Gold.-Production of gold declined 3.6 p.c. in quantity and 3.8 p.c. in value in 1956 compared with 1955. Slight declines were recorded by all producing provinces except Newfoundland, and by the Yukon and Northwest Territories. The increase in production in the Northwest Territories was 9.7 p.c. Canada, despite the small decline in production, retained its position as the third largest producer in the world, accounting for about 13 p.c. of world output.

## 10.-Quantity and Value of Gold Produced by Province 1947-56

Nore.-Values are calculated at world prices in Canadian funds. Figures for 1862-1910 are given in the 1916-17 Year Book, pp. 268-269; for 1911-28 in the 1939 edition, pp. 336-337; for 1929-44 in the 1946 edition, p. 332; and for 1945 and 1946 in the 1956 edition, p. 533.

Zinc.-In 1956, zinc production (including refined zinc, zinc ores and concentrates) fell 2.2 p.c. to 424,000 tons from the record high of 433,000 tons established in 1955. Of the 1956 total, 256,000 tons were refined zinc. Nearly all of the zinc concentrates produced in Eastern Canada-about 128,000 tons or 30.2 p.c. of the Canadian total-were exported. Total exports of zinc concentrates in 1956 amounted to 199,000 tons, and exports of refined zinc to 184,000 tons.

## 11.-Quantity and Value of Zinc[Produced ${ }^{1947-56}$

Nots.-Figures for 1911-28 are given in the 1939 Year Book, p. 347; for 1929-44 in the 1946 edition, p. 335; and for 1945 and 1940 in the 1956 edition, p. 534.

${ }^{1}$ Eatimated foreign amelter recoveries and refined zinc produced in Canada.
Lead.-Primary lead production dropped 7.9 p.c. in 1956 to 187,000 tons worth $\$ 57,900,000$; this followed a decline of 7.2 p.c. in 1955 . Output of refined lead amounted to 148,000 tons with exports totalling 80,000 tons. Additional exports of lead in concentrates amounted to 50,000 tons.

British Columbia's mines produced 77.7 p.c. of Canada's lead in 1956. The Consolidated Mining and Smelting Company of Canada at Trail is by far the principal producer and operates the only lead refinery in Canada. Production in Newfoundland in 1956 was 23,000 tons, and in Yukon 13,000 tons; the remainder was mined mostly in Quebec and Ontario. Canada used about 66,000 tons domestically in 1956, a slight decrease from 1955.
12.-Quantity and Value of Lead Produced from Canadian Ores 1947-56

Nore.-Figures for 1887-1910 are given in the 1929 Year Book, p. 367 ; for 1911-28 in the 1939 edition, p. 341; for 1929-44 in the 1946 edition, p. 333; and for 1945 and 1946 in the 1956 edition, p. 534.

Uranium.-Uranium production began in Canada in 1942 when this country joined with the United Kingdom and the United States to develop the atom bomb. The Port Radium mine of Eldorado Mining and Refining Limited supplied the initial production and from this modest beginning the uranium mining industry has grown to a total of six producers capable of processing in excess of 10,700 tons of ore per day. Current estimates indicate the operation of 22 mills with a production capacity of 42,000 tons of ore per day.

Uranium mineralization has been found at intervals along the western and southern edges of the Canadian Shield. Production, however, is from four areas within this belt: Great Bear Lake, N.W.T., Beaverlodge, Sask., Blind River, Ont., and Bancroft, Ont. All uranium production must be sold to the Canadian Government. In December 1956 official restrictions concerning uranium production and ore reserves were lifted. The production of uranium is shown for three years in Table 13, the figures representing the value of products shipped from the refinery at Port Hope, Ont.

## 13.-Value of Uranium by Province 1954-56

Nors.-Figures represent value of products shipped from the refinery at Port Hope, Ont.

| Year | Ontario | Saskatchewan | Northwest Territories | Canads |
| :---: | :---: | :---: | :---: | :---: |
|  | \$ | \$ | \$ | 8 |
| 1954. | - | 10.981,417 | 15,486,157 | 26,467,574 |
| 1955. |  | 12,312,471 | 13,232,079 | 26,031,604 |
| 1956. | 5,891,000 | 24,292,000 | 9,394,000 | 39,577,000 |

Silver.-Silver production in 1956 recorded a gain of 2.9 p.c. in quantity and of 4.7 p.c. in value compared with 1955 but was still below the record output of 1954 . About 82 p.c. of the silver produced came from the refining of base metal ores, 15 p.c. from silvercobalt and silver ores, and 3 p.c. from gold ores.

British Columbia produced 32.4 p.c. of the Canadian total, the Yukon 21.4 p.c., Ontario 22.5 p.c. and Quebec 14.4 p.c. Most of the production goes out of the country. Of the $14,300,000 \mathrm{oz}$. t. of silver bullion exported in 1956 , over $13,000,000 \mathrm{oz} . \mathrm{t}$. went to the United States. In addition, Canada exported $6,900,000 \mathrm{oz}$. t. of silver in ores and concentrates of which over 90 p.c. went to the United States.

Canada holds third place in world production, following Mexico and the United States.

## 14.-Quantity of Silver Produced by Province and Total Value 1947-56

Norg.-Figures for 1887-1910 are given in the 1916-17 Year Book, p. 271; for 1911-28 in the 1939 edition. p. 345; for $1929-44$ in the 1946 edition, p. 334; and for 1945 and 1946 in the 1956 edition, p. 535.

${ }^{1}$ Includes relatively small quantities produced in New Brunswick and Alberta.
Metals of the Platinum Group.-Total production of platinum, palladium, rhodium, ruthenium and iridium fell $73,000 \mathrm{oz}$. t. below 1955 production in 1956 to $312,000 \mathrm{oz}$. t . Total dollar value dropped very slightly to $\$ 22,100,000$ in 1956 , of which platinum values were $\$ 15,600,000$. All of the platinoid metals were produced in Ontario, mainly from the nickel-copper ores in the Sudbury area.

These metals are recovered in the form of residues in the electrolytic refinery tanks at Port Colborne, Ont., and some at the refinery in Norway to which Falconbridge Nickel Company Limited ships nickel-copper matte.

## 15.-Quantity and Value of Platinum and Palladium ${ }^{1}$ Produced 1947-56

Nors.-Comparable figures for 1921-39 are given in the 1940 Year Book, p. 340 and for 1940-46 in the 1951 edition, p. 513.

## Subsection 4.-Production of Non-metallic Minerals (excluding Fuels)

Asbestos is by far the most important item in this group in point of value, followed in order by salt, gypsum and sulphur, which are treated separately below. The group also includes such minerals as titanium dioxide, fluorspar, barite, diatomite, magnesitic dolomite, nepheline syenite, peat moss, quartz and sodium sulphate.

Asbestos.-Despite a 2.3 p.c. decline in shipments of asbestos in 1956 as compared with 1955, the Canadian asbestos industry had the second highest production in its history, shipping $1,039,000$ tons of various grades of fibre. Higher prices brought the 1956 value to $\$ 109,700,000$, a gain of 14.0 p.c. over the 1955 total. The slight decline in tonnage resulted from decreased use of asbestos in the United States and from intensified competition from Russia in the European market.

Quebec, with eight producing mines, accounted for 95.3 p.c. of the Canadian total, Ontario had one producer which recorded an output of 28,000 tons in 1956 and another mine in British Columbia contributed 22,000 tons. Exports of 964,000 tons in 1956 went mostly to the United States.

## 16.-Quantity and Value of Asbestos Produced 1947-56

Nors.-Figures for 1896-1910 are given in the 1911 Year Book, p. 424; for 1911-28 in the 1939 edition, p. 354; for 1929-44 in the 1946 edition, p. 353; and for 1945 and 1946 in the 1956 edition, p. 537.

| Year | Quantity | Value | Year | Quantity | Value |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | tons | \$ |  | tons | \$ |
| 1947. | 661,821 | 33,005,748 | 1952. | 929,339 | 89,254,913 |
| 1948. | 716,769 | 42,231,475 | 1953. | 911,226 | 86,052,895 |
| 1949. | 574,906 | 39,746,072 | 1954. | 924,116 | 86,409,212 |
| 1950. | 875,344 | 65,854,568 | 1955. | 1,063,802 | 96, 191, 317 |
| 1951. | 973,198 | 81,584,345 | 1956. | 1,038,975 | 109,665,924 |

Salt.-Production from the brine wells of Ontario increased 36.0 p.c. in 1956 over 1955 with increases in Manitoba and Saskatchewan. Alberta production equalled that of 1955 but dollar-value dropped from $\$ 1,000,000$ to $\$ 900,000$ in 1956. Salt produced in Nova Scotia mines dropped 17,000 tons during the year but value increased $\$ 459,000$. Total Canadian production in 1956 was 28.0 p.c. more than in 1955.

## 17.-Quantity of Salt Produced by Province and Total Value 1947-56

Norz.-Figures for the years 1926-44 are given in the 1946 Year Book, p. 354, and for 1945 and 1946 in the 1956 edition, p. 538.

| Year | Nova Scotia | Ontario | Manitoba | Saskatchewan | Alberta | Canada |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Gypsum.-A record total of $5,200,000$ tons of gypsum was produced in 1956 valued at $\$ 8,300,000$. Exports of $3,800,000$ tons nearly all went to the United States and were up 26.4 p.c. over 1955 . Nova Scotia produced 85.4 p.c. of the total output.

## 18.-Quantity of Gypsum Produced by Province and Total Value 1947-56

Norg.-Figures for 1926-43 are given in the 1943-44 Year Book, p. 321; for 1944 in the 1955 Year Book, p. 527; and for 1945 and 1945 in the 1956 edition, p. 538.

Sulphur.-Figures in Table 19 represent the quantity and value of sulphur contained in iron pyrite shipments and in derivatives from smelter gases such as sulphur dioxide, sulphuric acid, etc. Sulphur refined from natural gas production is not included.

During 1956 production increased 135,000 tons and value $\$ 1,500,000$. In Canada sulphur is used in the treatment of sulphite pulps and in the manufacture of rayon, explosives, rubber goods, petroleum refining, matches and insecticides.

## 19.-Quantity and Value of Sulphur Produced 1947-56

Nors.-Figures for 1926-44 are given in the 1946 Year Book, p. 355 and for 1945 and 1946 in the 1956 edition, p. 539.

Subsection 5.-Production of Fuels
Coal.-During 1956 all coal-producing provinces except Alberta showed increased production, thus checking the downward trend that began in 1950.

Nova Scotia produced 38.8 p.c. of the total tonnage and Saskatchewan 15.4 p.c. Alberta's contribution declined to 29.2 p.c. Exports of Canadian coal remained approximately the same as for 1955 but imports increased by 14.5 p.e.

91593-35

## 20.-Coal Production by Province 1947-56

Note.-Figures for 1874-1910 are given in the 1911 Year Book, p. 419; for 1911-28 in the 1939 edition, p. 348; for 1929-44 in the 1946 edition, p. 347; and for 1945 and 1946 in the 1956 edition, p. 539.

| 1955 | 2,646,503 | 30,190,088 | 17,094,480 | 76,352,171 | 1,548 | 8,663 | 19,742,531 | 106,550,922 |
| 1956 | 2,545,627 | 30,060,480 | 20,065,807 | 98,668,368 | 1,940 | 9,822 | 22,613,374 | 128,736,670 |

${ }^{1}$ Includes anthracite dust. ${ }^{2}$ Includes coal ex-warehoused for ships' stores. ${ }^{3}$ Canada also imported 245,678 tons of briquettes of coal or coke valued at $\$ 2,233,654$ in 1947, 308,753 tons valued at $\$ 3,204,839$ in 1948 , 186,971 tons valued at $\$ 2,185,707$ in $1949,191,134$ tons valued at $\$ 2,316,570$ in $1950,170,157$ tons valued at $\$ 2,061,798$ in 1951, 155,597 tons valued at $\$ 1,868,619$ in 1952, 128,673 tons valued at $\$ 1,601,376$ in $1953,128,163$ tons valued at $\$ 1,583,610$ in 1954, 124,216 tons valued at $\$ 1,536,347$ in 1955 and 126,724 tons valued at $\$ 1,581,699$ in 1956.

## 22.-Exports of Domestic Coal 1947-56

Notz.-Figures for 1868-1910 are given in the 1911 Year Book, p. 421; for 1911-28 in the 1939 edition, p. 349; for 1929-44 in the 1946 edition, p. 348 ; and for 1945 and 1946 in the 1956 edition, p. 540.

| Year | Quantity | Value | Year | Quantity | Value |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | tons | \$ |  | tons | \$ |
| 1847. | $\begin{array}{r}714,549 \\ \hline\end{array}$ | $5,440,788$ $11,555,985$ |  | 388,960 255,274 | $3,203,522$ $1,999,908$ |
| 1948. | $1,273,262$ 432,043 | $11,555,985$ $3,563,892$ | 1953. | 255,274 219,346 | 1,999,936 |
| 1950. | 394,961 | 3,198,040 | 1955. | 592,782 | 4,870.598 |
| 1951. | 435.083 | $3,495,664$ | 1956. | 594,166 | 4,710,030 |

The sources of coal consumed in Canada in the years 1947-56 are shown in Table 23 and detailed figures of coal made available for consumption in 1955 and 1956 are given in Table 24; the difference between the totals of the two tables in the same year is accounted for by the fact that coal received may be held in bond at Canadian ports and not cleared for consumption until required, and coal received in previous years may be taken out of bond (oleared for consumption) in a later year. Normally the coal made available for consumption is greater than the apparent domestic consumption as coal is landed at

Canadian ports and re-exported or ex-warehoused for ships' stores without being taken out of bond but, while remaining in bond at the port, it is available for domestic consumption if required.

## 23.-Consumption of Canadian and Imported Coal in Canada 1947-56

Note.-Figures for 1886-1910 are given in the 1921 Year Book, p. 354; for 1911-28 in the 1939 edition, p. 350; for 1929-44 in the 1946 edition, p. 349; and for 1945 and 1946 in the 1956 edition, p. 540.

| Year | Canadian Coal ${ }^{1}$ |  | Imported Coal 'Entered for Consumption' |  |  |  | Grand Total | Con-sumption per Capita ${ }^{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

[^178] briquettes in 1955 and 118,975 tons in 1956.

Petroleum.-Of the record 1956 total of $170,600,000 \mathrm{bbl}$. of crude petroleum produced in Canada, 99.6 p.c. was produced west of Ontario. Alberta continued to lead all provinces with an output of $144,300,000 \mathrm{bbl}$., which was 84.6 p.c. of the national production and an increase of 27.7 p.c. over 1955. Saskatchewan and Manitoba accounted for 14.7 p.c. of the total with both provinces showing substantial gains during the year. British Columbia reported its first production in 1956.

## PRODUCTION AND GROSS VALUE OF CRUDE PETROLEUM, 1946-55

## 25.-Quantity and Value of Crude Petroleum Produced by Province 1947-56

Nork.-Figures for 1936-44 are given in the 1948-49 Year Book, p. 476, and for 1945 and 1946 in the 1956 edition, p. 511.
$\left.\begin{array}{c|c|c|c|c|c|c|c}\hline \hline \text { Year } & \begin{array}{c}\text { New } \\ \text { Brunswick }\end{array} & \text { Ontario } & \text { Manitobs } & \begin{array}{c}\text { Saskat } \\ \text { chewan }\end{array} & \text { Alberta } & \text { Northwest } \\ \text { Territories }\end{array}\right]$ Canada
${ }^{1}$ Includes 101,000 bbl. valued at $\$ 197,250$ produced in British Columbia.
Natural Gas Production.-The estimated record flow of natural gas for all Canadian wells during 1956 was $173,300,000 \mathrm{M}$ cu. feet. The production of natural gas in Canada is dependent upon markets and transportation. Some expansion in markets permitted an increase of 14.9 p.c. in natural gas recoveries in 1956 . Alberta accounted for 86.6 p.c. of this amount but increases were shown by all producing provinces except New Brunswick. British Columbia reported its first small production from the Fort St. John area.

## 26.-Quantities of Natural Gas Produced by Province and Total Value 1947-56

Nors.-Figurea for 1920-28 are given in the 1940 Year Book, p. 347; for 1929-44 in the 1946 edition, p. 350; and for 1945 and 1946 in the 1956 edition, p. 543.

${ }^{1}$ Includes $172,000 \mathrm{M} \mathrm{cu}$. feet valued at $\$ 18,455$ produced in British Columbia.

## Subsection 6.-Production of Structural Materials

Continued high levels of construction in Canada raised the production of structural materials as a group to $\$ 247,300,000$ in 1956, the highest on record. The main advances were recorded in New Brunswick, Quebec, Ontario, Manitoba and Alberta. Minor gains
were recorded in all other provinces except Saskatchewan. Cement showed an increase of about 18 p.c. over 1955 and clay products 8 p.c. The output of sand, sand and gravel, and stone remained near the 1955 levels.

Cement. - In 1956, both the value and quantity of cement produced increased about 19 p.c. over 1955. The industry has nearly tripled its output during the past ten years and there are now 16 operating mills in Canada with an annual production capacity of almost $36,000,000 \mathrm{bbl}$. Factories under construction at Picton, Ont., and at Vancouver, B.C., will augment that capacity. In 1956, Quebec produced 36.4 p.c. of the Canadian total, Ontario 28.3 p.c., Alberta 12.4 p.c., Manitoba 10.6 p.c. and British Columbia 7.6 p.c.

## 27.-Quantity and Value of Production, Imports, Exports and Apparent Consumption of Cement 1947-56

Norz.-Figures for 1910-28 are given in the 1939 Year Book, p. 356; for 1929-44 in the 1946 edition, p. 356; and for 1945 and 1946 in the 1956 edition, p. 545.

${ }^{1}$ 'Production' as used here means quantity and value of sales.
${ }^{2}$ The barrel of cement equals 350 lb .
Clay Products.-The sales value of clay products produced in 1956 was the highest recorded. Common clays suitable for the production of building bricks and tile are found in all the provinces; production is greatest in Ontario and Quebec. Stoneware clays are produced largely from the Eastend and Willows areas in Saskatchewan and shipped to Medicine Hat, Alta., where, utilizing the cheap gas fuel, they are manufactured into stoneware, sewer pipe, pottery, tableware, etc. Stoneware clay also occurs in Nova Scotia and, although it has not been developed extensively for ceramic use, some is used for pottery. Two large plants and a few small plants manufacture fireclay refractories from domestic clay in British Columbia, Saskatchewan and Nova Scotia. Deposits of high-grade, plastic, white burning clays occur in northern Ontario and deposits yielding high-grade china clay have been found along the Fraser River in British Columbia but these have not been used on a commercial scale. Ball clays of high bond strength occurring in the white mud beds of southern Saskatchewan have not been developed to any extent.

## 28.-Value (Total Sales) of Clay Products Produced by Province 1947-55

Nore.-Figures for 1926-44 are given in the 1946 Year Book, p. 356, and for 1945 and 1946 in the 1956 Year Book, p. 544.

Sand, Gravel and Stone.-Deposits of sand and gravel are numerous throughout Eastern Canada with the exception of Prince Edward Island where gravels are scarce. The local needs for these materials are usually supplied from the nearest deposits as their cost to the consumer is governed largely by the length of the haul. This accounts for the large number of small pits and the small number of large plants. Every province except New Brunswick and Prince Edward Island produces natural bonded sand but some grades particularly suitable for certain industries demand a much higher price than ordinary sand. Quebec and Ontario contributed 71.3 p.c. of the total quantity of sand and gravel in 1956. The greater part of the output is used in road improvement, concrete works and railway ballast, and most of the commercial plants are equipped for producing crushed gravel, a product that can compete with crushed stone.

The stone industry has two main divisions, stone quarrying and the stone products industry. The granite, limestone, marble, sandstone and slate quarries of Canada yield high grade structural and decorative materials and also supply requirements for chemical and other allied industries. The gross value of stone of all varieties produced in Canada in 1956 totalled $\$ 48,809,918$ as compared with $\$ 43,736,687$ in 1955.

## Section 5.-Industrial Statistics of the Mineral Industry

The scope of the annual statistics on mineral production published by the Dominion Bureau of Statistics includes a general review of the principal mineral industries such as the copper-gold, silver-lead-zinc, and nickel-copper industries as well as a section on metallurgical works. Additional data published at irregular intervals include such features as numbers of employees, wages and salaries paid and net value of shipments.

The figures for 'net value of shipments' of industries given in Tables 30 and 31 are, in each table, the settlements received for shipments by producers and the additional values obtained when the smelting of ores is completed in Canada, less the cost of materials, fuel, etc. The totals indicate more nearly the actual returns to the different industries than do the values for the minerals in Table 2 of this Chapter where, with respect to copper, lead, zinc and silver, values are computed by applying the average prices for the year in the principal metal markets to the total production from mines and smelters with no reduction for fuel, electricity and other supplies consumed in the production process.

Some imported ores and concentrates are treated in Canadian non-ferrous smelting and refining works, especially in the production of aluminum, where imported ore only is used, and of cobalt which is derived mainly from African ores. The net shipments of these plants include therefore the net value of the metals recovered from these imported ores and to this extent the net shipments shown in Tables 30 and 31 include products of other than Canadian origin.
30.-Summary Statistics of the Mineral Industry by Province 1955 and 1956

## Section 6．－World Production of Certain Metallic Minerals and Fuels

Table 32 shows the production of certain metallic minerals and fuels in the different countries of the world for the year 1955．These figures are taken from the United Nations Statistical Yearbook 1956 which presents production figures for 1936－55 for a much more extensive list of mining and quarrying industries．The 1955 figures are provisional and have been converted from kilograms to ounces troy for gold and from metric tons to short tons for the other metals and fuels shown．

32．－World Production of Certain Metallic Minerals and Fuels， 1955
Nore．－Dashes are given in this table where no figures were shown in the United Nations Statistical Yearbook either because there was no production or because the quantity was not available．

Power from All Sources. ..... 589
Nore.--The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

## Section 1.-Water Power Resources and Their Development*

Canada, a land of many lakes and rivers, has been abundantly endowed by nature with great water power resources well distributed across the country. In most sections adequate precipitation and favourable topography result in numerous rivers on which falls and rapids frequently occur and which offer excellent opportunities for the development of hydraulic power; with the exception of the prairies of the middle west, water power resources of importance are found in virtually every part of the country. In British Columbia, where precipitation is high, the rivers flowing down the Pacific slope of the Rocky Mountains offer many fine power sites. Alberta, although a prairie province, also has mountain streams from the Rockies and great reserves of undeveloped power on its large northern rivers. The Canadian Shield of Precambrian rock, which forms an are around Hudson Bay, covers a portion of the Northwest Territories and northern Saskatchewan as well as large parts of Manitoba, Ontario, Quebec and Labrador; it is a rough, forest covered, well watered area characterized by innumerable lakes and by rivers with many falls and rapids. The water power of the Great Lakes-St. Lawrence River System forms part of the vast resources of Ontario and Quebec upon which their status as the principal manufacturing provinces of Canada is dependent and which compensate in large degree for the lack of indigenous coal. In New Brunswick and Nova Scotia and on the Island of Newfoundland, precipitation is moderately heavy and the rivers, though not large, afford numerous possibilities for power developments of moderate size. In Labrador the potential resources of the Hamilton River are outstanding.

An accurate comparison of Canada's water power resources and their development with those of other countries is not possible because world statistics are incomplete and are tabulated on differing bases. However, from figures available at the end of 1953 it appears that Canada ranks second among the countries of the world in total installed capacity, being exceeded only by the United States; in installation per thousand population, Canada is exceeded only by Norway. Canada is in approximately fifth place in potential power resources but, on the whole, those resources are more readily available to prospective markets than are the water power resources of other countries that outrank Canada, an exception being the United States. In particular might be mentioned the enormous potential resources of the great river systems of Africa and Asia.

[^184]
## Subsection 1.-Available and Developed Water Power in Canada

Table 1 gives a summary of the water power resources of Canada and their development as at the end of 1956.
1.-Available and Developed Water Power by Province as at Dec. 31, 1956

| Province or Territory | Available 24-Hour Power at 80 p.c. Efficiency |  | Turbine Installation ${ }^{1}$ |
| :---: | :---: | :---: | :---: |
|  | At Ordinary Minimum Flow | At Ordinary Six Months Flow |  |
|  | h.p. | h.p. | h.p. |
| Newfoundland. | 958,500 | 2,754,000 | 336,750 |
| Prince Edward Island. | 500 | 3,000 | 1,882 |

| Quebec. | 10,896,000 | 20,445,000 | 8,489,957 |
| Ontario. <br> Manitobe | $5,407,000$ $3,333,000$ | $7,261,000$ $\mathbf{5 , 5 6 2 , 0 0 0}$ | $5,443,766$ 796,900 |
| Saskatchewan. | - 550,000 | 1,120,000 | 109,835 |
| Alberta. | 508,000 | 1,258,000 | 285,010 |
| British Columbia | 10,200,000 | 17,300,000 | 2,514,960 |
| Yukon and Northwest Territories | 382,500 | 814,000 | 33,240 |
| Canada. | 32,384,000 | 57,607,000 | 18,356,148 |

${ }^{1}$ Includes water wheels and hydraulic turbines installed.

The figures given in the first and second columns of Table 1 represent 24 -hour power and are based upon rapids, falls and power sites of which the actual drop, or the head of possible concentration, has been measured or at least carefully estimated. Tabulations of potential power in Canada are not complete as many unrecorded rapids and falls of undetermined power capacity exist on rivers and streams throughout the country, particularly in the less explored northern districts. Apart from areas where definite studies have been carried out and the results recorded, no consideration has been given to the power concentrations that are feasible on rivers and streams of gradual gradient where economic heads possibly may be created by the construction of dams. Furthermore, the estimates of power available in different provinces do not include the power potential of major river diversions which have been investigated but not developed. Thus the figures in Table 1 of available power, under the two conditions of stream flow, represent only the minimum water power possibilities of Canada.

The third column of Table 1 gives the total capacity of the water wheels actually installed and should not be placed in direct comparison with those in the first and second columns to deduce the percentage of the available developed water power resources. At developed sites, the water wheel installation averages 30 p.c. greater than the corresponding calculated maximum available power at the same sites. Figures of the table therefore indicate that the at present recorded water power resources will permit of a turbine installation of about $74,000,000$ h.p. and that the turbine installation at Dec. 31,1956, represents less than 25 p.c. of recorded water power resources.

The consistent growth of hydraulic turbine capacity is shown in Table 2. The average annual increase from 1900 to 1905 of $56,000 \mathrm{~h} . \mathrm{p}$., was stepped up sharply in subsequent years because of improvements in the transmission of electricity and the building of large central electric stations. During the period 1906-22 development proceeded at the fairly uniform rate of $150,000 \mathrm{~h} . \mathrm{p}$. per annum but the rate of installation increased sharply in 1923 and continued at about $377,000 \mathrm{~h} . \mathrm{p}$. each year from 1923 to 1935. As an aftermath to the economic depression, the rate of installation was low during the years 1936-39 but increased to a high average of $481,000 \mathrm{~h}$. p. per annum during the period $1940-43$ to satisfy war requirements. Few developments were undertaken in the later war years or in the immediate postwar period so that only a small amount of new capacity came into operation in the 1944-47 period. However, the effects of the later postwar program of construction are apparent in the large growth in the years 1948-56 when the average rate was about $845,000 \mathrm{~h} . \mathrm{p}$. per annum. A continuation of this rate of growth is indicated for some years.

## 2.-Hydraulic Turbine Horsepower Installed by Province as at Dec. 31, Decennially 1900-50 and Annually 1951-56

Note.-Figures for each year 1900-30 are given in the 1939 Year Book, p. 362; for 1931-39 in the 1946 edition, p. 362; and for $1940-49$ in the 1954 edition, pp. 556-557.

The availability of large amounts of hydro-electric energy has greatly fostered the economical utilization of the natural products from land, forest and mine. Low-cost power is fundamental in meeting the enormous requirements of the pulp and paper industry -Canada's largest industry and one of the world's great industrial enterprises; it also allows economical mining, milling and refining of base and precious metals and facilitates their fabrication into a multitude of manufactured articles. Thus, Canada's outstanding industrial growth in the postwar period has been made in conjunction with accelerated development of water power resources. From hydro-electric plants ranging in capacity from a few hundred to more than $1,000,000 \mathrm{~h} . \mathrm{p}$., networks of transmission line carry power to most urban centres and to an increasing number of rural districts. This wide distribution of power has facilitated the decentralization of industry, enabling manufacturing processes to be carried on in many of the smaller centres of population. Economical domestic electrical service also contributes in no small measure to the high standard of living in Canada.

The total of $18,356,148 \mathrm{~h} . \mathrm{p}$. of installed capacity of water power plants in 1956 produced about $86,680,000,000 \mathrm{kwh}$. of energy. Assuming a working year of 275 eight-hour days and that the working capacity of a manual worker equals $1 / 10 \mathrm{~h} . \mathrm{p}$., the total energy produced from water power in 1956 represents the equivalent of the output of about $525,000,000$ labourers.

Table 3 shows, under three classifications, the purposes for which the developed water power is primarily utilized.
3.-Developed Water Power by Province and Industry as at Dec. 31, 1956

[^185]Central electric station classification totalling $16,028,424$ h.p. represents 87 p.c. of the total developed water power as at Dec. 31, 1956. Central hydro-electric stations produced 96 p.c. of all electricity sold in or exported from Canada during the year. The pulp and paper turbine installation total of $931,630 \mathrm{~h} . \mathrm{p}$. includes only water power actually developed and directly used by pulp and paper companies. In addition, this industry is the greatest purchaser of central electric station power, buying nearly 15 p.c. of all power sold for industrial purposes in 1956. Part of the purchased power is classed as secondary, being used for steam generation by electric boilers.

The 'other industries' group developed $1,396,094 \mathrm{~h} . \mathrm{p}$. solely for its own use. These diversified industries also provide a broad market for the power sold by the central electric stations, as the amount of power produced by these industries represents only a part of the power they use.

The figure of total hydraulic installation in Canada ( $18,356,148 \mathrm{~h} . \mathrm{p}$.) is the cumulative total of all existing installations of water wheels and hydraulic turbines irrespective of whether or not the equipment has been in use during the year. It has been adjusted to Dec. 31, 1956, by the inclusion of new installations completed during the year and by deletion of those old units which were dismantled.

## Subsection 2.-Water Power Developments in the Provinces and Territories, 1955 and 1956

During 1955 and 1956, the appreciable amounts of $827,000 \mathrm{~h} . \mathrm{p}$. and $845,000 \mathrm{~h} . \mathrm{p}$., respectively, of new hydro-electric capacity were installed in Canada. Although considerably lower than the record amount of $1,758,000 \mathrm{~h} . \mathrm{p}$. which was brought into service during 1954, these quantities represent closely the average annual rate of development since 1947. Construction of hydro-electric plants was accelerating during 1956 with about $3,500,000$ h.p. of new capacity expected to come into operation during 1957 and 1958 and an additional $4,500,000 \mathrm{~h} . \mathrm{p}$. under preliminary construction or planning for later years. Construction was active also in the field of power distribution and in the building of thermal-electric plants. Progress in each province and in Yukon Territory, pertaining principally to hydro-electric developments, but also covering thermal developments, is outlined below.

Atlantic Provinces.-In Newfoundland during 1955 the Union Electric Light and Power Company Limited completed the installation of a $2,000-\mathrm{h} . \mathrm{p}$. turbine on the Trinity River near Trinity with the addition of a second similar unit under active prospect. The Company extended transmission facilities by completing 81 miles of $46-\mathrm{kv}$. line in 1955 and 1956; construction of 20 miles of $13.8-\mathrm{kv}$. line was started. By a replacement of the turbine runners, the Anglo-Newfoundland Development Company Limited increased from $60,000 \mathrm{~h} . \mathrm{p}$. to $64,000 \mathrm{~h} . \mathrm{p}$. the capacity of its plant at Grand Falls on the Exploits River. The United Towns Electric Company Limited completed, in December 1956, the installation of a single 5,600-h.p. unit on New Chelsea Brook at New Chelsea. Extensions to its transmission lines included the completion of 33 miles of $66-\mathrm{kv}$. line and 31 miles of $13.8-\mathrm{kv}$. line during 1955 and 1956. The Newfoundland Light and Power Company Limited has under active prospect the construction of two plants on Rattling Brook near Norris Arm, the first to develop an estimated $13,000 \mathrm{~h} . \mathrm{p}$. and the second about $31,000 \mathrm{~h} . \mathrm{p}$. On the Corner Brook River at Corner Brook, the Bowater Power Company Limited is constructing a development of $12,000 \mathrm{~h} . \mathrm{p}$. in two units for operation in 1957. The Maritime Mining Corporation expects to complete, early in 1957, a $500-\mathrm{h} . \mathrm{p}$. plant on Venams Brook at Green Bay and, at a later date, an $850-\mathrm{h} . \mathrm{p}$. plant at Snooks Arm, Green Bay.

In the field of thermal plant construction, the Newfoundland Light and Power Company completed, in 1956, the installation of the initial unit of $10,000 \mathrm{kw}$. in its St. John's steam plant with a second unit of $20,000 \mathrm{kw}$. under active prospect for operation in 1959; the Bowater Power Company Limited completed the construction of a $6,600-\mathrm{kw}$. steam plant in one unit at Corner Brook for use as a stand-by.

In Nova Scotia, the 1955 activity of the Nova Scotia Power Commission brought about the completion of a 6,240-h.p. development on the Mersey River at Lower Great Brook, comprising two $3,120-\mathrm{h} . \mathrm{p}$. units. A second project, scheduled for completion in 1957, involves a single 5,300-h.p. turbine on the Bear River at Bear River and investigations are proceeding on the proposed Wreck Cove development on Cape Breton Island. During 1955 and 1956, the Commission extended transmission lines by 103 miles of main line, mostly of $69-\mathrm{kv}$. capacity, and 100 miles of rural distribution line, with 120 miles of transmission lines of various capacities under active construction at the end of 1956. The Nova Scotia Light and Power Company has under active prospect the replacement of two units of $1,150 \mathrm{~h}$. p. each by a single $5,000-\mathrm{h} . \mathrm{p}$. unit at its Hemlock Falls plant on the Avon River, with change-over expected in 1958. Also under study is the development of an estimated $4,000 \mathrm{~h} . \mathrm{p}$. on the Nictaux River at Alpena. New transmission line construction included 67 miles of $69-\mathrm{kv}$. line and 17 miles of $23-\mathrm{kv}$. line.

In 1955 at Trenton in Pictou County, the Nova Scotia Power Commission increased to $40,000 \mathrm{kw}$. the capacity of its steam plant by the addition of a $20,000-\mathrm{kw}$. unit; a fourth similar unit is to be added in 1959. The Nova Scotia Light and Power Company Limited completed a fifth unit of $27,500 \mathrm{kw}$. at its Halifax steam plant; construction is progressing towards the completion of a $45,000-\mathrm{kw}$. unit in 1957 and another in 1959. At Glace Bay the Seaboard Power Corporation Limited installed a new steam unit of $18,750 \mathrm{kw}$. in 1955, with another scheduled for operation in 1958.

In New Brunswick, the construction of the Beechwood development on the St. John River by the New Brunswick Electric Power Commission was continued with two 45,000-h.p. units scheduled for completion in 1957 and with provision for a third similar unit. At other potential sites, investigations were under way during 1956 on the St. John, Tobique and Napisiquit Rivers and on the Passamaquoddy Bay tidal project. The Commission completed 200 miles of 69 -kv. transmission line and 245 miles of rural distribution line in 1955 and 1956. At the end of 1956,147 miles of $138-\mathrm{kv}$. main line were under construction.

In 1955, Edmundston installed an additional diesel unit of $3,000 \mathrm{kw}$. to its thermal station and in 1956 the New Brunswick Electric Power Commission added a new unit of $22,500 \mathrm{kw}$. to its steam plant in Chatham.

Quebec.-During 1955 and 1956 new hydro-electric capacities amounting to 240,000 h.p. and $514,300 \mathrm{~h} . \mathrm{p}$., respectively, were brought into operation in Quebec. The addition for 1956 represented 61 p.c. of Canada's total development for that year.

The most notable progress was made by the Quebec Hydro-Electric Commission which placed in operation at its Bersimis No. 1 plant at Lac Casse during 1956 and 1957 three $150,000-\mathrm{h}$. p. units. Three similar units are scheduled for operation in 1959 and two others in 1960. At the Bersimis No. 2 site, preliminary construction was continued toward an ultimate installation of $855,000 \mathrm{~h} . \mathrm{p}$. in five $171,000-\mathrm{h} . \mathrm{p}$. units. At the Beauharnois development on the St. Lawrence River dredging of the intake canal was continued and preliminary construction started on the third and final section of the powerhouse where five new 67,000 -h.p. units are scheduled for operation in 1959 and one in 1960 . The ultimate eapacity of the whole development is expected to reach $2,235,000 \mathrm{~h}$. . At the Commission's Rapid II plant on the upper Ottawa River the third $16,000-\mathrm{h} . \mathrm{p}$. unit was completed in 1956, and provision made for a fourth unit. Work was well advanced on the construction of a storage dam at the outlet of Lake Ste. Anne, on a tributary of the Manicouagan River, to allow a higher firm output from the plant of the Manicouagan Power Company where additional capacity is being installed. Studies and surveys are also being carried out by the Commission towards the development of the Lachine Rapids on the St. Lawrence River. In the transmission field, 146 miles of $154-\mathrm{kv}$. line were completed in 1955 to serve the Chibougamau district; in 1956, a double-circuit 450 -mile $300-\mathrm{kv}$. line from Labrieville to Quebec and Montreal was completed and work was begun on three additional $300-\mathrm{kv}$. lines-Labrieville to Quebec City, Labrieville to Hauterive and a tie between the Bersimis plants Nos. 1 and 2.

During 1955, the Shawinigan Water and Power Company brought into operation a total of $158,500 \mathrm{~h} . \mathrm{p}$. by installing a new unit in each of three plants on the St. Maurice River comprising $44,500 \mathrm{~h} . \mathrm{p}$. at Rapid Blanc, $65,000 \mathrm{~h} . \mathrm{p}$. at La Trenche and $49,000 \mathrm{~h} . \mathrm{p}$. at La Tuque. In addition, construction was started in 1956 on a new plant on the St. Maurice River at Rapid Beaumont to develop $333,000 \mathrm{~h} . \mathrm{p}$. in six units, with initial operation scheduled for 1959 and completion in 1960. During 1955 and 1956 the Company extended its transmission line network by completing 160 miles of line at 220 kv ., 79 miles at 110 kv . and 22 miles at 60 kv .

The Gatineau Power Company completed the installation of a $47,000-\mathrm{h} . \mathrm{p}$. generating unit at Paugan Falls on the Gatineau River during 1955 and extended rural transmission services by 82 miles in 1955 and 68 miles in 1956.

The Northern Quebec Power Company Limited completed in 1955 the installation of an additional 34,500-h.p. unit in its Quinze Rapids plant on the upper Ottawa River, bringing the total capacity to $119,000 \mathrm{~h} . \mathrm{p}$. Extension to the McCormick development of the Manicouagan Power Company at First Falls on the Manicouagan River will add $180,000 \mathrm{~h} . \mathrm{p}$. in three units, the first scheduled for operation in 1957 and the other two in 1958. In 1956 the Aluminum Company of Canada began the construction of a hydroelectric development on the Peribonca River at Chute des Passes to comprise five 200,000h.p. units. The turbine, which will be the largest in Canada, will receive water from the Passe Dangereuse reservoir by means of a seven-mile tunnel. Operation will be started in 1959 and development completed in 1960. In 1956, Price Brothers Company Limited commenced a 78,000-h.p. single-unit development on the Shipshaw River below Wilson Falls for operation in 1957 which will replace the existing 10,100 -h.p. plant at Murdock Falls.

The Eastern Smelting and Refining Company Limited is constructing, on the Chicoutimi River, a development of $42,000 \mathrm{~h} . \mathrm{p}$. in one unit scheduled for operation in 1957. In 1956, the town of Parent, Chapleau County, completed the installation of a $1,300-\mathrm{h} . \mathrm{p}$. unit at its Bazin River plant with provision for a second similar unit. The James Maclaren Company plans initial construction in 1957 of a new development on the Lièvre River at Dufferin Falls, to comprise $50,000 \mathrm{~h} . \mathrm{p}$. in two $25,000-\mathrm{h} . \mathrm{p}$. units, for operation in December 1958.

Ontario.-The Hydro-Electric Power Commission of Ontario continued the rapid expansion of generating capacity in several major projects during 1955 and 1956. In the Sir Adam Beck-Niagara Generating Station No. 2, five $105,000-\mathrm{h} . \mathrm{p}$. units were added during 1955 , raising the total capacity to $1,260,000 \mathrm{~h} . \mathrm{p}$. Four additional units were under construction during 1956, one scheduled for operation late in 1957 and three in 1958. The eventual capacity of No. 2 development will be $1,680,000$ h.p. Six reversible pumpturbines are being installed at the pumped storage generating station associated with the development. Water will be pumped from the power canal into a 700 -acre reservoir with a usable capacity of 16,000 acre-feet. When acting as turbines, using water returning from the reservoir to the canal, each unit will have a capacity of $47,000 \mathrm{~h} . \mathrm{p}$. From early 1957 the units are expected to be completed at intervals of about two months.

The Commission continued construction of the control dam which forms part of the Niagara River remedial works being carried out jointly by Canada and the United States. The dam, which is located upstream from the Cascades, will extend 1,550 feet from the Canadian shore and will consist of 13 individually operated bascule-type gates mounted on concrete piers. At the end of 1956 nine gates were in operation.

Rapid progress was made on the St. Lawrence River Power Project, the Canadian portion of which is being constructed by the Commission. By the end of 1956 the foundation for the powerhouse structure at the foot of Barnhart Island was completed and concrete was being placed for the draft-tubes of the first six units. A diversion of the Cornwall canal near the powerhouse site was effected for service at the start of navigation in 1957. The relocation of the village of Iroquois was almost finished; about 220 houses were moved during 1956 from areas to be flooded. Thirty-five miles of relocated highway were
virtually completed as well as the laying of about 40 miles of double railway track. Channel excavation in the vicinity of Chimney Island and Galop Island was under way and excavation for the canal at Iroquois Point started. The Canadian portion of the powerhouse will contain 16 units totalling $1,200,000 \mathrm{~h}$. . capacity; the first units will be in operation in 1958 and the project completed in 1960.

Progress was made by the Commission on the construction of new hydro-electric plants in northwestern Ontario to meet growing demand for power by mining and pulp and paper companies. On the English River at Manitou Falls, the installation of four 18,500 -h.p. units was completed in 1956, with provision for a fifth unit in 1958. On the Winnipeg River at Whitedog Falls, construction was begun in 1955 for the development of $81,000 \mathrm{~h} . \mathrm{p}$. scheduled for completion in 1958. At Caribou Falls, located on the English River near its junction with the Winnipeg River, construction began in 1956 on three units totalling $102,000 \mathrm{~h} . \mathrm{p}$. to be completed in 1958. A $19,000-\mathrm{h} . \mathrm{p}$. unit will be added to the Alexander Falls plant on the Nipigon River and one of $25,000 \mathrm{~h} . \mathrm{p}$. at Cameron Falls. To increase the output of stations on the English River, and incidently those on the Winnipeg River in Manitoba, the Commission is completing a scheme of diverting water from the Albany River at Lake St. Joseph via the Root River into Lac Seul. This work is being planned in close liaison with the Manitoba Hydro-Electric Board.

In addition to hydro-electric development, the Commission, with the co-operation of Atomic Energy of Canada Limited and Canadian General Electric Company Limited, is proceeding with the construction of a $20,000-\mathrm{kw}$. nuclear-power experimental plant for operation in 1959 at a site near its Des Joachims generating station on the Ottawa River. At its Richard L. Hearn steam plant in Toronto, the addition of a $200,000-\mathrm{kw}$. unit has been authorized for operation in 1958 with three similar units to be added in 1959, 1960 and 1961 , respectively, to raise the total capacity to $1,200,000 \mathrm{kw}$.

Extensions to the Commission's transmission facilities in 1955 and 1956 included 58 circuit miles at 230 kv ., 516 circuit miles at 115 kv ., 204 circuit miles at $13-44 \mathrm{kv}$., and 1,954 circuit miles of rural distribution line.

Apart from activities of the Commission, the Ontario-Minnesota Pulp and Paper Company Limited modernized its Rainy River plant by dismantling one unit and increasing the capacity of each of the remaining eight units to $2,000 \mathrm{~h} . \mathrm{p}$. by runner replacement. This resulted in a capacity increase of $650 \mathrm{~h} . \mathrm{p}$. The Great Lakes Power Company is installing in its Upper Falls plant on the Montreal River for operation in 1957 a new unit comprising a $30,000-\mathrm{h} . \mathrm{p}$. turbine driving a $25,000-\mathrm{kv}$. generator. The dam for this development was raised by 33 feet and the resulting increase in head increased the combined capacity of the two existing units from $23,400 \mathrm{~h} . \mathrm{p}$. to $25,300 \mathrm{~h} . \mathrm{p}$. Construction of a new plant on the Montreal River at Centre Falls is expected to be under way in 1957 with one 28,000-h.p. unit scheduled for completion in 1958. The Gananoque Electric Light and Water Supply Company is installing in its Jones Falls plant on the Rideau River an additional $1,500-\mathrm{h} . \mathrm{p}$. unit to be completed in 1957.

Prairie Provinces.-In Manitoba during 1955, the Manitoba Hydro-Electric Board installed the last four units of $10,000 \mathrm{~h}$. . each in its McArthur Falls plant on the Winnipeg River bringing to completion the development of the resources of that river. On the Saskatchewan River near Lake Winnipeg, preliminary surveys and ground tests for the Grand Rapids project were completed in 1955 for the development of up to $460,000 \mathrm{~h} . \mathrm{p}$. at peak load. However, further investigations at this site have been tentatively discontinued in favour of the proposed Grand Rapids development on the Nelson River where construction is expected to begin in 1957 on four or five $37,500-\mathrm{h} . \mathrm{p}$. units, with provision for additional units when required. Sherritt Gordon Mines, Limited is constructing, for operation in 1957, a second unit of $7,000 \mathrm{~h} . \mathrm{p}$. on the Laurie River.

In addition to hydro-electric activities, the Manitoba Hydro-Electric Board continued with the construction of a steam generating station at Brandon where four $30,000-\mathrm{kw}$. generators will be installed, two for operation in 1957 and two in 1958. The Board also plans to construct a steam plant at East Selkirk with an initial installation of two 66,000-kw. units; completion is scheduled for late 1959.

In the field of electrical distribution, The Manitoba Power Commission, which is the sole distributor of power in the Province outside of the city of Winnipeg, extended its transmission network during 1955 and 1956 by 336 circuit miles of main line and 513 miles of rural line. The inter-connection of the electrical systems of southern Manitoba and northwestern Ontario was effected in 1956 to permit the transfer of power between the two systems.

In Saskatchewan, the Churchill River Power Company is considering the extension of its Island Falls hydro-electric plant on the Churchill River by the addition of a 19,000-h.p. turbine to act as a stand-by unit. The Saskatchewan Power Corporation, whose transmission network covers a large part of the southern portion of the Province depends exclusively on thermal engines for power production. In 1955 a new station, consisting of two gas-engine generating units at $3,000 \mathrm{kw}$. each, was built at Kindersley to replace the steam plant at Battleford; a similar unit added in 1956 brought the total plant capacity to $9,000 \mathrm{kw}$. At the Corporation's Swift Current plant, a gas-engine generating unit of $3,000 \mathrm{kw}$. was installed in 1955 and a $6,000-\mathrm{kw}$. unit in 1956 ; an additional $3,000-\mathrm{kw}$. unit will be installed in 1957. At the Saskatoon steam plant, a $33,000-\mathrm{kw}$. unit was added in 1956 and a $30,000-\mathrm{kw}$. unit will be added to the Estevan plant in 1957. Main transmission line extensions included the completion of 516 miles of line in 1955 and 1956 and service was extended to an additional 16,000 farms.

In Alberta, Calgary Power Limited continued the expansion of several of its hydroelectric developments in the Bow River basin during 1955 and 1956. Additional units were installed in existing plants including an $18,400-\mathrm{h}$.p. turbine driving a $15,000 \mathrm{kva}$. generator at the Pocaterra plant and a 6,900 -h.p. turbine at the Interlake plant. The installation of an additional $23,000-\mathrm{h} . \mathrm{p}$. unit at the Cascades plant neared completion and investigations continued towards doubling the combined capacity of $85,000 \mathrm{~h} . \mathrm{p}$. at the Spray and Rundle plants. Possible developments on the Brazeau River and on the North Saskatchewan River received preliminary investigation. In the field of thermal development, the Company completed the installation of the initial $66,000-\mathrm{kw}$. steam turbine at its Wabamun plant, a second similar unit to be added for operation in 1958 and a third unit of $150,000 \mathrm{kw}$. for operation in 1960. Extension to the Company's transmission facilities included 176 circuit miles of $132-\mathrm{kv}$. line, 65 circuit miles at 66 kv . and, 532 circuit miles at 22 kv .

Northland Utilities Limited completed in 1955 the installation of a Kaplan turbine of $1,000 \mathrm{~h} . \mathrm{p}$. to increase the capacity of its Astoria River plant near Jasper to $1,800 \mathrm{~h} . \mathrm{p}$. A $3,000-\mathrm{kw}$. unit is to be added in 1957 to its Fairview steam turbine plant which is operated jointly with Canadian Utilities Limited. In 1955, Canadian Utilities Limited installed a new $2,500-\mathrm{kw}$. gas engine in its Grand Prairie plant and an additional $500-\mathrm{kw}$. diesel unit at Fort St. John. Elsewhere, the Company completed in 1956 the construction of an initial unit of $30,000 \mathrm{kw}$. in its new Forestburg plant and has in active prospect the addition of a $32,000-\mathrm{kw}$. thermal unit for 1961 operation in its Battle River plant. The Company increased its transmission facilities in 1955 by 30 miles of $138-\mathrm{kv}$. line, 70 miles of $69-\mathrm{kv}$. line, 62 miles of $23-\mathrm{kv}$. line, and 1,220 miles of rural distribution line. Extensions during 1956 included 10 miles of $6.9-12$-kv. line, 78 miles of $22-\mathrm{kv}$. line, 53 miles of $66-\mathrm{kv}$. line and 48 miles of $138-\mathrm{kv}$. line. A number of cities in Alberta are expanding their thermal plant facilities. Medicine Hat is planning the addition of a steam generating unit of 10,000 or $20,000 \mathrm{kw}$. for 1959 operation, Lethbridge is adding a $10,000-\mathrm{kw}$. gas turbine for 1957 operation and Edmonton is planning the addition of two $30,000-\mathrm{kw}$. gas turbines for operation in 1957 and 1958.

British Columbia.-The British Columbia Power Commission was very active in hydro-electric development particularly on Vancouver Island. During 1955, the redevelopment of the Puntledge River near Courtney was completed with the installation
of a 35,000 -h.p. turbine. A 5,500 -h.p. development on the Spillimacheen River was completed, including two reconditioned $1,250-\mathrm{h}$. p. units and a new 3,000-h.p. unit. At Ladore Falls on the Campbell River, the first of two 35,000 -h.p. units was installed, with the second scheduled for 1957. Also under construction was an initial unit of $42,000 \mathrm{~h} . \mathrm{p}$. at the outlet of Upper Campbell Lake to be completed in 1957 with provision for two similar units at a later date. On the mainland, the Commission continued the installation at the Whatshan River plant, of a third unit comprising a 16,500 -h.p. reaction-type turbine scheduled for operation in 1957. In 1956, construction started on the Ash River near Alberni where the development of $35,000 \mathrm{~h} . \mathrm{p}$. under a head of 735 feet is to be completed in the winter of 1958-59. In the field of thermal development, the Commission in 1955 increased the capacity of its diesel plants at Vanderhoof and Dawson Creek by $1,000 \mathrm{kw}$. each, and early in 1957 new gas diesel generating units are expected to be in operation at Prince George, Quesnel and Dawson Creek raising the capacities of these plants to $16,270 \mathrm{~h} . \mathrm{p} ., 12,060 \mathrm{~h} . \mathrm{p}$. and $14,700 \mathrm{~h} . \mathrm{p}$. respectively. A $100,000-\mathrm{h} . \mathrm{p}$. gas turbine generating station presently under way at Chemainus and scheduled for operation late in 1957 will comprise initially two $19,750-\mathrm{kw}$. units and subsequently two regenerative-cycle, two-shaft turbo-generator units at $18,000 \mathrm{kw}$. each. In 1955 and 1956 the Commission completed a $33-\mathrm{kv}$. transmission line from Spillimacheen to Golden, a double-circuit 138-kv. line from Ladore Falls to the John Hart station, and a $60-\mathrm{kv}$. line between Kamloops and Savona.

The British Columbia Electric Company made active progress towards the development of an additional $408,500 \mathrm{~h} . \mathrm{p}$. at its Bridge River power plant system. Part of this capacity was brought into operation in 1956 with the completion of $58,500 \mathrm{~h} . \mathrm{p}$. in one unit at the Seton Creek plant near Lillooet. At the La Joie dam, construction was under way with one $30,000-\mathrm{h} . \mathrm{p}$. unit scheduled for completion in the autumn of 1957. Work started on the Bridge River No. 2 development to comprise four $80,000-\mathrm{h} . \mathrm{p}$. units, three scheduled for operation in 1959 and one for 1960 . Work proceeded on the Cheakamus development of $190,000 \mathrm{~h} . \mathrm{p}$. in two units, scheduled for service in late 1957. At the 4,000 -h.p. development at Clowhom Falls-which, with the Sechelt peninsular system, was purchased from the British Columbia Power Commission in May 1956-work is under way for the replacement of the present plant by a single $40,000-\mathrm{h} . \mathrm{p}$. unit for operation in the autumn of 1957. This project will include a new dam to give a maximum head of 174 feet and to provide a larger storage reservoir. A gas turbine plant capable of operating on either oil or natural gas will be added to the system in 1958; it will comprise four 33,500 -h.p. turbines, each driving a 30,000 -kva. generator. Expansion of the Company's transmission lines included the completion of 25 miles of overhead line and 19.6 miles of submarine cable which together form a $132-\mathrm{kv}$. connection between Vancouver Island and the mainland. The erection of a 97 -mile, $132-\mathrm{kv}$. line was completed in 1956 to supply the Powell River and Sechelt areas; part of this line forms one of the longest overhead crossings in existence where it spans Jervis Inlet for a total distance of 10,100 feet. The Company is proceeding with a second transmission line at 345 kv . between Bridge River and Vancouver to be completed in 1957.

The Aluminum Company of Canada installed a fourth $150,000-\mathrm{h}$.p. unit in its Kemano plant during 1956; a fifth similar unit will be ready for operation in mid-1957 and another in prospect for operation late in 1958 will bring the capacity of the plant to $900,000 \mathrm{~h} . \mathrm{p}$.

The Powell River Company Limited, by diverting water from the upper Theodosia River into Powell Lake, increased the firm output of its plant by about $2,000 \mathrm{kw}$. The Northern British Columbia Power Company rebuilt its Shawatlans plant comprising a single unit of 2,140 h.p. Northwest Power Industries Limited continued with surveys on the Nass River.

Yukon Territory.-In 1955, the Yukon Hydro Company Limited completed a new development on McIntyre Creek near Whitehorse comprising an 800-h.p. turbine driving a 750-kw. generator. The Northern Canada Power Commission started work in October 1956 on its development at Whitehorse Rapids on the Yukon River, about 1.5 miles upstream from Whitehorse. Two 7,500-h.p. units will be completed in October 1958, and a third provided for. The Commission is also adding a 3,000-h.p. unit to its Mayo River plant which will increase capacity at this site to $6,000 \mathrm{~h} . \mathrm{p}$.

Northwest Power Industries Limited has all but completed surveys on the proposed Yukon-Atlin-Taku project, which entails an initial 880,000 -h.p. development at powerhouse No. 1 and a possible eventual development of nearly $5,000,000 \mathrm{~h} . \mathrm{p}$.

## Section 2.-The Central Electric Station Industry

Central electric stations are companies, municipalities or individuals selling or distributing electric energy whether generated by themselves or purchased for resale. Stations are divided into two classes according to ownership, viz.: (1) private-those privately owned and operated by companies or individuals, and (2) public- those owned and operated by municipalities or governments.

## 4.-Electric Energy Generated by Type of Station 1940-55 and by Province 1954 and 1955

| Year, Province or Territory | Generated by- |  | Total | Year, Province or Territory | Generated by- |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Subsection 1.-Statistics of Central Electric Stations*

The growth of the central electric station industry has been practically continuous since 1919 when statistics of kilowatt hours generated were first made available. Horsepower installed increased almost continuously even during the depression years mainly because large power projects planned before the depression were in process of construction. Expansion since the end of the War has been spectacular and continuing; installed capacity of the industry in hydro and thermal units is now well over one horsepower for every Canadian.

[^186]
5.-Summary Statistics of Central Electric Stations 1946-55

| Year | Generating Power Plants | Revenue from Sale of Power ${ }^{1}$ | Power Equipment | Kilowatt Hours Generated | Customers | Persons Employed | Salaries and Wages |

Domestic Service.-Power used by domestic customers or for household purposes amounted to 17.5 p.c. of the total production of central electric stations. Details of the number of domestic customers served, the kilowatt hours delivered and the costs to the customers, exclusive of direct federal, provincial and municipal taxes on such service, are shown in Table 7. The average consumption per customer and average cost per kilowatt hour vary considerably as between municipalities and also as between provinces but the differences in the average bills are smaller. The availability of low-cost power to domestic users contributes greatly to the high standard of living in Canada. Average consumption per customer has almost doubled since 1946 and costs per kilowatt hour have remained approximately the same.

## ELECTRICITY CONSUMED FROM CENTRAL STATIONS BY FARMS AND HOMES

1945-56

7.-Summary Statistics of Domestic Consumption of Electricity 1946-55

| Year | Customers | Consumption | Average Consumption per Customer | Average Charge per Annum | Average Charge per kwh. |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | No. | '000 kwh. | kwh. | \$ | cts. |

| 1954.. | 3,448,980 | 11,280,513 | 3,271 | 55.29 | 1.69 |
| 1955.. | 3,645,313 | 12,759,657 | 3,500 | 58.03 | 1.66 |

Farm Service.-Table 8 shows the number of farm customers, the average annual consumption, average annual revenue and the average revenue per kilowatt hour sold to these customers in each province in 1954 and 1955. Rural electrification has made considerable progress during the past decade. Farm customers added during 1955 totalled 30,560 and the national total at 441,694 increased by 7 p.c. over 1954 . It is estimated that about 74 p.c. of the farms in Canada now enjoy the benefits of power line service. In addition many other farms generate their own electricity by the use of engines, windmills, etc.

Equipment of Central Electric Stations.-Power station equipment shown in Table 9 includes thermal and hydraulic equipment of generating stations and thermal stand-by equipment of non-generating stations. The capacities of the equipment are manufacturers' ratings and, with regard to water wheels and turbines, it should be noted that the kilowatt hour capacities vary with the supply of water. The majority of the hydraulic stations are large, serving wide areas over heavy transmission lines. With a few exceptions most of the thermal plants are small, serving the needs of local municipalities. In 1955 the capacity of thermal plants increased 8 p.c. as compared with the previous year. In some localities larger units are being installed to replace two or three small units. Equipment data were not included for small industries or firms, particularly in Saskatchewan and Alberta where output was largely consumed by the producing plants.

## 9.-Capacity of Central Electric Station Equipment by Province 1954 and 1955

Export and Import of Electric Power.-Electric energy is exported from Canada only under licence and an export tax of 0.03 cents per kilowatt hour is levied with some exceptions. The export duties for the years ended Dec. 31, 1953 to 1956, were \$727,209,
$\$ 815,492, \$ 1,330,038$ and $\$ 1,531,101$, respectively. Exports at the International Boundary for the years 1953-56 are shown in Table 10. There are also large interprovincial movements of electric energy from Quebec to Ontario, and smaller movements between other provinces.

Exports to the United States reached a record high of $5,103,669,000 \mathrm{kwh}$. in 1956.

## 10.-Electric Energy Exported from Canada, by Companies, and Imported from the United States 1953-56

## Subsection 2.-Ownership and Regulation of Central Electric Stations*

Water power is developed in Canada by provincial commissions, by municipalities and by private companies. The first such provincial commission was formed in Ontario in 1906 to act as trustee for a group of municipalities to develop and distribute electricity. The Hydro-Electric Power Commission of Ontario now generates and purchases power, transmits it to rural and urban municipalities and also serves large power customers. This Commission also exports and imports power to and from the United States and is currently developing water power along the projected St. Lawrence Seaway in co-operation with the New York State Power Authority.

[^188]
## 11.-Summary Statistics of Publicly Owned Central Electric Stations 1916-55

| Year | Generating Power Plants | Customers | Electric Energy Generated | Power Equipment |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Water Wheels and Turbines | Total |

| 1954. |  | 2,749,481 | 32,553,238 | $6,964,177$ $7,613,957$ | 8,710,318 |
| 185. | . | 2,922,684 ${ }^{\text {a }}$ | 38,278,661 | 7,613,957 | 9,497,169 |

[^189]A large portion of the power development in Quebec is connected with pulp and paper plants and with the aluminum industry. Such power plants are operated as separate organizations and deliver power to the parent companies at relatively low rates. Substantial blocks of power are also produced in Quebec for use in Ontario.

Table 12 shows statistics of publicly owned central electric stations by province for 1954 and 1955. Table 14 gives comparable statistics for private stations.
12.-Publicly Owned Central Electric Stations by Province 1954 and 1955

| Year and Province or Territory | Customers ${ }^{1}$ | Electric Energy Generated | Power Equipment |  |
| :---: | :---: | :---: | :---: | :---: |

[^190]The predominant position of Quebec in the privately owned electric power field can be seen from Table 14, although that predominance is gradually diminishing. Of the total power generated in Canada by all central electric stations in 1955, 36 p.c. was generated by privately owned stations in the Province of Quebec as compared with 39 p.c. in 1954 and 40 p.c. in 1953.
14.-Privately Owned Central Electric Stations by Province 1954 and 1955

[^191]In 1955 private and public stations in Ontario produced about 69 p.c. as much power as Quebec stations; these two provinces generated almost 82 p.c. of the total for Canada.

Because of the absence of free market determination of prices and regulation of services in an industry that is semi-monopolistic, regulation of electrical utilities has been attempted in most provinces. The governing bodies of the provincial electric power commissions, their functions and activities are summarized by provinces in the following paragraphs. Certain privately owned utilities are also covered.

Newfoundland.-There are no publicly owned hydro-electric systems in Newfoundland. The largest water power development in the Province is located at Deer Lake. The plant, which is operated by Bowater's Newfoundland Pulp and Paper Company Limited, has a total capacity of $154,000 \mathrm{~h} . \mathrm{p}$. This Company develops hydro-electric energy at Deer Lake mainly for its own use in the manufacture of pulp and paper and also supplies electric power to the Buchans Mining Company for its mining operations and to the Newfoundland Light and Power Company Limited which distributes electricity to consumers in Corner Brook and adjacent communities in the Bay of Islands sections.

The Anglo-Newfoundland Development Company Limited develops hydro-electric power at two plants situated at Grand Falls and Bishop's Falls with a total capacity of $64,000 \mathrm{~h} . \mathrm{p}$. The Company utilizes most of its hydro-electric power in the manufacture of pulp and paper and supplies light and power to the towns of Grand Falls, Bishop's Falls, Botwood and adjacent communities.

The Newfoundland Light and Power Company Limited has seven plants that develop hydro-electric energy with a total installed capacity of $55,400 \mathrm{~h} . \mathrm{p}$. It distributes electricity to the city of St. John's and the town of Bell Island and the iron mining operations there.

The United Towns Electric Company Limited operates eight plants, of which five are located at Conception Bay, two on the Burin Peninsula and one on Trinity Bay. The Company sells light and power to communities on the Avalon and Burin Peninsula. The West Coast Power Company, a subsidiary of the United Towns Electric Company, operates a plant on Lookout Brook, a tributary of Flat Bay Brook which flows into St. George's Bay.

The Iron Ore Company of Canada operates a plant at Menihek Rapids on the Ashuanipi River in Labrador. The plant has an initial installation of $12,000 \mathrm{~h} . \mathrm{p}$. with provision for two additional units. It serves the new iron ore mining centre of the Iron Ore Company near Knob Lake.

Two small companies, the Clarenville Light and Power Company and the Union Electric Light and Power Company Limited, operate plants at Clarenville, Port Union and Trinity.

New power plant construction recently completed or under way is outlined at p. 562.
Prince Edward Island.-The area of Prince Edward Island is only 2,184 sq. miles and three-quarters of its population live in rural areas. Electric power must therefore be supplied to rather thickly populated rural districts interspersed with a considerable number of small municipalities. There is little opportunity for the development of hydroelectric power in the Province since the rivers are short, drainage areas small, and the country is relatively flat. Power is therefore mainly generated in thermal and diesel plants using imported fuels.

The Maritime Electric Company Limited, supplies approximately 75 p.c. of the Island's power requirements of $44,296,160 \mathrm{kwh}$., with a system peak of $11,000 \mathrm{kw}$. from its Charlottetown plant. The plant consists of six steam turbines of $22,365 \mathrm{kw}$. total capacity. In 1956 the Company served 11,565 rural and urban customers over 800 miles of Company-owned distribution line with an additional 1,363 rural customers being served by 310 miles of distribution line owned by the Provincial Government but connected to the Company system. The town of Summerside is connected to Charlottetown by a 33-kv. transmission line and purchases approximately $5,000,000 \mathrm{kwh}$. annually from the Maritime Electric Company.

Two other power systems supply 25 p.c. of the power consumed. The town of Summerside's station is powered by nine diesel engines, has a total capacity of $2,835 \mathrm{kw}$. and an annual energy production of $7,700,040 \mathrm{kwh}$. The station serves 1,996 customers in Summerside and 1,244 customers over 132 miles of rural lines. Approximately 520,000 kwh. of energy is sold to the Scales Hydro Electric Company Limited and about 470,000 kwh. is sold to the Maritime Electric Company Limited through interconnected systems.

The Scales Hydro Electric Company Limited operates a small station in Freetown on the Dunk River. Its total capacity is 250 kw ., 175 kw . of which is generated by water power and the remainder by diesel engines. The annual energy production is $453,050 \mathrm{kwh}$. and 681 customers in surrounding areas are served over 29 miles of distribution line.

Nova Scotia.-The Nova Scotia Power Commission was created under the Power Commission Act of 1919 with the function of supplying electric power and energy by the most economical means available. The Rural Electrification Act of 1937 greatly increased the possibilities for retail service by providing for financial assistance to equalize cost and revenue of extensions approved by the Governor in Council. In 1941 an amendment
to the Power Commission Act authorized the Commission, subject to the approval of the Governor in Council, to regulate and control the generation, transmission, distribution, supply and use of power in the Province. Certain investigatory work is carried on in the Province by the Federal Government in close association with the Commission but the control of water resources is vested in the Crown and administered under the provisions of the Nova Scotia Water Act of 1919. The Commission pays regular fees for water rights.

Financially the Commission is self-supporting, repaying borrowings from revenue. The balance sheet at Nov. 30, 1956, showed total fixed assets of $\$ 41,871,175$ including work in progress amounting to $\$ 3,915,638$. Current assets amounted to $\$ 643,856$. Liabilities are as follows: fixed $\$ 34,084,310$; current $\$ 1,935,416$; contingency and renewal reserves $\$ 4,055,673$; sinking fund reserves $\$ 6,913,749$; and general reserves and special reserves $\$ 2,309,145$.

The initial development of the Commission was an 800-h.p. installation on the Mushamush River which went into operation in 1921 and delivered $208,752 \mathrm{kwh}$. in the first complete year of operation. Succeeding years showed a marked growth in installed capacity in the Province, which has reached $107,580 \mathrm{~h} . \mathrm{p}$. in hydraulic turbines, 2,806 h.p. in diesel units and $41,125 \mathrm{kw}$. in steam turbines. Total generation for the year ended Nov. 30, 1956, was $500,366,384 \mathrm{kwh}$. Construction activity during 1955 and 1956 is outlined at p. 563.

The territory of the Commission extends over the entire Province and embraces seven systems which include 24 generating stations and over 4,500 miles of transmission and distribution lines through which wholesale and retail customers received 481,670,027 kwh. during the year ended Nov. 30, 1956.

The installed capacity and annual output of the various systems of the Nova Scotia Power Commission are given in Table 15.
15.-Capacity and Output of the Nova Scotia Power Commission, Year Ended Nov. 30, 1956

| Systems | First Year of Operation | Installed Capacity |  | Annual Generation |  |

[^192]New Brunswick.-The New Brunswick Electric Power Commission was incorporated under the Electric Power Act 1920. Generating stations owned by the Commission are as follows:-

| Plant | Type | Capacity | Plant | Type | Capacily |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Musquash | Hydro | h.p. 9,320 | St. Stephen. | Diesel. | h.p. 2,800 |
| Tobique.. | Hydro | 27,000 | Campobello. | Diesel. | 2,300 |
| Grand Lake. | Stearm. | 58,700 | Grand Manan. |  | 900 |
| Saint John.. | Steam. | 21,500 | Shippegan.... |  | 2,500 |
| Chatham.. | Steam. | 16,800 | St. Quentin. | Diesel. | 2,750 |
|  |  |  | Total Capactity |  | 140,570 |

All generating units, with the exception of diesel plants at St. Quentin, Campobello and Grand Manan are interconnected in a province-wide grid system.

The statistical information given in Table 16 shows the growth of the Commission's undertakings since 1952.

${ }^{1}$ Additions to capacity are outlined at p. 563.
Quebec.-The Quebec Streams Commission.-Created by S.Q. 1 Geo. V, c. 5, and given additional powers by 3 Geo. V, c. 6 (R.S.Q. 1925, c. 46) and 20 Geo. V, c. 34, the Quebec Streams Commission was authorized to ascertain the water resources of the Province, to make recommendations regarding their control, and to construct and operate certain storage dams to regulate the flow of streams. It assisted companies engaged in such work by the systematic collection of data on the flow of the principal rivers and on meteorological conditions, by investigation of numerous water power sites and determination of the longitudinal profile of a large number of rivers.

On Apr. 1, 1955, the Quebec Streams Commission was abolished and its powers and attributions transferred to the Hydraulic Resources Department, Province of Quebec. The rivers controlled by the Commission at the time of transfer, either by means of dams on the rivers or by regulating the outflow of lakes at the headwaters, were: the St. Maurice, the Gatineau, the Lièvre, the St. Francis, the Chicoutimi, the Au Sable, and the Métis. The Commission also operated nine reservoirs on North River, two in the watershed of the Ste. Anne-de-Beaupré River, and one at the outlet of Lake Morin on Rivière-duLoup (lower).

Other Reservoir Control.-Storage reservoirs otherwise controlled or operated are: the Lake St. John, the Lake Manouane and Passe Dangereuse on the Peribonca River, and the Onatchiway on the Shipshaw River; the Témiscouata Lake on Madawaska River, controlled by the Gatineau Power Company; Memphremagog Lake on the Magog River, controlled by the Dominion Textile Company; Témiscamingue and Quinze Lakes on the Ottawa River, controlled by the Federal Department of Public Works; Kipawa Lake on the Ottawa River, controlled by the Gatineau Power Company; and Dozois Lake on the upper Ottawa River and Pipmaukin Lake in the Bersimis River watershed, controlled by the Quebec Hydro-Electric Commission.

Power developments on the Saguenay River, benefiting from the Peribonca and Lake St. John reservoirs, have a total capacity of $1,950,000 \mathrm{~h} . \mathrm{p}$.

The Quebec Hydro-Electric Commission.-The Quebec Hydro-Electric Commission was established by S.Q. 8 Geo. VI, c. 22, with the object of supplying power to the municipalities, to industrial and commercial undertakings and to citizens of the Province of Quebec at the lowest rates consistent with sound financial administration.

On Apr. 15, 1944, in accordance with the provisions of this Act, the Commission took over: (a) the system of Montreal Light, Heat and Power Consolidated for the generation and distribution of electricity; (b) the undertaking of the Montreal Island Power Company for the generation and distribution of electricity; and (c) all the shares of the capital stock of the Beauharnois Light, Heat and Power Company. Thus the Quebec Hydro-Electric Commission at the end of 1956 controlled among other assets the following hydro-electric plants:*-

| Plant | River | Installed Capacily |
| :---: | :---: | :---: |
|  |  | h.p. |
| Cedars. | St. Lawrence. | 206,400 |
| Sault-au-Recollet. | Rivière-des-Prairies. | 45,000 |
| Beaubarnois. | St. Lawrence | 1,400,000 |
| Rapid VII. | Upper Ottawa. | 64,000 |
| Rapid II. | Upper Ottawa. | 32,000 |
| Bersimis No. 1. | Bersimis. | 300,000 |

The Commission operates a public utility system which supplies electric light and power requirements to Metropolitan Montreal and surrounding districts, embracing a population of nearly $2,000,000$. From the Cedars plant, electric energy is supplied to the Aluminum Company of America at Massena, N.Y., and through the Beauharnois Light, Heat and Power Company power is sold to The Hydro-Electric Power Commission of Ontario. Sales involved are in the neighbourhood of $100,000 \mathrm{~h} . \mathrm{p}$. to Massena, N.Y., and $250,000 \mathrm{~h} . \mathrm{p}$. to Ontario.

Power plant construction recently completed and under way is outlined at pp. 563-564.

> 18.-Distribution of Quebec Hydro Primary Power by Customer Group 1951-55
(Coincident with Montreal System peak)

| System | 1951 | 1952 | 1953 | 1954 | 1955 |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | h.p. | h.p. | h.p. | h.p. | h.p. |
| Montreal System....... | 803,000 | 873,000 | 997,000 | 1,117,000 | 1,230,000 |
| Beauharnois Local System......... ${ }_{\text {E }}$ | 171,000 | 189,000 | 213,000 | 154,000 | 106,000 |
|  | 250,000 | 250,000 | 250,000 | 250,000 | 250,000 |
| Massena System.... | 80,000 | 135,000 | 142,000 | 126,000 | 99,000 |
| Shawinigan System | 8,000 | 15,000 | 23,000 | 40,000 | 40,000 |
| Totals. | 1,312,000 | 1,462,000 | 1,625,000 | 1,687,000 | 1,725,000 |

In addition to these generating and distributing systems, the Quebec Hydro-Electric Commission owns the 64,000 -h.p. upper Ottawa River plant at Rapid VII, the $48,000-\mathrm{h}$.p. Rapid II plant and also the Dozois Reservoir. Average primary power capacities for this Northern Quebec System (Cadillac-Noranda district) are: 1951, 30,550 h.p.; 1952, 29,200 h.p.; $1953,54,000 \mathrm{~h} . \mathrm{p} . ; 1954,80,000 \mathrm{~h} . \mathrm{p} . ; 1955,96,000 \mathrm{~h} . \mathrm{p}$.

