The Cordilleran Forests.—The Cordilleran forest, which covers the greater part of the Pacific slope, may be subdivided into the Coast belt, the Interior Dry belt, the Interior Wet belt and the Rocky Mountain belt. The Coast belt includes several distinct forest types, their character being determined by variations in climatic and topographic conditions, among which altitude and precipitation have had the greatest effect on forest growth. In the southern portion of the belt Douglas fir and red cedar are the principal species at altitudes below 2,000 or 2,500 feet. With these are associated hemlock, white pine, amabilis and lowland fir. Toward the north and at higher altitudes, Douglas fir disappears and red cedar and hemlock are the important trees, with amabilis fir and yellow cypress as subsidiaries. In the Queen Charlotte islands and along the northern part of the coast Sitka spruce and western hemlock form a lowland type.

In the Interior Dry belt, western yellow or "bull" pine predominates at low altitudes bordering on the grass lands. Douglas fir gradually increases in importance until it predominates at elevations up to 3,500 and 4,500 feet. Western larch covers a limited area usually between the true yellow pine and Douglas fir types. At the northern latitudinal and upper altitudinal limits of the Douglas fir type, an Engelmann spruce type develops, which merges into a spruce-alpine fir type at still higher altitudes. Lodgepole pine has taken the place of Douglas fir, Engelmann spruce and, in some cases, yellow pine on burned-over areas and has become, to a considerable extent, established as a distinct type.

Forest types similar to those of the coast have developed in the Interior Wet belt. In the southern portion of this belt, red cedar predominates in the wetter situations, mixed with Douglas fir, Engelmann spruce, white pine, hemlock, western larch, alpine fir, lowland fir and cottonwood. On the benches and lower valley slopes, hemlock and cedar are the important species. Engelmann spruce replaces hemlock at higher elevations, cedar gradually disappears and the spruce-alpine fir type stretches up to timber line. To the north, Engelmann spruce and alpine fir are more prominent and the other species are gradually eliminated.

The Rocky Mountain belt includes portions of the Dry Belt types to the south and those of the Interior Wet belt further north. Otherwise the typical forest of the Rocky mountains is made up of Engelmann spruce and some white spruce, with an increasing proportion of alpine fir as the altitude increases. This type has suffered so severely from fire, especially on the dry eastern slopes, that lodgepole pine has established itself permanently in some cases and temporarily in others on burned-over areas.

In the sub-Arctic belt, comprising the Yukon plateau and that part of the Rocky Mountain system north of 58°, the general elevation is over 4,000 feet, the climate is severe, the growing season short and precipitation scant. As a result, tree growth is slow and confined to favourable sites in valleys. The timber is

small and of poor quality. It is, however, of great local value in the mining industry and to trappers. The principal type is the spruce-alpine fir, with lodgepole pine on poorer sites, and poplar and willow on richer soils on burned-over areas.

Most of the commercially important species of the Cordilleran region are confined to British Columbia. The spruce-fir-lodgepole pine type of the northern interior extends across the Rockies into the foothills of Alberta. Certain species, such as Douglas fir, Engelmann spruce, alpine fir and lodgepole pine, are also found in western Alberta, but in few cases do they extend any great distance eastward.

The Forests of the Great Plains.—The Great Plains region may be divided into the Prairie, Northern Forest and Sub-Arctic belts. There are no great variations in altitude in the region, and latitude and soil conditions, especially drainage, determine the distribution of forest types. The Prairie belt in southern Alberta, Saskatchewan and Manitoba extends north from the International Boundary for 200 to 400 miles. Patches of tree growth in protected situations are made up chiefly of aspen poplar, with some white spruce and jack pine. North of this purely agricultural and pastoral area is the great Northern Forest belt, from 300 to 400 miles wide, which extends from Alaska to Labrador, covering the greater part of the Laurentian Shield as far as the limits of commercial tree growth. Originally, white spruce predominated over this entire belt and it still forms the most important type commercially, although it has suffered severely through forest fires. In the East, balsam fir is an important associate, and the spruce-balsam fir type makes up most of the pulpwood resources of Eastern Canada. The black spruce type, frequently associated with eastern larch (tamarack), occupies poorly-drained areas within this belt. Enormous areas have been burned over by forest fires. Aspen poplar has replaced the spruce and balsam on the best soil in these areas, and is now the most prevalent species, although it will eventually be replaced by conifers where natural reproduction is possible. Over vast areas, however, there is no immediate prospect of securing a return to coniferous forest by natural agencies. Jack pine has taken possession of the drier, lighter soils, in some cases permanently. Paper birch comes in with aspen poplar toward the east, and balsam poplar occurs in the moister situations. Jack pine, aspen and balsam poplar reach a higher development along the Peace river in northern Alberta than they do elsewhere in America. Along its northern margin this belt merges into the sub-Arctic "tundra", with tree growth confined to narrow strips along waterways. Vigorous tree growth and fairly large timber are found along these shallow valleys as far north as 67°, indicating that soil conditions, especially drainage, are more important than climate in defining the limits of tree growth. To the northward, balsam fir disappears early from the forest growth, followed by balsam poplar, jack pine, aspen and paper birch, leaving white spruce, black spruce, tamarack or larch, and willow to define the northern limit of tree growth. This may be roughly indicated by a line drawn from the mouth of the Mackenzie river on the Arctic ocean to the mouth of the Churchill river on Hudson bay and across the Labrador peninsula at about 58° N. latitude.

The Eastern Forests.—In southeastern Canada a number of belts of forest growth with distinctive characteristics are recognized. The hardwood belts include the Carolinian zone, confined to the north shore of lake Erie and the western part of lake Ontario. This is important only as forming the northern fringe of a type which covers a large area in the central Eastern United States, and includes a number of species such as tulip, sassafras, etc., not found elsewhere in Canada.

North of this zone, still in the purely agricultural and pastoral area, the original forests were of the commercially important hardwoods, such as maple, elm, basswood, oak, yellow birch, hickory and beech, with patches of pine, hemlock and other conifers on the lighter soils. This area has been largely cleared and devoted to agriculture, and the original forest type is to be seen only on farmers' woodlots.

Since the beginning of the lumbering industry in Canada, the region north of this belt, extending, roughly speaking, to the height of land between the St. Lawrence and Hudson Bay waters, has been the centre of the most extensive exploitation, and still occupies that position as far as Eastern Canada is concerned. The forest types which still exist in this region vary considerably owing to soil and other conditions, but generally speaking white pine occupies the better situations on the lighter soils, and reaches its highest development in this belt. With it is frequently associated the red or Norway pine. On heavier soils, spruce, hemlock and the tolerant hardwoods also form an important part of the stand. Cedar, tamarack and black spruce form typical stands in poorly drained situations. Hardwood ridges, carrying chiefly maple and yellow birch, occur in the southern part of this belt. These, with hemlock, extend north to a line running approximately from the northeast corner of lake Superior to the mouth of the Saguenay river. The extensive lumbering operations of the past century, together with repeated forest fires, have greatly modified these original types. The exclusive cutting of white and red pine, practised until recently, has resulted in the displacement of these species by spruce, balsam fir, jack pine and the hardwoods, the spruce-balsam fir pulpwood areas being the most valuable type remaining. Jack pine has come in extensively on burned-over areas on lighter soils and in some cases has taken permanent possession of such sites. On account of its value for railway ties and pulpwood and the ease with which it can be grown it is not at all an undesirable species to perpetuate. Aspen and paper birch are also rapidly becoming established as temporary types. Along its northern border, this mixed hardwood and softwood type merges into the northern forest belt already described, with the disappearance of first the hemlock and the tolerant hardwoods and then the white and red pines.

The Acadian belt covers the Maritime Provinces and the south shore of the St. Lawrence in Quebec. The forest is similar to that of the New England States, being characterized by red spruce. With this are found varying proportions of white spruce and balsam fir. In the mixed softwood and hardwood type, which also occurs in this belt, white pine and hemlock occur, with yellow birch, maple and beech representing the commercial hardwoods. Cedar is fairly abundant in the western portion of this region. Burned-over areas in the Acadian belt are chiefly occupied by aspen and white birch as temporary species.

Section 3.—Important Tree Species.

In Canada there are approximately 130 species or distinct varieties of trees. Only 33 of these are conifers commonly known as "softwoods", but they comprise over 80 p.c. of the standing timber and 70 p.c. of the wood utilized for all purposes. While the number of deciduous-leaved or "hardwood" species is large, only about a dozen are of a commercial importance comparable with twice the number of conifers. The principal use for the hardwoods is for fuel, though increasing amounts are being manufactured into lumber, railway ties and veneers. A detailed description of the more important species of Canadian forest trees was given on pp. 282-285 of the 1924 Year Book.

Section 4.—Forest Resources.

Areas.—The total land area of Canada, revised according to the Labrador Boundary Award of 1927 and the latest surveys, is estimated at 3,457,484 square miles, of which 550,000 square miles is considered as being suitable for agricultural or pastoral purposes. According to the 1931 census about 255,094 square miles of this agricultural land was occupied and about 133,220 square miles was improved.

The total area covered by existing forests has been estimated at 1,153,000 square miles, including 26,652 square miles of occupied agricultural land still forested. Most of this will no doubt be left under forest cover in the form of farmers' woodlots. There is also a considerable area of forest land which is of agricultural value and will eventually be cleared but it is estimated that 1,100,000 square miles is essentially forest land which can best be utilised for forest production. (See Table 8, p. 42.)

The accessible and productive forest area is estimated to be 791,670 square miles of which 378,945 square miles carries timber of merchantable size and on 412,725 square miles there is young growth which if protected from fire will eventually produce merchantable timber. The remaining area of 361,330 square miles carries forests of value either because of their influence on water control, climatic conditions, game conservation, or by reason of their attraction to tourists and their value as a source of wood for local use. On account of their geographical location or because of unfavourable growth conditions these forests at present are considered as non-productive from a commercial viewpoint.

As a result of the constant and inevitable improvement in conditions affecting profitable exploitation, such as the extension of settlement and transportation facilities, the increasing world scarcity of forest products, and the ever increasing demand for these products, due to the development of industry, the discovery of new uses for wood, and the improvements in the methods, equipment and machinery used in logging and manufacturing forest products, most of this inaccessible timber will eventually become commercially exploitable. It is estimated that of the accessible forest area 481,790 square miles is producing softwood or coniferous timber, 213,590 square miles, mixed softwoods and hardwoods and 96,290 square miles, hardwood or broad-leaved species.

In Canada as a whole about 8.4 p.c. of the total forest area has been permanently dedicated to forest production. Previous to the transfer of the natural resources to the western provinces in 1930, some 33,023 square miles of this reserved area comprised national forests but these have now in large part become provincial forests. The distribution of provincial forests, provincial parks and national parks among the various provinces is shown in the following statement.

FOREST RESERVES AND PARKS IN CANADA, 1933.

Province.	Provincial Forest Reserves.	Provincial Parks.	National Parks.
	sq. miles.	sq. miles.	sq. miles.
Nova Scotia.....	-	-	0.05
New Brunswick.....	-	-	0.10
Quebec.....	28,960	7,288	-
Ontario.....	19,607	4,889	15.00
Manitoba.....	3,808	-	1,148.00
Saskatchewan.....	9,217	177	1,869.00
Alberta.....	19,433	3	24,816.00
British Columbia.....	15,964	2,221	1,715.00
Totals.....	96,989	14,578	29,363.15

Of the total forest area 9.6 p.c. has been permanently alienated, being owned in fee simple by private individuals or corporations. The Crown still holds title to 13.2 p.c. of the area but has alienated the right to cut timber thereon under lease or licence. So far 77.2 p.c. has not been alienated in any way. It may be said that 90.4 p.c. of Canada's forest area is still owned by the Crown in the right either of the Dominion or the provinces and, subject only to certain temporary privileges granted to limit-holders, may at any time be placed under forest management and dedicated to forest production.

Volume of Standing Timber.—In 1932 the total stand of timber in Canada was estimated to be approximately 267,733 million cubic feet, of which 217,776 million cubic feet was of coniferous species and 49,957 million cubic feet of broad-leaved species.

During the years 1926-30 the average annual depletion due to use was approximately 2,000 million cubic feet of conifers and 970 million cubic feet of hardwoods. The average annual loss from fire is estimated at 185 million cubic feet of conifers and 45 million cubic feet of hardwoods. Though no widespread epidemics of insects or fungous diseases have occurred in recent years, local infestations which cause considerable loss develop practically every year. In Nova Scotia in 1931, the balsam suffered severely from "gout" induced, it is believed, by minute sucking insects of the genus *Dreyfusia*, previously undescribed. In the Gaspé peninsula the spruce saw-fly became a serious menace. In the absence as yet of any basic data on which to estimate the annual depletion from these causes, it may be taken as 700 million cubic feet. The total annual depletion during the five-year period is therefore estimated to have been about 3,900 million cubic feet. To what extent this loss has been replaced by growth increment is not known but, considering the preponderance of the younger age classes in the reproduction, it is believed there has been a considerable net depletion in the merchantable age classes.

Another real difficulty is the division of the existing stand into merchantable timber and that which is inaccessible or unprofitable, since merchantability depends not only on the location but on the density of the stand, the demands of the market for certain species or qualities of product, and the regulations as to cutting. Light stands covering large areas may in the aggregate carry very large amounts of timber and still not be exploitable at a profit. For some species, such as aspen and white birch, which comprise three-quarters of the hardwoods, there is very little demand, and therefore these cannot properly be classed as merchantable, though accessible as far as location is concerned.

In June, 1929, a conference of the Dominion and provincial forest authorities was held in Ottawa and it was decided to undertake a national inventory of the forest resources of Canada, each authority conducting the necessary stock-taking surveys on the land under its jurisdiction. In connection with the inventory definite data are being secured regarding the depletion due to use, fire, insect damage, etc., and the increment accruing. Five years was set as an objective for the completion of an inventory of at least the more accessible parts of the area. This national inventory is being organized under the direction of the Department of the Interior and related studies of increment and decrement should shortly begin to throw new light on many problems.

Under present conditions it is doubtful whether more than 135,000 million cubic feet of conifers and 30,000 million cubic feet of hardwoods can be considered as accessible.

Section 5.—Forest Administration.

Subsection 1.—Administration of Dominion and Provincial Timber Lands.

In Canada the general policy of both the Dominion Government and the Provincial Governments has been to dispose of the timber by means of licences to cut, rather than to sell timber land outright. Under this system the State retains the ownership of the land and control of the cutting operations. Revenue is derived in the form of stumpage bonuses (either in lump sums or in payments made as the timber is cut), annual ground rent, and royalty dues collected as and when the wood is removed. Both ground rent and royalty dues may be adjusted at the discretion of the Governments so that the public may share in any increase in stumpage values or, as has happened, reductions may be made in the rates if conditions demand them.

The Maritime Provinces did not adopt this policy to the same extent as did the rest of Canada. In Prince Edward Island all the forest land has been alienated and is in small holdings, chiefly farmers' woodlots. In Nova Scotia 76 p.c. of the forest land is privately owned; nearly half of this is in holdings exceeding 1,000 acres. In New Brunswick nearly 50 p.c. has been sold, and 20 p.c. is in holdings exceeding 1,000 acres. The percentage of privately-owned forest land in the other provinces is as follows: Quebec, 7 p.c.; Ontario, 3.3 p.c.; Manitoba, 11.3 p.c.; Saskatchewan, 10.4 p.c.; Alberta, 15.7 p.c. and British Columbia, 13 p.c.

Until 1930 the Dominion Government administered the Crown lands, including timber lands, in the provinces of Manitoba, Saskatchewan and Alberta, in the Railway Belt and Peace River Block of British Columbia, and in Yukon and the Northwest Territories, but the forests as well as the other natural resources in the western provinces have now been transferred to provincial control. In all cases timber lands are now administered by the provinces in which they lie. As new regions are explored their lands are examined and the agricultural land disposed of. Absolute forest land is usually set aside for timber production, and the policy of disposing of the title to lands fit only for the production of timber has been virtually abandoned in every province in Canada. The ownership of forests by towns and

communities, so common in Europe, is now beginning in Canada. Efforts are being made, especially in Quebec and Ontario, to encourage the establishment and maintenance of forests on this basis.

Timber Lands Under Dominion Control.—The National Parks of Canada Branch of the Department of the Interior administers the Dominion parks, now embracing about 29,360 square miles. These are primarily national playgrounds and game preserves, the timber being practically withdrawn from commercial use. The Dominion Lands Administration of the Department of the Interior administers and protects forest land lying north of the provincial areas. The Department of Indian Affairs administers, in trust for the Indians, all timbered areas within their reservations. The Board of Railway Commissioners has charge of fire protection along practically all the railway lines in Canada.

Forest Administration in the Prairie Provinces.—Upon the transfer of the natural resources in 1930, each province took steps toward the creation of an adequate forest service with a Provincial Forester in charge. In Manitoba the service is under the Department of Mines and Natural Resources and in its forest regulations, framed under the Manitoba Forest Act, the former Dominion Forest Reserves and Crown Timber Regulations are very largely incorporated. In Saskatchewan and Alberta a closely similar policy is being followed. In every case the central object of policy is to safeguard the regeneration of valuable species in the natural forest types. The national forests in these provinces have practically all been retained as provincial forests and some additional reserves have been established, making a total area of 32,458 square miles. Approximately 27,335 square miles of forest lands in the Prairie Provinces are privately owned.

British Columbia.—In the province of British Columbia, the Forest Branch of the Department of Lands has administered timber lands since 1912. All unalienated lands in the province which are found to be better suited to forest than to agricultural production are dedicated to forest production, and all timber lands carrying over a specified quantity of timber are withdrawn from disposal until examined by the Forest Branch. During the last few years 15,964 square miles have been set aside permanently for forest purposes. The present practice is to sell cutting rights for a stated period by public competition but licences to cut, which are renewable annually in perpetuity, have been granted for a large proportion of the accessible timber. The royalties are adjusted periodically on the basis of prevailing industrial conditions. About 18,150 square miles of timber land are privately owned.

Ontario.—Forest administration is carried out in Ontario under the Department of Lands and Forests, which is subdivided into two divisions each under a Deputy Minister. The Lands and Forests Division controls timber sales and the Forestry Division has charge of reforestation, protection, air service, forest surveys and investigations. The Forestry Board, consisting of representatives of forest industries, the University of Toronto Faculty of Forestry and the Deputy Minister of Forestry, acts in an advisory capacity.

In recent years the sale of saw timber has been by tender after examination, with conditions covering the removal within a specified period, disposal of *débris*, etc. Much of the merchantable timber is at present held under licences granted in the past and renewable indefinitely. Pulpwood areas are usually disposed of by individual agreements for longer periods than in the case of saw timber. Manufacture in Canada was made a condition in the disposal of all softwood saw timber in 1897, of all pulpwood in 1900 and of all hardwood in 1924. In some individual

pulpwood agreements the licensee must undertake not only to erect a pulp-mill but also a paper-mill within the province, the type of mill being stipulated in the agreement. In this province about 7,972 square miles of forest land have been disposed of outright. Provincial forest reserves cover 19,607 square miles.

Quebec.—The Forest Service of the Department of Lands and Forests administers the timber lands in Quebec. Its powers include classification of land, disposal of timber and regulation of cutting operations. Forest protection has been since 1924 under a separate organization, the Forest Protective Service. Licences are granted after public competition and are renewable from year to year, subject to changes in royalty by the Government at any time. Grants of land in fee simple, made in some cases under the French *régime* in Quebec, are responsible for the private ownership of about 34,173 square miles of forest land. An area of 28,960 square miles has been reserved for forestry purposes.

New Brunswick.—The Forest Service, under the Department of Lands and Mines, and a special Forestry Advisory Commission are the forest authority in New Brunswick. The Forestry Advisory Commission, consisting of the Minister of Lands and Mines, the Deputy Minister, the Chief Forester, a lumberman representing the licensees of Crown lands, and one representing the private timberland owners is appointed to advise on matters of policy. At present timber lands are disposed of as in the other provinces, but in the past several grants of forest land were made to railway companies, private concerns and individuals, who now own in fee simple about 10,675 square miles of forest land.

Nova Scotia.—In Nova Scotia the greater part of the forest land, amounting to 12,000 square miles, has passed into private ownership, but the system of disposal of timber by licences to cut is now being followed. What remains vested in the Crown is administered by the Chief Forester under the Minister of Lands and Forests. Under the Minister, the Chief Forester has charge of forest protection, surveying and scaling throughout the province.

Subsection 2.—Forest Fire Protection.

The protection of forests from fire is undoubtedly the most urgent and most important part of the work of the different agencies administering forest lands in Canada. Except for the forests of the National Parks and the Northwest Territories and Yukon, which remain under Dominion control, the administration of forest lands is now the function of the individual provinces. Up to the end of the fire season of 1930, the Forest Service of the Department of the Interior was responsible for fire protection in the Prairie Provinces of Manitoba, Saskatchewan, and Alberta, and the Railway Belt of British Columbia. However, by reason of the transfer of natural resources from Dominion to provincial control, their administration is now a matter of provincial concern.

Each of the Provincial Governments, except that of Prince Edward Island, maintains a fire protection organization co-operating with owners and licensees for the protection of all timbered areas, the cost being in part distributed or covered by special taxes on timber lands. In each province, with the exception just mentioned, provincial legislation regulates the use of fire for clearing and other legitimate purposes, and provides for closed seasons during dangerous periods. An interesting development in this connection in the province of Quebec is the organization of a number of co-operative protective associations among lessees of timber limits. These associations have their own staffs which

co-operate with those of the Board of Railway Commissioners and the Provincial Government. The latter contributes money grants and also pays for the protection of vacant Crown lands lying within the area of the associations' activities.

In the matter of forest fire protection along railway lines, the provincial services are assisted by the Dominion Railway Act administered by the Board of Railway Commissioners. This Act gives to that body wide powers relating to fire protection along railway lines under its jurisdiction in Canada. Certain officers of the various forest authorities are appointed *ex officio* officers of the Board of Railway Commissioners. These officers co-operate with the railway fire-ranging staffs employed by the various railway companies, the compulsory control of all lines coming under the jurisdiction of the Board being one of the requirements of the Dominion Railway Act.

The most important single development of late years in forest fire protection has been the use of aircraft for the detection and suppression of incipient forest fires. Where lakes are numerous flying boats can be used for detection and for the transportation of fire fighters and their equipment to fires in remote areas. Where safe landing places are few and no other lookout system has been developed, as in northern Alberta, land machines are used for the detection and inspection of fire only; but in the Laurentian area, where lakes are numerous, flying boats are used both for observation and control. Specially developed aircraft equipped with wireless are employed on forest fire-protection operations; these enable the observer to report the location of the fire as soon as it has been detected. Aircraft are now being used extensively for exploring remote areas and mapping forest lands by means of aerial photography. Waste lands and the various forest types can be mapped more accurately and more economically by this means than by ground surveys. As a general rule aircraft are used in the more remote districts, while lookout towers, connected by telephone lines or equipped with wireless, are established in the more settled and more travelled forest areas. While these agencies have to a large extent supplanted the old canoe, horseback and foot patrol for detection of fires, a large ground staff with its equipment stored at strategic points will always be necessary for the fighting of larger fires and the maintenance of systems of communication and transportation, and of fire lanes and fire guards in the forest.

The most important improvement in forest fire-fighting equipment has been the portable gasoline pump. These pumps, which each weigh from 45 to a little over 100 pounds, can be carried to a fire by car, canoe, motor boat, automobile, aircraft, pack saddle or back pack. They can deliver efficient water pressure as far as seven thousand feet from a water supply and, when used in relays, at a much greater distance. Smaller hand pumps are also used effectively in many cases.

In addition to these improved measures, the enactment of legislation has tended to reduce the fire menace. The establishment of close seasons for brush burning, and seasons during which permits are required for setting out fires and for travel in the forest during dangerous dry periods, have been of enormous value as preventive measures.

Since its beginning in 1900, the Canadian Forestry Association has played an important part in securing popular co-operation in reducing the fire hazard. By means of its attractive magazine, which has a circulation of over 16,000, railway lecture cars and motor trucks provided with motion picture equipment, and by co-operation with radio broadcasting stations and the press, the Association reaches a large proportion of the population of the Dominion. Special efforts are made

through the schools, by specially appointed junior forest wardens and other means to educate the younger generation as to the value of the forests, the devastation caused by fire and the means of preventing such destruction.

Prepared lectures illustrated by slides and films are distributed to volunteer lecturers and other educational work is carried on in schools and at public meetings. The different Dominion and provincial forest authorities also carry on extensive publicity work independently and in co-operation with the Canadian Forestry Association.

Another interesting development in forest protection has been the establishment of special meteorological stations for the study of the effects of weather conditions on the fire hazard, and the broadcasting of special forecasts of hazardous fire weather.

Subsection 3.—Scientific Forestry.

Up to the present the practice of forestry in Canada has consisted chiefly in the administration and protection of existing forest areas. About 35 square miles is now being planted out annually, largely in connection with farmers' woodlots, shelter belts, and reclamation work, while several commercial reforestation projects are being carried on by paper companies and by the Ontario Government on denuded Crown lands. The great forestry problem in Canada, however, is the management of Crown forests, first under provisional and later more intensive working plans, so as to ensure a sustained yield. To this end, forest research activities are now assuming great importance. Silvicultural investigations are receiving marked attention both from the Dominion services and some of the provincial services.

About 200 technical foresters find employment either under the Dominion and provincial forest services or with paper and lumber companies. In addition to administrative work, these men carry on forest surveys either for the estimation of timber stands and making of maps, or to determine natural growth and reproduction conditions and factors. They also direct any planting or nursery work and direct the regulation of commercial logging operations along forestry lines.

The Research Division of the Dominion Forest Service has established permanent forest experiment stations at Petawawa, Ontario, and at Lake Edward, near Grand'Mère, in Quebec, and carries on similar experimental work at other points throughout Canada. A considerable amount of this work is done in co-operation with provincial forest services and with pulp and lumber companies.

The Forest Service of the Department of the Interior is now conducting a National Forest Inventory in co-operation with the various Provincial Governments (see p. 285). It is expected that, in so far as the commercially accessible timber is concerned, this inventory will be completed by 1935. An important feature is that the Forest Service is conducting special rate-of-growth surveys in each province to determine the nature and extent of the natural reproduction and the annual increment now being secured under varying conditions of site and type, following cutting or forest fires. The valuable silvical data thus obtained will provide a sound basis for future forest policies.

Another important phase of forest research is found in the work of the Dominion Forest Products Laboratories in determining the best methods of forest utilization, that is, the converting of standing timber into saleable commodities with a minimum

of waste. These Laboratories, established by the Dominion Forest Service at Ottawa and in connection with the University of British Columbia at Vancouver, carry on investigatory work in forest products, covering the strength, durability and other mechanical, physical and chemical qualities of Canadian woods, methods of seasoning, preservation from decay, and chemical utilization in wood distillation and other industries. A special pulp and paper division of the laboratories is located in Montreal, the recognized business centre of the industry, in the Cellulose Institute of the Canadian Pulp and Paper Association. The division is in close co-operation in this connection with the Association and with McGill University. Much credit is due to the forestry departments of some of the pulp companies for pioneering work in forest research.

Education in forestry and allied subjects and opportunities for research are offered by four Canadian universities and by other agencies. The University of Toronto, the University of New Brunswick and the University of British Columbia, provide four-year courses leading to a professional degree. The School of Forestry and Surveying in connection with Laval University at Quebec provides, in the French language, a combined course of four years' duration leading to diplomas in both sciences. The Government of Quebec has established a school in paper-making at Three Rivers in the heart of the paper industry; several agricultural colleges provide short courses in farm forestry and a school for forest rangers has been established at Berthierville by the Quebec Forest Service.

The practice of forestry by individuals and private concerns is encouraged by the furnishing of expert advice by Dominion and provincial services and by the distribution of tree-planting material. The Dominion Department of Agriculture maintains two nurseries in Saskatchewan, one at Indian Head and the other at Sutherland near Saskatoon. Over 7,000,000 trees are distributed annually to farmers and ranchers in the Prairie Provinces for planting woodlots and wind-breaks. If certain conditions are fulfilled, the material and instructions are provided free except for transportation charges. A total of over 120,000,000 trees has been distributed.

The province of Ontario provides material under similar conditions and distributes to woodlot owners at least 7,000,000 trees annually from its five nurseries. As many more are being provided for the creation of county forests, demonstration forests and plantations on denuded Crown lands. To encourage the establishment of communal forests by towns and other municipalities, the Provincial Government undertakes to plant free of charge any area purchased by the municipality for this purpose. The Government also assists counties that purchase areas of not less than 1,000 acres of land for forest purposes. As a result of these inducements there are at present scattered throughout the province 50 communal forests owned by municipalities and eight of the larger county forests. Farm land used for forestry purposes, while so used, is exempt from taxation up to 10 p.c. of the total farm area but not exceeding a total of 20 acres.

In Quebec, a forest nursery at Berthierville serves as a demonstration station for the School of Forestry and as a location for the forest ranger school. It provides trees for sale and distribution in the province, comprising seedlings and transplants for forest planting and larger trees for ornamental purposes. The capacity of the nursery is about 10,000,000 trees. Provision is made by legislation for the creation of communal forests and there are now 76 of these, covering 594,059 acres.

Section 6.—Forest Utilization.¹

Historical.—The forest has always played a large part in the life of the pioneer in Eastern Canada, providing him with building material and fuel but opposing his agricultural efforts. The material removed in clearing the first fields was usually more than sufficient for his needs, and in many cases what would now be considered valuable timber was burned by the early settler. Local trade in lumber began in New France shortly after 1650. The first attempts at forest conservation took the form of setting aside areas of timber for the use of the navy, and the first exports were of shipbuilding material and spars. Sawmills were established along the St. Lawrence before the close of the seventeenth century. While there was no recorded transatlantic trade in forest products other than naval supplies, shipments of lumber and staves were made to the French West Indies during the French *régime*. Shipbuilding became an important local industry and gave rise to considerable forest exploitation.

Transatlantic trade began to develop after the Conquest, stimulated by bounties and tariff privileges granted with the object of reducing England's dependence on Baltic supplies, especially in connection with naval material. This trade, however, did not develop satisfactorily until the beginning of the nineteenth century, when Napoleon succeeded in interfering seriously with British imports of wood from the Baltic. The export of timber from Canada increased enormously, and the square timber trade in white pine and oak spread from the St. Lawrence and Richelieu valleys to lake Champlain and Upper Canada, especially the Ottawa valley. This trade reached its height in the '60's and has steadily declined since that time.

Sawmilling on a large scale followed the square timber trade and the establishment of small custom mills followed in the wake of the settler. The building of wooden ships in the St. Lawrence valley and the Maritime Provinces developed hand in hand with the lumber industry, providing a local demand for timber and a means of exporting it overseas. The British preferences were reduced and finally abolished about 1860.

The export trade in sawn lumber to the United States developed from 1820 to 1830 and gradually replaced the more wasteful overseas square timber trade, but it was not until after Confederation that the export of sawn lumber by sea exceeded that of square timber.

Encouraged by the free entry of raw materials into the United States, an important trade developed, especially in Ontario, in the exportation of saw logs to be sawn into lumber in United States mills. The Provincial Government prohibited the exportation of this material, when cut on Crown lands, about 1900 and effectively checked this economic loss. Similar legislation has since been passed by the Dominion and the other Provincial Governments and has been extended to pulp-wood and other raw or unmanufactured forest products.

The lumber industry which began in Quebec and New Brunswick and extended into Upper Canada has since moved gradually through "Old" Ontario, along the Upper Ottawa and its tributaries, around Georgian bay into "New" or northern Ontario and through the Lake of the Woods and Rainy River districts. It is still an important industry in these regions. Lumbering to the north of the prairies, where the timber was never particularly large nor abundant, has progressed with the settlement of the district but the production does not usually exceed the local demand. In 1908 British Columbia provided less than a fifth of Canada's lumber

¹ An article on "The History of the Canadian Lumber Trade", by A. R. M. Lower, M.A., appears at pp. 318-323 of the 1925 edition of the Canada Year Book.

production but in 1931 this proportion had increased to 54 p.c., showing the rapid westward movement of the centre of production. British Columbia has added several new tree species to the lumber market and at present possesses the heaviest stands and the largest individual trees in Canada.

Remarkable developments in the manufacture of pulp and paper in the twentieth century have led to a remarkable increase of forest exploitation in Eastern Canada, giving rise to an industry which has already surpassed the manufacture of lumber and is to-day the most important manufacturing industry in Canada and the source of the greatest single item in our exports next to wheat.

Subsection 1.—Woods Operations.

Differences in forest conditions throughout Canada give rise to differences in logging methods. Generally speaking, throughout Eastern Canada the climate is such that the cutting and hauling of logs can be carried on most economically during the fall and winter months. The trees are felled and the logs hauled to the nearest stream or lake, where they are piled on the ice or sloping banks. The presence of connected systems of lakes and streams makes it possible in most cases to float the logs from the forest to the mill at a minimum cost during the annual spring freshets. The logging industry east of the Rocky mountains is therefore almost entirely seasonal. In many cases lumbermen co-operate in river-driving operations and improvement companies, financed by the logging operators, build river improvements to facilitate the passage of the floating logs, the logs being finally sorted and delivered to their respective owners. In British Columbia the scarcity of drivable streams and the greater average size of the logs give rise to entirely different logging methods. Logs are assembled by cable systems operated by donkey engines and are transported to the mills or to water chiefly by logging railways and in some cases by motor trucks. These operations are more or less independent of frost, snow or freshet and are carried on in most cases throughout the entire year.

In Eastern Canada logging operations are usually carried on by the mill owners or licensees of timbered lands, often through the medium of contractors, sub-contractors and jobbers. In the better settled parts of the country a considerable quantity of lumber is sawn by custom sawmills or small mills purchasing logs from the farmers. Unmanufactured pulpwood, poles, ties and other forest products have a market value, but saw-logs, being as a rule the property of the mill-owner, are not generally marketed as such in Eastern Canada. In British Columbia logging is carried on more frequently as a separate enterprise by limit-holders, who cut and sell logs on the market. In many cases mill operators are not limit-holders but buy their entire supply of raw material from logging concerns.

In connection with operations in the woods it should be borne in mind that the forests not only provide the raw material for the sawmills, pulp-mills, wood distillation, charcoal, excelsior and other plants but that they also provide logs, pulpwood and bolts for export in the unmanufactured state, and fuel, poles, railway ties, posts and fence rails, mining timber, piling and other primary products, which are finished in the woods ready for use or exportation. There are also a number of minor forest products, such as maple sugar and syrup, balsam gum, resin, cascara, moss and tanbark, which all go to swell the total.

Table 2 gives the total value of the products of woods operations in Canada for the years 1926 to 1930 inclusive. The imports and exports of forest products in the fiscal years ended Mar. 31, 1929-32, are shown in Tables 12 and 13 of the chapter on External Trade.

¹The value of woods operations for 1931, made available at the time of going to press, is \$141,123,930.

It has been estimated that operations in the woods in Canada in 1930 involved the investment of \$246,000,000 in logging equipment, gave employment for a part of the year to 90,000 men and distributed over \$67,000,000 in wages and salaries. In estimating the annual drain on our forest resources, certain converting factors have been used. Each of these factors represents in cubic feet the quantity of standing timber that must be cut in the forest to produce one unit of the material in question, based on the total cubic contents of the tree. By the use of these factors it has been estimated that the total drain on our forest resources in 1930 due to consumption for use amounted to 3,056,930,373 cubic feet. To this total must be added the volume of material destroyed by fire, insects and fungi, which would bring the average annual depletion for the period 1926-30 to approximately 3,970,000,000 cubic feet of standing timber—as compared to 4,408,000,000 cubic feet for the period 1922-26 and 4,740,000,000 cubic feet for 1917-21. Table 3 gives the reported or estimated quantity of wood cut, by chief products, together with the respective converting factors, the equivalent in standing timber and the estimated value in each case for 1930. Table 4 shows the extent of the drain on our forest resources in 1929 and 1930, by provinces.

The following statement summarizes the quantities and values, in the calendar year 1930, of the main products of the woods which are sold without further manufacture and of the two principal industries utilizing the forest resources, and shows the value of the forests as a source of wealth. It is estimated that in the further manufacture of wood and paper into such products as sash, doors, furniture, caskets and paper goods, at least \$75,000,000 is added to the value of these products.

Subsection 2.—The Pulp and Paper Industry.

The manufacture of pulp and paper is a comparatively recent development in Canadian industry. Paper was first manufactured in Canada about a hundred years ago but prior to 1860 no wood-pulp was used or produced. Rags, straw, esparto grass, cotton waste and other substances were the raw materials used. The first paper-mill was established at St. Andrews in Quebec (then Lower Canada) in 1803 by a party of Americans who obtained concessions from the seigneurs. Upper Canada's first mill, which is still in operation, was built in 1813 at Crook's Hollow (now Greensville) near Hamilton, and the Maritime Provinces entered the industry in 1819 with a mill at Bedford Basin near Halifax.

In 1866, Alexander Buntin installed at Valleyfield, Quebec, what is claimed to have been the first wood grinder in America and began the manufacture of wood-pulp by the mechanical process. During the same year Angus Logan and Co. built the first chemical wood-pulp mill in Canada at Windsor Mills in Quebec. During the next decade the use of wood-pulp in paper-making was extensively developed and in 1887 Charles Riordon installed the first sulphite mill in Canada at Merritton in the Niagara Peninsula; by the beginning of the century the output of the industry had exceeded \$8,000,000. In 1907 the Brompton Pulp and Paper Co. built, at East Angus in Quebec, the first mill in America to manufacture chemical pulp by the sulphate or kraft process.

The gross output of the industry increased rapidly and steadily until the boom years following the Great War, when it jumped to a peak of over \$232,000,000 in 1920. This was followed by a drop in 1921, following which there was a steady recovery, resulting in a total for 1929 of \$243,970,761 exceeding the abnormally high total value reported in 1920. There was a decrease of 11.6 p.c. in 1930 and of 19 p.c. in 1931.

The rapid development of this industry was due chiefly to the existence in Canada of abundant water powers adjacent to extensive forest resources of pulp-wood species. Summary statistics for the combined pulp and paper industry are given on p. 304.

There are to-day three classes of mills in the industry. These in 1931 numbered 32 mills making pulp only, 43 combined pulp and paper-mills, and 28 mills making paper only. The present tendency is toward the merging of individual companies into a comparatively small number of large groups.

The industry in Canada includes three forms of industrial activity, the operations in the woods with pulpwood as a product, the manufacture of pulp and the manufacture of paper. These three stages cannot be treated as entirely distinct nor can they be separated from the different stages of the lumber industry. Some of the important pulp companies operate sawmills to utilize the larger timber on their limits to the best advantage, and many lumber manufacturers divert a proportion of their spruce and balsam logs to pulp-mills. So far as operations in the woods are concerned, it is often impossible to state whether the timber being cut will eventually be made into lumber or into pulpwood.

On account of legislation already referred to, pulpwood cut on Crown lands must, in every province, be manufactured into pulp in Canadian pulp-mills. The pulpwood which is exported to the United States is cut from private lands. Table 5 shows the annual production of this commodity from 1920 to 1931, together with the quantities used by Canadian pulp-mills and the quantities exported. For figures for the years 1908 to 1919 inclusive, see the 1931 Year Book, p. 288.

¹Exports of pulpwood in the calendar year 1932 were 529,019 cords.

In 1908 almost two-thirds of the pulpwood cut in Canada was exported in the raw or unmanufactured form but by 1916 the proportion had declined to two-fifths. In 1931 the proportion exported was less than a fifth.

The manufacture of pulp is the second stage in this industry. This is carried on by mills producing pulp alone and also by paper manufacturers operating pulp-mills in conjunction with paper-mills to provide their own raw material. Such mills usually manufacture a surplus of pulp for sale in Canada or for export.

The supply of rags for paper-making is distinctly limited and the material too expensive for the manufacture of cheap paper. Early paper-makers experimented with fibres from the stems, leaves and other parts of numerous annual plants, but the small proportion of paper-making material recoverable from such sources led to experiments in the use of wood. Different species were tried, and finally spruce and balsam fir were found to be the most suitable for the production of all but the best classes of paper.

The preliminary preparation of pulpwood is frequently carried on at the pulp-mill, but there are in Canada a number of "cutting-up" and "rossing" mills operating on an independent basis, chiefly for the purpose of saving freight on material cut at a distance from the mill or on material intended for exportation. Pulpwood is measured by the cord (4' by 4' by 8' of piled material), which is approximately equivalent to 500 feet board measure or to 90 cubic feet of solid wood.

There are in Canada four methods of preparing wood-pulp, one of which is mechanical and three chemical. Detailed descriptions of these processes were given in the 1931 Year Book, pp. 290-1.

Pulp Production.—Table 6 shows the total production of pulp in Canada from 1920 to 1931 inclusive, together with the production of groundwood pulp and the production of fibre by the chemical processes described. Comparable statistics for 1908 to 1919 inclusive appear at p. 293 of the 1931 Year Book.

1931.....	3,167,960	84,780,809	2,016,480	37,096,768	1,151,480	47,684,041

¹ These totals include some unspecified pulp and screenings.

The growth of this industry was steady up to 1920, when 1,960,102 tons of pulp were produced. There was a drop in production in 1921, but production in 1922 more than overtook the previous year's drop. Since then, with the exception of 1924, each year up to 1929 showed consistent growth in the annual production, 1929 creating a record for the industry with a production of 4,021,229 tons. The 1931 figure of 3,167,960 tons marks a decrease of 12 p.c. from 1930.

During 1931 there were 32 mills manufacturing pulp only and 43 combined pulp and paper-mills. These 75 establishments turned out 3,167,960 tons of pulp, valued at \$84,780,809, as compared with 3,619,345 tons of pulp, valued at \$112,355,872 in 1930. Of the 1931 total for pulp 2,423,300 tons, valued at \$54,004,119, were made in the combined pulp and paper-mills for their own use in manufacturing paper. Of the remainder, 94,172 tons, valued at \$3,864,000, were made for sale in Canada, while 650,488 tons, valued at \$26,912,690, were made for export. As in the case of pulpwood, a part of the product at this stage of the industry provides raw material for the later stages, while the remainder has a definite market value as pulp.

Over 63 p.c. of the production in 1931 was groundwood pulp and over 20 p.c. unbleached sulphite fibre, these two being the principal components of newsprint paper. Bleached sulphite, sulphate and soda fibre made up the remainder, with screenings, for which a considerable market has developed in recent years in connection with the manufacture of rigid insulating boards. Table 7 shows the production of pulp by provinces in the last six years.

¹ Includes production in British Columbia, Manitoba, New Brunswick and Nova Scotia.

Pulp Exportation.—The following table gives the quantities of pulp exported by the principal pulp-producing countries of the world in 1931. Figures for 1913, the year immediately preceding the War, and for 1930 are shown for comparison. Figures of the exports of wood-pulp from Canada in the fiscal years ended Mar. 31, 1929-32, will be found in Table 12 of the chapter on External Trade. In the calendar year 1932 the exports of wood-pulp from Canada were 452,293 tons.

The total exports of the eleven principal pulp-exporting countries of the world in 1931 were 5,058,446 short tons, of which Canada contributed about 12 p.c.

Paper Production.—The paper-making stage of the industry involves the consumption of wood-pulp and other paper stock in the manufacture of paper and other pulp products. Accurate annual statistics for this part of the industry are available only for the years 1917 to 1931 inclusive. These are given in Table 9.

During 1931 there were 43 combined pulp and paper-mills and 28 mills making paper only. These 71 establishments produced 2,611,225 tons of paper, together with certain miscellaneous pulp products, with a total value of \$143,957,264, as compared to 2,926,787 tons, valued at \$173,626,383 in 1930. Newsprint paper forms about 85 p.c. of the annual paper production in Canada. In 1931, the production of newsprint paper was 2,227,052 tons, valued at \$111,419,637, reaffirming Canada in the position of largest producer of newsprint in the world. The preliminary estimate for 1932 is 1,907,566 tons.

Newsprint made up about 85 p.c. of the total paper production in 1931, with nearly 8 p.c. of paper boards, 3 p.c. of wrapping paper, over 2.3 p.c. of book and writing paper and nearly 1.7 p.c. of other miscellaneous papers.

10.—Production of Paper in Canada, by Provinces, 1931.

Province.	Quantity.	Value.
	tons.	\$
Quebec	1,275,105	71,855,954
Ontario	792,011	45,535,894
British Columbia	244,397	12,182,112
Nova Scotia, New Brunswick and Manitoba	299,712	14,853,304
Totals	2,611,225	143,957,264

Quebec produced 49 p.c. of the total quantity, Ontario 30 p.c., British Columbia 9 p.c. and Nova Scotia, New Brunswick and Manitoba the remainder.

World Production of Newsprint.—The world production of newsprint in 1931 has been estimated at 6,622,000 short tons, of which North America supplied over 55 p.c. and Canada alone over a third. The estimated production in the leading 23 countries, compared with 1930, and the five-year average 1927-31, was as follows:—

11.—Estimated Quantities of Newsprint Produced in 23 Leading Countries, 1939 and 1931, and the Five-Year Averages, 1927-31.

Exportation of Newsprint Paper.—In the fiscal year 1908, exports of printing paper were for the first time separately recorded, and valued at \$2,833,535. In the fiscal year 1913, when quantities were first shown, Canada exported 256,661 short tons valued at \$9,980,378. In 1931 our exports of newsprint amounted to 2,008,241 tons valued at \$107,233,112 and ranked second only to wheat among the exports of the Dominion. For exports of newsprint and other paper in the fiscal years ended Mar. 31, 1929-32, see Table 12 of the chapter on External Trade.

As early as 1913 Canada led the world in the exportation of newsprint, and since that date her exports have increased almost eight-fold in quantity. The following table shows the exportation of newsprint from the 13 principal exporting countries in 1913, 1929, 1930 and 1931. Canada contributed to the total over 61 p.c. or more than all the other 12 countries combined in 1931. Canada's exports of newsprint paper for the calendar year 1932 were 1,276,764 tons.

Statistics of the Combined Pulp and Paper Industries.—While the manufacture of pulp and that of paper are properly two industries, the existence of combined pulp and paper-mills makes it impossible to separate many of their statistics. Considering the manufacturing part of the industry as a whole, there were altogether 103 mills in operation in 1931 and 109 in 1930. The capital invested in 1931 amounted to \$630,176,540, the employees numbered 26,669 and their salaries and wages amounted to \$34,792,113. If we disregard pulp made "for own use" in combined pulp and paper-mills, the total value of the raw materials used in the industry as a whole amounted to \$63,947,678 and the gross value of production to \$174,733,954. The difference between these two, or the net value of production, represents the value added by manufacture and amounted in 1931 to \$110,786,276. The pulp and paper industry, now the leading single manufacturing industry in Canada, has been first in wages and salaries paid since 1922, when it first exceeded the sawmills. It has been the leading industry in gross value of production since 1925, when it replaced the flour mills, and also first in net value of production since 1920, when it outstripped the sawmills in this respect. Only the manufacturing stages of the industry are considered in these comparisons, no allowance being made for capital invested, men employed, wages paid nor primary products sold in connection with the woods operations which form such an important part of the industry as

a whole but cannot be separated from woods operations carried on in connection with sawmills and other industries. If the \$9,359,592 worth of exported pulpwood be taken into consideration, the gross total contribution of the pulp and paper industry toward a favourable trade balance for Canada in 1931 amounted to \$139,844,299, representing the difference between exports and imports of pulpwood, pulp, paper and paper products.

The United States market absorbs annually all of Canada's pulpwood exports, about 79 p.c. of her pulp and 85 p.c. of her paper shipments. The remainder goes to the United Kingdom and other widely distributed overseas markets. About half of the paper consumed in the United States is either of Canadian manufacture or is made from wood or wood-pulp imported from Canada.

Subsection 3.—The Lumber Industry.

The manufacture of lumber, lath, shingles and other products of the sawmill is the second most important industry in Canada depending on the forest for its raw materials. Annual statistics covering this and other forest industries were collected and published by the Forest Service of the Department of the Interior from 1908 to 1916, since when the work has been carried on by the Dominion Bureau of Statistics, in co-operation with the Forest Service.

The production of sawn lumber in Canada in 1920 reached a total of over four billion feet board measure, the highest cut recorded since 1912. Owing to the subsequent depression the production of lumber in 1921 decreased by over a third and the average value by over \$10 a thousand feet. Since that year there have been annual increases in cut for Canada as a whole except in 1927, 1930 and 1931. British Columbia now produces over half the total. Table 13 gives the production of lumber, lath and shingles in each year from 1920 to 1931; comparable figures for 1908 to 1919 inclusive are given at p. 300 of the 1931 Year Book.