The Commission delivers some $30,000 \mathrm{~h} . \mathrm{p}$. on the south shore of the St . Lawrence River in the Gaspe area. That power is temporarily purchased from Manicouagan Power Company and transmitted across the River through a 69-kv. submarine cable, over a distance of 30 miles. The Commission also purchases about $13,000 \mathrm{~h} . \mathrm{p}$. from Saguenay Transmission Company for delivery to mining companies in the Chibougamau area.

Ontario.-The Hydro-Electric Power Commission of Ontario was created in 1906 by an enactment of the Ontario Legislature. In its creation, consideration was given to the recommendations of advisory commissions previously appointed in response to public demand that the water powers of Ontario should be conserved and developed for the benefit of all the people of the Province. The Commission operates under the authority of The Power Commission Act (7 Edw. VII, c. 19) passed in 1907 as an amplification of the Act of 1906 and subsequently modified by numerous amending Acts (R.S.0. 1950, c. 281).

The Commission may have from three to six members, all of whom are appointed by the Lieutenant-Governor in Council. One commissioner must be, and a second commissioner may be, a member of the Executive Council of the Province of Ontario.

The Commission is a corporate entity, a self-sustaining public concern endowed under The Power Commission Act with broad powers to produce, buy and deliver electric power throughout the Province and to exercise certain regulatory functions with respect to the large group of municipal electrical utilities which it serves. The enterprise administered by the Commission is generally referred to as Ontario Hydro.

Initially the undertaking proposed to purchase a block of $100,000 \mathrm{~h} . \mathrm{p}$. from the Ontario Power Company Limited at Niagara Falls and to distribute this to 13 municipalities which had signed the original contracts with the Commission to take power at cost. Construction of a transmission system to distribute power to the member municipalities was begun in 1909, and by the end of 1910 power was being supplied to several municipalities through what was known as the Niagara System. In northwestern Ontario the Thunder Bay System was inaugurated when the Commission built a short transmission line and a substation to serve Port Arthur with power purchased from the Kaministiquia Power Company.

The establishment of the original Niagara System was followed in 1911 by the formation of the Severn System and subsequently of other systems to serve groups of municipalities in various sections of the Province. In 1924 the Severn and two other systems were consolidated to form the Georgian Bay System and in 1929 and 1930 a consolidation of
four systems created the Eastern Ontario System. In 1944 the Southern Ontario System came into being through the consolidation of the Niagara, Georgian Bay, and Eastern Ontario Systems.

The Commission continued to operate the Thunder Bay System in the northern part of the Province and in addition it undertook during the 1930's to operate, in trust for the Provincial Government, a group of unconnected systems serving mainly mining and pulp and paper industries, and known as the Northern Ontario Properties. In 1945 its services in northern Ontario were further extended by the purchase of the power system of the Northern Ontario Power Company Limited. On Jan. 1, 1952, the Northern Ontario Properties and the Thunder Bay System were merged for financial and administrative purposes and the consolidation continues to be known as the Northern Ontario Properties.

For the financial and administrative purposes of the Commission, the Province is divided into two parts: that part lying south of a line drawn approximately west from Mattawa on the Upper Ottawa River to Georgian Bay is served by the Southern Ontario System; the part lying to the north is served by the Northern Ontario Properties. The total area is in turn subdivided into nine regions, seven in the south and two in the north, with regional offices located strategically in nine major municipalities. The Southern Ontario System is a fully integrated co-operative power system. Primarily it serves a group of 324 municipalities receiving power at cost under contracts established according to the provisions of The Power Commission Act. In the Northern Ontario Properties, each of the two regions, which at present correspond with the Northeastern and Northwestern Divisions, is an integrated power system as the result of the gradual consolidation of several formerly isolated systems. There is no interconnection between the Northeastern and Northwestern Divisions but there are facilities for the interchange of power between the Northeastern Division and the Southern Ontario System. The Northern Ontario Properties is not a co-operative system although it does serve a group of eight municipalities in its Northwestern Region on a cost-contract basis. Apart from the supply of power to these cost-contract customers, the Northern Ontario Properties are held and operated in trust for the Province of Ontario. The basic principle governing the financial operations of the undertaking is that electrical service is provided by the Commission to the municipal electrical utilities, and by them to their customers at cost.

The Commission's total cost of operation includes the power it purchases, all charges for operation and maintenance of the power systems, interest, and reserve provisions for depreciation, contingencies and stabilization of rates. A sinking-fund reserve is also included for the retirement of the Commission's capital debt. The enterprise from its inception has been self-supporting, except for the Provincial Government assistance of 50 p.c. of the capital cost of rural distribution facilities, undertaken in pursuance of the Province's long established policy of assisting agriculture. The Province also guarantees the payment of principal and interest of all bonds issued by the Commission and held by the public.

The undertaking as a whole involves two distinct phases of operation: (1) Provision of power supply-either by generation or purchase-and its transformation, transmission and delivery in wholesale quantities to municipal electrical utilities, certain large industrial customers and rursl operating areas. This phase of operation is performed by The HydroElectric Power Commission of Ontario. (2) The retail distribution of electric energy. In most Gities and towns, and in many villages and certain township areas, retail distribution of electric energy is conducted by municipal commissions under the general supervision of The Hydro-Electric Power Commission of Ontario as provided for in The Power Commission Act and The Public Utilities Act. These local commissions own and operate their own distribution facilities. In a small group of municipalities Ontario Hydro owns the distribution facilities and conducts retail distribution through what are called local systems. Throughout most of rural Ontario the Commission, on behalf of the respective townships, operates the distribution facilities and attends to all physical and financial operations connected with the retail distribution of energy to customers in the rural operating areas. Since 1944 the rate structure applying to rural customers designated as farm, hamiet, commercial, and summer service has been uniform throughout the Province.

The growth of Ontario Hydro's physical and financial resources reflects the remarkable industrial and social development of the Province. In 1914 the Commission purchased its first generating station, Big Chute on the Severn River. Later in the same year the first Commission-built generating station was placed in service at Wasdell Falls, also on the Severn River. This early program of purchase and construction of generating stations reached a climax in the great Queenston-Chippawa development, later renamed Sir Adam Beck-Niagara Generating Station No. 1 in honour of the first Chairman of the Commission. This station first delivered power in 1922 but four years later the Commission found it necessary to negotiate for the extensive purchase of power from large Quebec suppliers in order to satisfy Ontario's steadily growing power demands-demands that have continued to increase over the years.

In 1956 the primary and secondary load carried reached a total of $4,909,104 \mathrm{kw}$. and a total of $29,523,5+6,866 \mathrm{kwh}$. was supplied during that year from all the Commission's resources generated and purchased.

Primary power requirements in the Commission's systems have increased over the past 34 years at a rate of 6.6 p.c. per annum. Since 1950 the rate has been 8.3 p.c. per annum and the Commission has been able to keep abreast of requirements only through a most vigorous program of capital construction. Table 20 shows the power development program and indicates the magnitude of construction work completed to date and in progress at four new developments and at five stations already in service. The two major projects under construction are the St. Lawrence Power Project and Sir Adam BeckNiagara Generating Station No. 2 on the Niagara River.

The 1955 Year Book, at pp. 549-553, contains a descriptive article on the St. Lawrence Power Project. It is a separate undertaking from the St. Lawrence Seaway but the planning, construction and operation of both must be carefully co-ordinated. Construction of the Seaway is the responsibility of authorities created by Canada and the United States. The Power Project is being built jointly by The Hydro-Electric Power Commission of Ontario and The Power Authority of the State of New York and is subject to the approval of a Joint Board of Engineers appointed by the Governments of Canada and the United States. The Commission and The Power Authority will share equally in the cost of constructing the Project, exclusive of the cost of powerhouse machinery and equipment which will be borne by the respective entities. The generating station on the Canadian side will be known as the Robert H. Saunders-St. Lawrence Generating Station.

The new station will have an installed capacity of $820,000 \mathrm{kw}$. in 16 units and will be of the modified outdoor type. It will form part of a common powerhouse structure extending 3,300 feet from the eastern end of Barnhart Island to the Canadian mainland. Other structures associated with the Project include the Long Sault dam at the upper end of Barnhart Island, the Iroquois dam about 25 miles farther up stream, and dykes as required to contain the headpond. The Project also involves the relocation of transportation and communication facilities, the re-establishment of whole communities beyond the area to be flooded by the headpond, and the improvement of channels in the St. Lawrence River.

First concrete for the powerhouse structure was placed in February 1956, just 18 months after the commencement of construction. By the middle of the summer, pours in excess of $2,000 \mathrm{cu}$. yards daily were being made and by the end of the year more than 40 p.c. of all concrete work for the Canadian powerhouse was finished. Concrete placing was begun on embedded parts for the first three turbines.

Almost all the residential work in two new townsites was complete and other work on providing essential services was proceeding in these townsites and in other communities where house-moving was under way. One section of relocated highway was open to traffic and track-laying for the relocated Canadian National Railway line was almost finished.

During 1957, the first of four additional units scheduled for installation in the main powerhouse at Sir Adam Beck-Niagara Generating Station No. 2 was placed in service, All four units will be in service in 1958. The six-unit pumping-generating scheme associated with this development was also initially placed in service in the summer of 1957 and all units were in service by the end of the year.

The 1,550 -foot control dam being built by the Commission as part of the Niagara River remedial works was scheduled for service in 1957. This marks the completion of the remedial works required under the Niagara Diversion Treaty of 1950 and undertaken on the United States side of the river by the Corps of Engineers, United States Army, and on the Canadian side by The Hydro-Electric Power Commission of Ontario. The cost is shared equally by Canada and the United States.

Other construction under way is outlined at pp. $564-565$.
During 1956 the Commission's fixed assets showed an increase of $\$ 160,238,456$ and at the end of the year amounted to $\$ 1,732,994,596$. The accumulated depreciation provided on these assets was $\$ 190,314,840$. Total assets after deducting this accumulated depreciation amounted to $\$ 2,010,680,078$.

In 1956 a total of 350 municipal utilities purchased power from the Commission under cost or fixed-rate contracts for resale to their customers. These utilities had fixed assets amounting to $\$ 298,832,20 \overline{\text { a }}$, against which they had provided $\$ 66,539,420$ in accumulated depreciation. Municipal utility assets after deducting this accumulated depreciation amounted to $\$ 466,075,117$, of which $\$ 183,262,708$ represented the equity acquired in the Commission's systems by those utilities operating under cost contracts.

## 19.-Resources of The Hydro-Electric Power Commission of Ontario Generated and Purchased (All Systems), December 1955 and 1956

[^194]Manitoba.-The Manitoba Power Commission was established in 1919 for the purpose of distributing electric energy throughout the Province, with the exception of the Metropolitan Winnipeg area. An agreement, signed in 1955 by the Manitoba HydroElectric Board, the City of Winnipeg, the Winnipeg Electric Company and The Manitoba Power Commission, provided for the acquisition by the Commission of the distribution properties of the Winnipeg Electric Company and of the City of Winnipeg Hydro Electric System in the suburban areas adjacent to the city. The transfer of these properties became effective Apr. 1, 1955. The utility currently operates under The Manitoba Power Commission Act (R.S.M. 1954, c. 203), as amended.

The Commission's supply of electric energy for distribution is purchased from The Manitoba Hydro-Electric Board at various points in or near Winnipeg. The Commission has gradually acquired virtually all the municipally owned and local privately owned distributing plants within the Province and now supplies service from a widespread network of transmission lines. The Commission's program of rural electrification which was started in the late 1930's and was designed to bring hydro-electric power at uniform service rates to all rural centres with a population of 20 or over, is now completed and currently serves 521 centres. The farm electrification program, recommended by the Manitoba Electrification Enquiry Commission in 1942 and begun in 1945, was successfully completed as an area coverage project in 1953. The Commission now serves over 43,000 farms.

Now that Manitoba is Western Canada's most completely electrified province, the Commission is placing special emphasis on long-range programs designed to keep progress with the future electrical needs of the Province.

Saskatchewan.-The Saskatchewan Power Corporation, established Feb. 1, 1949, operates under the provisions of the Power Corporation Act, 1950 (S.S. 1950, c. 10), as amended. It succeeded the Saskatchewan Power Commission which operated from Feb. 11, 1929 to Jan. 31, 1949. The main functions of the Corporation are the generation, transmission, distribution, sale and supply of hydro and steam electric energy. Since 1952 the Corporation has been authorized to produce or purchase, and to transmit, distribute, sell and supply power from natural or manufactured gas.

Particulars of the operations of the Saskatchewan Power Commission during the period 1929 to 1948 and of the operations of the Saskatchewan Power Corporation during 1949 to 1955 are given in earlier editions of the Year Book.

The Corporation is experiencing extensive growth. In 1956 it served 796 urban communities (with six or more customers) in retail sales and the urban communities of Saskatoon, Swift Current and Battleford in bulk sales. Activities of the Corporation are extended to the entire Province with the exception of such cities as Regina and Weyburn, which own and operate municipal plants and distribution systems, and Moose Jaw where the local plant and distribution system is owned and operated by National Light and Power Company Limited. A number of small communities, the largest being the town of Kamsack, are not yet served by the Saskatchewan Power Corporation. Some of these utilities, mostly privately owned, were taken over by the Corporation in 1956.

At the end of 1956 the Corporation served 162,594 customers, of whom 27,608 were located in communities which were supplied with power in bulk sales and 134,986 were Corporation retail customers. The latter comprised 96,763 customers in communities considered as urban and 38,223 customers classified as rural, predominantly farmers. During 1956 all these customers absorbed $659,720,877 \mathrm{kwh}$. of which $622,676,923 \mathrm{kwh}$. were generated in Corporation plants and $37,043,954 \mathrm{kwh}$. were purchased in bulk from Regina and from National Light and Power Company utilities. At the end of the year the investment of the Provincial Government in Corporation assets (electric and natural gas) amounted to $\$ 107,485,378$.

During 1956 the Saskatchewan Power Corporation owned and operated three steam generating plants (at Estevan, Prince Albert and Saskatoon) and eight diesel plants with capacity of over 500 kw . each (at Hudson Bay, Maple Creek, Meadow Lake, Shaunavon,

91593-38

Swift Current, Unity, Kindersley and Yorkton). The total plant capability at the end of 1956 was assessed at $202,950 \mathrm{kw}$., of which $170,000 \mathrm{kw}$. was located in steam plants and $32,610 \mathrm{kw}$. in diesel plants.

At the end of 1956 the Corporation owned and operated 41,444 miles of transmission and rural lines. Of this total 9,150 miles of line were added to the system in 1956 comprising 117 miles of 138,000 -volt line, 180 miles of 72,000 -volt line, 387 miles of 25,000 -volt line, and 8,466 miles of 14,400 -volt line in connection with rural electrification. Large substations were built in 1956 with a total capacity of 44,200 kva.

## 23.-Growth of the Saskatchewan Power Corporation 1947-56

Note.-Figures for 1929-33 are given at p. 499 of the 1947 Year Book and for 1934-46 at p. 578 of the 1950 edition.

Alberta.-Public ownership of power generating and distributing systems in Alberta is confined to certain urban municipalities. The regulatory authority over privately owned systems is the Board of Public Utility Commissioners which has jurisdiction over the distribution and sale of electricity. The Board has power to hold investigation upon complaint made either by a municipality or by a utility company and, following such investigation, may fix just and reasonable rates.

There are three private utility services in the Province: Calgary Power Limited, Canadian Utilities Limited, and Northland Utilities Limited. A synopsis of these services is given below.

Calgary Power Limited.-This Company has eleven hydro generating plants on the Bow River and its tributaries, west of Calgary, namely: Horseshoe Falls, Kananaskis Falls, Ghost River, Cascade, Barrier, Spray, Rundle, Three Sisters, Bearspaw, Pocaterra, and Interlakes. The Company also operates a steam plant of $88,000 \mathrm{~h} . \mathrm{p}$. at Wabamun, west of Edmonton. At Dec. 31, 1956, the Company's total plant capacity was $374,450 \mathrm{~h} . \mathrm{p}$. All the hydro plants except Bearspaw are operated by remote control from the Kananaskis Falls plant.

The Company has five reservoirs on the Bow River and its tributaries:
Lake Minnewanka.
180,000 acre-feet
Interlakes (Upper Kananaskis Lake)
100,000 acre-feet
Pocaterra (Lower Kananaskis Lake)
50,000 acre-feet
Spray Lakes.
200,000 acre-feet
Ghost.
74,000 acre-feet

An agreement with the City of Medicine Hat provides an additional 33,500 h.p. to the Company from the city's steam plant. Power from these plants is fed into a transmission network which supplies the entire electricity requirements of the cities of Calgary, Red Deer and Wetaskiwin, about 408 towns, villages and hamlets, and a substantial
industrial load in central and southern Alberta. This transmission network is also connected with the municipal utilities of the cities of Edmonton and Lethbridge, Canadian Utilities Limited at Drumheller, Vegreville and Vermilion, and the East Kootenay Power Company in the Crowsnest Pass.

During 1957 an addition to the hydro system is scheduled for completion; this is an extension to the Cascade plant of $23,000 \mathrm{~h} . \mathrm{p}$. The Company has about 4,300 miles of main transmission lines and 2,126 miles of distribution lines extending from Plamondon in the north, Milk River and Waterton in the south, and from Chauvin, Macklin (Sask.), Brooks and Bow Island in the east, to Nordegg, Banff and Crowsnest Pass in the west. The cities of Calgary and Red Deer, and the towns of Ponoka, Fort Macleod and Cardston are supplied on a wholesale basis, but all other points on the same system are supplied on a retail basis. At Dec. 31, 1956, electric pumping service was being supplied to over 2,500 oil wells, as well as service directly to other sectors of the oil industry, such as gathering stations, refineries and pipeline pumping. Service was also provided to several industrial plants near Edmonton.

An extensive farm electrification program is in progress in Alberta and at Dec. 31, 1956, the Company was serving 27,096 farms. Calgary Power constructs, operates and provides for the engineering of these co-operatives through a non-profit subsidiary (Farm Electric Services Limited), energy being supplied to the farm co-operative consumers at cost.

Canadian Utilities Limited.-Towns and villages to the north, east and west of Drumheller, and to the north and east of Vegreville are supplied by three inter-connected plants at Battle River, Vermilion and Drumheller. The Battle River plant has a $32,000-\mathrm{kw}$. coal-fired steam unit; the Vermilion plant has an $8,500-\mathrm{kw}$. gas turbine and $9,000 \mathrm{kw}$. in gas-fired steam equipment; and the Drumheller plant has $19,000 \mathrm{kw}$. in coal-fired steam equipment. Towns and villages north, east and west of Grande Prairie are served by two internal combustion plants. One, situated in Fairview, has $1,200 \mathrm{kw}$. in a natural gas unit-the other in Grande Prairie has $5,700 \mathrm{kw}$. in diesel and gas-diesel installations. Towns and villages south of Lesser Slave Lake are supplied by diesel installations totalling 390 kw . at Kinuso and Slave Lake. In addition, a $10,000-\mathrm{kw}$. gas turbine plant near Sturgeon Lake is to be completed in 1957, which will supply both Grande Prairie and Slave Lake areas. The Company's plant in Fort St. John, B.C., was sold in 1956.

There are tie lines with Calgary Power Limited at Vermilion, Vegreville and Drumheller; and with Northland Utilities Limited at Fairview and Valleyview. The Company serves over 36,200 customers in approximately 330 towns, villages and hamlets (including 111 rural electrification associations) through a network of approximately 3,118 miles of transmission and distribution lines, in addition to 7,427 miles of Rural Association lines. Since 1949, rural electrification in the territory served has been extended to farmers on a co-operative basis whereby the farm or rural electrification association system is constructed and operated at cost for the farmer by the Company. Over 8,000 farmers are receiving electric power service. In 1957, the Company purchased control of the McMurray Light and Power Company, Limited, operating a $300-\mathrm{kw}$. diesel installation serving the town of McMurray.

Northland Utilities Limited.-This Company, with headquarters at Edmonton, supplies electric service to 6,500 customers located in 36 communities. Diesel generating plants are located in Jasper, Athabasca, High Prairie, Fort Vermilion, McLennan, Peace River, Fairview, Lac La Biche and in Hay River, N.W.T.

A hydro generating plant supplies additional power at Jasper and through 250 miles of 24,000 -volt transmission line serves 27 other communities. In addition, approximately 1,200 miles of farm line owned by rural co-operatives serve 1,000 farm customers. A Northland Utilities subsidiary, Uranium City Power Company Limited, generates and distributes electricity to 450 customers in Uranium City, Sask.

Natural gas is supplied to 3,000 customers in 12 communities in Northern AlbertaFairview, Bluesky, Whitelaw, Brownvale, Berwyn, Grimshaw, Grande Prairie, Spirit River, Sexsmith, Rycroft, Woking and Clairmont.

91593-38 $\frac{1}{2}$

A subsidiary, Northland Utilities B.C. Limited, supplies gas to 2,200 customers in Dawson Creek and Pouce Coupe, B.C.

British Columbia.-The British Columbia Power Commission was appointed Apr. 17, 1945, under the provisions of the Provincial Electric Power Act. Operations were commenced in August of the same year with the acquisition of electrical properties in several parts of the Province. The following statement shows the growth in the number of customers from 1948 to 1957:-

Continued expansion in generating capability, transmission and distribution plant, power requirements, installed services and revenues marked the year ended Mar. 31, 1957. A 23.2 -p.c. rise in revenues compared favourably with a 16.8 -p.c. increase in expenditures. The resulting operating surplus was $\$ 1,531,937$ (before provision for hydro deficiency) an increase of 96.9 p.c. over the 1955-56 operating surplus. Details of construction under way are given on pp. 566-567.

The Northwest Territories and Yukon Territory.-The Northern Canada Power Commission was created by Act of Parliament in 1948 to bring electric power to points in the Northwest Territories where a need developed and where power could be provided on a self-sustaining basis. By legislation passed in 1950 the Act was extended to include Yukon Territory. The name of the Commission, formerly Northwest Territories Power Commission, was changed in 1956.

The Northern Canada Power Commission has authority to construct and operate power plants as required in a territory having an area of over $1,500,000 \mathrm{sq}$. miles. The Commission is continually investigating power needs in this large area and studying reports on hydro-electric power sites.

The Commission has a hydro-electric power development in operation on the Snare River about 94 miles northwest of Yellowknife, N.W.T., from which power has been supplied to the mines in the Yellowknife area since the autumn of 1948. In the summer of 1949 a transmission line connection was completed to augment the supply of power to the town of Yellowknife.

A diesel generating station and distribution system was put into operation at Fort Smith, N.W.T., in October 1950, and at Fort Simpson in October 1956. These projects supply the various Government establishments such as the Departments of Northern Affairs and National Resources, Transport, National Defence (RCCS), Health and Welfare, and Public Works as well as the Royal Canadian Mounted Police and private commercial consumers and residents of the settlements.

A hydro-electric development on the Mayo River approximately six miles north of Mayo Landing, Y.T., completed in December 1952, delivers power to the mining developments in that area and to the settlement of Mayo Landing. Current construction is outlined at p. 568.

## Section 3.-Total Development of Electric Power from All Sources

In Section 1 of this Chapter, water power resources are given with the proportion that so far has been developed. Table 3 of that Section analyzes the hydraulic turbine installation by the proportions in central electric stations, in pulp and paper mills and in other industries. This is useful but does not take into account electric power developed in central electric stations or in other industries from sources other than hydraulic.

Section 2 covers the central electric station industry including stations under public ownership (provincial and municipal governments) and those under private ownership. Neither of these Sections, however, gives a complete presentation of the total electric power developed in Canada. All the hydraulic energy developed is not converted to electric power: there are a number of water wheels and water turbines used for direct drive that are not geared to electric generators. On the other hand certain central electric stations in the Atlantic Provinces, Ontario and the Prairie Provinces generate electricity from steam or internal combustion engines. It is the purpose of this Section to show the total electric power generated from all available sources. Most of the power comes, of course, from central electric stations, the figures having been given in Table 4 of Section 2, p. 568. The total kilowatt hours of electric power generated by central electric stations, is divided into that generated from water power and that generated from thermal engines of all kinds.

Table 25 shows that total electric power generated by central electric stations in 1955 was $72,910,592,000 \mathrm{kwh}$. For a complete presentation, the power generated by manufacturing industries for their own use and the power generated by the primary mining industry for use in its own operations must be added. There are a few other sources of electric energy included such as electric railways which produced $8,463,000 \mathrm{kwh}$. in 1955. This production has been taken into the annual total shown in Table 25. There are
numerous small lighting and power plants on farms, rural homes, summer resorts, stores, etc., where electricity from central electric stations is not available and for which no data are available.

## 25.-Total Power Generated by Central Electric Stations, Manufacturing and Mining Industries 1946-55

Note.-Figures for the years 1927-43 will be found in the 1948-49 Year Book, p. 516 and for 1944 and 1945 in the 1956 edition, p. 582.

## Section 1.-Canadian Commercial Fisheries Resources

Canada has the enviable position of being the country closest to some of the world's most prolific fishing grounds and as a consequence is one of the world's principal fish producers and fish exporters. Rich harvests are drawn from the Atlantic and Pacific as well as from the country's many freshwater lakes and rivers.

Canada's commercial fisheries resources, including a detailed account of the Atlantic, the Pacific, the freshwater and the northern fisheries, are covered in the 1955 Year Book, pp. 578-590. The following special article deals in detail with groundfish, the most important species of Canadian fisheries.

## GROUNDFISH SPECIES IN THE CANADIAN FISHERIES*

Demersal or groundfish species are the most important group in the Canadian fisheries, accounting for almost one-half by volume and one-third by value of the catch of all species of fish and shellfish. This species is particularly important to the Atlantic fisheries where it makes up two-thirds or more by weight and one-half by value of the total catch. The proportion in British Columbia is around 5 p.c. of the volume and 12 to 18 p.c. of the value.
-Prepared by T. H. Turner, Director of Information, Department of Fisheries, Ottawa.
Volume and Value of Groundrish Landinge, and Proportion or Total Catch, 1956

[^196]In the Atlantic fishery cod is first in landed value followed by haddock, and on the Pacific Coast halibut is by far the most important of the groundfish. Halibut and other flatfish species, although true groundfish, are not always classed as such in commercial usage. For instance, a United States tariff classification of groundfish fillets includes only cod, haddock, hake, pollock, cusk and rosefish (the latter is usually called redfish and marketed as ocean perch). In addition to these, Atlantic groundfish species include wolffish (ocean catfish), turbot (Greenland halibut), skate•and dogfish. The sub-group of small flatfishes includes American plaice, witch or grey sole, winter flounder and yellowtail flounder in Atlantic waters, and Pacific species such as lemon sole, rock sole, butter sole, brill and Dover sole. Other Pacific groundfish are grey cod, lingcod, blackcod or sablefish, various rockfishes (including those designated red snapper and ocean perch) and dogfish.

## Stocks and Their Utilization

The annual catch by Canada and other nations is estimated to take about 15 p.c. of the combined total stocks of groundfish on the Atlantic Continental Shelf and 6 or 7 p.c. of Pacific groundfish stocks off Canadian shores. Some individual species such as haddock, the Pacific rockfishes, blackcod and grey cod are being exploited quite heavily but the annual catch of others, such as dogfish, represents a negligible proportion of the existing stock. The degree of exploitation or utilization is, of course, closely related to the demand for the species as expressed by the price the fisherman is able to obtain for his catch to the cost of landing that catch. The cost of production at any given level of exploitation is governed by many factors-the prospective and realized returns to capital investment necessary to secure and maintain in the fishery the requisite boats, gear and working capital; the returns to labour necessary to retain the requisite number of fishermen in the industry; and the location, size and density of the fish stocks that are being exploited.

An unexploited stock tends to become so dense that growth is slow and natural mortality is high. Thus, more intensive fishing may have the somewhat paradoxical effect of reducing the size of the stock yet raising the level of sustained yield, as removal of the larger and older fish increases the rate of growth or the rate of reproduction of the stock, or both. Furthermore, if a stock is being overfished, less intensive fishing may raise both the size of the stock and the level of sustained yield. On these grounds, an increased annual catch is considered possible, with appropriate fisheries management and conservation policies, for Pacific halibut, lingcod and small flatfish, and for most of the Atlantic groundfish species except haddock.

The Atlantic species are dominant in the groundfish group, constituting 85 to 90 p.c. of the combined groundfish stocks and supplying an even greater proportion of the volume of Canada's annual groundfish catch. However, because of the large amount of relatively high-priced halibut in the Pacific catch, the Atlantic species constitute a smaller proportion of the value of groundfish landings-about 80 p.c. At present rates of utilization, the Atlantic groundfish stocks as a group show a higher potential for increased yield.

The richest fishing grounds lie within the 250 -fathom depth contour on the Continental Shelf. Shallow-water "banks" are found many miles from shore on the Atlantic side but, because of the mountainous, steeply sloping character of the British Columbia coastline, the shallow-water area there is much narrower, although exceptionally well sheltered. The concentration of various species of fish in these coastal waters near to shore is the basis for a fishing industry in which costs are low enough to serve mass food markets with many groundfish products, such as frozen fillets for the North American trade and dried salted cod for the Caribbean and southern European countries.

Atlantic groundfish are caught inshore all along the coast and offshore in the Gulf of St. Lawrence, on the Grand Bank of Newfoundland and on various banks east of Labrador and Newfoundland and east and southeast of Nova Scotia and the State of Maine. They are caught by small and large craft, using principally line gear with baited hooks (hand-lines and long-lines) and drag-nets (otter-trawl and Danish seine) according to the suitability of the method: line gear is unsuitable for species with small mouths and
drag-nets cannot be used over very rough-bottomed fishing grounds. Trap-nets are used in some locations such as the east coast of Newfoundland, where heavy inshore runs of certain species (chiefly cod) occur.

## Atlantic Species

The Atlantic cod (Gadus callarius) is found on both sides of the north Atlantic Ocean, but so dense have been the stocks of the western Atlantic that several European countries have fished them ever since the Cabots discovered Newfoundland in 1497. Cod has long been the basis of the salted fish industry and later of fresh and frozen fillet production in New England, Quebec, Newfoundland and Nova Scotia, and on a smaller scale in New Brunswick and Prince Edward Island. Cod is found in North American waters from Greenland in the Arctic almost to Cape Hatteras in southern United States and it constitutes nearly two-thirds of the known groundfish resources in those waters. In recent years, almost one-half of the total volume of Canadian Atlantic fish and shellfish landings has been cod; of the total landed value, cod contributed just under 30 p.c. Its importance to the Newfoundland fishing industry is particularly great-about two-thirds of the total value of Newfoundland fishermen's landings. The annual catch by all nations is estimated to take only about 16 p.c. of present cod stocks in North American waters. There is every likelihood of expansion in the annual harvest to meet the needs of growing populations.

Haddock, taken mostly with drag-nets from the Grand Bank to Cape Cod, is at present next to cod in commercial importance. The use of mechanical filleting equipment in recent years has enabled processors to utilize younger and smaller haddock-much of it processed into frozen blocks for later conversion into breaded fish sticks. The catch has been increased in consequence to an estimated 42 p.c. of current stocks. This is expected to cause a substantial reduction in the stocks and, eventually, in the annual catch.

Redfish rank third in importance among the Atlantic groundfish species. They are taken exclusively with drag-nets in deep cold water from New Jersey to Labrador, chiefly in the Gulf of Maine off the coast of Nova Scotia, and west and south of Newfoundland. The development of the redfish fishery is comparatively recent, coincident with the growth of the market for frozen ocean perch fillets, particularly in the American mid-west. The species is slow growing and, although some of the more remote northern grounds remain unexploited and although new stocks may be found, the total stocks are expected to diminish. Some increase in annual yield, however, is probable as the older fish are removed and the food supply is improved for those remaining.

Landings of Atlantic halibut in recent years have ranked close to those of redfish in value although stocks and annual catch are less than one-tenth of those of the Pacific Coast. The catch is taken in deep water throughout the Atlantic area, mainly by longliners but to some extent incidentally by draggers. Although present utilization is only about 10 p.c. of the stocks, little change in the intensity of fishing is expected.

The small flatfishes-plaice, witch, winter flounder and yellowtail flounder-are marketed usually as sole fillets. American plaice are found from Long Island, New York, to the Arctic; the others are more localized. All are caught with otter-trawl and Danish seine but plaice may also be taken with line gear. The total catch of small flatfishes could be increased even if some reduction in the total stock resulted.

Pollock, hake and cusk are sometimes statistically included with cod and haddock as related species. All are found in the more southerly parts of the Canadian Atlantic Coast area. Pollock are taken with line gear and marketed chiefly in the dried salted form; cusk and the hake are seldom concentrated and so are usually caught incidentally with other groundfish species. Cusk is a food-fish of excellent quality but hake soften quickly, even when iced, which makes their processing difficult and, in consequence, large quantities are discarded at sea. Silver hake or whiting is a southern species and may move out of Canadian waters if the ocean temperature grows colder, but white hake and squirrel hake
are found throughout much the same region as pollock. The development of a stronger market for groundfish products could be expected to lead to increased utilization of these species.

The common or striped wolffish occurs mainly in the southern part of the Atlantic Coast area and the spotted wolffish farther north. Wolffish are, like cusk, excellent foodfish, being marketed chiefly as ocean catfish fillets, but the density of stocks is low and they are usually caught incidentally in line fishing or dragging for other species. Like halibut, the wolffish would be taken more intensively only if there were a substantial increase in their price relative to cod prices.

Turbot, or Greenland halibut, is a flatfish species caught with line gear principally along the northeast coast of Newfoundland. At present it is salted and dried, but expansion of the fishery could follow development of facilities to market it in fresh or frozen forms.

There are substantial stocks of skate and dogfish in Atlantic waters but little use is being made of either, although both species could be utilized for food or for reduction into fish meal and oil. Some skate is caught incidentally but there is no demand for dogfish as a food, and evidently a fishery for reduction purposes would not pay in the present state of technology and demand for the products.

## Pacific Species

Pacific halibut are found on the Continental Shelf from the Aleutian Islands to Juan de Fuca Strait, mostly in depths of 30 to 250 fathoms. Line gear is used mainly but some are taken by trolling. The bulk of the catch is marketed in frozen dressed form. The total catch of about $60,000,000 \mathrm{lb}$. annually, of which the Canadian portion is somewhat less than 40 p.c., is estimated to be about 9 p.c. of stocks. On the basis of the recovery of the stocks over the past twenty years, a moderate increase in exploitation is considered feasible. The fishery is under the control of an international commission under the Northern Pacific Halibut Convention of 1953 between Canada and the United States, the first agreement for joint regulation of the halibut fishery having been signed in 1924. An annual catch quota has been maintained and competition among fishermen for a higher share of the quota has resulted in a pronounced increase in the size and efficiency of the halibut fleet.

The grey cod is the true cod of the Pacific and is related to the cod of the north Atlantic. The species is abundant in Hecate Strait and off the west coast of Vancouver Island. Otter-trawlers account for the greater part of the catch but small quantities are taken incidentally by line fishermen. The catch is landed dressed and then filleted for freezing, but some is sold in the fresh market or smoked. Canadian annual landings of grey cod are $4,000,000$ to $5,000,000 \mathrm{lb}$.-less than one-half of the total catch.

The blackcod or sablefish is not a true cod but a member of the skilfish family. Most of it is taken in the off-season for halibut, with line gear in deep water at 70 to 250 fathoms off the Queen Charlotte Islands and the coast of Alaska. The major part of the catch is smoked. The Canadian catch of about $1,500,000 \mathrm{lb}$. is one-quarter of the total.

The lingcod is one of the larger commercial fish of the Pacific Coast, found from California to Alaska in both shallow and deep water. The greater part of the British Columbia catch is taken with line gear but some is taken by jigging and with otter-trawls. Lingcod are marketed either fresh or frozen, whole or filleted. The liver oil has a high vitamin A content. The volume of catch as well as the price received by the fisherman has varied widely from year to year.

There are 23 or 24 species of rockfish on the British Columbia coast, of which about ten have been fished quite heavily during the past decade for the fresh and frozen fillet trade and for fish stick production. They are taken over a wide range of depths up to 300 fathoms with hand-line, long-line, and trawls. The annual catch is about $9,000,000$ lb .-but only 10 p.c. of it by Canadian vessels. Rockfishes are slow growing and it is unlikely that the present catch rate, based upon accumulated stocks of older, larger fish, can be long maintained.

About sixteen species of flatfish, in addition to halibut, are found in British Columbia waters. Although they belong to the flounder and dab families, they are popularly known as 'soles'. The largest is the brill and other important species are the lemon sole and rock sole or 'rough-back'. These species are caught extensively off the west coast of Vancouver Island, in Queen Charlotte Sound, in Hecate Strait and in Georgia Strait and are marketed as fresh or as frozen sole fillets. The stocks could support an increase in catch but, as with the other Pacific groundfish except halibut, an increase would make little difference in the total Canadian groundfish catch.

Dogfish belong to the shark family and in their predatory activities cause great damage to fishing gear and netted fish. The Pacific dogfish industry reached a peak in 1944 when there were nearly $8,000,000 \mathrm{lb}$. of dogfish livers landed worth $\$ 2,700,000$ plus an additional amount for meal and fertilizer. In the past decade, however, competition from Japanese liver products and the development of synthetic vitamin A have caused a decline in the industry. The consequent increase in dogfish stocks has brought requests for a subsidy to assist a fishery for meal and oil as a means of reducing the damage done by dogfish to other fisheries.

During the past five years thère has been a rapid growth of a British Columbia trawl fishery specifically for scrapfish for fur farms, as the demand for mink feed outgrew the supply of horse meat and fillet scraps. This fishery concentrates on the turbot or arrowtooth sole and, when winter weather prevents fishing on the more exposed grounds, on the whiting or big-eye. Smaller quantities of hake and other species are also utilized.

## Section 2.-Governments and the Fisheries

The British North America Act gave the Federal Government full legislative jurisdiction for the coastal and the inland fisheries of Canada and under this Act laws are made for the protection, conservation and development of the fisheries throughout the country. However, the provinces have, by agreement, assumed administrative responsibilities in varying degree. Consequently, though all the regulations governing fishing are made by the Federal Government, the work of administering the fisheries (enforcing the different laws and regulations, inspecting fish products, issuing licences, etc.) is done without duplication of staff either by federal or by provincial officers, according to arrangement.

Specifically, all tidal or sea fisheries except those of the Province of Quebec are administered by the Federal Department of Fisheries, and the freshwater or non-tidal fisheries with some exceptions are administered by the provincial departments. Quebec takes responsibility for all its fisheries including those in salt waters. Ontario, Manitoba, Saskatchewan and Alberta look after their freshwater species. In British Columbia provincial government control extends to the freshwater forms and the Federal Government is responsible for marine and anadromous species. In Prince Edward Island, Nova Scotia, New Brunswick, Newfoundland and the Yukon and Northwest Territories, the Federal Government maintains complete control; administration of the fisheries of the National Park areas throughout Canada is the responsibility of the Canadian Wildlife Service, Department of Northern Affairs and National Resources. (See pp. 27-28.)

## Subsection 1.-The Federal Government*

The work of the Federal Government in the conservation, development and general regulation of the nation's coastal and freshwater fisheries is performed by three agencies under the Minister of Fisheries:-
(1) The Department of Fisheries proper with headquarters at Ottawa, Ont., and area offices under Chief Supervisors at Vancouver, B.C., Winnipeg, Man., Halifax, N.S., and St. John's, Nfld.
(2) The Fisheries Research Board of Canada with headquarters at Ottawa and eight stations across Canada.
(3) The Fisheries Prices Support Board with headquarters at Ottawa.

[^197]The Department of Fisheries.-The chief responsibilities of the Department of Fisheries throughout Canada are, in brief: to conserve and develop Canada's primary fishery resources; to encourage the development of the fishing industry in the national economy; to inspect fish products, establish standards of quality and promote the optimum utilization of the resource; and to develop a proper public understanding of the resource and the industry.

The larger part of the staff of the Department is stationed in the field and is composed mainly of protection and inspection officers. The protection officers, including those on the Department's 76 patrol and protection vessels, are concerned with the enforcement of the conservation regulations under the Fisheries Act and other Acts designed to ensure a continuing maximum yield of fish and are also responsible for the inspection of fish products and processing plants under the Fish Inspection Act and relevant section of the Meat and Canned Foods Act.

A conservation program is carried out by the Conservation and Development Service of the Department. Protection officers enforce regulations pertaining to restricted areas, close seasons, limitations in location and types of gear, and also inspect spawning streams and keep them clear of obstructions. Biologists investigate such problems as pollution and water supply, and engineers construct fishways to enable fish to bypass obstructions of all kinds. Hatcheries are maintained to restock waters where the fisheries are under federal administration.

For the past few years a bounty has been paid for the killing of the parasite-carrying harbour seals along the Newfoundland and Labrador coasts at a rate of $\$ 10$ for adults and $\$ 5$ for young seals. During 1955, 276 adults and 1,435 young seals were destroyed.

Inspection of fish and fish products to ensure a high standard of quality is carried out by the Inspection and Consumer Service, and fish inspection laboratories are maintained on the Atlantic and the Pacific Coasts. This Service also has a staff of home economists who operate test kitchens in Ottawa, Toronto, Vancouver, Montreal and Halifax and conduct demonstrations and lectures on methods of preparing and cooking fish and fish products.

Through the medium of printed material, films, radio, television and exhibitions, the Information and Educational Service of the Department informs the public on the various aspects of the industry and the work of the fisheries service, with the object of developing a better understanding of the resource and those engaged in its exploitation. This Service works closely with the Conservation and Development Service in matters concerning the conservation of fisheries and with the Inspection and Consumer Service toward encouraging increased consumption of Canadian fish products in the United States and other markets.

The Economics Service engages in two related fields of responsibility: (1) to provide the government and the commercial fishing industry with current information, including statistical data, under the general heading of trade intelligence, and (2) to carry out studies and investigations in the primary fisheries and in the processing and distribution of fish products. In the first field, the Service works in close co-operation with the Dominion Bureau of Statistics and the foreign trade branches of the Department of Trade and Commerce; in the second, there is similar collaboration with the Fisheries Research Board. In both, a necessary contribution is made to the formulation of policy for fisheries management, industrial development and market services.

In addition to these regular services the Department assists the commercial fishing industry in several special ways. To promote efficient primary fishing operations and improve the marketing of fishery products, assistance is provided for the construction of draggers and long-liners and for bait-freezing and storage facilities on the Atlantic Coast. For each new trawler built in Canada the owner is permitted a licence to operate a used trawler imported from either the United Kingdom or the United States and registered in Canada after payment of duty. An applicant wanting only one trawler may import a used one from the United Kingdom without having to lay down a new keel in Canada.

This policy applies to ships purchased from any country entitled to most-favoured-nation treatment in accordance with Canada's obligations as a signatory of the General Agreement on Tariffs and Trade.

The Fishermen's Indemnity Plan affords low-cost protection from losses of boats and lobster traps through storms and other causes. The Plan, in operation since 1953, meets a long-standing need on the part of small-scale individual fishermen. Vessels valued at from $\$ 250$ to $\$ 7,500$ may be insured with payment of a premium of 1 p.c. of the appraised value per annum. Up to Mar. 31, 1956, a total of 2,999 fishing vessels with an appraised value of $\$ 6,062,140$ had been insured under the Plan. In response to considerable demand for a similar type of protection against unusual losses of fishing gear and equipment other than vessels, a first step was taken by the introduction of regulations giving a measure of compensation to lobster fishermen suffering abnormal losses of lobster traps, provided that a small premium has been paid by the fisherman. The premium rate varies in accordance with conditions in the various fishing areas of the Atlantic Provinces and Quebec but is generally about 4 p.c. of the value of the traps. Indemnity is provided at about 50 p.c. of the value on losses in excess of the 20 to 25 p.c. normal annual disappearance.

The Department also provides financial assistance to educational institutions agreeing to carry out specialized educational work among fishermen.

The Fisheries Research Board.-The Fisheries Research Board of Canada was established in 1937 to succeed the Biological Board of Canada. The Board functions as the scientific arm of the Department of Fisheries and seeks to improve and expand Canadian fisheries through scientific research. It operates four biological research stations, two oceanographic groups, three technological research stations, an engineering service and a unit which devotes its activities to research on sea mammals and studies of fisheries in the Canadian Arctic. The Board consists of a full-time chairman and up to 18 members appointed by the Minister of Fisheries; the members include Canadian scientists in fields related to the Board's work and businessmen acquainted with fishing and the fish trade.

The biological work of the Board is designed primarily to provide a general scientific basis for the conservation and wise management of Canada's vast marine and freshwater fishery resources. Investigations include the life histories of the various species of commercial importance, their population dynamics, their diseases and enemies. Also investigated are positive cultural methods in areas where some control of the environment is possible, new fishing grounds are sought and experiments in improvement in fishing methods undertaken. The biological work on the Atlantic Coast is conducted by stations at St. Andrews, N.B., and St. John's, Nfld.; Arctic work is directed from Montreal, Que.; work on freshwater fish is directed from a station at Winnipeg, Man.; and Pacific Coast work is directed from a station at Nanaimo, B.C.

Oceanography includes the study of the biological, chemical and physical aspects of the marine and freshwater environments of fish and other aquatic organisms of importance. This information is necessary to understand the occurrence and distribution of the fish and is carried out by the Board's two oceanographic groups, one on each coast.

The technological studies are aimed at making the best use of Canada's fish catches. Investigations are conducted towards improving methods of preserving and processing and in the utilization of fish wastes. In recent years considerable work has been done on mechanization to further develop higher efficiency in the industry. The technological work on the Atlantic Coast is done at stations at Halifax, N.S., and Grand River, Que., and applied engineering work for Newfoundland is under the supervision of a unit at St. John's, Nfld. A station at Vancouver, B.C., undertakes Pacific Coast studies.

The Fisheries Prices Support Board.-Under the Fisheries Prices Support Act, passed in 1944, this Board was set up in July 1947 to recommend to the Government pricesupport measures when severe price declines occur. The Board functions under the
direction of the Minister of Fisheries and consists of a chairman, who is a senior officer of the Department of Fisheries, and five members chosen from private and co-operative firms in the industry, representative of the various fish-producing regions of Canada.

The Board has authority to buy quality fishery products under prescribed conditions and to dispose of them by sale or otherwise, or to pay to producers the difference between a price prescribed by the Board and the average price the product actually commands. The Board has no power to control prices nor has it any jurisdiction over operations in the fishing industry or the fish trade. Money necessary for dealings in fishery products is available to the Board from the Consolidated Revenue Fund to a maximum aggregate amount of $\$ 25,000,000$ but only on recommendation of the Federal Treasury Board and authorization of the Governor in Council.

The Board maintains a small staff for administrative activities. The work is closely integrated with that of the Department's Economics Service and, where possible, services required by the Board are carried out by Department personnel. The Board has carried out field surveys on market conditions and possibilities and on factors affecting the income of fishermen in the various producing areas. The financial position of fishermen is kept under continuous review and recommendations are made to the Government on the basis of the findings. Special investigations are made when serious problems arise in particular areas.

International Fisheries Conservation.-Conservation of the resources of the high seas can be effected only with regulations, and for this purpose international treaties have had to be made. Canada's obligations under such treaties with the United States and other countries are administered by the Department of Fisheries.

Canada and the United States have led the world in joint fisheries conservation development. Major examples of this joint effort are the International Pacific Halibut Convention, concerned with the preservation of the halibut stocks of the north Pacific and the Bering Sea, and the International Pacific Salmon Fisheries Convention, concerned with the conservation and development of the sockeye salmon of the Fraser River. Investigations carried out under the auspices of Commissions appointed under these conventions, subsequent regulation and limitation of catches, and the construction of salmon fishways appear to have been successful in arresting and reversing an earlier trend towards depletion of these fisheries. Another example of restoring a depleted marine resource by international agreement and action is that of the fur seals of the Pribilof Islands in the Bering Sea. Under a treaty signed in 1911, known as the (North Pacific) Sealing Convention, pelagic sealing was prohibited while the animals were migrating to and from the Pribilofs where most of them breed. This treaty had been signed by the United States, Canada, Russia and Japan, and was one of the earliest conventions on resources of the sea. In 1941 Japan abrogated the treaty and the following year Canada and the United States signed a Provisional Fur Seal Agreement under which Canada, in return for abstaining from pelagic sealing, received 20 p.c. of the annual catch, which was supervised by the United States. A conference to re-negotiate the original convention for the management of north Pacific fur seals was begun in Washington in November 1955, with representatives present from the four countries which had been signatory to the 1911 treaty. A new settlement was signed by the original four countries on Feb. 9, 1957.

In 1949 the Government of Canada became a signatory, along with nine other countries, to the International Northwest Atlantic Fisheries Convention which came into force in 1950. The Commission established under this Convention, with headquarters at Halifax, N.S., makes scientific investigations of the fishery resources of the northwest Atlantic. The Commission has no regulatory powers but can make recommendations to the respective governments regarding measures that may be necessary for maintaining the stocks of fish that support the international fisheries in the Convention area. Treaty signatories are: Canada, Denmark, Iceland, the United States, the United Kingdom, France, Italy, Norway, Portugal and Spain.

A step towards international action in regulating the high seas fisheries of the northern Pacific Ocean was achieved in December 1951 when Canada, the United States and Japan conferred at Tokyo. The resulting Convention was ratified by the three contracting governments and instruments of ratification were deposited at Tokyo in June 1953. The treaty is known as the International Convention for the High Seas Fisheries of the North Pacific Ocean and aims at providing the maximum sustained yield of the fishery resources of the northern Pacific non-territorial waters with each of the parties assuming obligations to encourage conservation measures. The Commission established under this Convention will study the northern Pacific fisheries, determine the application of the treaty principles and will promote and co-ordinate the scientific studies necessary for ascertaining conservation programs.

The seventh, and latest, international fisheries agreement to which Canada is a signatory is the Great Lakes Fisheries Convention, which provides for joint action by Canada and the United States in Great Lakes fishery research and in a program for the control of the predator lamprey in these waters. This Convention came into force in October 1955. (See also pp. 603-604.)

Canada is a member of the International Whaling Commission and is obligated to collect biological data on whales caught by Canadian vessels. Whaling operations are conducted off the coasts of Newfoundland and British Columbia.

## Subsection 2.-The Provincial Governments*

An outline of the work undertaken by each of the provincial governments in connection with administration of commercial and game fisheries is given in the following paragraphs.

Newfoundland.-The union of Newfoundland with Canada on Mar. 31, 1949, brought about a transfer of some responsibilities in fisheries administration. The Newfoundland Fisheries Board remained the agency of government in the supervision of salt codfish marketing but fish and plant inspection, operation of bait depots, etc., became the concern of the federal Department of Fisheries. The Board, formerly responsible to the Government of Newfoundland through the Commissioner for Natural Resources, has been made responsible to the federal Minister of Trade and Commerce.

The Provincial Government is concerned mainly with improvement and development in fishing and production methods and has conducted experiments in long-lining and deep water trawling, in the construction of multipurpose fishing craft and in the exploration of potential fishing grounds. Steps are being taken to secure more efficient use of fisheries salt. Loans have been made available to processors for the establishment or development of fishing fleets and processing plants and to fishermen for the construction and purchase of modern vessels capable of a greater variety of fishing operations and larger production.

In 1951 the Governments of Canada and of Newfoundland set up the Newfoundland Fisheries Development Committee consisting of representatives of fishermen, processors and exporters, and of both Governments. The objective of this Committee was to establish the role of each sector of the industry and each government, jointly or severally, in the organization and development of the fisheries. Action has been taken by both Governments along lines recommended by the Committee in its final report of April 1953. The Newfoundland Fisheries Development Authority was set up by the Government of Newfoundland to carry out the Province's share of the development program, while the federal Department of Fisheries continues to administer provincial fisheries legislation and to undertake development work in collaboration with the Authority.

The inland waters of Newfoundland, though they provide excellent sport fishing, are not commercially exploited to any significant degree. The lakes and ponds remain under the authority of the Natural Resources Branch of the provincial Department of Mines and Resources, but the rivers and streams-the resort of migratory fish such as salmon and

[^198]sea trout-are under federal jurisdiction. Matters of conservation and guardianship are therefore mainly or wholly the concern of the federal Department of Fisheries although, to the extent to which they affect the ponds and lakes, they are subject to provincial or joint action.

Prince Edward Island.-The sea and inland fisheries of Prince Edward Island are administered by the Federal Government, and the provincial Department of Fisheries supplements federal activity, which is mainly concerned with inspection and conservation, devoting special attention to the development of the fisheries industry.

The major part of the revenue of the commercial fishermen in the Province is from shellfish, particularly lobster. However, in recent years there has been increased activity in deepsea fishing. Sixty-foot draggers are used for deepsea operations and their catch is landed at filleting and reduction plants on the eastern shores of the Island. Inshore fishing is also carried out extensively, the catch from this type of operation being landed at various points around the coast.

Technical assistance to fishermen and the fisheries industry is provided by the Provincial Department and, through the Fishermen's Loan Board, financial assistance is given for the purchase of boats and engines. Loans of up to 50 p.c. of the cost of such equipment are available.

The streams of the Province, mostly spring-fed and fairly constant in flow, provide very favourable conditions for the reproduction of game fish, of which speckled trout is the most important. Investigations toward the problem of increasing the production of trout of a size attractive to anglers are being conducted by the Fisheries Research Board of Canada at sites provided by the Provincial Department. The necessary dams and the fish required for experimental purposes are provided by the Federal Government. Unfortunately many of the fertile and highly productive ponds of the Province have disappeared but the Provincial Department is actively concerned with damming and restoring them for the enjoyment of the public.

Nova Scotia.-The basic responsibility for the administration of tidal and inland fisheries in Nova Scotia is undertaken by the Federal Government. The Province, however, supplements the activities of this authority through its Department of Trade and Industry. In practice, a system of co-operative effort has been worked out between the two authorities with each free to carry out individual responsibilities and specific programs. Provincial activities fall into three sections: development, administration and research.

Development.-Development activities include engineering services, financial assistance to the fisheries industry generally, and educational services to the fishermen.

Engineering services are related to the design, construction and equipment of boats, vessels and fish processing plants. A marine engineer is employed for these services and for the extension of consultant services to all persons interested in the industry. Financial assistance is extended by way of loans for the construction and modernization of fish processing plants and to fishermen for the acquisition of boats and engines. Where the requirements of large new plants have exceeded the capacity of local authorities the Province has provided such utilities as water lines and rail sidings.

Educational services comprise instruction of fishermen in the care and maintenance of marine engines, in basic navigation and in the mending, design and construction of nets and other fishing gear. Short courses are conducted in the fishing ports by Departmentemployed instructors during the less active fishing seasons. This program is assisted by grants under the Canadian Vocational Training program of the federal Department of Labour.

Administration.-The Nova Scotia Fisheries Act serves to supplement federal jurisdiction and is administered jointly by the Department of Trade and Industry and the federal Department of Fisheries. The Act requires fish processing plants and fish buyers to obtain annual licences. These are issued by the Department of Trade and Industry
only on the recommendation of inspectors of the federal Department of Fisheries and the certification of the Department of National Health and Welfare as to compliance with standards of construction, operation and sanitation contained in federal regulations.

Information obtained from the licensing activities and other statistics supplied by the federal Department of Fisheries enables the provincial Department of Trade and Industry to handle inquiries about the fisheries industry.

Research.-Provincial fisheries research activities have been confined largely to the inland trout and salmon fisheries. The Department of Trade and Industry has carried out a fipe-year program of water control on the LaHave River in the interests of salmon preservation and development; has undertaken experiments in fertilization of lakes and in partial poisoning of lakes to reduce the numbers of coarso fish competing with trout for the available food supply; and has conducted some special studies of trout populations and salmon migrations. Research activities of this nature have been continued under the direction of the Nova Scotia Research Foundation.

New Brunswick.-Tidal or sea fisheries in New Brunswick are under the jurisdiction of the Federal Government while inland fisheries are administered jointly by the Federal and Provincial Governments. However, in co-operation with the federal Department of Fisheries, the Provincial Government, through its Department of Industry and Development, assumes certain responsibilities in the development of the commercial fisheries.

Financial assistance, by way of loans, is provided to fishermen for the purchase of boats and engines, and for the construction and expansion of cold storage facilities. Small loans are made available to inshore fishermen for the purchase of lobster and herring boats and larger amounts are granted to offshore fishermen for the building of modern groundfish draggers. Seventy units of from 48 to 72 feet in length are in operation in the Gulf of St. Lawrence and the Bay of Fundy. The Bay of Fundy fleet is being enlarged, with consideration being given to the fact that existing processing facilities are limited. However, an expenditure of $\$ 500,000$ is being made on cold storage and processing plants under construction at Beaver Harbour. The processing plant alone will absorb an estimated $5,000,000 \mathrm{lb}$. of fish annually, a capacity that will increase over the years.

The Provincial Government is experimenting with new fishing equipment and techniques that may assist the inshore fisheries. These experiments are carried out with the technical assistance of the Fisheries Research Board of Canada and with the close cooperation of the fishermen concerned. Educational services are extended to deepsea fishermen by offering them practical instruction in basic navigation, rules of the road, business administration and care of marine diesel engines. Technical assistance is also given by Fisheries Branch personnel to dragger owners, boatbuilders and inshore fishermen.

Quebec.-The Department of Game and Fisheries administers both the sea and the inland fisheries of Quebec. The Department has two divisions-the Division of Maritime Fisheries and the Division of Fish and Game, the latter being charged with the administration of the inland fisheries.

Sea Fisheries.-Quebec is the only province administering its own sea fisheries. For the benefit of producers and fishermen, it provides a system of cold storage plants for the freezing and preservation of fish. Since the erection of the first plant in 1932, the network has grown to 53 plants with a daily freezing capacity of 260 tons of fish and a storage capacity of $17,000,000 \mathrm{lb}$. These cold storage plants also perform a valuable service to fishermen by providing them with frozen bait. In addition, the Department owns and maintains 115 snow houses (where fish may be chilled before being sent to storage or filleting plants), 40 culling sheds, and tro artificial drying plants where $6,000,000 \mathrm{lb}$. of fish may be processed annually.

The Department maintains a staff of inspectors, fish wardens, technicians and technologists to administer fishery legislation and to assist in the application of new techniques for the expansion of the industry. The central administration is located at Quebec City
with an office at Gaspe for the administration of cold storage plants. Fish inspection is carried out under federal and provincial legislation by provincial inspectors who are vested with additional powers for export purposes by the Federal Government.

Educational work among the fishermen and producers is also conducted by the Department to teach the latest methods of fish preparation and of obtaining high quality products. The new Fisheries Training School at Grande Rivière gives to fishermen of all ages the opportunity of taking free theoretical and practical courses in fishery, and the Superior School of Fisheries at Ste. Anne-de-la-Pocatière conducts a four-year course for technologists. Encouragement is given to the co-operative associations of fishermen through the Social Economic Service of the latter institution. Under a maritime credite system fishermen are able to obtain loans from credit unions for the purchase of boats and gear. The Department adheres to the federal-provincial agreement on the building of draggers and long-liners and assumes the building costs on a five-year capital refunding plan.

The fish trade is being promoted by advertising campaigns in newspapers and magazines, cooking demonstrations, educational films and free distribution of fish recipes and publicity leaflets as well as by exhibits at fairs.

Hydrographical research in the Gulf of St. Lawrence, studies on the location of new fishing grounds, and experiments on seafish biology are conducted by a Marine Biological Station at Grande Riviere and two substations on the North Shore and Magdalen Islands. This research has brought into use new types of fishing vessels recommended to fishermen. The Department also operates a Limnological Laboratory at Quebec City for studying the biology of the freshwater fish of the St. Lawrence River and its tributaries.

Inland Fisheries.-The Division of Fish and Game exercises jurisdiction over the inland waters. Three hundred full-time wardens are employed and licences are required for sport fishing and hunting, the revenue from which is applied to the improvement of fishing and hunting conditions. Five hatcheries are maintained at strategic points throughout the Province: St. Faustin, Lachine, Lac Lyster, Tadoussac and Gaspe. These establishments distribute speckled trout, Atlantic salmon and grey trout fry, maskinonge fingerlings and older fish.

The Department administers five parks and eight reserves in all of which, except for Mount Orford Park, excellent fishing may be found. The Gaspesian and Laurentides Parks are renowned for their trout fishing. The Chibougamau Reserve and the La Vérendrye Park, situated on the height of land, are eminently suited to canoe trips in search of pickerel, pike and grey or speckled trout. Five salmon streams, all under the jurisdiction of the Fish and Game Division, are open to anglers: the Romaine River, the St. Jean River, the Petite Cascapédia River, the Matane River and Port-Daniel River. The Department co-operates with sportsmen through a joint committee composed of departmental officials and the directors of the larger fish and game associations. The committee studies the maintenance of satisfactory fishing and hunting conditions and other problems arising out of the ever-changing conditions of modern life and their effect on the wildlife of the Province.

The Biological Bureau of the Province, located at the University of Montreal, and the piscicultural laboratory at Quebec City, with its two stations for practical work located in the Trembling Mountain and Laurentides Parks, study problems connected with marine life.

Ontaric.-The fishery resources of Ontario are administered by the Division of Fish and Wildlife, Department of Lands and Forests. The Division operates under the authority of the Fisheries Act (Canada), the Special Fishery Regulations for the Province of Ontario, the Ontario Game and Fisheries Act and the Regulations connected therewith.

Commercial Fishing.-The commercial fishing industry in Ontario provides employment for about 4,000 persons directly and for many more indirectly, and produces an annual yield of from $35,000,000 \mathrm{lb}$. to $45,000,000 \mathrm{lb}$. of fish. The industry, although widely
scattered throughout the Province, is centred chiefly on the Great Lakes, particularly Lake Erie which is noted for its blue and yellow pickerel, white bass, whitefish and perch. Other principal species of fish taken commercially are: lake trout, herring or cisco, sturgeon, pike, catfish (including bullheads), carp and suckers. Over one hundred smaller inland lakes are commercially fished, principally those in the northwestern portion of the Province, and careful management of these lakes is essential to ensure continued production.

The types of fishing boats in use vary from small craft to 60 -foot tugs, and types of gear vary from the most common gill-nets, pound-nets and trap-nets, seines and baited hooks to small hand-operated seines and dip-nets. Fishing methods and equipment have been rapidly modernized during the past few years. Diesel driven steel-hull tugs have replaced steam-driven wooden tugs. Such aids as depth sounding devices, radar, ship-toshore and ship-to-ship communications have been developed and a better knowledge of the fish and their movements has been established from biological research findings. Modern icing facilities and transportation methods are in use as well as new types of fishing gear. Nylon gill-nets have replaced cotton and linen nets and a very efficient and economical trap-net is gradually replacing the pound-net in Lake Erie and other waters.

Excellent co-operation and understanding of the complex problems involved in the administration and management of Ontario's freshwater fishing industry by the Government and the fishermen, through their local associations and the Ontario Council of Commercial Fisheries, is working to the advantage of the industry as a whole.

Angling.-In Ontario with its estimated freshwater area of 78,747 sq. miles, angling constitutes one of the most widely distributed recreations. There are 144 different kinds of fish in the Province including such species as lake, speckled, rainbow and brown trout, yellow pickerel, black bass, pike and maskinonge. It is difficult to measure the value of sport fishing to the Province but the annual revenue from the sale of angling licences alone (mainly to non-residents, as residents require a licence for Provincial Parks only) $\mathrm{i}^{8}$ in the neighbourhood of $\$ 2,300,000$.

To maintain Ontario's reputation for excellent game fishing the wise management of this renewable resource is a prime factor, and a well-trained field staff of conservation officers and biologists is located in the 22 forestry districts of the Province.

Provincial Hatcheries.-Ontario operates 21 hatcheries and rearing stations and excellent results have been produced in the culture and distribution of the various species of commercial and game fish. Hundreds of millions of fry, fingerlings and yearlings, comprising whitefish, herring, pickerel, trout (lake, speckled, brown and Kamloops), maskinonge, bass and ouananiche are distributed annually. Three of the finest troutrearing stations on this Continent are located in Ontario at Dorion near Port Arthur, at Sault Ste. Marie and at Hill Lake near Englehart.

Fisheries Research.-Research in Ontario is carried on in the Great Lakes where commercial fisheries problems are being investigated, and in inland waters where game fish populations are being studied. At the South Bay Mouth Station, Manitoulin Island, research biologists are conducting studies relating to the removal and utilization of the less valuable species and the effects of this removal on stocks of the more valuable commercial and game species. In Algonquin Park a careful record of angling quality is kept for a number of test lakes to allow evaluation of management techniques. Certain of the more barren lakes are being treated with fertilizer to determine the effect on microscopic organisms and fish.

The habits of lake trout and eastern brook or speckled trout are being studied to provide additional information on the proper management of these species. Many authorities believe the increase in the sea lamprey and the drastic drop in production of lake trout in recent years in Lake Huron (including Georgian Bay and North Channel) to be directly related and this has led to an International Agreement between Canada and the United States and the establishment of the Great Lakes Fisheries Research Commission
for the co-ordination and direction of the fisheries research program, particularly as it is applied to the control of the sea lamprey menace. Co-operation is maintained by the exchange of biological findings and, where practicable and feasible, the results are applied in an attempt to control this menace.

Established fish management principles are applied by biologists in the various forestry districts. The program includes such projects as biological surveys and investigations, bass harvesting, coarse fish removal, creel census studies, fish tagging and other related subjects.

Manitoba.-For the year ended Mar. 31, 1956, the freshwater commercial fisheries of Manitoba, made possible by nearly 39,255 sq. miles of lakes and streams in the Province, yielded a catch of $34,936,600 \mathrm{lb}$. of choice edible fish, the market value of which was $\$ 6,146,761$. Fifteen varieties of fish make up the commercial catch, the most important, according to value, being pickerel, whitefish, sauger, pike and perch. In addition to commercial production, sport fishing yielded a considerable poundage.

The fisheries of Manitoba provide a large harvest of rich protein food about 90 p.c. of which is sold to United States dealers. Actual fishing operations employ over 6,000 men and at least a similar number find total or partial employment in the many industries dependent wholly or in part on the fisheries.

Since the commercial fishing industry began in Manitoba about 75 years ago, equipment has improved and methods of handling fish have changed to meet modern demands for a packaged product ready to serve or convenient to cook. Oars and sail have given way to high powered internal combustion engines and boats that can lift nets in almost any weather. Coarse linen gill-nets have also disappeared in favour of the finest of nylon gill-netting. In marketing, whole fish packed in ice is being replaced, in part at least, with a packaged filleted product, or precooked items. Throughout the fishing industry there is a keen appreciation of the necessity of producing a first quality product, convenient to prepare, attractively packaged, and appealing to the eye, palate and the cook. The city of Winnipeg has become one of the largest freshwater fish marketing centres on the Continent and the provincial Department of Mines and Natural Resources maintains a city patrol service to ensure, as far as is possible, that only fish of first quality is marketed or offered to the consumer. This patrol operates in co-operation with officials of the federal Department of Fisheries. To regulate the fishery operation and to ensure that seasons and limits are observed, the Fisheries Branch of the Provincial Department operates a fleet of patrol boats in summer and a number of bombardier snowmobiles in winter.

Four fish hatcheries are engaged in the artificial propagation of pickerel and whitefish on commercial fishing lakes and a trout hatchery provides a supply of lake, rainbow and speckled trout for sport fishing waters at the northern extremity of West Hawk Lake in Whiteshell Provincial Park.

Saskatchewan.-The fisheries of Saskatchewan are administered by the Fisheries Branch of the provincial Department of Natural Resources with head office at Prince Albert. Most of the fisheries resources are concentrated in the northern half of the Province where the lakes have always been a source of food to the fur traders, trappers, prospectors and the Cree and Chipewyan Indians who inhabit the area; they also provide food and supplementary income to settlers and homesteaders on the agricultural fringe.

There are approximately 135 commercially fished lakes in the Province and the principal species of fish include lake trout, whitefish, pickerel, northern pike, sturgeon, cisco, Arctic grayling, goldeye, mullet, perch and burbot. The growth of the filleting industry has been of particular significance, 12 filleting and 11 packing plants having been established since 1945. The importance of the fishery resources to mink ranchers in the Province is shown by the fact that in the year ended Mar. 31, 1956, 78 fur-farm fishing licences were issued and 43,167 mink were fed under these licences; 722 domestic licences and 1,769 free licences to Indians were also issued.

There has been marked development recently in sport fishing. In the fiscal year 1955-56 there were 78,988 resident and 6,658 non-resident angling licences sold, compared with 6,000 resident and 1,500 non-resident licences sold in 1945.

Emphasis in the fish cultural activities of the Province during the past few years has been on extending the range of the Arctic grayling species from the Far North into the Churchill River area, and on the introduction of eastern brook trout and certain warm water species into areas where preliminary study seems to indicate suitable environment. To a large extent the indiscriminate planting of fish has been discontinued. A new fish culture station is being built at Fort Qu'Appelle for the hatching of pickerel, rainbow, brown and lake trout. Rearing facilities will also be built for the rearing of various types of game trout. An experimental hatchery has been established at Lac la Ronge where Arctic grayling and lake trout eggs have been hatched, an Arctic grayling spawn camp in the Fond-du-lac River near Black Lake, and a pickerel spawn camp on the Montreal River near Lac la Ronge.

The management of the provincial water areas is conducted on a scientific basis. In 1947 a large-scale biological program was undertaken and since then more than 100 water areas have been studied as to their productivity as well as to the interrelationship of the species and their life histories. In so far as known facts permit, the management of the various lakes has been placed on a sustained-yield basis. Experiments are in progress on the introduction of non-native species into suitable water areas. Where sport fishing pressure has increased, such as on Lac la Ronge, Last Mountain Lake and Qu'Appelle Lakes, a creel census has been established and the annual take is recorded. The Fisheries Laboratory, established in 1949 at the University of Saskatchewan, has five permanent biologists on its staff, and usually about 12 students of the University are employed each summer on biological surveys. The Fisheries Branch has conducted a program of education designed to acquaint people of the Province with the importance of scientific research and the necessity of certain regulations governing the administration of fisheries.

Alberta.-Commercial and game fishing are administered by the Fish and Game Branch of the Department of Lands and Forests under the authority of the Fisheries Act (Canada) and the Fishery Act (Alberta).

Regulations under the Fishery Act (Alberta), designed to improve the packing, handling, processing, storage and quality of commercial fish, have been well received and supported by the Alberta industry. In line with a policy for producing good quality fish, lakes in which whitefish are infected with pike-tapeworm and do not meet the quality standard have been closed to commercial fishing.

About 80 p.c. of the whitefish production is exported to the United States. Mink farmers of the Province utilize almost the entire catch of tullibee.

Biological surveys of many lakes and watersheds have provided an opportunity to observe the result of former management policies. These surveys have shown that traditional practices of trout-stream management were inadequate or incorrect. As a consequence, the minimum size limit has been removed on all trout except lake trout and close seasons for trout, pike, walleye and perch have been abolished. A new management plan on the east slope streams of the Rocky Mountains has been extended to include all the forested area. The main streams are continuously open; the smaller streams are opened and closed in alternate years. The trout-rearing facilities are used largely to produce fish for planting in small lakes and reservoirs previously barren of fish. It has been found that such waters produce very fast-growing trout with a satisfactory survival.

British Columbia.-A Fisheries Office was organized in 1901-2 and became very active in fish cultural work, building and operating fish hatcheries and instituting scientific research into various fishery problems. In 1947 the Fisheries Office was superseded by the Department of Fisheries which in turn was superseded in 1957 by the Department of Recreation and Conservation.

Broadly speaking the administrative and regulative jurisdiction over the fisheries of British Columbia rests with the federal authority. When British Columbia entered Confederation in 1871 the Government of Canada undertook to protect, conserve and promote the fisheries of the Province, and one of the important functions of the provincial Department of Fisheries is to observe these activities and to keep the Provincial Government informed through the appropriate Minister.

The ownership of the fisheries in the non-tidal waters is vested in the Crown in the right of the Province, as are the shell fisheries such as oyster fishing and clam fishing in the tidal waters. The Province administers these fisheries although the regulations covering them are made under federal Order in Council on the advice and recommendation of the Province.

The Provincial Fisheries Act provides for the taxation of the fisheries and, under civil and property rights, for the regulation and control of the various fish processing plants under a system of licensing. Provision is also made for arbitration of disputes regarding fish prices that may arise between the fishermen and operators of the various licensed plants. The administration of the Act involves the collection of revenue and the supervision of plant operations.

Net fishing in the non-tidal waters of the Province, including commercial fishing, is regulated and administered by the provincial Department of Fisheries, and authority for regulation of the game fisheries in the non-tidal waters is vested in the Game Commission, a branch of the Provincial Government administration. The Game Commission operates a number of trout hatcheries and egg-taking stations for restocking purposes.

The harvesting of marine plants of commercial importance in British Columbia, including the kelps, has recently been placed under the provincial Department of Fisheries for regulation and control. Some research has been done on a few of the important species and more will be undertaken as required.

The provincial Department of Fisheries established a marine laboratory at Ladysmith on Vancouver Island for the purpose of conducting biological research into those species over which the Province has control, principally oysters, clams and other forms of shellfish as well as marine plants. This research is conducted with the object of encouraging the industry to produce better products more economically and of enabling the Department to regulate the various species so that maximum exploitation may be obtained on a sustained yield basis. The Department co-operates closely with the research work done by the Fisheries Research Board of Canada, particularly on the Pacific Coast.

## Section 3.-Fishery Statistics

## Subsection 1.-Primary Production

Since Newfoundland became a province of Canada in 1949, the landings of fish in Canada have fluctuated around $2,000,000,000 \mathrm{lb}$.; a maximum catch of $2,122,000,000 \mathrm{lb}$. was recorded in 1950. The landed value is generally over $\$ 90,000,000$, having reached $\$ 102,000,000$ in 1951. Since 1949, the Province of Newfoundland has contributed a yearly average of $588,000,000 \mathrm{lb}$. and of $\$ 13,500,000$. The total Canadian catch of fish in 1955 was $1,917,000,000 \mathrm{lb}$. valued at $\$ 90,900,000$, a decline of 6.5 p.c. in quantity and of 7.6 p.c. in value compared with the preceding year. The decline was most significant in British Columbia, Newfoundland and New Brunswick, freshwater fisheries having recorded a slightly higher level both for quantity and value.

British Columbia's 1955 catch of $498,376,000 \mathrm{lb}$. valued at $\$ 27,710,600$ was considerably lower than that of 1954 . The landings of sockeye and chum salmon, at $16,642,000 \mathrm{lb}$. and $18,178,000 \mathrm{lb}$., respectively, were disappointing and the low yield of these species was only partially compensated for by the highest yield of pinks since 1930 ( 831,253 cases of 48 lb .). The total salmon catch was $131,008,000 \mathrm{lb}$. valued at $\$ 18,481,000$ compared with $178,862,000 \mathrm{lb}$. valued at $\$ 23,578,800$ in 1954.

The halibut and herring catches in British Columbia were also low in 1955. Halibut declined to $19,679,000 \mathrm{lb}$. valued at $\$ 2,555,000$ from $25,199,000 \mathrm{lb}$. and $\$ 3,984,000$ in the preceding year and a depressed market for this product was reflected in lower unit returns to fishermen. The landings of herring were $305,692,000 \mathrm{lb}$. valued at $\$ 4,187,000 \mathrm{in} \mathrm{1955}$, against $360,962,000 \mathrm{lb}$. and $\$ 4,565,000$ in 1954 . The decrease was the result of two principal factors: the 1954-55 winter herring season ended early in February, a month earlier than usual, when schools of herring failed to appear; operators and fishermen failed to reach an agreement on prices for the summer operations and there was no fishing for herring in the summer months. A similar lack of agreement on prices for the 1955-56 winter season delayed the resumption of fishing from the normal early October opening to Nov. 17.

On the Atlantic Coast the yield of the fisheries was satisfactory in 1955. The catch declined by 2.3 p.c. to $1,299,954,000 \mathrm{lb}$. from $1,330,638,000 \mathrm{lb}$. in 1954 , but the landed value at $\$ 50,057,000$ was virtually unchanged from the previous year's level. A small catch of herring in New Brunswick and of cod in Newfoundland accounted for the decline in landings, though increased landings of other species partially offset the loss. Except for a decline in the cod fisheries, the groundfish fisheries were very successful mainly those of haddock, pollock and the small flatfishes-plaice and flounders. There were additions to the dragger fleet in the Gulf of St. Lawrence and offshore fishing out of the Nova Scotia ports was active throughout the year supported by a growing production of frozen fillets. Lobster fishing was also very successful, the 1955 catch being $48,568,000 \mathrm{lb}$. with a landed value of $\$ 16,470,000$ as compared with $46,675,000 \mathrm{lb}$. valued at $\$ 15,558,000$ in the preceding year. Provincial distribution figures indicate a decline in Newfoundland and New Brunswick as compared with 1954 but a rise in Nova Scotia, Quebec and Prince Edward Island.

The harvest of freshwater species in Canada amounted to $118,959,000 \mathrm{lb}$. in 1955 valued at $\$ 13,125,000$, both figures being a record for a great number of years. The Great Lakes fisheries of blue and yellow pickerel were particularly successful, the landings of these two species together being valued at $\$ 4,541,000$. However, the most valuable of the freshwater species are whitefish and lake trout. Whitefish is taken commercially in all the inland provinces and the Northwest Territories. Most of the lake trout is from the Great Slave Lake, the Great Lakes or the Saskatchewan waters. However, the whitefish and lake trout catch continued to decline in the Great Lakes in 1955 but they were landed in larger amounts from the Great Slave Lake.

In 1955, 62,511 persons were employed in the primary operations of the sea and freshwater fisheries (Newfoundland excluded), approximately the same as in 1954. No signfiicant change has been recorded in the number of fishermen in the past few years except in Newfoundland. Long-term records for this Province are confined to a count of the cod fishermen, who have gradually come down in number, especially since 1950. The latest figure available of number of fishermen in Newfoundland is for 1954 when 16,469 were reported.

The value of equipment used in the primary operations was $\$ 107,071,000$ in 1955 (Newfoundland excluded). This figure refers to investment in vessels of all kinds, boats, fishing gear, shore installations, etc. In recent years, a substantial investment was made in modern long-liners and draggers, especially for the groundfish fisheries. The capital equipment employed in primary operations in Newfoundland was reported at $\$ 17,535,300$ for 1954.

## 1.-Quantity and Value of Sea and Inland Fish Landed by Province 1951-55

Note.-Figures for the years 1918-50 are given in previous editions of the Year Book beginning with the 1947 edition.

## 2.-Value of All Products of the Fisheries by Province 1951-55

Nore.-Figures for the years 1917-50 are given in the corresponding table of previous Year Books beginning with the 1922-23 edition. Totals for five-year intervals from 1870 are given in the 1956 edition, p. 597.

| Province or Territory | 1951 |  | 1952 |  | 1953 |  | 1954 |  | 1955 |  |

## Subsection 2.-The Fish Processing Industry

The Census of Industry survey of the fish processing industry covers establishments engaged in the processing of fish at the secondary industrial level. Some fishermen also process the fish they land to a certain degree but their operations are not included; neither are the inland areas (Ontario, Prairie Provinces, Yukon Territory and the Northwest Territories) although some fish processing is done there. Summary statistics of sea fish processing establishments are shown in Table 6.

91593-39
6.-Summary Statistics of Sea Fish Processing Establishments 1951-55

| Item |  |  |  |
| :--- | :--- | ---: | ---: | ---: | ---: | ---: |

The most important species to the industry in point of value is the salmon, followed by cod, herring, haddock, lobster, plaice and sardines. The products of these species made up over 60 p.c. of the total value of output of the industry in 1955, as shown in Table 7.

${ }^{1}$ Represents a homogeneous product.
In 1955 the output of fishery products and by-products in Canada at $\$ 181,026,000$ was slightly higher than the average for the previous five years but lower by 5 p.c. than in 1954. This drop was attributed to a smaller salmon pack and to unfavourable marketing conditions for halibut in British Columbia. On the East Coast, a smaller pack of canned sardines in New Brunswick and a drop in dried fish production in Newfoundland was compensated for by increased marketings of lobsters and groundfish fillets. The lobster fishery with its high market value is still of great importance to the Maritimes. In recent years there has been a diversion from canned production of this product to fresh or frozen meat. The growth in the production of frozen groundfish fillets is also a major development. Considerable plant expansion took place during 1955, particularly in Newfoundland.
8.-Atlantic Coast Production of Frozen Fillets 1951-55

Nors.-The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

## Section 1.-The Fur Industry

The fur industry, at one time the most vigorous and remunerative industry in Canada, still contributes many millions of dollars annually to the national income. Until the end of the 19th century practically all Canadian furs were wild-caught and, although fur farming has since developed rapidly, trapping still provides about half of the income from raw furs produced in Canada.

Wild fur-bearers are still taken, even in settled areas of this country, but the populations of such animals have in general been so reduced by the advance of settlement that the principal trapping areas now lie in the northern parts of the provinces and the Northwest Territories. Many wild animals, including some important fur-bearers, are subject to marked fluctuations in numbers from year to year. These fluctuations are often greatest and most nearly regular in northern regions and notably affect the number of pelts taken of certain wild species.

Another and perhaps more important factor governing the 'take' of furs from wildlife is the fluctuation in demand and in price consequent on changes in fashion. Thus the vogue of recent years for short-haired furs has caused a decrease in demand for fox and other long-haired pelts and a corresponding decrease in the number of such pelts taken by trappers. In areas such as parts of the Northwest Territories where these furs were formerly a staple source of income, this style change has resulted in serious hardship.

The most important aspects of management of the fur trapping industry are: constant practical scientific research, maintenance of suitable habitat, sound and balanced regulation of the trapping of fur-bearers, provision of competent and adequate field staffs, and free education of trappers with respect to the principles of wildlife management. By these means many areas depleted of fur-bearers have once again become productive. Such means will become increasingly important in maintaining Canada's position as a major producer of raw furs.

Most of the fur resources of the provinces of Canada are under the administration of the respective provincial governments. Exceptions include those resources within the boundaries of the National Parks and the Indian reserves, and the fur resources of the Yukon Territory and Northwest Territories all of which are under the administration of the Federal Government. The Canadian Wildlife Service of the Department of Northern Affairs and National Resources (see pp. 27-30) is responsible for all Federal Government interests in wildlife resources except for those activities closely related to Indian affairs. The Service co-operates with provincial governments and other agencies concerned and handles federal interests in relevant national and international problems.

## Section 2.-Provincial and Territorial Fur Resources and Management*

Newfoundland.-Only a very small portion of the wild fur resources of Newfoundland is being utilized at present. Trapping is confined to areas in the vicinity of settlements and the operation of traplines is no longer practised in remote areas, which formerly provided the best pelts and the bulk of the fur harvest. This situation arises from the fact that other employment has become available to trappers. Steady income has raised their standard of living to such an extent that they can no longer depend on an occupation which fluctuates so drastically in both supply and market value. Thus no section of the population is now wholly or even partially dependent upon fur trapping for a livelihood and much of the wild fur crop remains unharvested.

Beaver offers the best basis for a revived fur industry within the Province but under present conditions there are not sufficient trappers to harvest the numbers required by managed fur resources.

Open seasons are declared annually upon such species as beaver, otter, muskrat, marten and mink, while hunting of fox and lynx is permitted throughout the year. These latter species have not been harvested to any extent in recent years and are now better known for their predation upon other species and upon livestock than for their fur.

The total value of wild furs produced decreased from $\$ 360,000$ in 1949-50 to $\$ 158,000$ in 1955-56, with a further decline in prospect if depressed prices for long-haired furs continue.

Prince Edward Island.-Wild fur-bearing animals are very plentiful on Prince Edward Island. Red fox, skunk and raccoon have become so numerous that all protection has been removed and bounties are paid on all three species. Beaver also have increased greatly but may be trapped only by permit secured from the Department of Industry and Natural Resources. There is no open season on beaver.

Ten years ago muskrats had become quite scarce but their population has increased and, being so easily trapped, they are now the best revenue producers. More than 3,000 of them are taken annually. Their increase is attributed largely to the shortening of the trapping season (now from Nov. 10 to Dec. 31) and to the strict enforcement of trapping regulations, which prohibit the setting of traps within ten feet of a muskrat house or den or the damaging of it. Mink are also increasing in number and are protected by a short trapping season. Mink is the only fur-bearing animal ranched to any extent in the Province.

Nova Scotia.-Nova Scotia is not a large producer of wild fur pelts. Trapping is seldom a full-time occupation but is a source of additional income to guides, woodsworkers and farmers who live near fur-producing areas. There is usually a six-week open season (Nov. 1 to Dec. 31) for mink, otter, weasel and muskrat. The present low market prices for long-haired fur has discouraged the trapping of wildcat, fox and raccoon and these animals have been removed from the protected list. No licence is required for the trapping of fur-bearers other than beaver.

Since 1931 the Department of Lands and Forests has been redistributing live beaver which before that time had been almost completely trapped out. Today, beaver is an important part of the trappers' catch in most of the counties of the mainland, where an autumn season has been instituted. A few live beaver have also been introduced into Cape Breton Island but no open seasons have been proclaimed.

The red squirrel has also become important as a fur-bearer and in 1954 the lsws were changed to permit trapping during the regular season and shooting during the rabbit season which lasts until the end of February.

[^201]Exports of wild fur for the year ended Mar. 31, 1955, included: 31,945 deer hides, and pelts of 4,445 beaver, 485 fox, 20 lynx, 2,857 mink, 40,441 muskrat, 212 otter, 1,253 raccoon, 41,757 red squirrel, 3,771 weasel and 178 wildcat.

Quebec.-Fur from wildife is still a very important asset of the Province of Quebec despite the invasion of the forest for industrial purposes.

The number of pelts taken in the 1955-56 season was 254,138 including: muskrat 141,511 , weasel 22,433 , squirrel 16,918 , beaver 36,302 , white fox 3,042 , mink 12,019 , seal 8,289 , red fox 3,325 , otter 2,749 , raccoon 2,394 , lynx 1,469 , fisher 1,401 , marten 1,273 , cross fox 234 , skunk 276 , blue fox 53 , bear 221 ; and a few pelts of the other types of foxes, lynx cat, polar bear and wolf. The tax rate per pelt varies from one cent on squirrel to $\$ 1$ on fisher. The royalties revenue to the Province on the total take of furs in 1955-56 was $\$ 73,096$.

The fur resources of Quebec are administered by the Department of Game and Fisheries. Under the game laws and regulations it is unlawful to hunt, catch or trap fur-bearing animals out of season, or in season without a licence; to use poison to hunt or kill any animals; to destroy or damage lairs or burrows of fur-bearing animals; or to keep in captivity, without special permit, any game protected by law. Regulations also cover the marketing of furs. It is not permissible to buy or sell any fur or pelt for commercial purposes without a licence; neither is it permissible to ship any fur outside the Province, or from one place to another within the Province, or to a tanner, without a permit attached to the bill of lading or without royalty having been paid and each pelt stamped or sealed.

By Order in Council of Aug. 17, 1945, the first registered game territory for trappers was set up by the Provincial Government in the Counties of East Abitibi and West Abitibi. In 1946 the County of Pontiac was organized, in 1947 the County of Temiskaming and in 1952 the northern part of the County of Laviolette.

Regulations provide mainly that the land under lease must not exceed 50 sq. miles. The lessee, who pays an annual rental of $\$ 10$, is responsible for his own land which he must occupy 15 days before the opening of the trapping season and evacuate 15 days after its close. Each year he must make an inventory of his land and report on the location of the beaver huts thereon. He must hold a special permit to hunt beaver and must prove that there are at least five huts on his land. The quota allowed at the outset is one beaver per hut; as the population increases, the quota is raised to $1 \frac{1}{2}$ beavers per hut. Beaver pelts must be specially labelled before marketing. The present registered game territory extends over 30,000 sq. miles. More than 400 trappers hold permits for the capture of beaver. In addition, the Fur Service of the Department of Fish and Game administers 320,000 sq. miles of beaver preserves where Indians enjoy free trapping rights.

Steps are being taken also to assist in the re-establishment of marten, the population of which has been steadily decreasing.

Ontario.-The fur and big game wealth of Ontario is administered by the Division of Fish and Wildlife, Ontario Department of Lands and Forests, under the authority of the Ontario Game and Fisheries Act, the Wolf and Bear Bounty Act, and regulations thereunder.

In the production of wild-caught fur, Ontario leads all other Canadian provinces. In the 1955-56 season wild fur taken in Ontario was valued at almost $\$ 3,000,000$ and included pelts of 113,200 beaver valued at $\$ 1,386,700$. Other important species in order of decreasing total value were mink, muskrat, otter, fisher, raccoon, weasel, marten, red fox and lynx.

The high production of wild fur in this Province is attributed to the efficient system of fur management now in effect. Throughout most of the chief fur-producing areas all trappers-the majority of whom are Indians-are holders of registered trapline licences. Each trapper is registered with the Province as the sole permittee on a defined trapping area. Thus competitive trapping has been almost entirely eliminated in all but the primarily agricultural areas and the Department is in a position to set quotas to restrict the annual
take of the less abundant species during times of scarcity. Beaver, marten, fisher and lynx, comparatively rare in the Province a few years ago, have now attained populations which permit larger annual harvests to be taken than have been possible for many years.

Big Game.-A long season for moose in Ontario provides sport for hunters and meat for trappers. In most parts of the Province moose of any age or sex are legal game for the resident. In 1955 there were 8,959 resident moose licences sold and 1,141 non-resident licences; there was a known kill of 2,381 moose, made up of 1,354 bulls, 771 cows, 245 calves, and 11 unspecified.

Over 100,000 deer licences were sold in 1955 and about 30 p.c. of the hunters were successful in getting a deer. There is no open season on woodland caribou at present.

Manitoba.-In Manitoba, fur production and value showed a sharp decrease in 1955-56 as compared with the previous year. Furs taken from the wild were valued at $\$ 2,239,892$ as compared with the $1954-55$ total of $\$ 2,969,804$, a decline of almost 25 p.c.

Registered traplines were extended into the southern portions of the Province and into a large area of the western portion around Swan River including the Duck Mountain Forest Reserve. Beaver is the major fur animal taken and beaver pelts from the registered trapline districts were valued at $\$ 219,343$ in $1954-55$ as compared with $\$ 152,400$ in the previous year.

Wild fur production by species during 1955-56 included: 27,213 beaver, $15,708 \mathrm{mink}$, $1,301,972$ muskrat, 123,237 squirrel, 95,119 weasel and 2,069 fox (silver, blue, cross, white and red).

The fur-ranching industry had a record production in 1955-56 of $\$ 3,847,827$, considerably exceeding the value of wild fur taken.

Saskatchewan.-Unethical practices and lack of management brought beaver to virtual extinction in Saskatchewan by 1944 and the trapping industry in general had reached a low ebb. The Government in 1945 appointed a committee to recommend what steps might be taken to encourage and assist persons dependent on fish and game for their livelihood, particularly in isolated northern areas. As a result the wildlife fur industry in Saskatchewan has been completely reorganized during the past ten years. The system of allowing only one trapper for a given area, inaugurated throughout the Province, is providing security for trappers on their traplines.

A Fur Marketing Service was established in Regina to give fur-producers a local auction where furs could be graded, displayed and sold. A Fur Conservation Agreement was concluded in 1946 whereby the Federal Government and the Government of Saskatchewan agreed to make certain annual expenditures for the purpose of managing fur and game and improving wildlife habitat in the northern isolated areas for the benefit of the residents of those areas. The particular interest of the Federal Government in this region is the welfare of Treaty Indians who are its wards. Regulations under the Agreement gave Indians, métis, and whites equal rights and security on their community, family or individual traplines. Local councils were elected by the trappers to act as spokesmen on their behalf when dealing with the provincial Department of Natural Resources. During the subsequent five years, 3,600 live beaver were moved from settled areas to new homes in the northern frontier where they were required for propagation purposes and for the improvement and maintenance of water levels. The result of this action has been a steady increase in the population of beaver, while the take has increased from approximately 400 pelts in 1943-44 to 41,666 in 1955-56.

A muskrat trapping program was inaugurated in southern Saskatchewan in 1946 under which each trapper in settled areas obtains a permit describing the area in which he is authorized to trap muskrats. General close seasons are a thing of the past and muskrats existing in any section may be trapped on the basis of the program. Average yearly production since 1946 has been almost tripled in relation to the average production for a similar earlier period. The 1955 crop of about $1,951,800$ muskrats was the highest ever recorded in the Province; 1956 production was $1,731,978$ pelts.

Other fur-bearers of economic importance are fisher, fox, lynx, marten, mink, otter, squirrel and rabbit. These animals have fluctuated in population and pelt value in the past but the increased production of beaver and muskrat has helped stabilize the income of the trapper. Most fur prices have declined in recent years, but the income received from Saskatchewan wildlife fur pelts has been maintained.

Badger, raccoon and wolverine are of little economic importance at present. Wolves, coyotes and foxes are on the predator list in settled areas and very comprehensive programs of control have been carried on to reduce the population of these animals. A paid hunter program has been in operation since 1948 to reduce the coyote population and these animals are no longer a problem in settled areas. In the autumn of 1954 the bounty on wolves was discontinued. Bait treated with poison, placed out on large lakes in isolated areas, is the present method of controlling wolves but only employees of the Department are allowed to handle the poison. This work is becoming increasingly important not only to protect game that is necessary to the welfare of people living in the north country but also to reduce the chances of spreading the rabies epidemic which has been apparent in the West during the past few years as well as hydatid disease which has been found in some species of big game.

The weasel is a valuable fur-bearer as well as a controller of rodents. Closure in large areas does not seem to increase the weasel population and the policy is now to hold a short autumn and early winter season in all areas where the normal winter season is not in effect. This gives the farm boys and others an opportunity to take some of these valuable fur-bearers.

The jack-rabbit is gaining in importance in recent years-approximately 100,000 were taken in 1956. The average price received for them was 58 cents.

Alberta.-The fur trade in Alberta has shown a steady decline over the past four or five years mainly because of the poor market for long-haired furs. There is practically no sale for pelts of such animals as coyotes, wolves, foxes, badgers and skunks and little for lynx and wolverine. Demand today is for squirrel, muskrat, ermine, mink and beaver in approximately that order of importance. There was a slight decline in fur prices during the fur season ended June 30, 1956, as compared with those obtained during the previous fur season. In 1956, beaver pelts sold at an average price of $\$ 10.45$ and muskrats at 91 cents per pelt compared with $\$ 13.08$ for beaver and 99 cents for muskrat in 1955.

The trapping industry has changed considerably in recent years. About 3,000 registered trappers operating registered traplines formerly provided the major part of the take. But the trapping of fur-bearing animals by owners and occupants of privately owned lands is becoming more prominent, especially of beaver and muskrat. In fact about 50 p.c. of the beaver trapped in Alberta now come from privately owned land, such trapping being permitted under a resident trapper's licence. Another noteworthy change is the gradual replacement of white trappers operating registered traplines by Indians and métis, who now make up nearly 43 p.c. of the total as compared with 30 p.c. three years ago; of the 2,800 registered trappers now operating, 1,200 are Indians.

In connection with the destroying of predators. it has been found that the paid hunter system gives better returns for the money invested than the old system of bounty payment. Bounties are now paid on cougars only, although certain well-equipped cougar hunters receive an additional $\$ 25$ from the Province for each cougar taken.

In 1956, the Game Regulations were changed to afford some protection for biack and brown bear. These animals are now protacted at all times except during the regular big game season.

The Wild Life Resources of Alberta are administered by the Fish and Game Branch of the Department of Lands and Forests under the supervision of a Fish and Game Commissioner.

British Columbia.- In 1926, effective control of fur-bearing animals in British Columbia commenced and a registered trapline system went into effect. Under this system registered trappers are granted exclusive rights over designated areas. Each is given a sketch map and legal description of the territory and is required to submit an annual 'return of catch' outlining the amount and kind of fur obtained. These returns provide an accurate check of the fur taken from each district. The system of registered traplines has worked remarkably well and is practically trouble-free.

Registered traplines cover all lands except private property, National Parks, Indian reserves, municipalities and certain other reserved areas. Trapping on private property may be pursued by the property owner himself or by someone to whom the owner has given permission, provided the trapper obtains a Special Firearms Licence which costs $\$ 10$ and which must be held by all trappers; this licence entitles the legal holder to hunt all types of large and small game. In 1955, 2,798 such licences were granted. In addition, about 1,500 Indians were engaged in trapping: because they are not required to be licensed at present, their take is not recorded and the fur records for the Province are incomplete to that extent.

Fur-bearers in the Province include bear, badger, beaver, fisher, fox, lynx, marten, mink, muskrat, otter, raccoon, skunk, squirrel, weasel and wolverine. Wolf, coyote, cougar and wildcat are classed as predators although the pelts of these animals are sometimes marketable. There is no close season on the predators or on raccoon, skunk, wolverine and black and brown bear. Raccoons and foxes have become so numerous in certain parts of the Province that they also may be considered as predators.

Trapping seasons are confined to the winter months, usually commencing Nov. 1, but beaver may be taken in some areas as late as May 24. Beaver are covered by tagging regulations under which the trapper is required to submit a yearly estimate of the number of beaver left on his trapline. Before setting out to trap he makes known to the game warden of his area the number of animals he wishes to take; if it is not excessive he receives a tag which must be attached to each pelt. Trappers are not allowed to take more than 25 p.c. of the total population of beaver in their areas and this has played an important part in saving the beaver from extinction. These animals are now so numerous in some areas that it has become necessary to move them to districts where their activity will not cause damage. Nuisance animals are usually liberated on Indian traplines in need of restocking.

Muskrat and squirrel are consistently the most important source of revenue among the furs of British Columbia. Marten was once in greatest demand, but mink appears to be taking precedence.

It is unlawful to ship fur out of or into the Province without permission and also to ship fur within the Province without plainly labelling the parcel with the sender's name, address and the number of his Special Firearms Licence. These regulations enable the game authorities to keep close control over fur shipments. Almost all of the raw fur business is centred in Vancouver and a game warden is posted there to supervise fur sales and fur traders. His regular visits to the traders keep infractions of the regulations at a minimum.

Low prices caused by changes in fashion and other factors such as the relatively high wages in construction and other industries, have made the trapping of fur for a livelihood unattractive in recent years. Little trapping is carried on today as compared with earlier years and in consequence fur-bearers have become quite prevalent in all parts of the Province. The number of pelts upon which royalty was paid during 1955 was 359,365 , of which 76 p.c. were squirrel, 12 p.c. muskrat, 4 p.c. mink, 3 p.c. weasel and 2 p.c. beaver. The remainder included fisher, silver, red and cross fox, lynx, marten, otter and wolverine.

Yukon Territory.-Under registered trapline legislation introduced in 1950, 420 individual trapline registrations have been approved for the area extending from the southern border to the 65 th parallel of latitude. Beyond this line to the northern boundary the trappers, who are nomadic bands of Indians, have registered on two group-trapping
areas; one, for the Loucheaux Band No. 10 of Old Crow, has 32 registrations approved for heads of families, and the other, for the Loucheaux Band No. 7 of Fort McPherson, N.W.T., has five registrations. The initial registration fee for a trapline, either group or individual, is $\$ 10$ and the annual renewal fee is $\$ 5$.

During the past few years, low fur prices have discouraged trapline activities and trappers have been forced to find other occupations. As a consequence, beaver, fox, lynx and squirrel are more prevalent and marten, mink and muskrat are more than holding their own in number. On the other hand, fisher, wolverine, otter and weasel are scarce. Pelts taken in the 1955-56 season included: 51,323 squirrel, 49,947 muskrat, 3,162 beaver, 949 marten, 837 weasel, 651 mink (plus ranch raised 125), 2,029 lynx, 24 cross fox, 59 red fox, 6 silver fox, 85 white fox, 48 otter, 42 fisher, 3 bear, white or polar, 29 bear not specified, 232 wolverine, 19 wolf and 4 coyote.

The only fur-bearing animal on a quota is beaver; trappers are permitted to shoot or trap one beaver, including bank beaver, from each beaver house. Trapping may be prohibited over an area covered by a trapline permit if this is considered necessary for the conservation of breeding stock. During the months of February, March and April 1957, the lethal control program conducted since 1953 against predators, particularly wolves, was extended in scope by the establishment of lethal stations as far north as the 66th parallel of latitude. Poisoned bait was distributed by aircraft over a large number of lakes where wolf concentrations were observed.

Game law enforcement is in the hands of the Royal Canadian Mounted Police; in addition three federal park wardens, 20 grade A and B guides and 15 appointed citizens act as game guardians.

Northwest Territories.-Utilization of the fur and game resources in the Northwest Territories is governed by the Northwest Territories Game Ordinance. Trapping privileges are available only to resident Indians and Eskimos and those white persons who were licensed to hunt and trap in the Territories prior to 1938 and who have continued to reside therein. Provision is also made for the issue of general hunting licences to the descendants of these white persons provided they have continued to reside in the Northwest Territories and are dependent upon hunting for a livelihood.

Because of the nomadic nature of the Eskimo and the large areas over which he must hunt and trap, there is no provision for trapline registration in the Franklin and Keewatin Districts though a number of game preserves have been established in the Territories. Largest of these is the Arctic Islands Game Preserve which comprises all the Arctic Islands north of the mainland and a large area on the mainland.

Provision under the Game Ordinance for the establishment of registered traplines became effective in the Mackenzie District on July 1, 1949. Under this legislation, exclusive trapping rights in limited areas are granted to the trappers to encourage them to manage carefully the fur-bearers found there and to effect improvements leading to increased fur production. The Mackenzie District is divided into eight Game Management Districts, covering 369,315 sq. miles-over 50 p.c. under registration. There are 271 individual registered areas and 102 group areas.

The downward trend of the fur market in recent years has caused trappers to lose interest in trapline activities; many have obtained employment elsewhere and others are reluctant to trap very far away from the settlements. After showing a considerable increase in 1954-55, the trapping industry declined again in 1955-56. In the latter year 366,000 pelts were taken valued at $\$ 806,000$ as compared with 478,000 in $1954-55$ with a value of $\$ 1,167,000$. Thus the fur trade continues in a depressed condition and there is no indication of substantial revival. White fox production dropped to 27,720 in 1955-56 as compared with 60,483 in $1954-55$ which was the peak year of the four-year cycle. Muskrat and beaver production also declined considerably mainly because of low prices for pelts.

Beaver are taken on a quota basis. Trappers are permitted to shoot or trap one beaver for each occupied beaver lodge. In areas where beaver are scarce and where conditions are suitable, transplant operations have been carried out. Close or short seasons
and, if necessary, quotas are established when a particular species of fur-bearing animal is being overtrapped. A wolf-poisoning program is carried out in areas where these animals have become detrimental to desirable wildlife.

Game law enforcement is the responsibility of wardens stationed at the principal settlements in the Mackenzie District; elsewhere in the Territories it is handled by the Royal Canadian Mounted Police.

## Section 3.-Fur Farming

Fur-bearing animals were first raised in Canada on farms in Prince Edward Island about 1887 and in Quebec in 1898; today fur farming is carried on in all the provinces. Foxes were the first fur-bearers to be raised in captivity on a commercial scale but mink, chinchilla, raccoon, marten, fisher, fitch, nutria and others are now being reared. Mink are the most numerous, accounting for 93 p.c. of the total fur-bearing animals on farms in 1955 ; chinchilla followed with 6 p.c.

There was a slow and steady increase in the number of fur farms until 1920 when 587 were reported, followed by a period of more rapid growth from 1920 to 1938 when the number reached 10,454 with a production value of $\$ 6,500,000$. In 1939, when the London and other European markets were lost to the fur industry, prices declined and many fur farms went out of production. Though prices rose considerably after World War II, operating costs increased and the number of fur farms, particularly those conducted in conjunction with other farming operations, continued to decrease. By 1955 only 2,706 farms reported but the value of production had reached $\$ 17,000,000$.

Though the earliest and most intensive fur-farming operations were concerned with fox raising in the Maritime Provinces and Quebec, the sharp decline in the popularity of fox furs and the steady rise in mink resulted in Ontario and Western Canada taking predominant positions in the raising of fur animals. A distribution of the 433,266 animals on fur farms at Dec. 31, 1955, showed 18 p.c. in British Columbia, 41 p.c. in the Prairie Provinces, 26 p.c. in Ontario, 7 p.c. in Quebec and 8 p.c. in the Atlantic Provinces.

Furs have for centuries been used for clothing and adornment and the demands of fashion, encouraging the development of new colour phases in fox and mink, have been an important incentive to the fur-farming industry. There have always been mink mutations in the wild state but these unusual animals stood little chance of survival and such pelts were exceedingly rare. Starting with wild-caught mink, breeders have, by crossbreeding, produced mink furs in a variety of colours. Among the earliest mutations to appear was an attractive bluish gray mink which became known as platinum mink. Then mutations were crossbred and a still greater profusion of colour combinations appeared, notably the sapphire mink, a cross of the steel blue Aleutian with the blue gray platinum. Other unusual colour patterns are the royal pastel, a beautiful brown mink with a bluish cast, and an exquisite snow white mink.

In 1937 some chinchillas were imported into Saskatchewan and later into other provinces. These valuable little animals have a rich, soft fur. Although the original cost of chinchillas is high, the outlay for raising them is small. By 1955 there were 669 fur farms reporting 26,913 chinchillas valued at $\$ 3,031,107$.

## Section 4.-Statistics of Fur Production*

Total Fur Production Statistics.-Early records of raw fur production were confined to the decennial censuses when account was taken of the number and value of pelts obtained by trappers. In 1920 the Dominion Bureau of Statistics commenced an annual survey of raw fur production. For a number of years the statistics were based on information supplied by the licensed fur trappers. More recently annual statements based on royalties, export tax, etc., have been made available by the provincial game departments (except Prince Edward Island), and these statements are used in the preparation of the statistics issued annually by the Bureau. Figures for Prince Edward Island are based on returns supplied to the Dominion Bureau of Statistics by fur dealers in that Province.

| British Columbia. | 522,604 | 2,830,659 | 9.3 | - 446.491 | 3,576,444 | 12.7 |
| Yukon Territory | 213,515 | 212,944 | 0.8 | 109,576 | 155,777 | 06 |
| Northwest Territories....... . | 477.611 | 1,166,919 | 3.8 | 366,089 | 805,558 | 2.9 |
| Canada | 9,670,796 | 30,509,515 | 100.0 | 7,727,264 | 28,051,746 | 100.0 |

Average prices for the pelts were generally lower in 1955-56 than in 1954-55. Of the nine kinds having the highest value of production, muskrat pelts dropped from $\$ 1.16$ in $1954-55$ to $\$ 0.95$ in 1955-56, beaver from $\$ 14.88$ to $\$ 12.10$, squirrel from $\$ 0.55$ to $\$ 0.46$, ermine from $\$ 1.57$ to $\$ 1.35$, fisher from $\$ 22.75$ to $\$ 22.04$ and marten from $\$ 9.49$ to $\$ 7.85$. Increases were noted for mink including standard and mutation from $\$ 19.38$ to $\$ 20.19$, white fox from $\$ 11.39$ to $\$ 13.14$ and otter from $\$ 25.70$ to $\$ 26.71$.

| Totals. | 9,670,796 | 30,509,515 | ** | 7,227,264 | 28,051,746 | $\cdots$ |

Fur Farm Statistics.-There were 2,706 fur farms operating in Canada in 1955 in comparison with 2,566 in the previous year. The increase resulted from the operation of a larger number of chinchilla farms and from the inclusion of fur farm statistics of Newfoundland for the first time.

Fur farms reporting foxes in 1955 numbered 189 as compared with 249 in the previous year; the number of foxes on farms was down by 32 p.c. and the value of these animals by 39 p.c. The number of mink farms increased from 1,858 to 1,912 during 1955. Farms having fewer than 80 mink decreased by 4 p.c. while those having 80 or more increased by 7 p.c. The number of mink on farms increased from 335,150 valued at $\$ 9,632,795$ in 1954 to $\mathbf{4 0 2 , 4 5 3}$ valued at $\$ 11,880,147$ in 1955 . Fox pelt production increased from 6,836 valued at $\$ 70,554$ in 1954 to 7,238 valued at $\$ 66,070$ in 1955 , and mink pelts from 677,014 valued at $\$ 12,868,787$ to 786,760 valued at $\$ 15,787,520$.

## Section 5.-Marketing of Furs

Montreal, Que., is the leading Canadian fur mart although auction sales are also held at Vancouver, B.C., Edmonton, Alta, Regina, Sask., and Winnipeg, Man. The Saskatchewan Government maintains a Fur Marketing Service at Regina to assist producers in that Province.

Grading.-The grading of furs to secure uniformity was introduced in 1939 by the federal Department of Agriculture so that furs may be purchased by grade without the necessity of buyers from other countries personally examining the pelts. Grading offers many advantages to the producer as well as to the trade in general. It educates the rancher as to the proper value of his pelts and creates an incentive to improve the quality of the product; it furnishes guidance in the planning of future matings, aids in raising the standard of quality of the entire crop of pelts and helps in advancing the level of prices for high quality pelts.

Exports and Imports.-Before World War II, Canada marketed fur pelts mainly in the United Kingdom but that market was practically dormant during the war years and the fur trade was carried on chiefly with the United States. A revival of trade with the United Kingdom took place after the War but almost 80 p.c. of Canadian fur exports still go to the United States.

The Canadian fur trade, both export and import, is mostly in undressed furs, the value of dressed and manufactured furs going out of or coming into Canada being a comparatively small proportion of the total. Exports consist largely of furs which Canada produces in greatest abundance, mink being the most valuable followed by beaver, muskrat and fox. Furs such as Persian lamb, certain types of muskrat, mink, sheep and lamb and squirrel make up the major portion of the imports.

In 1947 the Canadian Government sought to interest European buyers in Canadian furs by sponsoring an exhibit of ranch-raised furs at an international trade fair in Switzerland. This was the beginning of a series of exhibits in European countries-England, France, Italy and Switzerland-the primary purpose of which was to induce buyers to attend the sales or to purchase their requirements through brokers. These exhibits assisted in attracting attention to Canada as a producer of high quality furs.

Exports and imports of all furs to and from the United States, the United Kingdom and all countries are given for the years 1955 and 1956 in Table 7.

## Section 6.-The Fur Processing Industry*

The rather general term 'fur processing' includes the fur dressing and dyeing industry and the fur goods industry. The former is concerned with the dressing or dyeing of pelts on a custom basis and the latter is a manufacturing industry that makes up fur goods such as coats, scarves and gloves.

[^206]Fur dressing and dyeing industry statistics were first recorded in 1917 when 12 establishments with 511 employees reported receipts of $\$ 1,071,805$. Eight establishments in 1924 reported revenues of $\$ 1,120,895$, expenditures of $\$ 162,013$ on dyes, chemicals and other materials used, and expenditures of $\$ 561,233$ on salaries and wages to 539 employees. Of the $3,473,909$ skins treated in that year, muskrat pelts made up 47 p.c., rabbit 19 p.c. and squirrel 10 p.c.

The greatest number of skins treated was reported in 1941 when 14,592,079 were handled, but almost 53 p.c. of those were rabbit skins so that the revenue for that year was only $\$ 2,476,289$. The record revenue reported was that for 1949 when $\$ 6,691,418$ was received and rabbit skins constituted 38 p.c. of the total processed.

In 1955 the number of skins treated was $9,762,062$, of which muskrat comprised 51 p.c., Persian and other types of lamb 13 p.c., mink 12 p.c., squirrel 9 p.c. and rabbit 7 p.c.
8.-Principal Statistics of the Fur Dressing Industry 1952-55

| Item |
| :--- | :--- |

Statistics on a comparable basis for the fur goods industry are available from 1921, when 219 establishments reported a gross value of production of $\$ 13,639,609$, employees numbered 2,621 and salaries and wages amounted to $\$ 3,013,706$. Cost of materials used in the manufacturing process totalled $\$ 8,118,833$. Principal statistics of the industry for the years 1952 to 1955 are given in Table 9.

## 9.-Principal Statistics of the Fur Goods Industry 1952-55

| Item |  |
| :--- | :--- | ---: | ---: | ---: | ---: | ---: |

Changes in living habits and standards in the past quarter-century are reflected in the type of goods produced by the fur goods industry. For example in 1921 there were 31,604 ladies' fur coats and jackets produced whereas in 1955 the number was 203,233. The manufacture of men's fur coats showed a decided reversal in the market; there were 5,692 men's fur or fur-lined coats manufactured in 1921 but only 149 in 1955.

## CHAPTER XV.-MANUFACTURES

Notg.-The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

This Chapter deals with manufacturing in Canada in three Parts. Part I reviews the manufacturing situation at the end of 1955, emphasizing particularly the fifteen leading industries. Part II provides general statistical analyses including: manufacturing statistics from 1917; detailed treatment of current production under various groupings and individual industries; and principal factors in manufacturing production such as capital expenditures, employment, salaries and wages and size of establishment. Part III deals with the provincial and local distribution of manufacturing production.

A special review of postwar growth of manufacturing within the framework of Canadian cconomic development appears in the 1956 Year Book, pp. 619-624.

## PART I.-REVIEW OF MANUFACTURING

Canada is one of the world's largest manufacturing nations, probably ranking about sixth. Manufacturing contributed 29 p.c. of the net national income in 1955, which was almost as great a proportion as manufacturing holds in the United States, where it contributed 32 p.c. About one-quarter of the employed population in Canada were working in manufacturing in mid-1955.

Canada's position as one of the world's leading traders is based largely on the country's natural resources, and is reflected in the industrial structure. Three industries stand out as major exporters-the pulp and paper mills, the non-ferrous smelting and refining plants, and the sawmills. These three large exporters are all closely concerned with the processing of Canada's natural resources. The aluminum plants, which form part of the smelting and refining industry, are an exception, since they process imported raw materials, but the reason for their location in Canada is the abundant supply of another natural resourcewater power.

Slaughtering and meat packing and the butter and cheese industry, two other resourcebased industries appearing among the leading fifteen in value of shipments, were once important exporters but are now occupied in supplying the home market because demand for their products from a larger and more wealthy population has increased faster than production. The bakeries and the manufacturers of miscellaneous food preparations are also turning out much greater quantities of food for the growing population.

The growth of population is only one way in which Canada is providing a domestic market for more and more industrial produce. The range of industries supplying domestic needs has greatly expanded and at the same time the major export industries are finding an expanding market for their products in Canada. Growth stimulates growth. Canada's mines, forest industries, transport systems and service trades expand, and that expansion requires building materials, machinery and equipment. Every new factory provides an increased market for capital goods and for raw materials or semi-finished products. Thus the market for existing products expands calling for increased output, and a demand for new products springs up, which is met by imports until the market isable to support domestic production.

Fifteen industries were responsible for 46.4 p.c. of total shipments by manufacturers in 1955. Five of these were primarily engaged in meeting the requirements of the domestic consumer for goods required for current use-the four food-producing industries already mentioned, and the printing and publishing industry which derives most of its revenue from newspapers and periodicals. The three major exporting industries have also been mentioned, and the remaining seven of the fifteen leading industries are mainly occupied in meeting the requirements of Canadian industry for capital goods or materials, and the requirements of Canadian consumers for durable goods.

Several of the leading industries are controlled by interests in the United States. Information for 1955 is not available, but a special study for 1953 gave figures which are still of interest. The value of shipments of selected firms under United States control was expressed as a percentage of all shipments by the industry in question. For the exporting industries, 39 p.c. of shipments of the pulp and paper industry were made by United States-controlled firms in 1953, and 70 p.c. of the shipments of non-ferrous smelters and refineries. Data for sawmills were not available separately, but 6 p.c. of the shipments of the wood products industries were by firms controlled in the United States. For the main industries meeting current domestic needs, there were no such striking figures although 16 p.c. of the shipments of dairy products were from United States-controlled firms.

For the leading industries meeting manufacturers' needs and the needs of consumers for durables, the percentages of shipments made by United States-controlled firms in 1953 were as follows: petroleum products, 68 p.c.; motor vehicles, 98 p.c.; primary iron and steel, 7 p.c.; rubber goods, 78 p.c.; and motor vehicle parts, 67 p.c. Data for the aircraft and parts industry and the miscellaneous electrical products industry were not available separately.

In 1955, pulp and paper production was Canada's leading industry; shipments were valued at $\$ 1,327,000,000$. The pulp and paper mills are fed by the great coniferous forests, through which run extensive river systems. The rivers provide a means of transporting pulpwood to the mills, and also provide the power for generating electricity. The importance of cheap power to this industry is emphasized by the fact that, in 1955 , it used about 34 p.c. of all the electricity utilized by Canadian manufacturers.

On the market side, there has been a great increase in the consumption of paper throughout the world, especially in North America. Increased education has advanced the sales of newspapers, books and other printed matter, and new uses are continually being found for paper-for building materials, packaging materials, electric insulation, and for a wide range of other purposes. In 1955, 74 p.c. of the industry's shipments consisted of paper- $\$ 981,000,000$ out of a total of $\$ 1,327,000,000$. Exports of paper and paper goods were valued at $\$ 694,000,000$ and exports of wood pulp at $\$ 297,000,000$. These exports, totalling $\$ 991,000,000$, amounted to 75 p.c. of production. The industry produced 10.151 .000 tons of wood pulp in 1955, of which $2,383,000$ tons were exported. The
remainder, together with about 502,000 tons of other material (mainly waste paper), was turned into $8,000,000$ tons of paper including $6,196,000$ tons of newsprint and 861,000 tons of paperboard; $5,763,000$ tons of the newsprint were exported.

The non-ferrous smelting and refining industry, Canada's second largest manufacturing industry, shipped products to the value of $\$ 1,212,000,000$ in 1955. Canada is one of the world's leading producers of non-ferrous metals, standing first in the production of nickel, second in aluminum, third in zine, fourth in lead, and fifth in copper. These figures do not include the metallic content of exported ore. Canads is the world's leading exporter of non-ferrous metals.

Many of the country's most important base-metal ore bodies were discovered before the turn of the century, but their complexity prevented early exploitation. Unlike important deposits in other countries, which consist largely of oxides or of sulphides of a single metal, they were found to contain ores of two or more base metals intimately associated and frequently containing appreciable quantities of precious metals, such as gold, silver and platinum. Their development was the result of considerable skill and enterprise. The industry operates smelters and refineries that rank among the largest and most highly integrated of their kind in the world. Cheap water power located near the ore bodies is another advantage that enabled the industry to sell in world markets at competitive prices. The industry is based largely on Canadian ores, with the major exception of the aluminum plants which import bauxite and alumina, depending on cheap electric power for their success in international trade.

Exports of products of this industry in 1955 included nickel in various forms $(\$ 215,000,000)$, aluminum in primary forms ( $\$ 199,000,000$ ), copper in primary forms $(\$ 110,000,000)$, zinc slab or cake $(\$ 47,000,000)$ and pig lead $(\$ 22,000,000)$. These together amounted to about $\$ 593,000,000$, or 49 p.c. of the total value of the industry's shipments.

The petroleum products industry was the third largest of Canadian manufacturing industries, recording sales of $\$ 1,049,000,000$ in 1955 . The industry used about $6,800,000,000$ gal. of crude oil, of which 55.4 p.c. was from Canadian wells. The refineries of Quebec and the Maritimes continued to operate on imported oil because of their distance from Canada's western oil fields. However, the recent construction of pipelines has resulted in heavy consumption of Canadian crude by refineries in Ontario.

This industry has grown considerably in the past few years, keeping pace with general Canadian expansion. Special studies made of the net use of energy in Canada showed an increase from about $1,088,000,000,000,000$ British thermal units in 1926 to about $2,171,000,000,000,000$ in 1952. This growth was partly a result of the increase in population but the wider use of energy caused an increase in the net amount used per head of population from $115,000,000$ B.t.u. in 1926 to $151,000,000$ in 1952. The part played by liquid petroleum fuels in the total energy picture increased considerably over the period; in 1926, they supplied about 9 p.c. of Canada's net consumption of energy and in 1952 about 37 p.c. The advance resulted from increased use by industry, a large increase in the consumption of fuel oil for heating homes and buildings, and the conversion of the railroads to diesel locomotives.

Three of Canada's fifteen largest manufacturing industries are occupied in the production of transportation equipment; the motor vehicles industry ranked fourth in 1955 with sales of $\$ 907,000,000$, the aircraft and parts industry ninth with sales of $\$ 354,000,000$, and the motor vehicle parts industry fourteenth with sales of $\$ 285,000,000$.

The main items shipped by the motor vehicles industry were approximately 375,000 passenger cars valued at $\$ 611,000,000,78,000$ trucks valued at $\$ 136,000,000$, and 557 buses valued at $\$ 7,100,000$. Of the vehicles shipped, 25,700 passenger cars worth $\$ 20,000,000$ (including 13,300 chassis without bodies) and 9,400 trucks worth about $\$ 9,000,000$ were shipped for export. Imports included about 48,500 passenger cars, 8,900 trucks and 500 buses, with a total value of $\$ 114,000.000$.

Taking into account production, imports and exports, the apparent supply of new vehicles in Canada in 1955 was 398,000 passenger cars and 79,000 commercial vehicles. This new supply was offset by the withdrawal from use of about 151,000 passenger cars and 21,000 commercial vehicles. Total registrations during the year covered 2,935,000 passenger cars and 938,000 commercial vehicles so that there was one passenger car for every 5.3 persons in the country. Taking all motor vehicles together, including motorcycles and tractors, there was one vehicle for every 4.0 persons. Ontario has one of the world's heaviest concentrations of automobile ownership. In that Province, there was one car for every 4.0 persons, one motor vehicle for every 3.2 persons, or 0.98 automobile for each family. By 1956 the latter figure had increased to 1.02 per family.

The production of aircraft and parts was a major industry in Canada during the Second World War, but output declined abruptly afterwards and as recently as 1950 amounted to only $\$ 55,000,000$. By 1955, however, its total shipments had increased again to $\$ 354,000,000$, including $\$ 73,000,000$ worth of parts alone, though this total was still well below the $\$ 427,000,000$ recorded in 1944. The recent growth in the industry began with the outbreak of war in Korea in 1950. Features of the expansion were the development of an all-Canadian long-range fighter for defence in the North and the production of several types of defence aircraft designed in the United States or the United Kingdom. The industry, however, is not dependent entirely on the defence program. Several types of aircraft have been developed to meet Canadian flying conditions, especially in the vast areas of the North, and these have also met with a good response from users abroad. The expansion of aircraft production has been accompanied by the establishment of facilities for producing many component items, some of them new to Canadian manufacturing, such as aircraft instruments, needle bearings, and special alloys to withstand the heat of jet engines.

The slaughtering and meat packing industry, which came fifth in 1955 with shipments valued at $\$ 809,000,000$, was the largest industry in the foods group. Also included among the fifteen leading industries were butter and cheese factories which came eighth with sales of $\$ 427,000,000$, the miscellaneous food preparations industry twelfth with sales of $\$ 304,000,000$, and bakeries thirteenth with sales of $\$ 289,000,000$. In terms of value added by manufacture, these industries, except for bakeries, would be considerably lower on the list. Their products are not so highly processed as are those of many other industries and much less is added in the manufacturing process to the value of their raw materials. Shipments by the slaughtering and meat packing industry included $\$ 432,000,000$ worth of fresh and frozen meats, $\$ 120,000,000$ worth of cured and smoked meats, and $\$ 84,000,000$ worth of sausage and cooked meats. Inedible by-products included $\$ 8,900,000$ worth of cattle hides. To produce these items, the industry slaughtered over $8,400,000$ animals valued at \$467,000,000 in 1955.

Of the $\$ 427,000,000$ worth of shipments by butter and cheese factories in 1955, milk and cream sold as such brought in $\$ 159,000,000$, and ice cream $\$ 36,000,000$. About $306,000,000 \mathrm{lb}$. of butter and $81,000,000 \mathrm{lb}$. of cheese were shipped, together valued at $\$ 202,000,000$.

The miscellaneous food preparations industry ranked twelfth with sales of $\$ 304,000,000$. This industry depends largely on imported materials but sells almost entircly in the domestic market. Over one-third of the industry's activities are concerned with the roasting and packing of coffee, and the blending and packing of tea. Shipments of coffee were valued at $\$ 73,000,000$ and those of tea at $\$ 47,000,000$ in 1955.

The bread and other bakery products industry, which came thirteenth among the industries in 1955, produced goods to the value of $\$ 289,000,000$, all for the home market. Bread sales accounted for $\$ 175,000,000$ of this total; the average per capita consumption of bread was 98.1 lb ., which was 7.3 lb . less than in 1953 and 2.4 lb . less than in 1954.

The lumber industry has been a mainstay of Canada's economy since the earliest days and in 1955 ranked as the sixth largest manufacturing industry of the country. In that year sawmill products shipped were valued at about $\$ 644,000,000$ and consisted mainly of lumber ( $\$ 542,000,000$ ). shingles $(\$ 30,000,000)$ and railroad ties ( $\$ 9,000,000$ ).

Logs and bolts to the value of about $\$ 311,000,000$ were used, together with about $\$ 28,000,000$ worth of other materials and supplies. Of the lumber sawn, 63 p.c. by value was produced in British Columbia, 13 p.c. in Quebec, and 11 p.c. in Ontario. Softwoods made up 95 p.c. by quantity of the lumber sawn. Exports from Canada of sawmill products were valued at $\$ 423,000,000$ in 1955.

There has been a considerable expansion in the primary iron and steel industry in recent years and important technical developments have been pioneered in Canada, including the continuous casting of steel shapes and a faster process for the use of oxygen in steel-making. In 1955 , shipments valued at $\$ 526,000,000$ placed the industry seventh among the industries of the country. Production amounted to $4,535,000$ tons of steel. Few of the steel ingots produced were sold as such, nearly all of them being further processed by the makers. About 23 p.c. of the pig iron produced was sold to other firms.

The industry is dominated by four integrated plants, two of them at Hamilton, Ont., and one each at Sydney, N.S., and Sault Ste. Marie, Ont. There are also other steel plante across the country which feed their furnaces on purchased pig iron and scrap, and two blast furnaces which do not form part of an integrated steel plant. The industry uses a good deal of Canadian iron ore and coke from Canadian coal, but imported ore is mainly used. This is partly because some plants can ship ore more conveniently from United States mines than from Canadian mines, and partly because a blast furnace requires a range of different types of iron ore, and must therefore rely on varied sources.

The miscellaneous electrical apparatus and supplies industry, the main products of which are electric wire and cables, electric light bulbs and fluorescent tubes, came tenth on the list of industries in 1955 after having appeared within the fifteen leading industries for the first time in 1954. This industry is only one of the electrical industries showing extremely rapid growth in recent years. While the miscellaneous industry shipped goods to the value of $\$ 325,000,000$, in 1955 the radio and radio parts industry had a production valued at $\$ 263,000,000$, the heavy electrical machinery industry at $\$ 198,000,000$, the refrigerators, vacuum cleaners and appliances industry at $\$ 136,000,000$, and the batteries industry at $\$ 40,000,000$. Other industries also produce wire and cables and electric light bulbs and tubes, and the total output of these commodities in 1955 amounted to $\$ 151,000,000$ and $\$ 22,000,000$ respectively.

The rubber goods industry, eleventh in the field with shipments of $\$ 322,000,000$ in 1955, depends mainly on the home market. It is heavily influenced by the automotive industry because tires and tubes together make up over half the shipments, the other major item being rubber footwear. Of the rubber used in 1955, 44.5 p.c. was imported natural rubber, 40.4 p.c. was domestically produced synthetic rubber and the remainder was reclaimed rubber.

The printing and publishing industry, with sales valued at $\$ 275,000,000$ in 1955 , came fifteenth among the industries. This industry is rather unique in that it pays more in salaries and wages than it spends on raw materials- $\$ 108,000,000$ as against $\$ 75,000,000$; in 1955 of the total sales, newspapers accounted for $\$ 171,000,000$. Advertising brought in $\$ 127,000,000$ of that amount and the remaining $\$ 44,000,000$ came from the actual cash price of the newspapers.

## PART II.-STATISTICS OF MANUFACTURING

## Section 1.-Growth of Manufacturing

It is impossible to give absolutely comparable statistics of manufacturing over a long period of years. From 1870 to 1915 statistics were collected only in connection with decennial or quinquennial censuses and there was inevitably some variation in the information collected. The annual Census of Manufactures was instituted in 1917 and, though numerous changes have been made since then in the information collected and the treatment of the data, an effort has been made to carry all major revisions back to 1917, so that the figures for the period since then are on a reasonably comparable basis.

Beginning in 1952 the Bureau of Statistics changed its policy with regard to the collection of statistics on the production of manufactured goods. Firms in several industries where year-end inventory changes were known to be insignificant were requested to report value of shipments f.o.b. plant instead of gross value of products. Under the "value of products" concept, establishments were asked to report the factory selling value of the products made whether sold or not, the unsold portion being assigned the average selling value of similar articles sold during the year. Under the "value of shipments" concept, establishments are required to report their sales during the year regardless of when the products were made, an item usually readily available from the firms' records. The changeover was made to provide increased ease in reporting for the majority of plants and at the same time to produce more reliable and useful statistics.

## 1.-Summary Statistics of Manufactures 1917-55

Norg.-Statistics of manufacturing from 1870 have been published but between that year and 1917 figures are not on a comparable basis to the series given below. Statistics for significant years appear in the 1943-44 Year Book, p. 363. Figures of the non-ferrous metal smelting industries were first included with manufactures in 1925.

| Year | Estab-lishments | Employees | Earnings | Cost at Plant of Materials Used | Value <br> Added by <br> Manufacture ${ }^{1}$ | Gross Value of Products ${ }^{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Subsection 1.-Consumption of Manufactured Products

The value of all manufactured commodities made available for consumption in 1955 was $\$ 20,152,020,318$, a figure obtained by adding to the value of manufactured products the value of the imports of manufactured and partly manufactured goods, and deducting the value of the exports. More accurate statistics could be presented were it possible to exclude from the gross value of manufactured products the duplications involved when the products of one manufacturing establishment become the material worked upon in another. Iron, vegetable, wood and paper, non-ferrous metals and non-metallic minerals were, in that order, the leading groups in the value of finished products made available for consumption in 1955.

Animal, wood and paper, and non-ferrous metal products were manufactured in Canada in greater quantities than required for home consumption, providing export balances in these groups.

On balance, Canada in the past imported large quantities of iron and steel, textiles, chemicals and non-metallic mineral products despite large home production. The expansion of the iron and steel, chemical and non-metallic mineral products industries will enable Canada to meet more of her requirements for home consumption and to export greater quantitios in the future.

## 4.-Consumption of Manufactured Products, Significant Years 1929-53 and by Industrial Group 1954 and 1955

| Year and Industrial Group | Gross Value of Products Manufactured ${ }^{2}$ | Manufactured and Partly Manufactured Goods ${ }^{1}$ |  | Value of Manufactured Products Available for Consumption |

${ }^{1}$ Figures for the years 1929 and 1933 are for the fiscal years ended Mar. 31 of the following years; for 1939-55 they are for the calendar year. Net imports are total imports less foreign products re-exported. ${ }^{2}$ In 1952 grocs value of products was replaced by value of factory shipments: see text on p. 634.
${ }^{2}$ Consumption figures for the major standard industrial classification groups (see p. 646) cannot be calculated because statistics of imports and exports are compiled on the component material classification basis.

## Subsection 2.-Value and Volume of Manufactured Production

Value of Manufactured Production.-In the interpretation of manufacturing values over a number of years variations in the level of prices must be borne in mind. In recent years owing to large changes in prices, unadjusted value series used in isolation have become increasingly inadequate as indicators of economic trends. Consequently interest has shifted to measures of volume. The range of prices since 1929, on the base period $1935-39=100$, is as follows:-

| Year | General Wholesale Price Indez | Price Index of Fully or Chiefly <br> Manufactured Products |
| :---: | :---: | :---: |
| 1929. | 124.6 | 123.7 |
| 19393. | 87.4 | 93.3 |
| 1944........ | 139.6 | 129.1 |
| 1946 | 138.9 | 138.0 |
| 1949. | 198.3 | 199.2 |
| 1953. | ${ }_{226}^{226} 0$ | 2307 |
| 1954. | 220.7 | 224.8 |
| 1955.. | 218.9 | 224.5 |

Volume of Manufactured Production.-Real income is ultimately measured in goods and services so that the growth of the volume of manufacturing production, as distinguished from its value, becomes a matter of great significance. The important thing to know is whether consumers are getting more goods and services and not whether they are expending more dollars and cents. The field of industrial production, because of its dominating position in the national economy, has attracted increasing attention and this in turn has resulted in the need for more accurate measurements of physical output.

During the past few years the Dominion Bureau of Statistics has been engaged in the reconstruction of the index of industrial production* which was first published in 1926 and later subjected to several major revisions. The latest reconstruction was made possible by the availability of a great deal of basic data. Annual statistics valuable for this project have been collected by the Bureau from the end of World War I to the present and the scope of the monthly information has been greatly expanded. Applying methods developed through the experience of the past quarter-century, it has been possible to compute an index with a fair measure of accuracy from 1935 to the present.

The manufacturing sector is divided, at the major group level, into durable manufactures and non-durable manufactures, for the reason that the movement of durable goods normally varies from that of non-durables. There tends to be greater fluctuation in durables from prosperity to depression, the demand for non-durables being more constant.

## 5.-Index of the Total Volume of Manufactured Production classified on the Basis of Durable and Non-durable Goods 1946-55

(1935-39=100)
Nors.-Figures for the years 1935-45 are given in the 1955 Year Book, y. 641.

| Year | Nondurable Manufactures | Durable <br> Manufactures | All Manufactures | Year | Nondurable Manufactures | Durable <br> Manu- <br> factures | All Manufactures |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1946. | 180.2 | 205.1 | 1899 | 1951. | 214.0 | 285.9 | 242.1 |
| 1947. | 191.2 | 233.5 | 207.7 | 1952. | 215.2 | 294.9 | 246.3 |
| 1948. | 197.1 | 244.4 | 215.5 | 1953. | 224.1 | 323.9 | 263.0 |
| 1949 | 198.2 | 246.3 | 217.0 | 1954. | 221.7 | 297.7 | 251.4 |
| 1950 | 208.3 | 2591 | 228.1 | 1955. | 235.2 | 324.8 | 270.1 |

The period 1946-55 was characterized by unprecedented industrial expansion. The end of hostilities in 1945 and the subsequent reconversion to peacetime production were attended by declines in output but the upward trend was resumed in 1947. The rate of advance slackened moderately in 1948 and 1949 but regained most of its 1947 impetus in 1950 when the outbreak of hostilities in Korea resulted in heavy anticipatory buying on the part of consumers and in growing expenditures for national defence. A remarkable feature is that in 1952 the index of the volume of manufacturing production stood at 246.3 having surpassed the record wartime level of 242.3 established in 1944. The index continued to advance in 1953, dropped somewhat in 1954 but reached a new high in 1955.

Durable Manufactures.-The volume index of durable manufactures reached a peak of 340.1 in 1944 but declined sharply to 205.1 in 1946 . Since then the advance has been steady, except for 1954, and the index stood at 324.8 in 1955. Over the 1946-55 period, the greatest gains were shown by electrical apparatus and supplies and non-metallic mineral products.

All groups in the durable goods sector with the exception of transportation equipment recovered in 1955 from the downward adjustment experienced in 1954. Non-metallic mineral products were up 15.1 p.c., iron and steel products 14.1 p.c., electrical apparatus and supplies 12.0 p.c., wood products 10.8 p.c., and non-ferrous metal products 9.8 p.c.

[^211]The transportation equipment group was slightly lower than in 1954. Although the volume of output of the automobile industry was 29 p.c. higher, the lower levels at which the shipbuilding, aircraft and railway rolling-stock industries operated more than offset that increase, leaving a decline of 1.2 p.c. for the group as a whole as compared with 1954 and a 20.0 -p.c. decline from the high level of 1953. The iron and steel group, despite the recovery made in 1955 , was still about 1.8 p.c. below the record level of 1952.

## 6.-Indexes of the Volume of Manufactured Production of the Groups Comprised within the Durable Manufactures Classification 1946-55

(1935-39=100)

Nore.-Indexes for the years 1935-45 are given in the 1954 Year Book, p. 630.

| Year | Wood Products | Iron and Steel Products | Transportation Equipment | Nonferrous Metal Products | Electrical <br> Apparatus and Supplies | Nonmetallic Mineral Products |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1946. | 175.0 | 222.6 | 221.5 | 160.1 | 247.3 | 221.4 |
| 1947. | 195.6 | 249.9 | 239.5 | 182.8 | 316.8 | 269.8 |
| 1948. | 200.7 | 270.4 | 232.6 | 201.6 | 328.5 | 283.7 |
| 1949. | 202.3 | 264.5 | 243.9 | 200.5 | 333.8 | 284.4 |
| 1950. | 215.1 | 263.2 | 262.2 | 212.8 | 367.6 | 314.6 |
| 1951. | 220.6 | 292.2 | 315.0 | 234.7 | 392.3 | 342.1 |
| 1952. | 214.1 | 292.7 | 373.1 | 232.2 | 393.1 | 346.1 |
| 1953. | 235.3 | 290.8 | 436.3 | 243.3 | 486.7 | 399.0 |
| 1954. | 230.3 | 251.8 | 354.9 | 246.7 | 477.8 | 409.5 |
| 1955. | 255.1 | 287.3 | 350.7 | 270.9 | 535.2 | 471.5 |

Non-durable Manufactures.-The trend of output in the non-durable sector of manufacturing from 1946 to 1955 was visibly smoother than in the durable sector. Except for 1954 there has been no interruption in the upward movement of production during this period. Unlike durable goods, non-durable commodities are mostly consumer goods and are less influenced by sudden changes in the international situation or the capital investment programs of producers and governments. By 1955 the non-durables index of output had reached 235.2, the highest on record. All groups reported increased activity in 1955 as compared with 1954, the greatest increases being reported by rubber goods and textiles.

## 7.-Indexes of the Volume of Manufactured Production of the Groups Comprised within the Non-durable Manufactures Classification 1946-55

$(1935-39=100)$
Note.-Indexes for the years 1935-45 are given in the 1954 Year Book, p. 629.

| Year | Foods | Beverages | Tobacco and <br> Tobacco <br> Products | Rubber Products | Leather Products | Textile <br> Products (except Clothing) |

| 1955. | 149.0 | 267.7 | 219.5 | 385.4 | 291.8 |

# Section 2.-Manufactured Production Variously Classified 

## Subsection 1.-Manufactures classified by Industrial Groups and Individual Industries

Current Changes in Manufacturing Production.-The manufacturing industries of Canada during 1955 made a rapid recovery from the downward adjustment experienced in 1954. The selling value of factory shipments at $\$ 19,513,933,811$ was the highest on record and exceeded by 9.7 p.c. the previous high mark attained in 1953. In employment, however, the record was not so impressive. Although there was an increase of 2.4 p.c. in the number of employed in 1955 as compared with the previous year, the number still fell short, by about 29,000 , of the record number of $1,327,451$ employed in 1953. Salaries and wages paid at $\$ 4,142,409,534$ and value added by manufacture at $\$ 8,753,450,496$ were the highest on record, exceeding the previous high of 1953 by substantial margins.

The improvement in manufacturing operations that occurred during 1955 was the result of three main factors. First was the accelerated spending on capital goods, such as construction and machinery and equipment of all kinds, which rose from $\$ 5,620,000,000$ in 1954 to $\$ 6,230,000,000$ in 1955 , an increase of 11.0 p.c. This stimulated the durable goods industries to a marked degree, and was reflected in the increased output of pig iron which rose from $2,211,029$ tons in 1954 to $3,215,367$ tons in 1955 , steel ingots and castings from $3,195,030$ tons to $4,534,672$ tons, aluminum from 557,897 tons to 612,543 tons, nickel from 166,299 tons to 174,928 tons, cement from $22,437,477$ bbl. to $25,168,464$ bbl., and motor vehicles from 352,109 units to 452,114 units. The second factor was the improvement in the export demand for many Canadian manufactured commodities. Exports of newsprint, wood pulp, planks and boards, shingles, veneer and plywood, aluminum, nickel, copper, zinc, automobile parts and fertilizers were all substantially higher in 1955 as compared with 1954. Exports of whisky, farm implements and artificial crude abrasives were at about the same level while exports of wheat flour and aircraft were considerably lower. The third factor was the impact on the consumer goods industries of the increase of about 400,000 in population as well as by the rise in labour income.

Demands stemming from population growth and a rising standard of living have been noticeable at all levels. In food processing, a steady up-grading in the quality of foods sold on the domestic market has been even more important than population growth. The two together have almost doubled the dollar sales of processed foods in this country since 1945. And at the intermediate level other important changes have taken place. Many of Canada's new chemical plants, for example, have been built with the domestic consumer market in mind. Frequently using petroleum or natural gas as a source of raw material, they have gone a long way towards making Canada independent of imports in such categories as vanillin, nylon and ravon intermediates, and plastics for packaging and other uses.

## 8.-Percentage Variations in Employment, Earnings and Gross Value of Products in the Main Industrial Groups, 1955 Compared with 1954

| Industrial Group | 1955 Compared with 1954 |  |  |
| :---: | :---: | :---: | :---: |

| 1951 | 1,173 | 28,756 | $66,908,755$ | 87,292,415 | 120,899,546 | 210, 804, 555 |
| 1954. | 1,360 | 31,071 | 85, 748,818 | 102,179,368 | 149,157,222 | 252, 300,085 |
| 1955 | 1,524 | 31,511 | 89, 239,630 | 114,448,353 | 164,876,649 | 283,147,886 |

${ }^{2}$ In 1952 gross value of products was replaced by value of factory shipments; see text on pp. 633-634. ${ }^{2}$ Not comparable with previous years because of major changes in concept affecting the data for the primary iron and steel industry.

Detailed Statistics by Group and Individual Industries.-Table $\mathbf{1 0}$ presents for 1955 detailed statistics regarding the individual industries under which all industrial plants in Canada are classified. The industries are assembled under seventeen main groups according to the Standard Industrial Classification.

In interpreting the statistics of individual industries it should be noted that the figures on employment, production, etc., do not refer to individual products but to all the products produced by an industry. For example the value of production of the confectionery industry amounting to $\$ 112,630,426$ in 1955 does not imply that this was the value of confectionery produced. What it means is that the firms whose principal product was confectionery had a value of production of $\$ 112,630,426$. This figure, in addition to confectionery, includes all the subsidiary products made by these firms, such as ice cream which was valued at $\$ 3,505,761$ and bread and other bakery products valued at $\$ 1,596,455$. Confectionery is also produced as a subsidiary product by firms credited to other industrial classifications. The quantities and values of the principal individual commodities produced are given in Table 11. Commodities produced in small quantities are not included, but the list covers approximately 75 p.c. of total production.

## 10.-Principal Statistics of Individual Manufacturing Industries 1955

Nors.-Comparable figures for 1954 have not been published in the Canada Year Book but are available from DBS publication General Review of the Manufacturing Industries of Canada, 1954.

| Group and Industry | Estab-lishments | Employees | Earnings | Cost at Plant of Materials Used | Value <br> Added by Manufacture | Selling Value of Factory Shipments |

## Subsection 2.-Manufactures classified by Origin of Materials

The distinction made between farm materials of Canadian and foreign origin is based on whether the materials are indigenous to Canada rather than on their actual source. Thus, the industries included in the foreign origin classes are those depending upon materials that cannot be grown in Canada, such as tea, coffee, spices, cane sugar, rice, rubber, cotton, etc. Industries included in the Canadian origin classes may, however, be using large quantities of imported materials.

The mineral origin group includes, in addition to non-ferrous metals so largely produced in Canada, the manufactures of iron and steel, of petroleum, and of other mineral substances, the raw materials for which are very largely imported. Products of mineral origin, with the exception of fuels, are nearly all durable goods.
12.-Principal Statistics of Manufacturing Industries classified according to Origin of Materials Used, by Main Group 1954 and 1955

| Year and <br> Origin of Material Used | Estab-lishments | Employees | Earnings | Cost at Plant of Materials Used | Value <br> Added by Manufacture | Selling Value of Factory Shipments |

## Subsection 3.-Manufactures classified by Type of Ownership

The figures showing the classification of the type of ownership under which Canadian manufacturers operate are available from 1946, although the first survey did not include the fish curing and packing industry. Its inclusion in subsequent years has not materially altered the percentage distribution of individual ownership, incorporated companies, etc.

As is to be expected, the smaller establishments, regardless of the type of products manufactured, are carried on under individual ownership. In that category industries conducted on a small scale contain a large number of establishments, the percentage decreasing as the scale of operations increases, as the following figures for 1955 show:-

|  | Average <br> Number of <br> Group <br> Employees <br> per <br> Establishment |
| :---: | :---: |

Of the 38,182 establishments operating in 1955, 1,617 establishments in the periodica publishing industry were unclassifiable, leaving 36,565 establishments in the four categories of ownership. Individual ownership numbered 15,609 establishments, partnerships 4,977, incorporated companies 15,037 and co-operatives 942 . The percentage distribution of the four categories of ownership is given in Table 13 for 1946-55.

## 13.-Percentage Distribution of Establishments in Manufacturing Industries classified by Type of Ownership, by Province and Industrial Group 1954 and 1955 with Totals for 1946-55.

| Miscellaneous manufacturing industries | 35.6 | 12.2 | 52.0 | 0.2 | 100.0 |

${ }^{1}$ Four main categories of ownership only; the non-classifiable group is not included.
The establishments operating under individual ownership are not as important from the point of view of employment provided as their large numbers would indicate. According to Tables 14 and 15, these establishments, which comprise 43 p.c. of the total, had only 5 p.c. of the total employees. Partnerships accounted for 14 p.c. of the number of establishments and 3 p.c. of the total employees. Incorporated companies with 41 p.c. of the number of establishments had 91 p.c. of the employees. Co-operatives with 3 p.c. of the number had only 1 p.c. of the employces.

On the basis of employment provided, incorporated companies are, by a wide margin, the most important factor in the employment field. In the petroleum and coal products group practically 100 p.c. of the employees were reported by such companies. Incorporated companies in the electrical apparatus and supplies, rubber, paper, and transportation equipment groups had 99 p.c. of the employees; chemicals, tobacco and non-ferrous metal products groups had 98 p.c.; iron and steel products 96 p.c.; textiles 95 p.c.; knitting mills 94 p.c.; non-metallic mineral products 93 p.c.; leather products 90 p.c.; miscellaneous industries 88 p.c.; printing, publishing and allied trades 86 p.c.; clothing 83 p.e.; and foods and beverages 82 p.c. Companies in the wood products group, with 73 p.c., reported the lowest proportion of total employment.

## Subsection 4.-Leading Manufacturing Industries

The rank of the ten leading industries in 1955, from the standpoint of selling value of factory shipments, is compared with their respective ranks in significant years since 1929 in the following statement:-

|  |  |  |  |  | in- |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Industry | 1989 | 1933 | 1989 | 1944 | 1949 | 1953 | 1954 | 1955 |
| Pulp and paper. | 1 | 1 | 2 | 5 | 1 | 1 | 1 | 1 |
| Non-ferrous metal smelting and refining.... | 9 | 2 | 1 | 2 | 3 | 2 | 2 | 2 |
| Petroleum products. | 10 | 6 | 6 | 14 | 5 | 5 | 3 | 3 |
| Motor vehicles. | 4 | 11 | 5 | 7 | 4 | 3 | 5 | 4 |
| Slaughtering and meat packing. | 2 | 3 | 3 | 1 | 2 | 4 | 4 | 5 |
| Sawmills...................... | 5 | 14 | 8 | 11 | 6 | 6 | 6 | 6 |
| Primary iron and steel | 16 | 31 | 11 | 13 | 8 | 7 | 8 | 7 |
| Butter and cheese. | 6 | 5 | 4 | 10 | 7 | 9 | 7 | 8 |
| Aircraft and parts.......................... | 1 | 1 | 1 | 4 | 1 | 8 | 9 | 9 |
| Miscellaneous electrical apparatus and supplies. | 2 | 2 | 2 | 2 | 2 | 17 | 13 | 10 |

${ }^{1}$ Did not rank among the forty leading industries in that year. $\quad{ }^{2}$ Classification not comparable with
A prominent feature of Canadian manufacturing development during the past 25 years has been the rapid growth of non-ferrous metal smelting. This industry, based upon the rich base-metal resources of the country, has taken its place among the leading manufactures along with the industries based upon forest and livestock and other agricultural resources. During World War II the industries engaged in producing the equipment needed by the Armed Forces, such as shipbuilding, aircraft, automobiles, miscellaneous chemical products, and primary iron and steel, advanced to higher positions. When the War ended, the industries engaged in the production of consumer goods bettered their positions.

During the past few years the ranking has changed little. Petroleum products continue to move closer to the top, being in third place in 1955 as compared with fifth in 1953. Miscellaneous electrical apparatus and supplies moved up from seventeenth place to tenth in the same comparison.
16.-Principal Statistics of the Forty Leading Manufacturing Industries ranked according to the Value of Factory Shipments 1954 and 1955

| Year and Industry | Estab lishments | Employees | Earnings | Cost at Plant of Materials | Value <br> Added by Manufacture | Selling Value of Factory Shipments |

## Section 3.-Principal Factors in Manufacturing Production

## Subsection 1.-Earnings in Manufacturing Industries*

In 1955 the 38,182 establishments covered employed 287,469 supervisory and office employees and $1,010,992$ production workers, a total of $1,298,461$ persons. Out of every 1,000 persons employed in manufacturing, 221 were classed as supervisory and office employees and 779 as production workers; the former earned 28 p.c. and the latter 72 p.c. of the total amount paid out as remuneration for services.

A notable feature during the past few years has been the reduction in the disparity between average annual earnings of supervisory and office employees and production workers. In 1939 average annual earnings of production workers were only 56 p.c. of that paid to supervisory and office workers, in 1943 the percentage rose to 76 , declined to 69 in 1947 and rose to 74 in 1955. This tendency towards equalization is attributed, in part, to the controls adopted by the Government during the war years which stabilized earnings of supervisory and office workers more so than the earnings of production workers. The increase in average earnings of production workers was also influenced by the fact that large numbers were employed in the highly paid iron and steel industries and by the increase in the number of hours worked, some at overtime pay.