13.—Quantities and Values of Lumber, Lath and Shingles Produced in Canada, calendar years 1920-31.

Year.	Lumber Cut.		Shingles Cut.		Lath Cut.	
	Quantity.	Value.	Quantity.	Value.	Quantity.	Value.

1929	4,741,941	113,349,886	2,707,235	9,423,363	835,799	2,860,799
1930	3,980,421	87,710,957	1,914,836	5,388,837	398,254	1,154,593
1931	2,497,553	46,136,340	1,453,277	3,331,229	228,060	576,060

The total number of sawmills, tie, shingle, lath, veneer, stave, heading and hoop mills, and mills for cutting-up and barking or rossing of pulpwood operating in 1931 was 3,562, as compared with 3,531 in 1930. The capital invested in these mills in 1931 was \$121,336,176, the employees numbered 22,361 and their wages and salaries amounted to \$16,409,674. The logs, bolts and other raw materials of the industry were valued at \$37,379,034 and the gross value of production was \$62,927,750. The net production, or the value added by manufacture, in 1931 was \$25,548,716.

The production of sawn lumber decreased in quantity from 1930 to 1931 by 37.4 p.c. Lath production decreased by 42.7 p.c., and shingle production by 24.1 p.c. Decreases were reported in the production of all but a few of the minor products. The total gross value of production decreased from \$121,142,985 in 1930 to \$62,927,750 in 1931; for production by provinces for the latter year see Table 14.

14.—Quantity and Value of Lumber and Value of Other Sawmill Products Made in Canada, by Provinces, 1931.

Province.	Lumber Production.		Other Sawmill Products.	Total.
	Quantity.	Value.	Value.	Value.
	M ft. b.m.	\$	\$	\$
Prince Edward Island.....	4,532	101,177	14,287	115,464

British Columbia.....	1,342,164	20,721,143	6,268,844	26,989,987
Totals.....	2,497,553	46,136,340	16,791,410	62,927,750

British Columbia comes first in total production, contributing 53.7 p.c. of the total cut in lumber and 80.1 p.c. of the shingles. Quebec comes second in total production, Ontario third and New Brunswick fourth. Douglas fir was the most important kind of lumber sawn, being produced almost entirely in British Columbia. Spruce is sawn in every province and comes second, with white pine, hemlock and yellow birch next in order of importance. Cedar is the most important shingle wood sawn. The conifers usually form about 95 p.c. of the total cut of all kinds of wood in this industry, only 5 p.c. being deciduous-leaved trees or hardwoods.

Lumber Exportation.—The square timber trade reached its maximum development in the '60's, thereafter declined gradually and has now almost entirely disappeared. Simultaneously with its decline came the increased exportation of deals and other sawn lumber, first to Great Britain and later to the United States. Our trade with the latter country has been from the first largely confined to planks, boards and dimension stock. During the American Civil War our exports of forest products of all kinds to the United States for the first time exceeded those to Great Britain, but in late years this has become invariable. The total quantity of sawn lumber exported from Canada changed little during the first 30 years of the century, averaging about two billion feet board measure per annum. The exports in 1931 amounted to 937,733 feet board measure, valued at \$20,116,020, of which the United States took the greater part. The exports of lumber, lath and shingles decreased in 1931 as compared with 1930.

Subsection 4.—Summary of Primary Forest Production.

For the purpose of comparing primary industries such as agriculture, fishing, forestry and mining, forestry production is here understood to consist of the total value of the products of woods operations, together with the value added by manufacture in sawmills and pulp-mills, but not in paper-mills. Forestry production

under this system of classification, amounted to \$303,145,169 in 1930 or about 20 p.c. of the total primary production for the Dominion, which was estimated at \$1,525,528,806. Forest production, therefore, stood in second place in this respect, being exceeded by agriculture with \$758,791,743 or 50 p.c. and followed by mining, with \$279,873,578 or 18 p.c.

Subsection 5.—Other Forest Industries.

Sawmills and pulp-mills draw their raw material directly from the forest in the form of logs and pulpwood, and produce sawn lumber, other sawmill products and pulp and paper. There are also a number of important industries which use these products as raw material for further manufacture. Some of them produce commodities made almost entirely of wood, wood-pulp or paper, others manufacture articles in which wood is the most important component, and others produce articles in which wood is necessary but forms only a small proportion of the value. There are, in addition, a number of industries which use wood indirectly in the manufacture of articles which do not contain wood as a component part. The first class includes the manufacture of paper, sash, doors and other millwork and planing-mill products; boxes, baskets, cooperage and other containers; canoes, boats and small vessels; kitchen, bakers' and dairy woodenware; wooden pumps, piping, tanks and silos; spools, handles, dowels and turnery. The second class includes the manufacture of furniture, vehicles and vehicle supplies, coffins and caskets, etc., and the use of paper in printing and the manufacture of paper boxes, bags, stationery and paper goods. The third class, where wood has a secondary importance, includes the manufacture of agricultural implements, railway rolling stock, musical instruments, brooms and brushes, etc. The fourth class can be said to include practically every form of industrial activity, as few, if any, of these are entirely independent of the use of wood, directly or indirectly.

Subsection 6.—Manufactures of Wood and Paper.

A classification based on the chief component material in the products of each manufacturing establishment is now largely used in comparing manufacturing industries and for external trade purposes. Under this system most of the forest industries fall in the wood and paper group. In 1931 the gross value of production for all classes of manufactured products amounted to \$2,698,461,862 of which total the wood and paper group contributed \$484,237,930 or nearly 18 p.c. It was exceeded in this respect by the vegetable products with nearly 20 p.c. Of the ten groups of the industrial census the wood and paper group, which includes the manufacture of lumber, pulp and paper as well as the wood- and paper-using industries, was highest in number of establishments with 7,767, in capital invested with \$1,053,064,435 in total number of employees with 121,672, and in salary and wage distribution with \$140,349,106.

In few industries did manufacture add, in 1931, a higher percentage to the raw material used than in the wood- and paper-using industries; in the manufacture of pulp and paper this percentage is 173 and in the lumber industry, 68. By the manufacture of lumber into planing-mill products its value is increased by 91 p.c. For the wood and paper group as a whole the net value of production, or the value added by manufacture, in 1931 was \$291,858,015, or 152 p.c. of the value of raw materials used. In respect also of the net value of production the wood and paper group of industries surpasses any other group of manufactures. Further details are given in the Manufactures chapter of the present volume.

The forests of Canada contribute an important part to her export trade. During the fiscal year ended Mar. 31, 1932, exports of forest origin amounted to \$175,740,269 and made up 30.4 p.c. of the total value of exports for the period, amounting to \$576,344,302. Exports of forest origin were exceeded only by those of farm origin, which made up 35.4 p.c. of the total and were followed by products of mineral origin with 17 p.c. Forest products are also prominent among the individual items of exportation. Newsprint paper is second only to wheat on the list, with wood pulp third and sawn lumber sixth. The gross contribution of the forest toward a favourable trade balance for Canada amounted to \$144,054,459 during the same period, exceeding all other groups in this respect.

Subsection 7.—Forest Depletion and Increment.

Fire Losses.—No accurate summing up of forest fire losses in Canada's forests has ever been made, but it has been estimated that 60 p.c. of the original forest has been burned, 13 p.c. has been cut for use and 27 p.c. remains. Though the loss of merchantable timber has been greatly reduced in recent years by forest protective services and the education of the public, it still constitutes a serious drain on our resources. At a low estimate fire destroys annually about 230,000,000 cubic feet of merchantable timber and the young growth on 550,000 acres.

Since the historic Miramichi fire, which burned along the valley of the Miramichi river in New Brunswick in 1825, there have been a number of disastrous forest fires. About 1845 vast areas, west of lake Superior, were burned over. Some years later a very extensive fire burned along the height of land from lake Timiskaming to Michipicoten. In 1871 a fierce fire swept over more than 2,000 square miles of forest from lake Nipissing westward along the north shore of Georgian bay. About the same time the greater part of the Saguenay and Lake St. John district, in Quebec, was swept by one of the most destructive fires on record. Two other fires in 1891 and 1896 devastated more than 2,000 square miles of country in the southern Algoma district; in Quebec, the country along the line of the Quebec and Lake St. John Railway also suffered by a number of disastrous forest fires about this time.

During more recent times a series of disastrous fires swept over northern Ontario. A number of isolated fires around the mining camp of Porcupine culminated, on July 11, 1911, in a conflagration which resulted in the loss of 72 lives and property damage estimated at \$3,000,000. In 1916, fires in the same general region were responsible for the deaths of at least 224 people. In 1922 a third fire destroyed the town of Haileybury and other centres. In 1908, a fire originating in the forest around Fernie, B.C., destroyed that city. Every year thousands of acres are devastated by fires of less individual importance, which in the aggregate are rapidly depleting our forest resources. In 1923 there were unusually disastrous fires, chiefly in Eastern Canada. A total area of over 6,000,000 acres was burned over with a loss of approximately \$46,000,000.

Speaking generally, there are annually two periods in Canada when the forest fire hazard is highest—in the spring, after the disappearance of the snow, when the forest floor is dry and the green underbrush has not yet developed, and again in the fall when the herbaceous growth is dead and the ground covered with dry leaves.

Statistics compiled by the Dominion Forest Service from reports received from the various provincial and private forest protective organizations, show that during the last ten years—from 1922 to 1931—86.5 p.c. of all fires reported were due to

human agencies and were therefore preventable. The remainder were attributed to lightning. Campers, settlers and railways are responsible for most of the fires whose origin is determined. Other causes, including lumbering operations, lightning and incendiarism, account for smaller proportions.

Losses through Insects and Fungi.—From 1912 to 1923 the spruce bud-worm caused tremendous damage to the spruce and balsam fir forests in Eastern Canada. In Quebec it was estimated that 100 million cords of pulpwood were destroyed by this insect, and in New Brunswick the loss was placed at 15 million cords. In this region the active stage of the infestation is now practically over, but the insect is causing damage in northern Ontario and Cape Breton island. Other insects, though not as destructive as this one, entail a heavy drain on the forest. The hemlock looper and a new species closely related to the spruce bud-worm are causing considerable damage in eastern coniferous forests. During the last few years dusting by aeroplane has been developed on a practical basis by the Entomological Branch of the Department of Agriculture and promises to be effective in the control of defoliating insects. The loss caused by the various forms of rot and other fungous diseases is probably not less than that caused by insects under normal conditions. The butt rot is especially prevalent in balsam fir, and the value of the hardwoods is also greatly decreased by rot.

Summary of Losses and Increment.—The annual consumption of standing timber for use amounts to about 2,970,000,000 cubic feet. During the last few years fire has destroyed annually about 230,000,000 cubic feet of merchantable timber and the young growth of various ages on 550,000 acres. The destruction occasioned by insects, fungi and windfall is not known, but is estimated at 700,000,000 cubic feet per annum. It may be safely estimated that the forests of Canada are being depleted at the rate of upwards of 3,900,000,000 cubic feet per annum. With about 600,000 square miles of accessible timber in a growing condition, an average annual increment of 10 to 11 cubic feet per acre would be quite possible under forest management and would cover this depletion. In view of the destruction of young growth which occurs and the deterioration of the forests and the soil, caused by repeated fires, there is little hope that this increment is being produced at the present time throughout Canada, although particular areas are producing greatly in excess of this quantity. Extensive reproduction and rate of growth surveys being conducted by the Dominion Forest Service indicate that the increment is greater than previously estimated.

CHAPTER X.—THE FUR TRADE.¹

Historical Sketch.—The place which the fur trade held during the French régime in Canada, when for a century and a half it was at once the mainspring of discovery and development and the curse of settled industry, is familiar history. Later, the Hudson's Bay Company may be said with truth to have held the West until the Dominion had grown to absorb it, bequeathing to the civilization which followed a native race accustomed to the white man and an example of organization and discipline that was of lasting value. The salient facts in the story are given in the following paragraphs.

From the earliest times the Basque and Breton fishermen from the "Banks" had traded for furs. As the French court demanded more and more furs, adventurers came for the fur trade exclusively. Pont-Gravé and Chauvin built Tadoussac in 1599 as a centre for this trade with the Indians of the Saguenay and, when trade routes were discovered farther inland, the founding of Quebec and Montreal followed. The French Government from the first granted monopolies of the fur trade, always on the condition that the company should bring to Canada a stated number of settlers. But settlement and the fur trade could never go together—settlement, by driving fur-bearing animals farther afield, made trade increasingly expensive, and the great profits of the fur trade, together with its freedom and romance, took the more adventurous from the rational pursuits of settlers. Trade spread west and south by the river routes, convoys bringing the furs yearly to Montreal and Quebec. The de Caen Company, in the seventeenth century, sent yearly to France from 15,000 to 20,000 pelts. "Beaver" was made the Canadian currency.

In the meantime, English navigators had been seeking a Northwest Passage to the Orient. By 1632 their efforts came to an end with little practical result. Hudson bay, however, had been accurately charted, so that when the first English fur-trading ships came some 30 years later, they sailed by charted routes to a safe harbour. The first expedition came at the instigation of Radisson and Groseilliers, two French *coureurs des bois* who had travelled in the rich fur country north of lake Superior. They had sought aid in France but, being repulsed, turned to England. The charter of the "Adventurers of England trading into Hudson's Bay" was obtained in 1670 by Prince Rupert, uncle of Charles II, who became first Governor of the company (whence the name Rupert's Land). During the struggle with the French, beginning about 1685, no dividends were paid but with the English victory the company resumed payments. Forts were built on Hudson bay and James bay at the mouths of rivers; the company, as monopolist, waited for the furs to be brought to its posts.

With the Seven Years' War, the fur trade from the south passed out of the hands of the French, and until 1771 the English were busy re-discovering the old French routes to the West. A period of open competition followed. The discoverer of a new fur district was soon followed by competitors who undersold him and were undersold by him until some or all were ruined and left for new fields. The Northwest Company, founded in 1783-4, was a result of such competition. No capital was deposited, but each party supplied a proportion of the articles needed for trade. The Northwest Company pursued a vigorous policy, founding posts to control all the best fur districts. The Hudson's Bay Company felt the keenness of the competition, and was forced to abandon its ancient policy of waiting for furs to be brought to the bay. By 1816 the rivals had absorbed or ruined

¹Revised by Miss F. A. Brown, Chief of the Fur Statistics Branch, Dominion Bureau of Statistics. This Branch publishes a detailed Annual Report on the Production of Raw Furs (Wild Life), obtainable from the Dominion Statistician.

eleven other partnerships and were themselves on the verge of ruin. Finally, in 1821, the two were joined under the name of the older company. The Northwest Company brought with it the control of the Pacific and Arctic watersheds, to be added to the lands draining into Hudson bay, and over the whole region the Hudson's Bay Company secured legal recognition of its monopoly of the fur trade. There followed 40 years of great prosperity. The company's rights of exclusive trading in Indian territory expired in 1859, and ten years later it surrendered its other privileges. In return, Canada granted £300,000 to the company, as well as lands about its trading posts, and one-twentieth of the land in the fertile belt between the North Saskatchewan river and the International Boundary. The Hudson's Bay Company thereupon became a trading company, with no extraordinary privileges.

The Modern Industry.—Great changes have come over the fur trade in recent years. The railway has revolutionized conditions wherever its influence reaches. Vessels now ply the larger lakes and rivers and the aeroplane is frequently used in transporting furs from the more inaccessible districts. Competition has increased and new territory is eagerly sought as in the days prior to 1821. Increase in trapping and improved methods of capture, together with the advance of lumbering, mining and agricultural settlement, have driven fur-bearing animals farther and farther afield, and to conserve the fur resources of the country the Provinces have found it necessary to enact laws to regulate the capture of fur-bearing animals and to provide for close seasons during certain periods of each year. The fur trade has assisted in meeting the demand for furs by popularizing common and previously despised furs and by encouraging the use of the furs of domestic animals. Fur farming is playing an increasingly important part in the fur trade of Canada, the value of pelts of ranch-bred animals now representing about 26 p.c. of the total annual value of the raw fur production of the Dominion. The fox has proved the best suited for domestication, although other kinds of fur-bearers are being successfully raised in captivity—mink, raccoon, skunk, marten, fisher, muskrat and beaver. The successful breeding of the fox on fur farms came in the period of rising prices after 1890 and the introduction of woven wire fencing. About the middle of the last century Persian lamb, astrachan and broadtail, the product of the Karakul sheep, a native of Bokhara, Central Asia, came into general use. A few of these sheep were imported into Canada some years ago, but the industry as a source of supply for pelts has not shown progress in this country. Experiments in the breeding of rabbits for their fur have resulted in the production of several valuable kinds, chief among which are the Chinchilla rabbit, whose fur resembles that of the Bolivian Chinchilla, and the castorrex¹, named on account of the likeness of its fur to that of the beaver.

The important markets for Canadian furs are London and New York: the trade figures for the twelve months ended June 30, 1932, show that of the total of \$11,495,086 worth of raw furs exported, the United Kingdom received \$6,316,529 and the United States, \$3,908,773. At the close of the Great War Montreal took a position as an international fur market, holding the first Canadian fur auction sale in 1920 when 949,565 pelts, valued at \$5,057,114, were sold. The most recent figures show that at the auction sales held in Montreal during 1931 there were 1,381,130 pelts disposed of, with a total value of \$4,731,648. Sales are also held at Winnipeg and Edmonton. An important industry in Canada in connection with the fur trade is that of the dressing and dyeing of furs. In 1931 the number of fur skins treated in Canadian plants was 7,034,498 and the amount received for the work, \$1,571,740. The plants in operation numbered 10.

¹ Castor is the French word for beaver.

Exports.—Though the bison is gone forever and the beaver and the marten are slowly following, the fur trade of Canada is in no immediate danger of extinction. A century ago the value of the export trade in furs exceeded that of any other product. This has been greatly changed, yet the total output has not declined and Canada may be described as one of the great fur preserves of the world. In 1667 exports of furs to France and the West Indies were valued at 550,000 francs. In 1850, the first year for which trade tables of the Province of Canada are available, the value of raw furs exported was £19,395 (\$93,872); for the twelve months ended June 30, 1920, the value was \$20,417,329; for 1925, \$17,131,172; for 1930, \$15,357,386 and for 1931, \$13,544,088. Raw furs to the value of \$11,495,086 were exported during the twelve months ended June 30, 1932, the British market taking \$6,316,529 worth and the United States most of the rest. The chart below shows the fluctuation of fur exports between the seasons 1924 and 1932. The area which will continue to furnish the historic peltries when settlement has planted its furthest outpost will still have to be reckoned by the hundreds of thousands of square miles. It is the function of the fur trade to turn this vast domain to perpetual economic use.

For a review of the fur-farming industry of Canada, see Chapter VIII, pp. 248 to 251.

Conservation.—The conservation of the wild life of Canada has been made a special object of government policy through the organization, in 1916, of the Advisory Board on Wild Life Protection, to co-ordinate the efforts of various Departments and Branches of the Dominion Government in matters relating to the conservation of the wild-life resources of Canada. The Northwest Game Act and the Migratory Birds Convention Act are the most important subjects to which the attention of the Board is specially directed and upon which it makes recommendations. In addition, the Board investigates and studies all problems relating to the protection and better utilization of all fur-bearing animals, "big game" mammals and to bird life, whether game birds, insectivorous birds or others. The Board

serves entirely without remuneration and during the whole period of its existence has incurred no expenditure.

In all provinces and territories of the Dominion, regulations governing the taking of fur-bearing animals are in force, and most kinds are protected during certain seasons of the year. In cases where special protection is necessary to avoid extermination of the species, the killing of the animals is prohibited over a period of years. Licences are required for trapping and trading, and direct revenue is derived by the provinces and territories from raw furs. The activities of the Dominion as a whole, with respect to wild life, are co-ordinated through biennial conferences of provincial and Dominion game protection officials. These conferences are called by the Department of the Interior and have assisted in evolving efficient plans for the preservation of Canada's wild-life resources.

Fur Trade Statistics.—Statistics of the number and value of raw furs and skins taken were collected at the decennial census of 1881 and thereafter till 1911, the figures showing a value of \$987,555 taken in 1880, \$768,983 in 1890, \$899,645 in 1900 and \$1,927,550 in 1910. In 1920 the Dominion Bureau of Statistics commenced the annual collection of returns from fur traders, but arrangements were subsequently made with the provinces whereby the provincial game departments undertook to supply annually to the Bureau statements of the number and value of pelts taken in the respective provinces, the information being based on royalties, export taxes, etc. The figures of pelts taken and their values are given for the available years in Table 1. The high value shown for 1920 is due to the inflated prices of that time.

1.—Summary of the Numbers and Values of Pelts of Fur-bearing Animals Taken in Canada, years ended June 30, 1920-32.

Year ended June 30.	Pelts.		Year ended June 30.	Pelts.	
	No.	Value of Pelts.		No.	Value of Pelts.
1920.....	3,600,004	21,387,005	1927.....	4,289,233	18,864,126
1921.....	2,936,407	10,151,594	1928.....	3,601,153	18,758,177
1922.....	4,366,790	17,438,867	1929.....	5,150,328	18,745,473
1923.....	4,963,996	16,761,567	1930.....	3,798,444	12,158,376
1924.....	4,207,593	15,643,817	1931.....	4,060,356	11,681,221
1925.....	3,820,326	15,441,564	1932.....	4,418,715	10,156,225
1926.....	3,686,148	15,072,244			

† Fur prices in this year were abnormally high. Any comparison of this figure with those of later years should take this into account.

Details by provinces of the numbers of pelts taken in the two latest years are given in Table 2.

2.—Numbers and Values of Pelts of Fur-bearing Animals Taken in Canada, years ended June 30, 1931 and 1932.

Province.	Numbers of Pelts.		Values of Pelts.	
	1930-31.	1931-32.	1930-31.	1931-32.
Prince Edward Island.....	16,331	20,696	\$ 760,764	\$ 903,314
Nova Scotia.....	75,628	62,546	427,351	403,882
New Brunswick.....	53,013	74,779	504,160	549,329
Quebec.....	383,108	410,900	2,106,108	2,334,262
Ontario.....	944,711	952,850	2,188,686	1,857,397
Manitoba.....	407,297	577,607	898,261	689,396
Saskatchewan.....	614,235	593,486	1,132,718	1,043,739
Alberta.....	941,399	1,121,728	1,121,533	877,353
British Columbia.....	186,518	201,522	650,779	576,102
Northwest Territories.....	371,281	341,922	1,945,737	999,203
Yukon.....	61,832	57,679	145,224	132,268
Totals.....	4,060,356	4,418,715	11,681,221	10,156,225

Among the provinces Quebec occupies first place in value of raw fur production, its output in 1931-32 being valued at \$2,334,262. Ontario is second with \$1,857,397, and Saskatchewan third with \$1,043,739. The relation of raw fur production in each province to the total of Canada in 1931-32 is shown by the following percentages: Quebec, 22.98; Ontario, 18.27; Saskatchewan, 10.27; Northwest Territories, 9.83; Alberta, 8.63; Prince Edward Island, 6.82; Manitoba, 6.78; British Columbia, 5.67; New Brunswick, 5.48; Nova Scotia, 3.97; and Yukon, 1.30.

The silver fox occupies first place among the fur producers of Canada, the value of the pelts of this kind in the season 1931-32 representing 30 p.c. of the total raw-fur production. Although the silver fox is of first importance in Canada as a whole, other fur bearers take the lead in some of the provinces. In the Maritime Provinces and Ontario the silver fox is first, in Quebec and the Northwest Territories the white fox leads, in the Prairie Provinces, the muskrat, and in British Columbia and Yukon, the beaver.

The following table gives details of raw-fur production by kinds.

3.—Kinds, Numbers, Total Values and Average Values of Pelts of Fur-bearing Animals Taken in Canada, years ended June 30, 1931 and 1932.

¹Coyote or prairie wolf pelts for Manitoba are included with wolf pelts.

CHAPTER XI.—THE FISHERIES.¹

Section 1.—The Early Fisheries.

Fishing is one of the earliest and most historic industries of Canada. From a date which precedes authentic record, the Normans, the Bretons and the Basques were on the cod banks of Newfoundland. Cabot, in 1498, when he first sighted the mainland of North America, gave it the name of "Bacalaos", the Basque word for cod fish which he found already in use among those hardy seamen. Cape Breton, one of the oldest place-names in America, is another memorial of the early French fishermen—and the Spaniards and the Portuguese were but little behind. Fernandez de Navarrete mentions all three as frequenters of the Grand Bank before 1502. The fishing was by hand lines over barrels made fast to the bulwarks to prevent fouling, the vessels remaining during fine weather then returning to France with from 30,000 to 50,000 cod. Voyages along the coast soon showed the cod as plentiful inshore as on the outer banks, and it became common for a crew to anchor in a bay, erect a hut on shore, and make daily excursions to the fishing grounds. The product was salted and dried on land and at the end of the season shipped to France. In 1534 Jacques Cartier found traces in the gulf of St. Lawrence of these early "Captains Courageous" and their rivalries in arms, as well as in the capture of the teeming product which had tempted them so far from home. An establishment of the kind just mentioned was founded at Tadoussac by Chauvin in 1599. Soon the fishermen began to stay all winter and thus to erect permanent fishing settlements. Fishing, therefore, may well be regarded as the first industry to be systematically prosecuted by Europeans in what is to-day the Canadian domain. It has never since ceased to yield a perennial harvest to both Europe and America.

By the Treaty of Utrecht in 1713, Britain became the owner of Newfoundland and excluded France from fishing and drying fish on certain sections of the coast, but France retained rights of fishing and of drying fish on other sections of the Newfoundland coast together with the fisheries of Cape Breton and the Gulf. These French rights resulted in the French shore question which remained unsettled for nearly two centuries. The Seven Years' War (1756-63) put a stop to continuous fishing. At its close the Robin family of Jersey came to Canada and gradually acquired the former French fishing stations. Until the arrival of the Loyalists all other fishing but cod was neglected. Inshore fisheries alone (including those of the Labrador coast) were developed during this phase; no deep-sea fishing vessel put out from Lunenburg, now the chief centre of the deep-sea fishery, until 1873.

Section 2.—The Canadian Fishing Grounds.

The fishing grounds of the Dominion of Canada are perhaps the most extensive in the world. On the Atlantic, from Grand Manan to Labrador, the coast line, not including the lesser bays and indentations, measures over 5,000 miles. The bay of Fundy, 8,000 square miles in extent, the gulf of St. Lawrence, fully ten times that size, and other ocean waters comprise not less than 200,000 square miles, or over four-fifths of the area of the fishing grounds of the North Atlantic.

¹ Revised by Miss F. A. Brown, Chief, Fisheries Statistics Branch, Dominion Bureau of Statistics. This Branch publishes an Annual Report on the Fisheries Statistics of Canada, together with advance summaries on Fish Caught, Marketed and Prepared, by provinces. These may be obtained from the Dominion Statistician.

In addition there are on the Atlantic seaboard 15,000 square miles of inshore waters controlled entirely by the Dominion. Large as are these areas, they represent only a part of the fishing grounds of Canada. The Pacific coast of the Dominion measures 7,180 miles in length and is exceptionally well sheltered. Throughout the interior is a series of lakes which together contain more than half of the fresh water on the globe—Canada's share of the Great Lakes alone amounts to over 34,000 square miles, a total which of course does not include lake Winnipeg (9,457 square miles), lake Manitoba and others of even greater area.

Still more important than the extent of the Canadian fishing grounds is the quality of their product. It is an axiom among authorities that food fishes improve in proportion to the purity and coldness of the waters from which they are taken. Judged by this standard, the Canadian cod, halibut, herring, mackerel, whitefish and salmon are the peers of any in the world. It is possible, therefore, to state that by far the most valuable fisheries of the western hemisphere, if not of the globe, belong to Canada.

It will be seen from the above that it is impossible to deal adequately with the Canadian fisheries in the aggregate; they are those of a continent rather than of a country, and are of corresponding diversity. Omitting the enormous Hudson Bay and peri-Arctic region, which extends from Ungava to Alaska and the fish resources of which are not known, the Canadian fisheries may be divided into Atlantic, inland and Pacific fisheries.

A detailed description of these respective fishing grounds of Canada, of the fish caught on these grounds, and of the methods of fishing, will be found at pp. 222-5 of the 1932 Year Book.

Lobstering is another distinctive industry. In 1870, there were three lobster canneries on the Atlantic coast of Canada; in 1930 the canneries numbered 333 and gave work to 6,000 people: 30,000,000 lobsters is a normal catch. The difficulty

of enforcing regulations as to the capture of undersized and spawning lobsters offers a constant problem in connection with the output, but with the co-operation of the fishermen there is hope that the fishery may be maintained and the annual harvest show no decline. In New Brunswick the canning of "sardines" (locally young herring and not a distinct type of fish) is second only to lobstering. Oysters, once plentiful everywhere, are now found in diminished quantities, but the Government is working towards the restoration of the industry through the development of oyster farming; favourable areas in Prince Edward Island waters have been seeded and the work in connection with oyster culture is being carried on under the direction of experts.

Section 3.—The Government and the Fisheries.

Upon the organization of the Government at Confederation, the administration of the Canadian fisheries and marine was placed in the charge of a Department of the Dominion Government, which then exercised complete jurisdiction over the fisheries under the supervision of a Minister, with a large staff of inspectors, overseers and guardians to enforce the fishery laws. Early in 1930 a change in departmental organization was effected, whereby two Departments, each in charge of a Minister, were created to administer respectively the Marine and the Fisheries.

In 1882, 1898, 1913 and 1920, decisions in the courts considerably altered the status of jurisdiction as between the Dominion and the provinces. The Dominion now controls the tidal fisheries of the Maritime Provinces and British Columbia and the fisheries of Yukon and the Northwest Territories, and the Magdalen islands. The non-tidal fisheries of the Maritime Provinces, the Prairie Provinces and Ontario, and both the tidal and non-tidal fisheries of Quebec (except the fisheries of the Magdalen islands) are controlled by the respective provinces, but the right of fisheries legislation for all provinces rests with the Dominion Government. [See the Fisheries Act (R.S.C. 1927, c. 73)]. The expenditure of the Dominion on the fisheries in the fiscal year 1931-32, including Civil Government salaries, contingencies, etc., was \$2,045,891, and the revenue \$105,937.

Conservation.—River and lake fisheries certainly, and sea fisheries probably, if left to themselves, conform to the economic law of diminishing returns. The Canadian Government, accordingly, has had for a main object the prevention of depletion, the enforcement of close seasons, the forbidding of obstructions and pollutions and the regulation of nets, gear and fishing operations generally. In addition, an extensive system of fish culture has been organized; the Dominion, in 1931, operated 23 main hatcheries, 9 subsidiary hatcheries and 7 salmon-retaining ponds at a cost of \$271,160, and distributed 133,654,169 eggs, fry or older fish, mostly salmon and trout. The young fish are distributed gratis if the waters in which they are to be placed are suitable and are open to public fishing.

Investigations and experiments directed toward the culture of the oyster have been carried on since 1929 at Malpeque bay, P.E.I., by the Dominion Department of Fisheries. Extension of oyster-farming, as it is called, to New Brunswick waters is in prospect as a result of an agreement entered into in 1932 between the Dominion and New Brunswick authorities, whereby control of the oyster areas in the Westmorland County portion of Shediac bay was vested in the Department of Fisheries. Investigational work is now under way there with a view to introducing a farming plan similar to that followed in Prince Edward Island. The knowledge gained in these fields will doubtless be applied in other parts of the country which are found suited to commercial oyster culture.

Direct Assistance.—Since 1927 fish collection services have been operated on several stretches of the Atlantic coast by the Fisheries Branch of the former Department of Marine and Fisheries and by the present Department of Fisheries. Fishermen in the waters covered by the fish-collection boats are thus enabled to sell their catches promptly and have them delivered to purchasers at central points at small cost. They are also able to spend their time in catching fish instead of in preparing their catches for the dried and cured-fish markets. Again a system has been established of broadcasting radio reports as to weather probabilities, bait and ice supplies, ice conditions along the coast and prevailing prices. Further, under authority of the Fish Inspection Act (R.S.C., 1927, c. 72), systems of instruction in improved methods of fish curing and barrel making have been in operation for several years.

Scientific Research.—Stations under the direction of the Biological Board of Canada for the conduct of biological research into the numerous complex problems furnished by the fisheries are established at Halifax, N.S., St. Andrews, N.B., and Nanaimo and Prince Rupert, B.C. The biological stations at St. Andrews and Nanaimo are concerned chiefly with problems of fish life, while at the fisheries experimental stations at Halifax and Prince Rupert, attention is devoted to the practical problems of the fishing industry. A marine biological station, chiefly for oyster investigation work, is conducted at Ellerslie, P.E.I., and a sub-station for salmon investigations at Cultus Lake, B.C. The Biological Board employs a permanent staff of scientists, and in addition, Toronto, McGill, Queens, Manitoba, British Columbia and the chief Maritime Province universities send workers to the several stations, chiefly professors and trained scientists. The life-histories of edible fishes, the bacteriology of fresh and cured fish, improved methods of handling and preparing fish, and numerous other practical problems have been taken up and scientific memoirs and reports issued.

International Problems.—The chief international fisheries problem is the question of the rights of the United States, whose fishermen were granted, by the Treaty of Versailles, certain privileges in the Canadian inshore fisheries. Losing these by the war of 1812, the United States, after 1818, surrendered all but their right to call at Canadian ports for shelter, wood, water, or to make repairs, and to fish around the Magdalen islands and on the north shore of the gulf of St. Lawrence from Point Joli eastward, and to dry and cure their fish in any of the unsettled bays on this portion of the North Shore.

Questions of interpretations to be placed on certain parts of the Treaty of 1818 were set at rest for the years 1854-66 by the Reciprocity Treaty. This treaty provided for the free admission into either country of the fish products of the other, and fishermen of each country were allowed to fish in the Atlantic territorial waters of the other, with the exception of specified rivers and other grounds.

In 1871, the Treaty of Washington revived the fishery provisions of the Reciprocity Treaty of 1854, and provided for a commission to determine the compensation to be paid by the United States as the difference in the value of the concessions mutually granted. This commission sat at Halifax in 1877, handing down the "Halifax Award", the amount of which was \$5,500,000. In 1885, however, the United States terminated the fisheries articles of this treaty and a period of disagreement followed. A settlement was negotiated in 1888, when the plenipotentiaries of the two nations agreed to the "Unratified Treaty of 1888", which provided that United States fishing vessels were to be granted, without fee, annual licences author-

izing them to purchase provisions and outfits in Canadian ports, to tranship catches and to ship crews. Out of this treaty grew the so-called *modus vivendi* licences. Since it was recognized that the treaty could not receive official sanction before the commencement of the fishing season, it was agreed that United States fishing vessels, on payment of \$1.50 per registered ton, should receive annual licences conveying the above privileges. The treaty was rejected by the United States Senate but Canada continued to issue *modus vivendi* licences up to 1918, when arrangements were made for reciprocal privileges in the ports of either country. The arrangement was discontinued in the United States on July 1, 1921. In the following year the *modus vivendi* licences were revived in Canada but this system was terminated on Dec. 31, 1923, and United States fishing vessels are now limited to the provisions of the Treaty of 1818.¹

On the Great Lakes also, the more important fishery problems, such as restocking and marketing, are necessarily international in character, and are complicated by the number of State Governments interested. Much the same situation has developed in British Columbia, where the sockeye of the Fraser are taken by the canners of Puget sound in quantities that largely exceed the catch of the Canadian canners, and by trap nets and other methods forbidden in Canadian waters. In 1906 an International Commission first discussed the question, while in 1922 the prohibition of sockeye fishing in the Fraser for five years, with a view to conservation, was recommended by a Parliamentary Commission.

The Halibut Fishery.—The halibut fishery on this side of the Pacific is engaged in only from Canadian and United States ports, but, owing to the fact that it is largely carried on beyond territorial waters, neither country alone can control it. At the same time it is in the interests of both countries that the fishery should be permanently maintained in a flourishing condition. The question of finding an adequate method of dealing with the matter was therefore referred to the Canadian-American Fisheries Conference that was appointed in 1918 by the Governments of the two countries to consider the settlement of outstanding fishery questions between Canada and the United States. In 1922 Canada proposed that the halibut question should be considered by itself. This was agreed to, and resulted in the treaty signed Mar. 2, 1923, "For the Protection of the Pacific Halibut" Under this treaty a close season in each year was provided for halibut fishing. A further convention, signed by the plenipotentiaries of both countries at Ottawa on May 9, 1930, and ratified by the Governments of the two countries on May 9, 1931, provided certain additional regulations in connection with the division of the waters into fishing areas, changing of dates for close seasons, etc. This revised convention provides a simpler and more responsive system of control than was previously possible.²

Fishing Bounties.—An important though indirect aftermath of the Washington Treaty remains. By an Act of 1882 (45 Vict., c. 18), for the development of the sea fisheries and the encouragement of boat-building, provision was made for the distribution annually among fishermen and the owners of fishing boats of \$150,000 in bounties, representing the interest on the amount of the Halifax Award. An Act of 1891 (54-55 Vict., c. 42), increased the amount to \$160,000, the details of the expenditure to be settled each year by Order in Council. For the year 1931 payment was made under authority of the Deep Sea Fisheries Act

¹Licences are being issued to United States' vessels for the fishing season of 1933, and these confer the privilege of entering Canadian ports to buy bait or to obtain supplies of water.

²For a pamphlet containing the text of this revised convention application should be made to the Department of Fisheries, Ottawa.

(R.S.C. 1927, c. 74) on the following basis: to owners of vessels entitled to receive bounty, \$1 per registered ton, payment to the owner of any one vessel not to exceed \$80; to vessel fishermen entitled to receive bounty, \$6.80 each; to owners of boats measuring not less than 12 feet keel, \$1 per boat; to boat fishermen entitled to receive bounty, \$5.80 each. The claims paid numbered 11,157, compared with 10,308 paid in the previous year. The total amount paid in 1931 was \$159,432. Details of the distribution of bounties for the years 1928 to 1931 are as follows:—

Fisheries Statistics.—The fisheries statistics of Canada are issued under an arrangement for statistical co-operation between the Dominion Bureau of Statistics, the Dominion Department of Fisheries and those branches of the different Provincial Governments having jurisdiction with regard to fisheries. The Fisheries Department of the Dominion Government exercises jurisdiction over the fisheries of the Maritime Provinces, the Northwest Territories, Yukon and British Columbia; and the Fisheries Branches of Ontario, Quebec, Manitoba, Saskatchewan and Alberta have jurisdiction over the fisheries of their respective provinces, excepting that in the case of Quebec the fisheries of the Magdalen islands are under the jurisdiction of the Dominion authorities. The province of British Columbia has a Fisheries Branch, but it does not engage in independent statistical work. Under the arrangement above referred to, the statistics of the catch and of the products marketed in the fresh state or domestically prepared are collected by the local fishery officers, checked in the Department of Fisheries and compiled in the Dominion Bureau of Statistics. In the case of manufactured fish products, schedules similar to those of other sections of the Census of Industry are sent by the Bureau to the operators of canneries, fish-curing establishments, etc., the fisheries officers assisting in securing expeditious and correct reports.

Section 4.—The Modern Fishing Industry.

The existing fishing industry of Canada is in the main the growth of the past half century. No comparable figures of production are available prior to the Confederation of the provinces, but about 1836 the production of fish in what are now the three Maritime Provinces had an estimated value of something like \$1,500,000, while the production of Lower Canada was probably worth \$1,000,000. In 1870 the total was \$6,600,000 and this was more than doubled by 1878. In the '90's it passed \$20,000,000 and in 1912, \$34,000,000. The highest figure was reached in 1918, with over \$60,000,000, but this was in a period of greatly inflated prices. Between that year and 1921 the total value of the products of the fisheries decreased and in the latter year was back to \$34,000,000. From 1921 to 1926 a steady increase to \$56,000,000 took place and in the following three years the value fluctuated around

the \$50,000,000 mark. The prevailing world-wide depression has affected the markets for fish products; the value dropped to \$48,000,000 in 1930 and to \$30,500,000 in 1931. These figures represent the total values of fish marketed, whether in a fresh, dried, canned, or otherwise prepared state.

The number of employees, which was 80,450 in 1929 and 79,558 in 1930, fell to 74,903 in 1931 and the capital invested in the industry which was \$60,000,000 in 1918 and \$62,579,000 in 1929, reached \$64,026,297 in 1930 but decreased to \$45,350,514 in 1931.¹

Among individual fish products the cod and the salmon long disputed the primacy; if the record is taken back to early times, the cod is the most valuable fishery; in the past 30 years, however, the salmon has definitely taken the lead, and the heavy pack and relatively high price of lobsters have more than once sent cod down to third place as in 1927, 1929 and 1930. Halibut, for a number of years prior to 1931, occupied fourth place among the chief commercial fishes but in 1931 dropped to fifth place, yielding fourth place to herring. These changes have, of course, affected the relative standing of the provinces, British Columbia now occupying the leading place that in earlier times belonged to Nova Scotia, and producing in recent years fish products to nearly half the total value. The yearly record of production since 1870, the total production by provinces for the past six years, and the record by values of principal fish products for the past five years in descending order of importance, are shown in Tables 2, 3 and 4. The aggregate value of production in 1931, \$30,517,306, shows a decrease of 36.2 p.c. from the figure of \$47,804,306 in 1930. The wide variations in prices from year to year make total values misleading. On the other hand, the quantities of different kinds of fish are stated in many different units and the total volumes of production are difficult to compare. An effort is made to overcome these difficulties in Table 7 by working out what the values would be in 1931 if prices had remained the same as they were in 1930. On this basis, the decrease due to smaller quantities was 21.2 p.c. and that due to lower prices 15.0 p.c.

¹ For detailed historical statistics of the fisheries, see pp. 53-56 of Fisheries Statistics of Canada, 1931, obtainable from the Dominion Statistician.

2.—Total Values of the Products of the Fisheries of Canada, 1870-1931.

NOTE.—From 1870 to 1906 inclusive, years ended June 30; from 1908 to 1917 (a) inclusive, years ended Mar. 31; since and including 1917 (b), calendar years. No statistics are available for the nine months' period ended Mar. 31, 1907.

¹ Quantities caught. ² Values marketed.

Operations in 1931.—Detailed Record of Production.—The total value of the products of the Canadian fishing industry in the calendar year 1931 was \$30,517,306, as compared with \$47,804,216 in 1930, \$53,518,521 in 1929, \$55,050,973 in 1928, \$49,123,609 in 1927, \$56,360,633 in 1926, \$47,942,131 in 1925 and \$44,534,235 in 1924. In Tables 5 and 6 will be found statements for the whole of Canada of each fish and fish product marketed in 1931, with comparative figures for the preceding year—Table 5 dealing with sea fish and Table 6 with products of the inland fisheries. In Table 7 an analysis is made of the change in the value of each product from the preceding year due to variations in price and quantity respectively. On the whole, prices were lower in 1931. In Tables 8 and 9 the numbers of the fish-canning and curing establishments are shown, together with the materials used and values of the products.

Capital and Employees.—In 1931 capital investments in the fisheries were as follows: (a) in vessels, boats, nets, weirs, traps, wharves, ice-houses, etc., used in the primary operations of capturing the fish, \$26,265,001, of which \$21,283,241 was invested in the sea fisheries and \$4,981,760 in the inland fisheries; (b) in fish-canning and curing establishments (land, buildings, machinery, supplies on hand, cash and operating accounts), \$19,085,513—grand total \$45,350,514. The number of employees engaged in the primary operations of fishing was 61,832 in 1931, and in canning and curing establishments, 13,071, a total of 74,903. The total salaries and wages bill in canneries and fish-curing establishments was \$3,182,875. Tables 10 and 11, herewith, show the items included in the above totals, with comparative figures for 1930, while Table 12 analyses the salaries, wages and earnings of the employees in canneries, etc.

Trade.—For reasons already noted, the domestic consumption of fish is relatively small in Canada, and the trade depends largely upon foreign markets. From 60 to 70 p.c. of the annual catch is an average export. In the fiscal year 1932 fish worth \$10,651,233 went to the United States and \$5,481,301 to the United Kingdom. The most important single export is canned salmon (to Great Britain and European markets), followed closely by cod, dry-salted (to the West Indies, South America, etc.), and canned lobsters to Great Britain, the United States and France. For fresh fish, especially whitefish and lobsters, the United States is the chief market. Canadian imports of fish in the fiscal year 1932 amounted to \$2,398,677. A general review of the import and export trade in fish for 31 years past is given in Table 13,

while Table 14 gives a comparative record of exports by countries during 1931 and 1932. Table 15 shows the leading items of export for the calendar years 1929-31. For a complete analysis of imports and exports, as well as of production, see the annual report "Fisheries Statistics", issued by the Dominion Bureau of Statistics.

13.—Values of Exports and Imports of Fish and Fish Products, fiscal years 1902-32.

NOTE.—In this table "Exports" include seal skins and fish oils, and "Imports" include turtles, whalebone, shells, mother of pearl, seal skins, fish oils and ambergris, in addition to fishery products as shown in Tables 12 and 13 of the External Trade chapter of this volume.

CHAPTER XII.—MINES AND MINERALS.¹

An article on the geology of Canada, referring to the chief mineral-bearing areas of the Dominion, will be found at pp. 18-28 of the present edition of the Year Book. This is followed by an account of the chief discoveries and investigations of mineral-bearing ores in 1931, at pp. 29-37; similar articles for earlier years were published in previous editions. These articles furnish references to more detailed sources of information in the publications of the Dominion and Provincial Governments and in the scientific journals.

The Mines and Minerals chapter of the Year Book is divided into six sections: (1) a sketch of the administration of mineral lands and mining laws, (2) a summary of general production, (3) the industrial statistics of the mining industries, (4) production of metallic minerals, (5) production of non-metallic minerals, (6) production of clay products and structural materials.

For more detailed information on the mineral production of Canada the reader is referred to the various reports issued by the Mining, Metallurgical and Chemical Branch of the Dominion Bureau of Statistics.

Statistics of Mines and Minerals.—The compilation and publication of statistics of the production of mines and minerals in the Dominion is carried out by the Mining, Metallurgical and Chemical Branch of the Dominion Bureau of Statistics, which works in close co-operation with the Mines Departments of the various Provincial Governments, collecting the data in collaboration with these Departments. Questionnaires sent out to the mining producers are designed to meet the requirements of both the Dominion and the provincial authorities, thus eliminating duplication of labour.

Annual and Monthly Statistical Reports.—Detailed statistics of the mineral production of the Dominion are published annually in a comprehensive report of over 300 pages which includes tables of Dominion-wide production, capital invested in the mining industry, number of employees, salaries and wages, fuel and machinery used in mining, together with tables showing imports and exports of minerals and their products, and a résumé of general mining conditions. The latest of these reports available for distribution at the time of writing covers the calendar year 1931 and may be obtained from the Dominion Statistician on request.

A summarized report on mineral production giving fairly detailed preliminary figures for the preceding calendar year is issued about March 15 of each year, and the salient points are reviewed at the Annual Meeting of the Canadian Institute of Mining and Metallurgy held in the first week of April. (The 1932 report is now available.) Further, a bulletin issued each year at the beginning of January gives the most accurate estimate then possible for the mineral production of the year just closed. In addition to the above, annual bulletins giving the detailed production of each mineral are issued as soon as the final figures become available in each case.

Monthly statistics of the physical production of 16 of the leading minerals of Canada have been compiled for the past four years and are published separately in monthly bulletins. These figures indicate the current trend of activity in mining operations.