## 17.-Annual Earnings of Employees in Manufacturing Industries, Significant Years 1917-55

Note.-The averages of earnings for the years 1933-45 are strictly comparable with those for the years up to 1924 but not with those for the intervening years. The figures for the latest years-as for the earlier-represent the earnings for complete man-years of work, with no allowance for periods of unemployment. The difference amounts to about 3 or 4 p.c. in the total figures and affects chiefly the seasonal industries.

| 1953. | 195,843 | 78,382 | 1,016,679,409 | 3,707 | 828,363 | 224,863 | 2,940,338,939 | 2.792 |
| 1954 | 199,763 | 79,173 | 1,075, 101, 215 | 3,854 | 779,955 | 209,075 | 2,821,586,476 | 2.883 |
| 1955. | 206,881 | 80,588 | 1,147,142,086 | 3,990 | 796,721 | 214,271 | 2,995, 267,448 | 2,963 |

Average earnings of supervisory and office employees in 1955 amounted to $\$ 3,990$ which was $\$ 1,154$ or 41 p.c. higher than in 1949. Supervisory and office employees in Ontario with $\$ 4,156$ were the highest paid. Those in British Columbia were second with $\$ 4,079$, Quebec third with $\$ 3,959$, and Manitoba fourth with $\$ 3,632$. The fact that head offices of many large corporations are located in Toronto, Vancouver, Montreal and Winnipeg tends to raise the average salary in the provinces in which these cities are located.

[^216]Average carnings of production workers in 1955 amounted to $\$ 2,963$ which was $\$ 896$ or 43 p.c. higher than in 1949. The manufacturing industries of British Columbia paid the highest average wages of $\$ 3,307$. Ontario with $\$ 3,166$ was in second place, followed by Saskatchewan with $\$ 3,017$, Alberta $\$ 2,977$, Manitoba $\$ 2,762$, Newfoundland $\$ 2,752$, Quebec $\$ 2,695$, etc. The high figure of average earnings of production workers in the Yukon and Northwest Territories is the result of the unusual conditions under which industry is carried on in these regions and is not representative. Statistics of the distribution of employees by provinces and groups as well as average annual earnings are given in Table 18.

Ontario has a larger proportion of females among its supervisory and office employees than the other provinces. The same situation prevails in Quebec with regard to production workers, because of the importance of the textile industries in providing employment to femsles. Of all female production workers engaged in the manufacturing industries of Canada in 1955, 42 p.c. were found in the textile and clothing groups.

Average Annual Earnings in the Forty Leading Industries.-Variations in average earnings are related to the number of employees in industries or areas where pay levels are above or below the average because of differences in basic pay rates, in sex and occupational distributions, in amounts of bonus or commission payments, in levels of activity, etc. The earnings of salaried men are substantially higher, on the average, than those of other categories, mainly because their numbers include relatively highly paid managerial and professional workers. Women's earnings are generally well below those of men in the same industry, chiefly as a result of pay differentials, occupational differences, the greater incidence of part-time work and absenteeism among women, and their higher proportions of younger and less experienced workers.

In 1955 three industries were paying supervisory and office workers an average of $\$ 5,000$ or over, as compared with none in 1951. Indicative of the rapidly changing pattern of remuneration in manufacturing is the fact that in 1945, no industry paid supervisory and office workers annual salaries of over $\$ 3,000$. The highest average earnings in that year were $\$ 2,935$ reported by the brewing industry. Highest average earnings in 1955, amounting to $\$ 5,636$, were received by the supervisory and office employees of the pulp and paper industry which held the premier position for a number of years. Breweries with $\$ 5,539$ and non-ferrous metal smelting and refining with $\$ 5,167$ were the two other industries with salaries of $\$ 5,000$ or over. There were six industries with average salaries of $\$ 4,500$ to $\$ 5,000$ : motor vehicles $\$ 4,977$; primary iron and steel $\$ 4,936$; acids, alkalies and salts $\$ 4,745$; bridge building and structural steel $\$ 4,743$; motor vehicle parts $\$ 4,711$; and petroleum products $\$ 4,570$. In nineteen other industries average salaries ranged between $\$ 4,000$ and $\$ 4,500$, in eight they were between $\$ 3,500$ and $\$ 4,000$, and in the remaining four they were below $\$ 3,500$.

The average salary for the forty leading industries was $\$ 4,084$ as compared with $\$ 3,789$ for the smaller industries. The lower average is caused in part by a higher proportion of female office employees in the smaller industries. In the forty leading industries, 26 p.c. of the office employees were female while in the smaller industries 33 p.c. were in that category.

The increase in the average earnings of production workers since 1945 paralleled that of office and supervisory employees. Whereas in 1945 there were only four industries averaging over $\$ 2,000$, in 1955 the number jumped to thirty-six. In 1945, the highest annual earnings, amounting to $\$ 2,365$, were paid by the motor vehicle industry, while in 1955 the highest earnings, which totalled $\$ 4,189$, were paid by the petroleum products industry which had been in first place for a number of years. The highest earnings are usually paid by industries in which the proportion of skilled workers is high and the proportion of female workers is low. Three industries in 1955 had average annual earnings of $\$ 1,000$ or more: petroleum products $\$ 4,189$; primary iron and steel $\$ 4,089$; and pulp and paper $\$ 4,004$. Eight other industries had annual averages of $\$ 3,500$ to $\$ 4,000$. Non-ferrous metal smelting and refining $\$ 3,933$, acids, alkalies and salts $\$ 3,856$, motor vehicles $\$ 3,764$, breweries $\$ 3,705$, bridge building and structural steel $\$ 3,665$, aircraft $\$ 3,661$, printing and publishing $\$ 3,655$, and wire and wire goods $\$ 3,539$ were in this category. In fifteen other industries average annual earnings ranged between $\$ 3,000$ and $\$ 3,500$, in ten others they were between $\$ 2,400$ and $\$ 3,000$, while in the remaining four they were below $\$ 2,000$. Men's factory clothing, women's factory clothing, leather footwear, and fruit and vegetable preparations are the industries included in the latter group.

Average annual earnings of production workers in the forty leading industries amounted to $\$ 3,120$ as compared with $\$ 2,610$ for the smaller industries. The lower average for the smaller industries is caused mainly by a higher proportion of female workers. Employment by sex and average annual earnings in the forty leading industries are given in Table 19.

## 19.-Annual Earnings of Employees in the Forty Leading Manufacturing Industries 1954 and 1955

Nork.-Industries ranked according to the aggregate earnings paid.

AVERAGE ANNUAL WAGES OF PRODUCTION WORKERS,

Average Earnings of Production Workers. - In comparing earnings by provinces or groups, consideration should be given to the type of industries in each case since the distribution of industries has a very definite regional significance. In some industries a labour force possessing deftness and speed or the ability to exercise muscular strength is necessary, in others the labour force must exercise craftsmanship or possess a high degree of technical knowledge. Workers in the latter industries naturally command relatively higher wages than those in industries where employees are routine workers.

The ranking of provinces and industries as regards annual earnings is often different from that of weekly or hourly earnings since the factors of number of weeks worked per year and number of hours worked per week enter into the calculation.

## 20.-Average Annual, Weekly and Hourly Earnings of Male and Female Production Workers Employed in Manufacturing Industries 1946-55

## 22.-Average Earnings of Male and Female Production Workers in the Manufacturing Industries, by Province and Industrial Group 1954 and 1955-concluded

Average Earnings of Supervisory and Office Employees.-The survey on weekly earnings and hours worked by production workers was expanded in 1946 to include supervisory and office employees. Earnings and hours worked are reported for male and female workers separately in 13 groups of hours ranging from 30 hours or fewer to 65 hours or more. The earnings reported for the week is the gross amount paid before deductions for
incorne tax, unemployment insurance, etc. Weekly and hourly earnings as well as the hours worked are thus obtained directly from the tabulated results of the establishments covered. The annual earnings, however, must be calculated as they are not obtained directly from the survey. To calculate annual earnings, the results on weekly earnings are correlated with the results obtained through the annual Census of Industry.

It is the intention in future to alternate the system of classifying employees. One year the basis will be the hours worked per week and the following year it will be the earnings per week. Information will thus be made available on both the number of hours worked and the range of weekly earnings of employees engaged in manufacturing.

Annual earnings of male supervisory and office employees in 1955 averaged $\$ 4,636$, weekly earnings $\$ 93.50$ and hourly earnings $\$ 2.36$. For female supervisory and office employees annual earnings averaged $\$ 2,332$, weekly earnings $\$ 47.02$ and hourly earnings \$1.24. Average annual earnings of all supervisory and office employees totalled $\$ 3,990$ in 1955, an increase of 76 p.c. since 1946. Weekly earnings at $\$ 80.57$ were 84 p.c. higher and hourly earnings at $\$ 2.06$ were 93 p.c. higher.

## 23.-Average Farnings of Male and Female Supervisory and Office Employees in Manufacturing Industries 1946-55

Nors.-Figures are based on returns received from establishments employing 15 or more persons; figures for 1946 and 1947 refer to the last week in November whereas those for later years refer to the last week in October.

## 25.-Average Earnings of Male and Female Supervisory and Office Employees in Manufacturing Industries, by Province and Industrial Group 1954 and 1955

25.-Average Earnings of Male and Female Supervisory and Office Employees in Manufacturing Industries, by Province and Industrial Group 1954 and 1955-concluded

A survey of weekly earnings of salaried employees, classified by (1) managerial and professional employees and (2) office workers, was made for the first time in 1951 and will be repeated every third year. Results of the 1954 survey, the latest currently available, are summarized in the 1956 Year Book at p. 660.
'Real' Earnings of Production Workers.-When the index number representing the average yearly earnings of production workers is divided by the consumer price index, on the same base, a measure of 'real' income is obtained. Index numbers for 1946-55 are given in Table 26.

## 26.-Average Yearly Earnings and Index Numbers of Earnings, Consumer Prices, and Real Earnings of Production Workers in Manufacturing Industries 1946-55

Note.-Figures for 1931-43 are given in the 1947 Year Book, p. 560, and those for 1944 and 1945 in the 1956 Year Book, p. 661 .

| Year | Total Yearly Earnings | Production Workers | Average Yearly Earnings | Index Numbers ( $1949=100$ ) |  |  |

Percentages of Earnings to Net Value of Products.-Table 27 shows the relation between earnings of employees in manufacturing industries and the value added by manufacture. Such added values constitute the real production of the manufacturing plant and are alone available for payment of salaries and wages, interest, rent, taxes, repairs and all other overhead charges that ordinarily must be met. The percentage of supervisory employee earnings declined steadily with the increasing manufacturing production from 1924 to 1929, while from 1931 to 1935 and again in 1938 and 1939, the percentage of such earnings to value added was above normal owing to decreased industrial activity. It should be borne in mind, however, that supervisory employees increased 343 p.c. during the period 1917-55 while production workers increased 87 p.c. The percentage of earnings of the latter has fluctuated much less than that of the former. The number of production workers may be adjusted more rapidly to the activity of the industry and wage levels likewise may be adjusted more readily to the price levels of the products. Of the increase in the net value of production since 1939, amounting to $\$ 7,222,398,595,47$ p.c. was passed along in increased earnings.
27.-Percentage of Earnings to Value Added by Manufacture 1946-55

| Year | Value Added by Manufacture | Earnings of Supervisory and Office Employees | Earaings of Production Workers | Percentages of- |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Subsection 2.-Capital and Repair Expenditure

The present series of statistics covering expenditure on fixed capital and repairs by manufacturing industries commences with the year 1944.

Capital expenditure by manufacturers in 1955 totalled $\$ 344,700,000$ for construction and $\$ 601,800,000$ for machinery and equipment, while $\$ 513,200,000$ went for repairs. Of the total espital expenditures amounting to $\$ 946,500,000$ in 1955,15 p.c. was reported by the paper products group, 12 p.c. by products of petroleum and coal, 11 p.c. by foods and beverages, 10 p.c. by iron and steel products and 9 p.c. by non-ferrous metal products.

Of the eleven groups reporting capital expenditures of more than $\$ 25,000,000$ in 1955, seven reported greater expenditures than during 1954. Of the increases, paper products led the list with expenditures of $\$ 138,900,000$ in 1955 as compared with $\$ 87,300,000$ in 1954 followed by non-ferrous metal products with $\$ 83,700,000$ compared with $\$ 53,600,000$. The groups showing lower capital investment in 1955 than in 1954 were transportation equipment, electrical apparatus and supplies, foods and beverages, and textile products.
28.-Capital and Repair Expenditure by the Manufacturing Industries classified by Province and Industrial Group 1954 and 1955 with Totals for 1946-55

| Year, Province and Industrial Group | Capital Expenditure |  |  | Repair Expenditure |  |  |

28.-Capital and Repair Expenditure by the Manufacturing Industries classified by Province and Industrial Group 1954 and 1955 with Totals for 1946-55-concluded

## Subsection 3.-Size of Manufacturing Establishments

The size of a manufacturing establishment is generally measured either by the value of factory shipments or by the number of employees but each of these methods has its limitations. The former measure has to be adjusted for changes in the price level and, as between industries, it makes those in which the cost of raw materials is relatively high appear to operate on a larger scale. The latter takes no account of the differences in capital equipment at different times or in various industries and obviously the increased use of machinery may lead to an increase in production concurrently with a decrease in number of employees.

Size as Measured by Value of Factory Shipments.-In 1946, after heavy wartime production had ceased and reconversion had barely begun, there were 1,442 manufacturing establishments, each with an output of $\$ 1,000,000$ or over. Their combined production was valued at $\$ 5,377,870,217$ and accounted for 66.9 p.c. of the total for all manufacturing plants. By 1949, the number of factories in that category had increased to 1,926 and the proportion of their production to the total was 74.4 p.c. As a result of the tremendoos industrial expansion and the increase in prices of the 1950's, the number of plants with shipments valued at over $\$ 1,000,000$ increased to 2,729 in 1955 . These plants shipped 79.7 p.c. of the total in that year.

29．－Manufacturing Establishments and Total and Average Production classified by Value of Product Group 1946，1949， 1954 and 1955

${ }^{1}$ In 1952 gross value of products was replaced by value of factory shipments．${ }^{2}$ Includes Newfoundland．
Size as Measured by Number of Employees．－In 1946 the 311 establishments employing 500 hands or over accounted for 32.3 p．c．of the total number of emplovees engaged in manufacturing．In 1955 there were upwards of 380 plants with more than 500 employees， 61 of them with over 1,500 ．The 380 plants employed 35.4 p．c．of the total workers in all manufacturing establishments．

30．－Establishments and Employees in Manufactures classified by Number of Employees per Establishment 1946，1949， 1954 and 1955

Size of Establishments in Leading Industries.-Table 32 shows the degree of concentration in some of the leading industries of Canada. Concentration is extremely marked in the motor vehicle, non-ferrous metal smelting and refining, aircraft and parts, railway rolling-stock, pulp and paper, rubber goods, cotton yarn and cloth, and primary iron and steel industries. On the other hand, the degree of concentration is low in such industries as women's factory clothing, furniture, butter and cheese, miscellaneous food preparations and fruit and vegetable preparations.

## 32.-Percentage Importance of Establishments, each Employing 200 or more Persons, in the 25 Leading Industries 1954 and 1955

## PART III.-PROVINCIAL AND LOCAL DISTRIBUTION OF MANUFACTURING PRODUCTION

## Section 1.-Provincial Distribution of Manufacturing Production

This Section shows the distribution and concentration of the manufacturing industries in each province followed by a general analysis of the leading industries in the individual provinces. Ontario and Quebec are by far the most important manufacturing provinces of Canada. Their combined production in 1955 amounted to $\$ 15,540,000,000$ or 80 p.c. of the total factory shipments of manufactured products. The water power and other varied resources of the two provinces and their nearness to the larger markets of Canads and the United States have all contributed to this progress.

Table 1 shows the outstanding predominance of Ontario and Quebec in each industrial group. Quebec leads in the manufacture of tobacco and tobacco products, textiles and clothing, paper products and products of petroleum and coal. In each of the other groups Ontario has the greater production of the two provinces. In the production of wood products British Columbia with 43 p.c. of the total holds the dominant position, outranking both Ontario and Quebec which account for 24 and 21 p.c. respectively of the total. In each of the other groups Ontario and Quebec lead by a wide margin.

## 1.-Summary Statistics of Manufactures of each Province classified by Industrial Group 1955

Nore.-Comparable figures for 1954 have not been published in the Canada Year Book but are available from DBS publication General Review of the Manufacturing Industries of Canada 1954.

## Subsection 1.-The Manufactures of the Atlantic Provinces

The Atlantic Provinces are of economic importance in a number of fields, such as pulp and paper, fish processing, sawmills and primary iron and steel. In Newfoundland manufacturing production is dominated by the forest and fisheries resources. Pulp and paper was the most important industry in 1955 with shipments valued at $\$ 62,615,842$ followed by fish processing with $\$ 17,445,197$. These two industries accounted for 69 p.c. of the total production of the Province. In Prince Edward Island agriculture and fishing resources, butter and cheese, fish processing, and prepared stock and poultry feeds are the leading industries. Nova Scotia is renowned for its coal mines and its fisheries as well as extensive forests and agricultural lands and is favoured with easy access by sea to the high grade iron ore supply of Newfoundland. On these resources are based the leading manufactures of fish processing, primary iron and steel, sawmills, pulp and paper, shipbuilding and butter and cheese. In addition an important petroleum refinery, cotton yarn and cloth, and coke and gas plants add to the diversification of manufacturing in the Province. The forests of New Brunswick give a leading place to its pulp and paper and sawmilling industries. Other important manufacturing and processing is based on fish and agricultural resources.

Considering the Atlantic Provinces as an economic unit, pulp and paper was the leading industry in 1955 with factory shipments valued at $\$ 178,103,158$. This was followed by fish processing with $\$ 88,652,293$, sawmills $\$ 46,516,711$, primary iron and steel $\$ 43,561,192$, shipbuilding $\$ 26,806,967$, and butter and cheese $\$ 25,830,553$. These six industries accounted for 53.5 p.c. of the total factory shipments of the Atlantic region. Other leading industries with shipments valued at $\$ 10,000,000$ or more were (in order of value): sugar refining, petroleum products, sash, door and planing mills, bread and other bakery products, slaughtering and meat packing, miscellaneous food preparations, railway rolling-stock, printing and publishing, prepared stock and poultry feeds and breweries.

In the Atlantic region the program of industrial development has been more selective than in some of the other provinces. Fish processing, new sawmills, increased pulp-making capacity and the manufacture of non-metallic building materials like cement and gypsum products have accounted for well over 50 p.c. of the industrial growth. There are, however, a few outstanding exceptions. Two sizable defence plants have been established in Nova Scotia, one to repair and overhaul naval aircraft and the other to build and repair radar and related electronic equipment. Considerable development has taken place in Newfoundland. Besides plants for the manufacture of cement and gypsum wallboard and plaster, factories for producing boots and shoes, birch veneer, cotton textiles, leather and optical goods, industrial machinery and a leather tannery were established, thus broadening the industrial base of the Province.

Despite the rapid development in the Atlantic Provinces since 1949, manufacturing production did not quite keep pace with the development in the more industrialized provinces of Ontario, Quebec and British Columbia. This is indicated by a slight drop in the Atlantic Provinces' share of the Canadian total which declined from 4.5 p.c. in 1949 to 3.9 p.c. in 1955 . In number of persons employed there was an increase of 1.0 p.c. for the Atlantic Provinces as compared with an increase of 10.6 p.c. for Canada as a whole. For earnings of employees the increase was 37.8 p.c. as compared with 59.7 p.c. for Canada.

Up to 1952 the increase in employment in the Atlantic Provinces was about the same as for Canada as a whole. From 1953 to 1955, however, employment in the Atlantic Provinces declined by 6.0 p.c. while for Canada as a whole the decline was 2.2 p.c. The increased employment since 1949 reported by Newfoundland, Prince Edward Island and Nova Scotia was offset by a drop of 4.3 p.c. in New Brunswick, resulting in a net increase of only 1.0 p.c. for the Atlantic Provinces as compared with an increase of 10.6 p.c. for Canada. Selling value of factory shipments were 32.5 p.c. higher in the Atlantic Provinces while for Canada as a whole they were 56.2 p.c. higher.

## 3.-Statistics of the Leading Industries of the Atlantic Provinces 1955

Norg.-Comparable figures for 1954 have not been published in the Canads Year Book but are available from DBS publication General Review of the Manufacturing Industries of Canada 1854.

For footnotes. see end of table, p. 687.
3.-Statistics of the Leading Industries of the Atlantic Provinces 1955-concluded

${ }^{1}$ Publication of these figures was authorized by the firms concerned.
${ }^{2}$ Includes hydraulic cement; dairy products, n.e.s.; miscellaneous food preparations; industrial machinery; gypsum products; paints, varnishes and lacquers. ${ }^{2}$ Includes bags, cotton and jute; fertilizers; and slaughtering and meat packing.
${ }^{4}$ Includes breweries; cotton yarn and cloth; bridge building and structural steel; wire and wire goods; aircraft and parts; salt; coke and gas products; petroleum products; boxes and bags, paper; and railway rolling-stock. Includes biscuits; breweries; brass and copper products; brooms, brushes, and mops; hydraulic cement; railway rolling-stock; and sugar refining.

## Subsection 2.-The Manufactures of Quebec

Quebec with about 30 p.c. of Canada's total selling value of factory shipments ranks as the second largest industrial province in Canada. Several important factors have contributed to the great industrial development of the Province. Its geographic situation is extremely favourable including as it does that great water highway, the St. Lawrence River with its excellent harbour 800 miles inland. There is also an extensive road system linking the small rural areas to the big industrial centres. Other significant factors include abundant forest resources, water power, minerals, agricultural lands and, of even more importance, an industrious and stable population.

Quebec ranks first in available water power resources, having more than 40 p.c. of the total recorded for all Canada. Its power development has been remarkable and its installation of $8,031,422 \mathrm{~h}$. p. at the end of 1955 represents about 45 p.c. of the total for Canada. The St. Lawrence River Beauharnois development of $1,408,000$ h.p. and the Saguenay River Shipshaw development of $1,200,000 \mathrm{~h} . \mathrm{p}$. were the two largest in the country until 1955. They are now surpassed only by the Sir Adam Beck-Niagara Generating Station in Ontario.

Quebec has developed its $\$ 5,900,000,000$ manufacturing output with such leading industries as pulp and paper, non-ferrous metal smelting and refining, petroleum products, slaughtering and meat packing, cotton yarn and cloth, men's and women's clothing, tobacco, cigars and cigarettes, synthetic textiles and silk, railway rolling-stock and leather
footwear. In common with the rest of Canada, Quebec experienced a great industrial expansion following World War II, an expansion affecting existing industrial areas as well as many towns and villages in the accessible areas of the Province.

Quebec's leading industry is pulp and paper with an output of approximately $\$ 561,000,000$ in 1955 . Quebec is a principal world centre for the production of newsprint with 55 major pulp and paper plants concentrated in the Three Rivers and Shawinigan Falls districts as well as along the Saguenay, Ottawa and St. Lawrence Rivers. The production of non-ferrous metals has expanded considerably during the past decade. The output of aluminum has made impressive strides during recent years and reached a record total of 612,543 tons in 1955. Quebec, with its new furniture factories, its new titanium smelter and its expanded aluminum-making facilities, is challenging Ontario's long-established lead in such fields of manufacture.

Quebec's industries are not-as diversified as those of Ontario, although a number have an output approximately 50 p.c. or more of total Canadian production. Quebec predominates in tobacco, cigar and cigarette industries with 94.0 p.c. of the Canadian total; women's factory clothing 69.5 p.c.; cotton yarn and cloth 67.6 p.c.; men's factory clothing 56.2 p.c.; synthetic textiles and silk 53.0 p.c.; miscellaneous chemical products 44.2 p.c.; non-ferrous metal smelting and refining 43.6 p.c.; pulp and paper 42.3 p.e.; and railway rolling-stock 42.0 p.c.

The manufacturing industries of Quebec, in common with those of other provinces, recovered in 1955 from the minor recession that occurred during 1954. All groups, with the exception of transportation equipment, reported increased value of shipments. For the Province as a whole the increase was 9.8 p.c. as compared with an increase of 11.2 p.c. for Canada. Employment in all groups, with the exception of transportation equipment and leather products, was higher, the increase for the Province being 1.3 p.e. and for Canada 2.4 p.c.

## 4.-Statistics of the Leading Industries of Quebec 1955

Nors.-Comparable figures for 1954 have not been published in the Canada Year Book but are available from DBS publication General Review of the Manufacturing Industries of Canada 1954.

${ }^{1}$ Sugar refining is also a leading industry but statistics are confidential.

## Subsection 3.-The Manufactures of Ontario

Ontario, one of the world's major industrial areas, accounts for approximately half of Canada's manufacturing production. Here, the proximity of raw materials, cheap hydro-electric power, and a strategic location in relation to export markets, not only on this Continent but overseas, have been the decisive factors of development. Most of the manufactures of the Province and most of its population are located in the southern area. This area has the inestimable advantage of bordering on the St. Lawrence-Great Lakes waterway system, which gives access westward to the heart of the Continent and eastward to the shipping routes of the world, and which isalso the source of most of Ontario's hydroelsctricity. Many new industrial areas are being created as new industries and branch plants of established industries are increasingly being located in the smaller towns.

Despite the great industrial progress made by other provinces, Ontario continues to maintain its predominance and in 1955 produced 49 p.c. of the nation's manufactured goods. Steel ingot capacity is increasing. Huge investments have gone into the construction of plants in Sarnia for a whole group of new products based on Alberta oil flowing through the Edmonton-Sarnia pipeline. Other significant developments are taking place in synthetic rubber, synthetic textiles, and industrial and consumer chemicals. Ontario has continued to gain in such traditional lines as motor vehicles, industrial and farm machinery, and the manufacture of household equipment, business and office machinery, and electrical apparatus and supplies. Numerous plants making aircraft components and building materials have favoured the Toronto area, and chemical and synthetic textile plants have been rising in the vicinity of Sarnia and along the lower reaches of the St. Lawrence River between Cornwall and Kingston.

Ontario also has the greatest diversification of manufacturing production of any province. Certain industries, such as the manufacture of motor vehicles, motor vehicle parts, heavy electrical machinery, agricultural implements, machine tools, starch and glucose, bicycles, and the processing of raw tobacco are carried on practically in this Province alone. Of the forty leading industries in Canada in 1955, a substantial number of them were dominated by Ontario's share of the total production. These industries, with the percentage which the production of each bears to the 1955 Canada total
are as follows: motor vehicles 98.9 p.c., motor vehicle parts 96.1 p.c., heavy electrical machinery 91.0 p.c., rubber goods 81.3 p.c., telecommunications equipment 79.2 p.c., primary iron and steel 78.4 p.c., iron castings 70.7 p.c., fruit and vegetable preparations 65.6 p.c., aircraft and parts 64.9 p.c., miscellaneous paper products 63.0 p.c., sheet metal products 59.0 p.c., printing and bookbinding 58.5 p.c., brass and copper products 58.3 p.c., industrial machinery 57.1 p.c., acids, alkalies and salts 53.8 p.c., paper boxes and bags 52.1 p.c., furniture 50.5 p.c., and miscellaneous chemical products 50.0 p.c.

There are also a number of medium-sized industries with a total Canadian production of over $\$ 100,000,000$ in which Ontario dominated: agricultural implements to the extent of 92.4 p.c., soaps and washing compounds 88.4 p.c., refrigerators, vacuum cleaners, etc., 80.1 p.c., household and office machinery 73.9 p.c., hardware, tools and cutlery 71.6 p.c., heating and cooking apparatus 69.6 p.c., and confectionery 56.5 p.c.

The manufacturing industries of Ontario in 1955 reported $\$ 9,617,642,961$ as the selling value of factory shipments, an increase of 12.7 p.c. over the previous year. This was the highest on record and exceeded the previous high attained in 1953 by 8.3 p.c. Accompanying the increase in shipments was an increase of 2.5 p.c. in the number of employees which totalled 613,872 in 1955.

## 5.-Statistics of the Leading Industries of Ontario 1955

## Subsection 4.-The Manufactures of the Prairie Provinces

The leading industries of the Prairie Provinces are those based on agricultural re-sources-grain-growing, cattle-raising and dairying areas. Next in importance generally are industries providing for the more necessary needs of the resident population, such as the baking of bread, printing and publishing, etc. The extensive railway services require large shops for the maintenance of rolling-stock, especially in the Winnipeg area. The widespread use of motor vehicles and power machinery on farms has given rise to petroleum refineries in each province. The greatly increased production of crude petroleum in Alberta will undoubtedly lead to further development of the refining industry. This industry, which was in second place in 1955, has made tremendous strides in the Prairie Provinces since 1949. It has increased its proportion of the total manufacturing production of the Prairie Provinces from 8.5 p.c. in 1949 to 15.8 p.c. in 1955 . In Manitoba, the early commercial centre of the Prairies, natural resources of accessible water powers, forests and, more recently, minerals, have given rise to quite a diversification of industrial production. In Saskatchewan, while the main economic role continues to be played by agriculture, oil and uranium are coming into prominence.

In water power resources the Prairie Provinces are not so well endowed as the more highly industrialized provinces of Quebee, Ontario and British Columbia. At the end of 1955 power installation in the three Provinces totalled only $1,191,845 \mathrm{~h}$. p. or about 7 p.c. of the Canadian total. However, developments of natural gas and oil will, in large measure, be able to overcome a lack of water power resources which is so vital to industrial development.

In the Prairie Provinces the nature of development varies from one province to another. Alberta has moved to the forefront, especially since 1950. There the emphasis has been more on the manufacture of machinery and equipment, including products like drill bits and tanks, heat exchangers and other bulky equipment for the burgeoning oil and gas industries. Chemicals, and especially petrochemicals, have made striking gains; second in terms of new growth, they now embrace various rayon intermediates and polythene plastics, as well as fertilizers and the manufacture of other new inorganic products like caustic soda and chlorine. Sizable gains have been made by the expansion of food processing plants and the construction of additional factories for making building materials.

Manitoba, next to Alberta in value of shipments, experienced great development in manufacturing production during the War and postwar periods although, percentagewise, it did not keep pace with the other two Prairie Provinces. Since 1946, however, development has been on a wide front. The increase in the number of persons employed totalled 2,951 , about 42 p.c. of which was reported by the iron and steel group. In 1955 the foods and
beverages group was in first place as an employer of labour, followed in order by transportation equipment, clothing, iron and steel products, printing, publishing and allied trades, and wood products. These six industries accounted for 81 p.c. of the manufacturing employment of Manitoba.

Developments in Saskatchewan have continued along more or less traditional lines, The largest gains in shipments have been recorded by the food processing industry and a substantial increase has also been shown by the building materials group, which includes non-metallic mineral products and lumber. However, the largest single gain in employment has been in the refining of oil for local use.

## 6.-Statistics of the Leading Industries of the Prairie Provinces 1955

Nore.-Comparable figures for 1954 have not been published in the Canada Year Book but are available from DBS publication Genera! Review of the Manufacturing Industries of Canada 1954.

${ }^{1}$ Includes aircralt and parts, bridge and structural steel work, hydraulic cement, gypsum products, non-ferrous metal smelting and refining, and primary iron and steel. ${ }^{2}$ Non-ferrous metal smelting and refining is also a leading industry but statistics are confidential since there are fewer than three firms reporting.
${ }^{2}$ Includes hydraulic cement, fertilizers, non-ferrous metal smelting and refining, primary plastics, and sugar refining.

## Subsection 5.-The Manufactures of British Columbia

British Columbia, with factory shipments totalling $\$ 1,679,344,816$ in 1955, ranked third among the provinces in manufacturing production. This Province increased its share of the total Canadian output from 7.1 p.c. in 1939 to 8.6 p.c. in 1955.

Forest resources, fisheries, minerals and electric power have given a broad base and wide diversification to its industrial development. The sawmilling industry ranked first in 1955 with a gross value of shipments of $\$ 414.944,542$, and pulp and paper second with $\$ 169,370,459$. British Columbia holds the dominant position among the provinces in the production of wood products, its output making up 43 p.c. of the Canadian total. Third in importance was the petroleum products industry with shipments valued at $\$ 101,985,120$. This industry received great impetus in the completion of the Trans Mountain oil pipeline. In 1953 it had ranked seventh with shipments valued at $\$ 40,562,462$. The Province also accounted for approximately 41 p.c. of the output of the nation's fish processing industry in 1955 and plays a large part in making Canada the largest fish exporting nation in the world.

A feature of recent progress has been that new developments are taking place in areas far removed from accepted industrial centres. Growing lines of communication and transportation are fanning out from and leading into formerly locked interior communities to tap a vast new potential and offer new sources of provincial economic unity and strength. Factories and plants in remote sections are drawing greater value in employment and dollars from natural resources. The growth of the Province industrially may be indicated by the increase in employment-in 1955, more than two and one-half times the prewar
figure. In dollar terms, gross value of manufacturing was up more than sixfold since 1939. The consumption of $5,200,000,000 \mathrm{kwh}$. of electric power during 1955 marked a steady upward climb of 150 p.c. in the past decade.

British Columbia ranks second among the provinces in available water power resources and its hydraulic development, which at the end of 1955 totalled $2,439,508 \mathrm{~h} . \mathrm{p}$. out of a Canadian total of $17,735,221 \mathrm{~h}$. p., was exceeded only by Quebec and Ontario.

The manufacturing industries of British Columbia expanded during 1954, at a time when the remainder of Canada experienced a minor recession, and continued to expand during 1955. In the latter year the number of employees was 6.8 p.c. higher than in 1954 and the value of factory shipments was 13.9 p.c. higher. These figures compared with 2.4 p.c., and 11.2 p.c. respectively for Canada as a whole.

## 7.-Statistics of the Leading Industries of British Columbia 1955

Norp.-Comparable figures for 1954 have not been published in the Canada Year Book but are available from
S publication General Reveco of the Manufacturing Industries of Canada 1954. DBS publication General Revew of the Manufacturing Industries of Canada 1954.

${ }^{1}$ Other leading industries for which statistics cannot be shown since there are fewer than three establishments In each industry are non-ferrous metal smelting and refining, sugar refining, and distilled liquors.

## Section 2.-Manufacturing Industries in Urban Centres

The prosperity of most of the cities and towns of Canada, especially in Eastern Canada, is intimately connected with their manufacturing industries, which provide employment for a large proportion of the labour forces. In Western Canada the cities are largely distributing centres, though manufacturing is increasing rapidly there also.

Table 8 indicates the extent to which the manufacturing industries are concentrated in urban centres and shows, by province, the proportion of the value of factory shipments contributed by cities and towns having shipments of over $\$ 1,000,000$ each. In the more highly industrialized provinces of Ontario and Quebec such cities and towns accounted for 79 p.c. and 93 p.c. respectively of the total manufactures of those provinces in 1955, while in the Atlantic Provinces and British Columbia, where sawmilling, fish packing and dairying are leading industries, the proportions were 64 p.c. and 54 p.c. respectively. In the Prairie Provinces, manufacturing is confined largely to a few urban centres.

Comparing 1955 figures with those of 1954, a noticeable trend towards the decentralization of industry is apparent in all provinces but the most striking change is shown by Ontario where there has recently been a tendency to establish new industry in smaller urban centres and where many new one-industry areas have been opened up. In that Province the percentage of manufactures accounted for by urban centres having shipments of over $\$ 1,000,000$ was 90 in 1952 but dropped to 79 by 1955.

## 8.-Urban Centres each with Selling Value of Factory Shipments of Over $\$ 1,000,000$, Number of Establishments and Total Shipments in these Centres as a Percentage of the Provincial Total, by Province 1954 and 1955.

Nore.-Statistics published in this table are sometimes higher than the figures published in Table 11, pp. 697-699, since the table below includes statistics of towns with fewer than three establishments and production of over $\$ 1,000,000$ each. It is not possible to publish this information in Table 11 without disclosing the operations of individual establishments.

| Year and Province or Territory | Urban Centres with Value of Factory Shipments of over $\$ 1,000,000$ each | Establishments <br> Reporting in Urban Centres with Value of Factory Shipments of over $\$ 1,000,000$ | Value of Factory Shipments of Urban Centres having $\$ 1,000,000$ or over | Value of Factory Shipments of each Province | Value of Factory Shipments of Urban Centres as a <br> Percentage of Shipments in each Province |

Note.-The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

This Chapter provides data on the capital expenditures made by all sectors of the Canadian economy on construction and on machinery and equipment together with summaries of other available statistics for the construction industry. Section 1 describes the purpose of capital expenditures and shows the amounts spent by each of the various industrial or economic sectors. Section 2 brings together a number of summaries of related series on construction activity: value of work performed by type of structure, value of materials used, salaries and wages paid and numbers employed, contracts awarded and building permits issued. Construction of dwelling units and government aid to house building is covered in Section 3.

## Section 1.-Capital Expenditures on Construction and on Machinery and Equipment*

Capital expenditures made by business, institutions, governments and individuals form one of the most important determinants of the economic growth of the country, as well as being one of the principal factors affecting the level of economic activity within the nation at any given time. Capital expenditures for new physical assets create jobs for many people who provide the materials and labour required in the erection of new structures and in the manufacture of new machinery and equipment. In addition, they have the long-term effect of improving and expanding the productive facilities of the country. In the past, the volume of capital investment has been one of the most dynamic factors affecting the level of employment and income.

Since the end of World War II, capital investment in Canada has been increasing rapidly each year, with the one exception of 1954 when expenditures declined 4.8 p.c. from the previous year. In this period expenditures on new construction and for the purchase of new machinery and equipment totalled over $\$ 50,000,000,000$ and ranged from $\$ 1,703,000,000$ in 1946 to $\$ 7,900,000,000$ in 1956 . In 1956 private capital investment was at an all-time high in Canada and accounted for 22 p.c. of the gross national product; when account is taken of similar expenditures by government, the proportion rises to well over 26 p.c. Thus approximately one-quarter of the national product is being directed to expanding and diversifying Canada's economy, a rate of investment in capital assets higher than that recorded by any other industrialized private-enterprise society.

[^223]

${ }^{1}$ Newfoundland included from 1949.
Maintenance of such a high rate of expansion and its accompanying improvement in the standard of living has been accomplished only because a substantial part of the investment funds have come from outside the country. This inflow of funds has been mainly from the United States, although considerable sums of money have also come from the United Kingdom and other countries which look upon Canada as a favourable investment field.

The expansion of capital investment in the postwar period has passed through three main phases. In the first years of that period, accumulated demand at home and abroad provided the stimulus for rapid expansion in capital outlays, with emphasis on consumer goods, agriculture and housing. The second phase was initiated after the outbreak of war in Korea in mid-1950 which created new demands on the economy, shifting the emphasis in the investment program towards defence and defence-supporting activities. The third phase followed the short-lived North American recession of 1953-54 and was related to the high and rising levels of activity in Canada's principal foreign markets. The strength of foreign demand encouraged heavy capital outlays in traditional export industries. Two persistent influences underlying the expansion of investment during the postwar period may be identified-a world environment that favoured the development of new and known resources, and a rapid growth and redistribution of population that created a need for additional social capital of all kinds. The strength of expansionary forces is demonstrated by the fact that capital outlays as a percentage of current dollar gross national product rose from 14.2 in 1946 to 26.6 in 1956. The extensive development of Canada's mineral, forest and water power resources contributed substantially to this trend.

The interplay of forces making for an expansion in capital outlays is particularly evident in the utilities sector. It became clear shortly after the War ended that the facilities in this field were inadequate to support the level of activity to which the economy was moving. Subsequently, the discovery of new resources, of which oil is the conspicuous example, and the expansion of such industries as non-ferrous metals and pulp and paper required heavy capital outlays on the related utilities. As a result, the utilities absorbed a greater share of the total program in the past six years than in the earlier postwar years.

The capital outlays of central electric stations, which form the largest single group in the utility field, ranged as high as 48 p.c. of the total for the group in 1951 and 1952, continued to advance until 1953 and 1954 when major projects were near completion, and in 1956 accounted for 36 p.c. of the group total. The growth of central electric stations
in the period is indicated by the substantial increase in electric power generated and by the new capacity that will become available by 1960 . The nation's output of $43,425,000,000$ kwh . in 1947 advanced to $78,004,000,000 \mathrm{kwh}$. in 1956 and will reach an estimated $110,000,000,000 \mathrm{kwh}$. by 1960.

Capital outlays by the railways have fluctuated considerably, but during the period they added to motive power and rolling-stock, constructed additional yard and siding track and extensions serving industrial sites, and built new lines to link newly developing areas with established settlements.

The commencement of work on the St. Lawrence Seaway late in 1954 involved a rapid growth of capital expenditures on water transport, while construction of pipelines for the transmission of oil and gas made this the most rapidly growing element in the utilities program. Expansion of outlays in the communications industry has been more continuous than in the other major utilities although the level of expenditures anticipated in 1957 involves a rate of increase substantially higher than in most postwar years.

A notable feature of postwar capital expenditure in manufacturing was the relatively small increase in outlays in the consumer soft-goods industries (foods and beverages, tobacco, rubber, leather, textiles, clothing, and printing and publishing). These industries in the first postwar years accounted for about 30 p.c. of all capital outlays in manufacturing but by 1956 the proportion had fallen to 15 p.c., the same percentage as in 1952 when the Korean war was influencing the pattern of expansion.

Heavy manufacturing industries have been expanding since the end of the War under varied influences. The iron and steel industry advanced sharply in 1952 to supply war materials for the Korean conflict, and again during 1956 and 1957 in line with the general expansion in the investment program. This latter influence also had a substantial effect on investment for primary cement production during 1956. Pulp and paper, Canada's largest manufactured export industry, grew steadily until 1953, in which year most firms were consolidating their rapid postwar growth. However, a second round of pulp and paper expansion commenced in 1955, indicating continued confidence in the export market for these products. Important developments have taken place in petroleum refineries in the Sarnia area of Ontario following the construction of the Interprovincial pipeline, and in the Vancouver area of British Columbia at the terminal of the Trans Mountain oil pipeline. A further development of considerable importance to the Canadian economy in recent years has been the development of a petrochemical industry based on the new discoveries of large amounts of oil and gas in the Prairie Provinces. The automobile industry's major rebuilding in 1953 and establishment of the chemical industry's synthetic plants in that period increased substantially the importance of these industries among Canada's manufactures.

The growth and redistribution of Canada's population bas required substantial increases in capital expenditures in the trade, financial and commercial sectors of the economy, ranging from $\$ 137,000,000$ in 1946 to an estimated $\$ 607,000,000$ in 1956. Although, as a proportion of the total program, expenditures in these sectors have remained relatively stable, there has been a tendency for such expenditures to form a larger portion of the total at a time when investment in commodity-producing industries was slowing down. For example, in 1950 and in 1954 when some other sectors showed declines these groups accounted for 10.3 p.c. of the total program, whereas in 1956 when the general economy rose the proportion was only 7.7 p.c. The pattern of expenditures for institutional servicesschools, hospitals, churches, etc.-was similar during the period, with the highest proportions of 6.0 and 6.4 p.c. in 1954 and 1955 respectively.

Capital expenditures by government departments have remained relatively constant as a proportion of the total except for 1952 when outlays for defence purposes rose sharply.

Investment in housing was at a high level and represented from 21 to 25 p.c. of the total investment program in the period 1946 to 1950 . These high rates of building reflected accumulated needs backed by accumulated savings, a high rate of family formation, and favourable terms of financing. With the firming of interest rates in 1951, and renewed
scarcities of labour and materials, investment in housing declined in 1951 and 1952. New legislation in 1954, which broadened the mortgage market, strongly reinforced the upward trend in house-building activity that had begun in 1953. During 1956, difficulties in financing again began to have a restraining effect on house-building activity and the shortage of serviced land in some localities was a further complicating factor.

The development of Canada's natural resources has led to substantial investment in related industries as is evidenced by a brief examination of the effect of petroleum and natural gas output in Canada.

In the early postwar years, Canada's supply of petroleum was sufficient to meet only a very small part of the demand and most of the available supply was located far from the major markets. To help meet growing demand, refineries were built during 1947 and 1948 in the Montreal area of Quebec based on the use of imported crude oil. However from 1947, when the first major discoveries of new oil fields in Western Canada were made, the whole nature of the industry in Canada changed rapidly. Production of crude oil which in 1946 amounted to $7,600,000 \mathrm{bbl}$. advanced to $172,000,000 \mathrm{bbl}$. in 1956. To utilize these newly discovered resources, pipelines were laid from the Prairie Provinces to Central Canada and to the Pacific Coast. New refineries were built at Sarnia in Ontario and later in the Toronto area and in the Vancouver area of British Columbia as well as in the Prairie Provinces. Oil companies operating with increased refinery capacity found that although the market for gasoline products was expanding it was also becoming more competitive. To improve their position in the market, major oil companies launched a service station modernization and expansion program in 1952. Increased production of crude oil and natural gas also provided the base for a rapid rise of the petrochemical industry in Canada.

Although the construction of oil pipelines followed fairly closely the development of oil fields in the Prairie Provinces, it was not until the latter part of 1955 that gas trunkpipeline construction was undertaken. The first of these was a line from the Peace River area through the mountains to the United States border and Vancouver. In 1956 a pipeline to bring natural gas from the Prairie Provinces to Eastern Canada was started.

Capital expenditures made directly in the petroleum and natural gas industry have increased very substantially in every phase of operations-development, refining, transporting and distributing. Total capital expenditures in 1946 were $\$ 20,000,000$ as compared with an estimated $\$ 821,000,000$ in 1957 . This very large expansion has also generated large capital expenditures in such industries as iron and steel to supply steel pipe for the pipelines, in the utilities which distribute natural gas to the consumer when the pipelines reach the more populated areas, and in the chemical industry which uses petroleum products as raw materials.

As further evidence of major resource development in mining, the uranium and iron ore industries are outstanding examples. Development of uranium mining has been so rapid during the past few years that it may soon rank first in value of production of all metal mining. During World War II small-scale development was undertaken at Great Bear Lake by the Government followed by larger operations at Beaverlodge Lake in northern Saskatchewan. However, the Blind River area of Ontario is now the major source of supply. As for iron ore, the development of the Quebec-Labrador area has been most prominent, involving construction of a railway running 360 miles north from the St. Lawrence, a new townsite at Schefferville, dock facilities and the changing of a small village into a substantial shipping port at Sept-Iles, and hydro-electric developments close to the mining and dock areas. Large-scale expansion has also taken place in the Steep Rock area of northwestern Ontario. These developments have increased the importance of iron ore to the point where, in 1956, it occupied fourth place among the minerals of Canada, following oil, copper and nickel.

The growth of capital expenditures in Canada since the end of World War II has been one of the most dynamic factors in the country's rapid economic expansion. It has not only added to production facilities but has contributed to greatly increased labour productivity.

## 2.-Summary of Capital Expenditures and Repair and Maintenance Expenditures by Economic Sector 1955-57

Note.-Actual expenditures 1955; preliminary actual 1956; intentions 1957.
(Millions of dollars)

Details of some of the above economic sectors are given in Table 3. The construction industry and housing are dealt with in Sections 2 and 3 of this Chapter.

## 3.-Details of Capital Expenditures and Repair and Maintenance Expenditures for Certain Economic Sectors 1955-57

${ }^{1}$ Includes privately operated social and welfare institutions．

A summary of the capital expenditures in each province for the years 1955－57 is given in Table 4．Such expenditures represent gross additions to the capital stock of the province and are a reflection of economic activity in that area，but the actual production of these assets may generate its major employment in income－giving effects in other regions．For example the spending of millions of dollars on oil refineries and pipelines in Western Canada means activity in the steel industries of Ontario as well as construction activity in the Prairie Provinces．
4.-Summary of Capital Expenditures and Repair and Maintenance Expenditures by Province 1955-57
Nore.-Actual expenditures 1955; preliminary actual 1956; intentions 1957.
(Millions of dollars)

${ }^{1}$ Includes the Yukon and Northwest Territories.
${ }^{2}$ Slight differences between these and totals those of Table 2 are caused by minor adjustments and rounding.

## Section 2.-The Construction Industry

## Subsection 1.-Value of Construction Work Performed

Statistics of the construction industry are based largely on information received at the same time and from the same sources as the data on capital expenditures which appear in Section 1.* The data represent the estimated total value of all new and repair construction.

Canada's intended construction program for 1957 is estimated at $\$ 6,702,000,000$, about 5 p.c. above the 1956 level. This contrasts with a rise in 1956 of more than $\$ 1,000,000,000$ or 20 p.c. over the 1955 realization of $\$ 5,311,000,000$. New construction in 1957, estimated at $\$ 5,563,000,000$, is expected to account for most of the increase. The value of repairs to be undertaken in that year is estimated at $\$ 1,139,000,000$.

[^225]Table 5 shows construction, both new and repair, in constant as well as current dollars. It is interesting to note that in 1956 construction work accounted for over onefifth of the gross national product. The slight differences between these figures and the corresponding figures of Section 1 are accounted for by rounding and minor revisions.
5.-Value of Construction Work Performed, Current and Constant (1949) Dollars 1948-57

Note.-Actual 1948-55; preliminary 1956; intentions 1957.
(Millions of dollars)

| Year | New Construction |  | Repair Construction |  | Total Construction |  | Total Construction as P.C. of Gross National Product |  |

|  |  | . |  | . |  |  |  |  |

${ }^{1}$ Newfoundland included from 1949.

Table 6, which compares contract construction with other construction, illustrates that contractors are accounting for a greater proportion of the work each year; in 1954 they handled 72 p.c. of all work; in 1955, 73 p.c.; in 1956, 76 p.c.; and in 1957,77 p.c. This trend is apparent in both new and repair work.

## 6.-Value of Construction Work Performed by Contractors and Others 1954-57

Nore.-Actual 1954 and 1955; preliminary 1956; intentions 1957.
(Millions of dollars)

[^226]The estimated increase in construction in 1957, a moderate 5 p.c., was low because of an anticipated drop in residential construction. Estimates for most other principal types of construction-electric power construction, gas and oil facilities, commercial and institutional construction-were substantially higher as shown in Table 7.

## 7.-Value of Construction Work Performed by PrincipaI Type 1954-57

Nots.-Actual 1954 and 1955; preliminary 1956; intentions 1957.
(Millions of dollars)

Principal statistics of the construction industry are shown by province and for contractors, utilities, governments and others in Table 10. The statistics given for Canada as a whole may be considered as relatively accurate but those for individual provinces and by class of builder are approximations only. All estimates given for cost of materials used are based on ratios of this item to total value of work performed, derived from annual surveys of construction work and applied to the total value-of-work figures. Estimates of labour content are similarly based but in addition are adjusted to include working owners and partners and their withdrawals. Although the ratios were calculated in some detail by type of industry, still further refinements are required. There are also some difficulties in obtaining the precise location of projects undertaken or to be undertaken by large companies operating in a number of provinces. However, if used with these qualifications in mind, the table provides useful estimates.

## 10.-Labour Content, Cost of Materials and Value of Work Performed in Construction, by Province and by Employer 1953-57

Note.-Actual 1953-55; preliminary 1956; intentions 1957.

## Subsection 2.-Contracts Awarded and Building Permits Issued

In this Subsection statistics are given of work actually in sight either as contracts awarded or as building permits. These figures are related to those of work performed during the year only so far as the work thus provided for is completed and duly reported in the capital expenditure surveys. Further, values of contracts awarded, and especially of building permits, are estimates (more often under-estimates) of work to be done.

Contracts Awarded.-According to figures published by Hugh C. MacLean Building Reports, the Canadian construction industry registered new gains in 1956. Total construction contract awards reached $\$ 3,426,905,500$ by the year-end, an increase of 7.6 p.c. over 1955. This gain, however, was not as great as was indicated even as late as midsummer. Contract volume lagged during the last four months of the year as a result of the deflationary measures imposed by the Federal Government on financial institutions.

During 1956, engineering construction led with a gain of 30.0 p.c. and contributed 31.1 p.c. of the total awards, almost equalling the proportion contributed by residential construction. Industrial work gained 17.9 p.c. and commercial and institutional construction 8.9 p.c. Residential construction was lower by 11.4 p.c. The regional spread of new work was somewhat uneven in 1956. Solid gains were shown in Ontario and Quebec but specific declines in Nova Scotia and New Brunswick brought the Maritime total down from 1955. Also a sharp drop in British Columbia more than counterbalanced gains in the three Prairie Provinces.

13.-Estimated Value of Proposed Construction as Indicated by Building Permits Issued in 204 Municipalities 1955 and 1958 -Concluded

Table 14 shows the value of building permits issued in fourteen metropolitan areas across Canada. In 1956 the permits issued in these areas made up 91 p.c. of the total for the 204 municipalities.
14.-Estimated Value of Building Permits Issued in Metropolitan Areas 1955 and 1956

Tables 15 and 16 show the value and volume of building permits by province for 900 municipalities covering areas in which live about 62 p.c. of the national population and 87 p.c. of the urban population. These figures are useful when appraising the construction activity within, and among, municipalities. Comparisons of construction costs would not be warranted, however, without assurance that structures of similar size and quality were being compared. Despite limited application, this information constitutes one of the few indices of current economic activity in smaller localities.

The relative material was compiled from municipal figures and therefore varies with the terms of individual by-laws, with the methods of estimating the value of local construction and with other factors which may differ from area to area. Information is not available on the permits allowed to lapse without the relative construction being undertaken.

Provincial totals do not add to the Canads totals because certain minor adjustments could not be distributed provincially.
16.-Value of Building Permits Issued by Province 1952-56

${ }^{1}$ Provincial totals do not add to the Canads totals because of rounding of the figures and because certain minor adjustments could not be distributed provincially.

The indexes given in Table 17 show as far as possible the fluctuations in building costs and their effect upon construction work and employment. The relative proportions of material and wage costs in general building are difficult to determine since such proportions vary with the type of building and the centres studied.
17.-Value of Building Permits Issued in 204 Municipalities and Index Numbers of the Building Construction Industries 1947-56

## Section 3.-Housing*

## Subsection 1.-Government Aid to House Building

Federal Assistance.-The Federal Government's housing policy has been developed through a succession of Housing Acts. The Government originally entered the housing field in 1919 when, by an Order in Council passed under the War Measures Act of 1918, it made $\$ 25,000,000$ available for loans to provincial governments. The provinces in turn lent the money to municipalities for the construction of moderate-cost housing. The first general piece of federal housing legislation was the Dominion Housing Act of 1935. This was succeeded by the National Housing Acts of 1938,1944 and 1954.

The Federal Government's activities in housing today are defined by the National Housing Act, 1954. Central Mortgage and Housing Corporation, incorporated by Act of Parliament in 1945, administers these activities. The President of the Corporation reports to the Minister of Public Works.

In general, the Federal Government has attempted to stimulate and supplement the market for house building, rather than assume direct responsibilities which rightfully belong to other levels of government or which could more effectively be borne by private enterprise.

More than one-third of the house building in Canada today is aided by the participation of the Federal Government in one way or another.

Insured Mortgage Loans.-To assist the financing of new housing construction, both for home ownership and rental housing, the Corporation insures mortgage loans. These loans are made by banks and other financial institutions which have been approved as lenders under the Act.

The borrower pays an insurance fee. CMHC is the underwriter and all insurance fees remitted by the approved lenders are paid into the Mortgage Insurance Fund. When claims are made on the Fund, the amount paid includes 98 p.c. of the aggregate of the

[^227]principal owing on the mortgage, approved borrowers' charges and interest, together with an acquisition fee of $\$ 125$ and approved taxable legal disbursements. The usual term of an insured mortgage loan is 25 years.

For home ownership, the loans may be 90 p.c. of the first $\$ 12,000$ of lending value and 70 p.c. of the remainder. The total loan cannot exceed $\$ 12,800$ plus the insurance fee. For rental housing, loans are limited to 80 p.c. of lending value. Maximum loans are prescribed by Order in Council for various types of housing units. Repayment periods, as well as loan proportions, are prescribed in the National Housing Act. There are special provisions for loans to co-operative groups and defence workers. The maximum interest rate for loans is determined by Order in Council and was set at 6 p.c. in January 1957. The interest rate must not exceed the yield on 20 -year Federal Government bonds by more than $2 \frac{1}{4}$ p.c. at the time it is set.

The Act requires the Corporation to determine lending values of properties, to prescribe minimum standards of construction and to perform compliance inspections during construction. These and other administrative arrangements are included in the National Housing Loan Regulations established by Order in Council.

During 1956, loans were approved for 38,673 units amounting to $\$ 387,757,000$; in the first six months of 1957 , loans were approved for 12,264 units amounting to $\$ 132,918,000$.

Direct Corporation Loans.--The Act authorizes the Corporation to make direct Ioans for new residential construction in certain cases:-
(1) Loans in lieu of private loans. The Corporation may make loans directly to prospective borrowers who are unable to obtain loans from a private approved lender. These loans are subject to the same terms and conditions as insured loans. Government policy has directed that, except for defence worker loans, direct loans are not available in metropolitan areas, nor in cities with more than 55,000 population, nor to merchant builders, nor to rental investors.
(2) Loans to limited dividend companies. The Corporation, with the approval of the Governor in Council, may make a direct loan to a limited dividend company for the construction of moderate- or low-rental housing. Such loans may be up to 90 p.c. of the lending value and may be repayable over a period of up to 50 yoars.
(3) Loans to primary producers. The Corporation may make a loan to a company engaged in mining, lumbering, logging and fishing for the construction of a moderate cost rental housing project. Such loans may be up to 80 p.c. of the lending value. The term may not exceed 15 years.

The rates of interest for loans to limited dividend companies and primary producers are established by Order in Council. The interest rate on limited dividend loans is restricted to a rate not exceeding the rate on long-term government bonds plus $\frac{1}{2}$ of 1 p.c. In the case of primary producer loans, the rate must not exceed the bond rate by more than $1 \frac{1}{2}$ p.c.

In 1956, 26 loans were approved for 1,620 units to limited dividend companies; their value was $\$ 10,600,000$. In the first six months of 1957,25 loans for 1,190 units totalling $\$ 8,930,000$ were approved. Six loans for 290 units totalling $\$ 2,500,000$ were approved in 1956 for primary industries and, in the first six months of 1957, five loans for 416 units amounting to $\$ 3,700,000$ were approved.

In 1956 other direct loans were approved for 700 units amounting to $\$ 6,300,000$ and in the first half of 1957 other loans for 1,969 units totalling $\$ 19,600,000$ were approved.

In addition to making direct loans, the Corporation may also supply money to private lenders to make loans on behalf of the Government. No such activity was undertaken in 1956. Arrangements for making such loans, however, were entered into with the approved lenders in September 1957, and over 16,000 units were approved by December 1957.

Purchase and Sale of Mortgages.-The Act provides that any person or company may purchase insured mortgages in Canada, provided that the mortgage is continuously administered by an approved lender. During 1956, 4,922 insured mortgages totalling
$\mathbf{\$ 4 9 , 6 0 0 , 0 0 0}$ were sold by lenders. In the first six months of 1957, 2,954 mortgages amounting to $\$ 28,700,000$ were sold. The majority of these insured mortgages were bought by pension funds. The Corporation is authorized to buy and sell mortgage loans under both the National Housing Act and the Central Mortgage and Housing Corporation Act but there has been little activity under these provisions.

Home Improvement Loans.-The Corporation provides insurance to banks and instalment credit agencies for loans made to home owners for the improvement of property. Fees, which are paid by the borrowers, are deposited in an insurance fund maintained by the Corporstion. The Act prescribes the forms of security, the limit of loans upon individual properties and the term of the loan. During 1956, 30,380 loans were approved for a total amount of $\$ 29,700,000$. In the first six months of 1957 , there were 12,317 loans approved smounting to $\$ 12,258,000$.

Federal-Provincial Projects.-Where the Federal Government and a provincial government enter into a partnership agreement, the Corporation may undertake jointly with the province the development of a housing or land-assembly project. Capital costs, profits and losses of such projects are shared 75 p.c. by the Federal Government and 25 p.c. by the province, or jointly by the province and a municipality. Under this legislation two main types of projects are involved: (1) construction of housing units for rental on either an economic or a subsidized basis; and (2) the assembly and servicing of residential lots for sale to prospective home owners and builders.

During 1956 agreements were made for construction of 520 dwelling units in six low-rental housing projects. In the first six months of 1957 agreements were made for 47 units. In 1956 agreements were made for the assembly and servicing of 595 lots in three land-assembly projects. None were made in the first six months of 1957.

Urban Redevelopment.-The Act also provides that where a municipality agrees to acquire and clear a blighted or substandard area with a view to using the site for low-rental housing or for other purposes, a federal grant may be made to the municipality amounting to 50 p.c. of the cost of acquisition and clearance. The area must be substantially residential either before or after redevelopment. The Corporation receives a share of the revenue from the project proportionate to the contributions made.

In 1956 the Federal Government authorized a grant of $\$ 2,467,587$ to Montreal to aid in the acquisition and clearance of 20 acres of blighted land. It is proposed that this land be used for a federal-provincial rental project of 800 units. There were no grants made in the first six months of 1957.

Construction Activities.-The Corporation may also carry out construction on its own account or on behalf of Federal Government departments and agencies. It has built projects for the Departments of National Defence, Public Works, Fisheries and Transport and also for Atomic Energy of Canada Limited. During 1956 total expenditures on construction were $\$ 31,600,000$. A limited amount of housing is also constructed by other Federal Government departments and agencies for their employees. Often this housing is built in remote areas.

Research and Community Planning.-The Corporation is responsible for undertaking investigations into housing conditions, for sponsoring technical research and for causing the distribution of information leading to the improvement of housing accommodation and the adoption of community plans. The Act provides that the Government can make funds available to the Corporation for these purposes and that, by Order in Council, a grant may be made to a municipality, to an educational or research institution or to an individual. Expenditures of $\$ 694,444$ for these purposes were made during 1956. In the first six months of 1957 expenditures of $\$ 175,400$ were made.

Guarantees.-The Act provides the following powers which are not at present being used.
(1) Guaranteed rental. Under certain conditions the Corporation is authorized, for a premium, to guarantee returns of private investors from moderate rental housing projects. While this section is technically operative, the related loans are rarely available through the approved lenders, and the Government has instructed the Corporation that direct loans of this type are not to be offered.
(2) Lending companies investment. The Corporation is authorized to offer guarantees to life insurance companies for low-cost or moderate-cost rental housing projects, or to institutional investors for land development. There has been no activity under these headings in recent years.
(3) Buybacks. The Corporation is also authorized to offer purchase guarantees to builders. Guarantees have been offered recently in respect of housing for defence workers, but by Government direction the section is otherwise inoperative.
Other Legislation.-Other Federal legislation in the housing field includes the Canadian Farm Loan Act, 1927, which provides for federal long-term loan assistance for farm housing as well as for other farm purposes; the Veterans' Land Act, 1942, which is administered by the Department of Veterans Affairs and provides loan and grant assistance to veterans for housing and other purposes; and the Farm Improvement Loans Act, 1944, which provides for guarantees for intermediate- and short-term loans made by approved 1 ending agencies to farmers for housing and other purposes.

Provincial Assistance.-All provinces except Prince Edward Island have passed complementary legislation to provide for federal-provincial partnership arrangements for the assembly of land and the construction of low-rent housing as provided in the National Housing Act. The Provinces of Quebec and Ontario have also passed separate housing legislation. In Quebec the "Act to Improve Housing Conditions" (S.Q. 1948, c. 6) and an amendment (S.Q. 1951-52, c. 7) authorize the Province to pay a subsidy on interest charges in excess of 3 p.c. on new dwellings. A further amendment (S.Q. 1953-54, c. 7) increases authorized expenditures under the Act to $\$ 55,000,000$ from $\$ 40,000,000$.

In Ontario the Housing Development Amendment Act (S.O. 1952, c. 39) authorizes the Province and a municipality to enter into joint housing projects. For industries starting in rural areas and in small communities the Province and municipality may join with Central Mortgage and Housing Corporation in the development of housing projects. Under certain conditions the Province may expropriate land in municipalities for the purpose of housing projects. This Act amended the Housing Development Act (R.S.0. 1950, c. 174).

The Planning Amendment Act (S.O. 1952, c. 75) permits municipalities with an approved official plan to designate an area within the municipality as a redevelopment area and to acquire land in that area and clear and prepare it for residential, commercial, industrial or other designated purpose. This Act amended the Planning Act (R.S.0. 1950, c. 227).

The Rural Housing Assistance Act (S.O. 1952, c. 92) authorizes the establishment of the Rural Housing Finance Corporation, a Crown company which can lend and invest mortgage money in order to provide financial assistance in the building of new houses in villages and rural areas. The Corporation may lend money independently or in co-operation with CMHC or with any approved lending institution.

The Junior Farmer Establishment Act (S.O. 1952, c. 45) establishes the Ontario Junior Farmer Establishment Loan Corporation, which makes loans to assist qualified young farmers in buying, developing and operating their farms. The Corporation may make loans for the construction and improvement of farm houses. Such loans may be secured by a first mortgage on the property. They cannot exceed $\$ 15,000$, and are repayable in 25 years.

The Elderly Persons Housing Aid Act (S.O. 1952, c. 27) authorizes the Province to make grants to any limited dividend company to which a loan has been made under the NHA and whose application has been approved by a municipality. The grant amounts to $\$ 500$ for each dwelling or 50 p.c. of the capital cost of the project, whichever is the lower. The capital cost excludes the amount covered by the mortgage loan.

## Subsection 2.-Housing Development in 1956-57

House-building activity in 1957, although lower than in the previous year, continued at a high level. Housing starts declined during the first quarter of 1957 but made a substantial recovery during the second quarter. This upward trend continued, though at a more moderate rate, throughout the remainder of the year and it appeared that total starts for 1957 would exceed 120,000 units. The decline from the level of 1956 , when 127,000 units were started, was mainly a result of the continued scarcity of mortgage credit.

The shortage of mortgage funds was particularly acute for loans under the National Housing Act. In August 1957, the Government acted to ease the situation and made available $\$ 150,000,000$ for loans under the Act for moderately priced housing.

Housing completions, which lag starts by about six months, are expected to number about 117,000 units in 1957 . In 1956 completions totalled 136,000 , reflecting a carryover of some 79,000 uncompleted units from the record number started in the preceding year.

House-Building Activity.-Housing starts began to decline in the latter part of 1955 but the rate of decline was moderate until the fourth quarter when there was a sharp drop. This decline extended into the first quarter of 1957. A recovery commenced during the second quarter and the upward trend continued throughout the remainder of the year. Virtually all of the decline in housing starts in the two years 1956 and 1957 took place in the urban centres of 5,000 population or over. Starts in other areas were down only slightly. This disparity in the rates of new house building reflects differences in methods of financing such construction. Activity under the National Housing Act is largely concentrated in urban centres. With the shortage of mortgage money having its main impact on loans under the Act, house building in urban centres suffered more than in other areas.

The decline in activity under the National Housing Act was also reflected in the change in the proportion of starts represented by single-family dwellings. Starts of such dwellings represented 72 p.c. of the 1955 total but declined to 68 p.c. during the first nine months of 1957.

Corresponding with the record number of completions, expenditures on new housing construction reached a peak in 1956, amounting to $\$ 1,574,000,000$ compared with $\$ 1,499,000,000$ in the previous year. The estimated expenditure for 1957 was $\$ 1,416,000,000$.

Mortgage Lending.-The reversal during 1956 and 1957 in the upward trend which started in 1953 reflected in large measure shifts in the demand for investment funds. Between 1953 and 1955 capital investment for non-housing purposes showed no increase, mortgage funds for new housing were readily available, and housing starts increased by 35 p.c. From late 1955 to 1957, however, demand for long-term capital for non-housing purposes increased greatly and such investment outlets generally offered higher yields than mortgage loans. The volume of mortgage lending for new housing was reduced, and between 1955 and 1957 housing starts declined by 16 p.c. while investment for non-housing purposes increased by more than 50 p.c.

With the strength of demand for funds for mortgage loans weaker, relative to supply, in 1956 and 1957 than in 1955, mortgage lending by lending institutions declined. During 1956, lending institutions-comprising the chartered banks, life insurance companies, and loan and trust companies-approved mortgage loans for $\$ 997,000,000$ which was 17 p.c. below the amount for 1955 . In the first six months of 1957 , the decline from the previous year was 33 p.c. In both years, mortgage lending under the terms of the National Housing Act suffered the largest decline-in 1956 all of the decline was under the Act. In 1957, mortgage lending on existing housing and on non-residential property also declined. Coventional mortgage lending for new housing showed little change from 1955 to 1957. Starts were held as high as 127,000 in 1956 by virtue of the increase in that part of the housing program financed without the assistance of mortgage loans. Two factors effected the decline in institutional mortgage lending-the rise in interest rates and the position of the chartered banks at the end of 1955.

As competition for the available supply of investment funds increased through 1956 and 1957, interest rates also increased, reaching their highest levels in the postwar period. The maximum rate of interest chargeable on loans under the National Housing Act was
raised in both 1956 and 1957. In March 1956 it was increased by one-quarter per cent to $5 \frac{1}{3}$ p.c. and in January 1957 there was a further increase to 6 p.c. Despite these increases, mortgage loans under the Act became less attractive to investors than other forms of investment. During 1957 many of the institutional lenders also experienced a reduction in the rate of growth of their total assets which was reflected in reduced mortgage portfolios.

The chartered banks entered the mortgage-lending field under the National Housing Act of 1954. In that year and in 1955, they were in process of building up their mortgage portfolios, in which they were aided by the relative liquidity of their assets and by the marked asset growth they were experiencing. In 1956 and 1957, however, the growth in the assets of the chartered banks was only moderate and, in addition, they were faced with heavy demands for business loans. As a result, the mortgage-lending activity of the chartered banks, all of it under the National Housing Act, declined by more than 50 p.c. between 1955 and 1956. In March 1957, the Governor of the Bank of Canada received assurances from the chartered banks that they would approve mortgage loans for $\$ 150,000,000$ in 1957 an amount that represented little change from 1956.

In August 1957, the Government acted to ease the shortage of funds under the National Housing Act by making available $\$ 150,000,000$ for loans under the Act for small homes. The arrangement provided for approved lenders to act as agents of Central Mortgage and Housing Corporation in making the loans.

By mid-November, agency loans in process and approved amounted to over $\$ 132,000,000$ and in December a further $\$ 150,000,000$ was provided. With a reduced flow of mortgage funds under the Act from private investors, there was an increase in the use of public funds for direct loans, particularly in 1957. Mortgage loans made directly by Central Mortgage and Housing Corporation increased by nearly 200 p.c. from mid-1956 to mid-1957. During 1956 and 1957 loans to limited dividend companies increased over 1955. In 1956 loans were approved for 1,620 rental housing units in limited dividend projects compared with 1,419 units in the preceding year. During the first nine months of 1957 there were approvals for 2,800 units and loans to primary producers were approved for 416 units.

Building Costs.-The costs of housing construction increased by 8 p.c. in 1956 and 6 p.c. in 1957. Most of this increase reflected higher wage costs; building material prices rose in 1956 but changed little in 1957 and land costs continued to advance. In 1956 the average price paid for lots for single-family dwellings financed under the National Housing Act was $\$ 2,041$ compared with $\$ 1,819$ in 1955 . In the first half of 1957, the average price was $\$ 2,254$.

In addition to increases in construction and land, higher costs also resulted from an increase in the average size of new dwellings. In housing financed under the Act, average floor areas went up from 1,102 sq. feet in 1955 to 1,138 in 1956 and to 1,169 in the first half of 1957.

As a result of all these changes, average total costs of houses financed under the National Housing Act, including land and construction, went up from $\$ 12,847$ in 1955 to $\$ 13,960$ in 1956 and $\$ 14,598$ in the first half of 1957.

Urban Renewal and Federal-Provincial Projects.-Interest in urban renewal continued to grow throughout 1956 and 1957 and several cities applied to Central Mortgage and Housing Corporation for assistance in carrying out renewal studies. The results of earlier studies were published during 1956-57 by the Cities of Halifax, Winnipeg, Saint John, Toronto and Vancouver.

Construction commenced during 1956 on a 733 -unit federal-provincial project in the Regent Park South area of Toronto. This project is being built on a 26-acre site, which is being cleared for redevelopment. Construction also started on a federal-provincial project at Lawrence Heights in Toronto, designed to provide 1,081 dwelling units. Clearing of substandard units from a Montreal downtown area was started in 1957 as part of the plan to renew 20 acres and provide an 800 -unit low-rental federal-provincial project.

Housing Design.-During 1956, Central Mortgage and Housing Corporation assisted in the establishment of the Canadian Housing Design Council, an independent body devoted to the promotion of improved housing design. The Council has initiated annual series of regional and national awards for good design in builders' houses.

During 1956 and 1957 the Corporation's architectural division designed, wholly or in collaboration with private firms, permanent married quarters for the Department of National Defence, federal-provincial projects for Regent Park South and Lawrence Heights in Toronto and for St. John's, Nfld., and the Jeanne Mance redevelopment project in Montreal. It also developed plans for the northern towns of Fort Smith, Frobisher Bay, Aklavik, Great Whale River and Tuktoyaktuk, in collaboration with the government departments and agencies concerned.

Housing Statistics.-Tables 18 and 19 show housing starts and completions for 1952-56 and by province and locality for 1956. The numbers of loans approved under the National Housing Act and their amounts for 1952-56 are shown in Table 20.

## THE CHANGING PATTERN OF CANADA'S HOUSING

Housing is one of the nation's most valuable assets and house building is one of its largest industries. By far the greatest number of houses in a developed country is inherited from the past and the houses built in any year constitute but a fraction of the total stock. The whole character of Canada's cities has been shaped by previous generations and is part of the legacy from the past. Many houses in Canada today are old-nearly one in every ten was built in the 1880's or earlier and more than half a million are from fifty to seventy-five years old.

In every period of national expansion the large amount of new building irrevocably leaves its imprint on the community. The old is torn down to make way for the new, land uses change, and the pattern of each community alters. There is a continual change in the nature of the housing problem. The changes may be less spectacular in some places than in others, but work goes on constantly at the margin of the housing stock. Not only is the face of the old city altered, but new towns come into being.

Each generation has left its mark upon the housing stock but the present generation is destined to leave a major imprint, the result of the massive population growth being experienced and of two factors peculiar to the times - the long-term high level mortgage and the automobile. The first has encouraged the building of single-family homes in large quantity and the second, by increasing people's mobility, has permitted the sprawling suburban development that has become almost synonymous with postwar building.

More than anything else, these two factors can be said to have determined the character of the recent growth in housing. They have brought to the Canadian scene a uniformity in city building which was absent in the past. Until recently, Canadian cities have been recognizably different. Each bore the marks of the particular period in which its greatest expansion occurred. Saint John was notably different from Quebec, Montreal differed markedly from Edmonton or Calgary. In the postwar period, however, all cities have grown together and all bear the character of this newer growth.

At the end of the Second World War the country's housing stock was greatly overburdened. Its growth had been impeded by depression and war, and the demands on the existing supply of houses were intensified by the return of the veterans. Moreover, there were only a small number of contractors and construction workers with any substantial experience in house building, which had seen its last boom in the 1920's, and many building materials were in short supply. By the 1950's, however, this bottleneck had largely disappeared and the introduction of new building techniques, greater use of power equipment and the emergence of large-scale merchant builders helped to increase substantially the industry's capacity.

Curiously enough, even in this period of stringent shortage of accommodation, there was widespread doubt about the effective demand for new housing over the long pull. At the outset, the housing problem was considered simply as one of overcoming the backlog of demand and meeting the needs of returning veterans. In fact, it soon became a question of keeping pace with the current rate of growth in the number of families and in the population generally. Marriages and births during the period far exceeded expectations and there was heavy immigration. In addition there was a persistent drift of persons from farms to cities.

Canada, however, entered the postwar period with some advantages. There was enough land already serviced for building to proceed rapidly, the lenders were anxious to make mortgage loans, and legislation passed immediately before the end of the War enabled prospective home owners to get fairly large loans on comparatively easy terms.

In most urban areas the supply of serviced land at the beginning of the postwar period was substantial. The housing boom of the 1920 's had collapsed before meeting the expectations of land developers and many municipalities had extended sewer and water services to areas thought to be in the path of immediate growth. Much of this land lay fallow during the 1930's and through the war years and was available for immediate postwar housing development in the late 1940's.

Mortgage money was not a serious obstacle. The companies providing the bulk of private institutional mortgage funds were peculiarly disposed at the end of the War to look favourably on the mortgage field. They came out of the War with heavy portfolios of low-yield Federal Government securities and greatly reduced mortgage holdings. To the extent that Federal Government bond prices were maintained, these institutions were ready and even anxious to convert them to other investments, including mortgages. Moreover, a ready channel for these funds for mortgage purposes was provided through the National Housing Act, 1944, the principal instrument of government policy in the housing field. This Act made it possible for the borrower to obtain mortgage loans with relatively low down payments, 20 - or 25 - year amortization and convenient monthly payments in constant amounts. To the lender, the legislation offered an attractive interest return and guarantees against losses that greatly diminished the risk in the event of default. The National Housing Act also contained provision for financing low-rental houses through limited dividend companies, for grants to municipalities undertaking slum clearance projects, for loans to primary industries for the construction of employee dwellings, and it set aside funds to promote research into social, economic and technical housing matters, both by government and outside agencies. Central Mortgage and Housing Corporation was established, by Act of Parliament in 1945, as a Crown agency to administer federal housing policy. A new National Housing Act was introduced in 1954.

Demand remained strong throughout the whole postwar period and, except in the early postwar years, the capacity of the house-building industry and of its suppliers has not limited the output of houses. The limits on house-building, particularly since 1950, have come rather from tightness in the capital market, or from shortage of serviced land or from both. These particular restraints directly reflect the two basic problems of new housing in any period-how much to build and where to build it.

The amount of money invested in mortgages from year to year is subject to the constraint imposed by the total volume of savings available, domestic and imported, and the competing claims for their use. Through the capital market, mortgages and therefore housing must compete for funds with other investment outlets. Important changes were made in the National Housing Act in 1954 to enable mortgage borrowers under the Act to compete more effectively with other borrowers for available funds. The chartered banks of Canada and the Quebec savings banks were empowered to make mortgage loans under the National Housing Act. Furthermore, the guarantees against loss to the lenders were attached to the mortgage rather than to the original lender, so that the resulting mortgage would be more easily negotiable. This was done to facilitate sales of these mortgages so that pools of savings not formerly available for such purposes could serve as a source of mortgage money. Whatever the degree of institutional or individual freedom in the investment of funds, the mortgage market will, however, always be affected by developments in the general capital market, and can never be held free from the effects of business, institutional and government investment in other fields. Shortage of mortgage funds need not always constitute the main immediate limitation on house building, but it has done so over much of the past seven years.

The amount of land ready to receive new housing is also affected by the availability of investment funds. Most residential land in urban Canada today must be served with water and sewer mains and roads and with the attendant trunk lines, arterial traffic routes, and municipal plant and services that these frontage facilities imply. The basic municipal plant and trunk facilities are financed in large measure by the municipality but the cost of fronting services may be financed by the municipality, or may be capitalized in the price of land to the purchaser and paid for with mortgage funds or purchasers' savings. If financed by municipalities or by mortgage lenders, the provision of these services is limited by the constraints of the capital market. If, on the other hand, their costs are met in cash by the purchaser, their market is limited by the availability of liquid assets for down payments.

Two factors in recent times have tended to increase the cost of urban services. Canada's postwar housing program has been based largely on demand generated by comparatively easy mortgage-lending terms for home ownere. In addition, the private
automobile has made it appear feasible to accommodate large urban populations in singlefamily houses. As a result, a very great part of postwar residential building in Canada has been in the form of single-family houses for home ownership. More conspicuous than any other feature of the housing stock provided by Canadians in the postwar period has been its spatial extent. It is not merely that the growth has been suburban. Urban growth for the most part has to be suburban. But the suburban growth itself has been prodigal of land. The flatness of Canada's urban growth has not been manifest only in the predominance of single-family houses, but in the concentration on one-storey to the exclusion of one-and-a-half and two-storey houses. Escape from the servicing costs of this kind of development has seldom been sought in a more compact arrangement of houses, but often in a further dispersion of house building to areas where lots are large enough to permit the use of wells and septic tanks in place of piped water supply and sewage disposal.

It is widely believed that this kind of development, by extending unduly the distances over which urban services are provided, raises the costs of new housing both to the owners and to the community. From the point of view of costs, the community may be unable to provide as much new housing in this form as could be built if there were a higher incidence of row houses and other types of multiple accommodation and a less prodigal use of land for single-family dwellings.

The prospects for urban growth in Canada during the next quarter-century point to an even greater development of towns and cities than during the past twelve years. Demand is likely to be sustained for the next ten years and after that to be greatly accelerated by a high rate of family formation and natural population increase. The housebuilding industry has shown itself capable of increasing its capacity to meet any demands it may face. New techniques are also likely to increase its productivity and through increased competition to improve the product. The critical factors will be the flow of mortgage money and the supply of serviced land. A flexible policy will be necessary to keep in balance the demands for mortgage funds and the claims for other investments. It is estimated that before 1980 about 900 sq . miles will be required to house the new population of Canada's cities.

Recent surveys show that the number of automobiles in use on Canadian highways will continue to increase sharply during the next few decades, but it is too early to foretell the impact of this greater mobility on Canadian living patterns. Equally, the broader mortgage facilities which permit a larger proportion of families to own a home are of comparatively recent origin. In the generality of their use, both are newcomers and their full effects have yet to be seen. Working out the appropriate use of these devices so far as housing is concerned is undoubtedly one of the main problems of the present and the future.

1. The business district of Montreal, that proud and progressive cosmapolitan city of interminable individuality, reflects, perhaps more than any other area of like size, Canada's present era of economic and physical growth. It is in a state of continual change-new buildings rear their heads, thoroughfares are widened and new traffic arteries opened. A striking plaza-type business, commercial and entertainment centre of massive proportions, of which the new Queen Elizabeth Hotel forms a part, will be completed within the next five years.

2-4. The B.C. Electric Building rising high on Vancouver's skyline, the cafeteria in the Imperial Oil Building in Toronto and a clean-cut modern factory in a new industrial area typify the present concept of working conditions for the office and production employee.

5-9. Service establishments and public buildings-such as (5) the Park Plaza Hotel in Toronto, (6) the recently completed City Hall in Ottawa, (7) and (8) the hundreds of new bank buildings and post offices, large and small, scattered across the country, and (9) health and welfare institutions exemplified by one of Ontario's several newly constructed homes for the aged-keep pace in attractiveness and utility of design.
10. This beautiful custom-built home, perfectly suited to its surroundings, might be found in any Canadian city or town.
11. Federal-provincial housing projects are replacing slums in downtown Toronto and Montreal, providing pleasant comfortable accommodation for low-income families.
12. A medium-priced housing development near Ottawa is typical of the new look in suburban residential districts.

13-15. An essential part of suburban expansion is the new church, dignified in its quiet simplicity, the low sprawling functional school building, and that postwar innovation, the shopping centre.

16-17. The Yancouver Att Gollery ond Woodbine Race Track grandstand at Toronto are certain indications that new cultural and sports facilities also add to the aesthetic scene.

## The <br> Chaurging

ECENT social and industrial advances in Canada have had their effect on the physical urban picture. As business and industry have expanded hundreds of thousands of people have poured into the cities and towns and hew construction has become commonplace. In the cily centres, new business buildings fower above the old, factories and warehouses have mushroomed in the industrial oreas and, os population has increased, new residential districts have extended far boyond municipal limits, demanding the necessary community facilities-schools, churches, shopping centres, hospitals and cultural and sports facilities. New structures are functional in design and modern in aspect, embodying the progressive efforts of the builder, the architect and the researcher, and attempting to provide the best possible environment in which to work and live.

## CHAPTER XVII.-SURVEY OF PRODUCTION*

CONSPECTUS

|  | Page |  | Page |
| :---: | :---: | :---: | :---: |
| Section 1. Industrial Distribution of Production. | 736 | Section 3. Per Capita Net Value of ProDUCTION. | 742 |
| Section 2. Provincial Distribution of ProDUCTION. | 739 |  |  |

Note.-The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

The scope of the Survey of Production is limited to industries chiefly engaged in the actual production of commodities. The activities of such industries as transportation, communication, trade, finance and service are excluded, except for certain of their costs that are indirectly reflected in the value of output of the commodity-producing industries; for instance, costs of such business services as insurance, advertising and telephone to the commodity-producing industries are included in the selling or gross value of their products. This is in contrast to the widely used Gross National Product series (see Chapter XXV) which encompasses all industries.

In obtaining the "net" value for each commodity industry, the cost of materials, fuel, purchased electricity and process supplies (but not other business services) consumed in the production process is deducted from the selling or gross value of output. The resulting net value of production (or value added) is generally considered more significant as a measure of output than gross value of production and is therefore used in the following analyses and tables.

The measurement of value added is similar, although not strictly comparable, to the concept involved in the contribution of each industry to gross national product at factor cost (net income originating plus depreciation). Apart from variations in the statistical structure the main difference is that value added, as computed for each commodityproducing industry, includes the cost of business services as described above. In national income accounting, the contribution of these services to gross national product at factor cost is classified to the non-commodity industries from which they originate.

One of the major advantages of the commodity-production series is that the statistics may be classified by provinces. With the exception of personal income and its major components, the geographical distribution of gross national product is not available mainly because profits cannot be allocated according to the provinces in which they are generated by productive activity. A more detailed explanation of the series is given in the current DBS Bulletin Survey of Production.

Major revisions made in the statistics of the construction and forestry industries have affected the comparability of the survey of production figures presented here with those presented in earlier editions. A description of these revisions together with revised data is given in DBS Bulletins Survey of Production 1950-54 and 1951-55.

[^228]
## Section 1.-Industrial Distribution of Production

Trend in the Period 1950-55.-The total net value of commodity production rose by 46 p.c. between 1950 and 1955. Sustained demand for consumer goods both domestically and abroad, the industrial and resource development programs, and the expansion of defence industries all contributed to this advance, and each of the eight industrial groups showed an increase in value of output in the five-year comparison. The net value of agricultural production in 1955 was $\$ 1,937,000,000$, somewhat higher than in 1950 , though far below the total for 1951. A much larger wheat crop in 1955 resulted in an increase in value from the low point of 1954. The net value of output of forestry operations was nearly $\$ 665,000,000$ in $1955, \$ 80,000,000$ above the 1954 total and 36 p.c. above 1950 ; the 1955 total, however, was only slightly above the previous peak in 1951. Value of production in the primary fisheries industry for 1955 was $\$ 91,000,000$, about 11 p.c. higher than in 1950 but lower than in most intervening years. Quantity of seafish landed fell off in 1955 from the 1954 peak, although prices of fisheries products were slightly higher. Value of output in the trapping industry in 1955 was somewhat above the 1950 level.

Over the review period the net value of production in the mining industry advanced steadily to a record high of $\$ 1,061,000,000$ in 1955 , more than 61 p.c. above the 1950 level. The volume of fuel production was up 156 p.c., petroleum rising by nearly 350 p.c. Volume of metal output recorded a 24-p.c. gain. Shipments of iron ore were well over four times higher in 1955 than in 1950 and were still rising rapidly. In 1955, when operations in the Labrador area covered the full season for the first time, output of ore was double the 1954 total. Production of non-metals rose by 23 p.c. in the 1950-55 period. The generation of electric power showed an increase of 50 p.c. in the same comparison and, in terms of net value, the industry advanced by over 73 p.c.

The net value of manufacturing production rose fairly steadily over the 1950-55 period-the total of $\$ 8,753,000,000$ in 1955 was 47 p.c. above 1950 . The value of durable manufactures was up more than 52 p.c. in this comparison, and of non-durables nearly 43 p.c. The former accounted for nearly 48 p.c. of manufacturing net value in 1955 as compared with 46 p.c. in 1950. Non-ferrous metal products advanced 90 p.c. and showed the greatest increase among the durable industries, iron and steel products and transportation equipment increased by about 47 p.c., and wood products by 36 p.c. The net value of non-metallic mineral products increased by over 79 p.c., and value of electrical apparatus by 49 p.c. In the non-durables sector, petroleum and coal products recorded the largest increase of 189 p.c., followed by chemical products and printing and publishing with gains of 67 p.c. and 52 p.c., respectively. By contrast, value of output in the textiles industry showed a fractional decline as compared with 1950 and production of clothing (including knitting mill products) rose by less than 14 p.c.

The construction industry showed the largest proportionate gain of the major commodity industries. The value of net output increased by almost 88 p.c. from $\$ 1,475,000,000$ in 1950 to $\$ 2,770,000,000$ in 1955 , accounted for by a substantial rise in the amount of building activity and by a sharp advance in construction costs. Investment in new construction for 1955 stood at $\$ 3,328,000,000,82$ p.c. above the corresponding figure for 1950. Investment rose steeply in both the residential and the non-residential sectors.

During the period 1950-55, the contribution of secondary commodity output continued to increase, relatively to primary production. In 1955 secondary production (manufacturing and construction) accounted for nearly 73 p.c. of all commodity output as compared with 68 p.c. in 1950 . The main factor in this change was the large gain in the contribution of construction which accounted for 17.5 p.c. of all commodity production value in 1955 as compared with 13.6 p.c. in 1950 . The share of manufacturing, which was slightly under 55 p.c. in 1950, was virtually unchanged in 1955.

The decline in the contribution of the primary industries from just under 32 p.c. in 1950 to slightly over 27 p.c. in 1955 was entirely accounted for by a drop in agriculture from 17.3 p.c. in 1950 to 12.2 p.c. in 1955 . The reduced share of agricultural output during 1954 and 1955 was largely the result of smaller wheat crops.

## 1.-Net Value of Production by Industry 1950 and 1952-55

Nore.-Net production represents total value under a particular heading, less the cost of materials, fuel, purchased electricity and supplies consumed in the production process. Data for fisheries and trapping represent total value.

| Industry | 1950 | 1952 | 1953 | 1954 | 1955 |

| Construction. | 107.6 | 144.2 | 179.0 | 1844 | 202.0 | 13.6 | 14.3 | 16.8 | 17.8 | 17.5 |
| Totals | 108.4 | 137.8 | 145.6 | 141.5 | 158.1 | 1000 | 100.0 | 100.0 | 1000 | 100.0 |

Current Trend.-The net value of Canadian commodity production during 1955 rose to $\$ 15,838,000,000$, nearly 12 p.c. above the 1954 total. All industries except fisheries shared in this advance. Manufacturing and construction accounted for about two-thirds of the over-all increase of $\$ 1,661,000,000$ and the primary industries one-third.

Among the major expansionary forces were the rise in personal expenditure on consumer goods and services, the sharp increase in residential construction, and the strong recovery of exports (principally of forestry and mining products) and of business outlays for plant, machinery and equipment. The rise in government expenditures for goods and services, the larger grain crop and the swing in business inventories from liquidation in 1954 to net accumulation in 1955 also contributed to the increase.

Preliminary data for 1956 indicate an increase over 1955 of more than 10 p.c. in the net value of commodity output. This continued strong expansion of economic activity was principally the result of the very large advance of 33 p.c. in business investment outlays for new construction, machinery and equipment. In addition, both consumer expenditures and exports continued to show strong gains as compared with the preceding year. By contrast, investment in residential construction recorded only a small increase. This strength in end-product demand was reflected in the expansion of most commodityproducing industries. Advance data indicate that agricultural output rose by 10 p.c. over 1955, mining production showed an appreciable increase of more than 12 p.c., and the forestry, fisheries and electric power industries recorded some advance over the high levels of 1955 . The net value of manufacturing production rose by about 10 p.c. in the same
comparison, accounted for mainly by substantial gains in most durable industries, especially iron and steel products. The construction industry showed the largest increase among the commodity groups in 1956; the net value rose by more than 20 p.c. as compared with 1955.

Advance indicators suggest a levelling off in the net value of production for 1957. During the first nine months of 1957, the index of industrial production averaged only 1.5 p.c. higher than in the corresponding period of 1956 ; the seasonally adjusted index reached a peak in February and later showed a steadily declining trend. For the first ten months of 1957, the general wholesale price index averaged a little over 1 p.c. above the level for the same period of 1956.

## Section 2.-Provincial Distribution of Production

Each province and territory recorded a higher net value of production in 1955 than in 1950. Alberta and British Columbia showed the highest proportionate gains in this comparison. Value of output in Alberta rose by over 73 p.c. during the five years, and value of production in British Columbia by more than 54 p.c. These provinces were followed by Quebec with an increase of 47 p.c., Ontario with 43 p.c., and Saskatchewan with 45 p.c. Advances were more moderate in the other provinces.

Newfoundland.-In 1955 the net value of commodity production in Newfoundland, exclusive of agriculture which is of minor importance in the Province, amounted to nearly $\$ 190,000,000$, or about 1.2 p.c. of the Canadian total. Manufacturing accounted for more than 30 p.c. of all commodity production, the products being mainly produced by pulp and paper mills and fish processing plants. Mining followed manufacturing in importance with a contribution of 22 p.c. to provincial output. The principal mineral product is iron ore, which had a greatly expanded output in 1955, and the production of zinc and lead was substantial. Construction also contributed 22 p.c. of Newfoundland's value of commodity production, followed by forestry and primary fisheries.

Prince Edward Island.-The economy of this Province is largely agricultural. Farm output in 1955-principally livestock, potatoes and dairy products-constituted nearly 46 p.c. of the total value of commodity production. Construction contributed 25 p.c. and, together with manufactures, accounted for the bulk of non-farm output. Total net value of production was more than 27 p.c. higher in 1955 than in 1950, and in the later year represented 0.3 p.c. of Canadian commodity production.

Nova Scotia.-The net value of production in Nova Scotia increased nearly 31 p.c. between 1950 and 1955 and accounted for 2.2 p.c. of the national total in the latter year. In 1955, manufactures contributed 40 p.c. of the Province's value of production and primary iron and steel, fish processing, pulp and paper production and shipbuilding were the most important manufacturing industries. Construction accounted for almost 21 p.c. of the Province's total output. Mining and agriculture, Nova Scotia's principal primary industries, contributed approximately 15 p.c. and 9 p.c., respectively, to the 1955 total. Coal mining represented nearly 75 p.c. of the total value of mineral output and dairy products, livestock, poultry and eggs were the principal farm products.

New Brunswick.-The net value of commodity output in New Brunswick recorded a substantial increase in 1955 after declining slightly during the immediately preceding years, and was nearly 22 p.c. above the 1950 total. Over the period, New Brunswick's contribution to the Canadian aggregate fell from 2.3 p.c. to 1.9 p.c. Manufacturing accounted for 40 p.c. of all value of commodity output in 1955, and the main industries were pulp and paper, sawmilling, fish processing and shipbuilding. The primary industries of agriculture and forestry accounted for 13 p.c. and 11 p.c., respectively, of 1955 output. The most important farm products were livestock, dairy items, potatoes and eggs. The net value of construction output increased to make up nearly 27 p.c. of the provincial aggregate in 1955.

Quebec.-In 1955 Quebec's net value of production was $\$ 4,205,000,000$, which was nearly 27 p.c. of the total Canadian value of output. The provincial increase during the 1950-55 period was more than 47 p.c. Manufacturing was by far the most important activity; it represented over 62 p.c. of all provincial production. Pulp and paper remained the leading manufacturing industry, contributing about 11 p.c. of total factory output, but non-ferrous metal smelting and refining, clothing, petroleum products, textiles and electrical apparatus were also of major importance. In 1955, agriculture's share of the provincial output fell to less than 8 p.c. as compared with 10 p.c. in 1950; dairy items, livestock and poultry accounted for the greater part of farm production. The construction industry contributed 15.5 p.c. to provincial production as compared with 12.3 p.c. in 1950.

Ontario.-The net value of commodity production in Ontario rose from $\$ 4,544,000,000$ in 1950 to $\$ 6,480,000,000$ in 1955, a gain of 43 p.c. The Province's contribution to the Canadian total was just under 41 p.c. in 1955 as compared with 42 p.c. in 1950 . The economy of Ontario is largely dominated by manufacturing, which represented between 67 p.c. and 70 p.c. of total provincial commodity output throughout the $1950-55$ period. Manufacturing industries contributing more than $\$ 100,000,000$ to the value of net output in 1955 were, in order of importance: motor vehicles, primary iron and steel, non-ferrous metal smelting and refining, pulp and paper, rubber products, aircraft and parts, motor vehicle parts, petroleum products and heavy electrical machinery. Agricultural output contributed just over 8 p.c. of the Province's value of production in 1955; the principal sources of farm income were: livestock, dairy products, tobacco, poultry, eggs and vegetables. Construction accounted for 15 p.c. of provincial net value of output in 1955 compared with 12.3 p.c. in 1950.

Manitoba.-Manitoba's net value of commodity production rose from $\$ 483,000,000$ in 1950 to $\$ 590,000,000$ in 1955 , a gain of 22 p.c., although the total fluctuated somewhat over the period. Manitoba's contribution to the Canadian aggregate, however, declined from 4.4 p.c. to 3.7 p.c. over the $1950-55$ period. The value of farm output in the Province has declined in recent years and manufacturing has displaced agriculture as the Province's dominant activity.

Thus in 1955 manufacturing contributed nearly 42 p.c. of the total value of commodity output. Slaughtering and meat packing, railway rolling-stock and petroleum products were the leading manufacturing industries. Agriculture's share of provincial output, which had been 38 p.c. in 1950, fell to just over 25 p.c. in 1955; grains and livestock were the principal farm products. The value of construction rose sharply during the period and accounted for nearly 23 p.c. of the total value of provincial output in 1955; the comparable figure for 1950 was 15 p.c.

Saskatchewan.-The economy of Saskatchewan is largely dependent upon agriculture and particularly on the wheat crop. The poor yield of 1954 was followed by a fair crop in 1955, and the Province's commodity output rose in that year to $\$ 795,000,000$. Although this amount was 45 p.c. above the 1950 output, it was lower than the total value for several of the intervening years. In 1955 Saskatchewan contributed 5.0 p.c. of the Canadian aggregate, almost unchanged from its contribution in 1950 but distinctly less than in the years from 1951 to 1953 when bumper crops were harvested. Agriculture contributed 58 p.c. of the Province's output in 1955.

Manufacturing in the same year represented more than 14 p.c. of the Province's value of production. Petroleum products form the leading industry of Saskatchewan, but slaughtering and meat packing, flour milling, brewing and butter and cheese industries also make significant contributions. The net value of construction was lower than in 1954 and accounted for nearly 19 p.c. of net commodity output.

[^229]in relative importance in Alberta, accounting for slightly over 25 p.c. of provincial output in 1955 compared with 44 p.c. in 1950. The net value of mining output, on the other hand, rose from $\$ 123,000,000$ in 1950 to $\$ 304,000,000$ in 1955 , reflecting primarily the development of Alberta's petroleum resources. The contribution of mining to the provincial total increased from less than 17 p.c. in 1950 to nearly 24 p.c. in 1955. Manufacturing output also rose steadily, accounting for nearly 21 p.c. of the provincial total in 1955 compared with 17 p.c. in 1950. Petroleum refining, slaughtering and meat packing, sawmilling and brewing were the leading manufacturing industries. The dynamic growth of this Province during the $1950-55$ period is indicated by the fact that construction accounted for nearly 27 p.c. of the provincial aggregate in 1955 and thus was the leading commodity industry; in 1950 its contribution was 19 p.c.

British Columbia.-The net value of output in British Columbia advanced from $\$ 1,023,000,000$ in 1950 to $\$ 1,578,000,000$ in 1955 , or by 54.2 p.c. In 1955 the Province contributed 10 p.c. of the Canadian total, ranking third among the provinces. Manufacturing continued to account for nearly half the provincial total in 1955, sawmilling heading the list of industries, followed by pulp and paper. Also of importance were veneers and plywoods, petroleum products, fertilizers, fish processing and shipbuilding. Construction accounted for over 20 p.c. of the provincial total in 1955 and was second in value of output. Forestry was third with nearly 17 p.c. and mining fourth. Zinc, lead and copper are the principal mineral products of British Columbia, and lower levels of prices for lead and zinc contributed to a decline in the relative importance of the mining industry since 1952.

## 3.-Net Value of Production by Province 1950 and 1952-55

## Section 3.-Per Capita Net Value of Production

Between 1950 and 1955, an advance of 46 p.c. in the net value of commodity production was accomplished with a 14.5 -p.c. increase in population and an 8 -p.c. increase in the labour force. The national per capita net value of commodity output (exclusive of Newfoundland) increased from $\$ 805$ in 1950 to $\$ 1,023$ in 1955 , a gain of over 27 p.c. Wholesale prices rose by less than 4 p.c. in the same period, indicating a substantial gain in 'real' per capita production.

Per capita net value of output in the Maritime Provinces has always been far below the Canadian average and, at $\$ 519$, was just over half that figure in 1955. Quebec's per capita production, which was 11 p.c. below the national average in 1950, stood at 9 p.c. below the average in 1955. On the other hand, per capita output in Ontario, consistently the highest among the provinces, was more than 20 p.c. above the national average in 1955.

Manitoba's production per capita was well below the national average throughout the period and, at $\$ 704$, was 31 p.c. below this figure in 1955. The figure for Saskatchewan, which fluctuates very widely with crop conditions, was 11 p.c. below the Canadian average in 1955, after rising 18 p.c. above it three years earlier in 1952. Alberta has been well above the Canadian average in this respect in recent years. It exceeded that average by 14 p.c. in 1955 and ranked third in per capita production. British Columbia with its diversified economy always ranks high in per capita output, and in 1955 stood second among the provinces, 15 p.c. above the national figure.

## 6.-Per Capita Net Value of Production with Percentage Variation from the National Average by Province 1950 and 1952-55

## Section 1.-The Government in Relation to Labour

## Subsection 1.-Federal Labour Legislation

The Federal Department of Labour was established in 1900 under the Conciliation Act which provided machinery to aid in preventing and settling labour disputes and required the Department to collect, compile and publish statistical and other relevant information. The Department also assumed the administration of the Fair Wages Policy adopted in the same year for the protection of workmen employed in the execution of Federal Government contracts and on works aided by grants from public funds.

The statutory duty of disseminating information concerning labour and industrial matters is now set out in the Department of Labour Act passed in 1909. In addition the Minister is responsible for the administration of the following statutes: Conciliation and Labour Act (1906); Government Annuities Act (1908) $\dagger$; Government Employees Compensation Act (1918); Fair Wages and Hours of Labour Act (1935); Unemployment Insurance Act (1940); Vocational Training Co-ordination Act (1942); Reinstatement in Civil Employment Act (1946); Merchant Seamen Compensation Act (1946); Industrial Relations and Disputes Investigation Act (1948); Canada Fair Employment Practices Act (1953); and Female Employees Equal Pay Act (1956). (See also pp. 92-93.)

Fair Wages Policy.-The Fair Wages Policy applying to all Federal Government contracts was first set forth in a Resolution of the House of Commons (1900) and later incorporated in an Order in Council and amended from time to time. Wages and hours on contracts for construction are now regulated by the Fair Wages and Hours of Labour

[^231]Act and Order in Council P.C. 2029 of Dec. 22, 1954. Hours of work on construction contracts are limited to eight per day and 44 per week, except in an emergency or in exceptional circumstances where exemption is granted by Order in Council; wages to be paid are those current for the type of work in the district or, if there are no current rates, fair and reasonable rates as determined by the Minister of Labour.

Wages and hours of work on contracts for equipment and supplies are also regulated by Order in Council P.C. 2029. The hours of such work must be those fixed by the custom of the trade in the district where the work is performed, or fair and reasonable hours. The wages must be current or fair and reasonable but in no event shall they be less than those established by statute or regulation of the province in which the work is being performed. This Order in Council contains a clause prohibiting discrimination against any person in matters of employment because of that person's race, national origin, colour or religion, or because he has made a complaint or given information with respect to such alleged discrimination.

Government Prevailing Rate Employees.*-Twenty-six departments and agencies of government together employ approximately 38,000 ( 50,000 in summer) non-office workers in public buildings, defence establishments, parks and forests, experimental farms, canal operation, airports and government vessels, survey parties, special projects, etc. Such positions are exempt from the operations of the Civil Service Act and rates of pay are fixed by the Treasury Board in consultation with the Department of Labour on the basis of prevailing private industry rates for comparable work in the employment area. Data used in the determination of these pay rates are secured from wage surveys made by Industrial Relations Officers of the Department of Labour and wage research conducted by the Economics and Research Branch as well as from collective agreements and information supplied by some provincial Departments of Labour.

The Fair Wages Section of the Industrial Relations Branch also recommends rates of pay for 3,700 commissionaires employed by various government departments and agencies throughout Canada, provides wage data to assist certain Crown corporations in the preparation of their wage schedules, and gives assistance in the establishment of class titles, job descriptions and the application of job evaluation techniques.

Three sets of comprehensive Regulations have been established by the Treasury Board governing the hours of work, overtime, vacations, statutory holidays, sick leave, pensions, etc., for (1) prevailing rate workers generally employed; (2) ships' officers, and (3) ships' crews.

The Industrial Relations and Disputes Investigation Act.-This legislation came into effect by proclamation on Sept. 1, 1948, revoking the Wartime Labour Relations Regulations in effect since March 1944 and repealing the Industrial Disputes Investigation Act which had been in force from 1907 until suspended by the Wartime Regulations in 1944. The Act protects proceedings commenced and decisions, orders and certifications made under the wartime legislation in so far as these involve services authorized by the Act.

The Act applies only to industries within federal jurisdiction, viz., navigation, shipping, interprovincial railways, canals, telegraphs, steamship lines and ferries, both international and interprovincial, aerodromes and air transportation, radio broadcasting stations, and works declared by Parliament to be for the general advantage of Canada or of two or more provinces. However, the Act provides that provincial authorities if they so desire may enact similar legislation for application to employees within provincial jurisdiction and make mutually satisfactory arrangements with the Federal Government for the administration of such legislation by the federal authorities.

In general, the Act in its important features provides that employees and employers shall have the right to organize and bargain collectively and that trade unions may be certified as bargaining agents for employee groups. Trade unions and employers are required, upon notice, to bargain collectively in good faith. The Act provides for invoking collective

[^232]bargaining negotiations and for the mediation of conciliation officers and conciliation boards in reaching collective agreements. Employees may change bargaining agents at times under conditions specified in the Act which also prescribes conditions affecting the duration and renewal of collective agreements. Collective agreements are required to contain provision for the arbitration of disputes concerning the meaning or violation of such agreements and where such provision is lacking application may be made for its establishment. The Act prohibits unfair labour practices, i.e., the interference with or domination of trade unions by employers or interference, discrimination and coercion in trade union activity. The conditions which must be observed prior to strike and lockout action are provided for in the Act. Industrial inquiry commissions may be appointed to investigate industrial matters or disputes.

The Minister of Labour is charged with the administration of the Act, and is directly responsible for the provisions affecting the appointment of conciliation officers, conciliation boards, industrial inquiry commissions, consent to prosecute, and complaints that the Act has been violated or that a party has failed to bargain in good faith.

The Canada Labour Relations Board administers provisions concerning the certification of bargaining agents, the writing of a procedure into a collective agreement for the final settlement of disputes concerning the meaning or violation of such agreement, and the investigation of complaints made to the Minister that a party has failed to bargain collectively.

Detailed statistics concerning activities under the Act may be found in the Annual Report of the Department of Labour. In brief, from Sept. 1, 1948, to Mar. 31, 1957, the Canada Labour Relations Board received 754 applications for certification, 461 of which were granted, 140 rejected, 139 withdrawn and 14 were pending at the end of the period. Of the 428 industrial disputes dealt with under the conciliation provisions of the Act, 358 were settled by conciliation officers and conciliation boards, 41 were not settled, 11 lapsed and 18 were pending at Mar. 31, 1957.

Labour-Management Co-operation Service.-During World War II, production committees based on the principle of joint consultation between labour and management were established in many vital industries. Since 1947 the establishment of labour-management production committees in industry has been encouraged and assisted by the LabourManagement Co-operation Service, a section of the Industrial Relations Branch of the Department of Labour. The number of active committees has grown from 526 in 1947 to approximately 1,100 . Their activities are directed towards such objects as better understanding between management and labour, improved production efficiency, improved quality, reduction of waste, accident prevention, good housekeeping, and reduction of absenteeism.

Reinstatement in Civil Employment Act.-This Act provides for the reinstatement in their civil employment of discharged members of the Armed Forces and other designated persons. It was passed in 1946 and is administered by the Department of Labour through the Unemployment Insurance Commission. In 1954, by the Veterans Benefit Act, the Act was made applicable to certain ex-members of the Special Force and to former members of the regular Forces who have served for a period not exceeding three years since July 5, 1950, and prior to July 1, 1955.

Canada Fair Employment Practices Act.-This Act, which came into effect on July 1, 1953, prohibits discrimination in employment based on race, colour, religion or national origin. It applies only to industries within federal jurisdiction-those covered by the Industrial Relations and Disputes Investigation Act (see p. 745). This law prohibits acts of discrimination by employers; discrimination by trade unions in regard to membership or employment; the use by employers of employment agencies which practise discrimination; and of advertisements or inquiries in connection with employment which express, directly or indirectly, any limitation, specification or preference as to race, colour, religion or national origin.

Female Employees Equal Pay Act.-This Act came into effect on Oct. 1, 1956, and applies to employers and employees engaged in works, undertakings or businesses coming within federal jurisdiction. The Act, in its principal provision, prohibits an employer from employing a female for any work at a rate of pay that is less than the rate at which a male is employed by that employer for identical or substantially indentical work.

## Subsection 2.-Provincial Labour Legislation

Labour legislation in Canada is mainly a matter for the provincial legislatures as it usually deals with the contract of service between employer and employee, the contract between members of a trade union which forms the basis of the union, or regulates conditions in local work places. The right to contract is a civil right and the British North America Act, which distributes legislative powers between the Parliament of Canada and the provincial legislatures, grants to the provinces power to enact laws in relation to "civil rights" and, with certain exceptions, "local works and undertakings" In each province a Department of Labour (in Alberta, the Department of Industries and Labour) is charged with the administration of labour laws. Legislation for the protection of miners is administered by departments dealing with mines.

Factory legislation and shops legislation in several of the provinces prohibit child labour, regulate the hours of work of women and young persons and provide for safety and health. Most provinces have minimum wage legislation and maximum hours laws, legislation to ensure freedom of association, to promote collective bargaining and to provide for the settlement of industrial disputes, and legislation dealing with apprenticeship and the licensing of certain classes of workmen. The Industrial Standards Acts of Nova Scotia, New Brunswick, Ontario and Saskatchewan, the Labour Act of Alberta and the Fair Wage Act of Manitoba enable the wages and hours of work agreed upon at a conference of representatives of employers and employees in designated trades to be made the minimum standards throughout the trade concerned. The Quebec Collective Agreement Act permits collective agreements between employers and trade unions to be made binding on all in the industry. The workmen's compensation laws in each province are administered by a board appointed by the Lieutenant-Governor in Council.

Provincial labour legislation enacted in 1956 and 1957 is outlined in the following paragraphs.

Newfoundland.-In 1956 the Workmen's Compensation Act was amended to increase the monthly allowances payable to the widows and children of deceased workmen. The allowance to a widow was increased from $\$ 50$ to $\$ 60$, to a child with one parent from $\$ 12$ to $\$ 20$, and to an orphan child from $\$ 20$ to $\$ 30$. The amendment also raised the rate of earnings used in determining compensation in disability cases from $66 \frac{2}{3}$ to 75 p.c.

Prince Edward Island.-The Workmen's Compensation Act was amended in 1957 to raise the monthly payments to a child living with a parent from $\$ 15$ to $\$ 20$, and to an orphan child from $\$ 25$ to $\$ 30$. A further change enables the Board to pay compensation in respect of a child who is over 16 and under 18 years of age at the time of his father's death, in order to assist in furthering his education. Previously, the Board had authority to continue payments for such purpose only if the child had been receiving compensation before the age of 16 .

A 1957 amendment to the Trade Union Act made the Act apply to employers who regularly employ more than six employees. Formerly, only those with more than 15 employees were covered.

Nova Scotia.-A new Elevators and Lifts Act passed in 1956 provides for the licensing and regulation of all passenger and freight elevators and other types of lifts. The Act requires the approval of the Department of Labour before any new installations may be made or any major alterations undertaken. Every elevator or lift must be inspected annually and the Act provides for the appointment of a Chief Elevator Inspector and
an inspection staff who are all required to hold certificates of competency. No elevator or lift may be operated unless it is licensed by the Chief Inspector. Should an accident occur in an elevator or lift, the owner must notify the Chief Inspector within 24 hours. Safety standards with respect to construction, installation and maintenance of elevators and lifts may be set by regulation. The Act is in force from Jan. 1, 1958.

A new Equal Pay Act, which was passed in 1956 and became effective on Jan. 1, 1957, forbids an employer to pay a female employee at a lower rate than a male employee for the same work in the same establishment. A difference in the rate of pay between a female and a male based on any factor other than sex does not constitute a failure to comply with the Act. An individual claiming to be aggrieved may make a complaint in writing to a designated officer of the Department of Labour who will inquire into the matter and try to effect a settlement. If he is unsuccessful, the Minister of Labour may appoint a commission to investigate and make recommendations, and may issue an order requiring the commission's recommendations to be carried out. Failure to comply with the order is an offence punishable by a fine on summary conviction.

The Workmen's Compensation Act was amended in 1956 to raise the rate of compensation for disability from $66 \frac{2}{3}$ to 70 p.c. of average earnings. By a further amendment, the minimum amount payable in cases of permanent total disability was raised from $\$ 85$ to $\$ 100$ a month.

The Trade Union Act was amended in 1957 authorizing the Labour Relations Board to refer to the Supreme Court for an opinion on any question which, in the Board's opinion, is a question of law.

An amendment made in 1956 to the Engine Operators Act permits a certificate to be issued to a qualified candidate who has been in Canada for at least one year and who has filed a declaration of intention to become a Canadian citizen. Formerly, applicants for certificates were required to be British subjects.

New Brunswick.-A Fair Employment Practices Act, passed in 1956 and becoming effective June 1, 1956, forbids discrimination by employers with regard to employment and by trade unions with regard to membership on grounds of race, national origin, colour or religion. Application forms, advertisements, and written and oral inquiries in connection with employment which express any limitation or preference as to race, colour, national origin or religion are prohibited. The Act applies to all employers with five or more employees, and also binds the Crown in right of the Province.

A 1956 amendment to the Labour Relations Act brings certain police officers under the Act, and provides that a municipal corporation or police commission which fixes their conditions of employment will be deemed to be an employer under the Act.

By a 1957 amendment, to the Workmen's Compensation Act, effective Jan. 1, 1958, the ceiling on earnings was raised to $\$ 4,000$ from $\$ 3,000$.

Quebec.-The Workmen's Compensation Act was amended in 1956 to raise the proportion of earnings on which compensation is based from 70 to 75 p.c., and to reduce the waiting period from seven to five days.

Ontario.-The Police Act, which provides for collective bargaining and the settlement of disputes between members of the police force and the employing municipal council, was amended in 1956 to specify time limits for the different steps in bargaining and settlement of disputes by arbitration, and provides that every agreement must contain a provision for the settlement of disputes arising out of an agreement or award. Amendments to the Fire Departments Act also set new time limits for collective bargaining and arbitration. A new Section setting out the procedure to be followed when a fire-fighter is dismissed provides that, if the fire-fighter so requests in writing, he must within seven days of receipt of a notice of discharge be given a hearing before the municipal council or a committee of the council.

By a 1956 amendment to the Workmen's Compensation Act, effective Jan. 1, 1957, the maximum annual earnings on which compensation is computed were increased from $\$ 4,000$ to $\$ 5,000$.

The Department of Labour Act was amended in 1957 to give the Lieutenant-Governor in Council authority to make regulations for the protection of the health and safety of persons who may be exposed to the effects of ionizing radiation in industry and commerce.

The section of the Factory, Shop and Office Building Act that requires the submission of building plans for any proposed factory and for any shop, bakeshop, restaurant or office building of more than two storeys in height was amended in 1957 to require departmental approval of plans of such buildings of less than two storeys, if they are to cover an area of 5,000 or more sq. feet. Certain regulatory measures authorized for factories were extended to shops, bakeshops, restaurants, offices and office buildings, including authorization of the inspector to direct the employer or owner to take remedial measures where he considers any "place, matter or thing" is a source of danger to the health and safety of employees and the public.

Manitoba.-The Equal Pay Act, 1956, effective July 1, 1956, forbids an employer to pay male employees on a scale different from that on which wages are paid to female employees working in the same establishment, if the work required of, and done by, employees of each sex is identical or substantially identical. The Act covers employers bound by collective agreements, and prohibits an employer, $\cdots$ trade union or a society acting as bargaining agent for employees from negotiating or entering into a collective agreement providing for scales of wages forbidden by the Act.

The Labour Relations Act was amended in 1956 to remove from the application of the Act school teachers who hold certificates or permits under the Education Department Act and who are empowered by a board of school trustees under a written contract in the prescribed form. Provisions were added to the Public Schools Act, effective July 1, 1956, setting out a procedure for collective bargaining between school trustees and teachers' associations and for the settlement of disputes by arbitration. Teachers are forbidden to strike.

The Workmen's Compensation Act was amended, effective July 1, 1956, to raise from $\$ 3,000$ to $\$ 3,500$ the maximum amount of average earnings that may be taken into account in computing compensation. The proportion of earnings on which compensation may be based was raised from 70 to 75 p.c. In death cases, the special immediate payment to the widow was increased from $\$ 100$ to $\$ 200$.

The Vacations with Pay Act was amended in 1956 to provide that when a business is sold or merged with another, an employee who continues in the employment of the new owner is, for the purpose of computing the vacation with pay to which he is entitled, to be considered to have been continuously employed by the one employer.

A 1956 amendment to the Fair Employment Practices Act forbids the use of discriminatory application forms, unless the request for an answer to the questions concerning such matters as race, national origin, colour or religion, is based upon a bona fide occupational qualification. The amendment also provides that the Crown is bound by the Act.

The Employment Standards Act, 1957, is a codification and revision of three of the Province's principal labour laws-the Hours and Conditions of Work Act, the Minimum Wage Act and the Factories Act. The new Act consists of four parts: Part I-General, providing for the keeping of records by employers, regulation of home work, control of employment of children, the making of regulations respecting the control of dangerous employments and other matters, special permits and exemptions and enforcement; Part IIMinimum Wages; Part III-Hours and Conditions of Work; Part IV-Safety of Employees in Factories. No significant changes were made in the provisions governing hours of work or in those providing for the fixing of a minimum wage rate. Some important changes were made, however, in the sections dealing with employment of children, 'take-home work' and safety in factories.

Under the general provisions of the Act, the employment of a child under 15 years of age is forbidden, except with a written permit from the Minister, and no child may be employed in such a manner that his safety, health or moral well-being may be adversely affected. Employment in factories of both boys and girls under 15 years of age is prohibited (formerly the prohibition applied to boys under 14 and to girls under 15). Birth certificates are required for the employment of adolescents under 18 years, instead of under 16 as previously. Further, the Lieutenant-Governor in Council may prohibit the employment of boys or girls under 18 (formerly, girls under 18, boys under 16) in a factory in which the work is considered dangerous, unwholesome or unhealthy.

More supervision of 'take-home work' is provided for. An employer intending to give out home work must first register with the Minister, and the Minister, in his absolute discretion, may impose "conditions and limitations" upon the work in so far as remuneration is concerned.

Regulations may be made by the Lieutenant-Governor in Council governing industries that utilize radioactive substances. Factories with fewer than three employees are no longer exempt from the provisions of the Act. There is now a much stronger provision regarding the cleaning of moving machinery. Cleaning or servicing of machinery involving danger to the employee doing the work is prohibited while the machinery is in motion, except with the Minister's written authorization.

Basement factories may be established only with the written permission of the Minister, who may specify the minimum standard of lighting or ventilation, or both, to be provided and lay down other conditions of operation.

The Steam and Pressure Plants Act was amended in 1957 to extend its coverage to plants subject to a pressure of 15 lb. p.s.i. or over (rather than 50 lb. p.s.i. as before). Any refrigeration plant or compressed gas plant subject to a pressure of 15 lb. p.s.i. or over must be operated by an engineer holding a certificate of qualification under the Operating Engineers and Firemen Act.

Saskatchewan.-The Workmen's Compensation (Accident Fund) Act was amended in 1956 to raise from $\$ 4,000$ to $\$ 5,000$ the maximum earnings that may be taken into account in computing compensation. The immediate lump sum payable to the widow on the death of a workman is increased from $\$ 100$ to $\$ 250$. Amendments passed in 1957 increased the monthly allowance to a child in the care of a parent from $\$ 25$ to $\$ 35$ and that payable to an orphan from $\$ 35$ to $\$ 45$.

The Fair Employment Practices Act, 1956, replaces provisions of the Bill of Rights Act dealing with discrimination in employment and prohibits discrimination in regard to employment and membership in trade unions by reason of religion, colour, ethnic or national origin. An employer is forbidden to use an employment agency that discriminates on these grounds. The Act adopts the administrative and enforcement procedure which is common to other provincial fair employment practices legislation.

Amendments to the Minimum Wage Act in 1956 add to the powers of the Minimum Wage Board in determining minimum wages and certain other working conditions. A 1957 amendment provides that, in recommending the minimum wage to be fixed, the Board may take into account the amount which it deems fair and reasonable, having regard to the wages that it considers to be generally prevailing in the class of employees affected, and the amount which it deems adequate to furnish the necessary cost of living to the employees concerned.

A new Wages Recovery Act was passed in 1957 providing for the collection of unpaid wages by making a complaint before a justice of the peace or a police magistrate and authorizing Department of Labour inspectors to collect wages due to an employee. The amendments raise from $\$ 400$ to $\$ 500$ the maximum amount of wages a magistrate may order an employer to pay.

The Apprenticeship and Tradesmen's Qualification Act was amended in 1957 to require an employer carrying on business in a designated trade to keep specified records of employees in his employ. Powers of inspection were also provided for in the amendment.

A new section was added in 1957 to the Annual Holidays Act to provide that, where a business is sold, leased, transferred or otherwise disposed of, the service of the employees concerned will, for the purpose of qualifying for vacations, be deemed to be continuous and uninterrupted.

Alberta.-Amendments were made to the Workmen's Compensation Act in 1956 incorporating recommendations of a special legislative committee set up in 1955 to investigate the operation of the Act. The monthly compensation payable to a widow was increased from $\$ 50$ to $\$ 60$. Provision was also made for an increase from $\$ 100$ to $\$ 150$ in the immediate lump sum payment to the widow on the death of the workman. The monthly payment to dependent children was raised from $\$ 25$ to $\$ 30$. The rates of all widows' and children's pensions were raised. Compensation is now payable to a child who is over 16 years of age at the time of his father's death, to permit the continuance of his education to age 18. In disability cases the maximum earnings on which compensation may be based are raised from $\$ 3,000$ to $\$ 4,000$.

Amendments were made to the Police Act in 1956 to provide for an appointment of a conciliation commissioner in disputes regarding the remuneration and working conditions of municipal police forces before a dispute goes to arbitration.

Extensive amendments were made in 1957 to the Alberla Labour Act which covers hours of work, minimum wages, holidays with pay, industrial standards and labour relations. A new section was added (Part VI) under which an employer is forbidden to pay a female employee at any lesser rate than the rate at which he pays a male employee for identical or substantially identical work. A difference in rates of pay based on any factor other than sex is permissible, however. An employer and employees bound by a collective agreement in force on July 1, 1957, are exempted from the application of the legislation for the duration of the agreement or one year, whichever is shorter. The provisions regarding equal pay are to be administered by the Board of Industrial Relations.

The weekly rest provisions were amended to ensure that an employee is given a day off "immediately following each period of not more than six consecutive days of work" The former wording requiring an employer to grant a day of rest "in each period of seven consecutive days" allowed the employer to give an employee the first day of one week and the last day of the following week.

Every employer who employs eleven or more employees must now give to each employee a written statement for each pay period, showing hours worked, wages at overtime rate, any bonus or living allowance paid and deductions. The employer of fewer than eleven employees must furnish such a statement on request. Under the former provisions an employer was obliged to furnish pay statements only upon request.

British Columbia.-A new Annual Holidays Act passed in 1956, effective from July 1, 1957, provides for an annual holiday of two weeks instead of one week and provides a corresponding increase in the rate of vacation pay from 2 p.c. to 4 p.c. of annual earnings.

A new Fair Employment Practices Act passed in 1956 forbids employers to refuse to employ, to discharge, or to discriminate against any person because of his race, colour, religion, nationality, ancestry or place of origin. Trade unions are also prohibited from excluding from membership, from expelling or suspending a member or person for any of these reasons. Expressions of discrimination in employment application forms, in advertisements or written or oral inquiries with respect to prospective employment are also banned. The Act does not apply to employers with fewer than five employees, to domestic servants in private homes or to non-profit charitable, philanthropic, educational, fraternal, religious or social organizations. Institutions under the Public Schools Act are covered.

A new Blind Workmen's Compensation Act was passed in 1957 providing special protection to employers of blind workmen. Under the Act, where total compensation to a blind workman exceeds \$50, the Workmen's Compensation Board is to be reimbursed from the Consolidated Revenue Fund for the amount in excess of $\$ 50$.

Regulation of Wages and Hours of Labour under Industrial Standards Legislation and the Quebec Collective Agreement Act.-The Industrial Standards Acts of Nova Scotia, New Brunswick, Ontario and Saskatchewan and the Labour Act of Alberta provide that wages and hours agreed upon at a conference of representatives of employers and employees, called by the Minister of Labour or his representative, may be made legally binding by Order in Council on the industry in the area concerned. The Nova Scotia Act applies only to construction work at Halifax, Dartmouth and Sydney.

In Nova Scotia, 13 schedules of hours and wages for individual building trades were in force during the year ended Mar. 31, 1956, including 12 renewals of previous schedules.

In New Brunswick, four schedules for individual building trades were in force during the year ended Mar. 31, 1956.

In Quebec, under the Collective Agreement Act, hours and wages and also apprenticeship, vacations with pay and family allowances provisions, established by a collective agreement voluntarily entered into by employers and unions or groups of employees, may be made legally binding by Order in Council on all employers and employees in the industry in the district covered by the agreement, if the parties are sufficiently representative of the industry. At Mar. 31, 1956, 99 agreements covering 225,526 workers and 24,224 employers had been generalized to apply either throughout the Province or to a certain district. The agreements in force throughout the Province apply to the following industries: building materials, the manufacture of women's cloaks and suits, dresses, millinery ladies' handbags, men's and boys' clothing, men's and boys' hats and caps, men's and boys' shirts, fine gloves and work gloves, shoes, furniture, paint, corrugated and uncorrugated paper boxes, the tanning industry and the elevator construction industry. Other agreements concern industries in particular cities or parts of the Province including all building trades and printing trades in large urban centres and many rural districts.

In Ontario, there were 149 wages and hours schedules in force at Mar. 31, 1956. Throughout the Province, schedules were in effect for brewery workers, cloakmakers, the men's and boys' clothing industry, men's and boys' hats and caps, the millinery industry and the hard furniture industry. In the construction industry one schedule covered several building trades in one city, and 69 schedules, each for a single trade in a single locality, covered one or more trades in 30 localities. Schedules were in effect in other industries also but only for certain zones: bakers, soft furniture manufacturing, taxi drivers, coal hoisting, and the coal industry, each had schedules in one zone, retail gasoline service in four, taxi drivers in one, and barbers had schedules in 64 zones.

In Manitoba, Part II of the Fair Wage Act provides similar machinery for fixing wages and hours in any business, trade or undertaking except agriculture. Orders in Council under this legislation have been passed fixing wages and hours in the barbering and hairdressing trades.

In Saskatchewan, 19 schedules were in effect at Mar. 31, 1956. The schedule for barbers covered the whole Province; others applied to bakers and bakery salesmen, carpenters, electrical workers, painters, shoe repairers and beauty culture operators in one or more areas.

In Alberta, 26 schedules were in effect during 1956. These governed, in one or more areas, bakers and bakery salesmen, certain individual building trades, dairy employees, garage and service-station workers, radio service, laundry and dry-cleaning employees and barbers.

Regulation of Hours and Annual Holidays.-Five provinces-Ontario, Manitoba, Saskatchewan, Alberta and British Columbia-have statutes that either place absolute limits on working hours or require time and one-half the regular rate to be paid if work is continued after specified limits. There is, in addition, an Act of limited application in Quebec. In the provinces that have no special hours-of-work legislation, the only statutory regulation of hours, apart from that described on p. 752 under the Industrial Standards Acts and the Quebec Collective Agreement Act, is that imposed by factories Acts, mines Acts and, in Newfoundland, an Act governing shops. In New Brunswick and Quebec the limits imposed by the factories Acts apply only to women and boys under 18 years of age. Several minimum wage Acts give authority for the regulation of hours as well as of wages.

In Ontario there is a maximum eight-hour day and 48-hour week with certain exceptions In Alberta the maximum daily and weekly hours in the cities of Calgary, Edmonton, Lethbridge and Medicine Hat are eight and 44; in the remainder of the Province they are eight and 48. In British Columbia hours are limited to eight in a day and 44 in a week. In these three provinces the Acts apply to most workers except farm labourers and domestic servants. In Saskatchewan the Act requires time and one-half to be paid for work after eight hours daily and 44 hours weekly and applies to workers in all industries except agriculture and domestic service. A Manitoba Act covering most industrial workers in the Province requires time and one-half to be paid for work done after eight hours in a day and after 48 hours in a week for men and 44 hours for women. In all provinces that have Acts regulating hours, longer hours may be worked in an emergency or by permission of the administrative authority.

Six provinces-Quebec, Ontario, Manitoba, Saskatchewan, Alberta and British Columbia-have legislation in effect providing for annual holidays with pay for workers in most industries, and New Brunswick has legislation requiring annual holidays in the mining and construction industries. In all these provinces except British Columbia and Saskatchewan, workers are entitled to a one-week holiday with pay after a year of employment. A two-week holiday is given in British Columbia and Saskatchewan aiter a year of employment, in Alberta after two years and in Manitoba after three. A worker employed for less than a year is entitled, in Quebec, to a half-day for each month of employment and, in Saskatchewan, to one day for each month. Coal miners in Alberta are entitled to a oneday holiday with pay for every 20 days worked in a month but not more than two weeks in a year.

Farm workers are excluded from the holiday provisions in all provinces, and domestic servants in all but Manitoba and Saskatchewan. In addition, Quebec exempts forest operations workers, public corporation employees, salesmen, janitors and watchmen, and certain part-time workers. Ontario exempts professional workers, salesmen, and funeral directors and embalmers. Manitoba and Saskatchewan exempt ranch and market garden employees, and British Columbia exempts professional workers and horticultural workers.

Minimum Wage Regulations.-In Nova Scotia the minimum wage law applies only to women. In Ontario, though the Act applies to both sexes, Orders apply only to women. In Newfoundland, New Brunswick, Manitoba, Alberta and British Columbia there are separate Orders for men and women but in British Columbia most Orders cover both sexes. In Quebec and Saskatchewan all Orders apply to both sexes.

Table 1 shows the minimum rates in effect in September 1957 for several classes of establishment in the principal cities. In Newfoundland, New Brunswick, British Columbia and, with respect to men in Manitoba, the rates set are for the entire Province. Elsewhere rates vary according to zone.

[^233]
## Section 2.-The Labour Force*

The current pace of economic activity in Canada necessitates constant planning and study. To the labour leader, the business man, the social administrator and the legislator, this pace requires a continuous process of plan-revision. To provide up-to-date and reliable information concerning the Canadian labour force, a current and periodic analysis of the state of employment in Canada was organized. A labour force survey, on a sample basis, was conducted in the autumn of 1945 and quarterly surveys were carried on until November 1952, when the survey was placed on a monthly basis. A multi-stage area sample was used involving the selection of progressively smaller sample areas and ultimately of households. Random methods of choice were used at every stage of selection so that all members of the population had an equal chance of inclusion. The present sample covers over 35,000 households in more than 115 different areas of Canada; these include 34 cities having a population of 30,000 or over in 1951 as well as some smaller urban centres and various rural areas. The estimates of the labour force are restricted to the civilian labour force; net strength of the Armed Forces is obtainable directly from official sources. Inmates of institutions and Indians living on reserves are excluded.

The labour force surveys provide a classification of persons 14 years of age or over on the basis of their activity during the week that precedes the beginning of the survey, and who had jobs or were seeking work during the survey week. These divisions of the labour force are defined as follows:-
(1) Persons with Jobs.-This category comprises: (a) persons at work-those who did any work for pay or profit or who did unpaid work which contributed to the running of a farm or business operated by a relative; and (b) persons with jobs but not at work-those who had jobs but did not work because of illness, bad weather, vacation, industrial dispute or temporary layoff with definite instructions to return to work within 30 days of the time of being laid off. Persons who worked part of the survey week and also looked for work are classed as "persons with jobs"

* Details of the labour force, as defined in the 1951 Census, relative to age, sex and occupation groups, are given in the 1954 Year Book, pp. 692-704.
(2) Persons without Jobs and Seeking Work.-This classification includes those persons who were looking for work during the survey week and did not work. Persons who were temporarily away from their jobs during the whole of the survey week seeking other work were considered as without jobs and were included in this category. In addition to those who were actively looking for work, this classification includes persons who would have looked for work, except that they were temporarily ill, were on indefinite or prolonged layoff, or believed that no work was available.
Information relating to the population 14 years of age or over not in the labour force is also collected. Persons not in the labour force include such groups as those going to school or keeping house in their own homes, persons who are permanently unable to work because of old age or other reason, and persons who are retired or voluntarily idle. Persons such as housewives, students and others who worked part time are classed as "persons with jobs" or, if looking for work, they are classed as "persons without jobs and seeking work".

The estimates derived from the labour force surveys are subject to sampling error. In general the percentage of error tends to decrease as the size of the estimate increases. The chances are about 19 out of 20 that the difference between the estimate and the figure which would have been obtained from a complete count is less than that shown below.

Size of Estimate

Data in Table 2 for June 1, 1946 to 1957, are compiled from labour force surveys conducted in late May or early June of those years. The information for years before 1946 is taken from estimates based upon 1931 and 1941 Census material rearranged according to the definitional system used in the labour force surveys, the revised census data being linked with the June 1946 survey on the basis of monthly and annual employment and unemployment figures.

## 2.-Estimates of the Civilian Labour Force and its Main Components, June 1, 1931-57

Norg.-Figures do not include persons in institutions and Indians on reserves. Figures for 1931-45 inclusive have been revised since the publication of the 1956 Year Book.

| Year | Civilian Population (14 years of age or over) | Civilian Labour Force (14 years of age or over) |  |  |  |  |  |  | Persons not in the Labour Force (14 years of age or over) |

${ }^{1}$ Employers, 'own-account' and unpaid family workers.
${ }^{2}$ Newfoundland included from 1950.

Main Characteristics of the Civilian Labour Force, 1946-57.-Since the end of World War II, the civilian population 14 years of age or over (exclusive of persons in institutions and Indians on reserves) has increased by over one-quarter-to an estimated $10,968,000$ persons at the beginning of June 1957 from an estimated $8,768,000$ persons at the same time of year in 1946. In the same period, the labour force increased by 21 p.c. from $4,862,000$ to $5,881,000$. The labour force constituted 53.6 p.c. of the population 14 years of age or over in 1957 compared with 55.5 p.c. in 1946 . The lower percentage in 1957 is largely accounted for by the fact that the population includes a greater proportion of persons over 65 years of age whose rate of participation in the labour force is much lower than that of the adult population as a whole, and by the fact that young persons are entering the labour force at a higher average age. These factors more than offset the increased proportion of married women with jobs outside the home.

The number of persons with jobs increased by 20 p.c. from $4,738,000$ to $5,687,000$ over the eleven years. While there has been a continuing decrease in the numbers employed in agriculture, which showed a drop of 39 p.c. in the period, total employment in nonagricultural industries increased 42 p.c. from $3,467,000$ at June 1, 1946, to $4,914,000$ in 1957. The increase in paid workers in non-agricultural industries was still higher and amounted to 46 p.c. The number of persons without jobs and seeking work fluctuated over the period; at the beginning of June 1957, the proportion of the labour force in this category was 3.3 p.c. and at June 1, 1946, it was 2.6 p.c.

Persons not in the labour force increased by 30 p.c. in the eleven years from $3,906,000$ to $5,087,000$. The increases were most marked for students and retired persons and were relatively smaller for persons keeping house in their own homes.

# Section 3.-Employment, Payrolls and Hours* 

## Subsection 1.-Historical Commentary

The Dominion Bureau of Statistics has collected monthly data for many years on the numbers of men and women on the staffs of establishments (usually having 15 employees or over) in the main non-agricultural fields, both by industrial classifications and geographical distribution. Motives of economy in time and money exclude the smaller firms. Until 1941, a count of employees at work was made by firms for the last working day in each month. Since early in 1941, when collection of payroll statistics was undertaken, establishments have reported for their last pay periods in each month. Employees, by definition, include wage-earner and salaried staffs, salesmen and commission workers, but exclude proprietors, firm members and directors. The industrial classification includes nine main divisions: forestry-mainly logging; mining; manufacturing; construction; transportation, storage and communication; public utilities; trade; finance, insurance and real estate; and service. All components of these industries are covered by questionnaires except the service classification, in which only hotels, restaurants, laundries and drycleaning plants, recreation, business services and a few other groups are surveyed. Such important services as government administration, fishing, agriculture, education, health, domestic and personal service are not covered in the monthly series. Data are published for 32 metropolitan areas and the provinces. Since 1951, the grouping of data has conformed to the Canadian Standard Industrial Classification; statistics for a considerable number of earlier years have been converted to this basis.

From information available in the 1951 Census, it is estimated that 78 p.c. of paid workers at work in the reported industries are covered in the monthly surveys. If all paid workers were taken into account, including those in the non-reported fields and those in small establishments in the industries surveyed, the coverage would approximate 59 p.c. In the broad industrial divisions, estimates of coverage range from a high of 96 p.c. for mining to a low of 40 p.c. for services.

Collected information on labour was expanded in 1941 to include current earnings of the reported employees, and records of weekly payrolls and average weekly wages and salaries were subsequently carried back, on an annual basis, to 1939. Since the autumn of 1944, statistics have also been collected on the hours and earnings of wage-earners for whom establishments can furnish a record of hours actually worked. Monthly statistics on the sex distribution of employees were first published in early 1946, superseding the annual and semi-annual series of immediately preceding years. With the entry of Newfoundland into Confederation, separate data for that Province were recorded from 1950 to 1953; from then on, the statistics have been incorporated into Canada-wide series. The index reference period has been changed several times throughout the years, and the index numbers are now computed on the 1949 average as 100 . The data currently compiled for manufacturing have been supplemented for a considerable number of years by a detailed annual inquiry into the earnings and hours of work of men and women wage-earners and salaried employees. More information on this survey will be found in Subsection 3, pp. 766-774.

Employment in the surveyed industries in 1956 was just about double the 1939 figure. The index was computed at 60.1 for 1939 and, reflecting steady population growth and greater industrialization, climbed to 120.1 in 1956. In the same period the annual average of weekly wages and salaries for the reporting industries showed uninterrupted advances: the industrial composite of average weekly earnings was $\$ 23.44$ in 1939 and increased to $\$ 64.18$ in 1956 , a gain of 174 p.c. In manufacturing, earnings increased to a rather greater extent-from $\$ 22.79$ in 1939 to $\$ 66.47$ in 1956, or 192 p.c., reflecting a pronounced expansion in employment in the heavy manufacturing industries in which earnings were above the general average.

[^235]Since the end of 1944, a monthly statistical series has been maintained for manufacturing and a few other industries, showing average hours and average hourly and weekly wages for wage-earners for whom employers keep records of hours actually worked. In 1945, the annual average of hourly earnings in factories was 69.4 cents, and each succeeding year experienced a step-up until a high of 151.5 cents was reached in 1956. Other industries in which payment by the hour is typical followed the same upward trend. For example, the average in construction advanced from 73.5 cents an hour in 1945 to a new peak of 163.9 cents in 1956. Increases in hourly earnings were attended by decreases in the average hours worked in most reporting industries. In manufacturing, the average weekly hours fell from 44.3 in 1945 to 41.1 in 1956.

## 3.-Annual Average Index Numbers of Employment by Industrial Group 1947-56 and Monthly Indexes 1955 and 1956

## Subsection 2.-Employment and Earnings in 1956

During 1956, exceptional economic advances were made in Canada. Expenditure by consumers on goods and services rose 8 p.c. and exports were up 12 p.c. over 1955. The developments were reflected in higher levels of employment, payrolls and per capita earnings. The annual average employment index $(1949=100)$ reached a new high at 120.1, up 6.8 p.c. from 1955 , and considerably above the previous peak of 113.4 set in 1953. The rate of increase from the previous year had been surpassed only in 1947 and 1951 during the postwar period. All major industrial divisions surveyed monthly, except logging, shared in the advance, employment rising to new peaks. In forestry, however, an 11-p.c. increase over 1955 did not suffice to bring the 1956 index up to the all-time high in 1947. The 13.8-p.c. increase for the construction industry was the greatest gain of the year. In other industries, the increases ranged from a high of 8.6 p.c. for services to a low of 3.3 p.c. for the finance, insurance and real estate group.

Manufacturing, which reports approximately 45 p.c. of all employees covered in the monthly surveys, rose by 5.6 p.c. over 1955 . The expansion in the durable goods segment of this industry continued at a faster rate than in the non-durable goods group, the employment increases over 1955 amounting to 7.8 p.c. and 3.4 p.c., respectively. Iron and steel products recorded a $9.6-$ p.c. jump in staffs over the preceding year. There was a rise of at least 5 p.c. in each of the individual industries except agricultural implements, in which case a lack of export and domestic orders resulted in an employment decrease of 10.2 p.c. The most notable increases in the durable goods branch were in fabricated and structural steel, primary iron and steel, iron castings and machinery manufacturing, ranging from 12 to 19 p.c. Increased activity in motor vehicle and railroad and rolling-stock equipment was largely responsible for a considerable rise in transportation equipment. There were also noteworthy gains in electrical apparatus and supplies, non-metallic minerals, and aluminum products groups. Declines in employment continued in fur goods and hats and caps, while staffs in synthetic textiles and silk, tobacco and tobacco products, grain mill products and canned and cured fish were also smaller than in 1955.

Employment rose in many of the non-manufacturing industries surveyed, the most notable exceptions being gold and coal mining and urban and interurban bus transportation; in these, a downward trend had been noted for some years. Relatively, the greatest increases in staffs in 1956 were shown in oil and natural gas production, radio and television broadcasting and in building construction, in all of which employment was more than 20 p.c. above the previous year.

The annual average number of women reported in the surveyed establishments in 1956 was higher by 5.9 p.c. and that of men by 7.1 p.c. For manufacturing only, the increases were 5.3 and 5.8 p.c. respectively. The highest proportion of women in the nine major industries, according to the Oct. 1 survey, was in the finance, insurance and real estate division, in which 493 of each 1,000 employees reported. The service and trade classifications followed with figures of 474 and 366 , respectively. The composite figure for Canada was 222. In manufacturing, which employs the largest number of women in the industries surveyed, 228 per 1,000 employees reported were of that sex. Provincially, Ontario continued to have the highest ratio of employed women-almost one-quarter of the total reported in that Province. This is partly accounted for by the fact that there is a great concentration of manufacturing in Ontario. In the metropolitan areas, the proportions of women ranged from a high of 315 in Kitchener, Ont., to a low of 53 per 1,000 in Sydney, N.S.

The expansion of employment during 1956 was widespread, all provinces showing gains of at least 2.7 p.c. over the preceding year. The largest increase was in Alberta, where reported staffs rose 11.1 p.c. as a result of increased activity particularly in construction, iron and steel products and oil, petroleum and coal products. British Columbia followed with a gain of 8.6 p.c. In that Province, construction showed the greatest upswing, but advances in iron and steel products and non-ferrous metal products were quite substantial. In both Alberta and British Columbia, employment in the coal-mining industry continued to decline, and lessened activity in gold mining in British Columbia
dropped the employment index in that group by 16.4 p.c. from 1955. Although industrial employment generally was up 6.8 p.c. in Ontario and Quebec, the manufacturing indexes in those areas did not climb in the same proportions. The gains were 5.9 p.c. in the former and 5.1 p.c. in the latter. Employment in practically all branches of industry in Ontario rose, the exceptions being gold mining and the manufacture of agricultural implements and women's clothing. Metal mining, other than gold, reached an all-time high with the index standing at $203.0,18.6$ p.c. above 1955. Employment in the iron castings and primary iron and steel groups of the iron and steel industry and in construction rose by about 14 p.c. in 1956. In Quebec, the working force reported in forestry operations increased by 18 p.c. from 1955. Staffs in the aircraft industry were up 14.3 p.c. in 1956 following a drop in 1955 caused in part by labour-management disputes. Greatly heightened activity was also recorded in construction and in the electrical apparatus and supplies group of manufacturing. In the Atlantic Provinces, construction operations expanded considerably, and logging in New Brunswick reported an employment gain of more than 25 p.c.

The annual average index of industrial employment rose in most of the 32 metropolitan areas for which monthly data are compiled. The exceptions were Saint John, N.B., where a slight decrease was recorded, and Drummondville, Que., where there was no general change as compared with 1955 . The increases in the other centres ranged up to 13.9 p.c. for Sault Ste. Marie, Ont. The larger areas of Montreal and Toronto recorded rises of 6.2 and 5.4 p.c. respectively. Higher levels of employment in construction was a main factor in both cities and, in addition, activity increased substantially in the electrical apparatus field in Montreal. Employment in many centres, including the two just mentioned, reached new all-time high levels in 1956.

The 1956 payroll index stood at 180.5, a new high. The advance over 1955 was 12.7 p.c., the highest rate of annual increase since the 1950-51 period, when it amounted to 18.5 p.c. Expanding employment and upward revisions in wage and salary scales contributed to the rise. All major industrial groups surveyed registered substantial gains, with the construction payroll index advancing 26 p.c. Forestry, service and mining also advanced above the national average. Payrolls in manufacturing generally were 10.8 p.c. over 1955; those in the durable goods component rose to a greater extent than the nondurables, the increases being 13.0 p.c. and 8.3 p.c. respectively.

Provincially, Alberta reported the most marked increase in industrial payrolls19.5 p.c. above 1955. British Columbia was not too far behind, recording a 15.5 -p.c. rise, while wages and salaries in Ontario and Quebec reached levels approximately 12 p.c. above the preceding year. All metropolitan areas for which statistics are published showed increases in this comparison, the gains ranging from 2.2 p.c. in Saint John, N.B., to 28.8 p.c. in Sault Ste. Marie, Ont. Increased employment and higher pay rates in the surveyed industries were the main factors.

The annual average of weekly wages and salaries continued the uninterrupted upward movement in effect since 1939, the earliest year for which data are available, rising by $\$ 3.31$ from 1955 to $\$ 64.18$, or by 5.4 p.c. This increase exceeded those recorded in the two immediately preceding years by about 2 p.c. As usual, British Columbia reported the highest average, provincially, with weekly earnings of $\$ 69.91$. The greatest rate of increase over the preceding year, however, was in Alberta. The trend of weekly wages and salaries was upward in all metropolitan areas except Windsor, Ont., where a decrease of 1.5 p.c. was caused mainly by short time in the automobile industry. Industrially, there were also general increases in average earnings. Mining, which reported the highest wages and salaries in the industries surveyed, showed a figure of $\$ 77.59$, which was 21 p.c. above the industrial composite. The greatest rise over 1955 was in construction, where an advance of 10.2 p.c. brought the 1956 average earnings to $\$ 68.26$.

Monthly data on man-hours and hourly earnings are collected from employers who keep a record of hours worked by their wage-earners. The industries for which such statistics are available tend to be those in which wage-earners are generally rated by the hour. In manufacturing, the annual average of hourly earnings increased by 4.8 p.c. to
151.5 cents in 1956. This rise was largely attributed to higher wage rates in many establishments and industries, with higher levels of employment in some industries paying above the general average. Labour-management disputes caused smaller losses in working time than in the two previous years and consequently had less effect upon the general average of earnings. The length of the average work week increased negligibly during 1956.

Average weekly wages were up 5.1 p.c. to $\$ 62.27$ in the twelve months. The two major components of manufacturing showed similar increases, amounting to 4.8 p.c. in heavy goods manufacturing and 4.7 p.c. in non-durables. The greater advance in manufacturing as a whole reflected relatively larger increases in employment in the former than the latter group. The most significant gains in hourly earnings in the heavy manufacturing industries were reported in primary iron and steel, hardware and tools, and motor vehicle parts and accessories. Almost all individual industries showed higher weekly wages, an exception being motor vehicles, in which wages declined because of a shorter work week. A longer work week and upward revisions of wage rates raised the average in steel mills by 10 p.c. over 1955, the largest increase reported in the durable manufactured goods section.

In the non-durables group, gains of 5 p.c. or more were reported in canned fruit and vegetables, bread and bakery, rubber, paper, chemical and petroleum, and coal products. Substantial losses in employment, hours and earnings were recorded in the textile industry during the summer months, especially in the cotton goods group, partly as a result of strikes. Average weekly wages rose in all light manufacturing industries listed, while the average hours worked were about the same as in 1955. The clothing group as a whole and several of its components, however, showed an average increase of 0.6 hours per week. A similar reduction in the acids, alkalies and salts group resulted chiefly from a shorter standard work week.

In mining, the average hourly earnings rose by 6.4 p.c. to 171.4 cents in 1956, a new high. The largest gains over 1955 were in metal mining and oil and natural gas extraction. In the former, wage-rate increases and a shorter standard work week with the same takehome pay in some mines accounted for part of the increase, although the lay-off of workers from mines paying below the general average was also a factor. Considerable advances in employment in the oil group were reported for higher-paid workers, while pay rates also rose in some cases.

Average hours in mining as a whole dropped by 0.3 per week in 1956 because of a shorter standard work week in metal mining. Other branches reported small gains, the most important of which was coal mining in Alberta. Construction was much more active during the year so that average hourly earnings and weekly wages rose significantly, and the average work week lengthened by 1.2 hours. Moderate increases in average earnings were reported in the electric and motor transportation group, and in those sections of the service industry for which data are available. Average hourly and weekly earnings in manufacturing increased in all provinces and in most of the metropolitan areas in 1956 and established new records.
4.-Annual Average Index Numbers of Employment by Industrial Division and Group 1939 and 1952-56
Nork.-These monthly indexes are calculated as at the first day of the month, on the base $1949=100$.