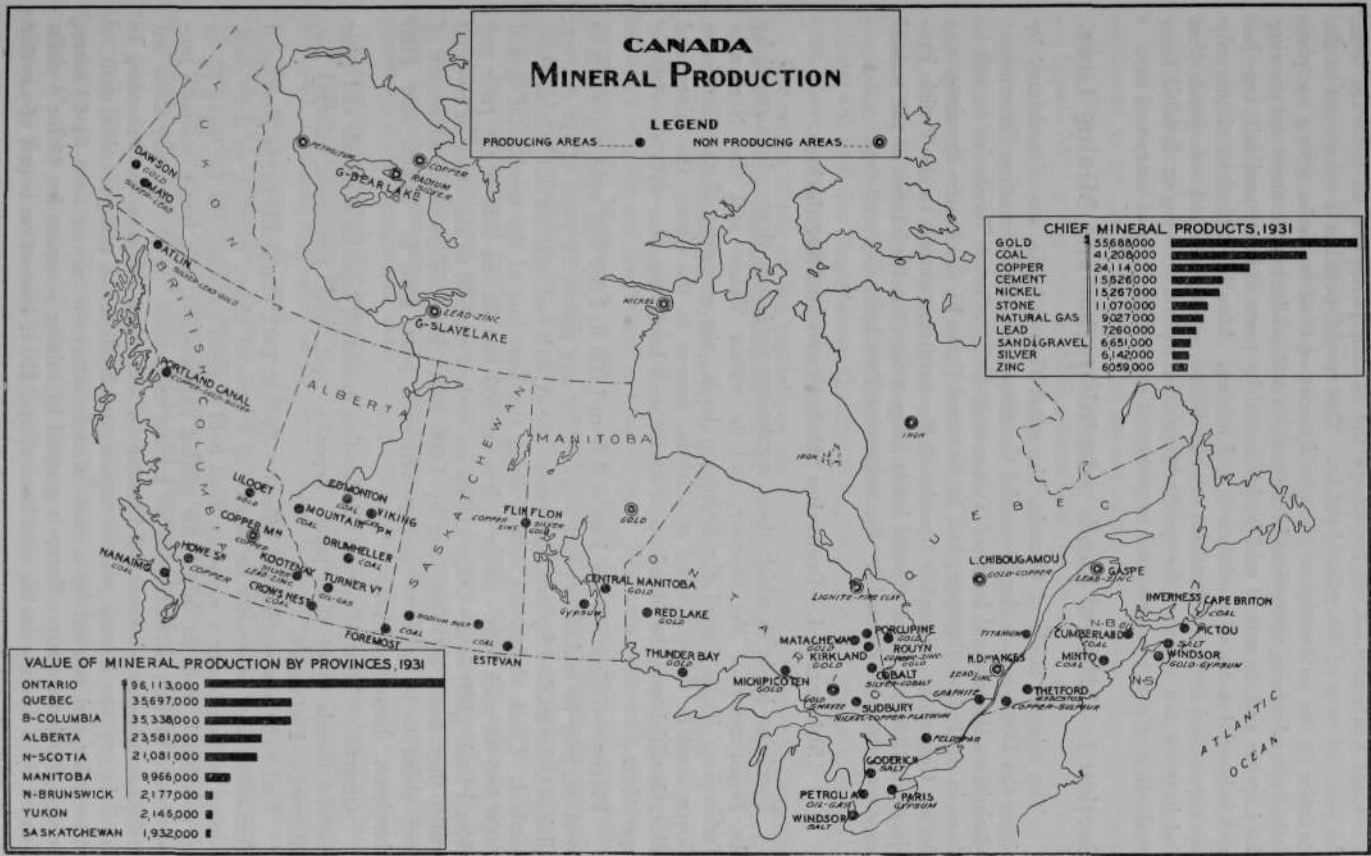

¹Revised by W. H. Losee, B.Sc., Chief of the Mining, Metallurgical and Chemical Branch, Dominion Bureau of Statistics. A complete list of the publications of this Branch appears in Chapter XXIX, Section 1, under "Production"

CANADA MINERAL PRODUCTION

LEGEND
 PRODUCING AREAS
 NON PRODUCING AREAS (C)

GOLD	3,568,000
COAL	41,208,000
COPPER	24,114,000

YUKON	2,145,000
SAKSCHEWAN	1,932,000

VALUE OF MINERAL PRODUCTION BY PRODUCTS AND PROVINCES

Coal Statistics.—Coal is perhaps the most important of all minerals, from the point of view of the general public. This special position is recognized in the statistics by the publication of an annual report on Coal Statistics, giving complete details of coal-mining operations in the various coal-producing provinces and showing the imports and exports of coal by kinds and by ports of entry and exit, together with industrial statistics in relation to coal mining. Monthly bulletins and quarterly reports on coal and coke statistics are also issued, giving coal and coke production and imports and exports, the quarterly printed reports showing in detailed form production of coal by areas, and imports and exports by ports of entry and exit.

Section 1.—Mineral Lands Administration and Mining Laws.

The mineral lands of Canada, like other Crown lands, are administered by either the Dominion or the Provincial Governments. The Dominion Government administers the mineral lands of Yukon and the Northwest Territories as well as those in all Indian Reserves, and in National Parks in the Prairie Provinces and British Columbia. Since the transfer of the natural resources to the Prairie Provinces in 1930, all other mineral lands lying within the boundaries of the several provinces are administered by the respective Provincial Governments.

Subsection 1.—Dominion Mining Laws and Regulations.

Dominion lands to which these regulations apply are those administered by the Department of the Interior, and lie within Yukon and the Northwest Territories. Titles issued for Dominion lands, the property of the Dominion Government in the territories of Canada, reserve to the Crown the mines and minerals which may be found on or under such lands, together with the right of operation.

Placer.—Claims 500 feet long and from 1,000 to 2,000 feet wide, according to location, may be staked out and acquired by any person 18 years of age or over. Claims to be marked by two legal posts, one at each end, and the line joining them marked. Creek claims are staked along the base line of the creek, and extend 1,000 feet on each side. River claims are 500 feet on one side of the river and extend back 1,000 feet. Other claims are staked parallel to the creek or river on which they front, 500 feet long by 1,000 feet. Expenditure in development of each claim to be incurred and proved each year, \$200 in Yukon and \$100 elsewhere. Royalty $2\frac{1}{2}$ p.c.

Quartz.—"Mineral" under this heading means all deposits of metals and other useful minerals other than placer deposits, peat, coal, petroleum, natural gas, bitumen and oil shales.

Under the new regulations, effective April 2, 1932, applicable to the Northwest Territories, any prospector or locator of a mineral claim, whether an individual, mining partnership or a company must hold a miner's licence, the fee being \$5 for an individual, from \$5 to \$20 for mining partnerships, and larger amounts proportionate to their capitalization for mining companies. A licensee may stake out 6 claims on his own licence and 12 more for two other licensees, not exceeding 18 in all in any one licence year in any mining division. A mineral claim shall be rectangular and marked by a post at each corner—maximum area 51.65 acres, being 1,500 feet square. Entry is granted by mining recorder, fee \$5 for a claim located by a licensee on his own licence, and \$10 if located on behalf of another

licensee. Grant is renewable from year to year, subject to representation work being done on the location each year to the value of \$100. When prescribed representation work has been done and confirmed, discovery of mineral in place shown to have been made, a survey made by a Dominion land surveyor at grantee's expense and certain other requirements met, a lease is issued for a term of 21 years, renewable, the rental for the full term being \$50. The cost of the survey, reckoned as \$100, may be counted as work done on the claim. A maximum of 36 claims may be grouped for purposes of representation work. When the profits of a mine exceed \$10,000 in any calendar year, there is a royalty of from 3 to 6 p.c. or higher, proportionate to profits. Miners' licences are not required in Yukon under the Yukon Quartz Mining Act, but the general provisions of the Act are similar to those of the Quartz Mining Regulations above, except that the fee for a grant is \$10 and only 8 mineral claims can be grouped for operation.

In addition to these Quartz and Placer Mining Regulations applicable to the Northwest Territories and the Yukon Quartz and Placer Mining Acts, the following regulations regarding minerals are in force: *Yukon*.—Dredging Regulations; Petroleum and Natural Gas Regulations.—*Yukon and Northwest Territories*.—Alkali Mining Regulations; Carbon-Black Regulations; Coal Mining Regulations; Potash Regulations and Domestic Coal Permits.—*Northwest Territories*.—Dredging Regulations; Oil and Gas Regulations; Quarrying Regulations and Permits to remove sand, stone and gravel from beds of rivers.

For copies of any of the regulations above referred to, application may be made to the Dominion Lands Administration, Department of the Interior, Ottawa.

Subsection 2.—Provincial Mining Laws and Regulations.

Nova Scotia.—All minerals in Nova Scotia, except limestone, gypsum and building materials, are the property of the Crown. They are dealt with under the provisions of the Mines Act (c. 22, R.S.N.S., 1923) and amending Acts of 1927 (c. 17) and 1929 (c. 22), and are administered by the Minister of Public Works and Mines, at whose office in the Parliament Buildings, Halifax, all records of mining titles are kept.

The chief mineral product of Nova Scotia is coal, which is subject to a royalty of 12½ cents per long ton. Coal used in mining operations, or used for domestic purposes by workmen employed about the mine, is exempted from royalty. Other important minerals of Nova Scotia are gold, salt, lead, zinc, copper, diatomaceous earth, manganese, antimony, gypsum and limestone.

Licences to search for mineral, good for a year, are issued at a nominal fee. More permanent holding is obtained by lease, which, in the case of minerals other than gold and silver, is granted for 20 years (subject to payment of an annual rental and the performance of work), the lease carrying the right to three successive renewals of 20 years each. A lease for gold and silver is given for 40 years, subject to a small annual rental and performance of work.

Full information concerning minerals and mining laws may be obtained by writing the Department of Public Works and Mines at the above address.

New Brunswick.—In grants of Crown land with few exceptions since about the year 1805, all mines and minerals are reserved to the Crown and regarded as property separate from the soil. Prior to that time, most of the grants reserved only gold, silver, copper, lead and coal. Royalties levied are 10 cents per long ton on coal and 5 p.c. on the value at the well's mouth for petroleum and natural gas

Prospectors must obtain a licence costing \$10 and good for the calendar year. It entitles the prospector to stake up to 10 claims of 40 acres each. Claims must be registered within 30 days and 25 days' work done on each claim within the year, after which a mining licence, renewable annually on the payment of \$10 per claim, will be granted. Administration is carried on under the provisions of the Mining Act (c. 35, R.S.N.B., 1927). For full information apply to the Department of Lands and Mines, Fredericton, N.B.

Quebec.—The mining lands of Quebec are administered by the Minister of Mines, subject to the provisions of the Quebec Mining Act (c. 80, R.S.Q., 1925) and amendments.

In townships the Crown retains full mining rights on lands granted subsequently to July 24, 1880, and, in the case of gold and silver, on lands granted previous to that date. All mining rights belong to the Crown in most of the seigneuries.

Mining lands up to 200 acres in extent can be acquired by staking the ground as prescribed by the Mining Act. Claims must be recorded and 25 days' work per claim done within 12 months, when a mining licence is granted upon payment of 50 cents an acre and a recording fee of \$10. The licence is renewable annually. When a mineral occurrence of importance has been found, the mining rights can be purchased as a mining concession for \$5 per acre for superior minerals and \$3 per acre for inferior minerals.

Mining operators must make annual returns to the Minister. Taxes are payable on annual profits at rates graduated up from 3 p.c. A mining inspector is appointed in each mining division for the administration of the mining laws and regulations.

Information and statistics on mining operations and geological explorations are to be found in the Annual Report of the Quebec Bureau of Mines.

Ontario.—Ontario owns and administers for mining purposes, through her Department of Mines, all the Crown lands within her boundaries except Indian lands. Mining lands are subject to the provisions of the Mining Act (c. 45, R.S.O., 1927). Title is a grant in fee simple, except in provincial forests, where the lands are leased. A resident mining recorder is appointed for each mining division created in the mineral areas. There is a tax on mining lands in unorganized territory of 5c. per acre per annum. Other taxation is on the net profits, the rate being 3 p.c. up to \$1,000,000; 5 p.c. from \$1,000,000 to \$5,000,000 and 6 p.c. on the excess above \$5,000,000. The first \$10,000 of profit is exempt. There is no apex law, all claim boundaries extending vertically downwards. Disputes are settled by the Recorder, or, on appeal, by the judge of the Mining Court of Ontario.

A miner's licence is necessary to stake out or acquire Crown lands for mining purposes, fee \$5 per year for an individual; for companies, \$100 on each million dollars capital. The holder may stake out for himself three claims in any and every mining division, and six additional for other licence holders, but not more than three for any such other licensee. A mining claim in unsurveyed territory is a square of 20 chains to a side (40 acres) with lines N.-S. and E.-W. astronomically. Where land is subdivided into lots a claim may be an eighth, a quarter or a half lot, *i.e.*, up to 50 acres.

There are special provisions regarding petroleum, natural gas, coal and salt on the James Bay slope, where these substances may be searched for under authority of a boring permit. A total of 1,920 acres may be taken up by an individual in blocks of 640 acres. Certain areas have been withdrawn from staking.

Full information concerning the mineral resources of the province and the mining laws may be obtained by writing the Department of Mines, Parliament Buildings, Toronto, Ontario.

Manitoba.—With the transfer of the natural resources to the province of Manitoba on July 15, 1930, control of most of the public lands passed to the Department of Mines and Natural Resources of the Manitoba Government.

The Mines Act (c. 27, 1930) and regulations thereunder govern the administration and leasing of: (1) Mineral claims—gold, silver, copper, zinc, etc.; (2) Boring permits—coal, natural gas, oil shale, petroleum and salt; (3) Quarrying locations—granite, limestone, marble, slate or any building stone, gypsum, gravel, marl, peat and sand.

A miner's licence is necessary to stake out Crown lands for mining purposes; fee is \$5 for an individual and larger amounts for mining partnerships and mining companies. A licensee may stake out for himself three mineral claims and six more for two other licensees, not exceeding nine in all in any mining division. He may also obtain one boring permit or one quarrying location.

A mineral claim in unsurveyed territory is a square of 1,500 feet (51.65 acres) with lines N.-S. and E.-W. astronomically. A boring permit allows 640 acres to be taken up and a quarrying location may cover an area up to 40 acres. The fee is \$5 for recording a claim located by the licensee and \$10 if recorded on behalf of another licensee. After recording, 25 days' work per claim must be done per year for 5 years. A maximum of nine claims may be grouped for the purpose of this work. When 125 days' work has been done, and certain other requirements complied with, a lease is granted. The cost of the survey may be reckoned as one year's work done on the claim.

A boring permit good for one year is necessary to search for oil, coal, gas or salt. If mineral is discovered a 21-year lease may be obtained subject to annual rental and certain annual work.

Lands containing granite, limestone, marble, slate or any building stone, together with clay, gravel, gypsum or sand may be leased at an annual rental, provided \$2.50 per acre per annum be expended in taking out the material.

For a copy of the regulations governing the disposal of mineral rights, apply to the Director, Mines Branch, Department of Mines and Natural Resources, Winnipeg, Manitoba. Mining recorders' offices are located at Winnipeg and The Pas.

Saskatchewan.—On Oct. 1, 1930, the province of Saskatchewan came into control of its natural resources, which had previously been controlled and administered by the Dominion. By the Mineral Resources Act of 1931, regulations, differing somewhat from those of former Dominion laws, have been brought into force dealing with coal, petroleum and natural gas, and placer. Except for these changes, the regulations are similar to the former Dominion ones.

Coal.—The area which may be taken is now from 40 to 640 acres. Application may be made by mail or in person and any eligible person may apply for three locations. The length of a location must not exceed three times the breadth. The minimum required to be mined annually is 5 tons per acre. Prior to commencing, a lessee must secure a permit to operate.

Petroleum and Natural Gas.—Application for locations may be made by mail or in person. The area of a location may be 160 to 1,920 acres but, while one applicant is allowed three locations, the total area must not exceed 1,920 acres. A permit must be obtained before commencing operations and all drillers must secure a

licence of competency to ensure that drilling will be efficiently carried out. The record of a driller may be obtained by payment of a fee. Operators are required to furnish a substantial bond to guarantee compliance with the regulations.

Permits to prospect for oil and gas are granted under similar regulations except that a cash rental of 20 cents per acre is required and a bond of 30 cents per acre which is forfeited if work to determine structure is not carried out within one year.

Placer.—These regulations remain as under Dominion administration except that 30 instead of 10 adjoining claims may now be grouped.

The Saskatchewan Mines Act provides for the competency of mine managers and pit bosses, for the reporting of accidents and generally for the welfare and safety of those employed in the production of minerals.

For further information apply to the Department of Natural Resources, Regina, Saskatchewan.

Alberta.—Since the Dominion Government in 1930 transferred control of the natural resources lying within the boundaries of Alberta to the Provincial Government, the leasing or disposal of mineral lands or rights is administered under provincial laws and regulations. However, for the present, mineral lands or rights within the province are being administered by the Provincial Government in accordance with the Dominion mining laws and regulations in force at the time of the transfer.

The Coal Mines Regulation Act of the province of Alberta and regulations made thereunder make provision for the safe operation of mines in the province, applying to mines of coal, ironstone, shale, clay and other minerals. Operations must be under the control of officials who hold certificates granted after suitable examination. A staff of inspectors is provided to administer the regulations. Monthly reports of operations must be returned to the Minister.

The Coal Sales Act requires that all coal mines shall be registered by name and all coal produced in Alberta sold under the registered name. The Coal Miners' Wages Security Act requires all coal operators to provide bond to insure the payment of wages, unless exemption is obtained through the Board of Public Utility Commissioners.

British Columbia.—The Department of Mines, organized under the provisions of c. 163, R.S.B.C., and amendments, administers mineral lands, and has charge of all matters relating to mining, including the Bureau of Mines and all offices established under the Bureau of Mines Act and all Government offices in connection with the mining industry.

The terms of the mining laws are favourable to the prospector, fees and rentals being small. On a lode mine of 51 acres an expenditure of \$500 in work, which may be spread over 5 years, is required to obtain a Crown grant, while surface rights are obtainable at a figure in no case exceeding \$5 per acre. Any person over the age of 18 and any joint stock company can obtain a "free miner's certificate" on payment of a fee, which for the individual is \$5 per annum and for a joint stock company either \$50 or \$100 per annum depending on capitalization. Mineral claims located under the provisions of the Mineral Act must not exceed 1,500 feet square.

Placer.—Placer mining is governed by the Placer Mining Act and, by the interpretation clause, its scope is defined as "the mining of any natural stratum or bed of earth, gravel, or cement mined for gold or other precious minerals or stones".

Placer Claims.—Placer claims are of 3 classes, as follows: (1) Creek diggings—250 feet long and 1,000 feet wide, 500 feet on each side of the stream; (2) Bar diggings—250 feet square on a bar covered at high water, or a strip 250 feet long at high water, extending between high-water mark and extreme low-water mark; (3) Dry diggings, over which water never extends—250 feet square.

A placer claim must be worked by the owner, or someone on his behalf, continuously during working hours. Discontinuance for 72 hours, except in close season, lay-over, leave of absence, sickness or other reason satisfactory to the Gold Commissioner is deemed abandonment. To hold a placer claim more than one year, it must be again recorded before expiration of the year.

Placer Leases.—Leases of unoccupied Crown lands may be granted by the Gold Commissioner of the district. Placer leases are of 4 classes, as follows:—(1) Creek lease—on rivers or on abandoned or unworked creeks, half a mile in length; annual rental, \$37.50; annual expenditure required on development, \$250. (2) Bench lease—80 acres; annual rental, \$25; annual expenditure required on development, \$250. (3) Dredging lease—on the bed of any river below low-water mark, 5 miles; annual rental, \$25 per mile; annual expenditure required on development, \$1,000 per mile; the value of any new plant or machinery employed to count as money expended in development. (4) Precious stone diggings—10 acres.

Section 2.—Summary of General Production.

Since 1886, the first year that the Geological Survey issued complete returns of mineral production, Canada has shown a fairly steady growth in mineral output. In that year the per capita production was only \$2.23; in 1901, five years after the Yukon discoveries, production totalled \$12.16 per capita, but there was a falling-off from 1902 to 1904. Thereafter, owing to the discovery of silver in the Cobalt area, the development of the copper and nickel ores of the Sudbury district, the opening up of the gold mines of Porcupine and Kirkland Lake in Ontario, the improvements in metallurgical practice which led to the recoveries of large quantities of lead and zinc from British Columbian ores, and the discoveries and developments in Quebec and Manitoba, the per capita production rose to \$31 in 1929, although owing to the current depression it has since dropped to \$17.35 in 1932.

In 1931, the latest year for which the world figures of the Imperial Institute are available, Canada stood first in the production of asbestos and nickel, second in the output of gold, zinc and cobalt, third in silver and copper, fourth in lead, and eleventh in the production of coal. During that year Canada produced 83 p.c. of the world production of nickel, 57 p.c. of the asbestos, 33.4 p.c. of the cobalt, 15.5 p.c. of the zinc, 12.6 p.c. of the gold, 10.6 p.c. of the silver, 9.6 p.c. of the copper and 8.9 p.c. of the lead.

The annual preliminary survey of the Canadian mining industry shows a total estimated valuation of \$182,320,150 for 1932; this is a decrease of 20 p.c. from 1931, reflecting the prolonged and intensified economic depression that has spread over the world in the last three years. Producers of base metals and structural materials were adversely affected by record-breaking low prices for metals combined with an extraordinary decline of industrial activities.

In contrast to the severe reductions in most mineral outputs was the pronounced increase of gold from Canadian mines. The 1932 gold production constituted a new high record for the Dominion and for the third consecutive year established Canada in the position of the second gold-producing country in the

world. Since the suspension of specie payments by Great Britain in September, 1931, there has been a heavy discount on the Canadian dollar in New York. This continues to react to the benefit of the Canadian gold producer. In order to facilitate the meeting of maturing obligations abroad the Canadian Government, in October, 1931, arranged for the purchase of Canadian gold produced after that date.

Field activity during 1932 was chiefly concentrated in the search for new gold deposits. In Ontario the recent gold discoveries of the Swayze area were extensively explored, while in Quebec various new gold properties were developed in the Rouyn area, including the new Cadillac-O'Brien and Bussières mines, which have commenced production. One gold mine in Ontario and one in Manitoba were also brought into production—the Ashley mine located in the Matachewan area of Ontario and the San Antonio situated in the Rice Lake area of Manitoba. British Columbia experienced a wide-spread search for gold properties and alluvial gold production was increased. In the Northwest Territories commercial shipments of silver-radium ores were made for the first time from the deposits of these metals discovered at Great Bear Lake in 1930.

Subsection 1.—General Statistics of Mineral Production.

In Table 1 will be found the total values of the minerals produced in Canada in each year since 1886, while Table 2 gives the details of the mineral production of 1930 and 1931, with the percentage of increase or decrease in the latter year.

An interesting comparison of the mineral production of the two years, 1930 and 1931, as to quantities and values, is furnished in Table 3.

The percentage increase or decrease in quantity production of individual minerals is shown in Table 2 above, but owing to the many different units in which the quantity of different minerals is expressed the total volume of production from year to year is difficult to compare, while the wide variations in prices make comparisons of total values misleading. Table 3 is an attempt to overcome these difficulties by working out what the values would be in the later year if prices had remained the

same as in the earlier, thus obtaining the increases or decreases due to changes in quantity alone; these are shown in the last column. Thus, of a total decrease of 18.5 p.c. in the value of mineral production from 1930 to 1931, declining prices accounted for 8.7 p.c., while decreased quantities accounted for 9.8 p.c. In the metallic group decreased production amounted to only 2.7 p.c.; in fuels to 15.5 p.c.; in other non-metallics to 22.5 p.c.; in clay products to 27.4 p.c.; and in other structural materials to 15.4 p.c.

Subsection 2.—Provincial Distribution of Mineral Production.

The principal mineral-producing province of Canada in 1931 was Ontario, with an output valued at \$96,113,235. Ontario took the leading position with the development of the Cobalt camp in 1907. British Columbia, which prior to that time was the leading mineral province, continued in second position until 1931 when its production was slightly exceeded by that of Quebec, largely owing to developments in the new northwestern district of that province. Alberta and Nova Scotia, because of their large resources of coal, are also important mineral producers, while in recent years valuable deposits of metallic minerals have been developed in Manitoba. The record of the respective provinces from 1899 is given in Table 4.

4.—Mineral Production of Canada, by Provinces, calendar years 1899-1932.

Calendar Year.	Nova Scotia. ¹	New Brunswick.	Quebec.	Ontario.	Manitoba.	Saskatchewan.	Alberta.	Yukon. ²	British Columbia.

¹ Includes a small production from Prince Edward Island.² Includes a small production from the Northwest Territories in 1932.

* Figures for 1932 are subject to revision.

The quantities and values of the minerals produced in each province during 1931 are shown in Table 5. Coal accounted for 90 p.c. of the value of mineral production in Nova Scotia, with gypsum the item of next importance. Coal and gypsum were likewise the most important mineral products of New Brunswick, which was also one of the provinces with a production of natural gas and petroleum. Quebec was the only province in which asbestos was produced. In 1929 this was her principal mineral, but since then asbestos production has been much curtailed. In 1931 cement was the chief mineral product, followed by gold, stone and copper and Quebec led all the provinces in the value of cement and stone produced. Gold represented 45 p.c. of the value of Ontario's mineral production in 1931 and with other metals, of which nickel, copper, silver, the platinum and cobalt were the chief, made up 76 p.c. of the total for the province. As the most populous province, Ontario had a large production of the various structural materials, and there was also a large production of natural gas, salt and gypsum. Cement and other structural materials were, until recently, the principal mineral products of Manitoba, but developments in the Precambrian formations of the north and east of this province have made it an important producer of metals. Copper and gold

were the chief minerals in 1931, while there was also production of zinc, silver, cement and gypsum. Saskatchewan's mineral production was small and coal constituted about half the total, the remainder being sodium sulphate and structural materials. Coal was the principal product in Alberta, accounting for 55 p.c. of the total, while natural gas, petroleum and cement were the other most important products. The metals, chiefly lead, copper, zinc, gold and silver, made up the greater part of the value of the minerals produced in British Columbia, although owing to the great decline in the prices of most of these metals in 1931, coal became the leading mineral product in point of value for the province. Silver, alluvial gold and lead were the principal mineral products of Yukon.

5.—Mineral Production of Canada, by Provinces, calendar year 1931.

NOTE.—The mineral production of Yukon during the calendar year 1931 was as follows in quantities and values:—Gold, 44,310 fine oz., \$915,969; Lead, 4,454,613 lb., \$120,734; Silver, 3,694,723 fine oz., \$1,103,615; Coal, 904 tons, \$5,039; Total, \$2,145,347.

¹ Sulphur content of pyrites at its sale value and estimated quantity and value of sulphur contained in the sulphuric acid made from smelter gases.

Section 3.—Industrial Statistics of Mines and Minerals— Capital, Labour, Wages, etc., in Principal Industries.

Annual statistical reports on the mineral production of Canada have been published for many years, first by the Geological Survey, later by the Mines Branch of the Department of Mines, and since 1921 by the Dominion Bureau of Statistics. Prior to that year the annual statistics of mines were confined chiefly to a presentation of the quantity production of each of the minerals and their value at average market prices for the year. The recent treatment has been extended to

include a general review of the principal mineral industries, such as the copper-gold, silver-lead-zinc and nickel-copper industries, as well as a section on metallurgical works. The additional data include such features as capital employed, numbers of employees, wages and salaries paid, and gross and net production. The aim has been to extend the mining statistics beyond a summary of the production of individual minerals by approaching the subject from the standpoint of industrial organization, definitely illustrating the place which mining holds in the scheme of Canadian productive enterprise.

The net value of the products of the mines, smelters, quarries, sand and gravel pits, oil and gas wells, clay products plants, cement mills and other mineral industries should not be confused with the figures given as the value of mineral production. The values produced by the metallic industries given in Tables 6 and 7 are those reported by the operating companies, and are in each case the settlements received for shipments by mine operators and the additional value obtained when the smelting of these ores is completed in Canada. The totals indicate more nearly the actual return to the different industries than do the values for the several metals in Table 2 of this chapter, where, in the cases of copper, lead, zinc and silver, the values are computed by using the average prices for the year in the principal metal markets. Furthermore, the production figures of Table 2 include all quantities shipped from the mines, while metals absorbed in new metallurgical operations or remaining in stock at smelters and refineries are not included in the industrial figures of Tables 6 and 7. On the other hand, some imported ores and concentrates are treated in Canadian non-ferrous smelting and refining works. The net value of the products of these plants includes, therefore, the net value of the metals recovered from these imported ores and to this extent the net sales shown in Tables 6 and 7 include products not of Canadian origin. Furthermore, the value of gold production is computed at the standard rate of \$20.671834 per fine oz. (Table 9), while the actual return to the industries includes the premiums on gold as well. For these reasons the industrial returns differ from the total of production and, while occasionally smaller as in 1930, are usually larger as in 1931.

The total net value of products of the fuel industries in Table 7 is less than the total production of fuels in Table 2, because the net value of products of the industries is confined to that for which the operators receive some economic return, while the production of the fuel commodities includes all of those commodities produced, whether the producer actually receives payment in any form for them or not. Thus in coal mining, the industrial values in Table 7 include only coal sold, supplied to employees for domestic consumption, or used in making coke and briquettes, whereas the figures of coal production as shown in Table 2 include, in addition to the above, coal consumed for power and other purposes in the coal-mining operations and also the difference between coal put on the bank and lifted from the bank. Petroleum producers have a larger monetary return than the actual value of the petroleum produced because many oil wells also produce large quantities of natural gas. On the other hand, the natural gas industry receives a smaller return than the total value of all natural gas produced because some of the gas is produced by the petroleum industry, because of leakage or other loss in piping gas to the consumers, and because a small amount of natural gas is produced by private individuals or groups from their own wells for their own consumption, without any industrial organization intervening between producer and consumer.

For other non-metallic minerals (if the small production of peat normally included with fuels is deducted) and clay products, and structural materials, returns to the producing industries are the same in each case as the total value of the mineral commodities produced.

The Growth of the Mining Industry in Recent Years.—Annual publication of industrial statistics of the mining industry, showing capital employed, the number of employees, the salaries and wages paid, the cost of fuel and electricity, and the net value of the products did not commence until 1921. In connection with the item of capital, operators were requested to report *only the capital actually invested in the enterprises*, including (1) cost of lands, buildings, plant, machinery and tools, (2) cost of materials on hand, supplies, finished products and ore on dump, and (3) cash, trading and operating accounts and bills receivable. It should be specially noted that no estimate of undeveloped ores was included in the capital.

The substantial growth of the mining industry in Canada during the post-war decade is established by the summary statistics of Table 6. From 1922 to 1929—a period of slowly declining prices—the output increased by 72 p.c., capital investment by 76 p.c., employment by 53 p.c., and the salaries and wages paid by 65 p.c. Progress was most rapid in the metallic mineral industries, where the expansion in net production amounted to 170 p.c. with proportionate increases in capital and employment. The period from 1922 to 1929 was marked by a rising cycle of activity in construction. This is reflected in the expansion of industries engaged in the production of clay products and other structural materials. The output of this group of industries increased by 47 p.c. during the period, while within the group progress was much greater in industries producing cement, gravel and stone than in the clay products industries. The group of non-metallic mineral industries remained relatively stationary in contrast to the other two main groups during this period of rapid expansion. This may be attributed to the fact that coal mining is the predominant industry in the non-metallic group and, under increasing competition from oil fuels and hydro-electric power, did not participate in the general industrial expansion of the period.

Under the influence of the world-wide depression, there has naturally been a recession in the mineral industries generally. As was to be expected, the decline since 1929 has affected the reported capital (3 p.c. lower) much less than employment (23 p.c. lower), output (24 p.c. lower) or salaries and wages (26 p.c. lower). The non-metallic mineral industries appear to have suffered most in spite of the fact that they participated so little in the previous expansion. Their salaries and wages and their net sales dropped to a lower point in 1931 than at any time during the years shown. The mineral industries producing various structural materials in 1931 still had a wage bill and an output larger than in 1926. The price decline in these materials was not severe and demand for them was somewhat maintained by some large construction enterprises and by public works' programs, road improvements and so forth. The metallic mineral industries, although showing the greatest expansion up to 1929, had declined the least from that point in 1931. Their salaries and wages and net sales were still above the 1927 level in spite of the drastic declines in the prices of a number of the metals. A number of the industries within this group have been helped by the relative rise in the value of gold. However, the figures are strong evidence that Canada's metal-producing industries have been established upon a solid foundation since, after so rapid an expansion, they have been able to withstand so well the shock of the depression.

¹ Gross value less freight and treatment charges and less value of ores charged in the case of smelters.² Electricity was not included in 1921 and 1922.

A summary of the principal statistics of the mining, metallurgical, clay products and other structural materials industries operating in Canada in 1930 and 1931 is presented in Table 7. Of these industries, coal mining provided the largest employment and paid the largest wage bill, with auriferous quartz second and non-ferrous metal smelting and refining third. In the amount of capital invested the smelting industry was highest, with coal mining second and auriferous quartz third. In net sales smelting led again, with auriferous quartz a very close second, coal mining third, copper-gold-silver fourth, cement fifth, and the stone industry sixth.

The only mineral industries to show increased returns in 1931 over 1930 were: alluvial gold, auriferous quartz, copper-gold-silver, salt, and miscellaneous non-metallics (due chiefly to an increase in sodium sulphate). Important industries which showed the most pronounced falling off were: silver-cobalt, silver-lead-zinc, and asbestos, all of which declined by from 43 p.c. to 51 p.c.

7.—Summary of the Principal Statistics of the Mineral Industries of Canada, by Industries, 1930 and 1931.

¹ Value of shipments by mine operators and of products sold by metallurgical works, less estimated cost of ores, concentrates, matte, etc., treated, irrespective of their origin. The major part of the value of ores treated is included as products of mines and mills, but there is necessarily a lag between production of ores and sales of smelter products, while some imported ores are also treated in Canadian smelters.

² Value added by smelting and refining. ³ Includes a small production of peat, normally included in fuels.

Section 4.—Production of Metallic Minerals.

Subsection 1.—Gold.

Canada has been a gold-producing country for over 75 years. During the last half of the 19th century production was chiefly the result of placer operations in British Columbia and Yukon, while during the present century there has been a rapid growth of production from lode mining both of auriferous quartz and of gold in association with other metals.

In 1931 the value of gold produced in Canada exceeded that of coal for the first time. Under the influence of the current depression, the production of coal has declined in quantity and value, while the general decline in commodity prices and the heavy discount to which the Canadian dollar has been subjected in New York, have reacted to the immediate benefit of Canadian gold producers. Thus gold ranked first among the minerals in 1931 and 1932. Favourable results from prospecting and exploration, new mines coming into production, and plans for expansion in a number of producing mines, give every prospect for a continued increase in gold production.

Prior to 1924 gold production in Canada attained a maximum in 1900, when the Yukon production reached its highest point and 1,350,057 fine oz. of gold were produced. For the provinces and Yukon, the years in which the greatest yields were obtained were: Nova Scotia, 1902; Quebec, 1932; Ontario, 1932; Manitoba, 1932; Alberta, 1896; British Columbia, 1913 and Yukon, 1900. The quantities and values of gold produced in Canada are given by provinces for 1911 and subsequent years in Tables 8 and 9, 1932 establishing a new record of production with 3,050,581 fine oz.

British Columbia.—The discovery of gold in paying quantities was an epoch-making event in the history of British Columbia. In the late '50's, alluvial gold was discovered along the Thompson river and in 1858 the famous Fraser River rush took place. The extraordinarily rich deposits of Williams and Lightning creeks, in the Cariboo district, were discovered in 1860 and three years later the area had a production of alluvial gold valued at \$4,000,000. In the northern part of the province, the Atlin division of the Cassiar district was prospected in 1892. Then the introduction of lode mining resulted in a rapidly increasing production until 1902, when previous records were surpassed by an output of more than 288,000 fine oz. Except for the maximum output of 297,459 fine oz. in 1913, the record of 1902 has not since been equalled. Though the bulk of the gold obtained in the Cordilleran region has been derived from the placer deposits of the central portion of the region from Yukon at the north almost to the International Boundary on the south, yet a large amount, averaging 178,039 fine oz. between 1913 and 1921, was obtained by lode mining, largely of the copper-gold ores of the Rosslund and Yale boundary districts. The copper concentrates of the Britannia mine also contain gold, as does the blister copper made at Anyox. The output of gold in British Columbia has been in part maintained by the successful operation of the Premier mine on the Portland canal. The Pioneer gold mine in the Lillooet district has reported a substantial production of gold during the past three years and production is expanding. Placer prospecting in British Columbia experienced a distinct revival during the 1931 and 1932 seasons and resulted in pronounced activity, especially in the Stikine, Liard, Cariboo and Atlin districts.

Yukon.—The discovery of gold in the Yukon River valley was reported in 1869, and bar-mining on the tributaries of the Yukon was conducted with increasing profit between 1881 and 1886. Ten years later, rich discoveries were made in creeks of the Klondike river, a right-bank tributary joining the Yukon at what is now Dawson city, and one of the greatest rushes in history was made to this locality. The richest streams in the district were Bonanza creek and its principal tributary, the Eldorado. There is still a production of gold from alluvial operations in Yukon.

Nova Scotia.—Gold was discovered in Nova Scotia in 1860. Two years after the discovery gold valued at nearly \$142,000 was recovered from the quartz veins; a steady, though in recent years declining, output has been reported since that time.

Quebec.—Although Quebec produced gold as early as 1823, production consisted only of the small quantities recovered in the treatment of the lead and zinc ores of the Notre-Dame-des-Anges district and from the gravels of the Chaudière river. Important discoveries of copper-gold deposits, however, were more recently made at Rouyn, in the northwestern part of the province, adjacent to the Kirkland Lake district of Ontario. Smelting facilities became available for this region as the result of the opening of the Noranda smelter in December, 1927. The operation of this smelter, together with the development of new gold properties in the northwestern part of the province, has established Quebec as the second largest gold-producing province. During 1932 extensive exploration and development of new gold properties throughout the Rouyn district included the commencement of construction on a 600-800 ton mill in Duparquet township by the Beattie Gold Mines Ltd., and the beginning of mill production by the Cadillac-O'Brien gold mine in Cadillac township. Several prospects situated in Pascalis, Louvicourt, Senneville and Bourlamaque townships were active and results were reported as encouraging. In this field the Treadwell Yukon Co. commenced operating a test milling plant on their Bussièrès claims. The Siscoe mine in Dubuisson township and the Granada in Rouyn township were in continuous operation during 1931. The Noranda mine and smelter experienced a successful year and although there was some reduction in copper output the value of precious metals was considerably increased.

Ontario.—Although gold was first discovered in 1866 in Hastings Co. and was later found and worked at many points from there to the lake of the Woods in the west, a distance of roughly 900 miles, no permanent gold-mining industry was established until 1911, when the Porcupine camp was opened up. Soon afterwards the discovery of gold in the Kirkland Lake area, on what is now the Wright-Hargreaves mine, led to the later development of this second camp. Porcupine was the most important gold-mining area of the province and of Canada from 1912 until 1930, with the Hollinger the leading mine. In 1931 and 1932, however, output from the Kirkland Lake camp exceeded that of the older area and the Lake Shore mine increased its production beyond that of any other Canadian gold mine.

Active prospecting and development were carried on during 1932 in a number of Precambrian areas in Ontario. In the Matachewan district the Ashley mine was brought into production; exploration of prospects was widespread in the Three Duck Lakes area and in Swayze township where the Kenty Gold Mines started sinking two 500-foot shafts. In the northwestern part of the province the Howey gold mine was in continuous operation and the Moss gold mines operated their new mill for the first time. The larger gold mines of the Porcupine and Kirkland Lake areas experienced a successful year resulting in increased gold outputs for both camps.

Manitoba.—The presence of gold-bearing ores in Manitoba has been known for a decade or more and the gold production of this province is now mounting. The Central Manitoba, an auriferous-quartz property in the Rice Lake area east of lake Winnipeg, has produced gold steadily for several years and the San Antonio in the same field has had a mill operating since May, 1932. The major part of the gold of the province is, however, produced as a by-product from the Flin Flon smelter which treats copper-zinc ores. Important gold discoveries were reported in the autumn of 1931 at Island lake, which lies near the Ontario boundary to the northeast of lake Winnipeg.

8.—Quantities of Gold Produced in Canada, by Provinces, calendar years 1911-32.

NOTE.—For the years 1892 to 1910, see Canada Year Book, 1916-17, pp. 268 and 269.

² Includes \$248 from Saskatchewan.

World Production.—A sketch of the development of the gold-mining industry of the world since the discovery of America may refer to four successive periods. During the first period, extending from 1493 to 1760, the annual production averaged nearly 337,000 fine oz. The placer mining of Brazil and Colombia swelled the average output of the last 60 years of the period to about 606,000 fine oz. per year.

The production of Russia from placer mining was a considerable factor in the next period, extending from 1761 to 1840, that country retaining first rank among the world's producers until 1837. The average annual production during the period was 565,500 fine oz.

The third period, extending from 1841 to 1890, was notable for the remarkable discoveries of gold in California and Australia in 1848 and 1851 respectively. The annual average during the 50 years was 4,937,000 fine oz. For the first decade the average was 1,761,000 fine oz. and for the second 6,448,000, while in the last decade it declined to 5,201,000. The production of the period was contributed chiefly by the United States, Australia and Russia.

In the fourth period, extending from 1891 to the present time, the outstanding features were the entry of South Africa as an important and later as the leading producer, and the phenomenal increase in the output of most of the gold-producing countries through the introduction of the cyanide process. The output was 6,320,000 fine oz. in 1891 and a steady increase was recorded until 1915, when a maximum of 22,737,000 fine oz. was produced. Thereafter the great increase in wages and in the other costs of production of an article of fixed value brought about a steady decline to a minimum production of 15,451,945 fine oz. in 1922, increased to 17,790,597 fine oz. in 1923, to 19,025,942 in 1925, to 19,700,000 in 1928, and to 22,819,000 in 1931, a total exceeding the former maximum of 1915. The annual world production for this period is shown in Table 10.

In 1931 the world's chief producers were the Union of South Africa, with a production of 10,877,777 fine oz. or 47.6 p.c., Canada, producing 2,693,892 fine oz. or 11.8 p.c.¹, and the United States, producing 2,213,741 fine oz. or 9.7 p.c. As Australia, Rhodesia and British India were also important producers over 68 p.c. of the world production of 1931 was produced in the British Empire. Preliminary figures for 1932 show that Canada again led the United States in gold production and now definitely ranks second to South Africa.

Detailed statistics of world gold production for 1930 and 1931 follow.

¹This percentage, derived from world production as reported by the Director of the United States Mint, is slightly less than that derived from estimates of the Imperial Institute as given on p. 339.

Subsection 2.—Silver.

Although no official statistics of the production of silver were published prior to 1887 the annual reports of the operating companies showed that from 1869 to 1885 about 4,000,000 oz. of silver, with a probable value of \$4,800,000, were produced in the Port Arthur district in Ontario. From 1887 to 1893 the annual

production ranged in value between \$300,000 and \$400,000, and was derived chiefly from Ontario and Quebec. The next three years saw a rapid increase in production, due to the development of the silver-lead deposits of British Columbia, and in 1896 a production worth over \$2,000,000 was recorded. From 1896 to 1905 annual production varied in value between \$2,000,000 and \$3,500,000, rising rapidly during the next five years, to 32,869,264 fine oz. valued at \$17,580,455 in 1910, as a result of the discovery of the rich ores of the Cobalt district. Since then there has been a falling-off in quantity, but owing to the higher price of the metal the value of the annual production increased to a maximum of \$20,693,704 in 1918. The post-war depression and the decline in the value of silver caused a low value of production in 1921, but the industry recovered, and in 1930 production amounted to 26,443,823 fine oz. The further decline in the price of silver since that time has resulted in a decreased production, amounting to only 18,356,393 fine oz. in 1932.

The silver production of Canada is chiefly credited to the copper-gold-silver and the silver-lead-zinc ores of British Columbia, the silver-cobalt ores of northern Ontario and the silver-lead ores exported from Yukon. An appreciable amount of silver also occurs in combination with the gold ores of northern Ontario, the nickel ores of the Sudbury district and the copper-gold ores of Quebec and Manitoba. Thus most Canadian silver is produced in combination with other metals.

During 1931 much interest was created by the reported discovery at Echo bay, Great Bear lake, of mineral deposits in which high-grade native silver was associated with cobalt and radium-bearing ores. The first commercial production from this area occurred in 1932 when shipments were made to the Trail smelter in British Columbia.

Ontario.—The production of silver in Ontario in 1931 was 7,438,951 fine oz., valued at \$2,222,014, practically the whole of which was derived from the rich silver-bearing ores of the Cobalt district, but small quantities were obtained from the products of the nickel refineries and from crude gold bullion. The Cobalt deposit was discovered in 1903, when the Temiskaming and Northern Ontario Railway was being built from North Bay to the head of lake Timiskaming. Later somewhat similar deposits were discovered at Gowganda, 55 miles northwest, and at South Lorrain, 18 miles southeast of Cobalt. Owing to the depletion of the ore bodies combined with the very low price of silver, operations have been much curtailed in the Cobalt, Gowganda and South Lorrain camps. During 1931 the Nipissing Mining Co. closed down their mines in Cobalt after continuous operation since 1905, while the Mining Corporation and the Keeley mine have discontinued mining operations in South Lorrain.

British Columbia.—In 1926 for the first time since 1905 this province surpassed Ontario in silver production. Comparing the quantity rather than the value, production in 1930 was the greatest on record and amounted to 11,825,930 fine oz., although this record was nearly equalled in 1927 with a production of 11,040,445 fine oz. Small amounts are recovered from alluvial gold and crude gold bullion, but the Sullivan and Premier mines have been responsible for the greater part of the output from this province. The Sullivan, primarily noted for its lead and zinc production, is the largest producer of silver in Canada. Silver was also recovered from the copper ores and concentrates which were exported for treatment in foreign smelters and from blister copper made at the Anyox smelter.

Yukon.—The increased production of silver in recent years from Yukon has been derived chiefly from the silver-lead ores exported from the Mayo district. For some years the difficulties and high cost of transportation involved in the export of these ores were serious obstacles to the successful operation of the mines. However, in the summer of 1925 the Treadwell Yukon Co. of Keno Hill, the largest producer in the district, completed a concentrating plant which has been operating steadily since that time. By eliminating much of the waste from the ores, concentration reduces the transportation costs. Ores from neighbouring mines are treated at this mill and this feature is of great assistance to the smaller operators in the district. The quantity of silver obtained from placer gold is gradually decreasing.

Statistics of the quantities and values of silver produced in Canada are given for the years since 1887 in Table 12, while statistics of the quantities and values produced in the various provinces are given for 1911 and subsequent years in Table 13.

¹ Preliminary figures.

World Production of Silver.—The world production of silver was estimated by the Director of the United States Mint, as shown in Table 11 of this chapter, at 192,709,971 fine oz. for 1931, a decrease of 22.5 p.c. from 1930 and of 26.2 p.c. from 1929, when world production reached a record maximum of 260,970,029 fine oz. The silver production of Canada in 1931 was 20,562,247 fine oz., or about 10.7 p.c. of the estimated world total for that year. This placed Canada third, next to Mexico and the United States.

In the following historical Table 14 the world production, value and average price of silver are given for each year from 1860 up to the present. During the period from 1860 to 1872, silver was still a monetary base in parts of the western world and the price remained fairly stable at about \$1.32 to \$1.35 per fine oz. (about 15½ oz. silver = 1 oz. gold), although production is estimated to have more than doubled during these 12 years. After the demonetization of silver in Germany and the United States, production continued to increase and by 1889 had nearly doubled again, although the price had declined to 94 cts. In spite of a further increase in production in 1890, the price in that year rose to \$1.05 per fine oz. During the next six years from 1891 to 1897, while annual world production increased only 17 p.c., the price declined nearly 40 p.c. During this same period, world gold production nearly doubled (see Table 10). From 1898 to 1904 annual production remained fairly stationary, while the price fluctuated around 60 cts. From 1905 to 1912 there was a further rise in annual production of about 35 p.c., but the price, while fluctu-

ating between 68 and 52 cts. per fine oz., was practically the same in 1912 as in 1905. During the economic disturbances of the War period, world production was on a lower level, while the price rose to a peak of \$1.12 in 1919 but dropped to 63 cts. in 1921. From then until 1929, world production increased again by 50 p.c. and the price after a rise to 74 cts. in 1924 declined steadily to 54 cts. On account of the world depression in 1930 and 1931, production has declined, while the price has dropped to little more than half the lowest price recorded in any other period shown in the table. The fact that silver is to a great extent a by-product is largely responsible for its present low price.

¹ At the average par price of a fine ounce of silver in London, excepting the years 1918 to 1922, inclusive, and 1931, for which the mean of the New York bid and asked prices was used.

Subsection 3.—Copper.

The copper-mining industry has developed at a very rapid rate. A production of 3,505,000 lb. in 1886 had doubled 6 years later. By 1913, the output had increased over twenty-one fold, amounting to 76,976,925 lb. The extraordinary demand for war requirements resulted in an average production from 1916 to 1918 of 115,048,931 lb. In the post-war depression production dropped to less than 43,000,000 lb. in 1922, but recovered rapidly and in 1930 reached the record of 303,478,356 lb. The preliminary estimate for 1932, a year of general depression with a very low price ruling for copper, indicates a production of 247,678,503 lb.

or only 28.4 p.c. below the record of 1930. This contrasts favourably with the production in the former depression year 1922 and shows the expansion of the copper industry in Canada in the past decade. Some Canadian copper producers, located principally in Manitoba, Ontario and Quebec, are fortunate in possessing ores containing sufficiently high values in precious metals to permit of operation in spite of the abnormally low copper prices prevailing in 1931 and 1932, so that copper has remained third in value among the minerals produced in Canada. Yet the low prices have lessened production and have also curtailed the search for and development of new copper properties. In June of 1932 the United States instituted a duty of 4 cents per pound on foreign copper, which adversely affected Canadian copper production, more especially that of British Columbia. Shortly afterwards, at the Imperial Economic Conference in Ottawa, it was recommended that Great Britain impose a duty of 2 pence per pound on copper produced outside the Empire, provided that if at any time Empire producers were unable or unwilling to offer this commodity on first sale in the United Kingdom at prices not exceeding the world prices and in quantities sufficient to supply the requirements of United Kingdom consumers, the duty might be removed.