## Subsection 3.-Earnings and Hours of Work of Male and Female Employees in Manufacturing Establishments

An annual inquiry is made in the last week of October each year into the earnings and hours of work of employees in manufacturing, providing more detailed data than are obtained from the monthly series of employment, payrolls and man-hours. Each year statistics of earnings and hours are requested for men and women wage-earners and salaried staffs. Rotating in a three-year cycle since 1949, additional data were collected as follows: (1) a distribution of wage-earners by a given range of hours; (2) office and clerical workers segregated from the general salaried data; and (3) a distribution of wage-earners and salaried staff employees by a given range of weekly earnings.

As in the monthly survey, the inquiry is limited to establishments employing 15 persons or over, accounting for about 90 p.c. of all employees reported to the Annual Census of Manufacturing. Establishments are asked to supply statistics for all regular employees, full- and part-time, as well as for casual workers who received pay in the week ended Oct. 31. Categories such as homeworkers, proprietors, firm members or directors, pensioners and staffs of separately organized sales branches are purposely excluded from
the reports. Gross payrolls are reported for the various categories before deductions for income tax and social security contributions. Such payments as regular bonuses and for absences in the week surveyed as well as overtime earnings are included. Part-time, full-time and overtime hours worked and hours of paid absence are given.

From 1946, when the first inquiry in the present series was made, to 1956, average earnings have shown a steady rise, weekly wages increasing by 97.6 p.c. and salaries by 94.4 p.c. In both cases, the annual averages of earnings of women have usually risen at a somewhat higher percentage rate though by smaller amounts, than those of men. The shortening of the work week in the postwar period has resulted in a considerably greater advance in average hourly wages than in average weekly wages.

Table 9 shows average earnings and average hours worked in certain industries. Table 10 shows the average hourly earnings of wage-earners and the increases recorded from year to year for the two sexes. Tables 11 and 12 summarize the available averages of hours worked, hourly earnings and weekly earnings for male and female wage-earners and salaried staffs for the last week in October 1955 and 1956. Table 13 shows the proportion of women employees and also the proportion of their average earnings to men's earnings for 1954, 1955 and 1956.

${ }^{1}$ Includes Prince Edward Island and the Yukon and Northwest Territories.
Data required for the tabulation of the provincial distribution of male and female wage earners and salary earners, classified by earnings group, are secured every third year. The figures for 1953 as compared with 1950 are given in the 1955 Year Book at pp. 790-791. Figures for 1956 may be obtained from the Labour and Prices Division, Dominion Bureau of Statistics.

## Section 4.-Wage Rates, Hours of Labour and Other Working Conditions

Statistics on occupational wage rates by industry and region or city, and standard hours of labour are compiled by the Federal Department of Labour and published in the annual report Wage Rates and Hours of Labour in Canada. Some of these statistics are also published from time to time in The Labour Gazette, the official journal of the Department.

The statistics on wage rates apply to the last normal pay period preceding Oct. 1, and cover about 13,500 establishments. Average wage rates of time workers and average straight-time earnings of piece workers and other incentive workers in a given occupation are shown separately but are combined in the calculation of index numbers. Predominant ranges of rates for each occupation used are also given. Overtime pay is excluded.

The industry index numbers measure changes in wage rates for non-office employees below the rank of foreman. They do not, however, provide a basis for comparing the level of wages in one industry with that in another. More detailed information on concepts and methods of developing these statistics is given in the annual report.

## 14.-Index Numbers of Average Wage Rates for Certain Main Industrial Groups 1947-56

$(1949=100)$

Nors.-Indexes for the years prior to 1949 are conversions of the previous series on the 1939 base. Indexes back to 1901 masy be obtained from the Department of Labour publication Wage Rates and Hours of Labour in Canada, 1856.

[^243]Wages of Farm Labour.-Wage rates for farm help have been increasing slightly over the past few years. Moderate gains were recorded in 1952 and 1953 and after levelling off in 1954 and 1955 the upward trend was resumed in 1956. The information on farm wages is provided by volunteer farm correspondents located in all provinces except Newfoundland.

## 21.-Average Daily and Monthly Wages of Male Farm Help as at Jan. 15, May 15 and Aug. 15, 1952-56

Note.-Figures from 1940 are given in the corresponding table of previous Year Books beginning with the 1943-44 edition.

## Section 5.-Unemployment Insurance

The Unemployment Insurance Act, which came into operation on July 1, 1941, applies to all persons employed under a contract of service, except the following: employment in specified industries or occupations such as agriculture, horticulture, forestry (effective Jan. 1, 1956, coverage was also extended to certain employments in these three industries); the Canadian Armed Forces; the permanent public service of the Federal Government; provincial government employees except where insured with the concurrence of the government of the province; certified permanent employees of municipal or public authorities; private domestic service; private duty nursing; teaching; certain director-officers of corporations; workers on other than an hourly, daily or piece rate, earning more than $\$ 4,800$ a year unless they elect to continue as insured persons; employees in a charitable institution or in a hospital not carried on for purpose of gain except where the institution or hospital consents to insure certain groups or classes of persons with the concurrence of the Commission. All persons paid by the hour, day, or at a piece-rate (including a milage rate) are insured regardless of amount of earnings, together with all employees who receive $\$ 4,800$ or less at weekly, monthly, yearly or commission rates.

Unemployment Insurance Fund.-Employers and employees contribute to the Unemployment Insurance Fund, the total paid by each group being equal. The Federal Government contributes an amount equal to one-fifth of the combined employer-employee contributions and assumes the cost of administration. From July 1, 1941 to Mar. 31,1956, employers and employees contributed $\$ 1,569,863,590$ to the Fund and the Federal Government added $\$ 313,982,080$. Interest and profit on sale of securities amounted to $\$ 197,095,791$ and fines of $\$ 250,318$ made a total revenue of $\$ 2,081,191,779$.

Benefits first became payable on Jan. 27, 1942, and from that date to Mar. 31, 1956, total benefit payments amounted to $\$ 1,226,993,261$, leaving a balance of $\$ 854,198,519$ in the Fund. Reserves of the Fund are invested in Government of Canada bonds and, as at Mar. 31, 1956, the par value of bonds held amounted to $\$ 853,253,000$.

WEEKLY RATES OF CONTRIBUTION AND BENEFIT UNDER THE UNEMPLOYMENT INSURANCE ACT, EFFECTIVE OCT. 2, 1955

| \$57.00 or over...... . | 60 | 60 | 1.20 |  |  |  |

${ }^{1}$ The weekly contribution is based on actual earnings in the week irrespective of the number of days in which the earnings are obtained. $\quad$ Unemployment insurance stamps combine both employer and employee contributions.
ated on the average weekly contributions for the last 30 weeks in the 104 weeks preceding claim. Since Oct. 2, 1955, a claimant to qualify for benefit must have at least 30 weekly contributions in the last 104 weeks prior to claim; 8 weeks must be in the last 52 weeks. (These periods of 104 weeks and 52 weeks may be extended under certain circumstances.) ${ }^{4}$ Employees earning less than $\$ 9$ in a week receive one-balf of a 32 -cent stamp ( 8 cents from the employer and 8 cents from the employee).

The duration of benefit is related to the contribution history-one week's benefit for every two weeks' contributions in the past 104 weeks with a maximum of 36 weeks. The rate of benefit is determined by the average of the contributions in the past 30 weeks. No benefit is payable in a benefit period until a claimant has served a waiting period equivalent to one full week's benefit.

Disqualifications for benefit include: loss of work owing to a labour dispute in which the contributor is participating or directly interested; unwillingness to accept suitable employment; being an inmate of any prison or any institution supported out of public funds; refusal to attend a course of instruction or training if directed to do so; residence outside Canada unless otherwise prescribed. Disqualification of a claimant for a period not exceeding six weeks may be imposed if an employee is discharged by reason of his own misconduct or leaves the employment voluntarily without just cause or refuses suitable employment.

Seasonal benefit is payable in the period Jan. 1 to Apr. 15 to certain claimants whose benefits have been exhausted or who have insufficient contributions to qualify for regular benefit.

## 22.-Persons Insured under the Unemployment Insurance Act by Industrial Group and Sex 1955 and 1956

[^246]${ }^{2}$ Jan. 1 to Apr. 21.

Employment Service.-The Unemployment Insurance Commission operates a free employment service under authority of the Unemployment Insurance Act, 1940. The public employment offices, which had functioned under a joint federal-provincial arrangement for more than two decades, were taken over by the Commission on Aug. 1, 1941, and additional offices were established in all provinces except Quebec. The Commission established its own offices in Quebec and the Provincial Government thereupon reduced the number of its offices.

## 29.-Applications for Employment, Positions Offered and Placements Effected by Employment Offices 1947-56 and by Province 1955 and 1956

## Section 6.-Vocational Training*

The federal Department of Labour, under the authorization of the Vocational Training Co-ordination Act 1942, co-operates with the provinces in promoting and developing vocational training in Canada by sharing with the provincial governments the costs of establishing and operating various types of schools and training programs designed to fit trainees for employment.

[^248]The federal-provincial program under which all classes and training projects are operated is known as 'Canadian Vocational Training'. In conducting this program, the Minister of Labour receives advice and co-operation from the Vocational Training Advisory Council which consists of representatives of provincial governments, employers, organized labour and other bodies concerned with vocational training in Canada. Problems regarding apprenticeship, including federal participation therein, are referred to the Apprenticeship Training Advisory Committee which reports to the Minister through the Council.

The established procedure is to have all training programs operated by or under the supervision of the appropriate provincial authority and to reimburse the provinces for provincial government expenditures in connection with such projects. Where classes or training programs are operated for federal government departments, the Armed Forces, or other federal agencies, the provinces are reimbursed for the full costs; otherwise they are reimbursed for one-half of such expenditures subject to the limitation of funds voted for such purpose by Parliament.

There are four federal-provincial agreements governing the nature and extent of the sharable expenditures for different types of training: the Vocational and Technical Training Agreement No. 2, the Apprenticeship Agreement, the Vocational Training Agreement, and the Vocational Correspondence Courses Agreement.

Assistance to Vocational and Technical Training.-Ten-year agreements for vocational and technical school assistance were signed by nine provinces and the Yukon and Northwest Territories in 1957. The agreements provide for a total of $\$ 15,000,000$ to be expended by the Federal Government over a five-year period for operating expenses of vocational schools and technical institutes of lower than college grade, and $\$ 25,000,000$ for capital assistance in building and equipping such schools, with preference given to trade schools and technical institutes.

The capital assistance is divided among the provinces and territories on the basis of number of persons in the 15-19 age group. Under the annual allotment an initial amount of $\$ 30,000$ is made available to each province and $\$ 20,000$ to each territory, the balance being distributed on the basis of the 15-19 age group. The total annual allotment for the first two years of the agreement is $\$ 2,500,000$, for the third year $\$ 3,000,000$ and for the fourth and fifth years $\$ 3,500,000$.

The Vocational Schools' Assistance Agreement, which had been in effect from 1945, expired on Mar. 31, 1957.

Apprenticeship Training.-Apprenticeship agreements covering a ten-year period commencing Apr. 1, 1944, were signed by all provinces except Quebec and Prince Edward Island. Newfoundland signed an agreement in 1950 for the remainder of the 1944-54 period. These agreements have been renewed for a further ten-year period expiring on Mar. 31, 1964. They provide for sharing, on a $50-50$ basis, in provincial government expenditures on the training of indentured apprentices who are registered with the provincial Departments of Labour under the provisions of the apprenticeship Act of each province. Training is provided on the job and in specially organized classes which may be conducted on a full-time basis during the day or as part-time day or evening classes. As of Mar. 31, 1957, a total of 16,663 apprentices was registered. Federal Government expenditures for this purpose for the year ended Mar. 31, 1957, were as follows:-

| Province | Payment | Province | Payment |
| :---: | :---: | :---: | :---: |
|  | \$ |  | \$ |
| Newfoundland. | 38,242 | Alberta.. | 281,313 |
| Nova Scotia.. | 71,306 | British Columbi | 110,769 |
| New Brunswick | 69, 460 | Northwest Territories | 2,176 |
| Manitoba. | 301,004 62,330 | Total. | 1,033,979 |
| Saskstchewan | 97,378 |  |  |

Special Vocational Training Projects.-Agreements that provide for sharing with the provinces the costs of various types of training projects, other than those regularly conducted in schools assisted under the provisions of the Vocational and Technical Training Agreement No. 2, have been in operation since 1939. These agreements were consolidated in 1948 and expired in 1954; they have been renewed for a further five-year period, except that the provision for sharing the costs of financial assistance to university students and nurses-in-training is subject to renewal on a year-to-year basis. The conditions governing financial assistance to the various types of projects are set forth in schedules attached to and forming part of each agreement. These schedules cover special training classes for members of the Armed Forces, the costs of which are borne entirely by the Federal Government; training programs on an individual or class basis for veterans of the Armed Forces for which the provinces are reimbursed 100 p.c.; and special training programs for employees of federal government departments, the full cost of which is also borne by the federal treasury. In addition the costs of the following types of classes are shared equally by the federal and provincial governments: training for unemployed persons who require such training to fit them for available employment; rehabilitation training for disabled persons; short-term classes for young people in rural communities; and training programs for supervisors in industrial establishments. Total expenditure from the federal treasury under these vocational training agreements for the year ended Mar. 31, 1957, was $\$ 948,668$.

Correspondence Courses.-Under the provisions of the Vocational Correspondence Courses Agreement, the Federal Government shares equally with the provincial governments in the costs of printing and preparing correspondence courses. These courses, of which there are approximately 100 , must be approved by a committee consisting of the provincial officials in charge of correspondence instruction. They are made available to students anywhere in Canada on the same terms as for students in the province where the course has been prepared. The sum of $\$ 125,000$ was appropriated in 1950 to provide for such expenditures during a five-year period. Payments are made to the provinces only on completion of approved courses, and the term of the agreements has been extended to Mar. 31, 1958, to take care of incompleted courses and needed revisions.

## Section 7.--Industrial Accidents and Workmen's Compensation

## Subsection 1.-Fatal Industrial Accidents

Statistics of fatal industrial accidents have been compiled by the federal Department of Labour since 1903. The data are now obtained from provincial Workmen's Compensation Boards, the Board of Transport Commissioners and other government authorities, departmental correspondents and from press reports.

\end{tabular}

Causes of Industrial Fatalities.-During 1956, of the 1,416 fatal accidents to industrial workers, 406 were caused by moving objects; 73 by falling trees and branches; 34 by falling or flying objects in mines and quarries; 37 by automobiles and trucks; and 56 by landslides and cave-ins. Collisions, derailments, wrecks, etc., were responsible for 344 industrial fatalities. Automobiles and trucks were involved in 157 of these accidents; watercraft in 51; tractors in 61; aircraft in 35; and railways in 31. Falls and slips were responsible for 250 industrial deaths, of which 247 were falls to different levels including 76 deaths caused by falls into rivers, lakes, seas or harbours; 32 by falls from scaffolds and stagings; 25 by falls into shafts, pits, excavations, etc.; 28 by falls from buildings, roofs and towers; and 12 by falls from ladders and stairs. There were 97 deaths caused by exposure to dust and poisonous gases, and 82 deaths caused by workers being caught in, on or between parts of machinery or other agencies. Conflagrations, temperature extremes and explosions caused 111 industrial fatalities; 57 were caused by over-exertion or industrial diseases, and 58 by contact with electric current.

## Subsection 2.-Workmen's Compensation*

In all provinces legislation is in force providing for compensation for injury to a workman by accident arising out of and in the course of employment, or by a specified industrial disease, except where the workman is disabled for fewer than a stated number of days. The Acts of all provinces provide for a compulsory system of collective liability on the part of employers. To ensure payment of compensation each Act provides for an accident fund, administered by the province, to which employers are required to contribute at a rate determined by the Workmen's Compensation Board in accordance with the hazards of the industry. A workman to whom these provisions apply has no right of action against his employer for injury from an accident during employment. In Ontario and Quebec public authorities, railway and shipping companies, and telephone and telegraph companies are individually liable for compensation as determined by the Board and pay a proportion of the expenses of administration. A federal Act provides for compensation for accidents to Federal Government employees according to the conditions laid down by the Act of the province in which the employee is usually employed. Seamen who are not under a provincial Workmen's Compensation Act are entitled to compensation under the Merchant Seamen Compensation Act.

In all provinces, free medical aid is given to workmen during disability. Compensation is payable in all provinces for anthrax and for poisoning from arsenic, lead, mercury and phosphorus and silicosis is compensated under certain conditions. Other diseases compensated vary according to the industries of the provinces.

Scope of the Workmen's Compensation Acts.-The Acts vary in scope but in general they cover construction, mining, manufacturing, lumbering, transportation and communications and the operation of public utilities. Undertakings in which not more than a stated number of workmen are usually employed may be excluded, except in Alberta and British Columbia.

Benefits.-Under each Act, except those of Saskatchewan and Alberta, if a workman is disabled from earning full wages for fewer than a stated number of days, usually called the 'waiting period', he cannot recover compensation for the period of his disability or, in Manitoba and British Columbia, for the first three days of his disability. Where the disability continues beyond the required number of days, compensation is payable from the date of the accident. Medical aid is always paid from the date of the accident. In Saskatchewan and Alberta the waiting period is one day, that is, compensation is not payable when the workman is off work only for the day on which the accident occues. When he is disabled for a longer time, compensation begins from the day following the accident.

[^249]Burial expenses are paid to the amount of $\$ 250$ in Saskatchewan and British Columbia, and of $\$ 200$ in Newfoundland, Prince Edward Island, Nova Scotia, New Brunswick, Quebec, Ontario, Manitoba and Alberta. In seven provinces an additional sum is allowed for transporting the workman's body.

A widow or invalid widower or a foster mother, as long as the children are under the age limit, receives a monthly payment of $\$ 75$ in Ontario, Saskatchewan and British Columbia; $\$ 60$ in Alberta and Newfoundland; $\$ 55$ in Quebec; and $\$ 50$ in Prince Edward Island, Nova Scotia, New Brunswick and Manitoba. In addition, a lump sum of $\$ 250$ is paid in Saskatchewan; $\$ 200$ in Ontario, Quebec and Manitoba; $\$ 150$ in Alberta; and $\$ 100$ in all other provinces.

For each child in the care of a parent or foster mother receiving compensation, a monthly payment of $\$ 35$ is made in Saskatchewan; $\$ 30$ in Alberta; $\$ 25$ in Ontario and British Columbia; $\$ 20$ in Nova Scotia, Quebec, Manitoba, Newfoundland and Prince Edward Island; and $\$ 12$ in New Brunswick; with a maximum of $\$ 130$ to any one family in Prince Edward Island and $\$ 150$ in Nova Scotia.

For each orphan child a monthly payment of $\$ 45$ is made in Saskatchewan; $\$ 35$ in Ontario; $\$ 30$ in Nova Scotia, Quebec, Manitoba, British Columbia, Prince Edward Island, Newfoundland and Alberta (in Alberta a further amount, not exceeding $\$ 10$ a month, may be given at the discretion of the Board); and \$25 in New Brunswick; with a maximum of $\$ 120$ a month to any one family in Prince Edward Island and of $\$ 150$ in Nova Scotia.

Invalids excepted, payments to children are not continued beyond the age of 16 years in seven of the provinces but the Board has discretion to pay compensation to the age of 18 years if it is considered desirable to continue a child's education. In Quebec, the age limit is 18 years and in New Brunswick and British Columbia compensation is paid to the age of 18 years if a child is regularly attending school. In Nova Scotia, New Brunswick, Quebec, Ontario, Manitoba, Saskatchewan and British Columbia payments to invalid children are continued until recovery, but the other provinces make payments only for the length of time the Board considers that the workman would have contributed to their support.

Where the only dependants are persons other than consort or children, all the Acts provide that compensation is to be a reasonable sum proportionate to the pecuniary loss but the total monthly amount to be paid to all such dependants is limited to $\$ 100$ in Ontario; $\$ 85$ in Alberta; $\$ 75$ in British Columbia; and $\$ 60$ in Prince Edward Island, Nova Scotia and Manitoba. In British Columbia, if a workman leaves dependent parents as well as a widow or orphans, the maximum payable to a parent or parents is $\$ 75$ a month. Compensation to dependants, other than consort or children, is continued only for such time as the Board considers that the workman would have contributed to their support.

Except in Alberta and British Columbia, each Act places a maximum on the total amount of benefits payable to dependants if the workman dies. A maximum is placed on the amounts that may be paid to the widow and children in Prince Edward Island and Nova Scotia. In Prince Edward Island the maximum is $\$ 130$ to a widow and children and $\$ 120$ to orphan children. The Nova Scotia maximums are $\$ 150$ in each case. In New Brunswick the maximum to all dependants is 70 p.c. of the workman's earnings and in Newfoundland, Quebec and Manitoba, 75 p.c. In Ontario and Saskatchewan the average earnings are the maximum amount payable.

Irrespective of the workman's earnings, however, compensation may not fall below certain minimum monthly amounts. The minimum payable to a consort and one child in Quebec is $\$ 75$ a month or $\$ 95$ if there is more than one child; in Manitoba the minimum is $\$ 70$ if there is a consort and one child and $\$ 90$ if there is more than one child; in Saskatchewan the minimum is $\$ 100$ a month to a consort and child and $\$ 115$ to a consort and two chddren plus $\$ 10$ a month for each additional child. In Newfoundland, a widow must receive at least $\$ 60$ a month with a further payment of $\$ 20$ for each child under 16 years of age unless the total exceeds $\$ 130$. In Ontario, the minimum payable to a widow is $\$ 75$ a month with a further payment of $\$ 25$ for each child up to but not exceeding $\$ 150$ a month.

Compensation for total disablement in Nova Scotia and New Brunswick is a periodical payment for the duration of the disability equal to 70 p.c. of average earnings; in the other provinces the rate is 75 p.c. Except in New Brunswick, the Acts fix minimum sums to be paid for a permanent total disability. The minimum is $\$ 15$ a week in Prince Edward Island, Quebec and Manitoba, and $\$ 25$ in Saskatchewan, Alberta and British Columbia. In Newfoundland the minimum is $\$ 65 \mathrm{a}$ month, and in Nova Scotia and Ontario $\$ 100$ a month. If average earnings are less than the minimum amount allowed, the amount of the earnings is paid in all provinces except Nova Scotia and Saskatchewan. For partial disablement, compensation is either a percentage of the difference in earnings before and after the accident, the percentage rate being the same as in total disablement, or the amount is determined by the Board according to the diminution of earning capacity. In all provinces, if the impairment of earning capacity is 10 p.c. or less ( 5 p.c. or less in Alberta), a lump sum may be given.

The average earnings on which compensation is based are limited to $\$ 5,000$ a year in Ontario and Saskatchewan; $\$ 4,000$ in New Brunswick, Quebec, Alberta and British Columbia; $\$ 3,500$ in Manitoba; $\$ 3,000$ in Newfoundland and Nova Scotia; and $\$ 2,700$ in Prince Edward Island. If the workmen's earnings at the time of an accident are not considered a proper basis for compensation the Board may use as a basis the average earnings of another person in the same grade of work. Compensation paid workmen under 21 years of age may be raised later if it appears that their earning power would have increased had the injury not occurred.

Table 34 gives the number of industrial accidents reported by each of the provinces and the amount of compensation paid by the Workmen's Compensation Boards in the years 1955 and 1956.

## Section 8.-Workers Affected by Collective Agreements

Statistics on the number of workers affected by collective agreements in Canada are compiled by the Department of Labour. Table 32 gives figures for the principal industrial groups. The second column of the table shows the number of workers affected by agreaments extended under the Quebec Collective Agreement Act (see Sect. 1, ss. 2).

Any duplication of the numbers of workers covered by agreements under this Act and by other agreements is eliminated in the third column. A more detailed table and studies of agreements in certain industries are available ffom the Department of Labour, Ottawa.

## 32.-Workers Affected by Collective Agreements by Industry 1955

## Section 9.-Organized Labour in Canada

## HISTORY OF THE LABOUR MOVEMENT IN CANADA*

Canadian trade union history goes back a surprisingly long way. Nova Scotia had an Act against unions, and therefore presumably some unions, as early as 1816. Printers were organized in Quebec in 1827, and in Montreal and Hamilton in 1833. Shoemakers were organized in Montreal in 1827, carpenters in 1834, and stonecutters in 1844. The York printers were organized in 1832, and the Toronto Typographical Union has a continuous history from 1844. But brief life was the portion of most of these, and it was not until the middle of the nineteenth century that the first small foundations of the present Canadian union structure were laid.

Almost from the beginning, Canadian unionism was predominantly "international"; that is, most of its members belonged to unions with their headquarters and the bulk of their membership in another country. The first "outside" unions were British. The Amalgamated Society of Engineers (ASE) established its first local in Canada in 1850, followed by three more in 1851. The Amalgamated Society of Carpenters and Joiners (ASCJ) in 1860 became the first permanent union in the building trades. The ASE was absorbed into the International Association of Machinists in 1920, and the ASCJ into the United Brotherhood of Carpenters and Joiners in 1914, though some branches seceded in 1922 and resumed their status as locals of the British organization until 1925, when the latter formally withdrew. The much more important American unions began to come in 1861, with the Iron Moulders, followed by the Locomotive Engineers in 1864, the National Typographical Society (now the International Typographical Union) and the Cigar Makers in 1865, the Knights of St. Crispin (shoemakers) in 1867, and the Railway Conductors in 1868. The Coopers arrived in the late 1860's and the Locomotive Firemen in the early 1870's.

At the same time, however, a variety of purely Canadian local unions were springing up: shipwrights [at Victoria and Quebec (1862), Halifax (1863), Saint John and Quebec (1865)], bakers, tailors, bricklayers, stonecutters, wharf porters, longshoremen, and bookbinders.

Until 1871, the various unions had little to do with each other but in that year five craft unions formed the Toronto Trades Assembly. Two years later Ottawa had a flourishing Trades Council which, in 1873 and 1875 succeeded in electing a Labour member, D. J. O'Donoghue, to the Provincial Legislature. Hamilton had a Trades Council about the same time. All of these disappeared in the depression of the 1870 's, but not without having laid the foundations of a national organization and won a resounding legislative victory.

In 1873, the Toronto Trades Assembly called a convention of unions in that city, attended by delegates from 31 locals of 14 unions, all in Ontario, though letters of approval came from typographical unions in Quebec and Montreal. This convention decided to set up a national central organization, the Canadian Labor Union, which met again in $1874,1875,1876$ and 1877. But the depression was as fatal to the national organization as to the local Councils, and from 1878 to 1882 there was not even the shadow of a national trade union centre.

The legislative victory resulted from the Toronto Printers' strike of 1872, part of the nine-hours movement. Most of the master-printers, headed by George Brown of the Globe, were fiercely anti-union. They had all 24 members of the committee of the Typographical Union arrested on a charge of seditious conspiracy. Labour had confidently assumed that unions were legal but now discovered they were not. They had benefited from none of the British Acts freeing unions of their Common Law disabilities as conspiracies and combinations in restraint of trade. Legally, Canadian unions were still in the eighteenth century, the age before the Industrial Revolution. They promptly set to work to get Canadian legislation to match the British. Sir John A. Macdonald, delighted

[^252]at the opportunity to win Labour votes and "dish the Liberals" with two pieces of unimpeachably Gladstonian legislation, lost no time in passing through the Dominion Parliament a Trade Unions Act and a Criminal Law Amendment Act (1872) modelled on the British Acts of the previous year. This was the first big piece of successful political action by Canadian unions. The prosecution was dropped and the strike was won.

With the adoption of the national policy of tariff protection in 1879, and the construction of the Canadian Pacific Railway in 1881-85, Canadian industry began to revive and to grow, and the unions revived and grew with it. The building trades showed a marked expansion. The railway unions followed the railways westward. The Nova Scotia coal miners in 1879 formed the first coal miners' union in North America and one of the earliest industrial unions, taking in all workers in the industry regardless of craft. Indeed, this organization, the Provincial Workmen's Association, became for a time almost a provincial "one big union", covering not only coal miners and coal pier workmen but also iron workers, steel workers, railway men, tramway men, glass blowers, boot and shoe workers, retail clerks and about ninety other classifications. The Knights of Labor, also an industrial organization, entered Canada in 1881, and remained active here long after it was practically dead in the United States. Even apart from the Knights, the 1880's saw over a hundred new locals added to those that had survived the depression. Almost half of these were in Ontario, 21 were in the Maritimes, 19 in Quebec and 18 in the West.

The local Councils also revived. The Toronto Trades and Labor Council was organized in 1881, the London Council in 1883, the Montreal Council in 1885, and others in Ottawa, Brantford, Hamilton, Vancouver and Victoria at various dates during the 1880's. At first the Knights of Labor took part in these Councils and often a very active part, but towards the close of the decade they formed their own district assemblies in Montreal, Quebec, Toronto, St. Catharines and St. Thomas.

With the revival of the Councils came also a revival of the national central organization. In 1883, a committee of the Toronto Council issued a call to all labour organizations to send delegates to a national convention. This set up the Canadian Labor Congress, consisting of delegates from unions and Knights of Labor assemblies in Ontario only.

In September 1886, three months before the founding of the American Federation of Labor, the Toronto Trades and Labor Council summoned the Congress to meet again, and the "Canadian Trades and Labor Congress" (which in 1887 became the "Trades and Labor Congress of the Dominion of Canada", in 1888 the "Dominion Trades and Labor Congress", and in 1892 the "Trades and Labor Congress of Canada") was born. The first convention had 109 delegates, including one woman. All were from Ontario except one from Quebec City. Of the total, at least 84 were Knights of Labor. The Knights had a majority of the delegates also at the conventions of 1887-1889, 1891, 1893 and 1894, and a Knight held the Congress presidency from 1886 to 1892 inclusive. After 1894, however, the Knights rapidly declined and in 1902 they were expelled from the Congress.

Until 1896 the Congress was far from being a nation-wide organization. At the conventions of 1887 and 1888 all the delegates were from Ontario. From 1889 on, there was always a substantial delegation from Quebec; in 1890 British Columbia sent three delegates and in 1895 Manitoba sent one; in 1896 British Columbia sent two and Manitobs one. New Brunswick sent its first delegate in 1897, Prince Edward Island in 1900 and Nova Scotia in 1903, but in 1905 and 1906 there were no Maritime delegates at all. Provincial Executives for British Columbia and Manitoba were elected in 1895, for New Brunswick in 1896, and for Nova Scotia and Prince Edward Island in 1901. Saskatchewan and Alberta were represented from the beginning of their existence. Even in 1901, however, the last year before unity was shattered by the expulsion of the Knights of Labor and other organizations competing with American Federation of Labor unions, the Congress had only 8,381 members in all its unions, and its expenditure for the year was $\$ 809.88$. In 1902, for the first time, it engaged "a stenographer and a typewriter", which "necessitated the fitting up of a small office with two desks and a chair".

From 1896 on, Canadian trade unionism had to face the problem of reconciling continental union solidarity with Canadian autonomy. The Canadian Labor Union of 18731877 had not had to do so because no competing American central labour organization existed. The Trades and Labor Congress at first did not have to either, partly because it confined itself almost wholly to legislative activities (most of its unions were locals of organizations chartered by the American Federation of Labor or local assemblies of the Knights of Labor) and partly because it seems to have had, till 1896, no formal contact with the American Federation of Labor. In that year, the Congress complained to the Federation about the application of the American Alien Contract Labor Law to Canadian workers. The Federation replied by suggesting that the Congress send a fraternal delegate to its convention. This it did not do, but in 1898 the Federation was invited to send a fraternal delegate to the Congress convention, and in 1899 the two began an exchange that lasted as long as the Congress itself.

By expelling the Knights of Labor and purely Canadian 'dual' organizations in 1902, the Congress ranged itself definitely on the side of international unionism as against national. It did not, however, by any means accept the subordinate role that the Federation repeatedly tried to impose upon it. From 1897 on, it kept trying to get the international unions, or the Federation on their behalf, to turn over to the Congress the dues these unions paid to the Federation on their Canadian membership. It finally solved this problem by getting the international unions to affiliate their Canadian membership direct. The Federation persisted, right down to 1955, in chartering local unions in Canada. It also made repeated unsuccessful attempts to deny the Congress the right to charter local Trades and Labor Councils, and it took the Congress 35 years (1910 to 1945) to win complete victory. The Federation was successful in forcing the Congress to expel, in 1939, a whole group of unions belonging to the Congress of Industrial Organizations (CIO), but only after a struggle. A similar attempt, in 1946, to force expulsion of the Machinists met a firm and spirited refusal, and collapsed. After this, the Congress decided to assert itself by setting up a series of departments and a full-scale organizing staff and otherwise make plain the status it felt it did, and should, enjoy as a fully autonomous Canadian trade union centre.

None of these disputes, however, really disturbed the basic harmony between the Congress and the Federation. The Congress, made up overwhelmingly of international unions whose American members were affiliated to the Federation, never faltered in its allegiance to international unionism. It knew that in most industries international unions alone had the staff, experience and money to do the job that had to be done.

Meanwhile, however, the whole Canadian Labour Movement had been "by schisms rent asunder, by heresies distrest" Nationalism, industrial as against craft umionism, revolutionary ideas, and a mixture of nationalism and denominationalism all played their part. The unions expelled by the Trades and Labor Congress in 1902 promptly formed the National Trades and Labour Congress, which in 1908 became the Canadian Federation of Labour, and in 1910 took in the Provincial Workmen's Association of Nova Scotia. In 1919, just after the Winnipeg general strike, and partly as a result of it, many western unionists, attracted by revolutionary industrial unionism, broke away from the Trades and Labor Congress and formed the One Big Union. Between 1901 and 1921, small local Roman Catholic unions (some of them former Knights of Labor Assemblies) sprang up in Quebec under the fostering care of the hierarchy and clergy, and in 1921 formed the Canadian and Catholic Confederation of Labour. This organization, at first distrusted and denounced by the orthodox unions as a collection of thinly veiled "company unions", has in the past ten years shed the narrow denominationalism and nationalism of its early years and become one of the most militant labour organizations in the country In 1927, the Canadian Federation of Labour and other national unions (notably the Canadian Brotherhood of Railway Employees, which had been founded in 1908, had entered the Trades and Labor Congress in 1917 and had been expelled from it in 1921) formed the All-Canadian Congress of Labour, dedicated to industrial and national uniouism. By 1935, purely Canadian unions of one kind or another, including the Communist Workers'

Unity League, made up nearly half the total union membership in Canada. Within a few years, however, international unionism reasserted its predominance and for many years now about 70 p.c. of all Canadian unionists have belonged to international unions.

The great debate in the United States in the 1930's over the relative merits of industrial and craft unionism found only faint echoes in Canada. The Trades and Labor Congress had, and was prepared to have, both kinds, and it was most reluctant to expel the Canadian branches of CIO unions. But, faced with a virtual ultimatum from the American Federation of Labor that it must either expel the CIO unions or lose the AFL unions (whose Canadian membership was then far larger), it had really no choice, and in 1939 the CIO unions were accordingly cast forth. They at once formed a Canadian CIO Committee, which became the fourth Canadian central organization.

Through all these changes and chances, the four railway running trades (Conductors, Engineers, Firemen and Trainmen) remained unaffiliated with any central body, though every one of them had occasionally sent delegates to Trades and Labor Congress conventions, and in 1896 their joint Legislative Board had sent two delegates, of whom one was elected to the Congress Executive. The "big four", however, co-operated with each other and two Congress railway unions in a Dominion Joint Legislative Committee.

Late in 1939 came the first step towards unity (though, paradoxically, it created the first effective opposition to the Trades and Labor Congress). The All-Canadian Congress and the Canadian CIO Committee agreed to unite in the Canadian Congress of Labour, which was set up in 1940, with complete autonomy not only for itself but for the Canadian branches of CIO unions. Contrary to most expectations, this new Congress not only survived but grew and waxed strong, organizing mass production industries and pioneering in labour research, Workers' education and labour public relations. For the next fifteen years, both Congresses passed resolutions almost every year in favour of unity and, from 1948 on, joint action on various matters became increasingly common. A Joint Consultative Committee of the two Congresses, the Canadian and Catholic Confederation and the Dominion Joint Legislative Committee was set up in 1951 but lasted only a year. As long as the two American central bodies were at loggerheads, their Canadian counterparts could make little progress towards reunion, because of the provisions of the Trades and Labor Congress Constitution which in effect forbade it to affiliate any union 'dual' to an American Federation of Labor union. Once the Americans agreed to discuss unity, this blockage disappeared. By the end of 1953 the two Canadian Congresses had appointed a joint Unity Committee, which first (1954) drew up a "No-raiding Agreement" (under which unions of the rival organizations agreed not to try to steal each others' members) and in 1955 a "Merger Agreement". After ratification by the two Congress conventions, the Merger Agreement came into force, and the founding convention of the united Canadian Labour Congress (CLC) took place in April 1956. In January 1957, the small and respectable remnant of the once powerful and revolutionary One Big Union joined the new Congress, the Locomotive Firemen followed in February, and the Trainmen in September. Meanwhile, both the Congress and the Canadian and Catholic Confederation of Labour had voted in favour of the latter's affiliation, and negotiations to this end are proceeding. The only unions of any size which remain altogether outside the unity movement are: the two big Communist-dominated unions expelled by the Canadian Congress of Labour; the United Mine Workers, which excluded itself by failing to pay its dues to that Congress; the Railway Conductors and the Locomotive Engineers; and the Operating Engineers, suspended by the new Congress. The total membership of the CLC (which, though made up mainly of international unions, is completely autonomous) is about $1,100,000$, or over 80 p.c. of all trade unionists in Canada. It includes both craft and industrial unions, and both national and international unions.

No adequate history even of the central organizations, let alone the whole Movement, has yet been written. The material is voluminous and much of it is fascinating, not only in itself but for the light it sheds on Canadian social history in general, and on Canadian

In some respects, Canadian trade unionism has changed almost out of all recognition since the first Canadian Labor Congress was founded almost three-quarters of a century ago. In others, it has changed very little. Some proposals which figured prominently in the early years have completely disappeared, sometimes because they have been carried into law, and sometimes because circumstances have made them obsolete or the whole climste of opinion has changed. Other early demands still figure in the present Canadian Labour Congress' Platform of Principles.

Of the early proposals that have completely disappeared, perhaps the most conspicuous is temperance. The Congress of 1883 unanimously passed a resolution of "hearty approval" for "any practical legislation tending to reduce the consumption of intoxicating liquor". In 1886, this became "any practical effort". The 1888 convention reaffirmed this. The 1886 convention actually received a deputation from the Dominion Alliance and empowered the Congress Executive to co-operate with the Alliance. The 1889 and 1890 conventions called upon all labour organizations to use their influence to promote and encourage temperance. The 1890 convention defeated a resolution for total prohibition by only 30 votes to 23 . The convention of 1898 tabled a motion for a plebiscite on prohibition.

Quite as surprisingly, until 1902, the Trades and Labor Congress consistently demanded compulsory arbitration of labour disputes, and passed several resolutions in favour of incorporation of unions, both now anathema to Labour. Henry George's Single Tax on land values was also a hardy annual till 1899, and a diluted form of it survived in the Platform of Principles at least as late as 1912. The initiative and referendum made their appearance as early as 1892, and were still in the Platform in 1913. In 1887, the Congress voted to abolish Lieutenant-Governorships and make the Governor General elective. The latter proposal was passed again in 1890, by 39 to 14 . The convention of 1893 wanted to abolish the office of High Commissioner in London. Those of 1892 and 1893 wanted to bave a popular vote on "maintenance of our present colonial status; Imperial Federation; Canadian Independence; Political Union with the United States". The conventions of 1886-1888 wanted to have the Government issue all money; that of 1893 wanted it to "demonetize both gold and silver". The convention of 1891 wanted to have the products of anti-union employers deprived of tariff protection; that of 1893 "pronounced in favor of free trade"; that of 1902 condemned any increase in the tariff; those of 1903 and 1905 condemned Mr. Chamberlain's protective tariff proposals for Britain. The conventions of 1907, 1908 and 1909 bluntly declared "that as the capitalists of the world create war, they should do their own fighting", and that of 1909 empowered the Executive to "take the lead in calling a convention of all peace-loving citizens in Canada" to protest against increases in military expenditures. The 1911 convention endorsed a general strike against war. The conventions of $1888-1890$ and 1900 condemned manual training in the schools. The conventions of 1886-1889 wanted governments to stop making grants to universities and colleges and to transfer the money to the schools. The convention of 1909 "offered up a sincere prayer that the light of common sense may yet reach the Canadian Manufacturers' Association".

The early demands for one day of rest in seven, "anti-truck" laws, provincial and Dominion bureaus of labour statistics, a Labour Department, a separate Minister of Labour, Employer's Liability Acts, manhood suffrage, and woman suffrage (1891), have all, in one form or another, been won. The nine-hour day has become the six-hour day, and the early and violently restrictive resolutions on immigration (first anti-Chinese, then antiJapanese also, then anti-Indian as well, and always anti-pauper) have become "planned immigration for full employment", with a representative National Advisory Committee to keep the Act, regulations and policy under constant review and to suggest changes. Early demands which still figure in the Canadian Labour Congress Platform include the abolition of the Senate, public ownership of banks and public utilities, a living minimum wage, free compulsory education and support for co-operatives.

One subject which figured prominently in the early conventions of the Trades and Labor Congress and then seems to have dropped out of sight for a whole generation is co-operation with the farmers. In 1886, the Congress appointed a committee to meet with the Dominion Grange "to secure to some extent united action" on the Factory Act. In 1893 the Congress Executive met with representatives of the Grange, the Patrons of Industry (another farm organization) and the Social Problems Conference and adopted a common "platform". In the same year, the convention set up a standing committee with the Patrons "for the purpose of . . . devising a scheme for a union of the labor forces (rural and urban)", and provided for a vote by affiliated organizations on allowing the Grange, the Patrons and Single Tax Associations to affiliate. The returns from the affiliates were considered too scattered to provide any basis for policy. None the less, in 1894, the Constitution was amended to let the Patrons affiliate and to give them three delegates. Nothing came of this and the amendment was deleted next year. But, undaunted, in 1896 the Congress agreed on the desirability of unity with the Patrons and instructed the Executive to be represented at any meeting called by the Patrons. The 1907 convention had a delegate from the Canadian Branch of the American Society of Equity, another farmers' organization, and the Alberta Executive of the Congress wanted the convention to discuss a possible amalgamation of the "Trades and Labor party" with this Society. In 1910, the Executive recommended the appointment of a special committee to arrange co-operation with the farmers.

From 1941 on, both the Trades and Labor Congress and the new Canadian Congress of Labour devoted some attention to farmer-labour co-operation. The former, in 1941, "recognized that the well-being of labor is inseparably bound up with the prosperity of the farmer" and, fearing that "many farmers" would be "driven off the land" and "forced into competition with workers thereby driving down wages", expressed its "sympathy and support for the farmers to secure adequate debt protection and parity of farm prices" In the same year, the newer Congress declared in favour of co-operating with farm associations wherever possible and of Government aid in marketing farm produce in any friendly country. The next year, the Trades and Labor Congress called on the Government to help the farmers meet the shortages of machinery and services. In 1946 both Congresses supported the Alberta farmers' strike; the older declared for "close co-operation" between the Congress and its provincial bodies and national and provincial farm organizations; the younger suggested $a$ conference of "Labour organizations and the official spokesman of the farmers" to work towards "complete unity . . . in our demands for social security". In 1947 the Canadian Congress of Labour declared its support for the farmers "in their attempt to get a fair price for their products", and in 1948 pledged itself to do all it could to promote "farmer-Labour-teacher" co-operation for "common aims and objectives", along the lines of the Saskatchewan Occupational Group Council. In 1949 the Trades and Labor Congress listened to a speech of greeting from the President of the Alberta Farmers' Union (which was already affiliated with the Calgary Trades and Labor Council). In 1951 the Canadian Congress of Labour called on the Government to work out with farm organizations "a just farm price-structure". The next year the older Congress had another speech of greetings, this time from the President of the Interprovincial Farm Union Council, and the other Congress declared for a "National Co-ordinating Committee of Farm and Labour organizations". From 1953 to 1955 both Congresses had farm speakers each year; so did the new Canadian Labour Congress at its founding convention in 1956. In February 1954 the two Congresses and the Interprovincial Farm Union Council set up the FarmerLabour Economic Council, which still exists.

One other subject of great importance which in some form or other has had a place in almost every national meeting of labour organizations since 1883 is political action. The Canadian Labor Congress of 1883 unanimously resolved that "the working class of this Dominion will never be properly represented in Parliament or receive justice in the legislation of the country until they are represented by men of their own class and opinions". The 1886 convention reaffirmed this and the members pledged themselves to "use their utmost endeavours, wherever practicable, to bring out candidates for the local and Dominion elections" or, where this was not "deemed advisable", to support the candidate "who
pledges himself to vote for most planks of the platform of this Congress". The 1887 convention dropped this last part and adopted the remainder unanimously. The 1889 convention set up a committee to consider forming an "independent political party" and recommended the organizations to nominate candidates where practicable and elsewhere to support the party which was prepared to do most for Labour. In 1892, on motion of two French-Canadian delegates, the convention resolved to "take into consideration the advisability of forming a labor party" Perhaps as part of the consideration, the 1893 convention invited its member organizations to answer four questions: (1) Are you in favor of the present industrial system? (2) Are you in favor of the so-called co-operative system of productive (sic) distribution and exchange? (3) Are you in favor of the communistic system of government? (4) Have you any other system better than the above to suggest? (Strange to say, there were almost no replies.) In 1895, by a very narrow majority, the convention voted to admit "sections of the Socialist Labor Party" (this was repealed in 1896) and resolved that "labor organizations should now unite for independent political action".

Meanwhile, some organizations had actually been taking political action. During the 1880's, the Toronto and Hamilton Trades and Labor Councils had nominated candidates for both provincial and Dominion elections, and in 1886 the Knights of Labor ran three provincial candidates in Montreal. None were elected, and for practical purposes the Congress seems to have relied for some years on what was later to become the standard practice of meeting Dominion and provincial Ministers to present its views. By 1899, however, the Ontario Executive had decided that this was useless, and that "the only way to get from the Government what is our right is to elect men in sympathy with the labor cause". In the same year, the Winnipeg Trades and Labor Council and the Winnipeg Labor Party nominated A. W. Puttee for the House of Commons; and the Congress, presided over by Ralph Smith, M.L.A. for Nanaimo, B.C., decided to ask its member organizations whether they favoured an independent Labour party and would back its candidates. The vote was 1,424 in favour to 167 against, with only three organizations out of 44 voting "no" The 1900 convention decided this was enough to justify the Congress in "taking such steps as it deemed advisable to further the progress of such action". It also asked the Nanaimo miners to nominate President Smith for the House of Commons. They did; and both Smith and Puttee were elected, with another Labour candidate in Manitoba barely defeated. In 1903 a new Congress President, John Flett, was declaring that the meetings with the Dominion Government were useless, and that Canadian Labour should follow the British example and elect Labour men to Parliament. In 1904 he reiterated this, and for three years the annual interview was dropped and a parliamentary counsel was substituted to look after Congress interests full-time during the session. In 1903, 1904 and 1905 the conventions passed resolutions favouring independent Labour candidates wherever possible. In 1906, Alphonse Verville, President of the Congress, was elected to the House of Commons for Maisonneuve (Montreal), and declared he hoped for "at least a dozen" Labour members in the next Parliament. The convention responded by adopting what became the political action policy of the Trades and Labor Congress for the rest of its life. The Congress was to endorse sending Labour representatives to Parliament and the Legislatures; its provincial Executives were to summon provincial conventions of trade unionists and sympathizers to set up "the necessary associations"; and the Congress was then to step out of the picture, having "recommended" its own Platform of Principles as the platform for "this independent effort". The result of this was the foundation of a Canadian Labour Party in Ontario, Quebec, Manitoba, British Columbia and Nova Scotia. Though launched with considerable fanfare, especially in Ontario, for the most part this did not amount to much. Its only substantial success was in Ontario in 1919, when eleven Labour candidates were elected and two Labour Ministers entered the Farmer-Labour coalition. A few surviving sections entered the Co-operative Commonwealth Federation (CCF) in 1932 and 1933, along with the Independent Labour Party of Manitoba, which had elected two members to the House of Commons.

The Canadian Congress of Labour explicitly endorsed the CCF in 1943 and continued to do so throughout the remainder of its existence. It set up political action committees to implement this policy. Its efforts certainly helped the CCF to win power in Saskatchewan in 1944 and to retain it ever since; to maintain its position as the official Opposition in British Columbia for most of the past twenty years; to become briefly, though for the second time, the official Opposition in Ontario from 1948 to 1951; to win a few seats in the Nova Scotia Legislature; and to carry some industrial ridings in the House of Commons in the elections of $1945,1949,1953$ and 1957. But on the whole the results were not what the Congress had hoped.

The Canadian Labour Congress at its first convention adopted a compromise policy on political action, leaving its provincial Federations, its local Councils and, of course, its autonomous affiliated unions free to follow whatever line they saw fit, and authorizing its Political Education Committee, under the guidance of the Executive Council, to initiate discussions with other free trade unions, the principal farm organizations, the co-operative movement, the CCF and "other parties pledged to support the legislative programme" of the Congress, in order "to explore and develop co-ordination of action in the legislative and political field". So far, no such discussions have taken place. The Ontario and British Columbia Federations and some important local Labour Councils have endorsed the CCF and several important unions that already were supporting the CCF have continued to do so.

This is, necessarily, hardly more than an impressionistic sketch of the history of the Canadian Labour Movement. Of the constant preoccupation of the Congresses with specific union problems, with questions of health and safety and general working conditions, and with a host of other matters, it has said nothing; nor has it so much as touched on the various unions which make up the central organizations and are, for many purposes, far more important-the affiliated unions do all the collective bargaining, have most of the money and are fully autonomous. It has barely mentioned the important Canadian and Catholic Confederation of Labour. But, again, the history even of the Congresses, let alone the particular unions, has yet to be written. Until it is, any summary must be preliminary, tentative and subject to drastic revision.

Labour Union Statistics.-Tables 33, 34 and $\mathbf{3 5}$ give historical and current figures on union membership in Canada.

## Section 10.-Strikes and Lockouts*

The number of strikes in 1956 and the number of workers involved increased from the previous year. However, the significance of the strikes within the economy, as reflected in the number of man-days lost and in the percentage of estimated working time lost, decreased substantially in the second period.

The time loss of about $1,250,000$ man-days in 1956 was less than in any one of the previous four years. Similarly, there was a significant drop in the percentage of estimated working time lost and a decrease in the average length of time each worker on strike was idle. These decreases are significant when viewed against the record of bargaining during 1956. Many of the larger bargaining units in several important industries negotiated new contracts during 1956. Among these new agreements, a larger number than in previous years were re-negotiated for periods of longer than one year-the bulk of them for two years. Most settlements included substantial wage and non-wage advances and were reached without interruption to production.

Slightly more than half the strikes occurring in 1956 took place in manufacturing industries, compared with almost two-thirds in this sector in 1955. In fact, the decrease in strike action among workers in manufacturing firms accounted for most of the drop in time lost during 1956. All other industries showed increases in the number of man-days lost; in particular, the mining industry suffered from a large number of small strikes involving relatively limited numbers of workers and of fairly short duration.

[^255]

${ }^{1}$ None reported.
${ }^{2}$ Includes non-ferrous metal smelting.
${ }^{3}$ Includes erection of all large bridges.

- Includes water service.

## Section 11.-Canada and the International Labour Organization

The Department of Labour is the officially designated liaison agency between the Government of Canada and the International Labour Organization. The ILO was established in 1919, in association with the League of Nations under the Treaties of Peace, with the object of improving labour and social conditions throughout the world by international agreement and legislative action. Under an agreement approved by the General Conference of the International Labour Organization at its 29th Session held at Montreal, Que., Oct. 2, 1946, and by the United Nations General Assembly on Dec. 14, 1946, the Organization became a specialized agency of the United Nations although retaining its autonomy.

The ILO is an association of 69 Member States, financed by their governments, and democratically controlled by representatives of those governments and of their organized employers and workers. It is comprised of three main organs: (1) the International Labour Conference; (2) the International Labour Office, and (3) the Governing Body. Since World War II the ILO has extended its field of activities by the establishment of eight tripartite industrial committees to deal with problems of important world industries, by the holding of regional and special technical conferences, and by the expanded program of technical assistance to aid the development of backward countries in such fields as co-operatives, vocational training, productivity techniques and employment service organization.

The International Labour Conference is a world parliament for the consideration of labour and social problems. It meets annually and is attended by four delegates from each Member State (two representing the Government, one representing the employers and one representing the workers) accompanied by technical advisers. The Conference
formulates international standards concerning working and living conditions in the form of Conventions and Recommendations. A Convention, after adoption, must be considered by the competent authorities in each Member State with a view to possible ratification; however each Member State decides whether or not to ratify any Convention, and only by ratification does it assume the obligation to bring its legislation in that field up to the standard set by the Convention. A Recommendation is less formal: it contains general principles for the guidance of governments in drafting legislation or in issuing administrative orders and is not subject to ratification by the Member States.

The International Labour Office acts as the permanent secretariat of the ILO and as a world research and information centre and publishing house on all subjects concerned with industry and labour. In the operational field it assists Member States by furnishing experts on manpower training and technical assistance. The ILO maintains branch offices in all parts of the world, including the Canada Branch, 202 Queen Street, Ottawa.

The Governing Body of the ILO, by a constitutional amendment adopted in June 1953, consists of 40 members- 20 government representatives, 10 employers' representatives and 10 workers' representatives. Of the government seats, each of the 10 Member States of chief industrial importance (of which Canada is one) holds a permanent place, and the other 10 government representatives are elected triennially by the Conference. The worker and employer members are elected by their groups every three years at the Conference. The Governing Body meets three times a year and has general supervision over the work of the International Labour Office and the various Conferences and Committees, in addition to framing the budget and approving the agendas of the various Conferences. Canada's representative on the Governing Body is G. V. Haythorne, Assistant Deputy Minister of Labour for Canada.

There have been 40 Sessions of the International Labour Conference, at which 107 Conventions and 104 Recommendations have been adopted, covering a wide range of subjects such as industrial relations, freedom of association, hours of work, weekly rest, holidays with pay, minimum wages, night work of women and young persons, industrial health and safety, workmen's compensation, conditions of work for seamen and dockers, unemployment and health insurance, protection of migrant workers, equal remuneration, forced labour, and many other aspects of industrial and social problems. By June 1957 the ratifications of Conventions by Member States totalled about 1,720 .

Canada has ratified 18 ILO Conventions, of which 12 concern maritime and dock labour. In Canada the provincial legislatures are the competent legislative authorities with jurisdiction over the subject covered by most of the ILO Conventions and Recommendations. The Department of Labour, as the official liaison agency with the International Labour Organization, is responsible for forwarding to the ILO Office annual reports on ratified Conventions as well as periodical reports on many other industrial and social matters. Canada is represented at most of the ILO annual and special meetings and accounts of the discussions and the decisions are regularly published in the Labour Gazette. The Department also keeps the provincial governments and the major employer and worker organizations informed of ILO activities.

Note.-The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

The physiographic and population characteristics of Canada present unusual difficulties from the standpoint of transportation. The country extends 4,000 miles from east to west and its main topographic barriers run in a north-south direction, so that sections of the country are cut off from one another by such water barriers as Cabot Strait and the Strait of Belle Isle separating the Island of Newfoundland from the mainland; by areas of rough, rocky forest terrain such as the region lying between New Brunswick and Quebec, and the areas north of Lakes Huron and Superior dividing the industrial region of Ontario and Quebec from the agricultural areas of the Prairie Provinces; and by the mountain barriers between the prairies and the Pacific Coast. Unevenly distributed along a narrow southern strip of Canada's vast area is its relatively small population of $16,589,000$ (estimate of June 1, 1957). To such a country, with a population so dispersed and producing for export as well as for consumption in distant parts of the country itself, efficient and economical transportation facilities are necessities of existence.

The extent of government control over the agencies of transportation is covered in Part I of this Chapter; Parts II to VI deal with the various types of transport facility.

## PART I.-GOVERNMENT CONTROL OVER AGENCIES OF TRANSPORTATION

The Federal Government's control and regulation of transportation reflects to a considerable extent conditions that date back to the period when the railways possessed a virtual monopoly of transportation within the country. Although federal regulation was a direct outcome of such particular matters as the prevention of unjust discrimination in rates and charges resulting from monopoly conditions in the industry and the safety of
transportation facilities and operating practices, yet the railways have been so involved in the public interest that their regulation has been extended to become the most comprehensive of any industry in Canada.

In the meantime, conditions in the transportation industry have been drastically altered by the increasing competition arising from the advance of highway transportation. Unlike the competition that existed between railways in early stages of their development, today's competition shows little indication of starting a trend toward consolidation and a return to semi-monopolistic conditions within the industry. Because so many shippers now provide their own transportation, it is evident that a large part of the present competition between common carriers has become a permanent feature of the transportation industry.

It is not surprising that regulations, which under monopoly conditions were not onerous to the railways or were purely nominal in their effect, are now alleged to have become increasingly restrictive and hampering under highly competitive conditions. Regulatory authorities are therefore faced with the problem of piecemeal revision of their regulations-retaining those where railway monopoly or near-monopoly conditions still make them necessary in the public interest, and relaxing those where competition can be relied on to protect the public in order to enable the railways to meet this competition more effectively. The emphasis has shifted from the regulation of monopoly to maintaining a balance between the several competing modes of transport. Indicative of this trend is the amendment to the Transport Act passed in 1955, which extends the freedom of the railways to make contract rates with shippers known as agreed charges.

On Nov. 2, 1936, the amalgamation of the Department of Railways and Canals and the Department of Marine, together with the Civil Aviation Branch of the Department of National Defence to form the new Department of Transport brought under one control railways, canals, harbours, marine and shipping, civil aviation, radio and meteorology.

Road and highway development is mainly under provincial or municipal control or supervision. According to the Judgment of the Judicial Committee of the Privy Council dated Feb. 22, 1954, jurisdiction over interprovincial and international highway transport rests with the Federal Government. Federal and provincial representatives conferred in Ottawa in April 1954 on means of implementing that decision and on June 26, 1954, the Motor Vehicle Transport Act was passed by the Federal Parliament giving to all provinces, at their option, the authority to apply to interprovincial and international highway transport the same regulations respecting certificates of public convenience and necessity and rates as they apply to undertakings operating entirely within the province. This Act has since been proclaimed in seven provinces.

The Board of Transport Commissioners for Canada.-The Board of Transport Commissioners for Canada was created and initially named the Board of Railway Commissioners for Canada by the Railway Act 1903, and was given its present name by the Transport Act 1938. It was organized on Feb. 1, 1904, and succeeded to all the powers and duties of its predecessor, the Railway Committee of the Privy Council. It was also given additional powers and duties which have been greatly enlarged since that date. When organized, the membership of the Board consisted of a Chief Commissioner, Deputy Chief Commissioner and one Commissioner. In 1908 an Assistant Chief Commissioner and two other Commissioners were added. The Board is a statutory Court of Record, so constituted by the Railway Act and recognized as such by other courts, but it also has extensive regulative and administrative powers.

The great majority of applications and complaints to the Board are disposed of without hearing in open court, but public hearings are held in various places throughout Canada as the Board sees fit, particularly to suit the convenience of the parties and avoid expense to them. Evidence at public hearings is given under oath and interested parties appear personally or by counsel or representatives. The finding or determination of the Board upon any question of fact within its jurisdiction is binding and conclusive and no order or decision may be questioned or reviewed except on appeal to the Supreme Court of

Canada upon a question of law or a question of jurisdiction with leave of a Judge of that Court, or by the Governor in Council.* Two Commissioners are a quorum or 'panel' for the hearing of a case and it is not unusual for two panels to be sitting at the same time on different appeals.

The Board has jurisdiction under more than a score of Acts of Parliament, including jurisdiction under the Railway Act, Transport Act and Pipe Lines Act, over transportation by railway and by inland water; over communication by telephone and telegraph; and over the transmission of oil and natural gas by interprovincial or international pipelines.

Under the Railway Act its jurisdiction is, stated generally, in respect of construction, maintenance and operation of railways that are subject to the legislative authority of the Parliament of Canada, including matters of engineering, location of lines, crossings and crossing protection, safety of train operation, operating rules, investigation of accidents, accommodation for traffic and facilities for service, abandonment of operation, freight and passenger rates, and uniformity of railway accounting. The Board also has certain jurisdiction over telephones and telegraphs, including regulation of the telephone tolls of The Bell Telephone Company of Canada, the British Columbia Telephone Company, the Quebec and Gaspe Telephone Company and the Yellowknife Telephone Company, and over express traffic and tolls for the use of international bridges and tunnels.

The Board has jurisdiction to inquire into, hear and determine any application by any party interested who complains that any company or person has violated or failed to comply with the Railway Act or a Special Act or any Order made thereunder, or who requests the Board to make any order or give any direction, leave, sanction or approval that, by law, it is authorized to make or give or with respect to any matter, act or thing that by the Railway Act or Special Act is prohibited, sanctioned or required to be done. It has power to make orders and regulations generally for carrying the Railway Act into effect and for exercising jurisdiction conferred on the Board by any other Act.

Regulation of railway freight and passenger rates is one of the Board's principal tasks. Except for certain statutory rates, it has power "to fix, determine and enforee just and reasonable rates, and to change and alter rates as changing conditions or cost of transportation may from time to time require"; it may disallow any tariff that it considers to be unjust or unreasonable or contrary to any provision of the Railway Act; it may prescribe other tolls in lieu of the tolls disallowed, or require the railway company to substitute a tariff satisfactory to the Board. Since the end of World War II there bas been a succession of applications for authority to make general freight rate increases and general telephone rate increases.

A review of transport regulation was undertaken by the Royal Commission on Transportation, under the chairmanship of the Hon. W. F. A. Turgeon, which held extensire hearings in 1949-50 and issued its Report in 1951. (See 1952-53 Year Book, p. 741.) Certain of its recommendations, including the following, were incorporated into the Railway Act by amendments made in 1951: the equalization of freight rates; the requirement that, when transcontinental competitive freight rates are published, the corresponding rates to intermediate points shall not be more than one-third greater than the former; the payment by the Government of Canada of the cost of maintaining the so-called 'bridge' lines of the transcontinental railway systems in Ontario (between Sudbury, Capreol and Cochrane, and between Port Arthur and Armstrong) up to the amount of $\$ 7,000,000$ annually, the amounts so received by the railways to be applied to reductions in freight rates between Eastern and Western Canada over the trackage referred to; and the requirement of a uniform classification of accounts to be prescribed by the Board of Transport Commissioners for the Canadian Pacific Railway and the Canadian National Railways. Purs iant to the amendments, a uniform scale of milage class rates has been prescribed by the Board and equalization of commodity rates is being proceeded with. The Board has also prescribed a uniform classification and system of accounts for railways and has approved a new freight classification.

[^256]Under the Transport Act the Board entertains applications for licences for ships to transport goods or passengers for hire or reward between places in Canada on the Great Lakes and the Mackenzie and Yukon Rivers, except goods in bulk on waters other than the Mackenzie River. Before granting a licence the Board must be satisfied that public convenience and necessity require such transport. It also has regulative powers over tolls for such transport.
'Agreed charges' between shippers and carriers, authorized by the Transport Act, were also reviewed by the Hon. W. F. A. Turgeon in 1955 and his recommendations were implemented in amendments to that Act in 1955. Under the amendments, an agreement for an agreed charge shall be executed in tariff form and a duplicate original shall be filed with the Board within seven days after the making of the agreement, and the agreed charge takes effect twenty days after the filing, without necessity of the Board's approval of the charge. The Board continues to have power to fix a charge for a shipper who is unjustly discriminated against by an agreed charge and it also has power to vary or cancel an agreed charge referred to it by the Minister of Transport or Governor in Council for investigation.

Leave of the Board is necessary, under the Pipe Lines Act, for construction of an interprovincial or international gas or oil pipeline. The Board has granted leave to construct such major pipelines as the Trans-Canada natural gas line, the Westcoast Transmission gas line, the Interprovincial oil line, the Trans Mountain oil line and the TransNorthern oil products line. In considering applications of this kind the Board has regard, among other things, to public interest, financial responsibility of the applicant company and the economic feasibility of the project. It may make orders and regulations for the protection of property and safety in the operation of pipelines. It may also make orders and regulations with respect to all matters relating to traffic, tolls and tariffs of oil pipelines, but it does not have similar powers over gas pipelines. It may declare an oil pipeline company to be a common carrier and may prescribe a uniform system of accounts for pipeline companies.

The Board is required by the Railway Act to make an annual report to the Governor in Council through the Minister of Transport. Copies may be obtained from the Secretary.

The Air Transport Board.-The Air Transport Board was established in Septe mber 1944 by amendment to the Aeronautics Act. Subsequent amendments to the Act were made in 1945, 1950 and 1952. The Board has three members including the Chairman, and the staff comprises an Executive Director's Branch including Legal, International Relations, and Traffic Divisions, and a Secretary's Branch including Administrative, Licensing, and Inspection and Enforcement Divisions.

The Board is responsible for the economic regulation of commercial air services in Canada and is also required to advise the Minister of Transport in the exercise of his duties and powers in all matters relating to civil aviation. The regulatory function relates to Canadian air services within Canada and abroad and to foreign air services operating into Canada. It involves the licensing of all such services and the subsequent regulation of the licensees in respect of their economic operation and the provision of service to the public. As provided by the Act, the Board issues Regulations, approved by the Governor in Council, dealing with the classification of air carriers and commercial air services, applications for licences to operate commercial air services, accounts, records and reports, ownership, transfers, consolidations, mergers and leases of commercial air services, traffic tolls and tariffs, and other related matters. Detailed regulatory instructions are issued by the Board in the form of General Orders, published in the Canada Gazette, relating to all air services or groups of air services; Board Orders relating to individual air services; and Rules and Circulars for general guidance and information.

Financial and operating statistics are collected under authority of the Board's Regulations by the Economics Division of the Department of Transport.

The Board is currently devoting special attention to the publication of a uniform charter tariff and to the formulation of basic principles for the guidance of operators in the establishment of their rates and fares. Helicopter operations are under constant review by an economic and technical committee set up for the purpose.

In the field of international aviation, the Board continues to take an active part in the work of the International Civil Aviation Organization, a member of its staff being the representative of Canada on the Council.

Canadian Maritime Commission.-By authority of an Act of Parliament (R.S.C. 1952, c. 38) passed in 1947, the Canadian Maritime Commission was constituted for the purpose of examining into, keeping records of, and advising the Minister of Transport on matters pertaining to Canadian shipping and shipbuilding services. In addition to these duties, the Act empowers the Commission to:-
(1) exercise and perform on behalf of the Minister such powers, duties and functions of the Minister under the Canada Shipping Act 1934, as the Minister may require;
(2) administer, in accordance with regulations of the Governor in Council, any steamship subventions voted by Parliament; and
(3) exercise or perform any other powers, duties or functions conferred on or required to be performed by the Commission by or pursuant to any other Act or order of the Governor in Council.

## PART II.-RAIL TRANSPORT*

The treatment of rail transport in this Chapter is divided into three Sections dealing, respectively, with railways, express companies and urban transit systems.

## Section 1.-Railways

Since Confederation the railways of Canada have been the principal utility for the movement of passengers and freight throughout, and beyond, the nation. The two great national systems, supplemented by a few regional independent railways, are the only carriers able to transport large volumes at low cost in all weather by continuous passage over Canadian transcontinental routes. Though competition by trucking firms is rapidly increasing, the railways still retain their primary position in the transport field.

The two national railway companies control a wide variety of Canadian and international transport and communication services. The government-owned Canadian National Railway System is the country's largest public utility and operates the greatest length of trackage in Canada. In addition, it operates a fleet of coastal and ocean-going steamships, a national telegraph system connecting the principal points of Canada with other parts of the world, an extensive express service in Canada and abroad, a chain of large hotels and resorts, and a scheduled air service connecting all major cities across the country and Canadian with North American and European points. Its chief competitor, the Canadian Pacific Railway, is a joint-stock corporation operating an extensive transcontinental railway supported by a national telegraph system with connections throughout the world, a large fleet of inland, coastal and ocean-going vessels, a chain of year-round and resort hotels, a domestic north-south airline which is one of the world's great airfreight carrjers, a transpacific airline service to the Orient and the Antipodes, air services to Mexico, Peru, Chile and Argentina, a transpolar air route connecting Vancouver and Amsterdam, and a transatlantic service to Lisbon. A world-wide express service and a domestic truck and bus network are included in the Company's operations.

The statisties of Subsections 1 to 3 of this Section cover the combined railway facilities of all companies operating in Canada. Details relating to the Canadian National Railway System are dealt with separately in Subsection 4. A special article covering the consolidation and organization of the CNR appears in the 1955 Year Book, pp. 840-847.

[^257]
## Subsection 1.-Milage and Equipment

Construction was begun in 1835 on the first railway in Canada-the short link of 14.5 miles between Laprairie and St. Johns, Que.-but only 66 miles were in operation by 1850. The first great period of construction was in the 1850's when the Grand Trunk and the Great Western Railways were built as well as numerous smaller lines. The building of the Intercolonial and the Canadian Pacific Railways contributed to another period of rapid expansion in the 1870's and 1880's. In the last period of extensive railway building (1900-1917), the Grand Trunk Pacific, National Transcontinental and Canadian Northern Railways were constructed.

Only a gradual increase has taken place in the milage of single track line since the 1920's but recently the construction of several large industrial projects in outlying districts has sparked a new phase of railway building. Entirely new districts have been opened up by the construction of the 43 -mile Terrace-Kitimat line in British Columbia, the 144 -mile Sherridon-Lynn Lake line in Manitoba and the 360 -mile Quebec, North Shore and Labrador Railway. A new 80 -mile line links Quesnel and Prince George in British Columbia. A 16 -mile line connecting the mining community of Nephton with Havelock in eastern Ontario provides easy access to a non-metallic mineral producing area. A new line from Struthers to Geco and one from Hillsport to Manitouwadge serve this new mining district of northwestern Ontario, and a 161 -mile line has been constructed in the Quebec mining area from Beattyville to Chibougamau and St. Félicien. About 29 miles of new track have been completed in Saskatchewan and a 40 -mile diversion of the CNR main line between Cornwall and Cardinal in the St. Lawrence Seaway area of Ontario was completed in 1956. In New Brunswick a new 22-mile branch line has been built for the transport of mineral ores. While these new lines have added considerably to the single track milage placed in operation in the past few years, other lines have been abandoned because they were unprofitable so that the new milage is not altogether reflected in the totals.

## 1.-Railway Track Milage Operated 1900-56

Nors-Figures of total milage of single track operated for 1835-1909 are given in the 1941 Year Book, p. 546; for 1911-14 in the 1954 edition, p. 786; for 1916-24 in the 1955 edition, p. 830 ; and for 1925-49 in the 1956 edition, p. 792.

[^258]Rolling-Stock.-The figures in Table 2 may be supplemented by the statement that between 1949 and 1955 the average capacity of box cars increased from 43.5 tons to 45.8 tons and of gondola cars from 61.5 tons to 64.4 tons, flat cars from 42.9 tons to 45.6 tons, hopper cars from 58.7 tons to 64.6 tons and of all freight cars from 45.3 tons to 48.6 tons. The average tractive power of locomotives advanced during the same period from $41,923 \mathrm{lb}$. to $42,701 \mathrm{lb}$. The changeover to diesel operation is indicated by the decrease in steam locomotives and the increase in oil-burning and diesel locomotives in operation.

## Subsection 2.-Finances

The tables in this Subsection give information on capital liability and capital investment, earnings, operating expenses, employees and their earnings and government aid to all railways.* Financial statistics of government-owned railways are given separately and in detail in Subsection 4.

Capital Liability and Investment.-The capital liability of the Canadian railways for the years 1936 to 1955 is shown in Table 3. The increase of $\$ 132,980,501$ in 1955 over 1954 compares with an increase in investment in road and equipment of $\$ 227,135,132$ as shown in Table 4.

[^259]
## 3.-Capital Liability of Railways 1936-55

Notr.-Figures for 1876 to 1925 are given in the 1927-28 Year Book, $\boldsymbol{y}$. 649, and those for 1926-35 in the 1947 edition, p. 662.

[^260]Revenues and Expenses.-The operating ratio, or ratio of expenditure to revenue, of Canadian railways in 1943 reversed a declining trend and began to rise, mainly because of increasing costs of materials and labour. From 1946 to 1955 operating revenues increased 66.8 p.c. and operating expenses 68.2 p.c. As a result, the net operating revenues per mile of line increased by 49.8 p.c.

## 5.-Operating Revenues and Expenses of Railways 1946-55

Nors.-Operating revenues and expenses for 1875 to 1914 are given in the 1916-17 Year Book, p. 434; those for 1915-25 in the 1941 Year Book, p. 550; for 1926-39 in the 1942 Year Book, p. 585 ; and for $1940-45$ in the 1951 Year Book, p. 722. Newfoundland included from Apr. 1, 1949.

Employment and Salaries and Wages.-In the ten latest years for which figures are available (1946-55) the number of railway employees increased by 8.4 p.c. and their salaries and wages by 70.1 p.c. Maintenance-of-equipment employees, on hourly rates, worked about 10 p.c. fewer hours and were paid 77 p.c. more wages per hour; average
hours worked by transportation employees were 15 p.c. fewer and their pay was about 77 p.c. higher. These figures reflect salary and wage increases received during this period and the conversion to the five-day week in 1951.

## 7.-Railway Employees and their Earnings 1946-55

Nors.-Figures include employees and wages for 'outside' operations amounting to from 3 to 6 p.c. of total employees and from 2 to 5 p.c. of total salaries and wages. Figures for 1912-39 are given in the 1941 Year Book, p. 551, and for 1910-45 in the 1951 edition, p. 723. Newioundland included from Apr. 1. 1949.

| Year | Employees | Total Salaries and Wages | Average Salaries and Wages | Ratio of Total Payroll (charged to operating expenses) to- |  |

Government Aid to Railways.-In order that the private railways of Canada might be constructed in advance of settlement as colonization roads or through sparsely settled districts where little traffic was available, it was necessary for federal and provincial governments and even for municipalities to extend some form of assistance. The form of aid was usually a bonus of a fixed amount for each mile of railway constructed and, in the early days, grants of land were also made other than for right-of-way. As the country developed, objections to the land-grant method became increasingly apparent and aid was given more frequently in the form of a cash subsidy for each mile of line, a loan or a subscription to the shares of the railway. Guarantees of debenture issues were given in a later period and, since the formation of the Canadian National Railways, all debenture issues of that System, except those for rolling-stock, have been guaranteed by the Federal Government. No new land grants or cash subsidies have been advanced by either the federal or provincial governments since 1939.

During the era of railway expansion before 1918, provincial governments guaranteed the bonds of some railway lines that afterwards were incorporated in the Canadian National Railway System. These bonds as they mature or are called are paid off by the Canadian National Railways, in large measure, through funds raised by the issue of new bonds with Federal Government guarantee. Bonds guaranteed by the Governments of Ontario, Manitoba, Saskatchewan, Alberta and British Columbia have been eliminated in this manner in recent years. The only provincially guaranteed railway bonds outstanding at Dec. 31, 1955, were those of the Government of New Brunswick to the amount of $\$ 465,000$. Federal Government guarantees at the same date amounted to $\$ 861,752,955$; this amount does not include $\$ 117,944$ perpetual debenture stock and guaranteed stock of the former Grand Trunk Railway, now part of the Canadian National Railway System, on which interest and dividends are guaranteed by the Federal Government.

## Subsection 3.-Traffic

Table 8 shows passenger and freight statistics for all railways for the years 1946-55. A separate analysis of the operations and traffic of the Canadian National Railways is given at pp. 824-826.

## 8.-Statistics of Passenger and Freight Services and Revenue Receipts 1946-55

Nors.-Figures for 1910-45 are given in the corresponding table of previous Year Books.

| 1952. | 1.377 | 5.81 | 422 | 767 | 31.68 | 10.56 |
| 1953. | 1.489 | 6.22 | 418 | 768 | 31.16 | 11.43 |
| 1954. | 1.516 | 6.09 | 402 | 764 | 30.34 | 11.58 |
| 1955. | 1.460 | 5.75 | 394 | 837 | 31.30 | 12.21 |

${ }^{1}$ Includes express, baggage, mail and other cars. ${ }^{2}$ Duplications included. ${ }^{3}$ Newfoundland included Irom 1950. $\quad$ Includes caboose miles but excludes miles made in passenger and no 1 -revenue trains. ${ }^{5}$ Duplications eliminated; see Table 9 for details of freight carried.

The amount of revenue freight carried on the railways in 1955 was 17 p.c. higher than that carried in 1954. Of the $167,862,156$ tons moved in 1955, mine products accounted for 41.6 p.c., manufactures and miscellaneous products 30.4 p.c., agricultural products 16.2 p.c., forest products 10.6 p.c., and animals and animal products 1.2 p.c. As compared with 1954, mine products carried increased by 35.2 p.c., manufactures and miscellaneous 13.2 p.c., forest products 10.5 p.c., and animals and animal products 3.7 p.c. The agricultural products group was the only one showing a decrease, dropping 4.3 p.c. The largest increase among the individual commodities carried was shown by ores and concentrates.

## 9.-Commodities Hauled as Freight on Railways 1952-55

Note.-In this table duplications are eliminated, i.e., the same freight handled by two or more railways is counted only once. The statistics do not include the United States lines of the Canadian National Railways, but the link of the Canadian Pacific Railway line across Maine, U.S.A., is included, as are the Canadian sections of United States railways.

| Commodity | 1952 | 1953 | 1954 | 1955 |
| :---: | :---: | :---: | :---: | :---: |
|  | tons | tons | tons | tons |

[^261]Railway Accidents.-In Tables 10 and 11 all passengers injured were included in the figures but, for employees, only injuries were recorded that kept the employee from his work for at least three days during the ten days following the accident.

## 10.-Passengers, Employees and Others Killed or Injured on Railways 1946-55

Norg.-Figures for 1919-45 are given in the corresponding tables of previous Year Books beginning with the 1922-23 edition.

| Year | Passengers |  | Employees |  | Others ${ }^{1}$ |  | Totals |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Killed | Injured | Killed | Injured | Killed | Injured | Killed | Injured |
|  |  |  |  | No. | No. | No. | No. | No. |
| 1946..... | 3 | 526 | 105 | 11,406 | 219 | 706 | 327 | 12,638 |
| 1947...... | 35 15 | 464 351 | 103 99 | 10,620 9,980 | 272 | 755 825 | 400 385 | 11,839 11,156 |
| ${ }_{19497} 194$. | 15 1 | 351 316 | 93 71 | 9,980 8,794 | 271 257 | 825 824 | 385 329 | 11,156 9,934 |
| 1950... | 18 | 297 | 67 | 8,108 | 232 | 744 | 317 | 9,149 |
| 1951. | 5 | 221 | 84 | 7,651 | 301 | 723 | 390 | 8,595 |
| 1952. | 2 | 183 | 74 | 7,019 | 317 | 707 | 393 | 7,909 |
| 1953. | 4 | 181 | 35 | 5,917 | 266 | 727 | 305 | 6,825 |
| 1954, | 4 | 251 | 48 | 4,654 | 245 | 586 | 297 | 5,491 |
| 1955.. | 1 | 235 | 48 | 4,467 | 258 | 552 | 307 | 5,254 |

${ }^{1}$ Includes trespassers walking along tracks, stealing rides, etc., and persons crossing tracks at level crossings. ${ }^{2}$ Newfoundland included from Apr. 1, 1949.

Accidents tabulated include all those in which railway trains were involved and accidents on railway property. The classification of accidents used for DBS vital statistics treats collisions between motor vehicles and trains as motor vehicle accidents; provincial statistics also class them as motor vehicle accidents and consequently adjustments should be made when compiling total accidental deaths of all kinds or comparing results of accidents of different kinds, such as train and motor vehicle.
11.-Persons Killed or Injured on Railways by Specified Cause 1953-55

| Class of Person and Description of Accident | 1953 |  | 1954 |  | 1955 |  |

## Subsection 4.-The Canadian National Railway System*

In view of the interest in Canada's publicly owned railway, the Canadian National Railway System is given separate treatment in this Subsection. Its history is presented in a special article published in the 1955 Year Book at pp. 840-847. More detailed information than can be given here is obtainable from DBS annual report, Canadian National Railways.

Financial Statistics.-The original financial Structure of the CNR and the steps taken through the Capital Revision Acts of 1937 and 1952 to alleviate the burden of interest debt undertaken by the Company on its formation in 1923 are described in the special article mentioned above. Briefly, the Capital Revision Act of 1937 wrote off all loans that had been made to cover deficits and also unpaid interest on loans, and certain loans made for the purpose of additions and betterments were converted to equity capital, relieving the CNR from paying fixed charges on this amount. Under the 1952 Capital Revision Act, 50 p.c. of the Company's interest-bearing debt was changed to preferred stock on which, after settling income taxes, a dividend of 4 p.c. is paid on earnings. Also for a term of ten years ending Dec. 31, 1961, the Railway is not obliged to pay interest on $\$ 100,000,000$ of its long-term debt. The Government is authorized to buy additional preferred stock annually in amounts related to the Company's gross revenues. As a consequence, the proportion of total capitalization represented by equity capital in shareholders' account was raised from 34.5 p.c. at Dec. 31, 1951, to 67.2 p.c. at Jan. 1, 1952, and the proportion of borrowed capital was correspondingly reduced.

## 12.-Capital Structure of the Canadian National Railway System as at Dec. 31, 1946-56

Nore.-Information given in greater detail in DBS report, Canadian National Railuays.

| At Dec. 31- | Shareholders' Capital |  | Funded Debt Held by Public |  | Government <br> Loans and <br> Appro- <br> priations- <br> Active <br> Assets <br> in Public <br> Accounts | Totals |

[^263][^264]Milage and Traffic.-At Dec. 31, 1955, main-track milage (exclusive of electric lines) of the Canadian National Railways (including lines in the United States and Newfoundland but exclusive of the Northern Alberta Railways and Toronto Terminals Railway lines controlled jointly by the Canadian National and the Canadian Pacific Railways) was $24,277.9$ miles. Including the Thousand Islands Railway, 4.51 miles, controlled but operated separately, the total milage was $24,282.4$. The grand total, including 70.2 miles of electric line, was $24,352.6$ miles.

## Section 2.-Express Companies

Express, which is actually expedited freight carried on passenger trains, is one of the services provided by companies which do not own the means of conveyance but use the facilities of railway companies under contract. The majority of such contracts provide for payment to the railways of a fixed percentage of the gross express revenue.

Express companies are organized under authority of federal legislation and their business concerns the rapid transit of valuable or perishable commodities and animals, the delivery of parcels and the issuing of financial papers, money orders, travellers' cheques and letters of credit. Express rates are usually much higher than freight rates and the two services are not normally competitive. Both tariffs are subject to the approval of the Board of Transport Commissioners.

Four express organizations operate in Canada-three Canadian and one American. The Canadian Pacific Express Company is a subsidiary of the Canadian Pacific Railway Company and handles the express business on the railways and the inland and ocean steamship lines of the parent company. The express business of the Canadian National and Northern Alberta Railways is handled by departments of the respective railways. The Railway Express Agency, Incorporated, of the United States operates over the Canadian sections of United States railways and over the route from Skagway in Alaska to points in Yukon Territory. No statistics are available on the volume of express traffic because much of it consists of parcels and small lots that cannot be classified.

## 16.-Summary Statistics of Express Companies 1946-55

Nore.-Figures for 1911-45 are given in the corresponding table of previous Year Books beginning with the 1927-28 edition.

${ }^{1}$ Includes wages paid to part-time employees.
${ }^{2}$ Includes part-time employees.

## Section 3.-Urban Transit Systems

The collection of statistical information on urban transportation systems is undergoing extensive reorganization. Such drastic changes have been made in recent years in the types of vehicles used for mass passenger movement in urban centres that the statistical series, which began with the financial and operating statistics of electric railways and later included their motor bus and trolley coach lines, has become inadequate.

The new series will cover all transit systems including electric railway, subway, motor bus, motor coach or trolley coach operation carrying passengers in urban, suburban or interurban service. A transit system may mean any one of these operations or any combination of them. Table 19 gives currently available summary statistics for all urban transit systems. Tables $\mathbf{2 0}$ to $\mathbf{2 3}$ give the latest information on electric railway systems, continuing the series presented in previous editions of the Year Book until the new, more comprehensive series becomes available.
19.-Summary Statistics of Urban Transit Systems 1955-57

[^266]Electric Railway Systems.-The statistics given here cover the urban and interurban operations of electric railway systems. Almost all the urban systems are now municipally owned, the largest privately owned system being the British Columbia Electric Railway Company; most of the interurban firms are controlled either by the Canadian National or Canadian Pacific Railways. The number of electric railways declines each year as motor and trolley buses replace electric cars. Of the 21 systems in service in 1955, five operated electric cars, motor buses and trolley buses; nine operated trolley buses and motor buses; three operated electric cars only; one operated electric ears and motor buses; one, trolley buses only; one, motor buses only; and one reported no electric cars, motor buses or trolley buses.

## 20.-Equipment of Electric Railways 1953-55

| Equipment | 1953 | 1954 | 1955 | Equipment | 1953 | 1954 | 1955 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | No. | No. | No. |  | No. | No. | No. |

| Closed cars. . | 2,212 | 2,112 | 1,837 | Baggage, express and mail |  |  |  |
| Open cars... | 4 | 4 |  | cars......... . . . . . . | 10 | 7 | 4 |
| Combination passenger and baggage cars. | 5 | 5 | 2 | Freight cars..... . . ... .. | 82 56 | 89 56 | 87 55 |
| Cars without electrical |  |  |  | Snow ploughs . | 46 | 42 | 34 |
| equipment. . | 91 | 16 |  | Sweepers.... | 65 | 54 | 38 |
| Motor buses... | 2,177 | 2,348 | 2,656 | Trucks... | 221 | 224 | 254 |
| Trackless trolley buses | 1,113 | 1,144 | 1,143 | Miscellaneou | 181 | 176 | 170 |

The financial statistics of electric railways given in Table 21 have been greatly affected by variations in traffic and by changes in mode of local transportation. When electric railways have ceased operation because of declining traffic or have substituted other types of rolling-stock their figures have been dropped from the tabulation. Despite changing conditions, however, the gross revenue of electric railways has continued to rise in the postwar years. The ratio of expenses to receipts advanced from 86.3 p.c. in 1946 to 99.9 p.c. in 1955. Many systems have changed from private to public ownership in the past few years which accounts for much of the recorded decline in the value of stocks and the increase in funded debt.

## 21.-Financial Statistics of Electric Railways 1946-55

Nort.-Figures for 1901-45 are given in the corresponding table of previous Year Books beginning with the 1926 edition.

| Year | Capital Liability |  |  | Investment in Road and Equipment | Operating Revenues | Operating Expenses | Ratio of Expenses to Revenues | Employees | Salaries and Wages |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

[^267]In 1955, electric cars travelled $55,650,898$ miles in passenger service, trackless trolley buses operated by electric railway companies travelled $37,975,614$ miles and motor buses $74,831,056$ miles. Although most of the urban centres in which transit services operate have greatly extended their populated areas in the postwar years, the number of fare passengers carried has declined each year since 1946.
22.-Traffic Statistics of Electric Railways 1946-55

Note.-Figures for 1901-45 are given in the corresponding table of previous Year Books beginning with the 1933 edition.

The Toronto Subway.-Construction of Canada's first subway commenced at Toronto in 1949 and the line was put into operation in March 1954. The route of the subway follows the general line of Yonge Street, a distance of about 4.5 miles from Front Street to Eglinton Avenue. Twelve stations are located along the line and a pedestrian tunnel links the Union Station and the Royal York Hotel with the subway. Subsurface sections of the subway are from six to 20 feet underground. Rapid-transit cars, 104 in number, each of 62 -passenger capacity, are used. The 500 -foot platforms at all stations accommodate trains of up to eight cars in length and a peak load of 40,000 passengers an hour in each direction may be handled.

## PART III.-ROAD TRANSPORT*

Highways and motor vehicles are herein treated as related features of transportation. An introductory section summarizes provincial regulations regarding motor vehicles and motor traffic.

## Section 1.-Provincial Motor Vehicle and Traffic Regulations $\dagger$

#### Abstract

Nors.-It is obviously impossible to include here the great mass of detailed regulations in force in each province and territory; only the more important general information is given. The sources of information for detailed regulations for specific provinces and territories are given at pp. 832-833.

The registration of motor vehicles and the regulation of motor vehicle traffic lies within the legislative jurisdiction of the provincial and territorial governments. Regulations common to all provinces and territories are summarized under the following headings.

Operators' Licences.-The operator of a motor vehicle must be over a specified age, usually 16 years ( 17 in Newfoundland and Quebec, and 18 in Alberta), and must carry a licence, obtainable in most provinces only after prescribed qualification tests and renewable annually, except in Alberta and British Columbia where they are renewable every five years. Special licences are required for chauffeurs in all provinces except Newfoundland and in some jurisdictions special licences may be granted to those who have not reached the specified age.

Motor Vehicle Regulations.-In general, all motor vehicles and trailers must be registered annually, with the payment of specified fees, and must carry two registration plates, one on the front and one on the back of the vehicle (one only for the back of trailers). In most provinces in event of sale the registration plates stay with the car but in Manitoba and Saskatchewan the plates are retained by the owner. A change of ownership of the vehicle must be recorded with the registration authority. However, exception from registration is granted for a specified period (usually at least 90 days except in Quebec where the maximum is 90 days and British Columbia where it is six months) in any year to visitors' private vehicles registered in another Province or a State that grants reciprocal treatment. Regulations require a safe standard of efficiency in the mechanism of the vehicle and of its brakes and stipulate that equipment include non-glare headlights, a proper rear light, a satisfactory locking device, a muffler, a windshield wiper and a rearvision mirror.

Traffic Regulations.-In all provinces and territories, vehicles keep to the righthand side of the road. Everywhere motorists are required to observe traffic signs, lights, etc., placed at strategic points on highways and roads. The speed limit in most provinces is 50 miles an hour except in Quebec where it is 60, in Manitoba and Alberta where it is 60 in daytime and 50 at night, and in Nova Scotia where the limit is a "reasonable and prudent" speed (of about 40). Slower speeds are always required in cities, towns and villages, when passing schools and public playgrounds, at road intersections, railway crossings, or at other places or times where the view of the highway for a safe distance ahead is in any way obscured. In almost all provinces truck specd limits are at least five miles an hour below automobile speed limits. Motor vehicles must not pass a street car that has stopped to take on or discharge passengers except where safety zones are provided. In most provinces accidents resulting in personal injury or property damage of $\$ 100$ or more must be reported to a provincial or municipal police officer and a driver involved must not leave the scene of an accident until he has rendered all possible aid and disclosed his name to the injured party.

[^268]Penalties.-Penalties ascend in scale from small fines for minor infractions of any of the regulations to suspension of the operator's driving permit, impounding of the car, or imprisonment for serious infractions, recklessness, driving without an operator's licence, and especially for attempting to operate a motor vehicle while intoxicated.

Safety Responsibility Legislation.- Each province of Canada has enacted legislation under this heading (sometimes referred to as financial responsibility legislation). In general, these laws provide for the automatic suspension of the driver's licence and motor vehicle permit of a person convicted of an offence arising out of a motor vehicle accident, or a person involved directly or indirectly in an accident who is not covered for third-party insurance at the time of the accident. The suspension remains effective until any penalty or judgment has been satisfied and proof of financial responsibility for the future is filed.

Although safety responsibility legislation has not been enacted in either the Yukon Territory or the Northwest Territories, the Motor Vehicle Ordinances of the two Territories require the owner of a motor vehicle to submit evidence of stipulated insurance coverage on such vehicle before he can obtain registration.

Unsatisfied Judgment Funds.-In recent years a new type of motor vehicle legislation has been enacted in all provinces except Quebec and Saskatchewan. This has usually taken the form of an amendment to the motor vehicle laws of the province and provides for the establishment of an Unsatisfied Judgment Fund, out of which are paid judgments awarded for damages arising out of motor vehicle accidents in the province which cannot be collected in the ordinary process of law. The Fund is created by the collection annually of an Unsatisfied Judgment Fund fee from the registered owner of every motor vehicle or from every person to whom a driver's licence is issued, except in British Columbia where the Fund is maintained by insurance companies. This fee does not exceed $\$ 1$ per annum except that, in 1958, Ontario will collect $\$ 5$ from each uninsured owner of a motor vehicle at the time of registration. A feature of this legislation which is contained in some provincial statutes provides for the payment of judgments in the so-called 'hit-and-run' accidents. When these occur, if neither the owner nor the driver can be identified, action may be taken against the Registrar of Motor Vehicles; any judgment secured against the Registrar is paid out of the Fund. All of these laws contain a provision limiting the amounc that can be paid out of the Fund on one judgment. In Ontario, Alberta and British Columbia the limits are $\$ 10,000$ for one person, $\$ 20,000$ for two or more persons injured in one accident and $\$ 2,000$ for property damage. In Manitoba the legal limits are $\$ 10,000$, $\$ 20,000$ and $\$ 1,000$ respectively, while other provinces retain lower limits of $\$ 5,000$, $\$ 10,000$ and $\$ 1,000$. For hit-and-run accidents payments are made for personal injuries or death only.

Sources of information for provincial motor vehicle and traffic regulations:-

## Newfoundland

Administration.-Deputy Minister of Public Works, St. John's.
Legislation.-The Highway Traffic Act 1951, as amended.

## Prince Edward Island

Administration.-The Provincial Secretary, Charlottetown.
Legislation.-The Highway Traffic Act (R.S.P.E.I. 1951, c. 73).

## Nova Scotia

Administration.-Motor Vehicle Branch, Department of Highways, Halifax.
Legislation.-The Motor Vehicle Act (1954, c. 184) as amended, and the Motor Carrier Act (R.S.N.S. 1923, c. 78) as amended.

## New Brunswick

Administration.-Motor Vehicle Division, Provincial Tax Branch, Department of Provincial Secretary-Treasurer, Fredericton.

## Quebee

Administration.-Motor Vehicle Service, Provincial Revenue Offices, Parliament Bldgs., Quebec.
Legislation.-The Motor Vehicles Act (R.S.Q. 1941, c. 142) as amended.

## Ontario

Administration.-Motor Vehicles Branch, Department of Transport, Toronto.
Legislation.- The Highway Traffic Act (R.S.O. 1950, e. 167), the Public Vehicles Act (R.S.O. 1950, c. 322) and the Public Commercial Vehicles Act (R.S.O. 1950, e. 304).

## Manitoba

Administration.-Minister of Public Utilities, Winnipeg.
Legislation.-The Highway Traffic Act (R.S.M. 1954, c. 112) as amended.

## Saskatchewan

Administration.-Treasury Department, Highway Traffic Board, Revenue Building, Regina.
Legislation.-The Vehicles Act, 1957.

## Alberta

Administration.-Motor Vehicle Branch, Department of Highways, Edmonton.
Legislation.-The Vehicles and Highway Traffic Act (R.S.A. 1955, c. 356) as amended, The Motor Vehicles Accident Indemnity Act (R.S.A. 1955, c. 209) as amended, the Public Service Vehicles Act (R.S.A. 1955, c. 265), and Rules and Regulations.

## British Columbia

Administration and Legislation.-Eniorcement of the Motor Vehicle Act, the Highway Act and the Motor Carrier Act is vested in the Royal Canadian Mounted Police and the various municipal police forces. The Highway Act is administered by the Minister of Public Works, the Motor Carrier Act by the Public Utilities Commission, and the Motor Vehicle Act by the Superintendent of Motor Vehicles, Victoria, B.C.

Yukon Territory
Administration.-Commissioner of the Yukon Territory, Whitehorse, Y.T. Information regarding regulations may also be obtained from the Northern Administration and Lands Branch, Department of Northern Affairs and National Resources, Ottawa.
Legislation.-The Motor Vehicle Ordinance (1952, First Session, c. 8) as amended.

## Northwest Territories

Administration.-Commissioner of the Northwest Territories. Address communications to the Director, Northern Administration and Lands Branch, Department of Northern Affairs and National Resources, Ottawa.
Legislation.-The Motor Vehicles Ordinance (1956, c. 72) as amended.

## Section 2.-Highways and Roads

The populated sections of Canada are well supplied with highways and roads. Access to outlying settlements is provided to some extent by roads built by logging, pulp and paper, and mining companies, although these are not generally available for public travel. At the same time, great areas of Newfoundland, Quebec, Ontario, the Prairie Provinces, British Columbia and the Territories are very sparsely settled and are virtually without roads of any kind.

At the end of 1955, the total milage of highway and rural roads in Canada was 455,404 . This milage includes all roads under provincial jurisdiction, federal roads including those in the National Parks and the Yukon and Northwest Territories, and local roads under municipal jurisdiction other than the milages in cities and towns. The latter are given separately under the heading "Urban Roads", p. 836.

The 1955 figures shown in Table 1 are not strictly comparable with those for the previous year. Reclassification of roads in Manitoba resulted in a considerable decrease in gravelled and earth milages. All other provinces except New Brunswick reported increases during the year. Federal roads in the ten provinces, including those in National Parks, the Federal District Commission driveways around Ottawa, and the 729-mile North West Highway System of British Columbia, measured 1,912 miles. The roads in the Yukon Territory were classed as provincial roads for the first time in 1955.

## 1.-Milage of each Type of Road by Province 1955

Norz.-The figures for Canada are the sums of the milages so reported. Urban streets are not included.

${ }^{1}$ Includes milages of gravelled roads; details not available.
Expenditures on roads and highways reached a new high in the year ended Mar. 31, 1956 , at $\$ 513,852,270$. This figure was nearly 20 p.c. higher than the expenditure in the previous fiscal year. Construction work was up 28 p.c. and maintenance 5 p.c. Table 2 shows the expenditures by provinces and the federal-provincial-municipal distribution for the fiscal years ended 1952-56.

[^269]The Trans-Canada Highway System.-The original federal-provincial agreement of 1949 for construction of the Trans-Canada Highway was given in outline, together with other data on specifications and proposed route across the participating provinces, in the 1951 Year Book, pp. 631-634. The original Act set the standards to be met: a hard-surfaced, two-lane highway, 22 to 24 feet wide with ample shoulder widths, bridge clearances and sight distances, low gradients and curvature, a maximum load capacity of nine tons for one axle, and the elimination, wherever possible, of railway grade crossings. The shortest practicable east-west route was to be designated by each province within its own borders, in agreement on terminal points with adjoining provinces. Those sections within the National Parks were to be the responsibility of the Federal Government.

Certain amendments to financial provisions and completion date were discussed at the Federal-Provincial Conference held at Ottawa in November 1955, and the TransCanada Highway Act was amended by Parliament in June 1956. The new Act gives authority for increasing federal expenditure from $\$ 150,000,000$ to $\$ 250,000,000$ under a formula by which the Federal Government will pay 90 p.c. of the cost of building 10 p.c. of the milage of the Trans-Canada Highway in each province in an effort to close gaps where no road at all exists or where certain portions are below standard. The basic 50-50 financial arrangement is still in force on the remaining 90 p.c. of the milage in each province. A revised completion date is set at Dec. 31, 1960. New federal-provincial agreements were entered into by the participating provinces during the six months following passage of the amendments.

The Provincial Government of Quebec is not a party to a federal-provincial agreement but there is a paved highway across that Province, linking the two ends of the TransCanada Highway route in Ontario and New Brunswick.

In the nine participating provinces the route as amended in 1956 will total 4,444 miles divided as follows: Newfoundland 554; Prince Edward Island 71; Nova Scotia 311; New Brunswick 390; Ontario 1,436; Manitoba 309; Saskatchewan 406; Alberta 282; British Columbia 568; and in the National Parks 117. Revisions in location have since altered some milage totals. For instance, the milage through Mount Revelstoke and Glacier National Parks in British Columbia was shortened by a decision to use the Rogers Pass route, and the decision on the location of Terra Nova, the new National Park in Newfoundland, increased the milage for which the Federal Government is solely responsible by 63 miles. Thus the National Park milage is altered to 143 . The sum of $\$ 10,000,000$ was allocated by Parliament for construction of the Highway through the National Parks during the fiscal year ended Mar. 31, 1958.

Contractual commitments of the nine participating provinces for new construction on the Highway during the period Dec. 9, 1949, to July 15, 1957, amounted to $\$ 345,625,433$ of which the Federal Government's share, including the additional 40 p.c. under the amended Act, was $\$ 189,317,814$. Federal payments to the provinces during this period for prior, interim and new construction totalled $\$ 109,431,701$. On-site labour expended on the Highway up to Mar. 31, 1957, amounted to $5,196,607$ eight-hour man-days of employment; off-site employment required for the provision of necessary material and services was estimated at $8,834,232$ man-days.

In Saskatchewan, work was completed over the whole route of 406 miles, and the Highway opened and dedicated at a ceremony on Aug. 21, 1957. In provinces more handicapped by problems of terrain and construction, progress continues to be made and the work is well up to schedule. At May 31, 1957, contracts for 2,488 miles of grading had been approved and the equivalent of 2,154 miles built, contracts for base-course had been approved for 2,131 miles and the equivalent of 1,761 miles completed; paving to specified standard had been completed over a distance of 1,559 miles; 261 bridges, overpasses and other structures of over 20 -foot span had been completed.

Urban Roads.*-Information on urban roads is obtained from municipalities with populations of over 1,000 . The number of such cities and towns reporting in 1956 ws well over twice the number reporting in 1954 (317) and the data secured was much more comprehensive.

## Section 3.-Motor Vehicles

Registration.-Automobiles were registered in Canada for the first time in 1904. Ontario was the only province to issue licences in that year. New Brunswick beggn registering cars in 1905; Quebec, Saskatchewan and Alberta in 1906; British Columbis in 1907; Manitoba in 1908; Nova Scotia in 1909; Prince Edward Island in 1913; and Yukon Territory in 1914.

In 1905 only 565 motor vehicles were registered in Canada but by 1915 the number had risen to 95,284 and by the end of the next decade to 724,048 . With the exception of 1931-33 an annual increase was in evidence until 1941 when $1,572,784$ motor vehichs were registered. The number of commercial vehicles continued to increase during the mar years but a considerable decline was shown in passenger cars because of the restrictions on manufacture and the rationing of tires and gasoline. However postwar recovery ws rapid and registrations have risen steadily to a 1956 total of $4,230,647$, including $3,187,099$ passenger cars and taxis, 995,723 trucks and miscellaneous vehicles, 12,246 buses and 35,580 motorcycles.

[^270]
## 4.-Motor Vehicles Registered by Province 1947-56

Nors.-Registrations given here include passenger cars, trucks, buses, motorcycles, service cars, etc., but not trailers or dealer licences. Figures for $1904-35$ are given in the 1937 Year Book, p. 668; for 1936-44 in the 1948-49 edition, p. 707; and for 1945-46 in the 1956 edition, p. 814.

Provincial Government Revenue from Motor Vehicles.-The taxation of motor vehicles, garages, drivers, chauffeurs, etc., is an important source of provincial government income. In every province licences or permits duly issued by the provincial authorities are required for motor vehicles of all kinds, trailers, operators or drivers, paid chauffeurs, dealers, garages and gasoline and service stations. In 1956 the average cost per motor vehicle for operating taxes and licences was about $\$ 90$. Lower gasoline tax rates in the five provinces from Ontario westward brought the averages for those provinces below the national average. Present gasoline tax rates range from nine cents per gallon in Manitoba to 17 cents in Newfoundland and Nova Scotia.

The more important sources from which provincial revenue from motor vehicles is derived are shown in Table 7. Federal Government revenue from import duties, excise and sales taxes are given in Chapter XXIV on Public Finance.

Motor Carriers.*-Statistics of the 'for bire' segment of the motor carrier industry have been collected since 1941. The continued co-operation of provincial authorities, trucking associations and other interested parties has resulted in gradual improvement in the statistical accuracy of these data but much still remains to be done. As little capital is required to enter the trucking business, many marginal operators are associated with the industry, and the large turnover and numerous changes of operators each year creates many problems in the collection of statistics. The 2,938 firms from which usable returns were secured in 1955 reported gross revenue of $\$ 283,513,579$ compared with 2,784 firms reporting $\$ 247,699,065$ revenue in 1954.

The motor carrier industry is divided into freight and passenger sections, each of which is subdivided into two groups according to gross annual revenue: (1) those having annual revenues of $\$ 20,000$ or over; (2) those having revenues under $\$ 20,000$. In the passenger carrier section, all city passenger carriers are included under "City Service" while intercity and rural passenger operators are divided into the two revenue groups.

These statistics do not include motor bus operations of street railways except where such services are entirely motorized. Motor bus data for street railways are included under electric railway systems (see p. 829). Excluded are operations of vehicle fleets owned and

[^274]operated by private companies where the vehicles are not available for public service, such as dairies, bakeries, departmental and grocery stores, oil and gasoline distributors and breweries. Operators under almost exclusive contract, such as those engaged in the collection of milk or co-operatively owned vehicles, are also excluded, as are school buses owned and operated by school boards or municipalities or under contract.

[^276]Motor Vehicle Accidents.-Motorists are required by law to report accidents but complete statistics of these accidents are not available for all provinces. Statistics on all deaths from motor vehicle accidents are shown in Table 11. A direct comparison of such statistics between the provinces is of little value because of differences in size, population, motor vehicle density, etc., but, to put them on somewhat the same basis, the average number of deaths per 10,000 registered motor vehicles has been tabulated. These data still give no weight to differences in use of motor vehicles, variations in climate, road conditions, tourist cars, etc., all of which are factors in accidents.

Data presented in Table 12 relate to traffic accidents only and consequently may not be compared with Table 11 which includes details of fatalities occurring elsewhere than on public streets or roads.

## 11.-Deaths Resulting from Motor Vehicle Traffic and Non-traffic Accidents by Province 1947-56

Nors.-Figures for 1926-35 will be found in the 1941 Year Book, p. 578; for 1936-44 in the 1948-49 edition, pp. 712-713; and for 1945-46 in the 1956 Year Book, pp. 819-820.

12.-Motor Vehicle Traffic Accidents by Province 1955 and 1956

For footnote, see end of table, p. 844.
12.-Motor Vehicle Traffic Accidents by Province 1955 and 1956-coneluded

${ }^{1}$ As of May 1, 1956, all reported sccidents are those resulting in property damage estimated at $\$ 100$ or over. Previously the minimum property damage varied in the different provinces from $\$ 25$ to $\$ 100$. ${ }^{2}$ Includes Quebec.

## PART IV.-WATER TRANSPORT*

The Canada Shipping Act.-Legislation regarding all phases of shipping is consolidated in the Canada Shipping Act (R.S.C. 1952, c. 29). Under the Act and its amendments the Parliament of Canada accepts full responsibility for the regulation of Canadian shipping.

## Section 1.-Shipping Facilities and Traffic

A special article on the importance of traffic using the Great Lakes-St. Lawrence Seaway appears in the 1956 Year Book, pp. 821-829.

## Subsection 1.-Shipping

All waterways including canals and inland lakes and rivers are open on equal terms, except in the case of the coasting trade, to the shipping of all countries of the world so that the commerce of Canada is not dependent entirely upon Canadian shipping. However a large part of the inland and coastal traffic is carried in ships of Canadian registry.

[^277]Canadian Registry.-Under Part I of the Canada Shipping Act all ships in excess of 10 tons net register are required to be registered; ships of lower tonnage may be registered voluntarily, otherwise they are required to be operated under a Vessel Licence if powered by a motor of $10 \mathrm{~h} . \mathrm{p}$. or more. Sect. 6 of the Act restricts ownership to British subjects or bodies corporate established under and subject to the laws of some part of Her Majesty's Dominions and having their principal place of business in those Dominions. Under the British Commonwealth Merchant Shipping Agreement all Commonwealth ships are given the general designation 'British Ship'; and a ship that should be but is not registered is not entitled to the privileges accorded to British ships. Ships in the planning stage or in course of construction may be recorded before registry by a Registrar of Shipping.

## 1.-Vessels on the Canadian Shipping Registry by Province as at Dec. 31, 1954-56

Norg.-Figures for 1935-53 are given in the corresponding table of previous Year Books beginning with the 1941 edition.

| Province or Territory | 1954 |  | 1955 |  | 1956 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | No. | net tons | No. | net tons | No. | net tons |

| Alberts. | 4 | 430 | 7 | 630 | 7 | 630 |
| British Columbia | 5,092 | 381,560 | 5,323 | 520,282 | 5,560 | 538,119 |
| Yukon Territory, | 16 | 3,572 | 16 | 4,413 | 16 | 4,413 |
| Northwest Territories | 6 | 263 | 7 | 326 | 7 | 326 |
| Totals. | 16,568 | 1,632,306 | 17,188 | 2,316,396 | 17,653 | 2,317,311 |

Shipping Traffic.-Complete statistics of shipping traffic, comparable with those given for the railways, showing all the freight carried by water, are not available. However, there is a record of the number and tonnage of ships calling at all ports at which there are customs collectors and of cargoes of vessels trading between Canadian and foreign ports. Each vessel visiting a customs port or outport makes a statistical return which is forwarded to the Dominion Bureau of Statistics. Coastwise cargo has been reported from Jan. 1, 1952. Reports are not made for vessels of less than 10 registered net tons.

## 2.-Vessels Entered at Canadian Ports ${ }^{1}$ 1946-55

Norz.-Figures for the years ended Mar. 31, 1929-35 are given in the 1941 Year Book, p. 597; for 1936-44 in the 1948-49 edition, p. 733; and for 1945 in the 1956 Year Book, p. 830.

## Subsection 2.-Harbours

Water transportation cannot be studied with any degree of completeness without taking into consideration the co-ordination of land and water transportation at many of the ports. Facilities provided to enable interchange movements include the necessary docks and wharves, some for passenger traffic but most of them for freight, warehouses for the handling of general cargo, and special equipment for such bulk freight as lumber, coal, oil and grain. Facilities may include cold storage warehouses, harbour railway and switching connections, grain elevators, coal bunkers, oil storage tanks and, in the chief harbours, dry dock accommodation.

Eight of the principal harbours of Canada are administered by the National Harbours Board. Seven other harbours come under the supervision of the Department of Transport and are administered by commissions that include municipal as well as Federal Government appointees. In addition, there are about 300 public harbours that are under the direct supervision of the Department of Transport. These harbours are administered under rules and regulations approved by the Governor General in Council. Harbour masters have been appointed by the Minister of Transport for 131 of these harbours, their remuneration being paid from fees levied on vessels under the terms of the Canada Shipping Act.

At most ports, in addition to the harbour facilities operated by the National Harbours Board or other operating commission, there are dock and handling facilities owned by private companies such as railway, pulp and paper, oil and sugar industries. At a number of ports there are also dry docks; these are dealt with separately at p. 851 .

## 5.-Facilities of the Six Principal Harbours as at Dec. 31, 1956

Note.-The facilities at these ports include those under the control of other agencies as well as those of the National Harbours Board.

${ }^{1}$ Includes a $3,000,000-\mathrm{bu}$. grain-storage shed connected with the elevator.
National Harbours Board.-The National Harbours Board, a Crown corporation established in 1936, is charged with the administration and operation of the following properties: port facilities such as wharves and piers, transit sheds, grain elevators, cold storage warehouses, terminal railways, etc., at the harbours of Halifax, Saint John, Chicoutimi, Quebec, Three Rivers, Montreal, Vancouver, and Churchill; grain elevators at Prescott and Port Colborne; and the Jacques Cartier Bridge at Montreal. These facilities represent a capital investment of approximately $\$ 263,000,000$. Current operating revenues and expenditures are given in Table 30, pp. 867-868.

Harbour Traffic.-The freight movement through a large port takes a number of different forms. The overseas movement of freight loaded on and unloaded from seagoing vessels frequently constitutes a surprisingly small part of the total. Usually the volume from coasting vessels is larger. There is, as well, the in-transit movement in vessels that pass through the harbour without loading or unloading and the movement from one point to another within the harbour, which in many ports amounts to a large volume. It is not possible to obtain statistics of the total freight handled at all the ports and harbours of Canada because many of them are small and without the staff necessary to maintain detailed records. However, the National Harbours Board prepares an annual report of the water-borne cargo loaded and unloaded at the eight ports under its control. Six of these are the principal ports of Canada and the cargo handled at each is shown in Table 6. The figures include freight carried by coasting and inland international as well as by sea-going shipping; they include all cargo loaded and unloaded, whether by facilities under the jurisdiction of the Board or at private docks and terminals. Cross-harbour movements, ballast (non-revenue), bunkers, ships' stores, mail and passengers' baggage

## 6.-Principal Commodities in Water-Borne Cargo Loaded and Unloaded at Each of the Six Principal Ports 1955 and 1956

Norg.-Commodities totalling less than 50,000 tons in 1956 are not listed.

Dry Docks.-The Department of Public Works of the Federal Government owns five dry docks-one at Kingston, Ont., two at Lauzon, Que., and two at Esquimalt, B.C.and operates all except the one at Kingston which is under lease to the Canadian Shipbuilding and Engineering Company of Kingston. The old Esquimalt dry dock was temporarily transferred to the Department of National Defence on Nov. 1, 1934, and, when commercially required, it will be returned to the control of the Department of Public Works. Each of the large dry docks at Lauzon, Que., and Esquimalt, B.C., can be divided for use of small vessels; the larger Lauzon dock cost approximately $\$ 4,500,000$ and the larger Esquimalt dock approximately $\$ 7,000,000$.

[^280]${ }^{2}$ Over sill (H.W.).

## Subsection 3.-Canals*

The canals and canalized waters of Canada under the jurisdiction of the Department of Transport comprise a series of waterways providing navigation for 1,875 miles inland from salt water. The canals included under the two classifications-main or primary canals and subsidiary or secondary canals-are listed in Table 9 with their locations, lengths and lock complement. In addition to these, the federal Department of Public Works administers the St. Andrews Lock (length, width and draught, respectively, 215, 45 and 17 feet) on the Red River at Selkirk, Man., and the lock at Poupore, Que. A few small locks are operated by provincial authorities.

During 1956, $40,016,565$ tons of freight and 32,865 vessels passed through the canals as compared with $34,874,198$ tons of freight and 28,172 vessels during 1955. In addition to freight and passenger vessels, thousands of pleasure craft are locked through the canals. Vessels locking at Sault Ste. Marie during 1956 carried 121,151 passengers as compared with 178,006 in 1955.

Revenue from canals during the year ended Mar. 31, 1957, amounted to $\$ 1,790,202$ of which $\$ 1,349,989$ was derived from rentals for hydraulic and land privileges and wharfage. In the previous fiscal year the total revenue was $\$ 2,163,611$ with rentals and wharfage amounting to $\$ 1,330,797$.

[^281]5.-Lengths of Channels and Dimensions of Locks under the Control of the Department of Transport as at July 1, 1957

[^283]The figures in Tables 12 and 13 include duplications where the same freight passes through two or more canals, but in Table 14 duplications in the traffic passing through the St. Lawrence and Welland Ship Canals and the Canadian lock at Sault Ste. Marie have been eliminated wherever possible.

Grain trans-shipped at Georgian Bay, Lake Erie, or other ports above Montreal is treated as new cargo and as most of this grain has passed through either the Canadian or United States locks at Sault Ste. Marie there are still duplications in the data because of this treatment. These duplications cannot be avoided when net totals for the Canadian canals are computed because it is impossible to ascertain which lock at Sault Ste. Marie was used by the grain reloaded at Port Colborne, Ont., or other trans-shipping port.

## 14.-St. Lawrence-Great Lakes Traffic using St. Lawrence, Welland Ship and Sault Ste. Marie Canals 1956

| Canals Used | Upbound Freight | Downbound Freight | Total |

| Sault Ste. Maric only.. | 545,621 | 1,887,197 | 2,432,818 |
| Trafic using United States Locks at Sault Ste. Marie only. | 13,765,513 | 92,343,655 | 106,109,168 |
| Totals | 21,775,623 | 115, 724,879 | 137,500,502 |

Traffic through the Sault Ste. Marie canals, Canadian and American, has been approximately twice as heavy as the traffic through the Panama Canal during the latest ten years for which records are available. Canal traffic has varied from 20,484,000 tons in 1932, which was less than the Panama traffic, to $109,907,136$ tons in 1954. The dominant traffic from a tonnage aspect is iron ore which fluctuated from a low of $3,607,000$ tons in 1932 to a high of $98,657,591$ tons in 1953. In 1955 this tonnage amounted to $89,396,865$, but dropped to $79,085,608$ in 1956.

Soft coal has usually been second in volume to iron ore, increasing from $8,676,297$ tons during the 1949 season to $13,301,048$ tons in 1950 ; succeeding years brought declines to 7,397,623 tons in 1954, 9,053,769 tons in 1955 and 10,238,048 tons in 1956.

Although wheat ranks third in tonnage, its value over the past quarter-century has been greater generally than that of either iron ore or coal. Other grains have been about one-quarter to one-fifth of the wheat tonnage and a smaller ratio of the value.

The Panama Canal.-The Panama Canal was opened to commercial traffic on Aug. 15, 1914, and has since been a waterway of great importance to the ports of British Columbia, from which vessels leave direct for United Kingdom and other European ports throughout the year. As an alternative route to that of the transcontinental railway lines, this water passage is of vital importance in the solution of the larger transportation problems of the Continent. During World War I the great expectations based upon the opening of the Canal were not realized, because of the scarcity of shipping. However, with the postwar decline in ocean freight rates, an increase in traffic between Canada's Pacific ports and Europe took place and, while the proportion carried in vessels of Canadian registry was comparatively small, the cargo tonnage nevertheless assumed considerable
proportions. During World War II the volume of Canadian traffic through the Canal was again reduced but has since increased considerably. A distinctive feature of this traffic is that most of the tonnage westbound is destined for Canadian West Coast ports, while only a small percentage of the freight originating on the West Coast is unloaded in Eastern Canada.

## 15.-Traffic to and from the East and West Coasts of Canada via the Panama Canal, Years Ended June 30, 1948-57

Notz.-Figures from 1921 are given in the corresponding table of previous Year Books beginning with the 1938 edition.

| Year | Originating on- |  | Destined for- |  | Year | Originating on- |  | Destined for- |  |

## Subsection 4.-Aids to Navigation

Included under aids to navigation are the lighthouses and the whole system of marine danger signals on the East and West Coasts of Canada, on Hudson Bay and Strait, the St. Lawrence River and Gulf, the inland rivers and lakes, and at the entrances to harboursa very extensive system designed to provide safe navigation in all Canadian waters. In
addition, a pilotage service is maintained in waters where navigation is difficult; this service is described under Marine Services at p. 859. A further aid to safe navigation is found in the chains of radio signal and direction-finding stations described under Radio Services at p. 896. Lists of aids to navigation, with the exception of very minor ones, are published by the Department of Transport.

## 17.-Marine Danger Signals maintained in Canada, Years Ended Mar. 31, 1952-57

Nors.-In addition to the aids to navigation listed, approximately 9,300 unlighted buoys, balises, dolphins and bescons are maintained. Lists of marine danger signals maintained from 1929 are given in the corresponding table of previous Year Books beginning with the 1941 edition.

| Type of Signal | 1952 | 1953 | 1954 | 1955 | 1956 | 1957 |

Navigable waters have been improved greatly by dredging in channels and harbours, by the removal of obstructions, and by the building of remedial works to maintain or control water levels. Incidental to these developments of navigable waters are works to guard shorelines and prevent erosion, and for the control of roads and bridges that cross navigable channels. Ice-breaking operations are carried on at the beginning and at the end of winter to prolong the season of navigation in important waters that freeze overparticularly in connection with sea-going shipping from Montreal-and to prevent flood conditions during the spring ice break-up.

St. Lawrence River Ship Channel.-This channel extends from about 40 miles below Quebec City to the foot of Lachine Canal at Montreal, a distance of 200 miles. About 113 miles of this distance is dredged channel.

Above Quebec the channel has a limiting depth of 35 feet at extreme low water and a minimum width of 550 feet, with additional width up to 1,500 feet at all curves, and difficult points, and additional anchorage and turning areas. This section comprises about 100 miles of dredged channel. Below Quebec the limiting depth of dredged channel, about 13 miles in length, is 30 feet at low tide, with a width of 1,000 feet. An average tidal range of 15 feet in this area provides ample depth for any vessel using the St. Lawrence route. Maintenance requirements owing to silting in this dredged channel are relatively minor above Quebec but below the city silting is more pronounced because of tidal action.

The ship channel is well defined by buoys and the centre marked by range lights, permitting uninterrupted day and night navigation throughout the open season from about mid-April to early December. The movements of all shipping, weather and ice conditions and obstructions to traffic throughout the St. Lawrence waterway from Fame Point, Que., to Kingston, Ont., are recorded and made available to all concerned through a series of reporting stations known as the Marine Reporting Service.

A fleet of ice-breaking vessels is maintained to facilitate the movement of shipping between Montreal and the sea during the opening and closing of navigation, and to alleviate flood conditions in low-lying areas.

## 18.-Seasons of Open Navigation on the St. Lawrence Ship Channel 1938-57

Nore.-Figures from 1882 are given in the corresponding table of previous Year Books beginning with the 1934-35 edition.

| Year | Channel Open, Quebec to Montreal ${ }^{1}$ | First Arrival from Sea, Montreal Harbour | Last Departure for Sea, Montreal Harbour | Year | Channel Open, Quebec to Montreal ${ }^{1}$ | First Arrival from Sea, Montreal Harbour | Last Departure for Sea, Montreal Harbour |

${ }^{1}$ "Channel Open" means the route can be navigated although there may be floating ice in the river.

## Subsection 5.-Marine Services of the Federal Government

The services covered in this Subsection deal with steamship inspection, pilotage service, sea-faring personnel and the operations of the Canadian National (West Indies) Steamships Limited.

Steamship Inspection.-The Steamship Inspection Service, provided for under Part VII of the Canada Shipping Act, is responsible for the administration and carrying out of the provisions of the Act respecting the periodic inspection of power-driven ships and the issue of inspection certificates; the assignment of load lines; the conditions under which dangerous goods may be carried in ships; the protection against accident of workers employed in loading and unloading ships; the prevention from pollution of Canadian territorial and inland waters by oil from ships; and also for the administration and carrying out of the provisions relating to the certification and employment of marine engineers. The Service has a headquarters staff at Ottawa and staffs of inspectors at the principal ocean and inland ports.

The Board of Steamship Inspection decides on questions arising out of the administration of the Act and takes care of the interests of the Federal Government in schools for marine engineers.

## 19.-Summary Statistics of Steamship Inspection, Year Ended Mar. 31, 1956

Pilotage.-Pilotage service functions under the provisions of Part VI of the Canada Shipping Act. Wherever a pilotage district has been created by the Governor in Council, qualified pilots are licensed by the pilotage authority of the district. There are in Canada 42 pilotage districts in nine of which the Minister of Transport is the pilotage authority (see Table 20); in each of the other districts the authority is a local body appointed by the Governor in Council.
20.-Pilotage Service by Districts, Years Ended Mar. 31, 1955 and 1956

| District | 1955 |  | 1956 |  |

| Totals. | 25,344 | 77,231,452 | 28,194 | 89,351,908 |

In addition there are 21 districts in Newfoundland under local pilotage authority. These districts are administered under Newfoundland statutes which, since the date of union with Canada (Mar. 31, 1949), come under federal jurisdiction. Part VI of the Canada Shipping Act with respect to pilotage has not been proclaimed in force in Newfoundland.

Seamen Engaged and Discharged.-Seamen engaged and discharged at Canadian ports under the provisions of the Canada Shipping Act during the years ended Mar. 31, 1947-56 are shown in Table 21.

## 21.-Seamen Engaged and Discharged at Canadian Ports, Years Ended Mar. 31, 1947-56

Norg.-Figures from 1918 are given in the corresponding table of previous Year Books beginning with the 1941 edition.

| Year | Seamen Engaged | Seamen Discharged | Year | Seamen Engaged | Seamen Discharged |

${ }^{1}$ Newfoundland included from Apr. 1, 1949.

Canadian National (West Indies) Steamships Limited.-In conformity with the Canada-West Indies Trade Agreement of 1926 (16-17 Geo. V, c. 16) the Federal Government has provided direct steamship services to the West Indies through the medium of Canadian National (West Indies) Steamships Limited.

At the end of 1956, the Canadian National Steamships owned and operated eight vessels in service between Canada and the British West Indies.

## 22.-Financial Statistics of Canadian $\underset{1947-56}{\text { National (West Indies) Steamships Limited }}$

Nore.-Figures for the years 1929-38 are given in the 1942 Year Book, p. 620; for 1939-44 in the 1950 edition, p. 777; and for 1945-46 in the 1956 Year Book, p. 844.

## Subsection 6.-The St. Lawrence Seaway

The St. Lawrence Seaway, in its broadest sense, will provide a deep waterway extending some 2,200 miles from the Atlantic Ocean to the Head of the Great Lakes. The waters of Lake Superior, seeking sea level, drop 602 feet through the lesser Great Lakes and the St. Lawrence River on their way from the heart of the Continent to the Atlantic Ocean. The greater part of this drop takes place in the Niagara River-now overcome by the 27-mile Welland Ship Canal with its eight locks-and in the St. Lawrence River.

The present navigation picture is as follows: (1) from the Gulf of St. Lawrence to Montreal, a distance of 1,000 miles, controlling navigation channels are 35 feet in depth; (2) from Montreal to Lake Ontario, a distance of 180 miles, controlling navigation
channels are 14 feet in depth; (3) from Lake Ontario to Lake Erie, a distance of 27 miles, controlling navigation channels are 25 feet deep; and (4) from Lake Erie to the Head of the Lakes, a distance of 970 miles, controlling navigation channels are 25 feet downbound and 21 feet upbound. Thus, between the highly developed Great Lakes section, which has a minimum channel of 21 feet, and the ocean port facilities at Montreal lie 114 miles of rapid-studded St. Lawrence River, navigable only through a chain of outmoded 14-foot canals capable of handling ships with a maximum capacity of 3,000 tons only. The Seaway project will break this bottleneck and extend 27 -foot facilities from the Great Lakes to the sea. Seven new locks are required for the purpose-five being built by the St. Lawrence Sesway Authority of Canada and two by the St. Lawrence Seaway Development Corporation of the United States. These will replace 21 inadequate locks between Montreal and Lake Ontario.

Also, because Canadian Government regulations require that all bridges spanning waters navigable by ocean-going ships have a minimum overhead clearance of 120 feet, extensive modifications must be made to seven bridges that exist between Montreal and Lake St. Francis. In addition, a new high-level suspension bridge is being constructed across the south channel of the St. Lawrence River at Cornwall Island-the substructure by the Canadian Authority and the superstructure by the United States entity.

Associated with the St. Lawrence Seaway navigation project is the construction of a large electric power development in the international rapids section of the St. Lawrence River between Cornwall and Prescott. A 38,000-acre power pool will be formed by means of control dams and an international powerhouse will generate about $2,200,000 \mathrm{~h} . \mathrm{p}$. of electric energy to be shared equally by Canada and the United States. (See pp. 582-583.)

The Seaway navigation project was 75 p.c. complete at the end of 1957. The most significant event in the progress of construction up to that date was the final test, on Nov. 27, 1957, of the Iroquois Lock, the most westerly of the seven new locks. Progressively, the lock gates, fenders, other machinery and controls were installed and tested and the lock was completed by late August, three months ahead of schedule. On the day of the final test, a ship was sailed into the lock, the lock chamber filled and the ship lifted some 12 feet to the present level of the St. Lawrence River above the lock and the nearby Iroquois control dam. The Iroquois Lock will provide access for ships passing from that part of the Seaway channel being dredged (from Lake Ontario down through the Thousand Islands) to the Seaway Lake downstream. The Lake, or power pool, is being created by the Iroquois control dam, and by the Long Sault control dam and the CornwallBarnhart Island powerhouse about 35 miles downstream. The Iroquois Lock will be in use sometime in 1958 as will the two United States locks near Massena, N.Y., opposite Cornwall.

The concrete structure of the St. Lambert Lock near Montreal, which is the first lock of the Seaway from seaward, was completed by the end of 1957, and the Lower Beauharnois Lock at the head of Lake St. Louis during the early months of 1958. The other two Canadian locks-Côte Ste. Catherine near the Lachine Rapids and the Upper Beauharnois Lock-are scheduled for completion later in 1958. The completed Seaway will be open to navigation in the spring of 1959.

An event of interest in connection with the bridge-raising projects took place on Oct. 20, 1957. The 250 -foot trans-channel span of the Jacques Cartier Bridge, near Montreal, was raised to provide the required 120 -foot clearance over the Seaway channel. In the early hours of a Sunday morning, when traffic was light, hydraulic jacks moved the old span horizontally to falsework erected downstream and then moved the new span, resting on falsework upstream, into place. The work was completed in four hours.

[^284]At the height of the summer construction season in 1957, more than 6,000 men were employed on the Canadian navigation facilities and about 2,000 men on the United States navigation project. The two power bodies-The Hydro-Electric Power Commission of Ontario and the Power Authority of the State of New York-employed a work force of about 10,000 .

The estimated cost of the whole Seaway project is $\$ 1,025,000,000$, divided as follows: the St. Lawrence Seaway Authority, $\$ 285,000,000$; the St. Lawrence Seaway Development Corporation $\$ 140,000,000$; The Hydro-Electric Power Commission of Ontario, $\$ 300,000,000$; and the Power Authority, State of New York, $\$ 300,000,000$. By the end of 1957, the St. Lawrence Seaway Authority had awarded contracts valued at approximately $\$ 235,000,000$.

The Seaway is a self-liquidating project and costs of construction and operation are to be recovered from tolls on shipping. Tolls committees of both Canada and the United States are of the opinion that a composite toll system would present advantages for both the Seaway and its users. This system calls for two parallel tolls: a lower toll on net registered tonnage of each ship whether loaded or in ballast; and a higher toll based on the actual tonnage of cargo in each ship.

The Canadian and United States entities have come to the conclusion that ships having an over-all length of not over 730 feet and a beam of up to 75 feet can be accommodated in the Seaway, subject to the proviso that vessels exceeding 715 feet in length or 72 feet in beam should be classified in the category of vessels having characteristics which will subject them to appropriate scheduling and handling so as not to interfere with other traffic whenever the transit of such vessels is unduly delaying other shipping. They believe such an arrangement will be in the best interest of the Seaway and of its traffic.

## Section 2.-Financial Statistics of Waterways

The principal statistics available on the cost of facilities for water-borne traffic consist of the record of public expenditure on waterways. Such expenditure may be classified as capital expenditure, or investment and expenditure for maintenance and operation. Revenue from operation is also recorded. The major part of the capital expenditure for the permanent improvement of waterways is provided by the Federal Government. Capital expenditure by municipalities and private capital expenditure is confined almost entirely to terminal or dockage facilities. On the other hand, investment in shipping has come almost entirely from private sources. No figures are available regarding private investment in shipping except those appearing in the reports of the operating companies that cover only a portion of the field. There are no statistics showing the revenue of ship operators from passenger and freight traffic.

Capital Expenditure.-The only figures available of federal capital expenditure on Canadian waterways are those compiled from the Public Accounts and the annual reports of the Departments of Transport, Public Works and Finance. It must be realized that such expenditure cannot be regarded as any indication of the present worth of the undertakings represented. The cost of building canals and other waterways and permanent works to facilitate water transportation in Canada is represented in such reports at their original book values, no deductions having been made from the cumulative totals for depreciation from year to year or for abandonment of works that have been superseded such as, for instance, the first Welland Canals. To this extent such figures are an overstatement of the present value of the works in use. The figures are further limited by the fact that they do not include the cost of maintenance and improvements or the operation of these works, such charges having been made to the consolidated deficit account as annual expenditure and not to capital account. Table $\mathbf{2 3}$ shows that capita! expenditure on canals, marine services and miscellaneous water-transport facilities reached the grand total of $\$ 435,000,000$ by the end of March 1956 , but this must be interpreted
with the above qualifications in mind. In Table 24 the capital values of the fixed assets administered by the National Harbours Board are shown as at Dec. 31, 1955 and 1956, and are additional to the capital expenditure of Table 23. Figures in Table 24 reflect the capital situation in regard to the national harbours of Canada far better than do those of Table $\mathbf{2 3}$ for waterways and facilities, inasmuch as they include all buildings, machinery and durable plant improvements; they also have been subject to deductions for depreciation and the scrapping or abandonment of plant and therefore more nearly approach the present value of the properties under the administration of the National Harbours Board.

## 23.-Capital Expenditure of the Federal Government on Canals, Marine Services and Miscellaneous Water Transport Facilities as at Mar. 31, 1955 and 1956

Norg.-Compiled from annual reports of the Department of Transport and the Public Accounts.

## 24.-Capital Values of Fixed Assets administered by the National Harbours Board as at Dec. 31, 1955 and 1956

Nore.-Compiled from the annual reports of the National Harbours Board.

Waterway Expenditure and Revenue on Consolidated Fund Account.Expenditure under this heading (Tables 26 to 28) is mainly for the operation and maintenance of various facilities for water transport but, unfortunately, the line between operation and maintenance expenditure is not as finely drawn as is desirable. Revenue in connection with waterways of the Department of Transport and the Department of Public Works is shown in Table 29.

To facilitate water transportation, the Federal Government expends annually, in addition to the recurrent expenditure shown here, a considerable amount to cover deficits of the Canadian National (West Indies) Steamships Limited and of the National Harbours Board and for mail subsidies and steamship subventions as shown in Table 31. Operating expenditure and revenue of facilities administered by the National Harbours Board are shown separately in Table 30.

## PART V.-CIVIL AIR TRANSPORT*

## Section 1.-Administration and Development

Historical Developments.-Canads's aviation history dates back to 1909 when the Silver Dart, piloted by Jack McCurdy (Hon. J. A. D. McCurdy, former LieutenantGovernor of Nova Scotia), flew at Baddeck, N.S. This was the first aeroplane flight by a British subject in the British Empire.

There was little aviation development in Canada until World War I. Following the War, many of Canada's wartime aviators assisted in developing air transportation services into inaccessible areas, air forestry patrols and intercity air services. During this period the flying clubs movement received government assistance in the training of pilots and engineers required by Canada's civil aviation industry.

World War II was a period of intensive construction of airports and aerodromes to meet the requirements for training of airmen under the British Commonwealth Air Training Plan. At the end of the War, many Service-trained Canadian airmen turned to commercial flying and were absorbed by existing operating companies or helped to develop other flying services. Transatlantic air services were inaugurated by the Department of Transport during the War and were turned over to Trans-Canada Air Lines which had come into being by Act of Parliament in 1937 to provide for the development of a government-controlled transcontinental air service for regular scheduled operations. Canadian Pacific Air Lines was created by the amalgamation of small commercial operators for the servicing of Canada's northland. In 1949 the Canadian Pacific Air Lines was designated to provide transpacific services on behalf of Canada. Current operations of TCA and CPA are covered on pp. 870-871.

The Control of Civil Aviation.-The control of civil aviation in Canada is under the jurisdiction of the Federal Government and is administered under the authority of the Aeronautics Act 1919, and amendments thereto. The Aeronautics Act is in three parts. Broadly speaking, Part I deals with the technical side of civil aviation comprising matters of registration of aircraft, licensing of airmen, the establishment and maintenance of airports and facilities for air navigation, air traffic control, accident investigation and the safe operation of aircraft. This Part of the Act is administered by the Director of Civil Aviation under the supervision of the Director General of Air Services, Department of Transport. Part II of the Act deals with the social and economic aspects of commercial air services and assigns to the Air Transport Board certain regulatory functions of commercial air services (see p. 813). Part III deals with matters of government internal administration in connection with the Act.

Weather Services.-Weather services are provided by the Meteorological Branch of the Department of Transport to meet the increasing demands of aviation, agriculture, industry and the general public. The expanding weather services required by the Department of National Defence both in Canada and with Canadian Armed Forces abroad are a major responsibility of the Branch. In 1956 a Central Analysis Office was operated in Montreal together with 51 forecast offices across Canada and four in Europe. Forecast offices are linked by teletype, radio teletype and a national facsimile system. As of July 1, 1956, the Branch maintained 250 synoptic stations taking six-hourly observations, a

[^285]network of 31 radiosonde stations (including five in the extreme Arctic operated jointly with the United States) taking upper air soundings, 71 stations recording upper winds and 1,387 climatological stations. One ocean weather station taking weather observations every three hours in the Pacific, 1,000 miles west of Vancouver, is maintained under international agreement.

Air Industries and Transport Association.-Commercial flying schools that are members of the Air Industries and Transport Association numbered 35 at the end of 1955. During 1955 the number of students instructed and graduated as private pilots was 498 , the number graduated as commercial pilots was 109 , and the number of instructional hours flown was 40,900 .

Royal Canadian Flying Clubs.-At the end of 1955 there were 38 flying clubs connected with the Royal Canadian Flying Clubs Association. The total membership was 7,765 and the aircraft available for instructional purposes numbered 143. During the year 1,120 students were instructed and graduated as private pilots and 83 as commercial pilots. Instructional hours of flying totalled 82,596 .

International Air Agreements.-The position of Canada in the field of aviation as well as its geographical location makes imperative co-operation with other nations of the world engaged in international civil aviation. Canada took a major part in the original discussions that led to the establishment of the International Civil Aviation Organization (ICAO) which has headquarters at Montreal, Que. A special article on The International Civil Aviation Organization and Canada's Participation Therein appeared in the 1952-53 Year Book, pp. 820-827.

In recent years Canada has been a signatory to agreements concerning civil aviation with Australia, New Zealand, Belgium, Denmark, France, Ireland, Japan, Mexico, the Netherlands, Norway, Peru, Portugal, Sweden, the United Kingdom and the United States.

## Section 2.-Air Services

Air Transport Services.-These services are grouped into two broad classesScheduled Services and Non-scheduled Services. The first group provides regular point-to-point service on scheduled advertised routes and the second group includes:-
(1) Specific Point Services from a designated base to specific points on the basis of unit rates that may be undertaken as the traffic warrants and that are not on a time schedule;
(2) Chartered Services operated on the basis of the private chartering of an entire aircraft for a specific trip;
(3) Contract Air Services which operate on one or more specific contracts-these do not operate on a time schedule nor need the contractor take the entire space of the aircraft; and
(4) Specialty Air Services concerned with large-scale forestry and utility surveys according to some specific agreement.

Trans-Canada Air Lines.-During 1956, TCA flew 1,191,784,000 passenger-miles, carrying $2,072,912$ passengers. Ton-miles of air freight totalled 11,928,000, air express $2,548,000$, and mail $8,613,000$. In April 1955, TCA began operation of Viscount aircraft, being the first airline in North America to place turbine-propeller aircraft in service. Orders have been placed for four Douglas DC-8 jet airliners for use on long routes and 20 Vickers Vanguards, large propeller-turbine aircraft, for medium-range operations, the objective being an all-turbine powered fleet by 1961.

At the end of 1956, TCA employed 8,788 persons, had a fleet consisting of nine Super Constellations, 18 Viscounts, 21 North Stars and 24 DC-3's, flying 25,187 route-miles and serving more than 60 communities in Canada, as well as points in the United States, the British Isles, France, Germany, Bermuda and the Caribbean Islands.

${ }^{1}$ Express and excess baggage.
${ }^{2}$ Includes other revenue.
Canadian Pacific Air Lines Limited.-CPA operates scheduled domestic services over 9,354 route-miles. Overseas routes operate from Vancouver to Australia, New Zealand, Honolulu and Fiji on the South Pacific service; the North Pacific serves Tokyo and Hong Kong via the Great Circle route through the Aleutian Islands. In September 1955, CPA took over the Trans-Canada Air Lines Mexico Gity route and later extended the service to Lima in Peru and Buenos Aires in Argentina. In 1957, the Company launched a new air link between Toronto, Montreal, and Lisbon in Portugal. Flight frequency on CPA's polar route from Vancouver to Amsterdam, inaugurated in 1955, was increased to three a week. In 1956, CPA flew 272,718 revenue passengers a total of $252,645,211$ revenue passenger-miles. Revenue cargo amounted to $4,871,657$ ton-miles and mail to $2,863,878 \mathrm{lb}$.

Independent Air Lines.-In addition to Trans-Canada Air Lines and Canadian Pacific Air Lines Limited, there are four other domestic airlines licensed to operate scheduled services in Canada: Trans-Air Limited, Winnipeg, Man.; Maritime Central Airways Limited, Charlottetown, P.E.I.; Pacific Western Airlines Limited, Vancouver, B.C.; and Quebecair Incorporated, Rimouski, Que.

Licensed domestic air carriers operating in Canada held valid operating certificates at Dec. 31, 1956, covering 42 scheduled, 98 flying-training and 658 non-scheduled and specialty services. Non-scheduled services are operated by the majority of the independent airlines. These services provide effective access to sections of Canada that are inaccessible by other means of transportation and act as feeders to the scheduled airlines. They also provide specialty services such as recreational flying, aerial photography and surveying, aerial pest control and aerial advertising.

Commonwealth and Foreign Scheduled Commercial Air Services.-At the end of December 1957, there were 16, Commonwealth and foreign air carriers holding valid Canadian operating certificates and licences covering international scheduled commercial air services operating into Canada, as follows:-

Air France (Compagnie Nationale Air France) operates between points in Metropolitan France and Montreal, Que., Canada, direct or via Shannon, Ireland; Keflavik, Iceland; or the Azores and Gander, Nfld., Canada; and New York, N.Y., and Chicago, III., U.S.A.

American Airlines, Inc., operates between Toronto, Ont., Canada, and New York, N.Y./ Newark, N. J., U.S.A., direct or via Buffalo, N.Y., U.S.A.

British Overseas Airways Corp., operates between London, England, Gander, Nfld., and Montreal, Que., Canada; and Detroit, Mich., U.S.A.; and between London, England, Montreal, Que., Canada, and Nassau, Bahamas; and between London, England, Gander, Nfld., and Bermuda.
Eastern Air Lines, Inc. operates between the terminals Ottawa, Ont., Canada, and Montreal, Que., Canada, and New York, N.Y., U.S.A., direct or via Burlington, Vt., U.S.A.; and between the terminals Ottawa, Ont., and Montreal, Que., Canada, and Washington, D.C., U.S.A., direct or via Massena/Syracuse, N.Y., U.S.A.

KLM Royal Dutch Airlines operates between the terminals Amsterdam, The Netherlands, and Montreal, Que., Canada; and between the terminals Montreal, Que., Canada, and Willemstad, Curaçao, Netherlands Antilles.

Lufthansa German Airlines operates between points abroad and Montreal, Que., Canada, and Chicago, Ill., U.S.A.
Northeast Airlines, Inc. operates between Montreal, Que., Canada, and Boston, Mass., U.S.A., via Burlington, Vt., Montpelier-Barre, Vt., White River Junction, Vt., (Lebanon Airport, N.H.), and Concord, N.H., U.S.A.

Northwest Airlines, Inc. operates between Winnipeg, Man., Canada, and Fargo, N.D., U.S.A., and between Minneapolis/St. Paul, Minn., U.S.A., Edmonton, Alta., Canada, Anchorage, Alaska, and beyond.
Pan American World Airways Inc. operates between Seattle, Wash., U.S.A., and Fairbanks, Alaska, with points of call at Juneau and Annette Island, Alaska, and Whitehorse, Y.T., Canada, and between the U.S.A., Gander, Nfld., Canada, and Europe.
Qantas Empire Airways Ltd. operates between Sydney, Australia, San Francisco, Cal., U.S.A., and Vancouver, B.C., Canada.
Sabena Belgian World Airlines operates between Brussels, Belgium, and New York, N.Y., U.S.A., via Shannon, Ireland, and Montreal, Que., Canada.

Scandinavian Airlines System operates between Stockholm, Sweden, Oslo, Norway, Copenhagen, Denmark, Prestwick, Scotland, Gander, Nfld., Canada, and New York, N.Y., U.S.A.

Seaboard and Western Airlines, Inc. operates between points in the United States, Gander, Nfld., Canada, and beyond.
TWA (Trans-World Airlines, Inc.) operates between points in the United States, Gander, Nfld., Canada, and points abroad.
United Air Lines, Inc. operates between Vancouver, B.C., Canada, and Seattle, Wash., U.S.A., via Bellingham, Wash., U.S.A.
Western Air Lines, Inc. operates between Great Falls, Mont., U.S.A., Cut Bank, Mont., U.S.A., and Lethbridge, Alta., and Edmonton, Alta., Canada, via Calgary and Penhold, Alta., Canada.

## Section 3．－Civil Aviation Statistics

Ground Facilities．－Aircraft landing areas in Canada are classified in Table 3 by administrative agency．Instrument Landing Systems（ILS），designed to facilitate safe landings under low visibility conditions，have been installed at 20 airports and nine of them are regular ports of call for international commercial air services．

## 3．－Aerodromes by Province as at July 31， 1957

#### Abstract

Notr．－An aerodrome is defined by the Air Regulations 1951 as：a defined area on land or water（including any buildings，installations and equipment）intended to be used wholly or in part for the arrival，departure，movement and servicing of aircraft．This table was compiled by the Aeronautical Charts Section，Department of Mines and Technical Surveys．The aerodromes included are in usable condition．

Air Traffic Control.-The primary functions of Air Traffic Control Service of the Department of Transport are to expedite and maintain an orderly flow of air traffic and to prevent collision between aircraft operating within controlled airspace and between aircraft and obstructions on the movement area of controlled airports. This is accomplished through airport control, approach control and area control services, together with flight information, alerting for search and rescue, customs notification and aircraft identification. These services are described as follows:-

Airport Control is designed particularly to provide air-traffic control service in the vicinity of major civil airports where the volume and type of aircraft operations, together with weather conditions and other factors, indicate its need in the interest of safety. The service includes the control of pedestrians and vehicles on the manceuvring area of the airport. Control is effected by means of direct radiotelephone communication or visual signals to aircraft and surface vehicles on and in the vicinity of controlled airports. The control towers are located at Patricia Bay, Port Hardy and Vancouver, B.C.; Lethbridge, Calgary and Edmonton, Alta.; Saskatoon and Regina, Sask.; Winnipeg, Man.; the Lakehead, Windsor, London, Toronto, Toronto Island, Ottawa and North Bay, Ont.; Montreal, Cartierville, Quebec, Val d'Or, Mont Joli and Sept-Ales, Que.; Moncton and Saint John N.B.; Sydney, N.S.; and Gander, Nfld. Most of these control towers are in continuous operation but a few provide 16 -hour daily service only.
Approach Control is provided by the North Bay and Ottawa approach control towers. This service is in addition to the regular airport control service provided at these locations. Approach control service consists of the provision of standard IFR separation to aircraft operating in accordance with the Instrument Flight Rules within the local approach control area of the airport.
Area Control is designed particularly to provide air-traffic control service to aircraft operating within controlled airspace during weather conditions which prevent a pilot from seeing other aircraft or obstructions and necessitate his reliance on instruments to conduct the flight. Area control centres are located at Vancouver, B.C.; Edmonton, Alta.; Winnipeg, Man.; Toronto, Ont.; Montreal, Que.; Moncton, N.B.; and Goose and Gander, Nfld. Each centre is connected with the control towers, radio range stations and operations offices within its area by means of an extensive system of local and long-line interphone or radio circuits and through the radio communication facilities available at these offices to all aircraft requiring area control service. Each area control centre is similarly connected with the adjacent centres, including centres in the United States, for the purpose of co-ordinating the control of aircraft operating through more than one control area. This communications system permits each centre to maintain a continuous detailed record of the movements of all aircraft operating in accordance with the Instrument Flight Rules, and a general record of the movements of all aircraft operating in accordance with the Visual Flight Rules within its control area. In addition to providing area control service to aircraft operating within the controlled airspace over Newfoundland, the Gander area control centre provides this service within the airspace over approximately one-half of the North Atlantic Ocean. Area control service is provided for approximately 15,000 miles of airways, air routes and control channels.
Flight Information provides advice and information useful for the safe and efficient conduct of flight, including weather reports and forecasts, field condition reports, data concerning aids to navigation, traffic information, refuelling and transportation facilities and other related data of assistance to the pilot in planning or conducting a flight. Such service is provided by all air-traffic control units but particularly by the seven area control centresone to a region.
Alerting for Search and Rescue is designed to ensure that the appropriate organizations are notified of aircraft in need of search and rescue aid and otherwise to assist such organizations, as required. Area control centres are responsible for notifying these organizations promptly of non-arrival at destination of any aircrait for which a flight plan or flight notification has been received. This requires the maintenance and constant supervision of a continuous record of active flights to ensure that non-arrival of any aircraft is detected immediately. The service is available to any pilot who files either a flight plan or a flight notification with any communications agency of the Air Services of this Department or directly with one of the area control centres or control towers.
Customs Notification Service facilitates the routine notification of the appropriate customs agency by pilots who plan to cross the Canada-United States boundary. The Air-Traffic Control communications system and units connected therewith forward pilot requests to notify the customs officer at the airport of destination.
Aircraft Identification Service is provided by area control centres to assist the Department of National Defence in establishing the identification of all aircraft operating within specified areas.

The number of controlled operations in Canada during 1957 was $2,838,066$, an increase of 27 p.c. over 1956.

Summary of Operation Statistics.-The statistics given in Table 4 show the steady increase in recent years in passenger, freight and mail traffic.

## 4.-Summary Statistics of Civil Aviation 1953-56

Nors.-Figures shown in this table include operations of Canadian international carriers and Canadian operations of foreign carriers. Figures published in previous editions of the Year Book covered domestic carriers only.