Quebec.—Until 1894, when Ontario took the lead, Quebec was the chief copper-producing province of Canada, the principal mines being the Eustis and Huntingdon properties in the Eastern Townships. There is still an annual production from this field. Recent developments in the Rouyn camp of northwestern Quebec have resulted in a greatly increased production of copper since 1927. These deposits are associated with an easterly extension of formations similar to those of the Kirkland Lake area in Ontario. The first discoveries were located as gold prospects; the existence of large bodies of copper and zinc ores was subsequently proved and there is now a large production of copper as well as of gold. During 1931 the Canadian Copper Refiners, Ltd., commenced treating blister copper in their new plant located at Montreal East. This material came from the Noranda smelter and the smelter at Flin Flon, Manitoba.

Ontario.—The Sudbury deposits were first noted in 1856 but did not attract attention until 1883-4, during the construction of the C.P.R., when a railway cutting was made through the small hill on which the Murray mine was afterwards located. During the first years the deposits were developed for their copper content alone; not until 1887 was the presence of nickel determined and the true value of the ores known. These nickel-copper ores of the Sudbury area are the source of nearly all the copper produced in Ontario. Under the International Nickel Co. of Canada, an amalgamation of the former International Nickel Co. and the Mond Nickel Co., an extensive program of expansion in the mining and metallurgical facilities of the district has been carried out. A subsidiary company, the Ontario Refining Co., Ltd., has completed a copper refinery at Copper Cliff where electrolytically refined copper is produced from the blister copper smelted by the International Nickel Co., chiefly from ores from their own mines in the district. The company also operates the Acton precious metals refinery situated near London, Eng., where it recovers, in a refined state, the gold, silver and platinum metals contained in the concentrates produced at both the Swansea and Port Colborne nickel refineries. The Falconbridge Nickel Mines, operating a mine in Falconbridge township, make a copper-nickel matte which is shipped to Norway for refining. Adverse industrial conditions led to reductions in the copper production of Ontario in 1931 and 1932.

Manitoba.—During the four years 1917-20, with high prices prevailing for copper, ores containing 9,866,328 lb. of copper were shipped by the Mandy mine. Much development has been carried on in the Flin Flon district of Manitoba in the last ten years, and large bodies of ore have been proven on the Flin Flon property of the Hudson Bay Mining and Smelting Co. and the Sherritt-Gordon property. About 135 miles of branch line from the Hudson Bay Railway provide these properties with transportation facilities. A copper smelter and electrolytic zinc plant are operated by the Hudson Bay Mining and Smelting Co. at Flin Flon, while a large hydraulic development on the Churchill river provides the necessary power. Production from the plants of this company was continuous throughout 1931 and 1932.

British Columbia.—Until 1930, British Columbia had been the leading copper producer among the provinces for many years, but it then gave first place to Ontario and in 1931 production further declined, owing to the closing of the Copper Mountain mine and the curtailed operations at Britannia as a result of the low price of copper. The production of the province during 1931 and 1932 consisted of the blister copper produced at Anyox by the Granby Consolidated Mining, Smelting and Power Co., Ltd., and the copper estimated as recoverable from the ores, matte and concentrates exported. The principal copper-producing mines in British Columbia are the Britannia mine on Howe sound, and the Hidden Creek and Bonanza mines on Portland canal. The Hidden Creek and Bonanza ores are smelted at the Anyox smelter.

15.—Quantities of Copper Produced in Canada, by Provinces, with Total Values, calendar years 1911-32.

NOTE.—For the years 1886 to 1910, see Canada Year Book, 1916-17, p. 272.

¹ Preliminary figures.

World Production of Copper.—World production of copper was estimated at 1,523,200 short tons in 1931, as compared with 2,150,400 tons in 1929, the record year. Canada had an output of 146,152 tons in 1931, producing about 9.4 p.c. of the world's estimated total and standing third among the nations.

Subsection 4.—Lead.

Lead is obtained in Canada largely from the deposits of British Columbia. From 88,665 lb. in 1891 the production advanced to over 39,000,000 lb. in 1897. Owing to the low price of silver in 1898 and labour troubles in the Slocan in 1899, the output in the latter year fell to 21,900,000 lb., but rose to 63,200,000 lb. in 1900. The output fell to 18,100,000 lb. in 1903, owing to the condition of the market affecting the production of the low-grade silver-lead ores of the East Kootenay district. An Act of October, 1903, provided for the payment of bounties on lead contained in lead-bearing ores mined in Canada and, as a direct result of the bounty, the output increased to 56,900,000 lb. in 1905 but fell off gradually to 23,800,000 lb. in 1911. A marked increase has since been experienced, a record total of 337,946,688 lb. being reached in 1928, while production in 1929 and 1930 continued at nearly the same level. Owing to the very low price to which the metal has since declined, production has fallen off, the preliminary estimate for 1932 being 255,949,960 lb.

British Columbia.—In the East and West Kootenay districts there are many important mines, the principal of which is the Sullivan lead-zinc mine near Kimberley. The ore averages about 11 p.c. lead, 7 p.c. zinc and 5 ounces of silver to the ton. The successful solving by the Consolidated Mining and Smelting Co. of the metallurgical problems connected with the separation and reduction of these lead-zinc ores accounts to a considerable extent for the rapid growth in lead pro-

duction during recent years. As a result of the low prices prevailing since 1930 for lead, zinc, and silver, many of the small silver-lead mines of the Slocan and the Monarch mine at Field have remained idle.

Other Provinces.—Occurrences of lead have been found in Gaspé peninsula and in the Rouyn district of Quebec, but the only production of importance has come from the Notre-Dame-des-Angeles district, Portneuf Co., where the Tetrault mine was a consistent producer of lead and zinc concentrates until 1930, when operations were suspended owing to the low prices of these metals. Lead mining in Ontario has been intimately associated with the successful operations of the Galetta mine and smelter, which closed down in the summer of 1931 owing to the low price of lead. Recent discoveries in the Sudbury Basin area have disclosed bodies of lead-zinc ore. These properties were under development but operations have been suspended and very little production has come from them as yet. An important production of lead came in recent years from the silver-lead ores of the Mayo district of Yukon. These operations are described under "silver" on pp. 359-63 of this chapter.

17.—Quantities and Values of Lead Produced from Canadian Ores, calendar years 1901-32.

¹ Previous to 1913 the figures reported show the metal content of the shipments and are somewhat in excess of the actual amount recovered. Since 1912 the data given represent the quantity of lead produced in Canada from domestic ores, together with the estimated lead recovery from lead ores and concentrates exported. From 1901 to 1908, average prices at New York; 1909 and 1910, average prices at Toronto; from 1911 to 1925, average prices at Montreal; from 1926 to 1931 the average yearly prices at London, Eng., were used in making up the values shown. ² Preliminary figures.

World Production.—The world production of lead in 1931 was about 1,400,000¹ short tons. The principal producers were the United States with 26.6 p.c., Mexico 15.1 p.c., Australia 11.3 p.c., Canada 8.9 p.c., Spain 7.8 p.c. and Germany 7.3 p.c.

¹ From the Imperial Institute.

Subsection 5.—Nickel.

With the exception of the small amounts of nickel recovered from the ores of the Cobalt district, the Canadian production of nickel has been derived entirely from the well-known nickel-copper deposits of the Sudbury district, Ontario. A brief description of the history and development of the nickel-copper mining industry will be found under copper in subsection 3 of this section. From 830,477 lb. in 1889, the production of nickel increased continually to a war-time peak of 92,507,293 lb. in 1918. After a slump to 19,293,060 lb. and 17,597,123 lb. in 1921 and 1922 respectively there was an increase to 73,857,114 lb. in 1925. In 1928 production at 96,755,578 lb. exceeded that of the war year 1918, while 1929 established a record at 110,275,912 lb. Preliminary figures for production in 1932 are 30,327,968 lb.

In recent years the producing companies have instituted extensive researches to discover and encourage new peace-time uses for the metal. The success attending their efforts in that direction accounted very largely for the marked increase in production during the nineteen-twenties. The automobile industry, electrical machinery, cooking utensils, new submarine cables and various nickel alloys all helped to absorb this increased production. Unfortunately the world-wide depression has seriously affected the demand for a commodity so dependent upon the world's industrial markets and production was greatly curtailed in 1931 and 1932.

Sudbury.—The nickel-bearing rocks of the Sudbury district, with a width of about two and one-half miles, form a wide ellipse 36 miles long and 13 miles broad. The ore mined in the district contains nickel, copper and iron, but cobalt, gold, silver, platinum and palladium are nearly always present in relatively small quantities. The proved deposits of nickel ore in Canada are estimated to be sufficient to provide for the world's requirements for many years, while there are still large reserves undeveloped.

World Production.—The world production of nickel was about 35,500 long tons in 1931, of which output 82.6 p.c.¹ was Canadian in origin, while the remainder was derived from New Caledonia, India, Norway and Greece.

¹ These figures, taken from the Imperial Institute's Statistical Summary, include some nickel produced in the U.S. as a by-product from the electrolytic refining of Canadian copper; such nickel is not included in Table 18.

18.—Quantities and Values¹ of Nickel Produced in Canada during the calendar years 1891-32.

NOTE.—For figures for the years 1889-1900, see 1929 Year Book, p. 368.

¹ A change in the method of computing the value of nickel produced accounts for the drop in value after 1923. ² Preliminary figures.

Subsection 6.—Cobalt.

The major portion of the world supply of cobalt was for almost two decades derived from the silver-cobalt-nickel arsenides of the Cobalt district, the cobalt produced by refineries in southern Ontario having practically controlled world production until recent years. Large deposits of cobalt-bearing ores occur in central Africa, and the introduction into the world's markets of cobalt from this source has limited the market for the Canadian product to such an extent that since 1926 Canadian production has dropped to less than half of the world production.

The ore bodies at Cobalt, discovered in 1903, carry silver, cobalt, nickel, bismuth and arsenic. The Deloro smelter treats ores and residues and disposes of cobalt oxide, metallic cobalt and unseparated oxides of nickel and cobalt. The smelter output of cobalt, computed as the metallic cobalt and cobalt in oxides together with the cobalt recovered in ores exported from the mines and including cobalt in residues exported, amounted in 1931 to 521,051 lb. valued at \$651,179, as against 1,116,492 lb. valued at \$2,328,517 in 1925. Production in 1932 is estimated at 490,631 lb.

Subsection 7.—Zinc.

The zinc-mining industry of Canada has recently made rapid strides, largely on account of the application of improved metallurgical methods in the treatment of the lead-zinc ores of British Columbia. The metallic recoveries from Canadian ores were 267,643,505 lb. in 1930, as compared with 5,600,000 lb. in 1913. From an insignificant position in 1913 the country advanced to the second position among the world's producers in 1931 with an output of about 15.9 p.c. of the world total. Production in 1932 is estimated at 172,283,558 lb.

British Columbia.—The principal zinc-mining regions are situated in the Kootenay district of British Columbia, where there are large deposits of silver-lead-zinc ore. The chief producing mine is the Sullivan near Kimberley, where the ore worked is a replacement deposit of considerable size. Other mines are located in the Ainsworth and Slocan divisions of the West Kootenay district. Further information regarding lead-zinc mining and metallurgical operations is given under "Lead"

Other Provinces.—There has been considerable exploration and development of zinc-bearing deposits during recent years in Eastern Canada, where these ores are often characterized by the close association of copper, zinc and gold. In north-western Manitoba the Flin Flon and Sherritt-Gordon mines have ores of this nature and refined zinc has been made at the Flin Flon smelter since the autumn of 1930. Some important deposits of zinc-bearing ore have been developed in the Rouyn district of Quebec. Zinc is associated with lead in the deposits at Galetta, Ontario, and at Notre-Dame-des-Anges, Quebec, and mines in both these districts have been producers of zinc concentrates, while the Errington mine in the Sudbury district was developing a lead-zinc deposit and made some small shipments of zinc concentrates. All these eastern lead-zinc properties were inactive in 1931 and 1932.

Subsection 8.—Iron.¹

Iron ore is widely distributed in Canada and extensive deposits have been discovered from time to time. In Quebec there is a small annual production of titaniferous iron ore from a deposit near Baie St. Paul, but this material which is principally exported is used for its titanium content and not as a source of iron. There are millions of tons of iron magnetite sands, containing a high percentage of iron, along the north shore of the St. Lawrence in Saguenay Co., but these sands contain a high percentage of titanium, rendering the briquetted ore unfavourable for blast-furnace treatment. Efforts to utilize them have not proved successful. There are also a number of deposits of bog iron ore in the St. Lawrence valley remarkably free from sulphur and phosphorus. These bog iron ores were successfully used in charcoal blast furnaces at Radnor Forges and Drummondville for many years. The known deposits of non-Bessemer iron ore in northern Ontario are very extensive. Millions of tons of red hæmatite were taken from the Helen mine in the Michipicoten district, while the Magpie mine in the same district produced siderite which was roasted before being shipped to the blast furnaces at Sault Ste. Marie. In British Columbia, some development work has been done on iron deposits on Kamloops lake and on Texada island, but no iron-mining or iron-smelting industry has become established in that province. Extensive deposits of hæmatite exist on the Belcher islands in Hudson bay, but the ore is rather low in grade and its comparative inaccessibility renders its development impracticable. Immense deposits of iron ores, large masses being high-grade, have been reported along the course of the Koksoak river, in northern Quebec, but these are so inaccessible that up to the present they have not even been systematically explored.

Hitherto there has been no great incentive to the development of the iron-mining industry in Canada, since there are easily accessible and abundant supplies in the higher-grade ores of Wabana, Newfoundland and of the Mesabi range in Minnesota. The Wabana section of Newfoundland contains one of the largest deposits of iron ore in the world, the probable reserves in that area being estimated at 3,635,000,000 tons, and consisting of an exceptionally high-grade hæmatite.

¹ A sketch of the iron and steel industry of Canada was given on pp. 452-456 of the 1922-23 Year Book.

In Ontario, where the iron and steel industry has reached its largest development in Canada, cheap and high-grade supplies of iron ore are readily available from the Mesabi range of Minnesota, while coal supplies are drawn from the nearby coal fields of Pennsylvania.

From Table 20, it will be observed that the tonnage of pig iron made in Canada in 1929 exceeded that of any previous year, while the 1929 quantities of steel ingots and castings made were exceeded only in the war years 1917 and 1918. Production has fallen off considerably since 1929 as a result of the reaction which set in during the latter part of that year. Ontario has been the leading producer of pig iron throughout the years recorded.

¹ Including a small production from Quebec in certain years. ² Owing to the fact that much of the pig iron produced in Canada is used by the firms producing it for further manufacture in their own plants, no attempt has been made since 1923 to place a nominal value on such production. ³ Preliminary figures. ⁴ Titaniferous iron ore.

Section 5.—Production of Non-Metallic Minerals.

Subsection 1.—Fuels.

Coal.

The fuel situation in Canada is somewhat anomalous as, in spite of the enormous resources of coal in the country, about 50 p.c. of the consumption is imported. The Canadian coal areas are situated in the eastern and western provinces, while Ontario and Quebec are more easily and economically supplied with coal from the

nearer coal fields of Pennsylvania and Ohio.¹ The anomaly of the situation is accentuated if we consider that Canada's present coal consumption is about 35,000,000 tons annually, as against reserves of 1,234,289,000,000 metric tons, sufficient for an unthinkable long period at the present rate of consumption.

The Dominion Fuel Board, with the Deputy Minister of the Department of Mines as chairman, was constituted in 1922 to meet the need for a standing organization definitely responsible for the systematic study of the fuel position of the Dominion.

Coal Resources.—A summary of the known coal resources of Canada was given on pages 391-394 of the 1922-23 Year Book; the accompanying table is reproduced as Table 21.

21.—Coal Resources of Canada, by Provinces and Classes of Coal.¹

¹See "Coal, Coke and By-Products", published by the Imperial Mineral Resources Bureau.

²The coal of all classes mined in Alberta to 1911, amounting to 20,000,000 tons, has been deducted.

³A=anthracite, B=Bituminous, L=Lignite.

⁴Extensive investigation has been carried on by the Ontario authorities in connection with the Onakawana lignite deposits of the Moose River basin, James Bay region, and development work was carried on throughout 1931.

The coal production in 1931 amounted to 12,243,211 short tons, valued at \$41,207,682, or an average of \$3.37 per ton. This represented a decrease of 5,321,082 tons, or 30 p.c., as compared with 1928, the record year. Nova Scotia was again the leading producer. The coal produced in Nova Scotia, New Brunswick, British Columbia and Yukon is all classed as bituminous, while Alberta produces bituminous, sub-bituminous and lignite, and Saskatchewan and Manitoba lignite only. The division of the 1931 production among these classes is given in Table 26. The quantity of coal mined annually in six provinces, Yukon and Canada from 1911 to 1932 is shown in Table 22.

¹See map showing the sources of the coal supply of different parts of Canada, p. 386 of 1922-23 Year Book.

22.—Production of Coal in Canada, by Provinces, calendar years 1911-32.

NOTE.—For annual production from 1874 to 1910, by provinces, see 1911 Year Book, p. 419.

¹ Preliminary figures.

Coal Consumption.—The sources of the coal consumed in Canada in the calendar years 1911-31 are shown in Table 25, detailed figures of coal *made available for consumption* during 1931 are given in Table 26; the difference between the totals of the two tables in the latest year is accounted for by the fact that coal received may be held in bond at Canadian ports and not "cleared for consumption" until required, while coal received in previous years may be taken out of bond (cleared for consumption) in a later year. Normally the coal made available for consumption is greater than the apparent domestic consumption, since coal is landed at Canadian ports and re-exported or ex-warehoused for ships' stores without being taken out of bond, but while remaining in bond at the port it is available for domestic consumption if required.

25.—Annual Consumption of Canadian and Imported Coal in Canada, calendar years 1911-31.

NOTE.—For the years 1886 to 1910, see 1921 Year Book, p. 334.

¹ Includes 60,762 tons from Germany and 4,592 tons from French East Indies.

World Production.—The total known coal production of the world in 1931 amounted to about 1,230,000,000 long tons, towards which Canada contributed 10,931,438 long tons or about 0.9 p.c. Table 27 shows the production of the British Empire and the chief foreign countries in units of 1,000 long tons during each of the years 1913 and 1921-31.

27.—Coal Production in the Principal Countries of the World, 1913, 1921-31 (000 long tons.)

NOTE.—For corresponding figures for 1914 to 1920, see 1932 Year Book, p. 281.

Natural Gas and Petroleum.

Natural Gas.—The production of natural gas increased in value from \$1,346,471 in 1910 to \$10,289,985 in 1930 but declined to \$9,026,754 in 1931. The producing wells in the east are in southwestern Ontario, and near Moncton, N.B. The principal producing fields in Alberta are the Turner Valley (about 35 miles southwest of Calgary), Medicine Hat, Viking (about 80 miles southeast of Edmonton), Redcliff, Foremost (about 6 miles south and east of the town of Foremost), Bow Island and Wetaskiwin. Wainwright is supplied with gas from the Maple Leaf well in the Fabyan field. The quantity of gas sold or used in 1931 was 25,874,723 M cubic feet. Ontario was credited with about 51 p.c. of the total value but only 29 p.c. of the total quantity, while Alberta produced 45 p.c. by value and 69 p.c. of the total quantity. The production by provinces since 1920 is given in Table 28.

28.—Quantity and Value of Natural Gas Produced in Canada, by Provinces, calendar years 1920-32.

¹ Totals for Canada include a small production in Manitoba.

² Figures for 1932 are subject to revision.

Petroleum.—The production of crude petroleum in Canada during 1931 was the greatest on record and amounted to 1,542,573 barrels, as compared with 1,522,220 barrels produced in 1930. Of this production 6,577 barrels came from New Brunswick, 122,365 from Ontario and 1,413,631 from Alberta. Alberta thus produced 92 p.c. of the total for Canada. The Turner Valley field is the principal source of production in Alberta and embraces territory in which a number of productive wells have recently been brought in, beginning with the famous Royalite No. 4 well. The wells in this field give a wet gas from which a very high grade of crude naphtha is separated. The Red Coulee field in southern Alberta near the International Boundary began producing some petroleum in 1929, while a small production has been obtained for a number of years in the Wainwright field, about 120 miles east of Edmonton, where the oil is heavy and of a lower grade. Altogether 109 oil wells were in operation in Alberta at the close of the year 1931, while drilling was in progress on 14 other wells. These drilling operations were distributed over the Turner Valley, Wainwright, Ribstone, Red Coulee and other fields. There was 80,225 feet of well-drilling in addition to some structure test drilling done in Alberta during 1931.

The principal Ontario oil fields are situated in the southwestern peninsula between lake Huron and lake Erie. These fields reached their maximum production in the '90's and have since declined. New Brunswick's small production comes from the Stony Creek field, near Moncton. For the production by provinces in 1931 see Table 5 on p. 346.

Subsection 2.—Other Non-Metallic Minerals.

Asbestos.—Canada produces more asbestos than any other country. The value of the annual output of asbestos increased from less than \$25,000 in 1880 to \$14,792,201 in 1920 and \$13,172,581 in 1929. Owing to the current depression production has been curtailed during 1930-32 as will be seen in Table 29. In 1931 world production according to the estimate of the Imperial Institute amounted to about 248,000 long tons. Canada produced 164,296 short tons (146,693 long tons) valued at \$4,812,886, which was close to 60 p.c. of world production in that year. Other chief producers were: Russia, 66,000 long tons; Rhodesia, 21,466 long tons; Union of South Africa, 11,480 long tons and United States, 2,882 long tons.

Quebec.—The Eastern Townships has for many years been the most productive asbestos-mining area in the world. The most important deposits are at Black lake, in Coleraine township; at Thetford and Robertsonville, in Thetford township; at East Broughton, in Broughton township, and at Danville, in Shipton township. The veins of chrysotile asbestos traverse the serpentine in all directions, and as a rule the fibre lies at right angles to the walls of the veins. The veins vary in width from $\frac{1}{4}$ inch to $\frac{1}{2}$ inch and occasionally fibre has been obtained several inches in length. The fibre is of good quality and well adapted for spinning.

Open-cut methods of mining are those chiefly adopted throughout the Canadian asbestos fields. Nearly all the mining companies have installed machinery for the

crushing, fibrizing, screening and grading of the mine product. In addition, 10 plants in Canada manufacture asbestos products, including the following commodities: asbestos paper and mill board; asbestos roofing of all kinds; asbestos rigid shingles; asbestos building materials; asbestos cellular and sponge-felted pipe insulation; insulating sheets and blocks; asbestos brake linings and clutch facings (woven on special looms); and asbestos packings for steam, oil and hydraulic operations.

30.—Production of Asbestos in Canada, calendar years 1909-32.

NOTE.—Figures for the years 1896-1908 are given in the 1911 Year Book, p. 424.

¹ The quantity and value of sand, gravel and rock separated as a by-product in milling asbestos are included in the totals for 1924 and previous years, but are excluded in later years.

² Preliminary figures.

Gypsum.—Many large deposits of gypsum occur throughout Canada, but the production is chiefly from Hants, Inverness and Victoria counties, Nova Scotia; Hillsborough, New Brunswick; Paris, Ontario; Gypsumville, Manitoba; and Falkland and Mayook, British Columbia. The Hillsborough deposit of gypsum in New Brunswick is of very high grade. Nearly 50 p.c. of Canada's production is exported in crude forms from the Nova Scotia deposits, which are conveniently situated for ocean shipping and account for about 75 p.c. of the total Canadian production. Production of gypsum in Canada reached its highest point in 1928 with 1,246,368 tons valued at \$3,743,648. Production during 1931 was 863,752 tons valued at \$2,111,517 and preliminary figures for 1932 are 438,629 tons valued at \$1,080,379. The production by provinces during 1931 is shown in Table 5, p. 347.

Salt.—Practically the whole of the production comes from wells located in southwestern Ontario, but the Malagash deposits in Nova Scotia show an increasing production in recent years and some shipments have been made from deposits near McMurray in Alberta, while the first production in Manitoba of commercial importance was recorded in 1932. The deposits of Ontario occur in the Salina

formation of Upper Silurian age, in which the beds of the mineral sometimes reach a thickness of 250 feet. The Canadian production during the present century has shown fairly steady growth from 59,428 tons in 1901 to 91,582 in 1911, 164,658 in 1921, 262,547 in 1926 and a high record of 330,264 tons in 1929. Since then production has declined to 259,047 tons valued at \$1,904,149 in 1931 (see Tables 2 and 5 of this chapter) and 263,543 tons according to the preliminary figures for 1932.

Section 6.—Production of Clay Products and Other Structural Materials.

Brick and Tile.—Although the brick and tile industry is established in every province of the Dominion, production is naturally greatest near the chief centres of population, that is, in Ontario and Quebec. Here the widespread clays of glacial and post-glacial age occurring over considerable areas of the St. Lawrence Lowlands have furnished the materials for numerous brick and tile industries. Production fluctuates with building activity and reached its highest point in the year 1912. Since that time the gradual substitution of steel and reinforced concrete for brick has reduced the production of brick so that, while the value of construction undertaken in 1928 or 1929 is estimated to have exceeded that of 1912, the quantity of brick produced in the later years was only about half that of 1912. On the other hand, as will be seen from Table 31 below, the production and consumption of cement in 1929 greatly exceeded that of 1912 or 1913. The production of building brick of various types in 1930 and 1931 is shown in Table 2 of this chapter, while the production by provinces in 1931 is given in Table 5.

Cement.—The cement industry in Canada began with the manufacture of hydraulic or natural rock cement. The first production was probably at Hull, Quebec, between 1830 and 1840. The manufacture of Portland cement began about 1889. Owing to its superiority in uniformity and strength, it soon superseded the older product. Portland cement consists of an accurately proportioned mixture of lime, silica and alumina. The lime is usually furnished by limestone or marl, and the silica and alumina by clay or shale. The cement industry has naturally become established where these materials are situated and where fuel supplies and transportation are readily available. The largest production is in Quebec and Ontario, although there are also active plants in Manitoba, Alberta and British Columbia. As may be seen from Table 31, while production has declined somewhat since 1929, the industry still shows a healthy recovery from the unfavourable conditions from which it suffered during the War and early post-war periods. Whereas in pre-war years Canada was an importer of Portland cement she is now on balance an exporter of this commodity.

¹The barrel of cement=350 lb. or $3\frac{1}{4}$ cwt. ²"Production" as used here means quantity and value of sales. ³Quantities of exports were not recorded prior to 1921 and were insignificant prior to 1919. ⁴Preliminary figures.

Stone, Sand and Gravel.—While the Mineral Branch of the Dominion Bureau of Statistics presents details of the production and industrial organization of the stone industry separately from that of sand and gravel, for the sake of brevity they are here discussed together. Production of these materials has increased greatly in recent years and the expansion in the stone industry has been chiefly in crushed stone. Thus a production of crushed stone in 1922 of 3,044,399 tons had increased in 1930 to 8,062,330 tons, while in the same period the production of sand and gravel increased from 11,666,374 tons to 28,547,511 tons, used chiefly for railway ballast, concrete and road work and building sand. The preliminary figures for 1932 for stone are 4,803,910 tons and for sand and gravel, 12,599,706 tons. These figures reflect in general the curtailment of construction activities in 1932. Among the developments in Canada which have resulted in the increased production of these materials prior to the current depression may be mentioned: (1) the tendency for brick to be replaced by reinforced concrete, cement blocks, etc., as indicated above by a decline in brick production and an increase in that of cement; (2) the vast improvement during the past decade in the mileage and character of roads and highways in Canada; and (3) the improvement of railway road-beds.

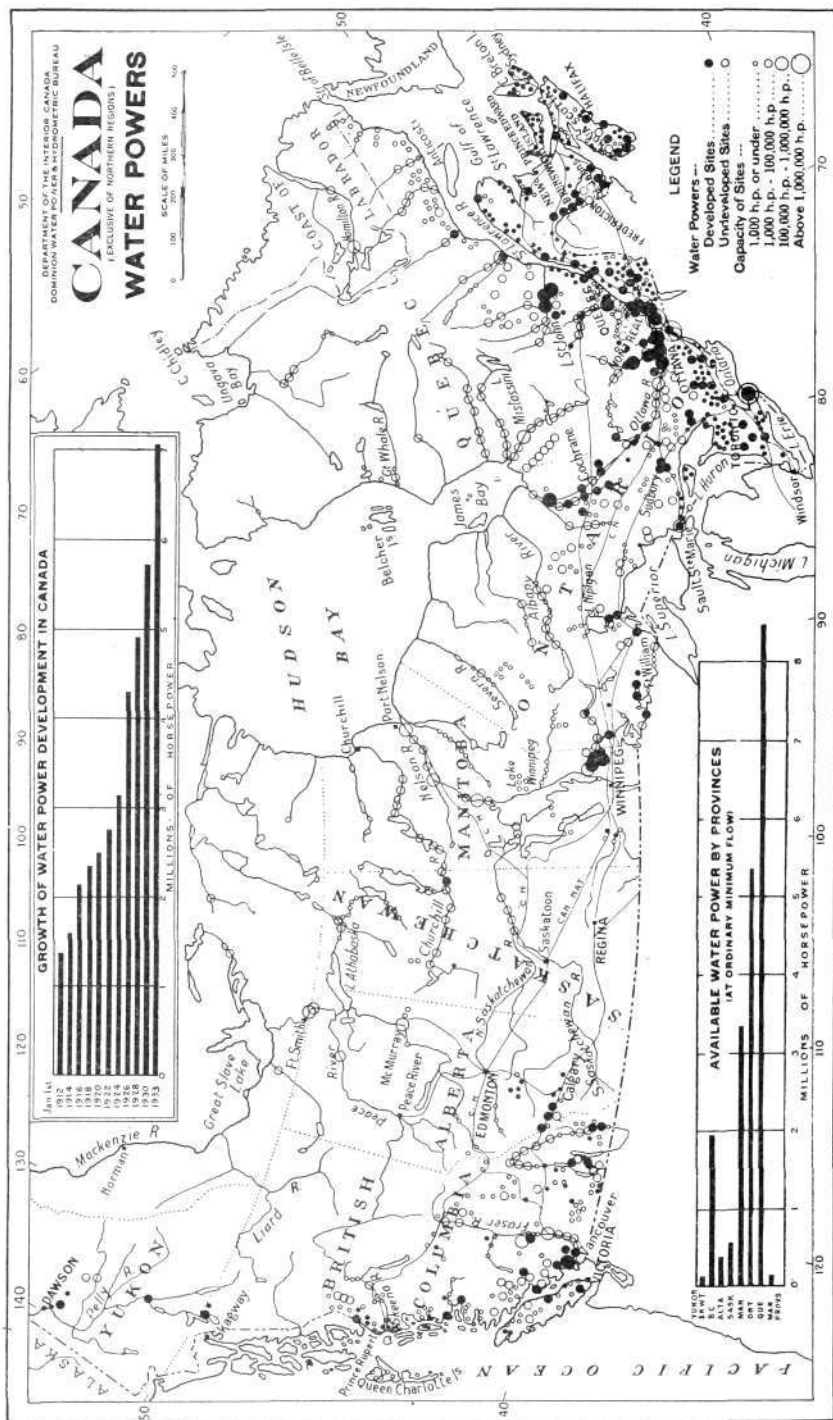

The provincial distribution of the 1931 production of stone, sand and gravel is shown in Table 5, while the chief purposes for which these materials were produced are shown in Table 32. The production of sand and gravel came chiefly from Quebec with 35 p.c., Ontario with 34 p.c. and British Columbia with 13 p.c. Of the stone Quebec produced 51 p.c. and Ontario 40 p.c., while Saskatchewan reported no stone production and Alberta less than 0.1 p.c. of the Dominion total.

†Totals include minor items not specified. ‡Totals include 150 tons of slate valued at \$3,000.

The quantities and values of stone produced, given in the table above, represent only the production of those establishments which actually quarry their own stone and are exclusive of the products of the stone-dressing industry comprising those establishments which buy rough stone and dress, polish or finish it; although frequently dressing operations are carried on right at the quarry and to that extent cannot be separated from the primary production. Of the total stone produced in 1931 over 74 p.c. was limestone, 14 p.c. granite, 11 p.c. sandstone and less than 0.3 p.c. marble. The average value per ton was \$1.01 for limestone, \$2.32 for granite, \$1.43 for sandstone and \$32.71 for marble. The marble was used chiefly for stucco dash, in pulp and paper mills and as dressed building stone. Of the other three kinds of stone by far the largest part was used as crushed stone.

CHAPTER XIII.—WATER POWERS.

The fresh-water area of Canada is officially estimated at 226,979 square miles—an area nearly twice as large as the whole land area of the British Isles, and certainly larger than the fresh-water area of any other country in the world. As many parts of this well-watered country are situated at a considerable height above sea-level, there are great sources of potential energy in the rapids and waterfalls of the rivers conveying the water from these areas to the sea. Water power, therefore, is among the chief natural resources of Canada, and its development has in recent years contributed materially to swell the volume of Canadian production.

This Water Power chapter of the Year Book is divided into three sections: the first describes our water powers, their development and use in industry; the second deals with the Canadian central electric station industry, which is based almost wholly upon hydro-electric power; the third treats of the public ownership of hydro-electric power in Ontario, the chief manufacturing area, and also describes the policies of the Hydro-Electric or Power Commissions in other provinces.

Section 1.—The Water Powers of Canada.¹

The progress of civilization in its material aspects may be measured by the extent to which the resources of nature are adapted to the uses of mankind. These resources yield, in the first instance, raw materials such as coal and iron, cotton and lumber, hides and wool, which enter into so many things that they are spoken of as basic commodities. Energy, until comparatively recently, was largely secured by the combustion of coal and was therefore looked upon as a secondary product, whereas, when produced from falling water, it is just as much a primary product as coal itself. Energy now enters so largely into the scheme of modern existence that it is recognized as a basic commodity. Statistics concern themselves with kilowatt hours of electrical energy produced just as with the production of pig iron, coal or cotton, and take note of undeveloped water power as being a source of raw material just as important as uncut forests or untapped oil fields. The relationship of power to production is of such vital consequence that every nation, besides considering its own power-producing resources, is deeply interested in the similar resources of other countries and the method of their development. To facilitate a study of world power conditions two Plenary World Power Conferences composed of representatives from 47 member states have already been held to consider the technical, economic and statistical aspects of power development. Arrangements for the future re-convening of such Conferences have been made.

Canada is richly endowed with water-power resources and is in the forefront as regards their utilization. In fact, practically every large industrial centre throughout the Dominion is now served with hydro-electric energy and has within practical transmission distance substantial reserves for the future. More than 95 p.c. of the total main plant equipment of the central electric stations of Canada is hydro-power, and this equipment generates more than 98 p.c. of the total electrical output. Indeed, water power is a mainspring of industrial progress in the central provinces, which have no indigenous coal supplies. Table 1 shows the provincial distribution of available and developed power in Canada at Jan. 1, 1933.

¹ By J. T. Johnston, Director, Dominion Water Power and Hydrometrie Bureau, Department of the Interior.

1—Available and Developed Water Power in Canada, by Provinces, Jan. 1, 1933.

Canada.....	20,347,400	33,617,200	7,045,260

The figures of available power in the above table are based upon rapids, falls and power sites of which the actual existent drop, or the head of possible concentration, is definitely known or at least well established. Innumerable rapids and falls of greater or smaller power capacity, not as yet recorded, are scattered on rivers and streams from coast to coast and will only become available for tabulation as more detailed survey work is undertaken and completed. This is particularly true of the less explored northern districts. Nor is any consideration given to the power concentrations which are feasible on rivers and streams of gradual gradient, where economic heads may be created by the construction of power dams, excepting only at points where definite studies have been carried out and the results made matters of record.

The turbine installation in the above table represents the actual water wheels installed throughout the Dominion, but these figures should not be placed in direct comparison with the available power figures for the purpose of deducing therefrom the percentage of the available water-power resources developed to date. The actual water-wheel installation throughout the Dominion averages 30 p.c. greater than corresponding maximum available power figures calculated at ordinary six months' flow. The figures quoted above, therefore, indicate that the "at present recorded water-power resources" of the Dominion will permit of a turbine installation of about 43,000,000 h.p. In other words, the present turbine installation represents less than one-sixth of the present recorded water-power resources.

The above figures may be said to represent the minimum water-power possibilities of the Dominion. To illustrate, detailed analyses of the water-power resources of the provinces of New Brunswick and Nova Scotia have disclosed most advantageous reservoir facilities for regulating stream flow. It is estimated that the two provinces possess within their respective borders 200,000 and 300,000 commercial h.p.

Recent Increase in Turbine Installation.—Table 2 shows the yearly increase in turbine installation, by provinces, from 1900 to 1932 inclusive. During the four years immediately preceding the War nearly 1,000,000 h.p. was installed, during the following eight years approximately the same installation was made, while in the latest ten years the gain was 4,036,915 h.p.

2.—Hydraulic Turbine Horse Power Installed in Canada, by Provinces, as at Dec. 31, 1900-32.

NOTE.—Turbine horse power in Saskatchewan is reported as 30 from 1910 to 1917, 35 from 1918 to 1929, and 42,035 from 1930 to 1932; installation in Yukon was 5 from 1900 to 1906, 2,085 in 1907, 2,095 in 1908, 3,195 in 1909 and 1910, 13,195 from 1911 to 1913 and 13,199 from 1914 to 1932. These figures are included in the totals for Canada.

Distribution of Developed Water Power.—An analysis is made in Table 3 of the distribution of developed water power among central electric stations, pulp and paper-mills and other industries. The extent to which pulp and paper manufacturing is dependent on water power is clearly shown by the figures below, which indicate that 8.5 p.c. of the developed power is installed by pulp and paper companies, in comparison with 4.7 p.c. developed by all other industries (excluding central electric stations). The pulp and paper industry also purchases a large amount of power from the central electric stations, and about 90 p.c. of its machinery is driven by water power. The bulk of the water power used in other industries is developed by central electric stations, converted into electricity and delivered to the various industrial plants.

During the past five years, from 1928 to 1932 inclusive, 2,246,343 h.p., or almost 32 p.c. of Canada's present total installation of 7,045,260 h.p., was installed. While no new developments of any considerable size were initiated during 1932, construction is continuing upon several large undertakings which will add materially to this total during 1933 and subsequent years.

3.—Developed Water Power in Canada: Distribution, by Provinces and Industries, and per 1,000 Population, as at Jan. 1, 1933.

Nors.—The figures in this table are preliminary and are subject to correction when official data are complete.

¹ Includes only hydro-electric stations which develop power for sale. ² Includes only water power actually developed by pulp and paper companies. In addition to this total, pulp and paper companies have motor equipment for operation by hydro-electricity purchased from central electric stations aggregating more than 1,007,000 h. p., making a total of more than 1,698,000 h. p. actually developed for the manufacture of pulp and paper. A considerable amount of off-peak power and surplus power is also purchased for use in electric boilers. ³ Includes only water power actually developed in connection with industries other than the central electric station and pulp and paper industries. These industries also purchase power from central electric stations. ⁴ As estimated by the Dominion Bureau of Statistics.

Section 2.—Central Electric Stations.¹

The rapid growth of the central electric station industry has been stimulated by the large demand for power from the manufacturing industries, particularly pulp and paper plants, and from the domestic and commercial light customers, and also by the many improvements in generating and transmitting equipment and in electric appliances and motors. In Table 4 will be found statistics of the number of central electric stations, capital invested, revenue from sale of power, total horsepower, kilowatt hours generated and number of customers for the 15 years ended 1931, together with the number of persons employed and the amount expended for salaries and wages. The total output for 1931 amounted to 16,330,867,000 kilowatt hours and, based on preliminary figures from the large stations, the total production in 1932 is estimated at 15,986,000,000 kilowatt hours, the decrease in the output of 344,867,000 kilowatt hours being more than accounted for in the exports to the United States, which declined by 667,879,000 kilowatt hours.

Large quantities of surplus, or off-peak, power were exported to the United States from the Niagara plants in 1930, but owing to industrial inactivity in Buffalo and contiguous municipalities the requirements for imported power so diminished that the export of off-peak power dropped from 402 millions in 1930 to 170 millions in 1931 and to less than one-quarter of a million kilowatt hours in 1932.

The rapid increase in the production of electric energy by central electric stations is largely due to the growth of the pulp and paper industry. In 1924 the central electric stations supplied power to motors in the pulp and paper mills with

¹ Revised by G. S. Wrong, B.Sc., Chief, Transportation and Public Utilities Branch, Dominion Bureau of Statistics. For a list of publications of this Branch see Chapter XXIX.

a total rating of 315,464 h.p. or 12.4 p.c. of all power equipment in manufacturing industries (the central electric station industry excluded). In 1930 this had increased to 993,024 h.p. or to 24.4 p.c. of the total power equipment in manufactures. Also the pulp and paper industry has been using an increasing amount of electricity for heating water. The capacity of electric boilers in this industry in 1931 was rated at 88,345 h.p. and the consumption of electric energy in these boilers amounted to 2,032,000,000 kilowatt hours. In pulp and paper mills practically all the electric energy is used 24 hours per day throughout the year, as against an average working day for other manufactures of 8 to 9 hours. Although the low rates are important factors in increasing the average consumption per capita for all purposes to 1,450 kilowatt hours (excluding exports), which is more than twice the average in the United States and over seven times the average in Great Britain, the large consumption by the pulp and paper industry, by mines and by electro-chemical industries are also important factors.

There are some interesting factors affecting the relative per capita consumptions of electricity from central electric stations in Canada and the United States. An abundant supply of low-priced coal in the industrial area of the United States, and no coal but an excellent supply of water power in the central provinces of Canada, tend to favour the generation of power in central stations in Canada more than in the United States. Again, the pulp and paper industry is proportionately a smaller industry in the United States than in Canada; on a power basis, the proportions are approximately 7 p.c. and 40 p.c. respectively. While the average consumption for domestic use is more than twice as high in Canada as in the United States, the total consumption for domestic or residential use is about 9.5 p.c. of the total output of central electric stations for Canada and 14 p.c. for the United States.

¹ Excluding non-generating stations in 1920 and subsequent years.

² Revised to exclude duplications.

³ Not including auxiliary plant equipment which is included in installation shown in central electric stations in Table 7 of the manufactures chapter, pp. 428 and 429.

Equipment of Central Electric Stations.—The main-plant primary power equipment of all central electric stations aggregated 5,706,757 h.p. in 1931. This included water wheels and turbines, steam reciprocating engines and turbines and internal combustion engines. The hydraulic power machines greatly predominated

over the other prime movers, providing 95 p.c. of the total capacity, with steam turbines, steam reciprocating engines and internal combustion engines making up the remaining 5 p.c. Not included in the above were steam engines and internal combustion engines with a capacity of 184,043 h.p., or 2.9 p.c. of the total power capacity, installed as auxiliary or standby equipment.

Central electric stations that have no water power, but are operated by steam and internal combustion engines, are on the whole small stations. Of the 66 main-plant steam reciprocating engines in central electric stations in 1931, only 12 in number, or about 18 p.c., were over 500 h.p. The steam turbines averaged over 3,620 h.p. with 15 units averaging 9,600 h.p., but there were only 66 steam turbines in the industry and these were confined to 27 stations, whereas the 790 water wheels and turbines averaged 6,860 h.p.

The majority of the fuel-using stations are primarily for lighting purposes, using the cheapest fuel procurable, generally local coal. In the Prairie Provinces bituminous and lignite coals are used for the steam engines, and gasolene, oil distillates and producer gas for the internal combustion engines.

Of the 317 main-plant internal combustion engines in central electric stations in 1931, 185, or 58 p.c., were in Saskatchewan, 51, or 16 p.c., in Alberta and 34, or 11 p.c., in Manitoba.

During 1931, the fuel stations produced 295,064,000 kilowatt hours at a cost for fuel of \$1,789,634, an average of 0.61 ct. per kilowatt hour. This production was, however, only 1.8 p.c. of the total output. The auxiliary equipment in central stations consumed fuel valued at \$102,618 and produced 10,469,000 k.w. hours.

Provincial Distribution of Electrical Energy.—The distribution by provinces of the electrical energy generated in central electric stations throughout Canada is shown in Table 6 for the calendar years 1927-31. In the latter year about 80 p.c. of the total generated electrical energy was produced in the leading industrial provinces of Ontario and Quebec. From Table 7 it is seen that

the total of electric energy generated for export in the fiscal year ended Mar. 31, 1932, was 1,008,398,958 kilowatt hours; in the calendar year 1931 it had amounted to 1,281,653,817 kilowatt hours, or 7.8 p.c. of the total amount generated in central electric stations.

Electric Light and Power.—Electric light and power companies are subject to registration and inspection under the Electricity Inspection Act, 1907 (6-7 Edw. VII, c. 14), and the production of electrical energy for export is regulated by the Electricity and Fluid Exportation Act, 1907 (6-7 Edw. VII, c. 16). Both Acts were administered by the Department of Inland Revenue until Sept. 1, 1918, when, by Order in Council of June 3, 1918, their administration was transferred to the Department of Trade and Commerce. (See cc. 54 and 55, R.S.C., 1927.)

Electrical energy produced for export increased from 538,331,425 kilowatt hours in the fiscal year ended Mar. 31, 1911, to 1,749,539,778 kilowatt hours in 1931 but fell to 1,008,398,958 kilowatt hours in 1932. Figures by companies for the last four fiscal years are given in Table 7.

² No exports March 1930 to January, 1931, inclusive.

Section 3.—Public Ownership of Hydro-Electric Power.

When, in the early years of the twentieth century, it became evident that the development of hydro-electric power would become a 'key industry' in Canada, more especially in its coal-less central provinces of Ontario and Quebec, a strong movement arose in favour of conserving the water powers of the country for the public benefit instead of allowing them to pass into the hands of private corporations. This 'public ownership' movement developed especial strength in Ontario and finally led to the establishment of the Hydro-Electric Power Commission, the operating statistics of which are given below. In more recent years, Manitoba, Nova Scotia, New Brunswick and Saskatchewan have established Hydro-Electric Commissions on the model of the Ontario system. In Quebec and British Columbia, on the other hand, the development of hydro-electric power has been left in the hands of private corporations.

Subsection 1.—The Hydro-Electric Power Commission of Ontario.¹

The publicly-owned hydro-electrical undertaking of Ontario—known in the province as the "Hydro"—is an organization of a large number of partner municipalities, co-ordinated into groups or systems for securing common action with respect to power supplies. It had its beginning in 1903, when, as a result of public agitation to ensure the provision of adequate supplies of electrical power for distribution throughout the province at low cost, seven municipalities united under statutory authority in appointing an investigating commission to deal with power problems. This commission, known as the Ontario Power Commission, completed its work in 1905, and in the same year the Ontario Government, by special Act, created the present Hydro-Electric Power Commission of Ontario. The operations of the undertaking have grown rapidly and in 1931 electrical service was supplied by the Commission to about 720 municipalities, comprising nearly all of the cities and towns of the province, as well as many small communities and rural areas.

The providing of the power, either by generation or purchase, its transformation, transmission and delivery to the individual municipalities and to large industrial consumers, and the operation of rural power districts are carried on by the municipalities acting *collectively* through their agent and trustee, the Hydro-Electric Power Commission of Ontario. The local operations involved in the retail distribution of the electrical energy to the consumers within the limits of the various urban municipalities are performed by the municipalities *individually* through municipal utility commissions acting under the general supervision of the Hydro-Electric Power Commission.

Capital required for plant to generate and transmit power is lent by the province, and the municipalities are under contract to repay, over a period of 40 years, the moneys thus lent, with interest in full. The local distribution systems are financed individually by the issue of municipal debentures. Provision is made, in the rates charged to the ultimate consumers, for revenue with which to retire these bonds in from 20 to 30 years. The rates at which power is supplied by the Commission to the various municipalities vary with the amounts of power used, the distances from the sources of supply, and other factors. The basic principle underlying the operations of the undertaking is the provision of service 'at cost'. The rates charged by the municipal utilities for retail service are under the control of the

¹ Revised by Arthur V. White, Consulting Engineer of the Hydro-Electric Power Commission of Ontario, Toronto, Ontario.

Commission and are designed to ensure that each class of consumer bears its appropriate share of the expenses of the undertaking. Each type of consumer is charged with the cost of the service he receives as far as is practicable.

Power Supplies.—To meet the constantly expanding power demands of the undertaking, the Commission has constructed its own generating plants, has made long-term contracts for the purchase of power from other organizations, and has acquired several privately-owned generating plants. Of the 38 hydro-electric power plants operated by the Commission in 1931, the largest is the Queenston-Chippawa development on the Niagara river which was constructed by the Commission and has a normal operating capacity of 525,000 h.p. Provision for the needs of the near future had been made at the end of 1931—including existing plants, plants under construction and power under contract for present and future delivery—up to an aggregate of about 2,000,000 h.p.

Hydro-Electric Power Commission Statistics.—The Canada Year Book of 1910 (p. xliii) described the turning on, Oct. 11, 1910, at Berlin (now Kitchener), Ontario, of electrical energy generated by Niagara falls. The small initial load of less than 1,000 h.p. increased rapidly and by 1915 had reached 100,000 h.p. In 1920 the total power distributed exceeded 350,000 h.p. and in 1930 it was over 1,260,000 h.p. Table 8 shows the growth of the co-operative municipal electrical undertaking of Ontario. It will be noted that the total capital of the undertaking, which includes investments of the Hydro-Electric Power Commission in power-producing and transmitting equipment, etc., and investments of the municipalities in distributing systems and other assets, aggregated about \$373,000,000 in 1931.

¹ In 1929 the Eastern Ontario system was formed as a consolidation of the Central Ontario and Trent, the St. Lawrence and the Rideau systems, and in 1930, the Ottawa and the Madawaska systems were also included. These former systems are now called districts.

The initial capital expenditure to serve some twelve municipalities amounted to about \$3,600,000. Table 10 shows for the past five years the capital investment in the respective systems of the undertaking and in the associated municipal undertakings.

For footnotes see footnotes to Table 10.

Statistics of Urban Municipal Electric Utilities of Ontario Supplied by the Commission.—The Commission exercises supervisory functions over the electrical utilities owned and operated by the partner municipalities, and has introduced a uniform accounting system which enables the Commission to present in its Annual Reports consolidated balance sheets and operating reports regarding these utilities. These statistics relate to about 90 p.c. of the retail customers supplied by the undertaking. Summary statistics regarding service to rural consumers are given in Table 14, p. 396.

Statistics of the assets and liabilities of the electric departments of urban municipalities served by the Hydro-Electric Power Commission are given in Table 12. These show, for 1931, total assets of \$125,537,858, as compared with liabilities of \$52,199,268. Of the difference, \$35,544,455 is allotted as reserves, leaving a surplus of \$37,794,135. The item "Equity in Hydro Systems", listed under both assets and reserves, relates to the sinking fund equity acquired by the individual municipalities in their collective generation and transmission undertaking administered by the Hydro-Electric Power Commission. All other items relate to the local distributing systems operated individually by the urban municipalities which are partners in the Hydro undertaking. In computing the percentage of net debt to total assets the equity in Hydro systems is not taken into account. It will be noted that whereas between 1927 and 1931 total assets have increased by \$33,601,974, total liabilities have increased by only \$4,912,112.

In Table 13 will be found details of the earnings and expenses of the electrical distributing systems of the urban municipalities served by the Hydro-Electric Power Commission, for the five years from 1927 to 1931. The first item of expense "power purchased" is the municipalities' share of the Commission's costs for generation, purchase, and transmission of the power in bulk; all other expenses and earnings relate to local distribution within the municipalities. A very rapid growth will be noted.

13.—Statement of Earnings and Expenses of Electric Departments of Urban Municipalities Served by the Ontario Hydro-Electric Power Commission for the calendar years 1927-31.

¹ Relates to rural service which is now given in "rural power districts"

Rural Electrical Service in Ontario.—During the past few years substantial progress has been made in Ontario in the field of rural electrification and the Commission's rural operations are now an important feature of its work. Towards this rural work the Ontario Government, pursuant to its policy of promoting the basic industry of agriculture, contributes, in the form of "grants-in-aid", 50 p.c. of the initial capital cost of distribution lines and equipment. In 1930 the Ontario legislature passed two additional Acts relating to rural service. The Rural Power District Loans Act, 1930, provides for advances up to \$1,000 to actual owners of lands and premises in rural power districts, for the installation of electrical wiring and the purchase of equipment. The Rural Power District Service Charge Act, 1930, provides for the fixing of low maximum service charges for all classes of rural service. In Table 14 will be found statistics relating to rural electrical distribution systems operated by the Hydro-Electric Power Commission. A rapid rate of increase is obvious from these statistics.

14.—Statistics Relating to Electrical Service in Rural Power Districts Operated by the Hydro-Electric Power Commission of Ontario, years ended Oct. 31, 1927-31.

NOTE.—*Re Rural Power District Legislation*, consult the following Provincial Government publications: *The Power Commission Act (R.S.O., 1927, c. 57)*; *The Rural Hydro-Electric Distribution Act (R.S.O., 1927, c. 59)*; *The Rural Power District Loans Act, 1930 (20 Geo. V, c. 14)*, and *The Rural District Service Charge Act, 1930 (20 Geo. V, c. 15)*.

Subsection 2.—Hydro-Electric and Power Commissions in Other Provinces.

Quebec.—The Quebec Streams Commission, originally created by 1 Geo. V, c. 5, and given additional powers by 3 Geo. V, c. 6 (see R.S.Q., 1925, c. 46) and by 20 Geo. V, c. 34, is authorized to ascertain the water resources of the province, to make recommendations regarding their control, and to construct certain storage dams and operate them so as to regulate the flow of streams. The Commission has not undertaken the direct production of electric power, but has assisted companies engaged in such work by a systematic collection of data on the flow of the principal rivers and on the meteorological conditions, by investigation of numerous water-power sites and determination of the longitudinal profile of a large number of rivers, but mostly by the regulation of the flow of the principal power streams, thereby increasing very materially the amount of power available. This regulation is obtained by constructing storage dams holding water in large reservoirs during flood periods and using it to increase the flow at low-water periods.

The Commission has built storage reservoirs on the St. Maurice river, where the low-water flow has been increased from 6,000 second-feet to 18,000 second-feet, on lake Kenogami, the St. Francis, the Métis, the Ste. Anne de Beaupré and the North rivers. The entire cost to the Commission of these storage works has been about \$9,000,000 and the annual revenue exceeds \$750,000.

Other reservoirs which are the property of the Commission and are operated by that body have been built and paid for by the benefiting companies instead of being financed by the Commission, namely:—

In the Gatineau River watershed two large storage reservoirs, Baskatong and Cabonga, were completed in 1927 and 1929, with a combined capacity of 140 billions of cubic feet, making it possible to increase the flow of the Gatineau river from 3,000 second-feet to 10,000 second-feet. This work was paid for by the Gatineau Power Co.

On the Lièvre river, a storage reservoir of 18 billions of cubic feet was completed in 1930 at Cedars Rapids, one mile and a half above Notre-Dame-du-Laus and will be operated to maintain a regulated flow of 3,500 second-feet at High Falls. The cost of this dam was paid by the James MacLaren Co., of Buckingham.

On Mattawin river, St. Maurice District, a storage reservoir of 33 billions of cubic feet was built in 1930 at Taureau rapid, 80 miles from the mouth of the river, with a view to a better and more complete regulation of the flow of the St. Maurice river. This work was paid for by the Shawinigan Water and Power Co.

Nova Scotia.—The Nova Scotia Power Commission was created in 1919 with powers similar to those of the Ontario Commission. It is authorized to "generate, accumulate, transmit, distribute, supply and utilize electrical energy and power in any part of the province of Nova Scotia, and do everything incidental thereto or deemed by the Commission necessary or expedient therefor". Its main operations, however, are undertaken with the approval of the Lieutenant-Governor in Council.

The Commission has already constructed several important hydro-electric developments and is now operating the following systems: *St. Margaret's Bay*—sells power by wholesale in Halifax and vicinity; *Mushamush*—sells power by wholesale and retail in Lunenburg Co.; *Sheet Harbour*—sells power by wholesale in Pictou Co., supplies demands of a groundwood pulp-mill at Sheet Harbour, retails in Sheet Harbour and in Musquodoboit valley and is extending retail service to Stewiacke valley, and is extending to serve town of Truro; *Mersey System*—supplies demands of pulp and paper-mill at Brooklyn, Queens Co.; *Markland System*—supplies town of Liverpool, Caledonia valley and places in vicinity, including woodworking factory and that of a gold mine; *Tusket System*—sells power by wholesale in Yarmouth, also supplies demands of Cosmos Imperial Mills, Ltd., at Yarmouth; *Roseway System*—sells power wholesale in Shelburne; *Antigonish System*—supplies Antigonish town, and other communities in Antigonish Co.

The total installed capacity is 62,875 h.p., and there are about 235 miles of main transmission lines and 121 miles of secondary transmission and distribution lines. The total capital expenditure to Sept. 30, 1932, was \$13,626,740 and the reserves were \$1,297,474.

New Brunswick.—The New Brunswick Electric Power Commission operates under authority of 10 Geo. V, c. 53, and amendments thereto, and has powers somewhat similar to those of the Hydro-Electric Power Commission of Ontario, except that the plant and equipment operated by the Commission are the property of the province and not of the municipalities.

The Commission owns and operates an 11,000 h.p. hydro-electric plant at Musquash, twelve miles west of Saint John, and purchases auxiliary power from the New Brunswick Power Co. at Saint John and the Bathurst Co. Ltd. on the Nipisiguit river. It operates 100 miles of 66,000 volt line between Musquash and Moncton, 37 miles of 32,000 volt line from Nipisiguit to Newcastle, together with 500 miles of primary distribution lines.

The Commission also has a powdered fuel plant at Newcastle Creek on Grand lake. This plant has an initial installed capacity of 5,000 k.w. The plant was placed in operation Sept. 1, 1931, supplying power to Fredericton and Marysville by means of a double circuit 33,000 volt transmission line. The plant is also connected with the Musquash system by means of a 66,000 volt transmission line from Minto to Moncton. This line was placed in operation Nov. 15, 1931.

The Commission sells power *en bloc* to Saint John, Moncton, Sussex, Newcastle and Fredericton; it retails directly in several towns and villages between Saint John and Dorchester, also between Moncton and Shediac, Moncton and Albert,

and along the Saint John River valley from Saint John to Gagetown, and from Fredericton north a distance of 18 miles and south a distance of 12 miles. This system serves, directly or indirectly, about 22,000 customers. The total plant investment of the Commission amounts to \$6,000,000 and the total annual revenue is about \$650,000.

Manitoba.—The formation of the Manitoba Power Commission was authorized by the passage of the Electrical Power Transmission Act of 1919 (c. 30, also c. 61 Consolidated Amendments, 1924) which authorizes the Commission to make provision for generating electrical energy, to enter into contracts for the purchase of power in bulk from generating agencies, and for its transmission and sale to municipalities, corporations and individuals. In 1929 legislation was passed whereby the Government undertook to pay interest charges and sinking fund charges on an amount not exceeding 50 p.c. of the capital cost of the construction and erection of equipment required for the generation and transmission of electrical power or energy to municipalities, farms and other customers.

The Commission has built and is now operating an extensive transmission system under authority of the above Act, supplying electrical power to many thousands of customers throughout Manitoba. This power is purchased under the Seven Sisters power contract from the Northwestern Power Co. and transmitted over high tension steel-tower lines to Portage la Prairie, Brandon and Morden. From this main system power is transmitted to the territory south of the Winnipeg-Brandon main line as far as the International Boundary.

A branch system serving the territory along the western boundary of the province, including the towns and villages of Reston, Pipestone, Melita, Napinka, Elkhorn, Miniota, Crandall and Arrow River, has been constructed and is operated by the Commission. This system which, until August 1931, was supplied with power generated by the Commission's plant at Virden, is now tied into the main system and supplied with power generated at Seven Sisters.

Under the authority granted by the Electrical Power Transmission Act of 1919, the Commission has made purchases of municipally-owned plants—notably at Birtle and Brandon—or entered into contracts for the supply of power by municipally-owned plants—as at Dauphin—or by the Winnipeg Electric Co., whereby power is supplied to outlying districts. This phase of the Commission's activities has shown steady growth and in 1931 several extensions were made.

The Commission owns and operates the central steam-heating system at Brandon, supplying heat to the business and part of the residential section of the city. The Commission also owns and operates the gas plant supplying gas to commercial and residential customers. It is the intention of the Commission to supply all outlying power areas from the main system just as soon as their loads are sufficient to justify the cost of building extensions.

Saskatchewan.—The Saskatchewan Power Commission was established in 1929 under the Power Commission Act (R.S.S., 1930, c. 30), authorizing the Commission to manufacture, sell and supply electrical energy, to acquire and develop water-power sites, to acquire or construct steam and oil plants, to construct transmission lines, to purchase power and to enter into contracts with municipalities for the supply of energy. The Commission is also given certain control and regulatory powers *re* the operation of electric public utilities, and is charged with the responsibility for the administration of The Electrical Licensing Act (R.S.S., 1930, c. 214).

The initial operations of the Commission were concerned with acquiring by purchase municipally-owned plants which were improved, enlarged or supplemented by installations made by the Commission and were operated as individual systems of supply. Examples of such acquisitions made in 1929 were the Saskatoon, Humboldt, and Rosthern plants, while the plant at Shellbrook, the Wynyard-Elfros-Wadena and the Leader-Prelate-Sceptre systems, served from plants at Wynyard and Leader, were established by the Commission in the same year. In 1930 the municipal plants at North Battleford, Swift Current, Unity, Maple Creek and Lanigan were acquired, and in 1931 the generating plant at Willow Bunch was added. The Watrous-Nokomis system, including ten towns and villages, was also purchased from Canadian Utilities Ltd., and has been connected with the Bulyea system of the Montreal Engineering Co., Ltd.

Transmission lines run from Saskatoon, as the centre of the main system, easterly to Humboldt, northerly to Shellbrook and Duck Lake, westerly to Radisson, and southwesterly to Rosetown. Additional lines link Rosetown with Moose Jaw and Tisdale, where the Commission has a generating plant, with Nipawin. The systems built in 1929 have been extended. All transmission lines supply towns and villages along their courses. There are now 1,322 miles of transmission lines owned and operated.

The Commission purchases several blocks of power or contracts for the interchange of power from private interests in addition to supplying energy generated at its own plants. The number of consumers served directly in 117 towns and villages is approximately 7,850 and those indirectly served (where the cities operate the distribution systems) number 16,124. The total plant investment as at Dec. 31, 1931, was approximately \$7,260,000.

British Columbia.—British Columbia as a province has not, up to the present time, established any commissions for the development and use of water power for the distribution of electrical energy. Such power developments as have been undertaken to date have been by private interests or by municipalities. The Water Board, a quasi-judicial body, regulates the rates which are charged by public utility companies.

CHAPTER XIV.—MANUFACTURES.¹

Manufacture is defined as the operation of making wares from raw materials by the hands, by tools or by machinery, thus adding, in the phraseology of the economist, new utilities, and therefore additional value, to the already existing utilities and values of the raw material. Manufacture, in primitive societies and in the pioneer stages of new communities, is normally carried on within the household for the needs of the household, as was the case among the early settlers of Canada in the seventeenth and eighteenth centuries, when domestic manufactures were carried on in combination with the cultivation of the soil, mainly at the times of the year when agricultural operations were suspended. At a later period in the evolution of society small manufactures were carried on in specialized workshops for the needs of the immediate locality or neighbourhood, as was generally the case in Eastern Canada in the first half of the nineteenth century. Later still, as a consequence of the introduction of machinery operated by steam or electric power—the so-called “industrial revolution”—and of the cheapening of transportation, manufacture has to an ever-increasing extent been concentrated in factories, often employing hundreds and even thousands of persons and producing for a national or even an international market. So far as Canada is concerned, this “industrial revolution” may be said to have commenced shortly before Confederation and to be still in progress. The growth of manufacturing production since 1870 is outlined in this article and the accompanying Table 1, while the increasing importance of Canadian manufacturing for the international market may be illustrated by the fact that Canadian exports of manufactured produce increased from less than \$3,000,000 per annum on the average of 1871-1875 to \$614,000,000 in the post-war fiscal year ended Mar. 31, 1920. Exports of “fully or chiefly manufactured” products in the fiscal year ended Mar. 31, 1931, amounted in value to \$352,108,830 and exports of “partly manufactured” products to \$142,452,920.

Section 1.—The Evolution of Canadian Manufacturing Industries.

Early Manufactures.—The type of manufactures established in a community will in the beginning be largely determined, more especially where transportation charges are high, by the raw materials available in that community. For example, probably the first agricultural process to be carried on by Europeans in what is now the Dominion of Canada was the raising of a crop of grain at Port Royal, Nova Scotia, in 1605; the first corresponding manufacturing process was the grinding of the grain in the autumn of that year. Other early manufactures were also necessarily connected with the satisfaction of the primary needs of human beings for food, clothing and shelter, and with the other primary need for protection. At a census of occupations taken in 1681, we find enumerated a comparatively large number of tailors and shoemakers, masons and carpenters, gunsmiths and edge-tool makers.

The earlier manufactures were necessarily of a rather crude and primitive type, concerned with the production of commodities which were too bulky to bear the heavy transportation charges of those days, when only one round trip per year

¹ Revised by A. Cohen, B. Com., Acting Chief, Industrial Statistics Branch, Dominion Bureau of Statistics. This Branch publishes individual reports on the manufacturing industries, comprising vegetable products, textiles and miscellaneous industries, also reports on the manufacturing industries generally for Canada and the provinces. For a complete list of publications of this Branch see Chapter XXIX, Section 1, under “Production”

could be made between France and Quebec, and vessels were constantly subject to the storms of the North Atlantic and very frequently to the attacks of the English. Indeed, although the colonial policy of France under the old *régime* aimed at preventing the manufacture in Canada of any article which could be imported from the Mother Country, the uncertainties of transportation due to the colonial wars of the period—France and England were at war for 34 years out of the 74 years between 1689 and 1763—led to a necessary relaxation of restrictions. On the occasion of the English capture of a convoy in 1705, the colonists were driven to manufacture rough cloth out of whatever fibres they could obtain, such as the Canadian nettle and the inner bark of the basswood. Such events led to the introduction of sheep raising and the manufacturing of homespun woollens. The number of sheep in the colony increased from 1,820 in 1706, to 12,175 in 1720, 28,022 in 1765, 84,696 in 1784 and 829,122 in Lower Canada alone in 1827. This increase in sheep approximately measures the growth of the manufacture of homespun woollens. In the same year, according to census records, there were in Lower Canada 13,243 spinning-wheels, while 1,153,673 French ells of home-made cloth, 808,240 French ells of home-made flannel and 1,058,696 French ells of home-made linen were produced. In 1842 Upper Canada produced 433,527 yards of home-made cloth, 166,881 yards of home-made linen and 727,286 yards of home-made flannel and, in 1848, 624,971 yards of fulled cloth, 71,715 yards of linen and 1,298,172 yards of flannel. Nova Scotia in 1851 produced 119,698 yards fulled cloth, 790,104 yards non-fulled cloth and 219,352 yards flannel. Such production of homespun goods did not materially interfere with the market for the more elaborate factory-made goods imported from the United Kingdom, but supplied the daughters of pioneer families with useful work in their own homes.

In the days when ships were built of wood Canada was advantageously situated with respect to their production. Pont-Gravé built two small vessels at Port Royal in 1606 and one at Tadoussac in 1608. Talon, in 1666, built on his private account a ship of 120 tons, and in 1672 a vessel of over 400 tons was on the stocks at Quebec. Ships were built for the French navy and for the West India trade. Under the British *régime* shipbuilding was conducted on a large scale in Quebec and New Brunswick, the industry reaching its climax of prosperity about 1865, when 105 Quebec-built ships with a tonnage of 59,333 were placed on the register. Thereafter iron and steel ships gradually supplanted the wooden vessels, but the forests of Canada have since provided the raw material for the pulp and paper and other important industries.

The manufacture of mineral products has been of comparatively recent date. Iron deposits in the St. Maurice region were worked as early as 1733 and furnaces set up there for smelting in 1737 were in fairly constant operation until 1883. The iron and steel used in manufacturing in Canada, as well as the coal which has supplied the manufacturing industries with power, has in the main been imported from the United States, chiefly because the principal manufacturing centres of this country in the St. Lawrence and Great Lakes region are fairly conveniently situated with regard to the coal and iron supplies of the United States and far away from the coal and iron supplies of the Maritime Provinces. In recent years the shortage of coal has been made up for by the increasing use of electric power, while the great bulk of the pig iron used in Canadian manufactures is now made in domestic blast furnaces.

The Introduction of the Factory System.—In Canada, as in the United States and in Great Britain, it was inevitable that manufactures, carried on in the household or in small adjoining workshops, should be supplanted in the leading

industries of the country by manufactures carried on in factories. A factory has been defined as "an establishment where several workmen are collected for the purpose of obtaining greater and cheaper conveniences for labour than they could procure individually at their homes, for producing results by their combined efforts which they could not accomplish separately and for preventing the loss occasioned by carrying articles from place to place during several processes necessary to complete their manufacture". Such factories began to exist in Canada in the 60's and the 70's of the last century and have now become the dominant type of Canadian manufacturing industry.

Encouragement of Manufactures by Protective Tariffs.—In all new and developing countries producing food products and raw materials in abundance, there comes, at a certain stage, a movement for working up these commodities within the country. Thus a movement to promote a rise of manufacturing industries in Canada took place in the 50's of the last century, and in 1858 the Canadian Legislature enacted a protective tariff against which English exporters of manufactured goods vehemently protested. Canada, however, claimed the right to raise her revenue in the manner which suited herself and Great Britain did not contest the point. From that day to this there has been an element of protection in Canadian tariff legislation. For a considerable time the protection afforded to Canadian manufacturers was described as "incidental protection", and after Confederation the tariff was reduced in deference to the low tariff sentiment prevailing in the Maritime Provinces, which were commercial rather than manufacturing communities. However, after a commercial depression which took place in the 1870's the people of Canada, at the general election of 1878, voted in favour of a higher tariff.

The policy of protection was definitely adopted in 1879, when the manufacturer was given an increase in the duty on his finished product, offset in some cases, it is true, by higher duties on his raw materials. Sugar and molasses products comprised some twelve tariff items, seven bearing a compound duty, the average *ad valorem* duty imposed being 26.25 p.c. On the lines of cotton goods likely to be manufactured in Canada duties were raised from 17½ p.c. to rates, specific and *ad valorem* equivalent, on the importations of 1891, to 30 p.c. The duties on woollens, which were all in the 17½ p.c. schedule in 1878, were practically doubled. On some of the 36 iron and steel articles enumerated in the schedule the duties were specific, on some compound, but on the whole there was an average duty of 16.17 p.c. Pig iron, previously free, was made to pay \$2 a ton. The duty on iron billets, bars and rods was increased from 5 p.c. to 10 p.c. and 17½ p.c., while manufactured iron and steel products and machinery were given 25 p.c. to 35 p.c. protection. On coal, both bituminous and anthracite, a duty of 50 cents a ton was imposed. The average *ad valorem* rate of duty on dutiable imports in 1880 was 26.1 p.c. as compared with 21.4 p.c. in 1878. The maximum percentage was reached in 1889, when the rate was 31.9 p.c. By 1896 there was a slight drop in the rate to 30.0 p.c. and the declining trend continued until 1918 and 1919, when a rate of 21.5 p.c. was recorded. In 1923 the rate was 24.9 p.c., in 1927, 24.1 p.c., and in 1930, 24.3 p.c. The average *ad valorem* rate of duty on all imports was 16.7 p.c. in 1923 and 15.9 p.c. in 1930. These rates are based on the gross sums collected; if the refunds and drawbacks were allowed for, the net rate of customs duty would be substantially lower.

Growth of Canadian Manufactures Prior to the War.—Until the later '90's, the growth of Canadian manufacturing industries was not particularly rapid, though the great fall in the prices of commodities during the period from 1873 to

1897 was largely responsible for the comparatively slow growth of the values of manufactured commodities from \$221,600,000 in 1870 to \$469,800,000 in 1890. Afterwards there was a change and the prices of commodities commenced to rise, while the industries generally shared in the advantages of the great growing period from 1900 to 1912. The gross product of establishments with five hands or over increased from \$368,700,000 in 1890 to \$1,166,000,000 in 1910 and to \$1,381,500,000 in 1915. The fundamental advantages of the position of Canada, her abundant raw material, her inexhaustible water power, her growing home market in the expanding West, had contributed to this result.

In the present, as in the past, Canadian manufacturing production has been chiefly dependent upon the use of Canadian raw material, though this is less true than formerly. Raw cotton, for example, is imported from the Southern States, hides from Argentina, rubber from the Straits Settlements and Malay peninsula, sugar from Fiji and the British West Indies, and wool from England, Australia and New Zealand to supply the raw material for Canadian manufacturing industries.

The Influence of the War.—The influence of the War upon the manufactures of Canada was profound and far-reaching, tending to promote the diversification of products and the production at home of many commodities which had previously been imported. On account of the practical suspension of the importation of manufactured goods of many kinds from Europe, enterprising Canadian manufacturers were given opportunities of entering upon new lines of manufacture with practical control of the market. There was added to this the reflex effect of the great prosperity of agriculture, produced by the unprecedented prices of war time, with the general result that industry worked at high pressure, not only to produce munitions and military supplies for the armies of the Allies, but also to make the manifold varieties of goods required for the stimulated civilian consumption. The world shortage of staple commodities, coupled with a strong domestic demand, gave Canadian industries in general a pronounced stimulus toward greater production and, in a great number of cases, the capacity of manufacturing plants was increased; this increase created a demand for greater supplies of raw material. Incidentally, factory methods became more specialized and a high degree of administrative and mechanical efficiency was attained, and Canada, partly owing to the absorption of the energies of Europe in the War, assumed a new position as one of the leading manufacturing countries of the world. The inflation of the war period also led to unprecedented figures of values produced.

The great boom in Canadian manufactures described above reached its height in the summer of 1920, statistics for that year showing a gross value of products which was not exceeded until 1929. Even the net value of manufactured products in 1920 was not exceeded until 1928. Statistics for 1921, as published in Table 1, show a great decline in values from those of 1920, which does not mean a corresponding decline in quantity of production, though a certain decline undoubtedly took place. There was also some decline in 1922 followed, however, by a general improvement during 1923. Final statistics for 1924 were a little below those of 1923. The statistics for 1925, 1926, 1927, 1928 and 1929 show a steady and notable growth in both gross and net values of products. These values in 1929 reached a higher point than in the post-war boom of 1920, although the prices of manufactured goods had dropped about 41 p.c. in the intervening period. This steady expansion was halted during 1930, owing to the world-wide recession in business which set in toward the end of 1929, with the result that Canadian manufacturing production in

1930 dropped back to near the 1927 level in gross value of production. The 1931 figures show a smaller gross production than in any year since the inclusion of the non-ferrous smelting industry in 1925.

Subsection 1.—Growth of Manufacturing Production in the Dominion and the Provinces Since 1870.

The growth of large-scale production in manufactures during the past half-century is evident from the statistics of Table 1, though this tendency has been less marked in Canada than in more highly developed industrial communities, with larger populations able to absorb a larger amount of standardized commodities. Even so, in the electoral district of South Toronto, the most important manufacturing centre of Ontario, the census of 1911 showed that one-half of the industrial establishments employed 90 p.c. of the workers. In the period immediately preceding the Great War many consolidations of independent manufacturing plants were effected, with large economies in the purchase of materials and in selling expenses, and this process has been even more evident in the post-war period.

The historical Table 1 shows fairly well the advance of the "Industrial Revolution" (which might better be called "evolution") in Canada. The average capital per manufacturing establishment, the average number of employees per establishment and the average value of product per establishment, if allowance be made for the inflation of values and generally disturbed conditions of the war period, have continued to increase. If the consolidation of industry lessens the chances of an employee becoming an employer, it must be remembered that the amounts paid to employees in salaries and wages have also increased, so that the position of the average employee has been greatly ameliorated, though the lack of statistics of Canadian retail prices before 1890 prevents any detailed comparison of the purchasing power of the average wages of the worker of 1870 and of the employee of the present time.

The Censuses of Manufactures.—The comparability of the statistics of various censuses is seriously affected by the different methods employed in census-taking. In the censuses of 1870, 1880 and 1890, all manufacturing establishments were included, the instructions to enumerators running as follows: "An industrial establishment is a place where one or several persons are employed in manufacturing, altering, making up or changing from one shape into another materials for sale, use or consumption, quite irrespectively of the amount of capital employed or of the products turned out. All repairs, mending or custom work are understood to be industrial products and are to be entered accordingly, by value, in the returns of industrial establishments"

In the statistics of 1900, 1905 and 1910, however, only establishments employing five hands and upwards were included. The 1901 instructions were that no manufacturing establishment or factory was to be recognized for census purposes if it did not employ at least five persons, either in the establishment itself or as piece-workers employed outside of it. This, however, did not apply to cheese and butter factories nor to certain mineral industries. The 1911 instructions stated that every factory in operation during the whole or part of 1910, and employing five or more persons, was to make a full report. All flour mills, saw and shingle-mills, lime kilns, brick and tile works, butter and cheese factories, fish-curing plants, electric light and power plants whatsoever were nevertheless to be included. The statistics

for 1915 included only establishments having an output of \$2,500 or over, irrespective of the number of persons employed, except in the case of flour and grist mills, butter and cheese factories, fish-preserving factories, sawmills, brick and tile yards, lime kilns and electric light plants, where all plants were included.

Censuses of Manufactures in Recent Years.—Under the Statistics Act of 1918, the policy of including mines, fisheries, manufactures and other industries in the decennial census was given up and an annual "Census of Industry" substituted therefor. (See Annual Report of the Dominion Statistician, 1919, pp. 30-36.)

In the Census of Industry for 1917 the limit of output was withdrawn and all establishments reporting to the Bureau were included, the effect being an increase in the number of establishments included from 21,306 in 1915 to 34,392¹ in 1917—an increase due mainly to change of method, rather than to a change in the actual number of industrial establishments existing in the Dominion. The statistics in regard to a large number of the custom and repair industries were not collected for 1922, resulting in the dropping from the compilation of the entire group of "construction, hand trades and repairs". For 1923, again, statistics of ship- and bridge-building and of various clay products industries were collected and included for the first time. The result was that, in order to restore the desired comparability between statistics of various years, a complete revision of all figures from 1917 to 1924 had to be made. Considerable changes have resulted, but statistics of these years are now free of all inaccuracies due to changes in methods of collection or compilation. In 1925 statistics of the non-ferrous metal smelting industry were, for the first time, included in the figures for manufacturing. Certain duplications in the revenues of central electric stations have not been uniformly treated, but net revenues only are now shown for 1926 and later years. The method of compiling the number of employees was changed for 1925 and subsequent years in the following respect: the yearly average of employees for each establishment was computed by dividing the sum of employees reported in each month by the number of months in operation instead of, as formerly, by 12 whether the industry was seasonal and only operated part of the year or not. These changes have created a slight incomparability with the statistics for the preceding years.

In any comparison between the results of the 1915 quinquennial census and the subsequent annual censuses, the rapid rise and fall in prices must be borne in mind, and in comparisons between these annual censuses themselves the same factor must be taken into account. Thus, the new Canadian weighted index number of wholesale prices, compiled by the Dominion Bureau of Statistics with 1926 as a base, was 155.9 in 1920 as compared with 134.0 in 1919, 127.4 in 1918, 114.3 in 1917 and 70.4 in 1915. In 1921, however, there was a great decline to 110.0—a decline of approximately 29.4 p.c. from the preceding year. In such circumstances, it was inevitable that up to 1920 phenomenal advances in the money value of manufactured products should have been recorded, and that wages and salaries paid should also have greatly advanced since 1915. It was equally inevitable that in all these respects 1921 should show a great decline, due in much larger measure to the fall in values than to the decrease in the volume of production. In 1922 the index number showed a further drop to 97.3, but afterwards there was a rise to 98.0 in

¹The subsequent decision to omit the group of "construction, hand trades and repairs" from the Census of Manufactures, together with other less important changes, accounts for the reduction of the number of manufacturing establishments in 1917, as appearing in Table 1, to 22,838, a comparable figure with the 23,587 establishments recorded in 1929, the 24,020 in 1930 and the 24,501 in 1931.

1923, to 99.4 in 1924 and 102.6 in 1925. In 1926, 1927, 1928, 1929 and 1930, however, there was a declining trend again to 100.0, 97.7, 96.4, 95.6 and 86.6, respectively, this last being the lowest figure since 1916. This would indicate that the comparatively small decline in the gross production of manufactured goods in 1922 was entirely due to declining values. Gross production in 1926, 1927, 1928 and 1929 showed large increases in spite of a definite decline in price levels, while the sharp decline in prices during 1930 was also accompanied by some diminution in the volume of manufacturing as well. (See Table 5.)

In Table 1 summary statistics for the Dominion only are presented for the years 1870 to 1931, while Tables 2 and 3 give statistics by provinces and industrial groups for the years 1920, 1922 and 1925 to 1931 inclusive.

1931.....	24,501	4,961,312,408	557,426	624,545,561	1,223,880,011	1,474,581,851	2,696,461,582

¹Certain duplications in the gross revenue of central electric stations were eliminated in a net figure and the difference shown as a "cost of material" for the years 1926-29, but net revenues only are now included for both gross and net values for those years. Therefore the figures here given differ slightly from those formerly published.

2.—Summary of Statistics of Manufactures, by Provinces, 1920, 1922 and 1925-1931.

NOTE.—See note to Table 3 p. 408. Statistics for certain years from 1917 to 1924 omitted here are given on pp. 407-9 of the 1931 Year Book.

3.—Summary of Statistics of Manufactures, by Industrial Groups, 1920, 1922 and 1925-1931.

Note.—Figures for the Chemical Group published in this table do not correspond with those published in the Annual Report on Chemicals and Allied Products for the following reason. In the report on Chemicals and Allied Products the figures for 1920 to 1928 have been revised and are directly comparable with those given for 1929 and 1930. Prior to 1929 the industry totals included the value placed on intermediate materials and products which were made and used in further processes in the producing works. In 1929 this policy was altered to exclude these intermediates and the figures have been revised on this new basis. Statistics of the non-ferrous metal smelting industries were included in manufactures for the first time in 1925. See footnote to Table 1 p. 406. Statistics for certain years from 1917 to 1924 omitted here are given on pp. 410-12 of the 1931 Year Book.

¹A change in the method of computing the number of employees in 1925 and later years increased the number somewhat over that which the method previously used would have given. There was therefore a proportionate reduction in the averages for 1925 and later years per employe and wage-earner, as compared to what these averages would have been under the former method.

²The figures of power in this table represent the installation in manufactures exclusive of central electric stations, which are also excluded from the number of establishments and of employees in working out the averages. These figures are thus not comparable with those given on pp. 384-385 in the 1926 Year Book.

³These are piece workers employed outside the establishments and are not included in general statistics of number of employees or of earnings.

Subsection 2.—Summary Statistics of Manufacturing Production.

Summary Statistics of Manufactures.—In Table 4 will be found an analysis of the most important statistics of manufactures for the eight years 1922 and 1924-30 here brought together in order that the tendencies in Canadian manufacturing industries may be traced as clearly as possible through this latest period of their development. Corresponding figures for the years from 1917 to 1922 were given at p. 384 of the 1926 Year Book, but the inflation of values in the war and immediate post-war periods makes the figures for these years largely incomparable. One very important figure, however, where the trend of development proceeds clearly and uninterruptedly throughout the 13 years, is concerned with the use of power. In the analysis here given the aim is to show the position of power as a factor in general manufacturing production. Therefore the power installation of central electric stations has been excluded. Unfortunately this was not done for the earlier years shown in the 1926 Year Book. When this change is made it will be found that the total horse-power employed increased from 1,664,578 in 1917 to 4,051,744 in 1930 or by 143 p.c. in 13 years. In the same period the horse-power used per establishment increased from 75 to 176 and the horse-power per wage-earner from 3.04 to 7.49, indicating the rapidly increasing contribution of power to manufacturing production. The increases from \$143,929 to \$216,624 in average capital per establishment between 1922 and 1930, and from 21.1 to 26.8 in average number of employees are very significant figures.

Value of Products.—The gross value of manufactured products in 1930 was reported as \$3,428,970,628; the cost of materials was \$1,666,983,902, leaving \$1,761,986,726 as the value added by manufacture. As the finished products of one branch of manufacture are constantly used as materials in other branches in the ascending scale of modern industry, it follows that they are counted over and over again, swelling in this manner the total gross value of products. The total value of manufactured products, strictly defined, would include: (1) the value of all raw materials obtained from the extractive and primary production industries which have entered into the manufacturing output; and (2) the entire value added to these raw materials by manufacturing processes from the time they first entered any factory up to the close of the census year. This total value would be very much greater than the \$1,761,986,726 shown as having been added by manufacture, but not so great as the \$3,428,970,628 shown as the gross value of production. (The decline of \$600,000,000 in gross value of products in 1930 was mainly accounted for by a drop of almost \$365,000,000 in the cost of materials).

Volume of Manufacturing Production in Recent Years.¹—An investigation of the greatest importance, especially in a period when values are rapidly

¹For a much more detailed and comprehensive treatment of this subject see the study "The Quantity of Manufacturing Production in Canada 1923-29" by A. Cohen, B. Com., Acting Chief of the Census of Manufactures, Dominion Bureau of Statistics.

changing (see p. 405 of this volume, also Chapter XX, Canada Year Book, 1932 dealing with prices), is that of the volume of manufacturing production as distinguished from its value. Since real income is ultimately measured in goods and services, the growth of the volume of manufactures therefore becomes a matter of great importance. The important thing to know is whether consumers are getting more goods and services, not whether they are expending more dollars and cents.

The ever-increasing use of factory products is one of the most significant features of modern life. Its beginnings are briefly sketched on pp. 400 to 406. The process has continued until at the present time fresh fruits and vegetables are about the only articles which reach the consumer without, in some way, being first processed at a factory. Fresh milk is pasteurized and bottled in a dairy plant, fresh fish and meats are dressed principally in packing plants, and the home preserving of fruits and vegetables is being superseded by more efficient processes in the canning factory. Thus even the foods we eat, as well as the clothing we wear, our household conveniences and our instruments of production and transportation, are increasingly products of factories. The growing volume of factory production, therefore, measures approximately the total flow of the economic goods upon which the rising standards of modern life so vitally depend.

The statistics of manufactures afford a variety of measures of the growth of factory production. The number of wage-earners, capital invested, value of production and value added by manufacture all show to some extent the direction and volume of growth. The value of production and that added by manufacture, being reported in dollars, are influenced by price changes as well as the quantity of goods produced and, as already explained, become misleading under the violent price changes of the past fifteen years. The capital invested is also affected by changing money values, while the relation between capital invested and value of goods produced varies greatly as between one industry and another. Neither is the number of wage-earners employed likely to be a representative measure of changes in the volume of production. The progressively increasing use of machinery and the rise in the power installed per wage-earner (see Table 4) tend to increase the employee's output. Thus while the reported wage-earners in 1930 had increased 27.6 p.c. over the number in 1924, the volume of production is estimated to have increased by 38 p.c. in the same period.

In the construction of an independent measure or index of the volume of manufacturing production many difficulties are encountered. There are constant changes in the commodities manufactured and in their relative proportions. New articles are introduced and rapidly come into common use, such as the radio during the past decade, giving rise to quite large new industries and frequently resulting in a decline of previously existing industries. It is difficult to construct an index which will accurately show changes in manufacturing effort resulting from these changes in production. A second difficulty arises from the fact that many establishments find it difficult to accurately report quantitatively their minor products or by-

products, and a few industries find the same difficulty in reporting their major products. In such cases the raw materials used or the wage-earners employed were considered in the construction of the index. A third important difficulty results from the fact that, even where there is continuity in the kind of commodities produced and where such commodities are reported quantitatively, there are changes which are not capable of statistical measurement in the quality of the commodities produced. For instance, the motor vehicle of to-day is a very different thing from that of ten or even five years ago. The improvement has entailed increases in plant equipment and workmanship and a generally greater manufacturing effort per unit produced. It is quite obvious that a true index of the volume of production should represent changes in quality as well as quantity. Since this is not possible, and since the trend of modern manufacturing is toward a more elaborate fabrication of materials with consequent improvement in quality and workmanship, it is essential to recognize that an index of volume is likely to understate rather than overstate the growth of manufacturing processes. In spite of these difficulties it is believed that the index in Table 5 on p. 416 is reasonably reliable for the broad groups of industries and may justifiably be used in making generalizations.

The central electric stations were excluded from general manufactures in making the index, since this industry is in a class by itself in the peculiar function of its product, and is also unique in the magnitude of its capital investment and the smallness of its labour force in proportion to its net production. The index is based on the quantities of manufactured products reported and includes 71.1 p.c. of the total value of the production in 1926, exclusive of central electric stations. It is weighted according to the values added in the manufactures of 1926. A complete description of the manner in which the index is constructed will be found in the publication referred to in the footnote on p. 412.

The physical volume of manufacturing production, exclusive of central electric stations, increased 50.2 p.c. from 1923 to 1929. When it is recalled that the population of Canada is estimated to have increased only 11.3 p.c. during the same period, the growth of manufacturing production is indeed remarkable. Of this advance, the part resulting from an increase in the domestic demand due to growth of population would be about 11.3 p.c. Exports of partly and fully manufactured goods increased from \$591,830,000 in the fiscal year ended Mar. 31, 1924, to \$690,904,000 in the fiscal year 1930, the increase in exports representing about 3.6 p.c. of the 1923 production. The remainder of the increase in production by 1929, or a margin equal to roughly 35 p.c. of the volume of manufactures of 1923, was therefore apparently absorbed by the rise in the standard of living of the population of Canada.

The index of the volume of production dropped from 150.2 in 1929 to 136.2 in 1930, a decrease of 9.3 p.c. This decrease is very significant when compared with the decreases in the net value of production and number of wage-earners employed

Owing to declines in the values of finished products (due, in a large degree, to the drastic declines in raw materials) and to the decrease in volume of production, the net value of production dropped from \$1,997,350,365 in 1929 to \$1,761,986,726 in 1930, a decrease of 11.8 p.c., while the number of wage-earners dropped from 597,827 to 551,496 a decrease of 7.8 p.c. It will be noted that the percentage decrease in volume of production between 1929 and 1930, *viz.* 9.3, was 1.5 greater than the percentage decrease in the number of wage-earners in the same period. This bears out the observations made in the special study on the volume of production that records of the number of wage-earners may be regarded as more likely to understate than to overstate the changes in the volume of production. As stated previously (p. 412) the tendency is toward increasing production per wage-earner through greater efficiency and increased use of machinery and labour-saving devices. Also in times of depression, many establishments follow the practice of keeping the wage-earners on the pay-roll on a part time basis rather than laying some of them off and employing the rest on full time, while in periods of increased industrial activity the additional output required is secured through overtime work rather than an increase in the number of wage-earners. The net result is to confine fluctuations in the number of wage-earners within narrower limits than that of the physical volume of production. All things considered, however, the average number of wage-earners is materially influenced by the fluctuations in industrial activity.

As may be seen from Table 5 below, all groups in the component material classification reported declines in the volume of production. The iron and steel group led with a decrease of 30.9 points, miscellaneous industries, 20.7 points, chemicals, 16.8 points, non-metallic mineral products, 13.6 points, wood and paper products, 11.4 points, non-ferrous metal products, 10.6 points, textiles and textile products, 9.4 points, vegetable products, 8.7 points and animal products with 3.6 points, the smallest decrease.

In analysing the changes in the volume of production, on a purpose classification basis, some interesting facts are revealed. The food group reported an increase of 2.1 points in the volume of production, while the output of vehicles and vessels which is very largely made up of the automobile and rubber-tire industries recorded the greatest decrease of 35.2 points. This was followed by the personal utilities group with a drop of 20.5 points. The decrease here, however, is somewhat misleading. The production of the musical instruments industry which is included in the group, has been decreasing steadily during the past few years, the output of pianos, phonographs and phonograph records becoming smaller and smaller. The main article of the musical instrument function, namely, the radio, is now produced in the electrical apparatus industry. This industry, however, is credited to the industrial equipment group, as by far the largest part of its output consists of industrial equipment. Producers' materials and industrial equipment declined 16.9 and 19.0 points respectively, due to general decreases in industrial activity. House furnishings dropped 15.0 points, drink and tobacco 12.7 points, and clothing 10.6 points.

¹Exclusive of central electric stations.

The construction of this new index of the volume of manufacturing production has superseded for the years 1923-29 the index shown in Table 4 of this publication in former years. The former index, which made no pretence to the reliability of the new one, was made by dividing the gross value of manufactures by the index number of the prices of manufactured goods. The central electric stations were included in the former index, while they are excluded from the new one. However, the former index covered the period 1917 to 1923 not covered in the new one and, since this earlier period was one of wide fluctuations in money values, the following index numbers are given for the whole period since 1917, using the earlier method, but excluding central electric stations, for the years 1917 to 1923 and the new index, transposed to the 1917 base, from 1923 to 1930: 1917, 100.0; 1918, 102.0; 1919, 98.1; 1920, 95.0; 1921, 86.1; 1922, 96.0; 1923, 104.8; 1924, 102.9; 1925, 112.7; 1926, 128.1; 1927, 136.5; 1928, 148.8; 1929, 157.5; 1930, 142.8.

Consumption of Manufactured Products.—One of the beneficial results of placing the classification of external trade and of production upon a common basis is exhibited in Table 6, where the value of commodities made available for consumption in Canada is derived from the statistics of the two important fields. For example, the value of all manufactured commodities made available in a period approximately corresponding to 1930 was \$3,610,328,443, a figure obtained by adding to the value of manufactured products in 1930 the value of the imports of manufactured and partly manufactured goods during the fiscal year ended Mar. 31, 1931, and deducting the value of the corresponding exports for the same period. In this table more accurate statistics could be presented were it possible to exclude from the gross value of manufactured products the duplications involved when the products of one manufacturing establishment become the materials worked upon in another. Iron, vegetable, wood and paper, textiles and animal products were, in that order, the leading groups in the value of finished goods made available for

consumption. The large amount of manufactured vegetable products made available for consumption was due to the large domestic production, as the exports and imports were about equal, while manufactures of textiles and iron and steel products, in addition to a large production, showed an excess of imports over exports of \$98,000,000 for textiles and \$149,000,000 for iron and steel products. Wood and paper, animal and non-ferrous metal products were manufactured in Canada in greater quantities than required for home consumption, providing export balances in these groups of commodities.

6.—Consumption of Manufactured Products, by Groups, 1930, with Totals for 1922-29.

NOTE.—Statistics of manufacturing production are for the calendar year. Imports and exports of manufactured and partly manufactured goods are for the fiscal years ended Mar. 31 of the following years.

Group of Industries.	Value of Manufactured Products.	Manufactured and Partly Manufactured Goods.		Value of Manufactured Products Available for Consumption. ¹

Totals, 1922.....	2,482,269,130	574,551,323	515,178,415	2,541,687,038

¹For 1928 to 1930 foreign products imported and later re-exported are eliminated from the value of products available for consumption, but for 1927 and previous years this was impossible since foreign exports for these years had never been analysed as raw materials or partly or fully manufactured goods. Therefore in this table the value of manufactured products made available for consumption, for the years 1922 to 1927 inclusive, is an overstatement by the amount of the foreign exports of manufactured goods in each year, probably varying from about \$11,000,000 in 1922 to \$18,000,000 in 1927.

Section 2.—Production of Industrial Groups and Individual Industries.

One of the factors in the progress of Canada is the possession of many natural resources favourable to industrial growth. It is upon the country's agricultural resources, forests, minerals and wild life that Canada's industries are mainly based. The sea and lake fisheries also make an important contribution of raw materials to the manufacturing industries of the Dominion. Nevertheless, the industrial development of Canada was a matter of small beginnings and gradual growth over a period of many years, and the comparatively small home market, restricted at the present time to a population of about ten millions, a large part of it in scattered agricultural areas, is still one of the difficulties of the situation. Yet Canada is now not merely the second largest manufacturing country in the British Empire; her

exports to the other Dominions consist largely of manufactured goods and her exports of manufactured and partly manufactured goods to the United States exceed the exports of raw materials. The rate at which this movement is to continue will depend almost entirely upon growth within the Dominion—upon the further development of the many-sided physical assets of the country.

Subsection 1.—Manufactures Grouped by Chief Component Materials.

A classification based on the chief component materials in the various products of each manufacturing establishment was applied for the first time in the compilation of the returns for 1920. The number of groups was reduced from fifteen to nine to correspond with the external trade classification and the classes of industry were somewhat altered to conform with recent industrial developments. Subsequently the central electric stations industry was taken out of the miscellaneous class and now forms a class by itself.

Vegetable Products.—Though first in value of gross production in 1930, this group ranked only fourth in the number of people employed and salaries and wages paid. With the exception of rubber, coffee and spices, sugar factories, and rice mills, the industries of this group are dependent mainly upon domestic farm products for their raw materials. They produced, in 1930, 19.6 p.c. of the total manufacturing production and employed 13.1 p.c. of all persons engaged in manufacturing industries.

The flour-milling industry is the leading industry of the group from the point of view of gross value of products. This industry, which has existed to meet the domestic needs for more than 300 years, is one of the Dominion's oldest manufactures, but it is only within recent times that its progress has become spectacular. The War and the demand it created gave a great impetus to this trade. The 383 flour mills, many of them of the most modern type and highest efficiency, have a capacity far in excess of Canada's demands. During 1928, productive capacity reached about 121,000 barrels per day. Since then, the industry has been adversely affected by the difficulties which beset the Canadian grain trade and the great decline in the prices of grains. Exports of wheat flour declined from 10,737,266 barrels in 1928 to 7,514,778 barrels in 1930, but in spite of the decrease Canada continues to be one of the leading exporters of wheat flour.

The rubber industry is another industry of importance in the industrial life of the country. Canada now ranks among the leading countries of the world as a manufacturer of rubber goods. In 1930, she was the fifth largest importer of raw rubber in the world, ranking after the United States, the United Kingdom, France and Germany. Existing plants in 1930 numbered 47 and represented a capital investment of \$69,164,512 including equipment and working capital. These plants furnished employment to 15,163 persons who received \$15,895,479 in salaries and wages and produced goods valued at \$73,752,673. They also used raw materials to the value of \$28,821,759, mainly imported from tropical countries. The rubber industry also forms an adjunct of considerable importance to the cotton yarn and cloth industry which supplies tire fabrics. The industry, besides supplying the domestic market, contributes materially to the export trade of Canada. The products find their way to the remotest parts of the world as a glance at the list of countries to which rubber tires are shipped would show. Spain, Peru, Dutch East Indies, Portuguese Africa and China are but a few of the far-flung countries into which Canadian tires find their way.

The fruit and vegetable preparations industry which includes canned fruits, canned vegetables, pickles, vinegar, jams, etc., comprises another large division of this group. In 1930, this industry reported an output valued at \$43,093,752, a capital investment of \$46,135,025 and an employment of 10,651 persons who received \$5,634,355 in salaries and wages. The development of the canned foods trade has affected great changes in the relation of foods to seasons. Fruits and vegetables of many kinds are to be had at all times of the year with much of their original freshness and flavour. The producers in the country are provided with an enormously extended market and the consumers in both city and country with cheap and wholesome food in great variety. The industry has made rapid strides in the past few years. During the period of 1923-30 the volume of fruit and vegetable preparations produced increased 149.0 p.c. This growth is indeed remarkable as it represents a corresponding increase in the domestic demand for these products, the foreign trade being relatively small as compared with the domestic production. Imports in 1930 were valued at \$6,819,532 and exports at \$2,706,661. According to these figures, the industry supplies about 92 p.c. of the domestic requirements.

The sugar-refining industry is also of substantial importance. The demands created by the War gave it a great impetus. All things considered 1919 was a record year. The number of persons employed (3,491), the value added by manufacture (\$16,321,882) and the exports (\$22,953,135) were the highest recorded while the volume of sugar manufactured was only 10 p.c. lower than that of the peak year 1925 when 11,714,967 cwt. was produced. Since 1925, however, exports of sugar have declined with the result that production and employment slackened considerably. In 1930, the 8 sugar refineries reported a capital investment of \$43,855,155 and a value of production of \$42,935,722. They also employed 2,281 persons who received \$3,560,260 in salaries and wages, and paid out \$30,610,701 for materials. Exports of sugar in 1930 amounted to 218,150 cwt. valued at \$1,025,073.

The beverages industry—breweries, distilleries and wineries—which are important elements of the vegetable products group, have expanded from a production of \$30,000,000 in 1922 to \$87,000,000 in 1930, owing partly to the modification of prohibition laws in Canada and also to the fact that a large part of their production is exported directly or indirectly to the United States. The tobacco industry, another important factor in the vegetable products group, had a total production in 1930 of nearly \$86,000,000 and a payroll of 8,905 persons who received \$7,837,711 in salaries and wages.

Animal Products.—Production in this group is determined, in large measure, by the demand at home and abroad for Canadian butter, cheese, canned fish, fresh or frozen meats, bacon and hams, condensed and evaporated milk, etc.

The leading industry of the group is that of slaughtering and meat packing, with a value of production in 1930 of \$164,029,953. Next comes butter and cheese with a value of \$113,018,789. These two industries produced about two-thirds of the production of the entire group.

The butter and cheese industry, which manufactures a product of farm animals, has been for many years of leading importance in Canada. Originating in the agricultural districts of the Maritime Provinces, the Eastern Townships of Quebec, and the southern counties of Ontario, it is now developing rapidly in the Prairie Provinces and in the more recent northern settlements of Quebec and Ontario. For an industry so large in the aggregate, it is unique in having shown very little tendency

toward consolidation in large units, the gross production of \$113,018,789 coming from no fewer than 2,698 plants, mostly small and scattered at convenient points throughout the farming communities.

The leather industries have long been established on a considerable scale, mainly, of course, because the large number of cattle raised and slaughtered provide a ready supply of hides. There are large tanneries in the eastern provinces, and no fewer than 179 boot and shoe factories were in operation in 1930, chiefly in Quebec and Ontario, representing a total capital of over \$28,000,000 with an annual output of over \$40,000,000 and employing 13,922 men and women. The canning and preserving of fish also calls for reference. Concentrated naturally upon the Pacific and Atlantic coasts, 699 establishments were engaged in 1930 in canning, curing and packing of various kinds of fish that were valued at \$33,000,000.

Textile Products.—The principal manufactures which may be so classified are: awnings, tents and sails; cotton and jute bags; batting and wadding; carpets, mats and rugs; men's factory clothing; women's factory clothing; cordage, rope and twine; corsets; cotton and woollen waste; cotton textiles; cotton thread; cotton yarn and cloth; dyeing and finishing of textiles; dressed flax; men's furnishing goods; hats and caps; hosiery and knitted goods; linen goods; oiled and waterproof clothing; silk goods; woollen cloth; woollen textiles and woollen yarns. An output of \$426,247,587 was established for this wide industrial group in the year 1929, being an increase of 2.6 p.c. over 1928. This is the highest figure attained since the depression of 1921, but it must be remembered that the index number of wholesale prices for fabrics, textiles and textile products has dropped from 303.2 in 1920 to 156.9 in 1929 and there is therefore every justification for assuming that the year 1929 was a record one in the textile industry.

In common with all other industrial groups, the textile industries of Canada felt the effects of the general depression prevailing in 1930. The output of textiles and textile products was valued at \$361,814,733, a decrease of \$64,432,854 or 15.1 p.c. as compared with 1929. The textile industries, however, were not as severely affected as this figure would indicate. Drastic declines in the value of raw materials with the consequent decline in the value of finished products account for the greater part of the decrease in the value of production, the yearly index of wholesale prices of fibres, textiles and textile products having dropped from 156.9 in 1929 to 140.5 in 1930, a decrease of 10.4 p.c. Therefore, the decline in the index of volume for textile products from 133.8 in 1929 to 124.4 in 1930, as shown in Table 5 on p. 416—a decline of 7 p.c.—gives a better idea as to the extent of the recession experienced by the textile group of industries in 1930.

The outstanding feature of the textile situation in Canada in 1930 was the expansion of the silk industry at a time when practically all other industries were experiencing a diminished demand for their products. Compared with 1929, the silk industry increased its output by \$3,332,518 and furnished employment to 1,021 more persons.

In net production, *i.e.*, in value added by manufacture, which is a truer criterion than gross production of the place of the group in the industrial life of the country, the textile group was fourth in 1930 among the ten major groups shown in the Census of Manufactures on p. 410, being exceeded only by the wood, iron and vegetable products groups. Textiles accounted for over 10 p.c. of the net manufacturing production of Canada. As an indication of the contribution which the textile group made in 1930 to employment in the Dominion, the group stood third in both

the number of employees and in salaries and wages paid, with nearly 17 p.c. of the total employees in manufacturing and 13 p.c. of the total salaries and wages paid. Again, this wide group of textiles may be regarded as two distinct divisions: (1) the spinning, weaving and knitting trades, and (2) the finishing trades. If so regarded, the first division still assumes the proportions of a very large industrial group with a gross production for 1930 of \$165,571,736, while the second division is still larger with \$196,242,997 gross production.

The hosiery and knitted goods industry, with products worth \$54,117,924, ranked second in the textile group in 1930. Despite the depressed condition of the textile industry generally, the volume and value of production in this branch of the industry held up remarkably well, the value of production being \$6,457,243 or 10.9 p.c. lower than the peak year of 1929. Employment only declined by 883 or 4.7 p.c.

The production of hosiery of all kinds ranked first in importance with an output valued at \$21,112,263. Next in order came underwear, combination and separate garments with a value of \$15,812,529. Various other knitted and woven goods accounted for \$13,518,933, while yarns and numerous small sundries made up the balance.

The industry is located chiefly in the province of Ontario; 105 of the 158 establishments were located there and produced \$36,911,433 or almost 70 p.c. of the entire output. The province of Quebec followed with an output of \$13,004,533 or slightly over 24 p.c. of the total.

Wood and Paper.—An outstanding feature of the general expansion of Canadian commerce since the opening of the century has been the change in the industries associated with forestry. Lumber output has shown wide fluctuations, being so largely dependent upon building and construction operations which are themselves subject to wide cyclical fluctuations. Furthermore, the increasing adoption of fireproof types of construction has resulted in a lower lumber consumption in proportion to the total building done. Thus the quantity of lumber sawn in 1911 has never since been equalled, the total being 4,918,000 M board feet compared with 3,989,421 M feet in 1930, the exports amounting to 35 to 40 p.c. of the total in each year. In contrast with this is the progress in pulp and paper production. The census of 1881 recorded only 36 paper and 5 pulp-mills in existence in Canada. In 1930 there were 109 pulp and paper-mills, consuming more than 4,741,349 cords of pulpwood in the year and using hydro-electric power to the extent of over 5 billion k.w.h. Production of wood pulp in 1917 was 1,464,308 tons and in 1930, 3,619,345 tons. Production of newsprint in 1917 was 689,847 tons, in 1921, 805,114 tons, in 1923, 1,252,000 tons and in 1924, 1,388,081 tons, while in 1930, the production was 2,497,952 tons. Included in the totals are hanging and poster papers. Canadian production in 1930 exceeded that of the United States by 95 p.c., so that Canada now occupies first place among the countries of the world in the production of newsprint paper.

Iron and Its Products.—The manufacture of iron and steel and their products is one of Canada's basic industries. Iron ore is not now produced in Canada as the known deposits, though extensive, are not of sufficiently high grade to permit economic recovery under present conditions. Yet there has been built up a primary steel industry of considerable importance and the secondary or fabricating industries have been expanding steadily to meet the country's increasing requirements.

There are now four concerns which make pig iron in Canada, one being in Nova Scotia and three in Ontario. The former uses Nova Scotia coal and iron ore from the great Wabana deposits which it controls on Bell island, Newfoundland, while the Ontario works are dependent on foreign ore and coal which are brought from the United States. These companies have blast furnaces with a rated capacity of 1.5 million tons of pig iron per annum but the highest tonnage yet attained was 1,080,160 long tons in 1929. Open hearth steel furnaces and rolling-mills are also operated by these companies which produce steel ingots, blooms and billets, bars, rods, rails, structural shapes, plates, sheets, rail fastenings, etc. Including electric steel furnaces, there were 27 steel plants in operation in 1930 which, with the 16 rolling mills, 4 pig iron plants and 2 ferro-alloy plants, represented a capital of \$112,000,000 and employed 9,723 hands to produce primary products worth \$52,588,935.

Among the secondary industries, the production and maintenance of railway cars, locomotives and parts is of first importance. In 1930, there were 37 plants for this purpose and 25,952 workers were employed. The value of products was \$104,922,701, which was \$22,000,000 lower than in 1929.

Automobile manufacturing is one of Canada's largest industries with 12,541 employees, products valued at \$101,677,487 and a capital investment of \$90,671,678 in 1930. This was not a representative year and the figures are hardly indicative of the real importance of the industry. In 1929, for instance, 16,435 people were employed in the 17 plants then in operation and cars and parts worth \$177,315,593 were produced for the home and export markets. Recently a number of new auto and truck factories have been established in Canada so that there are now 21 factories in operation with a yearly capacity of about 400,000 vehicles.

The export trade in automobiles and parts reached its peak in 1929 when cars and parts worth \$47,005,671 were shipped to other countries. In 1930 this market declined to \$20,386,354.

There are also numerous works for the manufacture of machinery, agricultural and implements, sheet metal products, foundry products and similar articles of iron steel and the variety of products made in these establishments is increasing yearly.

Non-Ferrous Metals.—Rapid development of Canada's resources in the field of non-ferrous metals, the completion of large electric power projects and the more extensive use of electrical equipment, has led to a spectacular increase in this group of manufactures in recent years. The importance of the non-ferrous metals as a factor in Canada's economic life may be judged by the fact that in 1930 in a year of depression and declining prices the output of the 428 works reached a value of \$250,458,721. This compares with \$283,545,666 in 1929 and \$183,501,723 in 1926. Capital invested in these factories in 1930 was \$325,605,549 and the number of employees was 38,756.

The production of electrical apparatus is eighth in importance among all manufacturing industries and growth has been rapid in the last few years. From a value of \$51,000,000 in 1923 the output advanced to \$113,796,002 in 1929 and then suffered a decline in 1930 to \$104,577,790. Capital has advanced in the same period from \$65,077,942 to \$102,979,896 and employees from 13,268 to 20,568. A total of 149 plants were engaged in this line of manufacture in 1930. Radio has contributed a great deal to this growth, the output in 1930 being 170,082 sets worth \$19,196,936 at factory prices.

The smelting and refining of non-ferrous metals has also shown a rapid gain. Within the last year or so two new copper refineries and two smelters have been added to Canada's metallurgical works. In 1930 the 13 smelters or refineries in

operation reported a capital investment of \$163,092,471 and employed 8,626 workers. The value of smelter and refinery products was \$100,946,136, including aluminium, nickel, cobalt, blister copper, electrolytic copper, zinc, lead, silver, gold, cadmium, bismuth, platinum, palladium, and other refinery products.

Exports of non-ferrous metals and their products reached nearly \$116,000,000 in 1930.

Non-Metallic Minerals.—This group of manufactures includes such leading industries as coke making, oil refining, the manufacture of glass, artificial abrasives, bricks, cement, etc. Final figures for 1930 show that the output for this group was \$25,000,000 or 10.4 p.c. below the corresponding total for 1929.

The petroleum-refining industry is by far the largest of the group. Canada produces some crude oil but the bulk of the oil treated in Canadian refineries is imported from United States or South America. In 1930 there were 15 refineries operating at advantageous points across the Dominion. These units used 1,064,434,974 gallons of crude oil in that year and produced refined commodities worth \$90,809,711. About 5,030 people were given employment and the capital investment was \$69,077,982.

Chemicals and Allied Products.—That chemical manufactures occupy an important place in Canadian industry is apparent from the fact that in 1930 an average of 15,503 persons were employed in the 591 plants which made chemicals and allied products. These plants produce the greater part of the chemicals that are consumed in this country. In 1930 the apparent consumption of chemicals and allied products amounted in value to \$140,000,000, of which \$120,000,000 or 85 p.c. was of domestic manufacture.

Chemicals and like products of great diversity are made in Canada but paints, soaps, medicinals, acids and chemical salts are most important. Production from the 17 plants in the heavy chemical industry, which represents a capital of \$52,000,000 normally amounts to about \$20,000,000 and in 1929 was up to \$28,000,000. Acetic acid, calcium cyanamide, sodium cyanide, caustic soda, soda ash, sulphuric acid, phosphorus, calcium carbide and nitre cake are among the leading products. The export trade in these commodities amounted to about \$11,000,000 in 1930.

The paints industry employed 2,835 workers in 1930 and paid \$4,307,998 in salaries and wages. Production in that year was valued at \$23,966,502. The soap industry is next in importance, there being 68 factories in this line of manufacture with output worth \$18,167,838. The production of medicinals and pharmaceuticals was worth \$17,768,806 and 2,833 people worked in the 144 factories in this industry. Compressed gases, fertilizers, coal-tar products, wood-distillation products, inks, adhesives, polishes, and a multitude of other such products are also made in the chemical plants.

Many chemical products are also made in industries which for statistical purposes are not included in the chemicals and allied products group. For instance, pulp and paper, distilled liquors, brewery products, and artificial abrasives are classified in other groups. By extending the scope of the chemical industry to include these other factories which primarily use chemical processes, approximately 100,000 workers would be employed and production would total about \$631,000,000.

Central Electric Stations.—This industry is shown under the totals by groups in Table 7 as a separate group in order to facilitate the presentation of statistics of power installed in the other groups and industries.

The principal statistics of each of the manufacturing industries of Canada during 1930 are presented in Table 7 on pp. 424-429.

Subsection 2.—Manufactures Classified by the Purpose of the Products.

Production of Manufactured Goods according to the Purpose Classification.—In addition to the classification according to the chief component material of the products, used for the industrial census in detailed presentation, a separate and distinct classification, based on the chief purpose of the products, was applied for the first time to the census returns of 1922 and is presented for the years 1926 to 1929 in summary form, and for 1930 in more detail, in Table 8.

During the period covered by the table, the gross production of the food industries dropped from 24.3 p.c. of the total for all industries in 1926 to 21.7 p.c. in 1930, while the clothing group dropped from 9.5 p.c. of the total in the former year to 8.7 p.c. On the other hand, the gross production of the "drink and tobacco" group, during the same period, rose from 4.1 p.c. of the total to 5.5 p.c. Producers' materials which stood at 29.0 p.c. in 1926 fell to 28.5 p.c. in 1929 and to 27.4 p.c. in 1930, due to the general decrease in manufacturing activity since the beginning of the general depression in the autumn of 1929. The percentage of the vehicles and vessels industries remained about stationary, being 9.3 p.c. in 1926 and 9.1 p.c. in 1930.

In analysing the relative standing of the two purpose groups which are perhaps of greatest interest, it is noted that the gross production of the food industries in 1930 was 21.7 p.c. of the output of Canadian manufacturing concerns, as compared with an output of 8.7 p.c. for the clothing industries. Aside from the fact that a much larger proportion of its products is exported, the greater production of the food group was in part due to the higher cost of raw materials, the value added by manufacturing being 13.5 p.c. of the total for all industries in the case of the food group and 8.8 p.c. for the clothing group. The clothing industries gave employment to approximately 8,000 more employees than the food industries.

8.—Principal Statistics of the Manufacturing Industries of Canada, Classified According to the Purpose of the Principal Product, by Main Groups for 1926-30 and in Detail for 1930.

Subsection 3.—Manufactures Classified by Origin of the Materials.

Classification of Manufacturing Production According to the Origin of the Materials Worked Upon.—The principal statistics of the manufactures of Canada, classified upon the basis of "origin", are presented in Table 9 for the years 1926 to 1930. By this means Canadian manufacturing production may be analysed from a new angle, one by means of which interesting comparisons may be made with the external trade classification according to origin.

The distinction made between farm materials of Canadian and foreign origin is based on whether the materials are indigenous to Canada rather than their actual source. Thus the industries included in the foreign origin classes are those depending upon materials which cannot be grown in Canada such as tea, coffee, spices, cane sugar, rice, rubber, cotton, silk, etc., but it should be understood that industries included in the Canadian origin classes may be using large quantities of imported corn, fruit, tobacco, hides, wool, etc.

While the period reviewed in the following table only covers the short space of the four years from 1926 to 1930, interesting changes have taken place in the relative importance of the industries based on materials from the different origins. Since the purpose of such a comparison is to discover the relative importance of the manufacturing work done upon materials from the different origins, the figures of net value of products or the value added to the raw materials by the manufacturing processes will give a more accurate measure of the importance of the industrial groups than the figures of gross value of products.

The values added in the manufacture of materials of mineral origin in 1930 represented 34.5 p.c. of the total value added by manufacture in all industries. This is an increase of 1.5 p.c. since 1926. The second largest group from the point of view of value added is that of farm origin which accounted for 28.5 p.c. of the total value added in 1930. This group remained practically stationary, having increased only 0.1 p.c. since 1926. The central electric stations group also bettered its position as compared with 1926, the percentages of the totals being 5.9 in 1926 and 7.1 in 1930. On the other hand, the values added by the industries of the forest group declined from 22.6 p.c. of the total in 1926 to 20.4 p.c. in 1930. The increase during the period under review in the relative importance of the industries of the mineral group was probably due to a number of influences. The expansion of the motor vehicle industry, the rapid growth in the use of electrical equipment, increasing activity in construction which absorbed large quantities of steel, cement and various other manufactured mineral products, and the development of metallurgical plants in Canada were some factors in the growing importance of the mineral group of industries. Another factor in this trend has been the growing appreciation and development of the wealth of the mineral resources of Canada. Not only have the various mining activities made the raw materials for mineral industries more readily available, but those activities have also required large quantities of machinery, electrical apparatus and other finished products of mineral origin.

In the year 1930, the industries of the mineral group exceeded those of any other group in the net value of products with 34.5 p.c. of the total, as compared with 28.5 p.c. for the farm and 20.4 p.c. for the forest origin groups. These three principal groups stood in the same order of importance with regard to employees engaged and salaries and wages paid. In the matter of capital invested the mineral group also led with 30.7 p.c. of the total, followed by the forest group with 23.2 p.c., central electric stations with 21.9 p.c., and the farm group with 18.6 p.c.

Subsection 4.—The Forty Leading Manufacturing Industries.

There has been little change from 1929 in the order of the ten leading industries arranged by gross production although there has been an appreciable decrease in the value of production in nearly every case. In 1930 pulp and paper was again in the lead, followed by slaughtering and meat-packing, and flour and grist-mill products, as in 1929, but central electric stations, which in the earlier year ranked fifth, was in fourth place in 1930. The automobile industry fell from fourth place in 1929 to ninth place in 1930 with a reduction of nearly 43 p.c. in the value of gross production. The electrical apparatus and supplies industry improved its position slightly.

On the basis of net value, or value added by manufacture, the order of importance of the industries in 1930 was very different from that based on gross values. The pulp and paper industry was foremost in this respect also, but it was followed by: central electric stations; electrical apparatus; tobacco, cigars and cigarettes; printing and publishing; and non-ferrous metal smelting in the order given. In salaries and wages paid the pulp and paper industry is followed by: railway rolling stock, sawmills, central electric stations, printing and publishing, and electrical apparatus, in the order named. Tables 10, 11 and 12 which follow show the forty leading industries for 1930 classified according to gross value of the products, the net value of products, and salaries and wages paid.

10.—Principal Statistics of Forty Leading Industries, Classified According to the Gross Value of the Products, 1930.

The Forty Leading Industries in 1931.—The completion of part of the compilation of the Census of Manufactures for 1931 permits the inclusion, as Table 12A of the forty leading industries in that year. It will be noticed that, compared with 1930, there has been a considerable readjustment in the order of the ten leading industries when arranged according to gross production, although there has been an appreciable decrease in the value of production in nearly every case; in the former year they all had gross productions of over \$100,000,000, whereas in 1931 only the three leading industries had gross productions exceeding this figure. In 1932 pulp and paper was again in the lead, followed by central electric stations, slaughtering and meat packing, non-ferrous metal smelting, and flour and feed mills, which in 1930 were in fourth, second, tenth and third places, respectively. The automobile industry fell from ninth place in 1930 to fourteenth place in 1931 with a reduction of over 41 p.c. in the value of gross production.

On the basis of net values, or value added by manufacture, the order of importance of the industries in 1931 was very different from that based on gross value. The central electric station industry was foremost in this respect, followed by pulp and paper; tobacco, cigars and cigarettes; printing and publishing; non-ferrous metal smelting; and electrical apparatus and supplies. In salaries and wages paid, the pulp and paper industry is decidedly in the lead, being followed by railway rolling stock; printing and publishing; central electric stations; electrical apparatus and supplies; and castings and forgings, in the order given. Contrary to the general impression the central electric stations industry, which is first in net value of production—its cost of materials being negligible—ranks high in salaries and wages paid, being fourth in 1930 and third in 1931 in this respect.

Section 3.—Provincial Distribution of Manufacturing Production.

Ontario and Quebec are the most important manufacturing provinces of Canada. Their combined production in 1930 amounted to \$2,735,000,000, or nearly 80 p.c. of the gross value of manufactured products of the Dominion. Of this amount Ontario contributed \$1,713,000,000 and Quebec \$1,022,000,000. The proximity of Ontario to the coal fields of Pennsylvania, the water-power resources of the two provinces and their nearness to the larger markets of Canada and the United States have all contributed to the above result. British Columbia had, in 1930, the third largest gross manufacturing production, \$241,000,000, and Manitoba the fourth, \$142,000,000. Alberta, Nova Scotia, New Brunswick and Saskatchewan followed in that order with gross production from \$94,315,000 to \$62,277,000, succeeded by Prince Edward Island with \$4,255,000.

Subsection 1.—The Manufactures of the Maritime Provinces, 1930.

Table 13 gives statistics of the leading industries of each of the Maritime Provinces for the year 1930. In Prince Edward Island the manufacture of butter and cheese, with a gross production in 1930 of \$345,417, was foremost, followed by fish-curing and -packing, with a gross production of \$831,585. Manufacturing in Nova Scotia and New Brunswick is, of course, to a considerable extent dominated by the steel industry in the former and the forest industries in the latter, although there is a large sugar refinery in each province. The pulp and paper industry with a gross value of production of \$12,614,177 in 1930 was the most important industry in New Brunswick, followed by sawmills with an output valued at \$8,564,415. These two industries combined provided 33.4 p.c. of the gross manufacturing production of the province. In Nova Scotia the primary iron and steel industry was dominant with an output valued at \$11,814,234. Other leading industries in order of their importance being, fish-curing and -packing, pulp and paper, railway rolling stock, biscuits and confectionery, central electric stations, etc.

13.—Statistics of Ten Leading Industries of each of the Maritime Provinces, 1930.

NOTE.—Other leading industries, statistics of which cannot be given because there are fewer than three establishments in each industry, are: in Prince Edward Island, tobacco, cigars and cigarettes, slaughtering and meat-packing, and railway rolling stock; in Nova Scotia, petroleum, sugar refineries, coke and gas products; in New Brunswick, sugar refineries and railway rolling stock. The statistics for these industries are included in the grand totals.

Subsection 2.—The Manufactures of Quebec, 1930.

The pulp and paper mills of Quebec, the most important manufacturing unit in the province, produced goods to the gross value of \$109,241,510 in 1930. This exceeded by over \$34,000,000 the gross value of products of the tobacco, cigar and cigarette industry (\$75,056,846), which was followed by railway rolling stock works (\$49,427,008) and the output of central electric stations (\$43,201,265). These four industries were followed by sawmills, cotton yarn and cloth mills, women's factory clothing, non-ferrous metal smelting and refining, etc. A change took place in the ranking of some of the important industries of the province. The cotton yarn and cloth industry dropped from third place in 1929 to sixth place in 1930. This change was due to both the transfer of oilcloth and linoleum from this group to that of miscellaneous textiles, *n.e.s.* and a greatly reduced output. Other important changes were boots and shoes, which declined from eighth to thirteenth place and sawmills which advanced from tenth to fifth place.

The importance of the pulp and paper industry in Quebec is shown by a comparison with the industry throughout the Dominion. The Quebec industry, in addition to supplying about 11 p.c. of the total gross value of all products manufactured in the province, furnished nearly 51 p.c. of the products of pulp and paper mills throughout the country. The gross value of cotton yarn and cloth products

from Quebec mills formed over 70 p.c., the gross value of cigars and cigarettes formed 88 p.c., the value of railway rolling stock 47 p.c., and the value of the boot and shoe products over 58 p.c. of the Dominion totals for these products. Thus Quebec is an outstanding manufacturing province rather on account of her great individual industries than because of the diversification of her industrial activities.

14.—Statistics of Forty Leading Industries of the Province of Quebec, 1930.

NOTE.—Leading industries having fewer than 3 establishments are sugar refineries and bridge-building.

Subsection 3.—The Manufactures of Ontario, 1930.

Ontario is the most important manufacturing province of the Dominion. The gross value of its manufactured products in 1930 represented nearly 50 p.c. of those of the whole Dominion, while those of Quebec, the second province in importance in this respect, amounted to about 30 p.c. This premier position in manufacturing has been fairly uniformly maintained by Ontario over a long period, as the following percentages show: in 1926, 52 p.c.; 1920, 50 p.c.; 1918, 53 p.c.; 1910, 50 p.c.; 1900, 50 p.c.; 1890, 51 p.c. and 1880, 51 p.c. Thus, in spite of the rapid industrial development in recent years in other provinces such as Quebec, British Columbia and Manitoba, Ontario is maintaining a manufacturing production equal to that of the remainder of the Dominion.

The automobile manufacturing industry of Ontario in 1930 came first in the value of its products. This amounted to \$96,668,671 as compared with \$83,358,509 for the slaughtering and meat-packing industry which held second place. Other important industries in descending order, with the value of their products in 1930 were: electrical apparatus and supplies, \$78,794,396; flour and grist mills, \$75,700,205; pulp and paper, \$68,036,733. Due to the general depression which prevailed in 1930, the five leading industries of Ontario, in common with many others, reported considerable decreases in the gross value of production, as compared with the previous year. The output of the automobile industry declined \$69,000,000, flour and grist mills, \$19,000,000, pulp and paper, \$14,000,000, slaughtering and meat packing, \$12,000,000, and electrical apparatus and supplies, \$7,000,000.

Indicating the greater diversification of industry in Ontario as compared with Quebec, the percentages which the 40 leading industries bore to the total manufactures of the province were higher in nearly every particular in Quebec than in Ontario, especially in the capital employed and the number of establishments and employees. Outstanding among the industries in which the province of Ontario was pre-eminent was that of automobile manufacturing, which was carried on practically in this province alone. Other important industries in which Ontario led, with the percentage which the production of each bore to that of the Dominion in 1930, were as follows: agricultural implements, 96 p.c.; leather tanneries, 87 p.c.; rubber goods, 78 p.c.; furniture and upholstering, 75 p.c.; fruit and vegetable canning, preserving, etc., 67 p.c.; electrical apparatus and supplies, 75 p.c.; castings and forgings, 65 p.c.; primary iron and steel, 58 p.c.; slaughtering and meat-packing, 51 p.c.; flour and grist-mill products, 52 p.c.; hosiery, knitted goods, etc., 70 p.c.

Subsection 4.—The Manufactures of the Prairie Provinces, 1930.

The flour-milling industry is outstanding among the manufactures of the Prairie Provinces when treated as a single unit. During 1930, as may be seen from Table 16, the gross value of production of flour mills was \$41,892,162 (Manitoba, \$13,-467,194; Saskatchewan, \$14,752,468; Alberta, \$13,672,500). The second industry from the point of view of gross production was slaughtering and meat-packing with products valued at \$41,276,942 (Manitoba, \$19,745,659; Saskatchewan, \$5,191,759; Alberta, \$16,339,524). Petroleum products comprised the third largest industrial group, with an output valued at \$22,986,549, followed by railway rolling stock, \$22,403,323, butter and cheese, \$21,946,491 and central electric stations, \$15,937,545.

The order of the leading industries is somewhat different in each province. In Manitoba, the leading industries, with their gross value of products in 1930, were as follows: slaughtering and meat-packing (\$19,745,659), railway rolling stock (\$17,-202,263), flour mills (\$13,467,194) butter and cheese (\$3,519,020) and central electric stations (\$6,574,463). In Saskatchewan the leading industries were: flour mills (\$14,752,468), butter and cheese (\$7,083,895), slaughtering and meat-packing (\$5,191,759), central electric stations (\$4,711,212) and printing and publishing

(\$3,517,774). In Alberta, slaughtering and meat-packing (\$16,339,524) was the leading industry, followed by flour mills (\$13,672,500), petroleum products (\$12,267,154), butter and cheese (\$6,343,576) and railway rolling stock (\$5,198,060).

The importance of these industries, based on such natural resources of the Prairie Provinces as grain-growing and cattle-raising areas, is evident.

16.—Statistics of Ten Leading Industries of Manitoba, Saskatchewan and Alberta, 1930.

Note.—Other leading industries, statistics of which cannot be given because there are fewer than three establishments in each industry, are: in Manitoba, bridge and structural steel work and cement; in Saskatchewan, petroleum refining. The statistics for these industries are included in the grand totals for the provinces.

Subsection 5.—The Manufactures of British Columbia, 1930.¹

British Columbia was in 1930 the third most important manufacturing province in the Dominion, producing goods to a gross value of \$241,121,932. About 19 p.c. of this production, or \$44,975,389, is seen in Table 17 to be that of the saw-milling industry; the predominance of forest products industries in the industrial life of the province is emphasized if to this figure be added \$17,785,550, the gross value of products of the pulp and paper industry and \$2,681,985, that of the planing mills and sash and door factories. Second in importance among the industries of the province is that of fish-curing and -packing, with a gross value of products of \$21,131,067, followed by the pulp and paper industry, slaughtering and meat-packing and central electric stations.

17.—Statistics of Twenty-Five Leading Industries of British Columbia, 1930.¹

NOTE.—Other leading industries, statistics of which cannot be given because there are fewer than three establishments in each industry, are: non-ferrous metal smelting, sugar refining, cement, explosives, cotton and jute bags, wood preservation and condensed milk. The statistics for these industries are included in the grand totals of the province.

Subsection 2.—Employment in Manufactures.

The total number of persons engaged in those manufacturing industries of Canada for which statistics were obtained in 1930 was in that year 644,439, as compared with 694,434 in the same industries in 1929 and 474,430 in 1922. The

1930 employees included 92,943 salaried employees, this figure being obtained from the manufacturers at the end of the year, and 551,496 wage-earners, the average number employed as derived from the manufacturers' records of the numbers on the pay-rolls on the 15th of each of the twelve months. Prior to 1925 the number of wage-earners was computed as the sum of the number recorded each month divided by 12 whether the establishment was operating the 12 months or not. Beginning with the statistics for 1925, in seasonal industries which are in operation only a limited number of months in each year, such as sawmilling, fruit and vegetable canning, etc., the average was computed by dividing the sum of the wage-earners reported on the 15th of each month by the number of months in operation. This change of method increased the apparent number of employees, especially in seasonal industries but also in the groups containing such seasonal industries and in provincial and Dominion totals. Consequently, the change of method exerted a reducing influence on apparent average wages and on all other averages per wage-earner and per employee.

The number of salaried employees and of wage-earners, as thus ascertained, is given for each of the years since 1917, the year of the first annual census of manufacturing production, in Table 21. Then, taking the percentages of the wage-earners and the total employees in each year to those in 1917, and dividing these percentages into the volume of manufacturing production in each year (see pp. 412 to 416 for the index of volume), the quotients give tentative conclusions regarding the efficiency of production per wage-earner and per employee in years subsequent to 1917, as compared with that year. Since central electric stations were excluded in computing the index of the volume of production, employees in these establishments have been excluded also in computing the percentages relative to 1917 for both wage-earners and total employees, and consequently from the indexes of efficiency of production. These indexes of the efficiency of production are, of course, affected by the change explained above in the method of computing the number of employees in 1925 and subsequent years as compared with 1924 and previous years. Inasmuch as the change increased the apparent number of employees in 1925 and later years, it proportionately decreased the index of the efficiency of production. The table illustrates the development of modern industry which has accomplished a large increase in production with a comparatively small increase in wage-earners by better organization and the use of improved equipment. Capital invested in manufacturing industries, exclusive of central electric stations, has increased by 73.8 p.c. from 1917 to 1930, compared with a decrease of 1.2 p.c. in wage-earners, while the horse power used per wage-earner has increased from 3.04 in 1917 to 7.49 in 1930. The factor of better organization is not susceptible of measurement. However, salaried employees have increased by 35.2 p.c. since 1917, or more nearly in proportion to the growth in production than wage-earners. The result of these developments has been the increase of 44.5 p.c. in the volume of production per wage-earner and the somewhat smaller increase of 39.7 p.c. per employee, owing to the increased proportion of salaried employees in the total. The indexes may be considered as supplying satisfactory evidence of a general gain in volume of production per person employed. In this connection it should be remembered, however, that in 1917, owing to the large numbers overseas, many persons of low efficiency were being employed, their inefficiency being concealed at the time by the prevailing inflation of prices; it is possible that the sudden rise in the indexes of efficiency from 1920 to 1921 may be partly accounted for by their elimination in the contraction of industrial operations which occurred at that time.

¹Central electric stations excluded.

Statistics of employment in manufacturing industries during 1930 derived from the Census of Manufactures, are shown in Table 7 of this chapter, (pp. 424 to 429). According to these statistics, the 24,020 establishments covered, employed 92,943 salaried employees and 551,496 wage-earners, a total of 644,439 persons. Out of every 1,000 persons employed in manufacturing, 144 were classed as salary earners and 856 as wage-earners; the former earned 25.0 p.c. and the latter 75.0 p.c. of the total amount paid out as remuneration for services.

Provincial Distribution of Employees in 1930.—An analysis of the returns by provinces shows that 48,958 or 52.7 p.c. of all employees on salaries were employed in Ontario; of this number 35,747 were males and 13,211 were females. The proportion of the male salary workers in Ontario to the total of such workers was 50.7 p.c. while female office employees constituted 58.9 p.c. of the corresponding total. In Quebec, which with 25,928 persons recorded the second largest number of salaried workers, were situated 28.8 p.c. of the total male and 24.8 p.c. of the total female salaried employees. British Columbia also had a higher proportion of male than female salaried employees, having 6.5 p.c. of the total male to 4.6 p.c. of the total female salary earners. Of the total salaries, \$97,716,795 or 53 p.c. was reported in Ontario, \$52,328,030 or 28.4 p.c. in Quebec, and \$11,380,384 or 6.1 p.c. in British Columbia.

Out of the total male wage-earners numbering 431,463 and the total female numbering 120,033, 47.1 p.c. of the former and 46.2 p.c. of the latter were employed in Ontario. Quebec manufacturers reported 30.4 p.c. of the total males as compared with 39.6 p.c. of the total females, while British Columbia had 7.7 p.c. of the former and 3.6 p.c. of the latter. As to earnings, Ontario firms paid out 49.5 p.c. of the total wages, Quebec 29.8 p.c. and British Columbia 7.9 p.c.

Distribution by Industries.—The wood and paper industries with 20,586 salaried employees, reported a larger number of these than any other group, having 22.1 p.c. of the total and paying 23.3 p.c. of the aggregate salaries; 24.7 p.c. of the total wage-earners, earning 23.9 p.c. of the total wages, belonged to this group. Only 9.2 p.c. of the total females working for wages were in the wood and paper

industries, as compared with 29 p.c. of the total males on wages. The textile industries had 18.1 p.c. of the wage-earners who earned 14.3 p.c. of the total wages; the number of female workers in these industries formed 49.8 p.c. of the total females and the males only 9.3 p.c. of the aggregate of male wage-earners. In the iron and steel group, 18.7 p.c. of the total wage-earners were paid 23.5 p.c. of the total wages. The number of men employed in these industries constituted 23.3 p.c. of the total male wage-earners in 1930, while only 2.2 p.c. of the female wage-earners were engaged in iron and steel plants.

Monthly Record of Employment in Manufactures, 1930.—A monthly record of the number of wage-earners employed in Canadian manufactures, as compiled by the Census of Industry, is given by sex for 1929 and 1930 in Table 23. The peak of employment during 1930 was in May and for 1929 in June. Ordinarily manufacturing employment in Canada reaches its highest point about September. Some of the seasonal industries such as canning are most active then, textile industries are preparing winter goods and industry generally feels the active demand of the agricultural purchasing power resulting from the season's harvests. In 1929, however, the rising tide of "good times" was checked about midsummer and the recession set in during the autumn with the stock market crash. The harvests of 1929 in the Canadian West were disappointing also. In February 1930, employment began to pick up moderately. This expansion continued until May, after which there was a recession to the end of the year. The maximum employment for the two years was reached in June 1929 when 596,544 wage-earners were employed. This figure dropped to 510,061 in Jan. 1930, rose again to 556,386 in May and then fell to 464,086 in December 1930, a level practically the same as that of January, 1927.

While employment for male operatives expanded from the beginning of the year to its maximum in May, the number of female workers was greatest in September, chiefly on account of seasonal activity in the vegetable and fruit preserving group, which employs a considerable proportion of women. Textiles, the one group in which the majority of workers are women, also reported an active period during the autumn.

Subsection 3.—Salaries and Wages in Canadian Manufacturing Industries, 1930.

The total salaries and wages disbursed by manufacturers during 1930 was \$736,092,766 paid to 644,439 workers, compared with \$813,049,842 paid to 694,434 persons in 1929, \$510,431,312 paid to 474,430 persons in 1922 and \$732,120,585 paid to 609,586 persons in 1920 at the peak of the post-war inflation. Of the 1930 aggregate, \$184,239,117 or 25 p.c. was paid to 92,943 salaried employees who constituted 14.4 p.c. of the total number, and \$551,853,649 or 75 p.c. was paid in wages to 551,496 wage-earners who formed 85.6 p.c. of the aggregate number of employees.

The average salary paid in the manufacturing industries during 1930 was \$1,982, compared with \$1,954 in 1929, \$1,899 in 1927, \$1,843 in 1925 and \$1,791 in 1922. The average salary in 1930, *viz.* \$1,982 is shown to be \$28 or 1.4 p.c. higher than in 1929 and \$191 or 10.7 p.c. higher than in 1922. The average wage paid was \$1,001 in 1930, \$1,045 in 1929, \$997 in 1927, \$971 in 1925 and \$939 in 1922. Thus this average wage of \$1,001 in 1930 was \$44 or 4.2 p.c. lower than in 1929 but \$62 or 6.6 p.c. higher than in 1922.

Average Earnings, by Provinces, of Persons Employed in Manufactures.—Table 24 shows the number of salary and wage-earners and the average salary and wage paid in 1930 by manufacturers in the various provinces, also average earnings in 1929.

In 1930 there were successive rises in average salaries in each province, excepting New Brunswick which recorded a slight decrease as compared with the previous year. British Columbia showed the highest average of \$2,026, followed by Quebec with \$2,018 and Ontario with \$1,996. The head offices of many large corporations being located in Montreal, Toronto and Vancouver tends to raise the average salaries in these provinces. In the Prairie Provinces the averages were smaller, especially in Saskatchewan and Alberta, while in the Maritime Provinces average salaries were still lower, there being comparatively few large executive offices in these provinces.

All provinces with the exception of British Columbia, Alberta and Prince Edward Island reported lower wages in 1930. British Columbia with an average wage of \$1,171 was the highest in the Dominion, being \$70 higher than the general average. In the western provinces average wages are usually higher; this being due to an unusually small proportion of women workers, while many of the male employees were engaged in the better-paid wood and paper, electric light and power industries. In the four provinces situated to the east, average wages in manufacturing were lower than the mean for the Dominion, while from Ontario westward the opposite was the case.

The seasonal nature of some of the leading manufactures, notably fish-preserving and lumbering, tends to reduce the mean wage in the Maritime Provinces and Quebec, and Quebec also has a larger proportion of female wage-earners employed chiefly in the textile, food and tobacco industries, than any other province, except Prince Edward Island.

Average Earnings in Forty Leading Industries.—Table 25 shows employees by sex and average salaries and wages in the forty leading industries during 1930, together with the salaries and wages paid in 1929. The rank of each industry is based on the aggregate of salaries and wages paid, as in Table 12 on p. 438.

Average Salaries.—In six industries the average salaries exceeded \$2,500; in seventeen they were from \$2,000 to \$2,500; in sixteen they ranged between \$1,500 and \$2,000, while in only one were they below \$1,500 in 1930. None of the six industries paying the highest salaries—breweries, pulp and paper mills, bridge and structural steel, non-ferrous metal smelting, petroleum, and primary iron and steel—reported a proportion of female workers equal to the general percentage in the forty leading industries, while the numbers employed were rather small except in the pulp and paper industry. The lowest salaries were reported by the butter and cheese industry. This is due to the fact that butter and cheese factories usually work less than the average number of days and are mainly situated in small towns and country places.

Average Wages.—The highest wages, or those above \$1,500 were paid in three industries—engraving, stereotyping and electrotyping; bridge and structural steel; and non-ferrous metal smelting—in all of which the proportion of skilled workers is probably high. In nine other industries the average wage ranged between \$1,200

and \$1,500. These were largely metal-working industries, non-metallic mineral products, printing and publishing and central electric stations, in all of which the proportion of women employed was low. In thirteen industries the average wage was between \$1,000 and \$1,200 while in the remaining fifteen the average was below \$1,000. This last group included such seasonal industries as sawmilling, and the flour and grist-mill industry with a large number of small grist mills in which work is intermittent. The other industries with low average wages were textiles, tobacco, and boots and shoes, in which the proportions of female wage-earners were high, the numbers in several industries being greater than those of the male.

Real Earnings of Employees in Recent Years.—When the index number representing the average yearly wages, with 1917 as a base, is divided by the index number of the cost of living, converted to the same base, it is seen that real wages advanced by 13.6 p.c. between 1917 and 1930. The details of the computation are given in Table 26. There was little change in real wages during the three years 1917 to 1920 when prices were rising rapidly. During the following two years, 1921 and 1922, when prices dropped rapidly, real wages increased over 5 p.c. Since then there has been an almost continuous rise from year to year with the exception of 1930. In 1929 real wages reached a maximum of 117.7.

Percentages of Salaries and Wages to Value of Products.—Table 27 shows the relation between salaries and wages paid by manufacturers and the total net value of production. Figures of gross production are often used in such calculations, but the values out of which the wages of employees must in the long run come are the values added to the raw materials while they are in the factory. Such added values constitute the real production of the manufacturing plant and are alone available for payment of wages and salaries, of interest, rent and taxes, charges for fuel, power, lighting, repairs, and all other overhead charges. The percentage of salaries was highest in the years 1921, 1922 and 1924. These were years in which manufacturing production was curtailed and it is probable that, salaried employees being a part of the organization of an industry rather than of its productive force, salaries were an abnormally high percentage of the lower levels of production then prevailing. The percentage has declined with the increasing manufacturing production since 1922, but in 1929 was still much higher than in 1917, while in 1930, due to decreased industrial activity, the percentage of salaries to value added rose to 10.5, an increase of 1 p.c. over the previous year. It should be borne in mind, however, that salaried employees increased by 35.2 p.c. in the period, while wage-earners decreased 1.2 p.c. (Table 21). The percentage of wages has fluctuated much less than that of salaries. The number of wage-earning employees may be more readily adjusted to the activity of the industry and wage levels likewise more readily adjusted to the price levels of the products. The percentage of wages to the values added in manufacture was thus almost the same in 1930 as in 1917. The percentage was highest in 1920, when, in the post-war inflation, average wages were highest (Table 26) and the efficiency of production lowest (Table 21).

Subsection 4.—Size of Manufacturing Establishments.

An essential characteristic of the recent evolution of industry has been the increase in the size of the typical manufacturing establishment. The full utilization of highly specialized machinery necessitates large-scale production, while the improvements in transportation have widened the market, and the development of more efficient methods of business administration has made it possible for the individual manufacturer to supervise effectively a larger plant. An increase in the scale of production of the typical manufacturing establishment has been experienced in all industrial countries which have been affected by the so-called "Industrial Revolution", and not least in Canada where the rise of the factory system in industry has taken place approximately since Confederation.

The size of the manufacturing establishment is generally measured either by the number of employees or by the value of product, but each of these methods has its limitations. The former takes no account of the differences in capital equipment at different times or in various industries and obviously the increased use of machinery, as in the flour-milling industry, may lead to increased production concurrently with a decrease in the number of employees. The latter measure has to be adjusted for changes in the price level; and, as between industries, it makes those which handle expensive raw materials appear to operate on a larger scale. Both measures are subject to two limitations: first, they depend on the fluctuation of business activity and the demand of the consumer; secondly, over any lengthy period of time there is the difficulty of comparability resulting from changes in the method of the census.

Thus, while it is possible in a general way to state that the average size of the manufacturing establishment in Canada has increased between 1870 and 1930, the 1930 figures are not on the same basis as the 1870 figures, especially since they do not include all the small custom and repair establishments included at the earlier date. The same difficulty arises right up to the most recent times. It is only in the last few years that the statistics have been so analysed as to be strictly comparable, and the results of this analysis are given in Tables 28 to 31.

Size as Measured by Gross Value of Products.—In Tables 28 and 29 the size of the establishments reporting to the Census of Manufactures is shown by the gross value of products—Table 28 giving comparative figures for 1922 (the first year for which the figures are available) and 1930, and Table 29 the figures by provinces for 1930.

The comparative Table 28 shows that, while in 1922 the 420 establishments which had each a gross production of over \$1,000,000 had an aggregate value of products of \$1,268,056,129 or 51 p.c. of the total production of all manufacturing industries, the 626 establishments producing over \$1,000,000 each in 1930 had an aggregate value of products of \$2,046,162,259, or 59 p.c. of the grand total for all manufacturing establishments—a very significant change in the short period of eight years when the general trend of prices of manufactured goods was slightly downward.

¹The value of production in 1930 shown above is greater in the aggregate by \$38,795,768 than the value of production shown in the other tables of this report. This is due to the elimination from the other tables of the value of electric energy purchased by central electric stations from other generating plants for distribution to local consumers. For the reporting plant, however, the cost of such power is regarded as the cost of materials. This necessarily involves a duplication in the value of production which it is impossible to make compensation for, as between the groups.

¹Includes one of the larger class grouped with those of the smaller class to avoid showing the individual production of any one establishment.

Size of Establishments as Measured by Number of Employees.—In Tables 30 and 31 the establishments reporting to the Census of Manufactures are classified by the number of their employees. In the comparative Table 30, it is shown that out of a total increase of 123,102 employees in our manufacturing industries between 1923 and 1930, 54,628, or almost 45 p.c., were in establishments with over 500 employees.

30.—Number of Establishments and of Employees in Canadian Manufactures, Grouped According to the Number of Employees per Establishment, 1923 and 1930.

Group.	1923.			1930.

Totals.....	22,642	526,110¹	23.2	24,020	649,212²	27.0

¹In order to make the figures comparable this total is computed by dividing the employees in each establishment in each month by the actual number of months the establishment was in operation, while in Table 1 of this chapter the sum was divided by 12 for all establishments (see p. 449, subsection 2).

²This total of employees in 1930 exceeds the total of 644,439 given elsewhere in this report because 4,773 contract workers in the salmon canneries of British Columbia are included here but are excluded elsewhere.

¹See note 2, Table 30, above.

Subsection 5.—Power and Fuel.

Power.—The power equipment installed in manufacturing establishments is a very good barometer of the industrial development of Canada, inasmuch as the production is increasingly dependent on the power equipment. Increases and decreases in productive capacity, measured in horse-power, are not the result of temporary fluctuations in costs and values in the same manner as capital investments, values of products, etc. Power equipment will not reflect temporary depressions, but over a period of several years will indicate industrial growth or decline.

Central electric stations, which generate electricity for both lighting and power purposes, are treated in Table 32 separately from the other groups of industries. Internal combustion engines include all gasoline engines, natural, coal and producer gas engines, and diesel and semi-diesel or other engines which produce power by burning the fuel in the cylinder.

Comparisons with the data for 1929 show an increase of 533,714 h.p. or 8.1 p.c. in 1930 in the total primary power equipment installed in all manufacturing establishments, including central electric stations, by far the largest increase amounting to 475,118 h.p., being in the central electric stations, there being a decrease in primary power installation in some of the other manufacturing groups due to the replacement of steam equipment by electrical equipment operated by purchased power. The water-power development of central electric stations increased by 425,182 h.p., while steam power installed increased by 46,349 h.p. and internal combustion engines by 3,587 h.p. Provinces with large water-power developments usually show the greatest primary power increases. During the year 1930, Ontario led with an increase of 147,737 h.p., Quebec came second with an increase of 123,796 h.p., British Columbia third with an increase of 99,216 h.p., Nova Scotia fourth with an increase of 46,633 h.p. and Manitoba fifth with an increase of 43,463 h.p. In the utilization of hydraulic power, Quebec exceeded Ontario for the first time in 1925. In 1927, Quebec exceeded Ontario or any other province in the total of installed primary power from all sources and has been the leading province since then, largely owing to its extensive water-power resources, 92 p.c. of its primary power in 1930 being derived from water.

The rapid increase in the development of power in Canada and in its utilization in manufacturing industries is illustrated by the summary figures for the years 1921 to 1930 in Table 32. The table is divided into two parts, the first showing manufacturing industries exclusive of central electric stations and the second showing central electric stations only. The abundance of readily available water power in many parts of Canada, facilitating the development of low-cost hydro-electric power, has no doubt played a large part in this rapid growth. Of the total primary power increase of 3,968,295 h.p., inclusive of central electric stations, in the 9 years, no less than 3,493,464 h.p. or 89 p.c. was in water power. However, some sections of Canada are not so well provided with water-power resources and chiefly in such sections primary power derived from steam engines and turbines and internal combustion engines has also increased rapidly during the period covered. In the provinces of Prince Edward Island, Nova Scotia, Saskatchewan and Alberta, primary power produced from fuels exceeded that from water in 1930. The total installation of electric motors increased 1,983,185 h.p. or 196 p.c. in the 9 years covered, by far the greatest part of this increase being in motors operated by power purchased from central electric stations.

32.—Totals for Canada, of Power Installed in the Manufacturing Industries other than Central Electric Stations and in Central Electric Stations, 1921-30, with Details by Provinces and Groups of Industries for 1930.

Fuel.—The fuel used in industrial establishments in 1930 included 6,385,728 tons of bituminous coal, valued at \$34,073,553 constituting 60.3 p. c. of the total fuel cost. The other chief fuels in order of value were: fuel oil, comprising 13.9 p. c., gas (principally natural gas) 10.5 p. c., wood 4.04 p. c., coke 3.4 p. c. and anthracite coal 3.3 p. c. Out of a fuel account of over \$56,000,000, Ontario expended \$27,044,693 or 47.8 p. c. of the total. The manufacturing concerns of Quebec expended \$15,165,061, those of British Columbia \$3,495,758 and those of Nova Scotia \$2,916,336.

The groups of industries in which fuel was most extensively used in 1930 were: non-metallic minerals, \$13,103,000; wood and paper, \$12,671,000; iron and steel, \$9,650,000; and vegetable products, \$6,524,000. Fuel is used quite generally throughout the industrial field for the generation of power by means of internal combustion and steam engines. The most important industries where heat is applied directly to materials to transform them or to facilitate their manipulation are foundries and machine shops, blast furnaces and steel mills, smelting plants, brick-, tile-, lime- and cement-making, petroleum refining and the glass industry.

In such industries as the manufacture of coke and gas the coal used as a material which enters into the actual composition of the product is not treated as a fuel but as a raw material and is not, therefore, included in the figures of Table 33.

The total annual expenditure on fuel increased by \$4,877,835 or 9.4 p.c. in the 9 years from 1921 to 1930, covered by the summary figures in Table 33. During this period prices of fuels generally have declined. Thus there has been an increase of 56 p.c. in the quantity of bituminous coal used while the value has decreased 2 p.c. The fuels which have shown the greatest proportionate increases are gas and oil.

¹Includes other kinds of fuel which, in 1930, were as follows: lignite coal, \$1,296,160; gasoline, \$420,636; other fuels, \$825,313.

Section 5.—Manufacturing Industries in Cities and Towns.

The prosperity of most of the cities and towns of Canada, especially in the East, is intimately connected with their manufacturing industries, which provide employment for a large proportion of their gainfully employed population. In the West the cities are more largely distributing centres, though manufactures are rapidly increasing there also.

Table 34, indicating the extent to which the manufacturing industries of Canada are concentrated in urban centres, shows by provinces the proportion of the gross manufacturing production which is produced in cities and towns having a gross production of over \$1,000,000 each. In the more highly industrialized provinces of Ontario and Quebec such cities and towns account for about 88 p.c. of the total, while in British Columbia and Prince Edward Island, where sawmilling, fish-packing, and dairying are leading industries, the proportion falls to 56 p.c. or less. In the Prairie Provinces manufacturing is largely confined to a few large urban centres.

34.—Cities and Towns with a Gross Manufacturing Production of over \$1,000,000 each, Number of Establishments and Total Gross Production in such Cities and Towns as a Percentage of the Grand Total, by Provinces, 1930.

NOTE.—Statistics published in this table are in some cases higher than the figures published in Table 36, since, in the table below are included statistics of towns with less than three establishments and production of over \$1,000,000 each. It was not possible to publish this information in Table 36 without disclosing the operations of individual establishments.

Province.	Cities and Towns with a Gross Production of over \$1,000,000 each.	Establishments Reporting in Cities and Towns Producing over \$1,000,000 each.	Total Production in Cities and Towns Producing over \$1,000,000 each.	Total Production in each Province.	Production in Cities and Towns as a Percentage of Total Production in each Province.

The five chief manufacturing cities of Canada are Montreal, Toronto, Hamilton, Winnipeg and Vancouver. Statistics showing the trend of production in these cities during the latest nine years for which the figures are available are given in Table 35. According to the census of 1921, Hamilton was proportionately the most largely dependent of these cities upon manufacturing industries. About 45 p.c. of its gainfully employed population was employed in manufacturing, as compared with 30 p.c. in Montreal and Toronto, and 17 p.c. in Winnipeg and Vancouver.

Twenty-one other important cities with a gross production of manufactured goods of over \$20,000,000 each in 1930 were as follows, in descending order of the

value of their products: London, East Windsor, Kitchener, Oshawa, Walkerville, Calgary, Quebec, Three Rivers, Ottawa, Peterborough, Brantford, Sarnia, Edmonton, Niagara Falls, Regina, Shawinigan Falls, Montreal East, New Toronto, St. Boniface, La Salle and Sault Ste. Marie. Statistics of manufactures of cities and towns with a gross production of \$200,000 and over and with three or more establishments are given for 1930 in Table 36.

CHAPTER XV.—CONSTRUCTION.

Construction is the most conspicuous example of a great industry carried on in almost complete dependence on a local demand. The building industry is not only the most widespread in its operation, it is one which expands most rapidly in good times when it attracts great numbers of general and casual workmen—a characteristic which explains the high rate of unemployment from which the industry periodically suffers. Again, apart from the effect of cyclical fluctuations of general business conditions, the construction industry is decidedly seasonal, although new types of construction and mechanical improvements are making it possible to work more steadily on all branches of construction the year round. Conditions in the industry are being transformed on account of the increasing substitution of reinforced concrete for wood and brick construction. Nevertheless, in the winter there is a serious contraction, especially in outside operations, while in the other seasons the contractors employ a much larger number of men, casually engaged, than can be retained throughout the year. A considerable number of the men are in no sense skilled artisans and the supply of unskilled men is generally in excess of the demand.

Relation of Construction Industry to General Business Conditions.—Statistics showing activity in construction are of particular interest both to those engaged in the industry itself and to those concerned with the supplying of its raw materials, such as lumber, steel, cement, paint, glass and hardware. All of these latter industries are prosperous when the construction industry is active, and depressed when it is at a standstill; again, the effects of their activity and depression are felt throughout the whole field of industry, so that the current conditions in the construction industry react powerfully upon the whole economic life of the nation. Thus, in the period between 1909 and 1913, construction, mainly financed with borrowed money, contributed in large measure to produce the "boom" of those years.

During the war period the industry was at a low ebb, except for the construction of munition plants, but after the War the housing shortage was a serious problem, and considerable building was undertaken in spite of the high cost of materials and skilled labour, as shown in Table 4. The urgent requirements due to the practical suspension of the industry during the War were fully met in the post-war years, but the peak of the inflation cycle in 1929 is reflected in the highest value of construction contracts on record, aggregating \$576,651,800, exceeding 1928 by no less than \$104,619,200 and the former peak year, 1912, by \$113,568,800. In 1932, the total value of construction contracts awarded had declined to \$132,872,400, which was \$182,609,600 or 57.9 p.c. less than in 1931, and represented a decline of \$443,779,400 or 77 p.c. from the peak in 1929. (See Table 2.)

Construction in Transportation and Public Utility Industries.—The expenditure for construction by the transportation and public utility systems is incorporated in their general maintenance and structural accounts. The maintenance of way and structures account of the steam railways in 1931 totalled \$66,109,521 as compared with \$78,035,587 in 1930, while investments in the road bed and equipment of new lines in 1931 totalled \$22,350,280 and in additions and betterments on old lines, \$42,804,071. There were 305 miles of new lines opened

for operation during 1931, 427.7 miles completed but not opened for traffic, and 592.9 miles under construction. Total track mileage in 1931 was 56,908 as compared with 56,642 in 1930, a net increase of 266 miles. The expenditure of electric railways on maintenance of way and structures account decreased from \$3,977,114 in 1930 to \$3,291,490 in 1931. There was a net decrease of \$5,909,416 during 1931 in the capital investment of electric railways.

As for the telephone systems of Canada, the pole line mileage increased from 222,113 in 1930 to 222,196 in 1931, and the wire mileage from 4,790,224 to 4,985,076 in the same period. The property and equipment account was \$319,101,191 in 1930 and \$333,055,119 in 1931.

The pole line mileage of the telegraph systems increased from 52,824 in 1930 to 53,228 in 1931, and the wire mileage increased from 367,721 to 368,583. The telegraph and cable companies reported new construction valued at \$1,089,413 and alterations and repair work costing \$1,179,376, or a total expenditure for construction of \$2,268,789 for the year.

Contracts Awarded.—A record of contracts awarded during the years 1911-32, as compiled by MacLean Building Reports, Ltd., is given in Table 1. The aggregate for 1932 is 77 p.c. less than for the record year 1929. It is the lowest figure since 1918, when new construction was largely suspended on account of the War. Immigration was exceptionally great in 1912 and an extensive building program was necessary to care for the rapidly growing population; railway construction was also very active. In 1928 the high level was largely accounted for by residential building and industrial contracts were considerably ahead of 1927. Although residential construction declined in 1929, the tremendous increase in engineering construction and the significant advances in building for business purposes combined to make the record total. While construction operations of all types declined in 1930 when compared with 1929, the declines were most pronounced in the industrial, residential and business types, whereas engineering construction continued very active and was nearly double that of any year prior to 1929. It will be observed from Table 2 that construction for all purposes has declined greatly since then to the very low level recorded in 1932.

1.—Summary of the Value of Construction Contracts Awarded in Canada, 1911-32, as Compiled by MacLean Building Reports, Ltd.

Building Permits.—The estimated value of construction in 61 cities of Canada, as indicated by their building permits, is shown for the years 1927 to 1932 inclusive in Table 3. These cities had in 1931 about 36 p.c. of the population of Canada, while their 1932 building permits aggregated \$42,319,397 or 31.8 p.c. of the total contracts awarded, as shown in Table 1. In Table 3, the 35 cities for which statistics of building permits are available since 1910 are indicated by an asterisk (*), and the totals for these cities are given beneath the totals for the larger group.

Table 4 shows the value of the building permits issued by 35 cities in the years 1910-32. The average weighted index numbers of wholesale prices of building materials since 1913 are given together with index numbers, since 1921, of employment in the construction industries as reported by employers, both these indexes have been compiled by the Dominion Bureau of Statistics. The average index numbers of wages in the building trades since 1910 as compiled by the Depart-

ment of Labour are also given. These indexes show as far as possible the fluctuations in building costs with their effect upon construction work and employment. Attempts have been made to determine the relative proportion of material and wage costs in general building, but representative data could not be obtained. The reduction in the cost of building operations has probably been much more than is indicated by these figures. Index numbers of wages in the building trades are based chiefly on union rates in cities, and the types of construction which have been stimulated have been those where the higher paid trades have not been in great demand. The reduction in common labour costs has been proportionately greater than in the trades.

Owing to the increasing use of the automobile and other means of rapid transportation, a growing percentage of those who work in the cities reside outside the municipal boundaries. Hence arises, in part, the necessity for an extension of the record of building permits to include such suburban areas as the York Townships in the case of Toronto, and North Vancouver in the case of Vancouver. South Vancouver and Point Grey were annexed to Vancouver as from Jan. 1, 1929.

The construction contracts in 1932 as shown in Table 2 decreased by 58 p.c. compared with 1931 and the building permits of 61 cities in Table 3 decreased by more than 62 p.c.

3.—Value of Building Permits Taken Out in 61 Cities for the calendar years 1927-32.

NOTE.—Asterisks indicate the 35 original cities, statistics for which are available since 1910.

CHAPTER XVI.—EXTERNAL TRADE.

This chapter commences with an historical sketch of Canadian external trade, the Canadian tariff, and recent developments in external trade, followed by a brief account of the Commercial Intelligence Service. Thereafter is to be found a treatment of statistics of external trade under ten subordinate headings: historical statistics of Canadian trade; general analysis of current import and export trade; trade with the United Kingdom and the British Empire; trade with the United States and other foreign countries; geographical distribution of Canadian trade by continents and countries; principal commodities imported and exported; trade in raw and manufactured products; Canada's position in international trade; main historical tables and tables showing current trends (Tables 1 to 21); and comparison of the volumes of imports and exports (Table 22). The chapter is finally brought to a close with sections on the tourist trade of Canada, and on Canada's balance of international payments in recent years.

Section 1.—The Development of Tariffs.

An outline of the development of tariffs as affecting Canada naturally falls into two divisions: first, a historical sketch showing the various phases of Canadian trade which have influenced tariff development; and second, the present tariff conditions under which Canadian trade is carried on.

Subsection 1.—Historical Sketch of External Trade and Tariffs.

In the early history of the American continent each of the European nations establishing settlements in the New World endeavoured to monopolize the commerce of its colonies, prohibited the ships of other nations from resorting to them and prohibited its colonials from importing European goods from other countries, generally granting them, however, preferential treatment in its own market. In these circumstances the colonial wars in America were carried on by Governments permeated by the mercantile spirit, for "ships, colonies and commerce" Owing to this fact, wars resulting in the transfer of colonies from one European power to another involved great economic as well as political changes in the community so transferred. The traders who had previously controlled the trade between the mother country and its colony found their occupations gone, while new traders from the conquering State arrived to take over the import and export trade, which thereafter flowed in new channels, perhaps no more artificial than those which had previously existed.

Throughout the earlier part of the French *régime* in Canada, the foreign trade of the colony was in the hands of the monopolistic chartered companies, of which the Company of One Hundred Associates was the most notable. When its monopoly was cancelled in 1663, the external trade of Canada still remained a preserve of the merchants of Old France. Upon the conquest of the country by the British, the French merchants, who had their offices in Quebec and Montreal, for the most part returned to France, and the trade of the colony fell into the hands of the traders from England, Scotland and New England, who had flocked into the country at the heels of the invading armies. Some of their descendants are still among the leading figures in Canadian import and export trade.

For the first sixty years of British rule, Canadian commerce was carried on almost exclusively with or through the United Kingdom, the merchants of New England complaining, after the American Revolution, of being shut out from the Canadian trade. The geographical juxtaposition of the United States to British North America was, however, a factor which could not permanently be ignored, and smuggling became more and more prevalent as settlement extended westward along the International Boundary. In 1822 Great Britain made considerable concessions to United States traders in respect of the Canadian trade. In 1846 she abolished the preferential treatment which she had given to Canadian wheat, and in 1860 all vestige of preference to colonial products disappeared from the British tariff. As a consequence, the colonies which, like Canada, Nova Scotia and New Brunswick, were by this time enjoying responsible government, could not any longer be refused the right to control their own commercial policy—a fact which was emphasized in an important report prepared in 1859 by the then Minister of Finance, (Sir) A. T. Galt, and forwarded to the British Government. This report declared that the responsibility of the Canadian Government must be to the Canadian people, more especially in matters of taxation (the greater part of the revenue being raised by customs duties), and that the Canadian Government must affirm the right of the Canadian Parliament to adjust the taxation of the people in the way it deemed best, even if this should happen to meet with the disapproval of the British Ministry. This doctrine remained unchallenged by the British Government and, coming at a time when all important parties in Great Britain had accepted free trade as a *fait accompli*, it facilitated the setting up in Canada of a protective tariff, designed to secure the establishment in Canada of manufacturing industries, at a time when British opinion desired that the colonies should concentrate their attention on the production of food and raw materials and import from Great Britain the manufactured commodities which they required.

The Abolition of Preference and the Reciprocity Treaty of 1854.—The abolition of the British preference on Canadian wheat in 1846 brought about a depression in the flour-milling industry of Montreal and an ephemeral agitation for union with the United States. The effects of the repeal of the preference were, however, mitigated in 1849 by the repeal of the Navigation Acts and the consequent opening of the carrying trade between Canada and the United Kingdom to the shipping of the world. Meanwhile, the abandonment of protection in the Mother Country led to the initiation of negotiations for a reciprocity treaty with the United States. A treaty for the free exchange of natural products between them and the British North American colonies was negotiated in 1854, and became effective on Mar. 16, 1855. From its operation the Canadian farmer and fisherman derived considerable benefit, more especially during the period of the Civil War, when prices in the United States were particularly high. Partly as a consequence of the friction between Great Britain and the United States during the Civil War period and partly because the new Canadian tariff of 1859 shut out the manufactured goods of the United States, the treaty was denounced by the United States at the end of the ten-year period for which it had been negotiated and ceased to operate 12 months later on Mar. 17, 1866. The denunciation of the treaty had a considerable effect in bringing about the confederation of the British North American colonies, which it was hoped would to a great extent consume each other's products.

Tariff Policy since Confederation.—The immediate effect of Confederation was to abolish the tariff barriers which existed between the provinces entering the Dominion. As the area of Canada increased until, except for Newfoundland and

Labrador, it became conterminous with British North America, the area of internal free trade was thereby extended, while protection against outside competition was generally maintained. However, the protective tariff of the old province of Canada, adopted in 1859 with a prevailing rate of 20 p.c., was replaced in 1866 by a tariff assimilated to the revenue tariffs of the Maritime Provinces, with the rates of duties on the great bulk of manufactured commodities reduced from 20 and 25 p.c. to 15 p.c. Later on, the world-wide depression which commenced in 1873, and the consequent falling off in a revenue based upon trade, necessitated an increase of the general rate to 17½ p.c., with a 20 p.c. rate on certain luxuries. Even this increase failed to fill the treasury.

In 1879, after the people had declared for a protective policy in the general election of 1878, the duties on imported manufactured goods were considerably increased, the rate on goods "not otherwise provided" being raised from 17½ p.c. to 20 p.c., the rates on cotton goods from 17½ p.c. to rates, specific and *ad valorem*, equivalent, on the importations of 1881, to 30 p.c., while the duties on woollens were practically doubled. The rate on furniture and clocks was increased to 35 p.c.; on carriages, glassware, wall-paper and silks, to 30 p.c.; on boots and shoes, buttons, rubber goods and woodenware, to 25 p.c. Pig iron, previously free, now paid \$2 a ton, and the duty on iron billets, bars and rods was increased from 5 p.c. to 10 and 17½ p.c., while manufactured iron and steel products and machinery were given 25 to 35 p.c. protection. Throughout the '80's the general trend of the minor revisions made in the tariff was still upwards but in the '90's a downward tendency became manifest. In 1891 the duty on raw sugar was repealed, and in 1894 material reductions were made on agricultural implements, and minor readjustments on cottons and woollens. This period was also marked by the thorough-going extension of protection to the iron and steel industry, both by customs duties and bounties.

In the tariff revision of 1897, the duties on Indian corn, binder twine, barbed wire, pig iron, flour and refined sugar were reduced or abolished, while the bounties on domestic pig iron were not reduced but in certain cases increased. But the most distinctive feature of the tariff revision of 1897 was the adoption of what was called a "reciprocal" tariff, one-eighth lower than the general. This "reciprocal" tariff was at once applied to the United Kingdom, and afterwards to New South Wales and to British India, while Belgium and Germany, in virtue of their trade treaties with Great Britain, were also admitted to the benefits of the "reciprocal" tariff, together with Argentina, Austria-Hungary, Bolivia, Colombia, Denmark, Persia, Russia, Sweden, Switzerland, Tunis and Venezuela, on account of most-favoured-nation treaties between these countries and Great Britain, also France and her colonies, in consequence of the Franco-Canadian treaty of 1893. A little later the "reciprocal" tariff was also extended to the Netherlands, Japan, Siberia, Morocco, Salvador, South African Republic, Tonga and Spain, under most-favoured-nation treaties between these countries and the United Kingdom.

The numerous concessions mentioned above were, however, of a merely temporary character, ceasing to exist in 1898 as a consequence of the denunciation by Great Britain of her most-favoured-nation treaties with Germany and Belgium. This left Canada free to confine her lower tariff rates to the United Kingdom and to sister Dominions and colonies. A British preferential tariff, consisting at first of a remission of 25 p.c. of the duty ordinarily paid (Aug. 1, 1898), and later of a remission of 33½ p.c. of the ordinary rate of duty (July 1, 1900), was established. This method of preference was abandoned in 1904 for a specially low rate of duty on almost all imported dutiable commodities.

Subsection 2.—Present Tariffs.¹

Tariff of 1907 and Empire Preferences.—A new Canadian Customs Tariff was adopted on April 12, 1907, containing three columns of duties, British preferential, intermediate and general. This tariff with amendments is still in operation. The Tariff Act itself mentions as being entitled to the British preference those parts of the Empire which were already enjoying it under previous measures, namely: United Kingdom, British India, Ceylon, New Zealand, Union of South Africa, Southern Rhodesia, Bermuda, British West Indies, British Guiana and Straits Settlements. Power was taken to extend the same advantages, by Order in Council, to other parts of the Empire. Under this authority the British preference was, on Jan. 25, 1913, granted to: Swaziland, Basutoland, Bechuanaland Protectorate, Northern Rhodesia, Nyasaland Protectorate, Uganda Protectorate, East Africa Protectorate, Protectorate of Northern Nigeria, Colony and Protectorate of Southern Nigeria, Gold Coast, Sierra Leone, Gambia, Somaliland Protectorate, Federated Malay States, British North Borneo, Sarawak, Brunei, Mauritius and Dependencies thereof, Seychelles, St. Helena, Ascension, Friendly or Tonga Islands, Fiji, Falkland Islands and British Honduras. Further extensions were to: Irish Free State, Sept. 21, 1923; Territory of Western Samoa, Oct. 1, 1924; Newfoundland, June 26, 1928; Tanganyika Territory, Dec. 19, 1930; Channel Islands, Isle of Man, Kenya Colony and Protectorate, Colony and Protectorate of Nigeria, British Sphere of the Cameroons, British Sphere of Togoland, part of New Guinea under mandate of Australia, and Cyprus, all on Sept. 24, 1931.

Trade Agreements with Australia.—Australia remained almost the only part of the Empire not accorded the British preferential tariff, either by Statute or Order in Council. However, a formal trade Agreement between Canada and Australia (superseding an arrangement of 1925, exchanging limited preferences by legislation) was brought into force on Aug. 3, 1931, providing for exchange of British preferential rates, except as set forth in two schedules—one of which concedes special Canadian rates on some Australian products, while the other specifies the tariff treatment given by Australia to Canada on certain items, as well as enumerating items which Australia reserves as regards granting preferential treatment. Canada is accorded the British preferential tariff of Australia on all but 18 of the 438 items comprising the entire tariff. On six items the intermediate tariff applies and on the other twelve, the general tariff. An important concession to Canada is the creation of new or larger margins of preference than existed in the former tariff on some products of importance to Canada. Other general provisions waive anti-dumping laws, define qualifications for domestic products, and permit either country to apply its general tariff rates to imports from the other which are injuriously affecting the sale of similar domestic goods, provided that, after three months' notice, the exporting country has failed to remedy the situation.

Trade Agreements with British West Indies.—To the British West Indies concessions independent of the British preference were made in an Agreement of 1912, which obtained West Indian preferential rates of four-fifths of the general tariff on some Canadian goods. In 1920 a second trade Agreement, broader both as to the extent of the preferences exchanged and the number of West Indian signatories, superseded the first. This in turn was replaced on July 6, 1925, by one still more extensive, brought formally into force by proclamation as from April 30,

¹ Revised by W. Gilchrist, Chief, Foreign Tariffs Division, Department of Trade and Commerce.

1927. It is binding for a 12-year period and thereafter until terminated on a year's notice. It includes: Jamaica, Trinidad, Barbados, Bahamas, Leeward Islands, Windward Islands, Bermuda, British Guiana and British Honduras. The larger colonies give a preference of 2s. per brl. on flour, and various stated amounts on some other commodities of importance. The preference on manufactured goods in general, when not specially dealt with, ranges from 20 p.c. to 50 p.c. of the general tariff. In return Canada grants the colonies: (a) specific amounts of preference on sugar and some other selected tropical products; (b) a 50 p.c. reduction from the general tariff on goods for which no special provision is made.

Trade Agreement with New Zealand.—Imports from New Zealand have been accorded British preferential rates since 1904. Furthermore on Oct. 1, 1925, the special rates of the trade Agreement with Australia were extended to New Zealand. Canada was granted the British preferential rates of New Zealand established in 1903. However, from Oct. 12, 1930, after due notice, Canada withdrew the Australian treaty rates as regards imports from New Zealand, and on June 2, 1931, New Zealand withdrew her British preferential rates from all but a few items of Canadian goods. After negotiations a new trade Agreement for one year with New Zealand was brought into force by proclamation as from May 24, 1932. In this Agreement Canada grants New Zealand rates lower than British preferential on various articles of outstanding interest to her, and otherwise extends to her the British preferential tariff. New Zealand restores the British preferential rates to Canada except on six items on which however, she, concedes rates lower than the general tariff. On lumber, laths, and shingles, where no preference existed previously because the general and preferential rates were the same, New Zealand creates a differential between her British preferential and general tariffs, so as to afford Canada a tariff preference on such products. Under a general provision of the Agreement anti-dumping laws of both countries are suspended except in the case of imports injurious to domestic industry when the exporting country does not apply remedial measures after 30 days' notice. Other general provisions extend the Agreement to Western Samoa and Cook Islands.

Preferences by Great Britain Prior to the Imperial Conference, 1932.—Great Britain, between 1919 and 1931, granted preferences to Empire products within the limited scope of her tariff of that time. By 1931 there were preferences on: motor cars, clocks and watches, musical instruments, cinematograph films, all known as "McKenna duties"; sugar, goods containing sugar, glucose, tobaccos, certain dried fruits, chicory, cocoa, coffee, hops, spirits, wines, silk and artificial silk goods; pottery, buttons, household hollow-ware (safeguarding duties); and on "key industry goods" mainly certain chemicals, optical instruments, arc lamp carbons, vacuum tubes, metallic tungsten, some scientific instruments and scientific glassware. In consequence of the *Abnormal Importations (Customs Duties) Act*, passed Nov. 20, 1931, to remain in effect for six months, giving authority for Orders in Council imposing duties, not to exceed 100 p.c. *ad valorem*, on foreign manufactured goods, some 50 items were subjected to 50 p.c. *ad valorem*. The *Horticultural Products (Emergency Customs Duties) Act*, passed Dec. 11, 1931, to remain in force for twelve months, gave the Government power to impose duties by Orders in Council up to 100 p.c. *ad valorem* on certain fresh fruit, fresh vegetables and flowers of non-Empire origin. Two Orders were passed under this Act. The *Import Duties Act* effective Mar. 1, 1932, imposed a duty of 10 p.c. *ad valorem* on goods which were not otherwise subject to duty except for some exemptions including wheat and maize, meats (not including canned), live animals, raw

cotton, flax and hemp, wool, hides and skins, newsprint, pulp, wooden pit-props, metallic ores, coal and certain other minerals, unwrought copper and all goods imported for shipbuilding. Products of the Dominions, India, and Southern Rhodesia were exempt from this duty until Nov. 15, 1932, their treatment after that date to depend on the Imperial Conference. Products of other parts of the British Empire were exempt from the 10 p.c. duty without limitation as to date. By an Order effective April 26, 1932, the 10 p.c. general tariff was increased to rates ranging from 15 to 33½ p.c. *ad valorem*, on a wide range of merchandise, chiefly manufactured goods.

The Imperial Economic Conference, 1932.—The United Kingdom-Canada Agreement.—Under this Agreement the United Kingdom, while continuing to grant to products of Canada those preferences and exemptions from duty established by the Import Duties Act cited above, provided, for important Canadian products, additional preferences by the imposition of new or increased duties on competing foreign imports. Chief among these products were: eggs, butter, cheese, condensed milk, wheat, fresh and canned apples, and unwrought copper. A continuation of a 10 p.c. preference was guaranteed on dutiable timber, fresh and canned fish, asbestos, lead and zinc. Canada was granted unrestricted entry for a maximum quota of 2,500,000 cwt. per annum of bacon and hams, and for 10 years a margin of preference of 2s.0½d. per lb. on unmanufactured tobacco. Certain preferences accorded in United Kingdom Agreements with other Dominions apply automatically to Canada as an Empire country. As regards eggs, poultry, butter, cheese, and other milk products, free entry is guaranteed for three years, after which the position as regards these articles is subject to review. Increased preferences to Canada in many of the non-self-governing Colonies and Protectorates were provided for on selected articles. The British reserved the right to remove duties on foreign wheat, copper, lead and zinc if at any time Empire producers were unwilling or unable to provide, at world prices, the United Kingdom requirements. In return Canada agreed to widen the margin of preference on imports from Britain on a great variety of goods as set forth in a schedule attached to the Agreement. Actual changes were made in 225 Canadian tariff items, on 223 of which the margin of the British preference was increased. The tariff was lowered on 133 items, more than half of which were placed on the free list, in the other cases the margin was increased by raising the intermediate and general tariffs. By major groups, the tariff changes mainly concern iron and steel, drugs and chemicals, textiles, leather goods, glass, vegetable oils, as well as a wide list of miscellaneous commodities. Generally speaking manufactured goods of a class or kind not produced in Canada were made free. Additional preferences were also provided for imports into Canada of various commodities produced largely in the non-self-governing Colonies and Protectorates. Canada agreed that the tariff should be based on the principle that protective duties should not exceed such a level as would give United Kingdom producers full opportunity of reasonable competition in Canada on the basis of the relative cost of economic and efficient production with special consideration to be given to industries not fully established. Canada undertook to institute the Tariff Board, already authorized by Statute, to review duties on United Kingdom goods in accordance with these principles and not to increase these duties except in accordance with the Board's findings. Canada further agreed to abolish surcharges on imports from the United Kingdom as soon as Canada's finances would allow and to give sympathetic consideration to the abolition of the exchange dumping duty on British goods. The Agreement was to continue for 5 years and be subject thereafter to termination upon 6 months' notice by either party.

Other Agreements.—The Agreement between Canada and the Union of South Africa places commercial relations between these two Dominions on a treaty basis for the first time. It covers the principal commodities which each Dominion can sell to the other, but is more limited in scope than the trade Agreements concluded earlier with Australia and New Zealand. A considerable extension of the preferred list of commodities has been obtained for Canada. Special consideration has been given to corn from South Africa, although fruits in certain seasons, peanuts, sugar and molasses are also given consideration. Wheat, flour, apples, hosiery, binder twine, machinery, vacuum cleaners, iron pipes, tools, shooks, lumber, canned fish, motor cars, electrical appliances, rubber goods and paper products are the chief items on which concessions are made to Canada.

The Agreement with the Irish Free State secured for all goods the produce and manufacture of Canada imported into the Irish Free State the benefits of the lowest rates of duty accorded to similar products of any country. In return, goods the produce of the Irish Free State, when imported into Canada, were to be accorded the same tariff treatment as similar goods imported from the United Kingdom.

The Agreement with Southern Rhodesia made provision for the exchange of preferential treatment on selected lists of commodities. In addition, other goods not enumerated in the schedules continue to enjoy the benefits of existing and future British preferences. Indian corn, citrous fruits and peanuts are given free entry by Canada, whereas Southern Rhodesia gives our manufacturers important concessions on cream separators, batteries, boots and shoes, and paper products.

Other Empire Preferences on Canadian Goods.—Even in the absence of trade Agreements many tariff preferences are accorded to Canadian goods throughout the Empire. The general position now is that nearly all goods, the produce or manufacture of Canada, shipped in accordance with prescribed regulations, are granted tariff preferences over non-Empire goods in Great Britain and Northern Ireland, Australia, New Zealand, Fiji, Western Samoa, British West Indies (thirteen tariffs), Bermuda, British Guiana, British Honduras, Southern Rhodesia, Northern Rhodesia (Zambesi Basin), Gambia, Sierra Leone, Seychelles, British Somaliland, Cyprus, and Isle of Man. To a considerable extent tariff preference is similarly granted to Canadian goods in the Irish Free State, the Union of South Africa, Ceylon, and Mauritius, also on some goods in the Federated Malay States, the Unfederated Malay States, British North Borneo, Sarawak, and Brunei. Empire motor cars enjoy preference in Hong Kong, the Straits Settlements, and Guernsey; spirits and malt liquors in Gibraltar; and wines in the Falkland Islands.

Canadian Tariff Arrangements with Foreign Countries.—Arising out of some old British treaties, later British treaties or favoured-nation clauses sanctioned by Canadian Acts of Parliament, or in consequence of purely Canadian conventions of commerce, Canada extends on a reciprocal basis most-favoured-nation customs treatment except where otherwise indicated to the goods of the following countries:—

Country.	Treaty or Convention.	Date.
Argentine Republic.....	Treaty of Amity, Commerce and Navigation with Great Britain.....	Feb. 2, 1825.
Brazil.....	Exchange of Notes granting Canadian Intermediate Tariff for most-favoured-nation treatment in Brazil.	Dec. 4, 1931.
Economic Union of Belgium and Luxemburg, Belgian colonies, possessions and mandated territory.....	Convention of Commerce with Canada.....	July 3, 1924.

Country.	Treaty or Convention.	Date.
Colombia.....	Treaty of Friendship, Commerce and Navigation with Great Britain.....	Feb. 16, 1866.
Czechoslovakia.....	Convention of Commerce with Canada.....	Mar. 15, 1928.
Denmark.....	Treaties of Peace and Commerce with Great Britain.....	Feb. 13, 1660-1 July 11, 1670.
Estonia.....	Canadian Trade Agreements Act accepted favoured-nation provision of United Kingdom-Estonia Treaty of Commerce and Navigation, Jan. 18, 1926.....	June 11, 1928.
Finland.....	Finland Trade Agreement Act accepted most-favoured-nation terms of United Kingdom-Finland Treaty of Commerce and Navigation of Dec. 14, 1923.....	June 12, 1925.
Germany.....	Exchange of Notes granting Canadian Intermediate tariff for Conventional rates of German tariff (for 3 months).....	Jan. 1, 1933.
Hungary.....	Canadian Trade Agreements Act accepted favoured-nation provision of United Kingdom-Hungary Treaty of Commerce and Navigation of July 23, 1926.....	June 11, 1928.
Italy, colonies and possessions.....	Convention of Commerce with Canada.....	Jan. 4, 1923.
Japan.....	Japanese Treaty Act sanctioned (with provisos) United Kingdom-Japan Treaty of Commerce and Navigation of April 3, 1911.....	April 10, 1913.
Latvia.....	Canadian Trade Agreements Act accepted most-favoured-nation provision of Great Britain-Latvia Treaty of Commerce and Navigation, June 22, 1923.....	June 11, 1928.
Lithuania.....	Canadian Trade Agreements Act accepted most-favoured-nation provision of Great Britain-Lithuania Agreement respecting commercial relations, May 6, 1922.....	June 11, 1928.
Netherlands, Netherlands Indies, Surinam and Curaçao.....	Convention of Commerce with Canada.....	July 11, 1924.
Norway.....	Convention of Commerce and Navigation between Great Britain and (Sweden and) Norway.....	Mar. 18, 1826.
Portugal, including Madeira, Porto Santo, and Azores.....	Canadian Trade Agreements Act accepted most-favoured-nation provision of Great Britain-Portugal Treaty of Commerce and Navigation, Aug. 12, 1914.....	June 11, 1928.
Roumania.....	Exchange of Notes under Article 36, Treaty of Commerce and Navigation between the United Kingdom and Roumania, Aug. 6, 1930.....	Sept. 30, 1930.
Serb-Croat-Slovene Kingdom (Yugoslavia).....	Canadian Trade Agreements Act accepted most-favoured-nation provision of United Kingdom-Serb-Croat-Slovene Kingdom Treaty of Commerce and Navigation, May 12, 1927.....	June 11, 1928.
Spain.....	Spanish Treaty Act sanctioned United Kingdom-Spain Treaty of Commerce and Navigation, Oct. 31, 1922 (revised April 5, 1927), also United Kingdom-Spain Agreement, June 27, 1924, regulating treatment of companies.....	June 11, 1928.
Sweden.....	Convention of Commerce and Navigation between Great Britain and Sweden (and Norway).....	Mar. 18, 1826.
Switzerland.....	Treaty of Friendship, Commerce and Reciprocal Establishment between Great Britain and Switzerland.....	Sept. 6, 1855.
Venezuela.....	Treaty of Amity, Commerce and Navigation between Great Britain and Colombia (of which Venezuela was then part).....	April 18, 1825.

Under mutual most-favoured-nation customs treatment each contracting country accords to the goods of the other the lowest duties applied to similar products of any foreign origin, unless there are reservations. These reservations would be tariff concessions, not considered of relatively great importance, which one country may grant to another on historical, geographical, or some related ground. Most-favoured-nation obligations do not include Canadian preferences given to other parts of the Empire. Canada's concessions to France in the Convention of Commerce of 1922 established the rates applicable to most-favoured foreign nations. The Convention was for an indefinite period, subject to termination on either party giving six months' notice. Canada gave such notice on Dec. 16, 1931, so that the Convention expired on June 16, 1932. That abrogation automatically cancelled all rates lower than the intermediate tariff to all most-favoured nations. The Canadian Government expressed its willingness to enter immediately on negotia-

tions with France for a new convention beneficial to the commerce of both countries. Negotiations were carried on in Paris during the winter 1932-33 but at the time of going to press no new Agreement had been ratified.² As the situation stands in March, 1933, therefore, rates of the intermediate tariff apply to most-favoured nations, and to Brazil and Germany.

The value to Canada of most-favoured-nation treatment in foreign countries depends on the customs system of the country concerned. Several countries have maximum and minimum schedules, meaning that there are reduced duties for practically all goods imported from reciprocating or treaty countries. Some countries, on account of rates conceded in treaties, maintain reduced duties on specified items of their tariffs. Many countries throughout the world have uniform tariffs regardless of the origin of the goods. The benefit of most-favoured-nation treatment depends also on the extent to which tariff favours apply to countries competing with Canada in the market in question.

Dumping Duties.—In the Canadian custom tariff there is also an anti-dumping clause. In 1930 and 1931 the statutory provisions relative to the levying of special or dumping duty were amended. Special or dumping duty is now leviable upon goods exported to Canada of a class or kind made or produced in Canada, if the export or actual selling price to an importer in Canada is less than the fair market value of the same article when sold for home consumption in the usual and ordinary course, in the country whence exported to Canada, at the time of its exportation, or is less than the fair market value, or value for duty thereof, as determined or fixed under the provisions of the Customs Act, R.S.C., 1927, c. 42 (see also sections 36, 37, paragraphs "a" and "e" of 41, and section 43, Statutes of 1930, c. 2). It is provided that the special duty shall not exceed 50 p.c. *ad valorem* in any case and that goods of a class subject to duty under the Excise Act shall be exempt.

Provision is also made for the levy of additional special or dumping duty not exceeding 50 p.c. when it appears that any person owning or controlling or interested in a business in Canada and also in any other country, or carrying on a business in any other country and owning, controlling or interested in a business operating in Canada is enabled thereby to import goods for further manufacture or assembling, or for resale and disposal of such imported goods, whether in the form as imported or as further processed, assembled or manufactured, at prices below the duty paid value thereof as entered at Customs plus, if any, the cost of processing, assembling or further manufacture in Canada. The Minister may declare that goods of such class or kind were and are an importation subject to additional special or dumping duty not exceeding 50 p.c.

Drawbacks.—Drawbacks of 99 p.c. of duties paid on imported materials are allowed by the customs laws and regulations in cases where articles manufactured from such materials are afterwards exported.

Surtax.—In 1903 the Customs Tariff Act of 1897 was amended to provide for a surtax of one-third of the duty on goods, the product of any foreign country which treats imports from Canada less favourably than those from other countries. This surtax was at once applied against certain German goods but was removed on Mar. 1, 1910, when Canada obtained the conventional rates of the German tariff on a specified list of goods. Under the Customs Tariff Act of 1914 the rate of surtax was left to be fixed in each case by the Governor in Council but was not to exceed 20 p.c. *ad valorem*. In the 1931 Tariff Amendments the maximum of the rate of surtax was increased to 33½ p.c. *ad valorem*.

¹ Revised in the Customs and Excise Division, Department of National Revenue. ² An Agreement between the two Governments was signed on May 12, 1933.

Powers of the Governor in Council.—The Governor in Council may make reductions of duties on goods imported into Canada from countries granting reductions on Canadian products.

The Governor in Council is given power to prohibit the importation of any goods exported directly or indirectly from any country not a contracting party to the Treaty of Versailles executed at Paris, France, on June 28, 1919.

In the event of producers of goods taking advantage of any duty under the provisions of the Customs Tariff, the Governor in Council is empowered to reduce or remove such duty and, where a producer violates the provisions of sec. 17, to impose upon all his products an Excise duty equivalent to the amount of Customs duty which would be paid by such goods if imported under the provisions of the General Tariff. These provisions, however, do not apply to agricultural products.

Combinations.—Whenever it is deemed in the public interest to inquire into any combination alleged to exist detrimental to consumers, the Governor in Council may commission or empower any judge of the Supreme Court or of the Exchequer Court of Canada, or of any superior court or county court in Canada, to hold an inquiry in a summary way and to report to the Governor in Council whether such combination exists, the judge being empowered to compel attendance of witnesses, examine them under oath, and require production of books and papers, etc., and, upon the judge reporting the existence of such a combination, the Governor in Council is given authority to admit the article concerned free of duty, or so reduce the duty thereon as to give the public the benefit of reasonable competition if it appears that the disadvantage to the consumer is facilitated by the duties of Customs imposed on a like article.

Section 2.—The Commercial Intelligence Service.¹

The Commercial Intelligence Service, maintained by the Department of Trade and Commerce, is designed to further the interests of Canadian trade in other parts of the Empire and in foreign countries. To this end there are established throughout the world offices administered by Trade Commissioners. These Trade Commissioners make periodical reports upon trade and financial conditions, variations in markets and the current demand or opportunities for Canadian products. They also secure and forward to the Department in Ottawa specific inquiries for Canadian goods and in general exert their best efforts for the development and expansion of overseas markets.

Organization at Ottawa.—Besides the overseas organization of the Commercial Intelligence Service, there is a headquarters staff at Ottawa. This is presided over by a Director, who is the head of the Service and administers and unifies the work assigned to the various Trade Commissioners. Assisting the Director are the following divisions: Trade Inquiries—where trade reports and information on foreign markets are filed in order to answer foreign and Canadian trade inquiries; Editorial—where the Commercial Intelligence Journal is compiled; Foreign Tariffs—where all the latest tariff data are kept and tariff inquiries answered; and the division handling the Directory of Canadian Exporters—where Canadian exporters are listed, with their agents abroad, commodities handled, ratings, cables and codes used, etc., and where the Foreign Importers' Directory is kept up to date by periodical reports from the Canadian Trade Commissioners.

¹ Revised by L. D. Wilgress, Director, Commercial Intelligence Service, Department of Trade and Commerce.

Also, in order to keep abreast of Canadian industrial development, each Canadian Trade Commissioner makes a periodic tour of Canada and while in this country gives first-hand information to the Canadian manufacturer regarding opportunities and conditions of trade in his territory.

Organization Abroad.—A list of the countries in which Canadian Trade Commissioners are located, showing territory covered, name, post office and cable address of the Trade Commissioner in each case, is given below:—

CANADIAN GOVERNMENT TRADE COMMISSIONERS.¹

NOTE.—Cable address of Trade Commissioners is "Canadian" unless otherwise stated.

<i>Argentine Republic</i> (Territory includes Chile and Uruguay).....	Harry A. Scott, B. Mitre 430, Buenos Aires (1).
<i>Australia</i>	D. H. Ross. Address for letters—Box 196c, G.P.O., Melbourne. Office—Safe Deposit Building, Melbourne. Commercial Agent—B. Millin, The Royal Exchange, Sydney, N.S.W.
<i>Belgium</i>	Henri Turcot, 98 Boulevard Adolphe Max, Brussels.
<i>Brazil</i>	A. S. Bleakney. Address for letters—Caixa Postal 2164, Rio de Janeiro. Office—Ed. Da "A Noite", Sala 802, Praca Maua.
<i>British West Indies</i> — Trinidad (Territory includes Barbados, Windward and Leeward Islands and British Guiana).....	Acting Trade Commissioner. Address for letters—P.O. Box 125, Port of Spain. Office—Colonial Bank Building.
Jamaica (Territory covers Jamaica, Hayti, the Bahamas, and British Honduras).....	F. W. Fraser, P.O. Box 225. Office—Canadian Bank of Commerce Chambers, Kingston.
<i>China</i>	L. M. Cosgrave. Address for letters—P.O. Box 264, Shanghai. Office—Daily News Building, 17 The Bund, Shanghai. Paul Sykes. Address for letters—P.O. Box 160, Dairen, Manchuria. Office—Cornabe Building, 1 Higashi-Koen-Cho, Dairen, Manchuria. (Territory covers Manchuria.)
<i>Cuba</i> (Territory includes San Domingo and Puerto Rico).....	E. L. McColl. Address for letters—Apartado 1945, Havana. Office address—Royal Bank of Canada Building, Calle Aguiar 75, Havana.
<i>Egypt</i> (Territory includes the Sudan, Palestine, Cyprus, Iraq, Syria and Persia).....	Yves Lamontagne. Address for letters—P.O. Box 1770, Cairo. Office—22 Shari Kasr el Nil, Cairo.
<i>France</i> (Territory includes French Colonies in North Africa).....	Hercule Barré, 3 rue Scribe, Paris (9). Cable address—Cancomac.
<i>Germany</i> (Territory covers Germany—except the Rhine Valley—Czechoslovakia, Austria, and Eastern European countries).....	Acting Trade Commissioner, Monckebergstrasse 31, Hamburg.
<i>Greece</i> (Territory includes Turkey).....	Acting Trade Commissioner, 1 Corsi Street, Athens.
<i>Hong Kong</i> (Territory includes South China, the Philippines, British North Borneo, and Indo-China).....	V. E. Duclos. Address for letters—P.O. Box 80, Hong Kong. Office—Gloucester Building, Hong Kong.
<i>India and Ceylon</i>	R. T. Young. Address for letters—P.O. Box 2003, Calcutta. Office—8 Esplanade Mansions, Government Place East, Calcutta.
<i>Irish Free State and Northern Ireland</i>	J. H. English, 66 Upper O'Connell Street, Dublin, Irish Free State; and 44 Ann Street, Belfast, Northern Ireland. Cable Address—Adanac.
<i>Italy</i> (Territory includes Spain, Portugal, Gibraltar, Canary Islands, Malta, Italian colonies in Africa, Albania, and Yugoslavia).....	A. B. Muddiman, Via Manzoni Nr. 5, Milan (102).
<i>Japan</i> — Tokyo.....	J. A. Langley, Commercial Secretary; Richard Grew, Trade Commissioner. Address for letters—P.O. Box F101, Tokyo Central. Office—Imperial Life Assurance Building, Marunouchi, Tokyo.
Kobe.....	Acting Trade Commissioner. Address for letters—P.O. Box 230, Kobe. Office—Chamber of Commerce Building, Kobe.

¹ As at Jan. 1, 1933.

CANADIAN GOVERNMENT TRADE COMMISSIONERS—concluded.

Mexico (Territory includes Guatemala, Honduras, and Salvador).....	Acting Trade Commissioner. Address for letters—Apartado Num. 126-bis, Mexico City. Office—Edificio Banco de Londres y Mexico, Num. 30, Mexico City. Cable address—Cancoms.
Netherlands (Territory includes the Rhine Valley and Switzerland).....	J. C. MacGillivray, Beursplein 26B, Rotterdam.
Netherlands East Indies (Territory includes Straits Settlements, Federated Malay States and Siam).....	G. R. Heasman. Address for letters—P.O. Box 84, Batavia, Java. Office—Chartered Bank Building, Malacca St., Batavia, Java.
New Zealand (Territory includes Fiji and Western Samoa).....	C. M. Croft. Address for letters—P.O. Box 33, Auckland. Office—Yorkshire House, Shortland Street, Auckland.
Norway (Territory includes Scandinavian countries and Finland).....	F. H. Palmer, Jernbanetorget 4, Oslo.
Panama (Territory includes Venezuela, Colombia, Nicaragua and Costa Rica).....	J. A. Strong. Address for letters—P.O. Box 222, Panama City. Office—Royal Bank of Canada Building, Santa Ana Plaza, Panama City.
Peru (Territory includes Bolivia and Ecuador).....	C. S. Bissett. Address for letters—Casilla 1212, Lima. Office—Calle Coca, 478, Lima.
South Africa (Territory includes Southwest Africa, the Rhodesias, Nyassaland, Tanganyika Territory and Kenya Colony).....	G. R. Stevens. Address for letters—P.O. Box 633, Cape Town. Office—Clegborn and Harris Building, Adderley Street, Cape Town. Cable address—Cantracom.
United Kingdom— London (Territory covers Home Counties, South-eastern Counties, and East Anglia).....	Harrison Watson, Canada House, Trafalgar Square, S.W. 1. Cable address—Sleighting, London.
London (Territory—for fresh fruit only—covers United Kingdom, Norway, Denmark, Sweden, France, Holland, Belgium, Germany, and Spain).....	J. Forsyth Smith, Fruit Trade Commissioner, Walter House, Bedford Street, Strand, W.C. 2. Cable address—Canfrucum.
London.....	W. A. Wilson, Animal Products Trade Commissioner, Canada House, Trafalgar Square, S.W. 1. Cable address—Agrilon.
Liverpool (Territory covers North of England, Lincolnshire, North Midlands, and North Wales).....	H. R. Poussette, Century Bldgs., 31 North John Street.
Bristol (Territory covers West of England, South Wales and South Midlands).....	Douglas S. Cole, Northcliffe House, Colston Ave.
Glasgow.....	Gordon B. Johnson, 200 St. Vincent Street. Cable address—Cantracom.
United States— New York City (Territory includes Bermuda)....	Frederic Hudd, 25 Broadway. Cable address—Cantracom.

Under an arrangement made by the Minister of Trade and Commerce with the British Foreign Office, Canadian manufacturers exporters and others interested in trade matters may secure information and advice from British commercial diplomatic officers and British consuls in all countries in which Canada is not represented by her own Commercial Intelligence Service.

Commercial Intelligence Journal.—The Commercial Intelligence Journal, containing the reports of the Trade Commissioners and other pertinent material relating to export trade, is published weekly by the Department of Trade and Commerce in both English and French editions. The subscription price for either edition is \$1 per annum in Canada and \$3.50 outside of the Dominion. Special reports dealing with various phases of Canada's export trade are also issued from time to time, as supplements to the Commercial Intelligence Journal.

Section 3.—Statistics of External Trade.¹

NOTE.—For the correct interpretation of the statistics of external trade, it is necessary that the following definitions and explanations of the terms used should be carefully kept in mind.

Fiscal Years.—The Canadian fiscal year ended on June 30 of the years from 1868 to 1906, and on Mar. 31 of 1907 and subsequent years.

Quantities and Values.—In all the following tables of imports and exports, the quantities and values are based upon the declarations of importers (import entries) and exporters (export entries), as subsequently checked by customs officials.

Imports: Valuation.—"Imports" means "Imports entered for consumption" "Entered for consumption" does not imply that the goods have been actually consumed in Canada, but that they have passed into the possession of the importer and that duty has been paid on that portion liable for duty.

The value of imported merchandise under the main provisions of the law is the fair market value or the price thereof when sold for home consumption in the principal markets of the country whence, and at the time when, the same was exported directly to Canada, also not less than the price to jobbers or wholesalers generally, nor less than the actual cost of production of goods at time of shipment plus a reasonable advance for selling cost and profit. The values shown are in Canadian dollars converted from the currency of the country whence exported at exchange ratios as prescribed for Customs purposes by existing authorities.

Canadian Exports: Valuation.—"Canadian produce" exported includes Canadian products or manufactures, also exports of commodities of foreign origin which have been changed in form or enhanced in value by further manufacture in Canada, such as sugar refined in Canada from imported raw sugar, flour ground from imported wheat, and articles constructed or manufactured from imported materials. The value of exports of Canadian merchandise is the actual cost or the value at the time of exportation at the points in Canada whence originally shipped.

Foreign Exports: Valuation.—"Foreign produce" exported consists of foreign merchandise which had previously been imported (entered for home consumption). The value of such commodities is the actual cost.

Countries to which Trade is Credited.—Imports are classified as received from the countries whence they were consigned to Canada. The countries of consignment are the countries from which the goods have come, without interruption of transit, save in the course of transhipment or transfer from one conveyance to another. The countries whence goods are consigned are not necessarily the countries of actual origin, since goods produced in one country may be purchased by a firm in another country and thence despatched, after a longer or shorter interval, to Canada. In such cases the second country would be the country of consignment to which the goods would be credited. An example is the case of tea grown in the Orient but purchased in the bonded market in London, England; Canadian statistics record such imports as coming from the United Kingdom.

Exports are credited to the country of final destination, *i.e.*, the country to which they are consigned, whether that country possesses a seaboard or not. The

¹ Revised by W. A. Warne, Chief, External Trade Branch, Dominion Bureau of Statistics. This Branch publishes the Annual Report of the Trade of Canada, the Condensed Preliminary Report of the Trade of Canada (annual), the Quarterly Report of the Trade of Canada, the Calendar Year Report of the Trade of Canada, the Summary of the Trade of Canada (monthly), etc. For complete list of the publications of this Branch see Chapter XXIX, Section I, under "External Trade".

country of final destination is the country to which goods exported from Canada are intended to pass, without interruption of transit save in the course of transshipment or transfer from one means of conveyance to another.

Discrepancies in Trade Statistics between Canada and Other Countries.—Canadian statistics of exports are rarely in exact agreement with the import figures of her customers and similar differences occur with Canadian imports. Many factors contribute to these discrepancies; among these are the following:—

(1) Differences in the basis of the Canadian valuations and the valuations of other countries.

(2) Even where the statistics cover the same period of time, there are quantities of goods in transit at the beginning and end of the period. Such goods are included in the statistics of the exporting country but not in the statistics of the importing country.

(3) By far the greatest discrepancies occur from the impossibility of determining the country of final destination for exports or the actual country of origin for imports. Thus about 20 p.c. of Canada's exports to overseas countries are shipped *via* the United States. Some of this is credited by importing countries to the United States. Canadian grain exports, for example, are to a large extent routed through the United States in bond. Most of this grain leaves Canada with the United Kingdom as the stated destination, but large quantities are later diverted to other European or overseas countries and some is taken out of bond for consumption in the United States. Thus the Canadian record of exports to the United Kingdom may be \$100,000,000 or more in excess of Canadian products actually received by the United Kingdom, while stated exports to other overseas countries are short this amount. Again, United States grain is routed through Canada and shipped from Montreal and therefore frequently shown by other countries as imported from Canada, while it is included in United States statistics as an export to Canada. As mentioned above, purchases in bonded markets in England, Germany, Belgium and France are included in Canadian imports from those countries but are not included by those countries in exports to Canada.

For more detailed discussion of this subject see the article and tables on "Discrepancies in Trade Statistics" on pp. 778-81 of the Annual Report on the Trade of Canada, 1928, published by the Dominion Bureau of Statistics.

Subsection 1.—Historical Statistics of Canadian Trade.

A general view of the trade of Canada in the fiscal years from 1868 to 1932 is furnished in Table 1 (p. 516), giving the imports of merchandise for home consumption, dutiable and free, and the exports of Canadian and foreign produce, the total trade as here given being the aggregate of the two. Necessarily, some difficulties have been met in maintaining comparable statistics through such a length of time, one of the most serious of these arising through different methods adopted in dealing with exports of foreign produce. For example, the shrinkage in the exports of foreign produce after 1920 has been due to change of statistical method rather than to actual diminution in value or volume of such goods exported. For the past 12 years, re-exports of foreign products from bonded warehouses have no longer been included in Canadian trade statistics either as imports or as exports,

while the exports of foreign produce during this period have been composed of goods which had previously been entered as imports for home consumption. Such goods are debited to Canada when entering this country, and should be credited to Canada when re-exported.

From Table 2 it will be observed that, in most of the years from Confederation to the outbreak of the Great War, imports entered for consumption exceeded total exports, especially during the great growing period from 1904 to 1914. From 1915 to 1929, except in the fiscal year ended Mar. 31, 1921, there was an annual excess of total exports over imports entered for consumption. In the fiscal years ended Mar. 31, 1930 and 1931, however, there was an excess of imports which was changed to an excess of exports in 1932 and 1933.

The percentage of exports to imports rose to a peak of 164.62 in 1918, owing to the exportation of war supplies, then dropped to 97.60 in 1921, rose again to 143.28 in 1926 and has since declined to 109.72 in 1929, 91.72 in 1930 and 90.12 in 1931, rising to 101.56 in 1932 and 118.32 in 1933.

The values of coin and bullion imported and exported are shown in Table 3. Amounts collected in export duties from 1868 to 1892, and in import duties from 1868 to 1932, together with the cost of collection expressed as a percentage of the total duties, are stated by years in Table 4. Tables 5 and 6 show respectively our exports of Canadian produce and our imports for home consumption, furnishing figures of our trade with the United Kingdom, United States and other countries since 1868. These figures show the overwhelming predominance of the two great English speaking countries in our foreign trade; in the fiscal year ended Mar. 31, 1932, for example, 71.0 p.c. of our exports of domestic produce was shipped to these two countries, which, in the same year, together provided 79.2 p.c. of our imports for home consumption. Tables 7 and 8 show respectively by years the percentage proportions of imports from the United Kingdom and the United States to totals of dutiable and free imports since 1907, and the *ad valorem* rates of duty collected on imports from these and from all countries from 1868 to 1932.

Importations of important raw materials used in Canadian manufacturing industries are given in Table 9 for the fiscal years ended 1911 to 1933.

Subsection 2.—General Analysis of Current Import and Export Trade.

The external trade of Canada, in common with that of every other country in the world, suffered a severe decline, both in volume and in value, following the War. By 1929, however, the value of Canada's external trade had reached an amount greater than even during the war years. Since then Canada's trade, like that of the principal trading countries of the world, has declined severely, reflecting the general depression in commerce and industry. The adverse factors which influenced Canada's foreign trade in the fiscal year 1930-31 continued during 1931-32, and the Dominion's trade suffered a still further decline. The general decline in world trade, which had its beginning in the fall of 1929 and continued throughout the year 1930, was particularly severe during the fiscal year 1931-32, being more marked than for the fiscal year 1930-31. The further drop in commodity prices was one of the principal factors in this decline. The particulars are set forth in the following statement:—

Fiscal Year.	Imports.		Exports (Canadian).	
	Declared Value.	Based on 1926 Average Value.	Declared Value.	Based on 1926 Average Value.
	\$	\$	\$	\$
1924.....	893,367,000	855,692,000	1,045,351,000	1,189,945,000
1925.....	796,933,000	805,247,000	1,069,067,000	1,120,360,000
1926.....	927,329,000	927,329,000	1,315,356,000	1,315,356,000
1927.....	1,030,893,000	1,100,530,000	1,252,153,000	1,283,685,000
1928.....	1,108,956,000	1,195,690,000	1,228,349,000	1,302,285,000
1929.....	1,265,679,000	1,403,097,000	1,363,710,000	1,548,578,000
1930.....	1,348,274,000	1,413,206,000	1,120,258,000	1,255,496,000
1931.....	906,613,000	1,169,380,000	799,743,000	1,097,832,000
1932.....	578,502,000	880,930,000	576,344,000	1,005,876,000

Canada's total imports of merchandise in 1932, amounting to \$578,503,904, show a decrease of 36.2 p.c. compared with 1931, and exports of domestic merchandise, amounting to \$576,344,302, a decrease of 27.9 p.c. During the past year, the drastic decline in commodity prices has materially affected the comparability of trade statistics. When the fluctuations in import and export prices have been eliminated from Canadian trade, by re-valuing the quantities imported and exported in 1932 at 1926 average values, as in the above table, the 1932 imports declined 24.7 p.c. and exports 8.4 p.c. from 1931. (See also Subsection 10 and Table 22 of this chapter.)

The decline in Canada's trade was not so marked as that of the United States and some other countries. However, the trade of both Canada and the United States suffered more from the general trade depression of the world than the trade of the chief commercial countries of Europe, with the exception of Hungary and Spain.

Statistical Tables of Current Trade.—Tables 10 to 18 (pp. 524-589) deal with the current trade statistics of the Dominion. Tables 10 and 11 are summary tables, showing by groups our trade with the United Kingdom, the United States and all countries, by values and percentages, for the latest four fiscal years. Table 12 shows the same in detail for exports and Table 13 for imports of all important articles. Table 14 shows by main classes imports as dutiable and free and exports as of Canadian and foreign produce for the five fiscal years 1928-32. Table 15 shows imports and exports for the fiscal year ended 1932 by degree of manufacture and by origin, and Table 16 gives similar information on a classification according to purpose. Table 17 gives our imports and exports for the two latest years by ports and provinces, and Table 18 shows the values imported from different countries under the general, preferential and treaty rate tariffs in 1931 and 1932.

The statistics in the following table indicate the trend of Canadian trade by main groups in 1914 (pre-war year), 1921 (peak year of post-war inflation) and 1932, (a) with all countries, (b) with the United Kingdom, and (c) with the United States.

SUMMARY OF THE TRADE OF CANADA BY MAIN GROUPS, FISCAL YEARS ENDED MAR. 31, 1914, 1921 AND 1932.

Subsection 3.—Trade with the United Kingdom and the British Empire.

Trade with the United Kingdom.—The import and export trade with the United Kingdom is outlined for the years 1914, 1921 and 1932 for the main groups of commodities on p. 496, while total imports and exports are shown for each year since Confederation in Tables 5 and 6 on pp. 520 and 521. In the post-war period imports from the United Kingdom have risen from a low point at \$117,135,000 in the fiscal year ended 1922 to a peak of \$194,041,000 in 1929 and declined again to \$149,497,000 in 1931 and \$106,372,000 in 1932. In the case of exports of Canadian produce, the value was \$299,362,000 in 1922, \$508,238,000 in 1926, \$429,730,000 in 1929, \$219,246,000 in 1931 and \$174,044,000 in 1932. Bountiful harvests and receptive world markets were the basis of a high level of exports in the years 1925-29. In this connection it should be emphasized that there is a wide discrepancy between Canadian figures of exports to the United Kingdom and the United Kingdom record of imports from Canada, due to the diversion to other countries of grain products exported *via* the United States (see p. 493), so that the excess of Canadian exports to the United Kingdom over imports from that country is not actually so large as our records show.

In connection with the serious decline in trade with the United Kingdom since 1929, it should be remembered that short crops in 1929 and subsequent years, together with an over-supply of foodstuffs on the world's markets, affected Canada's trading position very unfavourably while, as a result of the wide decline in prices, the recession in the value of exports and imports has been much greater than that in volume.

Canadian exports to the United Kingdom are made up very largely of grains and vegetable products, animal products, wood and paper products and non-ferrous metals. In the fiscal year ended 1932, the exports of wheat and wheat flour declined nearly \$47,000,000 as compared with 1931. Other important commodities to show reductions in value of exports were: rubber footwear, cheese, raw furs, newsprint paper, planks and boards, nickel in matte and pig lead. Important exports to the United Kingdom to show increases were: barley, raw tobacco, oats, live cattle, butter and copper. Exports to the United Kingdom of non-ferrous metal products, owing to the increased productive capacity of Canada in commodities of this group, have stood up remarkably well. In fact, the total of \$17,266,000 in 1932 was higher than for any previous year with the exception of the war years 1917-19, when prices were very much higher.

A decrease in imports from the United Kingdom in the fiscal year ended 1932, as compared with 1931, occurred in every one of the nine main groups. However, in recent years from 50 p.c. to 60 p.c. of Canada's imports from the United Kingdom have been made up of textiles and alcoholic beverages. It was in these commodities that the principal decreases occurred—\$18,657,000 in textiles and \$7,821,000 in beverages. Other leading imports to show reductions were: tea, leather, iron and steel products, and coal. No leading imports showed increased values.

The commodities making up Canada's export and import trade with the United Kingdom are dealt with in detail in Tables 12 and 13 of this chapter.

Trade of Canada with the British Empire.—Canada was the first of the British Dominions to grant a preference on goods the produce and manufacture of the United Kingdom and reciprocating British Dominions and possessions. This preference was extended by Order in Council from time to time to other portions of the British Empire until now it is applicable to practically every British Dominion and possession. In the case of Newfoundland, in addition to the preference, Canada grants free admission to fish and fish products. Australia receives special conces-

sions under the Trade Agreement of 1931 and the British West Indies under the Agreement of 1925 referred to on p. 483. The British preferential tariff enacted in 1897, as well as trade treaties and agreements negotiated with British and foreign countries, have had the effect of stimulating Canada's external trade. When the British preference became effective in 1897 Canada's total imports from the United Kingdom in that year amounted to only \$29,401,000, compared with an import in 1887 valued at \$44,741,000 and in 1873 at \$67,997,000. From 1873 to 1897 imports from the United Kingdom decreased \$38,596,000 or 56.7 p.c. Thus, since the introduction of the British preferential tariff, a downward trend in imports from the United Kingdom has changed to one strongly upward. But, in spite of the encouragement offered by the preferential tariff, a study of the figures in the following table will show that trade with the United Kingdom, and with the British Empire as a whole, has not grown so rapidly as that with foreign countries, with the result that in both imports and exports the percentage of the total trade of Canada carried on with the British Empire has declined. The proportion of trade with parts of the Empire other than the United Kingdom has increased but not sufficiently to overcome the decreased percentage with the United Kingdom. However, during the two latest years the proportion of trade with both the United Kingdom and the total British Empire showed a distinctly upward trend, especially in imports, but in exports also, although both the volume and direction of Canada's exports vary widely with the vicissitudes of crops here and in other parts of the world.

In the interpretation of statistics covering a long period such as those in the table following, the wide fluctuations in price levels should be borne in mind. Thus the fiscal year 1896, just prior to the introduction of the British preference, marked about the close of a long period of declining prices which began in the '70's. Prices followed a rising trend from then to the last pre-war fiscal year 1914, and rose very steeply throughout the War to a peak in the fiscal year ended 1921. In the following year, 1922, prices suffered a sudden drop and then remained fairly steady until 1929, since when the recent serious decline has occurred. (See Chapter XX). The trade of Canada with the British Empire in certain fiscal years was as under:—

Subsection 4.—Trade with the United States and other Foreign Countries.

Trade with the United States.—During the fiscal year 1932 nearly 61 p.c. of Canadian imports came from the United States, including large importations, though greatly reduced from the previous year, in all the nine main groups of commodities.

Iron and its products was again the leading group, including machinery, automobiles and parts, rolling-mill products, etc., while non-metallic minerals, chiefly coal and petroleum products, were second in importance. The total values of these main groups of imports, arranged in order of importance, with the decrease in 1932 compared with 1931, were: (1) iron and its products, \$81,005,384, decrease \$86,669,335 or 51.7 p.c.; (2) non-metallic mineral products, \$77,871,155, decrease \$41,113,263 or 34.6 p.c.; (3) agricultural and vegetable products, \$44,578,848, decrease \$23,001,533 or 34.0 p.c.; (4) fibres, textiles and textile products, \$30,944,027, decrease \$17,300,392 or 35.8 p.c.; (5) miscellaneous commodities, \$30,131,580, decrease \$15,136,929 or 33.4 p.c.; (6) non-ferrous metal products, \$27,026,602, decrease \$22,134,515 or 45.0 p.c.; (7) wood, wood products and paper, \$25,584,827, decrease \$12,553,201 or 32.9 p.c.; (8) chemicals and allied products, \$20,359,822, decrease \$2,842,170 or 12.2 p.c.; and (9) animals and animal products, \$14,184,530, decrease \$11,968,905 or 45.8 p.c. Among commodities, the leading imports were: coal, machinery, crude petroleum, automobile parts, fresh fruits, gasoline, raw cotton, iron plates and sheets, settlers' effects, engines and boilers, and raw silk. Raw silk was the only one of these in which the value of imports increased even slightly over the previous year. All the others, together with automobiles and farm implements, showed large reductions compared with the previous year.

Among Canadian exports to the United States the wood and paper products group is by far the most important. Indeed newsprint paper constituted about 38 p.c. of the total value of these exports in the fiscal year 1932. Other large items in this group, such as wood pulp, planks and boards, pulpwood and numerous other less important wood and paper products, made the exports under this group as a whole amount to 60 p.c. of the total exports to the United States, as compared with only 54 p.c. in the previous year, so that, while exports of all these important commodities were of reduced value, the reduction was not so great proportionately as in other exports. Non-ferrous metals was still the second most important group of exports, although the value of exports to the United States under this group made a further decline of 38 p.c. due to large reductions in exports of raw gold, copper, nickel, and silver and aluminium. The total values of the nine main groups of domestic exports, arranged in order of importance, with the decrease in 1932 compared with 1931, were: (1) wood, wood products and paper, \$140,473,352, decrease \$48,476,056 or 25.6 p.c.; (2) non-ferrous metal products, \$36,176,490, decrease \$22,659,193 or 38.5 p.c.; (3) animals and animal products, \$22,342,515, decrease \$11,725,893 or 34.4 p.c.; (4) agricultural and vegetable products, \$11,035,258, decrease \$16,609,-

116 or 60.1 p.c.; (5) non-metallic mineral products, \$8,233,323, decrease \$5,021,935 or 37.8 p.c.; (6) miscellaneous commodities, \$7,960,570, decrease \$4,398,520 or 35.6 p.c.; (7) chemicals and allied products, \$4,123,489, decrease \$2,238,202 or 35.2 p.c.; (8) iron and its products, \$3,097,883, decrease \$3,020,237 or 49.3 p.c.; and (9) fibres, textiles and textile products, \$1,743,794, decrease \$324,737 or 15.7 p.c.

The total trade of Canada with the United States in the fiscal year 1932 was 37.1 p.c. less than in 1931 and 56.9 p.c. less than in 1930. Imports decreased 39.8 p.c. from 1931 and 58.5 p.c. from 1930, while exports were 32.9 p.c. less than in 1931 and 54.5 p.c. less than in 1930.

For a more detailed treatment of the commodities making up our export and import trade with the United States, see Tables 12 and 13 of this chapter.

Canadian Trade via the United States.—Imports from overseas countries *via* the United States have steadily declined in recent years, especially those from the British Empire. This decrease has followed: (1) general propaganda to utilize Canadian sea and river ports, (2) additional concessions to goods imported under the preferential tariff if they come direct. Provision has been made, in trade treaties and agreements negotiated with foreign countries, that goods must be imported *via* a Canadian sea or river port in order to obtain the full benefits of special rates of duty. Between 1920 and 1932 imports *via* the United States have decreased from 9.5 p.c. to 2.2 p.c. of the total imports from overseas countries.

The proportion of exports from Canada to overseas countries *via* the United States shows a slight decline since 1927, the percentages for the past eleven fiscal years being: 1922, 32.8; 1923, 41.1; 1924, 36.2; 1925, 39.3; 1926, 39.2; 1927, 39.5; 1928, 38.9; 1929, 36.7; 1930, 33.8; 1931, 27.5 and 1932, 18.7. The decline has thus been very marked in the latest year. Details by countries are given in Table 21 of this chapter.

Trade with Other Foreign Countries.—The relative changes in the positions occupied by the United States and other foreign countries in Canada's trade in various years from 1886 to 1932 are shown in the following table. Imports from the United States increased from 44.6 p.c. of total imports in 1886 to 64 p.c. in 1914. During the War and the years immediately following, when production and exports by many European countries were curtailed, imports from the United States rose to a high proportion and were 69 p.c. in 1921, while those from other foreign countries declined. With this exception the proportion of imports from other foreign countries has remained surprisingly constant over the period of nearly half a century, although in the two latest years there has been a tendency for the proportion of total imports from the United States to decline, while that from other foreign countries has risen slightly. In the case of Canadian exports, on the other hand, those to the United States have fluctuated between 34 p.c. and 46 p.c. of the total, while those to other foreign countries have increased from 4.5 p.c. to 21 p.c. of total Canadian exports.

With further reference to the trade of Canada with countries other than the United Kingdom and the United States, attention is directed to Tables 10 to 36 (pp. 132-165) of the Condensed Preliminary Report on the Trade of Canada, 1932, published by the Dominion Bureau of Statistics and giving the trade of Canada in leading commodities with 81 British and foreign countries for the fiscal years 1931 and 1932.

Subsection 5.—Geographical Distribution of Canadian Trade by Continents and Countries.

Geographical Distribution of Canadian Trade by Continents.—During the fiscal year ended Mar. 31, 1932, values of exports to all continents were reduced as compared with the previous year. Canada again sold more goods to North America than to Europe, although the proportion to Europe increased considerably, there being increased proportions to both the United Kingdom and 'other Europe', while the proportion to North America (both the United States and other North America) and the other continents decreased. Imports declined in value from every continent as well as the two leading individual countries. North America was again the chief source of imports, providing 64 p.c. of the total. The proportions of imports supplied by Europe, other North America, South America, Asia, Oceania and Africa increased, while the proportion from the United States decreased. Summary statistics are given in the following statement:—

TRADE OF CANADA, BY CONTINENTS, 1926, 1931 AND 1932.

Imports from Principal Countries.—The relative order of the four leading countries which supplied Canada with goods in the fiscal year ended Mar. 31, 1932, was unchanged from 1929 to 1931, although in every case the value shows a heavy decrease. The principal countries from which Canada increased her imports over the previous year were Australia (raisins and currants, canned fruits, sugar, worsted tops, etc.), British South Africa (fruits, corn and sugar), Trinidad and Tobago (sugar), and British Guiana (sugar). With the depression in world trade, imports from most countries fell off, but disproportionately large reductions, that is, reductions in the percentage of imports, occurred in imports from New Zealand (butter and other animal products), Argentina (corn and flaxseed) and the United States. In appraising changes over the ten-year period shown by the comparison with the imports of 1922, the great decline in prices should be kept in mind as well as the effects of the current trade depression. Thus, apropos of the price decline, while the value of imports from the United Kingdom was about 10 p.c. less in 1932 than 1922, the average import valuations had declined over 40 p.c. in the same period, so that undoubtedly imports from the United Kingdom were in larger volume in 1932 than ten years before, and the same, though to a less degree, holds true with imports from the United States and Japan. But from many countries imports were greater in value in 1932 than 1922. The most important of these were Germany, Australia, Colombia and British South Africa, while imports were also greater in a less marked degree from the Netherlands, Belgium, Jamaica, Italy, China, Trinidad and Tobago, and Czechoslovakia. On the other hand, imports have declined greatly from Switzerland, Peru, Mexico and Hong Kong, while the diversion of imports of raw sugar and other tropical products from Cuba and Santo Domingo to countries willing to make more favourable trade agreements with Canada, such as the British West Indies, British Africa and the Fiji Islands, has resulted in Cuba dropping from 4th to 31st place.

CANADA'S IMPORTS FROM THIRTY-FIVE LEADING COUNTRIES, 1932.

Exports to Principal Countries.—After a decline in 1931 Canada's exports to most of the principal countries showed a further falling off in the fiscal year 1932 as compared with 1931, the contraction being due to a serious decline in commodity prices as well as reduced volume. Exceptions to the general rule in the latest year occurred in the cases of France, due to large increases in the exports of wheat, the Netherlands and Denmark, due to increased exports of grains, and Norway, due to copper-nickel matte. As a result France rose from 6th to 3rd place among the nations as a market for Canada. The United States and the United Kingdom retained first and second places respectively with Japan in 4th place, in spite of the fact that there was a considerable reduction in the value of exports in each case. The percentages of exports in 1932 over 1931 increased to the United Kingdom, France, Japan, Belgium, Netherlands, Germany, British South Africa, Denmark, and Norway, while percentages decreased to the United States, Newfoundland, China, Argentina, Italy, New Zealand, and British India, exports to Italy, Argentina and New Zealand showing disproportionately large decreases. During the ten-year period covered by comparisons with 1922, exports to many countries have increased

in value despite the great decline in commodity prices in the interval. Most important among the countries to which exports have increased in value and percentage are: France, Japan, Belgium, Netherlands, Germany, St. Pierre and Miquelon, British South Africa, and China. On the other hand, exports to each of our two principal customers, the United States and the United Kingdom, were lower in value in 1932 than in 1922; in the case of the latter the decline in value was 42 p.c. and the decline in the proportion to total exports was from 40 p.c. to 30 p.c. Other countries which took a decreased proportion of Canada's exports in 1932, as compared with 1922, were Newfoundland, Australia, Italy, Greece, Trinidad and Tobago, Cuba, and British Guiana.

CANADA'S DOMESTIC EXPORTS TO FORTY LEADING COUNTRIES, 1932.

1 The United Kingdom included the Irish Free State in 1922.

Statistical Tables of Trade by Countries.—Statistics showing the course of import and export trade during the latest five fiscal years, by countries with which Canada carries on trade, will be found in Tables 19 (imports) and 20 (exports). Table 21 shows by countries the values of goods imported into and exported from Canada *via* the United States for the latest two fiscal years.

A series of tables showing Canadian trade in principal commodities with the leading countries with which she trades (other than the United Kingdom and the United States, which are exhaustively dealt with in Tables 12 and 13) followed Table 21 in the 1931 Year Book. These tables have been omitted in the present edition to economize space. They will be found in the Condensed Preliminary Report on the Trade of Canada, 1932 (pp. 132-165), while historical tables showing our trade with these and other countries in each year since Confederation will be found on pp. 14-19 of the Annual Report of the Trade of Canada for 1932, both published by, and obtainable from, the Dominion Bureau of Statistics.

Subsection 6.—Principal Commodities Imported and Exported.

While Canadian imports and exports in all the principal groups show a decrease in value in the fiscal year 1932 as compared with 1931, imports were still greater than exports in the textile, iron, non-metallic mineral, chemical and miscellaneous groups, while exports predominated in the agricultural, animal, wood and non-ferrous metal groups. Nevertheless, the largest group of imports was that of agricultural and vegetable products, followed by non-metallic minerals, iron and textiles. In 1931 the iron group of imports was the highest, while as recently as 1929 imports of iron products exceeded those of vegetable products by 50 p.c. But the decline since then has affected the imports of iron products much more than those of vegetable and of non-metallic mineral products. In the fiscal year 1932, as compared with 1931, total imports declined 36 p.c. but imports of iron products declined 49 p.c., textiles 36 p.c., non-metallic minerals 34 p.c. and vegetable products 28 p.c. In domestic exports, while the average decline from the previous fiscal year was 28 p.c., exports of vegetable products dropped 30 p.c., non-ferrous metals 28 p.c., wood and paper products 24 p.c. and animal products 18 p.c.

For further information respecting Canada's trade in principal commodities with all countries, fiscal years 1929-32, see Table 13 for imports and Table 12 for exports.

Canada's Principal Imports.—The statement which follows shows the principal commodities imported into Canada in the fiscal years 1890, 1900, 1910, 1920, 1930 and 1932, the commodities being arranged in order of importance in 1932. In the interpretation of the trends in imports shown by the figures in this table, the effect of price changes and of fluctuations of the so-called business cycle should be kept in mind. Thus the Bureau of Statistics' index number of wholesale prices on the 1926 base was 59.3 in the calendar year 1889, 52.1 in 1899, 58.5 in 1909, 134.0 in 1919, 95.6 in 1929 and 72.1 in 1931, these calendar years approximating to the fiscal years ended 1890, 1900, 1910, 1920, 1930 and 1932. In the matter of business fluctuations, the fiscal year 1910 was influenced by the general development boom in Western Canada, 1920 was affected by the feverish activity which immediately followed the War, 1930 represented the end of the security inflation period and the beginning of the downturn, while in 1932 the effects of the depression and price decline were being severely felt.

During the period of 42 years covered by the table, great changes have occurred in the character of the leading imports, due to developments both in the industrial organization of the country and the goods consumed by the people. Thus many present-day leading imports such as crude petroleum, automobiles and parts, artificial silk, electric apparatus, aluminium, were in 1890 either non-existent or formed very insignificant items of trade. Imports of farm implements in 1890 amounted to only \$161,000 but, due to the tremendous agricultural expansion in Canada since that time as well as to increasing mechanization of agricultural operations, imports of farm implements have grown to a large item in spite of the wide development of their manufacture within the country. On the other hand, a number of the leading imports of 1890, such as woollen goods and raw wool, sugar and products, cotton goods and raw cotton, tea, grain products and meats, have become relatively much less important as imports. Then again, there were certain leading imports in 1890, such as coal, rolling-mill products, machinery and fruits, which still remain among the chief items of imports owing to the absence of coal and high grade iron ore deposits in the central portion of Canada where population and industry are chiefly concentrated, and to the demand for fruits which cannot be grown in Canada.

It is estimated that about one-third of the imports during recent years have been for use in the various industries of the Dominion. The decrease in imports of such commodities in the past three years has been about proportional to the decrease in total imports. Of the leading 62 commodities imported in the fiscal year 1932 for further manufacture in Canada, 49.8 p.c. by value was raw materials, 24.4 p.c. partly manufactured and 25.8 p.c. was classed as fully or chiefly manufactured goods such as automobile parts and engines, rolling-mill products, etc.

¹ Imports for 1924, the first year recorded.

² For 1913, the first year recorded.

Canada's Principal Exports.—The statement which follows gives Canada's leading domestic exports for the fiscal years ended 1890, 1900, 1910, 1920, 1930 and 1932, arranged in descending order of importance in 1932. In the interpretation of these figures of exports over the 40-year period, the same qualifications should apply regarding price changes and business fluctuations as cited in the case of imports (p. 506).

Over the period of 42 years covered by the table, the changes in Canada's exports have been very great, both in volume and in the relative importance of commodities. The great agricultural expansion of the Canadian West had scarcely begun in 1890. The leading exports then were sawmill and timber products, cheese, fish, cattle, barley, coal and furs, indicating the large dependence of Canadian production at that time upon the eastern forests, mixed-farming areas, and fisheries. Of the five leading exports in 1932 four were very unimportant in 1890. The year 1910 is the first year in this table in which wheat appears as the leading export although this first occurred in 1906. The rise of the great pulp and paper industry to a leading position has been still more recent, and similarly with regard to the production of non-ferrous metals, automobiles and rubber tires. On the other hand, exports of the products of mixed-farming operations, such as cattle, meats, hides, cheese and butter, while showing wide fluctuations, have not expanded proportionately, and in some cases were little or no greater in 1932 than in 1890. Much of the new agricultural area developed since 1890 has been better adapted to grain growing than to mixed-farming operations, so that, with the growth of population, the production of the older mixed-farming districts is to a larger extent consumed within the country. The rising importance during the two past decades of the mining and metallurgical industries producing non-ferrous metals in Canada is illustrated in this table by the increased importance since 1910 of exports of gold, copper, nickel, zinc, silver, lead, aluminium and platinum. Gold refined in Canada and exported as bullion is not shown in the table.

CANADA'S LEADING DOMESTIC EXPORTS, FISCAL YEARS, 1890, 1900, 1910, 1920, 1930 AND 1932.

¹ For 1891, the first year recorded. ² For 1922, the first year separately recorded. ³ For 1927, the first year value was recorded. The amount generated for export in millions of kilowatt hours was 538 in the fiscal year 1911; 950 in 1920; and 1,497 in 1930. ⁴ For 1903, the first year separately recorded.

Subsection 7.—Trade in Raw and Manufactured Products.

Relation Between Trade in Raw and Manufactured Products.—The industrial development of a country is indicated by the character of the goods it imports and exports. In the early years of Canada's development the imports were made up chiefly of manufactured products and the exports of raw and semi-manufactured products. Since the opening of the twentieth century this has been almost reversed, a large percentage of the imports consisting of raw and semi-manufactured products for use in Canadian manufacturing industries, and the exports consisting to a considerable degree of products which have undergone some process of manufacture. In fact the leading manufactures of Canada are for the processing of those raw materials in the production of which Canada excels and many of these processed domestic products are dependent upon foreign markets for part of their output. Furthermore, as the population of the country grows,

the range of elaborated goods formerly imported which may be manufactured on a competitive basis of mass production within the country expands, so that there are now many industries in Canada serving the domestic and even foreign markets, using raw materials which must be imported such as rubber, cotton and sugar. Since the opening of the present century, Canada has passed through much the same stages of development in her economic life as did the United States during the last quarter of the nineteenth century, although the trend in Canada has been more pronounced in increasing the proportion of partly and fully manufactured goods as compared with raw materials exported, rather than in increasing the proportion of raw materials compared with that of partly and fully manufactured goods imported. Since 1929, the rapid decline in commodity prices, which has affected raw materials so much more than manufactured goods, has tended to increase the percentages of both imports and exports of manufactures.

STATEMENT SHOWING PROPORTIONS OF RAW MATERIALS AND PARTLY AND FULLY MANUFACTURED GOODS IMPORTED INTO AND EXPORTED FROM CANADA AND THE UNITED STATES, 1900, 1914 AND 1920-32.

The table on p. 512 shows how Canada's imports and exports, analysed into the three categories of raw materials, partly manufactured goods, and fully or chiefly manufactured goods, are distributed among the continents and leading countries of the world as well as the United Kingdom, other British Empire countries, the United States and other foreign countries. This latter analysis clearly demonstrates that the imports into Canada from the British Empire except the United Kingdom, consist chiefly of raw and semi-manufactured products, while the exports are made up mainly of fully manufactured products.

In trade with industrialized continents such as Europe and Asia, Canadian imports are largely manufactured goods and exports raw materials or partly manufactured goods, while in trade with South America, Oceania, Africa and North America (if the United States be excluded) the situation is the reverse.

See also Table 15 of this chapter on this subject.

CANADA'S IMPORTS AND EXPORTS, BY CONTINENTS AND LEADING COUNTRIES,
ACCORDING TO DEGREE OF MANUFACTURE, YEAR ENDED MAR. 31, 1962.

Subsection 8.—Canada's Position in International Trade in the Calendar Years 1913 and 1932.

Canada, during the calendar year 1932, even with a material decrease in her trade, has maintained a relatively high place among the trading nations of the world. In 1930 the Dominion stood in fifth position in total trade and total imports, but in sixth position in total exports. In the calendar year 1931, due to unstable trade conditions, there were some notable changes in the relative positions of certain leading trading nations in world trade. The United Kingdom, Canada and British India, the three greatest trading nations of the British Empire, all moved downwards in their relative positions with respect to values of total exports in 1931. Germany in 1931 displaced the United Kingdom from second place in the value of exports, while Belgium and Argentina moved up to fifth and sixth positions, respectively, displacing British India and Canada. In 1932 Canada, in export trade, once more moved into fifth position, displacing Belgium and Argentina, but occupying, as last year, eighth place in total imports, and seventh place in total trade; the Netherlands, Belgium and Italy occupied fifth, sixth and seventh positions in total imports, while Belgium and the Netherlands occupied fifth and sixth positions in total trade.

COMPARISON OF THE TRADE OF THE PRINCIPAL COUNTRIES OF THE WORLD, CALENDAR YEAR 1932.

NOTE.—The figures in parentheses represent relative positions in 1931.

Country.	Total Trade.		Imports.		Domestic Exports.

Canada's Share in World Trade.—Two tables on pp. 70 and 71 of the Condensed Preliminary Report on the Trade of Canada, 1932, published by the Dominion Bureau of Statistics, and not reproduced here to economize space, show in values and percentages Canada's share in the imports and in the exports of the forty principal trading countries of the world for the calendar years 1913, 1922 and 1930.

Since 1913 Canada has made remarkable progress in the expansion of her export trade to the world's markets, and in supplying her requirements from all parts of the world. The first of the above-mentioned tables showing "Canada's Share in Imports of Principal Countries", indicates that while in 1913 Canada provided only 1.95 p.c. of the total imports of these countries, in 1930 her share was 3.50 p.c.

With regard to Empire countries, imports from Canada by the British West Indies expanded from 9.7 p.c. in 1913 to 17.8 p.c. of their total imports in 1930; by British Guiana from 9.3 p.c. to 15.8 p.c.; by Australia from 1.2 p.c. to 2.3 p.c.; by New Zealand from 2.1 p.c. to 8.9 p.c.; by British South Africa from 2.0 p.c. to 3.2 p.c.; by Newfoundland from 32 p.c. to 41 p.c.; while the percentage for the United Kingdom remained stationary at 3.6 in 1930 and 3.8 in 1913. Among the principal foreign countries, imports from Canada by the United States increased from 7.9 p.c. of its total imports in 1913 to 13.1 p.c. in 1930; by Germany from 0.6 p.c. to 1.3 p.c.; by Italy from 0.4 p.c. to 3.4 p.c.; and by France from 0.2 p.c. to 0.9 p.c.

In the interpretation of these and all tables showing trade between Canada and other specified countries, it should be borne in mind that there are numerous and, in some instances, quite large discrepancies between the figures of trade with a specified country as shown by Canada and as shown by that country. These arise in all countries, chiefly through inability to trace the actual origin of imports and final destination of exports. A large proportion of Canada's overseas exports passes through the United States and is therefore credited to that country rather than Canada by the importing countries. If the Canadian figures of declared exports be substituted, the total imports from Canada of these 40 principal countries in 1930 would be \$853,350,000, or 3.63 p.c. of the total imports of these countries in 1930.

The other side of this trade expansion is shown in the other table, "Canada's Share in Domestic Exports of Principal Countries", which indicates the increasing proportion of the exports of 40 countries taken by Canada. The exports of these countries to Canada increased from 3.39 p.c. of their total exports in 1913 to 4.35 p.c. in 1930.

Among countries of the Empire, Canada's purchases from the British West Indies increased from 11.8 p.c. of their total exports in 1913 to 22.3 p.c. in 1930; from New Zealand from 2.7 p.c. to 5.7 p.c.; from Fiji from 4.7 p.c. to 28.0 p.c.; from Australia from 0.2 p.c. to 1.1 p.c.; and from the United Kingdom from 4.5 p.c. to 5.1 p.c. Among the principal foreign countries, exports to Canada by the United States increased from 15.9 p.c. of its total exports in 1913 to 16.6 p.c. in 1930; by France from 0.4 p.c. to 1.1 p.c.; by Belgium from 0.5 p.c. to 1.0 p.c.; by the Netherlands from 0.1 p.c. to 0.9 p.c.; and by Japan from 0.8 p.c. to 1.3 p.c.

Subsection 9.—Main Historical Tables and Tables showing Current Trends in External Trade.

In this subsection are assembled in summary form the main tables of Canadian trade since Confederation, while the figures of trade in the latest years are given in greater detail by countries and commodities. Tables 1 to 9 inclusive are of an historical character, while Tables 10 and 11 give in summary form, and Tables 12 and 13 in detail, our exports and imports for the four latest fiscal years. In Table 14 imports are divided into dutiable and free, and exports into Canadian and foreign produce. Table 15 analyses our trade in the latest year by main groups of origin and degrees of manufacture. Table 16 classifies that trade according to purpose. Table 17 gives trade by provinces and customs ports, and Table 18 by tariffs. Tables 19 and 20 deal with our imports and exports by countries in the latest five years, while Table 21 shows the values of our imports and exports transported *via* the United States.

³ Preliminary figures.

3.—Movement of Coin and Bullion, fiscal years 1863-1933.

NOTE.—Up to 1919 "silver bullion in bars, blocks, ingots, drops, sheets and plates, unmanufactured" was included in "coin and bullion" but since that time it has been regarded as "merchandise". The figures from 1899 have been revised in accordance with the new arrangement.

¹No record for 1919 imports and exports.²Preliminary figures.

4.—Duties Collected on Exports, 1868-92, and on Imports for Home Consumption, 1868-1932, with Percentages of Expense of Collection to Gross Customs Revenue Collected, fiscal years 1868-1932.

NOTE.—Duties on exports were not collected after the year 1892. The figures in this table are the gross figures of duties collected; the net national revenue from customs taxation, because of the drawbacks paid where commodities on which duties have been collected are afterwards exported in a more highly manufactured state, is considerably smaller. For statistics of net customs revenue see Statement of Customs Duties, Table 4, in Chapter XXI on Public Finance.

Fiscal Year.	Duties Collected on Exports.	Duties Collected on Imports.	Percentage of Expense of Collection to Gross Customs Revenue.	Fiscal Year.	Duties Collected on Exports.	Duties Collected on Imports.	Percentage of Expense of Collection to Gross Customs Revenue.