Table 5 shows civil aviation figures for 1956 by type of service. A definition of scheduled and non-scheduled carriers is given on p. 870. Statistics for international carriers include traffic over Canadian territory for both Canadian and foreign operators; a small traffic across Canadian territory and between foreign stations is also included.
5.-Summary Statistics of Civil Aviation by Type of Service 1956

## PART VI.-OIL AND GAS PIPELINES*

A special article covering the history and development of pipeline construction in Canada appears in the 1954 Year Book at pp. 861-869. Additional information has been carried in each succeeding edition and the following Section brings pipeline development up to mid-1957.

## Section 1.-Pipeline Developments

Oil Pipelines.-Most of the crude oil in Canada, both domestically produced and imported, is carried through a network of pipelines connecting batteries, refineries and ports. This transportation system has grown rapidly in recent years and, at the end of 1956, totalled 7,321 miles exclusive of the miles of loops installed parallel to the original line to increase throughput capacity. Most of this system of pipelines ( 5,807 miles) is in Canada and the remainder is in the United States where it is used to transport Canadian crude oil exclusively.

The two principal components of the system are the trunk pipelines of Interprovincial Pipe Line Company and Trans Mountain Oil Pipe Line Company, both originating in Edmonton, Alta. The Edmonton pipeline terminal is served by six feeder lines bringing in crude oil from the surrounding fields: Britamoil Pipe Line Company Limited, Pembina Pipe Line Limited, Imperial Pipeline Company Limited, Edmonton Pipeline Company Limited, Interprovincial Pipe Line Company, and Texaco Exploration Company.

Interprovincial Pipeline.-Interprovincial pipeline stretches 1,765 miles from Edmonton to Sarnia in Ontario, gathering crude from the three Prairie Provinces and making deliveries along the line. During 1957 the line was being extended 156 miles to Toronto. Saskatchewan oil is accepted from two pipeline companies-Mid-Saskatchewan Pipe Lines Limited at Ermine, and South Saskatchewan Pipe Line Company at Regina. Deliveries are made by Interprovincial to two other systems-B.A. Saskatchewan Pipe Line Limited at Stony Beach and Saskatoon Pipe Line Company at Milden-and also to

[^287]refineries in Regina. Crude oil from the new fields of southeastern Saskatchewan is delivered by Westspur Pipeline Company, connecting with the Interprovincial line at Cromer, Man., where the Trans-Prairie Pipeline Limited system, serving the Manitoba fields, also connects. Deliveries in Manitoba are made to Brandon and to Winnipeg Pipeline Company at Gretna. In the United States, Interprovincial serves a connecting pipeline to St. Paul, Minn., and makes deliveries at Wrenshall, Minn.; Superior, Wis.; and West Branch, Midland and Bay City, Mich.

Sixty-seven miles of 24 -inch loop and 52 miles of 26 -inch loop were constructed in 1956, providing a two-line system from Regina to Clearbrook, Minn. Pumping capacity was increased and additional storage tanks were erected at Cromer. Construction was started on a second pump station at Indian River, Mich.

Capacities of the line, in barrels per day, between selected points at the end of 1956 were: Edmonton to Regina, 217,000; Regina to Cromer, 193,000; Cromer to Gretna, 241,000; Gretna to Superior, 212,000; and Superior to Sarnia, 147,000. Gross deliveries to regions served by the pipeline were: Western Canada, $33,700,000 \mathrm{bbl}$.; U.S. refineries, $16,900,000 \mathrm{bbl}$.; tankers out of Superior, $5,600,000 \mathrm{bbl}$.; and Eastern Canada, 40,500,000 bbl. Tariff charges from Edmonton to Regina, Gretna, Superior, and Sarnia were 23 $\frac{1}{2}, 36$, 44 and 64 cents per bbl., respectively. From Cromer to Sarnia the rate was 48 cents per bbl.

Trans Mountain Pipeline.-This line serves the area westward from Edmonton. In addition to taking oil from the six feeder lines at Edmonton, it is linked at Edson, Alta., with a pipeline bringing crude from the Sturgeon Lake area in Alberta. No deliveries are made in Alberta but all crude transported comes from that province. Deliveries are made to refineries at Kamloops and Vancouver in British Columbia, and Ferndale and Anacortes in Washington State. Deliveries may be made to tankers at a marine loading dock at Vancouver.

During 1956 construction started on two permanent pump stations at Jasper and Gainford, Alta., but by mid-1956 it was necessary to install two temporary units to meet demands for crude oil, and the capacity of the line was increased from 150,000 to 185,000 bbl. a day. In November the temporary pump station at Jasper was destroyed by fire, causing a reduction in capacity, but a permanent station was completed at that point early in 1957 again bringing the line's capacity to at least $185,000 \mathrm{bbl}$. a day. The capacity of the Washington State line was increased to $200,000 \mathrm{bbl}$. a day by construction of a pump station at Laurel.

Total deliveries for 1956 were $47,251,641 \mathrm{bbl}$., of which 46.1 p.c. was delivered to Canadian refineries, 40.7 p.c. to Washington State refineries and 13.2 p.c. constituted offishore shipments. This was the first year crude oil was shipped by sea from Trans Mountain pipeline and, during the year, 53 tankers were loaded at Vancouver. Tariff charges from Edmonton or Edson to Kamloops, Vancouver, Ferndale and Anacortes were $43,45,47$ and 47 cents per bbl. The marine loading charge at Vancouver was $2 \frac{1}{2}$ cents per bbl.

Other Oil Pipelines.-The addition during 1956 of 728 miles of operational oil pipeline reflected the continuing growth of the oil pipeline industry. Pembina Pipe Line Limited installed 153 miles of line to serve the expanding Pembina field in Alberta. Construction on the main pump station was completed and throughput during the year was about $32,120,000$ bbl. Peace River Pipe Line Company Limited completed 107 miles of trunk line and 37 miles of gathering lines which connect Sturgeon Lake, Sturgeon Lake South and Little Smoky fields in Alberta with the Trans Mountain line at Edson. Deliveries began in March and throughput totalled $1,824,000$ bbl. in 1956. Cremona Pipelines Limited constructed a trunk line to Calgary from the Sundre field 65 miles northwest of the city. The line will also carry crude to Calgary from the Westward Ho, Harmattan, and Elkton fields in Alberta. Britamoil Pipeline Company Limited, formerly Canadian Gulf Pipe Line Company, extended its system 35 miles south from the Fenn-Big Valley field to West Drumheller. Rangeland Pipe Line Company Limited constructed a 50-mile
gathering line and a 10 -mile trunk line from the West Joffre, Bentley, Gilby and West Gilby fields in Alberta to Rimbey, Alta., where the system connects with the Texaco Exploration Company pipeline to Edmonton.

In southwestern Saskatchewan, South Saskatchewan Pipe Line Company installed 59 miles of main line connecting the Dollard, Leon Lake, Instow, Bone Creek, Gull Lake and North Premier fields with the Company's existing trunk line in the Cantuar field. The line is capable of delivering $28,000 \mathrm{bbl}$. a day to the Interprovincial system at Regina. A new line to serve the fields in southeastern Saskatchewan was completed in July 1956 by Westspur Pipe Line Company. In the last six months of the year, a total of $3,928,330 \mathrm{bbl}$. of crude oil from the Midale, Steelman, Frobisher, Alida, Kingsford, Nottingham, Ingoldsby, Rosebank and Edenvale fields was carried to the Interprovincial receiving station at Cromer in Manitoba. In December, Trans-Prairie Pipelines Limited completed a 25 -mile pipeline which connects with the Westspur line in the Midale field and carries crude from the fields of Weyburn and Halbrite.

Sarnia Products Pipe Line, a division of Imperial Oil Limited and one of three products pipelines in Ontario, constructed 38.5 miles of 12 -inch loop between Waterdown and North Toronto and added pumping units at its three pump stations increasing capacity to 76,000 bbl. a day. Trans-Northern Pipe Line Company Limited increased throughput capacity of its Montreal-Toronto-Hamilton line from 50,000 to $65,000 \mathrm{bbl}$. a day.

Natural Gas Pipelines.-During 1956, Westcoast Transmission Company Limited and Trans-Canada Pipe Lines Limited began construction on lines that will deliver Alberta natural gas to Western and Eastern Canada, respectively. These were the most important developments in the pipeline industry in that year.

Westcoast Transmission Pipeline.-By the end of 1956, Westcoast Transmission had completed about 70 p.c. of the 650 miles of 30 -inch main line from Taylor in northeastern British Columbia to Vancouver and the United States border near Huntingdon, B.C. The line will have an initial design capacity of $400,000,000 \mathrm{cu}$. feet of gas a day, threequarters of which is destined to serve the northwest region of the United States through the Pacific Northwest Pipeline Corporation. In anticipation of deliveries of Canadian natural gas by Westcoast, British Columbia Electric Company converted the manufactured gas system in the Vancouver area to natural gas, enlarged it and began taking United States gas from a short Westcoast Transmission line connected with Pacific Northwest's system. When the Westcoast line is completed, B.C. Electric will receive domestically produced natural gas and the flow from the United States will be reversed. A second company, Inland Natural Gas Company Limited, was granted permission to construct a gas transportation system to serve the Okanagan Valley, West Kootenay and Cariboo regions in British Columbia with gas from Westcoast's line.

Westcoast has signed 20-year purchase contracts with producers in the Peace River area covering supplies of $450,000,000 \mathrm{cu}$. feet a day. The basic price to producers for the first five years, commencing Jan. 1, 1958, will be 10 cents per M cu. feet escalating $\frac{?}{4}$ cent per year to a maximum of $12 \frac{1}{2}$ cents per M cu. feet. The price to B.C. Electric and Inland Natural Gas, after the initial build-up period will be $30 \frac{1}{2}$ cents per $M$ at 100 p.c. load factor. Sales to Pacific Northwest Pipeline, when the volume reaches $400,000,000$ cu . feet daily, will be at the rate of 22 cents per M cu . feet under terms of an initial contract at 90 p.c. load factor and 25 cents at 90 p.c. load factor, under a second contract which provides for additional deliveries by 1959.

Trans-Canada Pipeline.-Trans-Canada Pipe Lines Limited in 1956 began construction of a 2,294-mile pipeline from near Burstall, Sask., to Montreal, Que., with a spur line to Ottawa. Construction did not commence until June, after the Company in the steel industry in the United States and the resultant slow delivery, only 230 miles of 34 -inch pipe had been laid by the time winter halted construction. To supply gas to Trans-Canada, Alberta Gas Trunk Line Limited constructed 34 miles of line to join the

Bindloss field about 60 miles north of Medicine Hat to the Trans-Canada intake terminal. Alberta Gas Trunk will construct and operate all feeder lines within Alberta that supply the Trans-Canada line.

During 1956, Trans-Canada signed gas sales contracts with five large distributors: Winnipeg and Central Gas Company, Northern Ontario Natural Gas Company, Consumers' Gas Company of Toronto, Union Gas Company of Canada, and Quebec Natural Gas Company.

Other Natural Gas Pipelines.-In Alberta, North Canadian Oils Limited completed a 136-mile 10 -inch line to Hinton from the Wabamun gas terminal 40 miles west of Edmonton. Maximum capacity will be $70,000,000 \mathrm{cu}$. feet a day. South Alberta Pipe Lines Limited completed a 46-mile pipeline from the Etzikom gas field to Medicine Hat to serve a chemical plant there. Canadian Western Natural Gas Company extended its system by 111 miles to include four communities in the Lethbridge area and seven communities in the Calgary area.

The Saskatchewan Power Corporation constructed a transmission line from the Swift Current area to Moose Jaw and extended its northern distribution system to North Battleford and to Humboldt, including several towns en route. The Corporation laid 435 miles of pipe in 1956.

In southwestern Ontario, Consumers' Gas Company of Toronto, Union Gas Company of Canada Limited, Dominion Natural Gas Company and several smaller utilities extended their systems during 1956 in preparation for more adequate supplies of natural gas when the Trans-Canada pipeline from Alberta is completed. In all, 436 miles of gathering, transmission and distribution lines were constructed in Ontario and placed in operation.

## Section 2.-Oil Pipeline Statistics*

There were 32 oil pipelines operating in Canada at Dec. 31, 1956, with a total milage of 6,051 compared to 5,079 at the end of 1955. Pipeline deliveries shown in Table 1 were made to non-pipeline carriers, foreign pipelines, and terminals including refineries and distributing centres. Prior to 1950, deliveries were small and comparable statistics are not available mainly because the major pipelines were not in operation. Net gatheringsystem deliveries in Alberta fell sharply after the opening of the interprovincial system in 1950 because the new trunk line carried most of the oil formerly moved eastward by railway tank cars.

During 1956 operating revenues of all oil pipelines except Amurex Oil Development Company, Anglo American Exploration Company, Green River Exploration Company, Mobil Oil of Canada Limited, and Sarnia Products Line totalled \$78,316,555 compared with $\$ 58,952,816$ in 1955.

## PART II.-WIRE COMMUNICATIONS*

## Section 1.-Telegraphs

The early history of telegraphic communication in Canada is given in the 1934-35 Year Book, p. 778.

Telegraph Systems.-At the end of 1956, the 11 telegraph and cable companies in Canada showed impressive gains over the preceding year. These systems, composed of lines owned by the Federal Government and the chartered railway and telegraph companies, increased their property and equipment to $\$ 150,000,000$, about 20.6 p.c. above that reported by 10 companies in 1955.

New records were set in 1956 for operating revenues of $\$ 40,720,000$, up 3.6 p.c. from 1955 , and net earnings of $\$ 6,784,000$, which gained almost 10 p.c. Telegrams and cables rose above 1955 totals but failed to exceed previous records. In proportion to population, Canadian facilities are among the most extensive in the world and the relative systems, with 442,900 miles of wire, operate under a great variety of climatic and geographic difficulties.

## 1.-Summary Statistics of Canadian Telegraphs 1947-56

Nots.-Figures from 1920 are given in the corresponding table of previous Year Books beginning with the 1938 edition.

${ }^{1}$ Excludes commission operators. $\quad{ }^{2}$ Includes messages to and from vessels on the Great Lakes and the St. Lawrence River and messages to and from stations. $\quad{ }_{3}$ Excludes relayed messages and includes paid wireless messages to and from ships in the Gulf of St. Lawrence and on the Atlantic Ocean.

Submarine Cables.-Four cable companies operate submarine cables landing in Canada: Canadian Overseas Telecommunication Corporation; the Commercial Cable Company; the Western Union Telegraph Company; and the French Telegraph Cable Company. These companies operate to stations in the United Kingdom, Ireland, the United States, Bermuda, Australia, New Zealand, and St. Pierre and Miquelon Islands. The number of cables operating between connected stations and the length of cables are given in the following table.

[^290]
## 2.-Cable Landings in Canada 1956

${ }^{1}$ Telephone cable in service since Sept. $25,1956$.

## Section 2.-Telephones

The tremendous growth of Canadian telephone systems since the War has been matched by their technological development. Automation in the Canadian telephone industry began on a large scale about thirty years ago with the introduction of dial telephones and step-by-step equipment for automatic completion of local calls. About 77 p.c. of all telephones in Canada are now served by this method and the proportion is increasing steadily. Crossbar, a type of automatic switching equipment faster and more flexible than step-by-step, is being introduced in several Ontario and Quebec communities with heavy calling volumes. The same basic type of crossbar switching, employed in the regional long-distance offices at Toronto and Montreal, enables operators to dial calls directly to telephones in many distant cities across the Continent. This system will be extended to most major centres in Canada and the United States, and the addition of automatic call accounting machines will make it possible for customers themselves to dial a large percentage of long-distance calls.

These developments in the automatic switching of long-distance calls are accompanied by advances in the provision of transmission channels on a trans-Canada basis. The first inter-system microwave radio relay chain, between Toronto and Winnipeg, was completed in 1956 by The Bell Telephone Company of Canada and the Manitoba Telephone System. Extensions eastward and westward, with Bell's existing Ontario-Quebec chain as a nucleus, will provide coast-to-coast microwave facilities for telephone and television purposes by mid-1958.

Long-distance services make possible the interconnection of practically any telephone across the country with any other, or with any of the $60,000,000$ telephones in the United States. Connections are also available with more than 100 other countries and territories, Within Canada, long-distance service is provided by the separate systems and, on a nationwide scale, by seven major systems which constitute the Trans-Canada Telephone System.

Canadian manufacturing companies produce the greater part of the telephone equipment and materials used in this country. Dependable high quality is maintained and desired uniformity is made possible in operating and maintenance practices across the country.

Telephone Systems.-Telephone systems operating in Canada in 1956 numbered 2,661 as compared with 2,739 in 1955 . There was a drop in both the number of small co-operative systems in rural districts and the number of shareholder-owned companies, the former decreasing to 2,172 from 2,214 and the latter to 349 from 373. The largest of the stock companics were The Bell Telephone Company of Canada, operating in Ontario and Quebec with 61 p.c. of all the telephones in Canada, and the British Columbia Telephone Company with 9 p.c. of the total. Four private companies served the Atlantic Provinces, and three systems operated by the respective provincial governments served the Prairie Provinces.

Telephone Equipment.-Because of the insistent demand for increased telephone service, the number of telephones in use in Canada has more than doubled in the past ten years. At Dec. 31, 1956, there were 4,499,325 telephones in service compared with $4,151,678$ in 1955 and 2,230597 in 1947. During 1956 a total of 347,647 telephones were installed, over 56,000 above the previous high in 1955 when installations numbered 291,409 . The number of residential telephones and the number of business telephones each rose by 9 p.c. in 1956. Rural telephones were up 6 p.c. and pay telephones 4 p.c. Several exchanges were converted to dial operation in 1956 and by the end of the year 77 p.c. of all telephones in Canada were dial-operated as compared with 74 p.c. in 1955. Pole-line milage and wire milage continue to increase year after year.

## 3.-Milages of Pole-Iine and Wire and Number of Telephones in Use 1947-56

Nors.-Figures from 1911 are given in the corresponding table of previous Year Books beginning with the 1938 edition.

| Year | Systems | Pole-Line Milage ${ }^{1}$ | Milage of Wire | Telephones in Use |  |  |  |  |  |

| 1956. | 2,661 | 269,303 | 16,410,897 | 1,229,150 | 2,625,787 | 584,484 | 59,904 | 4,499,325 |  |

[^291]The density of telephones in the different provinces is influenced by the urbanization of the population-the number of telephones used for business purposes is much greater in cities and towns than in rural areas.

${ }^{1}$ Ontario four-party telephones included under Rural Lines.
Telephone Calls.-The major telephone systems make counts of completed calls on representative days throughout the year and on this basis estimate the number of local conversations which, added to the actual count of long-distance calls, give their total volume of business. Estimates are included for the small systems which do not count completed calls. The number of completed calls on all systems in 1956 was estimated at $7,764,805,000$ compared with $6,961,476,000$ calls in 1955 , or an average of 1,726 calls per telephone and 483 calls per person compared with 1,677 calls per telephone and 446 per person in 1955.

Extended area service which eliminates toll charges between adjacent communities was introduced in more centres across Canada but, despite this service, long-distance calls increased by $15,326,000$ from 1954 to 1955 and by $18,193,000$ from 1955 to 1956.
5.-Local and Long-Distance Calls and Average Calls per Telephone and per Capita 1947-56

Nors.-Figures from 1928 will be found in the corresponding tables of previous Year Books beginning with the 1939 edition.

| Year | Local Calls | Long. Distance Calls | Total Calls | Total Calls per Capital | Average Calls per Telephone |  |  |

| 1956. | 7,593,525,000 | 171,280,000 | 7,764,805,000 | 483 | 1,688 | 38.0 | 1,726 |

${ }^{1}$ Per capita figures are based on official estimates of population given at p. 119.
Finances, Employees and Earnings.-The steady increases in capitalization, revenue and expenditure of telephone companies together with the increases in number of employees and salaries and wages paid are shown for the years 1947-56 in Table 6. Provincial figures for 1955 and 1956 are given in Table 7.

${ }^{1}$ Statistics of The Bell Telephone Company for both Quebec and Ontario are included under Quebec. ${ }^{2}$ Excludes wages and employees for rural systems.

## Section 3.-Federal Government Telegraph and Telephone Service

There are some scattered settlements throughout Canada where commercial telephone and telegraph companies do not furnish service, yet where adequate communication must be provided in the public interest. The Federal Government, therefore, through the Minister of Transport, has assumed responsibility for such services as: telegraph and telephone connections to scattered settlements on Cape Breton Island; cable services to islands in the Bay of Fundy and Prince Edward Island; certain telegraph lines and a telephone service in the Peace River district of Alberta; and a telephone service on the Magdalen Islands and in other areas of the Province of Quebec.

At Dec. 31, 1956, the telegraph and telephone service comprised 1,745 miles of pole line, 3,244 miles of open wire, 30 miles of aerial cable, 95 miles of submarine cable, and eight radio stations. It provided telephone service for 1,732 subscribers with telephones, of whom 444 were served through lines connected to other company exchanges. There were 89,064 telegraph messages handled by this service in 1956, operating expenses were $\$ 444,871$ and net revenues $\$ 129,817$.

The Northwest Communication System is operated for the Government by the Canadian National Telegraphs. It extends northwesterly from Edmonton to the YukonAlaska border and comprises 1,859 miles of pole line, 71,550 circuit-miles for telegraph purposes and 35,354 circuit-miles for telephone connections. The System provides commercial telephone and telegraph services at airports, settlements and communities in
northwest Canada, including Whitehorse, Y.T., and Dawson Creek and Fort St. John, B.C. During 1956, 130,669 telephone calls and 80,781 telegraph messages were handied, revenue amounted to $\$ 2,410,402$ and expenditure for operating and maintaining the System was $\$ 1,893,862$.

## PART III.-RADIO COMMUNICATIONS*

## Section 1.-Federal Radio Communication Services

The administration and regulation of radio communication in Canada is carried out by the Telecommunications Branch of the Department of Transport. The radio activities of the Branch may be summarized as follows: (1) the administration of national and international radio laws and regulations and of regional agreements, involving the issuance of radio licences, inspection of radio stations, certification of radio equipment, examination of operators, allocation and monitoring of frequencies, study of radio wave propagation, compilation and settling of international accounts for radio messages, investigation and suppression of inductive interference to radio reception; and (2) construction, maintenance and operation of radio communication stations and radio aids to marine and air navigation. (See also pp. 894-896.)

National and international radio laws and regulations include: the Canadian Broadcasting Act, the Radio Act and Regulations made thereunder; the International Telecommunication Convention and Radio Regulations annexed thereto; the Inter-American Radiocommunications Convention; the Inter-American Arrangement Concerning Radiocommunications; the North American Regional Broadcasting Agreement; those Articles of the International Civil Aviation Convention applicable to aeronautical radio requirements; the Canada Shipping Act and Radio Regulations for Ship Stations issued thereunder, and that part of the International Convention for the Safety of Life at Sea applicable to radio requirements for ships.

Licensing and Operation.-In all branches of radio, basic control is exercised over the right to establish a station, assignment of frequencies, operator standards, operating procedure, and general regulations concerning the manner in which radio stations are used.

Under the Broadcasting Act reasonably complete and technically acceptable applications for licences to establish broadcasting stations, or for modification of existing stations, are referred to the Canadian Broadcasting Corporation for its recommendations to the Minister of Transport before being finally dealt with by the Department of Transport. The Canadian Broadcasting Corporation also controls the linking-up of stations that form networks and, in addition, the character of programs being broadcast. With these exceptions, the control of broadcasting stations is carried out by the Telecommunications Branch of the Department of Transport.

The standard broadcast band is crowded with stations that are capable of interfering with one another over the entire North American region, particularly at night. A plan for the accommodation of the largest number of stations with the least interference was evolved as a result of extensive studies conducted by Canada, Cuba, the Dominican Republic, Haiti, the Bahama Islands, Mexico, and the United States and was embodied in the North American Regional Broadcasting Agreement.

Before a new standard broadcasting station can be licensed or before modifications can be made in an existing station, engineering briefs covering the selection or change of frequency, amount of power and design of the directional antenna system must be approved by the Department of Transport and notification sent to the signatory countries of the North American Regional Broadcasting Agreement. After the establishment or change is completed, proof of performance must be submitted to establish that the actual installation is in accordance with the approved plan.

[^292]The allocation of high frequencies and their efficient utilization requires reasonably accurate information on the transmission properties of the ionosphere which vary with the season, the sunspot cycle and other factors. This information is obtained from hourly measurements of the ionosphere made at some 70 points throughout the world and analyzed and correlated by the Radio Physics Laboratory, Defence Research Board, Ottawa, and by the United States Bureau of Standards at Washington, D.C. The Canadian measurement stations are located at St John's, Nfid.; Resolute Bay, Cornwallis Island and Baker Lake, N.W.T.; Fort Chimo, Que.; Churchill and Headingly, Man.; Ottawa, Ont.; and Prince Rupert, B.C. Eight frequency monitoring stations are maintained at suitable points across Canada to check operating frequencies of all classes of radio stations to ensure that they do not depart from the assigned frequency by an amount greater than that permitted by the international conventions.

Under the Safety of Life at Sea Convention and the Canada Shipping Act, most passenger ships and larger cargo ships must be fitted with radiotelegraph or radiotelephone equipment, primarily for distress use. Approval is given for each make and model of equipment that comes up to the required standard and, in addition, the ship station as a whole is inspected before the licence is issued and periodically thereafter. Foreign ships are subject to inspection before sailing from Canadian ports to ensure that they conform with the requirements of the Safety of Life at Sea Convention. Also, certain passenger, cargo, and other ships plying the Great Lakes are inspected to ensure compliance with the requirements of the Agreement between Canada and the United States for the Promotion of Safety on the Great Lakes by means of Radio.

Standards have been developed for the installation of aircraft radio stations specifying in detail the techniques and materials that may be used, to ensure that such stations will satisfactorily perform the function for which they are intended. Rigid standards are also in effect for the environmental testing of individual units of aircraft radio equipment, and approval is given to manufacturers for each model of equipment which has been demonstrated to meet the requirements. Inspections of radio stations aboard civil aircraft of all operational categories are carried out at prescribed periods. In-flight inspections of the radio communications and navigational aspects of proposed new air carrier operations, encompassing both land and oceanic routes, are also made as required.

Marine and aeronautical radio operator standards and related regulations are covered by international agreement. The International Telecommunication Convention prescribes the qualifications for radio operators on mobile stations and the Radio Act provides that all operators, both commercial and amateur, must pass examinations to prove their ability to operate the respective classes of stations on which they are engaged. Competent operators are required on all classes of stations in order that the technical requirements prescribed under international agreement be adhered to closely; they are particularly essential on ship and aircraft stations in the interests of safety of life.

Investigation and Suppression of Inductive Interference.-Under the Radio Act the use of electrical equipment that will produce harmful interference to broadcast reception is not permitted. The Telecommunications Branch of the Department of Transport maintains 60 cars equipped for measuring and locating sources of interference to broadcast reception. In addition to locating the sources of interference, advice is given as to how it may be suppressed or eliminated. These cars operate from the permanent radio inspection offices located in 27 cities throughout Canada. During the year 1956, 11,355 sources of interference were located and suppression was obtained in all but a few cases. Power lines were the largest single source of interference, constituting 37 p.c. of the total. Apart from cases of actual interference, the Branch also gives technical advice and assistance to manufacturers of electrical apparatus, in reducing to acceptable levels the radio noise (interference) produced by such apparatus.

Industrial, scientific and medical apparatus is brought under strict control in accordance with Regulations for Controlling Radio Interference and under the authority of the Radio Act. Regulations require that radiation from such apparatus, which is liable
to cause interference to radio communications, must be suppressed either by shielding or by replacing the apparatus with a non-interfering type. The Department of Transport conducts type tests on diathermy and industrial heating apparatus submitted by manufacturers, and the types that fulfil the requirements of the Department are listed as noninterfering. The radiation from all such sources on communication frequencies must not exceed the tolerances specified by the Canadian Standards Association.

Radio Revenue.-Regulations concerning the rendering and settlement of international accounts are contained in the International Telecommunication Convention and Regulations. Sources of revenue include commercial ship and inter-station messages handled by Departmental ships and land stations, radiotelegrams exchanged by foreign ships through Canadian coast stations, private commercial traffic via Departmental airway radio stations, and radio services rendered to aircraft of private airline companies by such stations. During the year ended Mar. 31, 1956, there were $1,119,987$ messages handled over marine stations consisting of $43,670,839$ words. The revenue therefrom, together with revenue from aeronautical messages and from licence fees, examination fees, fines and forfeitures, rentals, etc., are given in Table 1.
1.-Radio Revenue Collected by the Department of Transport, Year Ended Mar. 31, 1956

| Stations | Revenue |
| :---: | :---: |

| Collected from the issuance of private commercial broadcasting stations licences. | 355,884 |

## THE TELECOMMUNICATIONS BRANCH OF THE DEPARTMENT OF TRANSPORT

Radio in Canada traces its origin to the year 1900 when wireless telegraphy was introduced and placed under the jurisdiction of the Department of Public Works. The first commercial radio circuit was established between Chateau Bay, Que., and Belle Isle in the Strait of Belle Isle in 1901, replacing an underwater cable which was difficult to maintain. In the first days of radio there did not appear to be any necessity for special legislative control, but the growth of this new medium of communication was very rapid and the Wireless Telegraph Act of 1905 became the first legislation in Canada controlling radio communication.

Radio regulation and radio coast station services were under the jurisdiction of the Department of Public Works until 1909 at which time they were transferred to the Department of Marine and Fisheries where they remained until 1930, with the exception of the period 1914-1922 when they were under the jurisdiction of the Department of Naval

Services. In 1930, when a separate Marine portfolio was established, they became a Branch of that Department and then in 1936 a Division of the Air Services Branch of the newly formed Department of Transport. In 1936 an aviation radio service was organized within the Radio Division, and to it in 1948 was transferred the Government Telegraph and Telephone Service, which had been under the jurisdiction of the Department of Public Works since 1879. In 1950, the name was changed to Telecommunications Division, and later to Telecommunications Branch.

The present responsibilities of the Telecommunications Branch include the operation of radio aids to marine and air navigation, the regulation of all Canadian radio operations, the regulation of overseas cable communication services, the administration of the international telegraph regulations and operation of certain communication services for the public and for the handling of meteorological messages.

Since the end of the War in 1945 a number of radio aids to air navigation have been introduced, many of which were the result of wartime development, although much additional work was necessary to make them acceptable for service to civil aircraft. Through the medium of the International Civil Aviation Organization (ICAO), established in December 1944, it has been possible for participating administrations to reach agreement on desired systems and procedures. Probably no other single factor has contributed so much to the expansion of co-ordinated aviation telecommunications. Typical of new systems are the Instrument Landing Systems (ILS), Ground Control Approach (GCA), the Very High Frequency Omni-directional Ranges (VOR), and Surveillance Radar (see pp. 897-898). Also of importance to air navigation has been the development of integrated communication networks by landline and radio for the transmission of air traffic control and general airline operational messages. As these networks become more extensive and messages flow between a larger number of points, complicated relay stations are needed to keep message handling-time low. One of these relay stations has recently been constructed in the new signal centre at Gander, Nfld.

For all point-to-point communication systems, the trend has been toward automatic methods, as evident by the conversion of many radio circuits to radio teletype operation. In the field of international air-ground communication, the important development has been the changeover from radiotelegraph to radiotelephone. For the handling of meteorological data, facsimile has been introduced. Maps are transmitted by this means over both commercial and Department of Transport radio circuits, many of which have been especially designed for the purpose.

During the past ten years emphasis has been given to the modernizing of radio equipment used in aiding marine navigation. The development of efficient shipborne radar has minimized to some extent the need for new types of short-range navigation aid stations on shore. However, 'better medium-distance aid became necessary and was satisfied by the continuation and improvement of the wartime LORAN system. In ship-shore communications there has been a changeover from radiotelegraph to radiotelephone and a substantial expansion of the latter service for inland and coastal shipping. Of major significance in this connection is the Great Lakes Agreement with the United States respecting radiotelephone operation.

The number of radio stations regulated under the Radio Act and the Canada Shipping Act increased from 8,762 at Mar. 31, 1947, to 26,998 at Mar. 31, 1955. At the end of the War there was a large pent-up demand for new radio systems, both public and private. International planning, which is conducted by the International Telecommunications Union, was postponed during the war period, and at the first postwar Conference held at Atlantic City in 1947 all of the vast technological development that had taken place before and during the War had to be considered. Since the 1947 meeting there has been a series of subsidiary conferences notable among which was the Extraordinary Administrative Radio Conference in Geneva in 1951, at which a major step in international frequency planning was taken through the development of an implementation program for the allocation tables adopted at Atlantic City. Implementation of the new frequency arrangement is nearing completion.

The major developments in radio services in the past ten years include: broadcastingboth sound radio and television; telephone and telegraph company microwave systems; and mobile radio service for fire and police departments, taxis, railroads, power and oil distribution, construction operations, etc. The major build-up in military radio defence systems has also been most significant, particularly those installed in Canada by United States forces, because these are fully subject to the provisions of the Radio Act.

Most radio systems are becoming increasingly complex as new types of equipment are installed. For instance, the radio relay apparatus used by telephone and telegraph companies is capable of providing hundreds of circuits on one radio transmitter. Sound radio broadcasting has made use of complex directional antennae to permit the establishment of many more stations than previously thought possible with the limited number of channels available.

It may be noted that it has been the policy in recent years to turn, wherever possible, government-owned telegraph facilities over to private communication interests operating in the areas concerned. Some expansion of public communication services has taken place in other areas, but largely as a by-product at stations established for other purposes.

In addition to the radio services under its own control the Department of Transport is concerned with the regulation of the radio services of other government departments, public and private radio services including radio stations on ships and aircraft registered in Canada, with special reference to the assignment of suitable frequencies and the application of techniques compatible with frequency planning. The following Federal Government departments and agencies use radio to facilitate their operations: the Department of National Defence, the Department of Agriculture, the Department of Citizenship and Immigration, the Department of Fisheries, the Department of Mines and Technical Surveys, the Department of National Health and Welfare, the Department of National Revenue, the Department of Public Works, the Department of Northern Affairs and National Resources, the National Research Council and the Royal Canadian Mounted Police.

## Subsection 1.-Radio Services

Services of the Telecommunications Branch of the Department of Transport in aid of marine and aeronautical navigation and meteorological communications are described in this subsection. Details may be obtained on request from the Department of Transport, Ottawa.

Radio Aids to Marine Navigation.--Radio aids to marine navigation are provided for about 4,000 radio-equipped Canadian vessels and almost as many foreign ships using Canadian waters. A safety and communications service for shipping is provided covering the East and West Coasts, the Great Lakes, the St. Lawrence River and Gulf, Hudson Bay and Hudson Strait.

Coast Radio Stations.-Coast stations provide a safety watch and communications service for ships at sea and provide, as well, regularly broadcast weather reports, storm warnings and notices of dangers to navigation. The stations carry out communications by radiotelegraph and/or radiotelephone, and many of them provide connections to land telephone lines so that ships may communicate directly with any telephone subscriber. At Halifax (CFH) and Vancouver (CKN), shortwave facilities are furnished for world-wide communications. These stations participate in the Commonwealth long-range ship communication scheme.

The coast stations on Hudson Bay and Hudson Strait, in addition to the regular services, provide commercial communications for posts of the Hudson's Bay Company and various prospecting and development organizations, make weather observations, handle administrative traffic and assist aircraft with information, landing conditions and direction finding bearings.

Direction Finding Service.-Coast radio direction finding stations, operated on the Atlantic Coast and on Hudson Bay and Strait, enable ships to obtain a line of bearing from the station. No charge is made for this service.

A chain of automatic radiobeacon stations is also maintained to provide a navigational aid to mariners by transmitting signals on which bearings may be taken by ships. These stations are arranged, where possible, in groups of three, transmitting on a common frequency but in proper time sequence so as to avoid interfering with one another. A navigator may thus obtain three bearings within three consecutive minutes and fix his location. A number of radiobeacons are synchronized with fog alarms at the same point, for distance finding in foggy weather. Ships may also request the transmission of signals from the coast stations for direction finding purposes.

Loran Stations.-Loran is a long-range radio aid to marine and air navigation which provides accurate fixes at distances up to 600 miles by day and 1,500 miles by night. Two Loran stations operate in Nova Scotia, tbree in Newfoundland and one on the West Coast. These stations, in conjunction with Loran stations of the United States Coast Guard, give service to ships and aircraft plying the North Atlantic and Pacific Oceans.

Radar.-It has become general practice to equip merchant ships with radar, a valuable aid to marine navigation, and many important buoys are fitted with radar reflectors to increase their radar visibility. Two shore-based radar installations are in operation-one at Camperdown near the mouth of Halifax Harbour and the other on the Lion's Gate Bridge across the entrance to Vancouver Harbour.

Miscellaneous Services.-Lighthouses, particularly at locations where they would otherwise be completely cut off from summoning help in case of illness, are provided with low-power transceivers for use in emergencies. Lighthouse radiophone stations are organized into groups working into a control station.

Ships at sea may obtain medical advice from any coast station. The messages are delivered to the port medical officer of the Department of National Health and Welfare and replies are transmitted to the ship free of charge.

Radio and radar equipment used aboard vessels of the federal marine, pilotage and canal services, on vessels operated by the Department of Fisheries, the Department of Mines and Technical Surveys and the Department of National Revenue and on Canadian National Railway ferries is maintained by the Telecommunications Branch of the Department of Transport.

Radio Aids to Aeronautical Navigation.-Radio aids to air navigation are provided from coast to coast and from the Canada-United States border to the Arctic along and off the airways, and are used by many Canadian and foreign air carriers flying over Canadian territory. Trained engineers and technicians are assigned to six district offices located at Vancouver, B.C., Edmonton, Alta., Winnipeg, Man., Toronto, Ont., Montreal, Que., and Moncton, N.B., to carry out the construction and efficient operation of facilities.

Radio Ranges.-The principal radio aid to air navigation provided by the Department of Transport is the low-frequency radio range station, located approximately every hundred miles along airways. It provides specific track guidance to pilots by means of audible signals and the signals may also be used for the purpose of obtaining direction finding bearings. In addition, radiotelephone communications are provided between ground and aircraft, by which means pilots may obtain weather data, air traffic control instructions and other information concerning the safety of flights.

There are now being constructed a number of very high frequency omni-directional ranges (VOR). Unlike the existing radio range stations, this type of facility does not limit the aircraft using the station to one of four distinct courses, but enables the pilot to select his desired course. A six-station omni-range airway between Montreal, Que., and Windsor, Ont., with standard 200-watt installations located at Montreal, Ottawa, Stirling, Toronto, London and Windsor is in operation. Work is progressing on six additional stations for a high-altitude airway from Toronto, Ont., to Winnipeg, Man., and on one isolated station at Gander, Nfld.

Beacons, Markers, etc.-Aeronautical radiobeacon stations provide radio signals with which pilots may use their direction finding equipment to obtain relative directional bearings. Fan markers, operating on very high frequencies, are usually placed on an airway so as to inform the pilot when he may safely lose altitude after passing high terrain or to indicate accurately the distance from an airport. Station location markers are similar to fan markers except that the signal radiated is such that aircraft may receive the same indication irrespective of the direction of flight. They are installed at the same location as a radio range to enable a pilot to determine when he is exactly over the station, thus obtaining definite indication of position. Station location markers are installed at most radio range sites.

Radar.-Long-range (150 nautical-mile) surveillance radars are being installed at 15 major airports from Halifax to Vancouver for air traffic control purposes. Short-range (40 nautical-mile) radars will also be installed at Montreal, Toronto, Winnipeg and Vancouver airports. A 50-mile range surveillance radar at Gander forms part of a complete ground controlled approach radar facility.

Instrument Landing Systems.-Instrument landing systems provide radio signals which, when received by special radio equipment aboard aircraft, permit pilots to approach airports for landing during periods of very low visibility. An installation normally consists of a localizer transmitter providing lateral guidance to the runway, a glide path transmitter for slope guidance to the approach end of the runway, two marker transmitters giving distance indications from the runway and a low-power radiobeacon (compass locator) to assist in holding procedures and lining up on the localizer course. The localizer and marker transmitters operate on very high frequencies, the glide path on ultra high frequencies and the compass locators on low and medium frequencies. Twenty-six instrument landing systems are in operation.

Aeronautical Communications Stations.-To assist in providing communication between aircraft and ground, radio stations are located at strategic points across the country, including the Arctic. These stations, operating for the most part on high frequencies, provide communication to both domestic and international air carriers. The international communications stations form a major contribution on the part of Canada to international aviation. They may be grouped as follows: (1) communication for meteorological services; (2) communication for the air traffic control services; and (3) communication for the benefit of the airline operating agencies, with their aircraft and between their despatch offices.

Meteorological Communications Stations.--Six stations whose primary function is weather reporting are located at strategic points throughout the country from coast to coast and into the Far North; some are located in remote areas where radio is the only means of communication.

Supplementing the facsimile wirc-line services, the transmission of weather maps is extended by radio to points in northern Canada that cannot be served by wire lines.

## Subsection 2.-External Telecommunication Services

The Canadian Overseas Telecommunication Corporation was established in 1950 to maintain and operate, in Canada and elsewhere, external telecommunication services for the conduct of public communications by cable, radiotelegraph and radiotelephone, and any other means of telecommunication between Canada and any other place, and between Newfoundland and any other part of Canada; to make use of all developments in cable and radio transmission and reception for external telecommunication services; to conduct investigations and research with the object of improving the telecommunication service generally and to co-ordinate Canada's external telecommunication services with the telecommunication services of other parts of the Commonwealth.

Soon after its establishment, the Corporation embarked on a program of expansion of overseas services designed to meet anticipated requirements of the future. In November 1953, the Corporation, on behalf of Canada, entered into an agreement with interests in the United States for the construction and maintenance of a transatlantic telephone cable. The laying of the first section of the cable started from Clarenville, Nfld., in June 1955, and the whole system was placed in service on Sept. 25, 1956. Total cost of the project amounted to approximately $\$ 40,000,000$ of which the Corporation's share was about one-tenth. A second transatlantic cable will be laid by 1961 and will be financed by the United Kingdom and Canadian Governments. It will provide 60 telephone circuits, each capable of being transposed into 48 telegraph circuits.

Transpacific radiotelephone and radiotelegraph services began op erating from Vancouver to Australia and New Zealand on Nov. 1, 1956. Direct radiotelegraph service to Japan commenced in June 1957. Augmentation of overseas radiotelegraph facilities at Yamachiche and Drummondville, Que., became necessary as a result of the expansion of existing services and the introduction of new direct radiotelegraph circuits.

In December 1956, the Corporation initiated and brought into service International Telex, an overseas teleprinter switching system by means of which the user can teletype directly to a correspondent. Service is available across Canada.

## Section 2.-Other Government, Miscellaneous and Commercial Radio Communication Services

Radio services have been established by all provincial governments, mainly for police, highway and forestry protection purposes.

Municipal government departments have steadily increased their use of radio to facilitate operations. This increase is noted in all municipal services using radio as a medium of communication with vehicles, i.e., police, fire, engineering, hydro, etc. In addition, the trend toward expansion in the employment of radio for urban mobile communication has shown no signs of abating. Such services as taxi, heavy construction, ready-mix concrete, oil pipeline construction and operation, veterinarian and rural medical have participated extensively in this increase. Public mobile radio relay message services (telephone answering service) have also been licensed to operate in most of the larger cities.

Public utilities, power companies, provincial power commissions, oil exploration and mincral development organizations have considerably expanded their use of radio in both urban mobile and point-to-point radio fields.

Commercial Radio Communication Services.-The North-West Telephone Company operates a radiotelephone service between points in British Columbia not hitherto served by telephone. Under licences granted by the Department of Transport, the Company has established a number of permanent public commercial radiotelephone stations that are authorized to provide communication to private commercial radiotelephone stations located at isolated points in the Province. The Company is also licensed to establish limited coast stations at Lulu Island, Powell River, Vancouver, Nanaimo, Victoria, Harrison Lake, Parksville, Alert Bay, Campbell River, Hardwicke Island, Halberg, Sumas Mountain, and Prince Rupert, B.C., to provide a ship-to-shore service. These stations, used in conjunction with the ordinary telephone exchange, provide a duplex-radiotelephone service to isolated points and to certain ships at sea. They also provide a limited amount of service to stations of the land mobile category.

91593-57 $\frac{1}{3}$

The North-West Telephone Company is also licensed to provide emergency radiotelephone communication at any point in British Columbia and to carry out tests for extending the existing radiotelephone service throughout the Province.

To provide trans-river communication in the lower St. Lawrence area, the following companies operate stations in the Province of Quebec at La Malbaie, Tadoussac, Rivière-duLoup, Rimouski, Matane, Montmagny, St. Antoine, Ille aux Grues, Cap Chat, Forestville, Trinity Bay, Sept-Iles, Baie Comeau, Clarke City, Gaspe Copper Mines, Mont Louis, Chicoutimi, and Tour à Pica: La Compagnie de Téléphone de Charlevoix et Saguenay, La Compagnie de Téléphone de Kamouraska, the Quebec Telephone Corporation, Gulf of St. Lawrence Telephone Company and La Compagnie du Téléphone Saguenay.

The wire facilities between Saint John, N.B., and Digby, N.S., between Saint John, N.B., and Halifax, N.S., between Red Head, N.B., and Mount Hanley, N.S., between Lutz Mountain (Moncton), N.B., and Egmont, P.E.I., and between Charlottetown, P.E.I., and New Glasgow, N.S., are supplemented by radiotelephone connections.

Stations at Saint John, Red Head, and Lutz Mountain (Moncton) are operated by the New Brunswick Telephone Company. The terminals at Digby, Halifax, New Glasgow and Mount Hanley are operated by the Maritime Telephone and Telegraph Company. The stations at Charlottetown and Egmont are operated by the Island Telephone Company.

The Bell Telephone Company of Canada provides a land mobile terminal radiotelephone service at numerous points in Ontario and operates a microwave link between Toronto and Ottawa, Ont., and Montreal, Que., which carries television programs and is capable of providing many additional telephone circuits. Radio links are also maintained between Pelee Island and Leamington, Ont., and across the St. Lawrence between Sorel and Joliette, Que.

The Canadian National Railway Company operates an extensive radiotelegraph and radiotelephone service in Newfoundland including links between Table Mountain, Nfld., Cape North, N.S., and New Waterford, N.S. This Company is also authorized to provide a limited coast-station service at Port aux Basques, Nfld.

The Canadian National Railway Company and the Canadian Pacific Railway Company have jointly established microwave circuits between Toronto and Windsor, and between Montreal and Quebec City.

The Avalon Telephone Company operates public commercial stations in Newfoundland to supplement its wire lines and to provide telephonic communication with isolated communities.

The Manitoba Telephone System operates radiotelephone links involving stations at the following points: Riverton, Manigotagan, Hecla Island, Gimli, Norway House, Bissett, Great Falls, The Pas, Snow Lake and Winnipeg. In addition, the System operates stations at Gimli, The Pas and Norway House to provide terminal service for ships operating on Lake Winnipeg.

Norwesto Communications Limited operates a public commercial radiotelephone service to provide telephonic communication to privately owned stations at isolated points throughout the northwestern part of the Province of Ontario. Stations are located at Kenora, Red Lake, Ball Lake, Sioux Narrows, Dryden, Sioux Lookout, Minaki and Redditt, which are used in conjunction with the ordinary telephone exchanges.

The Red Lake Telephone Company operates a public commercial radiotelephone station at Madsen, Ont., to provide a connection between the local wire telephone system and the Norwesto Communications Limited network.

The Okanagan Telephone Company operates a public radiotelephone service between Revelstoke and Arrowhead, B.C., and a public commercial terminal station at Kelowna to provide telephonic communication to privately owned stations at isolated points in

## Section 3.-Broadcasting in Canada*

Broadcasting in Canada as it has developed over a period of more than thirty-five years is a combination of public and private enterprise. Under the Canadian Broadcasting Act (R.S.C. 1952, c. 32), authority for broadcasting service is vested in a Board of eleven Governors, appointed by the Governor General in Council and chosen to give representation to the principal geographical divisions of Canada. The Board is directly responsible to Parliament for carrying on a national broadcasting service in Canada and for the policies of the Canadian Broadcasting Corporation. It also administers and supervises regulations pertaining to broadcasting which are observed by both the CBC and privately owned stations.

As of Mar. 31, 1957, there were 22 CBC radio stations and ten CBC television stations; 203 privately owned radio stations and 30 privately owned television stations. All the privately owned television stations and many of the privately owned radio stations operate in partnership with the CBC in helping to distribute national radio and television services over five networks operated by the CBC-in radio, the Trans-Canada, Dominion and French networks, and in television, the English and French networks.

The privately owned stations are subject to licensing control by the Department of Transport and to CBC regulations authorized by Parliament. Their primary purpose is to provide community service in the locality where they are situated. Many stations are located in small urban centres and seive, as well, the larger population located in the surrounding rural areas. Others serve cities and their surrounding towns and rural areas, providing alternative programs to those of the CBC. In sparsely populated areas where privately owned stations would not be economical the CBC provides service through unattended, low-power relay transmitters. Many of the privately owned stations form an integral part of the national networks as outlets for national service programming.

The Chairman of the Board of Governors is required to devote the whole of his time to the performance of his duties under the Act. Members of the Board are not paid and must take an oath of office disclaiming any personal interests in broadcasting, and review broadcasting activities in Canada generally in the interests of the country as a whole. Policy is determined and supervised by the Board but day-to-day operations and executive direction of the CBC are conducted by the General Manager. The CBC is responsible for the regulations controlling the establishment of networks and the proportion of time that may be devoted to advertising in broadcast programs, but it neither exercises nor authorizes any private station to exercise on its behalf, censorship of any broadcast program. The responsibility of observing regulations rests with individual station management.

The general principles of this system, as established by Parliament, have been approved by fourteen Parliamentary Committees and two Royal Commissions.

Radio Broadcasting Facilities.-As stated above, the CBC operates three networks: the Trans-Canada and Dominion networks serving English language audiences from the Atlantic to the Pacific, and the French language network extending from Moncton, N.B., to Edmonton, Alta. As at Mar. 31, 1957, the Trans-Canada network was made up of 26 basic stations-13 CBC-owned and 13 privately owned. There were 19 supplementary stations, four of which were CBC-owned Newfoundland stations. The Dominion network consisted of 31 basic stations of which 30 were privately owned. Nineteen supplementary privately owned stations also received Dominion network service. The French network had five basic stations, four of which were CBC-owned and one privately owned, and 20 privately owned affiliated supplementary stations.

Table 2 lists the broadcasting stations of the CBC radio networks.

[^293]
## 2.-Broadcasting Stations of CBC Radio Networks as at Mar. 31, 1957

Nore.-The stations marked with an asterisk (*) are CBC-owned. The symbols used in the Power column have the following meanings: DA-1, one directional antenna both day and night; DA-2, two directional antennae, one in daylight, the other at night; DA-N, single directional antenna used at night only. Wattage of some stations differs between day and night as shown.

Television Broadcasting Facilities.-As at Mar. 31, 1957, there were 34 television broadcasting stations in operation on the English network (eight of which were CBCowned) and three under construction. On the French network, six stations were in operation (two of which were CBC-owned) and one was under construction. These stations were located and powered as follows:-

It was estimated that at the end of March 1957 more than 86 p.c. of all Canadians were within reach of the national television system. Microwave facilities linking television stations from coast to coast for instantaneous telecasting of programs are under construction and will extend from coast to coast by mid-1958.

When television broadcasting began in September 1952, 146,000 television sets were in use in Canada. One year later the number had tripled and by March 1957 more than $2,550,000$ receivers were in use in Canadian homes.

Canadian Broadcasting Corporation Service.-The Corporation's Head Office is located at Ottawa and provides over-all direction for the English and French language television and radio services through the CBC's seven operations divisions: British Columbia; Prairies; Ontario and English networks; Quebec and French networks; Maritimes; Newfoundland; and the International Service. To give expression to varying interests across Canada, the CBC maintains offices and production facilities at St. John's, Nfld., Sydney and Halifax, N.S., Moncton, N.B., Chicoutimi, Quebec and Montreal, Que., Ottawa, Toronto and Windsor, Ont., Winnipeg, Man., Regina, Sask., Edmonton, Alta., and Vancouver and Prince Rupert, B.C.

Domestic Radio Program Service.-During the year ended Mar. 31, 1957, 82,329 programs representing 25,415 hours of broadcasting were presented over the CBC TransCanada, Dominion and French networks. Of the total broadeasting hours in 1954-55, 75 p.c. was scheduled on the Trans-Canada network; the Dominion network released 4.3 p.c. and the remainder was released on the French network.

The CBC originated and produced 92.5 p.c. of its network broadcasts. Of the remainder, 1 p.c. came from private stations and 6.5 p.c. were exchange programs from the United States and the British Broadcasting Corporation. An analysis of network programs by categories for 1956-57 shows that, as in previous years, a large proportion of CBC radio network time was devoted to music-an estimated 44 p.c. News and weather ranked next in order of broadcast time with 12 p.c. Table 4 presents an estimate of the hours of radio programs by category. The figures are based on programs on all three CBC radio networks, 'live', recorded, or recorded for later presentation. They do not include the 'delayed' presentation of programs that are transmitted at different times by different sections of the network to meet the convenience of listeners in the various time zones. However, they do include regional programming presented on sections of the network exclusively for listeners in the areas served by such regional breakdowns of the network. The classifications in this table are based on the predominant function of each program although many programs serve more than one interest at the same time.
4.-Classification of CBC Radio Programs, Year Ended Mar. 31, 1957

Domestic Television Program Service.-During the year ended Mar. 31, 1957, the CBC English-language television network presented 2,511 hours of programming. Of this, 58 p.c. was produced by CBC, 38 p.c. was drawn from sources in the United States, 2 p.c. from non-CBC sources in Canada, and 2 p.c. from the United Kingdom and other countries. Of the 2,794 hours presented by the CBC French-language television network, 70 p.c. originated with the CBC, 3 p.c. with other Canadian sources, and 17 p.c. with sources in France. The remaining 10 p.c. was procured in the United States, the United Kingdom and other countries.

Radio and Television Talent.-The CBC is the main single outlet for Canadian talent in the fields of music, drama and other entertainment. In the year ended Mar. 31, 1957, a total of 14,514 free-lance artists contributed to the Corporation's programs. During the year, the CBC spent approximately $\$ 11,000,000$ for talent- $\$ 3,500,000$ for radio and $\$ 7,500,000$ for television. Of the total, $\$ 2,400,000$ was for scripts, performing rights, music and musical arrangements. The remainder was in the form of direct fees to musicians, singers, actors, and other performers. These figures cover 'outside' or non-staff talent and do not include CBC personnel in such categories as producers and directors, scenery, graphics and costume designers, and film editors and commentators.

CBC International Service (Shortwave).-The International Service, operated by the Canadian Broadcasting Corporation on behalf of the Government of Canada, is financed separately from CBC's national radio and television service through annual grants by Parliament. Headquarters and studios are in the Radio Canada Building at Montreal and the Service's two $50-\mathrm{kw}$. shortwave transmitters are in Sackville, N.B., 600 miles from Montreal.

The International Service was inaugurated on Feb. 25, 1945, and the first programs to Europe were broadcast mainly for Canadian Armed Force personnel. Later, the scope was broadened to give listeners in other lands a picture of life in Canada and to explain Canada's part in the United Nations and NATO. News and news commentary are the core of the program service and great emphasis is placed on the broadcasting of news bulletins to those who live behind the iron curtain. Shortwave broadcasts are now on the air some 92 hours a week in the following languages-English, French, German, Dutch, Italian, Spanish, Portuguese (for Brazil), Danish, Norwegian, Swedish, Czech, Slovak, Russian, Ukrainian, Polish and Hungarian. Programs are also prepared regularly on dise or tape and shipped to Austria, Greece and Finland for transmission by the radio facilities of those countries. The shortwave transmitters at Sackville are also used to broadcast news and other programs to people living in Canada's Far North beyond the signal of the domestic networks. Broadcasts beamed to Europe in the English and French languages are regularly relayed over Station CAE, the Canadian Army radio station in Europe. In addition to the regular shortwave programs, the International Service provides the Canadian Army station with broadcasts of special events from Canada.

In addition to its regular schedule of shortwave broadcasting, the International Service provides programs for use on the domestic stations and networks of countries all over the world. In the main, three types of programs are provided to external radio organizations: programs relayed by shortwave for immediate or almost-immediate rebroadcast; recorded broadcasts on tape or dise, usually for only one outlet; and transcriptions on processed disc for wide distribution. The third category-transcriptions-is made up of recorded music and spoken-word programs (talks, documentaries, etc.) in the English, French and Spanish languages. International Services sometimes exchange regular programs with other countries.

More than 300,000 letters have been received from listeners since the start of the service. The International Service replies in the language of the letter-writer and forwards printed information on a great number of subjects. Seven times yearly the International Service publishes an illustrated program schedule which is printed in the languages of the shortwave programs and contains information, times and frequencies of the International Service shortwave broadcasts. It goes to 180,000 individual listeners in all parts of the world.

Canadian Broadcasting Corporation Finances.-The operations for the year ended Mar. 31, 1957, resulted in an excess of expenditure over income of $\$ 1,561,211$ after providing $\$ 1,969,754$ for depreciation. The surplus of the Radio and Integrated Services was $\$ 202,299$ as compared to a deficit of $\$ 1,763,510$ for the Television Service.

91593-58

The Corporation's income from all sources was $\$ 10,346,563$ higher than the previous year; contributing to this was an increase of $\$ 2,438,200$ in net revenue from commercial broadcasting activities of the Television Service. The increase in total revenue was offset by an advance in expenditures of $\$ 10,549,153$, attributed to the development of the national television service and to the general rise in costs experienced by all industries.

The cash and investment position as at Mar. 31, 1957, was $\$ 4,829,022$ lower than at Mar. 31, 1956. Working capital was $\$ 17,993,620$ at the later date as compared with $\$ 22,518,050$ at the earlier date. The decrease was partially accounted for by expenditures of $\$ 552,885$ for extensions and improvements to broadcasting facilities for the Radio and Integrated Services and $\$ 4,041,261$ for the Television Service.

There were no loans during the year from the Government of Canada. Payments on the principal of loans granted previously amounted to $\$ 101,038$ for the Radio and Integrated Services and $\$ 36,975$ for the Television Service.

Statutory payments to the Corporation representing the equivalent of the excise tax on the sale of radio and television receivers and associated parts amounted to $\$ 18,923,029$ compared to $\$ 22,799,955$ for the previous year. Parliament extended the grant previously authorized for the five years ended Mar. 31, 1956, to the Radio Broadcasting Service toward the anticipated operating deficit and capital expenditures. A grant for similar purposes was provided for the Television Service.

The International Service's net operating expenditures of $\$ 1,566,087$ for the year ended Mar. 31, 1957, are not considered as chargeable to the CBC because grants and payments from the Government of Canada are used to serve only listeners within Canada.
6.-Income and Expenditures of the CBC, Year Ended Mar. 31, 1957

Privately Owned Stations.-As stated previously, privately owned broadcasting stations are subject to the Radio Act, the Canadian Broadcasting Act and Regulations made thereunder, and to the provisions of the Radio Regulations annexed to the International Telecommunication Convention and Regional Agreements in effect in Canada. Since Mar. 31, 1923, private commercial broadcasting station licences have been required by Government regulation and both sound and television broadcasting stations are now authorized by this class of licence.

Any application for a licence to establish a new private station or for an increase in power, change of channel, or change of location of any existing private station must be referred by the Minister of Transport to the Canadian Broadcasting Corporation; the Corporation after giving public notice thereof in the Canada Gazette will make such recommendations to the Minister of Transport as it may deem fit. The approval of the Governor in Council must be obtained before any licence for a new private station is issued. Private commercial broadcasting station licences are conditional upon the ownership or control of the stations, and the shares of capital stock of licensed companies in certain instances may not be transferred without the permission of the Minister of Transport having been first obtained upon the recommendation of the Canadian Broadcasting Corporation. Proof of performance statements showing public service, community service and light programming are filed annually with the Canadian Broadcasting Corporation. Organizational and financial statements are filed annually, on a confidential basis, with the Department of Transport.

The first sound broadcasting in Canada took place when a privately owned communieations company in Montreal was authorized to transmit programs on an experimental basis during the latter part of 1918 and in the winter evenings of 1919 over its Station XWA. Under the first licencing regulations in the year ended Mar. 31, 1923, 34 licences were issued. By Mar. 31, 1957, the number had increased to 203, of which 169 were AM standard band stations, 26 were frequency modulated stations and eight were shortwave stations. Of the 169 standard band stations, two were operating with a power of 50,000 watts, ten with 10,000 watts, 50 with 5,000 watts, 63 with 1,000 watts, 42 with 250 watts and two with 100 watts.

A privately owned broadcasting station is required to pay to the Receiver General of Canada an annual licence fee based on the gross revenue for licence fee computation for the fiscal year of the station. Because the fiscal years of the privately owned stations end at different dates it is difficult to estimate the gross revenue of all stations for any one year. The Report of the Royal Commission on Broadcasting published in 1957 indicates that gross sales for 144 broadcasting stations amounted to approximately $\$ 36,000,000$ in 1955, all of which was obtained from commercial advertising.

The first privately owned television broadcasting station in Canada at Sudbury, Ont., was authorized to commence scheduled broadcasting on Oct. 20, 1953. By Mar. 31, 1957, 30 privately owned television stations were in operation (see Table 3).

International Agreements.-In 1937 a conference was held at Havana, Cuba, to review the broadcasting situation in the North American region and to develop a workable plan which would permit the growth of the broadcasting industry. The product resulting from the deliberations of that conference was the treaty known as the North American Regional Broadcasting Agreement which came into effect in 1941 and was extended by an instrument known as the modus vivendi or interim agreement signed at Washington in 1946. In 1949 and 1950, conferences were held at Montreal and Washington, and a new North American Regional Broadcasting Agreement was drafted in December 1950 which has been implemented as an administrative arrangement.

The Canadian-United States Television Agreement provides for the assignment and utilization of 82 television channels between 54 and $890 \mathrm{mc} / \mathrm{s}$ along the border between Canada and the United States of America, within an area of 250 miles on either side of the International Boundary. This Agreement provides that all station assignments within its scope shall be made in accordance with the Agreement and shall have an effective radiated power in any vertical or azimuthal plane not in excess of 100,000 watts for Channels 2 to 6 , of 325,000 watts for Channels 7 to 13 and of $1,000,000$ watts for Channels 14 to 83 .

## PART IV.-THE POST OFFICE

The Canada Post Office Department was created at the time of Confederation in 1867 by the Canada Post Office Act to superintend and manage the postal service of Canada under the direction of a Postmaster General. For almost a century before Confederation, postal services in the Canadian provinces had been controlled by the British Postmaster General and administered by his deputies. Under the French régime a courier service had been organized as early as 1703 between Quebec, Three Rivers and Montreal. In 1734 a post road was constructed over the same route and post houses, complete with post horses and vehicles, were established for the use of travellers. In 1851 the control of their post offices was assumed by the different provinces of British North America and at Confederation these systems merged to form the Canada Post Office.

Functions.-The basic tasks of the Canadian Postal Service are to receive, convey and deliver postal matter with security and despatch. In discharging these duties it maintains post offices and utilizes air, railway, land and water transportation facilities. Associated functions include the sale of stamps and other articles of postage, the registration of letters and other mail for despatch, the insuring of parcels, the accounting for COD articles, and the transaction of money order and Post Office Savings Bank business. Because of its widespread facilities, it has been found expedient for the Post Office to assist other government departments in the performance of certain tasks including the sale of unemployment insurance stamps, the collection of government annuity payments, the distribution of income tax forms and Civil Service employment application forms, and the displaying of government posters.

Post offices are established wherever the population warrants. Those in rural areas and small urban centres transact all of the functions of the city office. In larger urban areas postal stations and sub-post offices have full functions similar to the main post office, including a general delivery service, lock-box delivery and letter carrier delivery to the surrounding area.

At Mar. 31, 1957, there were 11,879 post offices in operation compared with 11,996 in 1956. Letter carrier delivery, performed in 140 urban centres, employs over 6,400 uniformed letter carriers. Postage paid in 1956-57 by means of postage stamps amounted to $\$ 77,735,659$ as compared with $\$ 75,559,106$ in 1956 . Post office money orders, issued for any amount not exceeding $\$ 100$ and payable in almost any country of the world, are sold at more than 8,000 post offices. Orders payable in Canada only, for amounts not exceeding $\$ 16$ are sold at more than 3,000 additional post offices. Post Office Savings Banks operate in all parts of the country and, on Mar. 31, 1957, had total deposits of $\$ 35,918,499$.

Organization.-The Canada Post Office includes an Operating Service and Headquarters at Ottawa. The Operating Service is organized into five regions each under a Regional Director, who is the field representative of the Deputy Postmaster General. There are five Headquarters Branches: Administration, Operations, Transportation, Financial, and Personnel, each under a Director. Operating and secretarial features in the operating field affecting the post offices and local mail services in urban centres are taken care of by the local postmaster. District office functions relating to services in the district and all inspections and investigations are under District Directors of Postal Services in strategic centres across the country.

Postal service is provided in Canada from Newfoundland to the west coast of Vancouver Island and from Pelee Island, Ont. (the most southerly inhabited point of Canada) to settlements and missions far within the Arctic. Canada's airmail system provides several transcontinental flights daily and constitutes a great air artery from St. John's, Nfld., to Victoria, B.C., intersected by branch lines and connecting lines radiating to every quarter and linking up with the United States airmail system. Since July 1, 1948, all first class domestic mail up to and including one ounce in weight has been carried by air between one Canadian point and another, whenever delivery can thus be expedited.

On Apr. 1, 1954, this service was extended to first class items up to and including eight ounces in weight. Air stage service provides the sole means of communication with the outside for many areas in the hinterland. There were approximately 35,700 miles of airmail and air stage routes in Canada in 1957 as compared with 32,447 miles in 1956.

The principal means of mail transportation is the railway mail service that operates along about 30,260 miles of track and, in 1957, covered over $43,500,000$ service miles. The railway mail service employed a staff of 1,190 mail clerks to prepare the mails for prompt delivery and dispatch while en route in the railway mail cars. Like its airmail service, Canada's railway mail service is one of the most extensive in the world.

The rural mail delivery organization provides direct postal facilities to residents in the rural sections of the country; approximately 5,399 rural mail routes were in operation in 1957, involving over 130,000 route-miles and serving 465,180 rural mail boxes. Rural mail routes are generally circular in pattern and average about 24 miles in length. Considerable progress has been made towards the development of mail service by means of group boxes-a service intended for the more densely populated rural areas and for suburban residents not within the area of letter carrier delivery service. About 3,848 side services were in operation in 1957 to transport mail between post offices, railway stations, steamer wharves and airports, and 2,145 stage services operated to convey mail to and from post offices not located on railway lines. Transportation of mail by motor vehicle on highways is being developed and over 270 such services are in operation. Many of these services have replaced or reduced conveyance by rail. A local exchange of mails between offices on the route is effected by way-mail wallet. In 1957 there were approximately 792 city mail services transporting mail to and from post offices, postal stations and sub-post offices, collecting mail from street letter-boxes and delivering parcel post. In all, about 12,500 land-mail service couriers are employed and travel in the neighbourhood of $50,000,000$ miles annually. Land mail services are performed under a contract system, the contracts being awarded to the person submitting the lowest tender and competent to provide all the requisite equipment.

Coastal mail service to the more populous centres as well as to many isolated points is conducted by 17 contractors who operate as far north along the West Coast as Alaska and on the East Coast to the northern part of Labrador.

The increase in postal business is one of the impressive features of Canada's economic development during the past ten years. Gross revenue for the year ended Mar. 31, 1957, reached an all-time high.

Post Office Statistics.-Tables 1, 2 and 3 give the numbers of post offices in operation together with revenue and expenditure for the past few years.

## 1.-Post Offices in Operation by Province as at Mar. 31, 1954-57

## 2.-Revenue and Expenditure of the Post Office Department, Years Ended Mar. 31, 1948-57

Nore.-Figures from 1868 will be found in the corresponding table of previous Year Books beginning with the 1911 edition. Figures for Newioundland are included from 1950.

${ }^{1}$ Gross revenue less commissions and allowances to postmasters, and other smaller items. ${ }^{2}$ Exeludes rental of service staff and staff post offices.

The gross revenue receipts shown in Table $\mathbf{2}$ are received mainly from postage, either in the form of postage stamps and stamped stationery, or postage meter and postage register machine impressions. Some postage is also paid in cash without stamps, stamped stationery or meter and register impressions. The gross value of the postage stamps and stamped stationery sold during each of the latest five fiscal years was: $\$ 67,182,548$ in 1952-53, $\$ 64,546,067$ in 1953-54, $\$ 74,583,720$ in 1954-55, $\$ 75,559,106$ in 1955-56 and $\$ 77,735,659$ in 1956-57. Receipts from postage meter or postage register impressions and postage paid in cash by other means were as follows: $\$ 52,733,682$ in 1952-53, $\$ 55,398,788$ in $1953-54, \$ 65,516,441$ in $1954-55$, $\$ 70,696,501$ in $1955-56$ and $\$ 78,041,479$ in 1956-57.

## 3.-Gross Postal Revenue of Offices collecting upwards of $\mathbf{\$ 1 0 , 0 0 0}$, Years Ended Mar. 31, 1956 and 1957

Note.-Money order commissions are not included in gross postal revenue. Provincial totals of postal revenue include post offices not separately listed.

## PART V.-THE PRESS

About 105 daily newspapers, counting morning and evening editions separately, are published in Canada. They have an aggregate reported circulation of nearly $4,000,000-$ about 82 p.c. in English, 17 p.c. in French and the remainder in other languages. Ten of the daily newspapers enjoying circulations in excess of 100,000 account for more than half of the circulation. French dailies, as would be expected, have their widest circulation in Quebec where 10 of the 12 in existence in 1956 were published. Some of the largest of these papers have been established in that Province for over 60 years. Foreign-language publications, shown in Table 5, are gaining rapidly in number and circulation as a result of recent heavy immigration.

Weekly newspapers serve more people in rural communities than do the dailies. They cater to local interests and exercise an important influence in the areas they serve.

The Canadian Press, a co-operative organization owned and operated by Canada's daily newspapers, provides its 95 members with world and Canadian news and news photographs, mostly by means of teletype and wirephoto transmission. It also serves weekly newspapers and radio and television stations. It is, in effect, a partnership through which each member newspaper provides to its fellow members the news of its particular area and through which the general news of the world is brought to Canada. Cost of editing and transmission is divided among members according to the population of the cities in which they publish. CP gets world news from Reuters, the British agency, and from the Associated Press, the United States co-operative, and these agencies have reciprocal arrangements with CP for their coverage of Canada.

The United Press International (the British United Press and the United Press combined in May 1958) also provides a service of Canadian and world news, news photographs and related features for Canadian newspapers, radio and television stations. There are, as well, special news services operated by affiliated newspapers and individual newspapers. Several foreign news agencies have representatives in Canada to supply and interpret news of Canadian origin, as have a number of the leading United Kingdom and United States newspapers. Most of the latter are located at Ottawa.

Press Statistics.-The following tables are based on data estimated from Canadian Advertising. One serious difficulty has been encountered in connection with the compilation of circulation figures. Reliable circulation figures are relatively easy to obtain for daily newspapers because, in their own best interest, such papers qualify for and subscribe to the Audit Bureau of Circulation requirements: for these, A.B.C. 'net paid' figures have been used. However, it is difficult to obtain reliable circulation figures for many weekly newspapers and for magazines, and those shown in the following tables should be used with reservations.

## A HISTORY OF CANADIAN JOURNALISM, 1752- (Circa) 1900*

The press of Canada has had a 200 -year history. During that time journalism bas grown from a small, weak entity which at first made little impact on the country's development into a large and important component of the national life. A landmark in the story of that growth came at the end of the nineteenth century when Canadian journalism, like the journalism of so many other countries, underwent a rather sudden and impressive metamorphosis. The present article tells the story up to the time of that change. It considers the 150 -year period in three time divisions: (1) 1752-1807, the years when the press was being transplanted to Canada from the New England colonies; (2) 1807-1858, the era when the gains made during the earlier half-century were consolidated in Canada's six easternmost provinces; and (3) 1858 to circa 1900, a second time of journalistic pioneering when the press moved with the settlers into Canada's western provinces and northern territories. A second article covering the post-1900 history of Canadian journalism proposes to examine the manner in which technology has transformed the press of Canada into the large-scale, heavily capitalized enterprise so familiar today. This article is planned for the next edition of the Canada Year Book.

## First Period: The Transplant, 1752 to 1807

The press of British North America began as a transplant from New England rather than as a growth from seed. Most of the newspaper developments that had occurred in Britain after Caxton's introduction of printing in 1478 had been incorporated into New World journalism. Moreover, the press of the colonies which were later to become Canada's

[^301]six easternmost provinces gained from a 50 -year pre-hardening process under the semipioneering conditions of Massachusetts, Pennsylvania and New York. As England wrested control of the northeastern part of the Continent from the French and as pioneer settlements appeared as isolated pockets in the surrounding wilderness, the first news organs were set up. Thus Halifax gained its first newspaper a scant three years after the Honourable Edward Cornwallis started the seaport town on the rocky soil of Chebucto. Saint John's press arrived with United Empire Loyalists who established the centre, and Quebec's first press venture was launched only a year after the Treaty of Paris gave control of New France to the British. Under the primitive conditions of the day the early printer-editor worked along with the joiner, the blacksmith, the attorney, the linen draper, the tallow candler, the cabinet maker and the soapmaker in serving his small community.

## Some Early Newspapers

The first paper established in the Canada-to-be was the Halifax Gazette. Bartholomew Green Jr. established the first printing office in Halifax with a press brought from Boston, but died before he could produce a newspaper; it fell to the lot of his colleague, John Bushell, to launch Canada's pioneer press venture with his issue of the Halifax Gazette on Mar. 23, 1752. This event inaugurated a journalistic period that may be considered, only a little arbitrarily, to have lasted until 1807. It was during that 55 -year interval that all six of Canada's easternmost provinces made their press beginnings. Quebec's pioneer paper was the Quebec Gazette, started by William Brown and Thomas Gilmore in Quebec City in 1764. It survives today as part of the Quebec Chronicle-Telegraph, which makes the valid claim that it is the oldest continuing newspaper in North America. John Ryan and William Lewis set up the Royal St. John Gazette in Saint John in 1783, a year before the county of Sunbury was detached from Nova Scotia to form the Province of New Brunswick. Prince Edward Island had its journalistic start in 1787 when James Robertson founded the Royal American Gazette and Weekly Intelligencer at Charlottetown. The Upper Canada Gazette, launched by Louis Roy at Newark (now Niagara-on-the-Lake) in 1793, was the pioneer paper for what later became the Province of Ontario. Newfoundland gained its first news-organ when John Ryan, the New Brunswick press pioneer, set up the Newfoundland Gazette in 1807.

The longevity of these early news-sheets was directly related to the support they got. The Halifax Gazette under Anthony Henry lasted until 1766 when it was suspended for criticizing the Stamp Act, and was replaced by the Nova Scotia Gazette, edited by Robert Fletcher. In 1769, Anthony Henry began the Nova Scotia Chronicle and Weekly Advertiser, which absorbed the Fletcher paper the following year, and Henry became, without being so titled, King's Printer again. His renamed paper, the Nova Scotia Gazette and Weekly Chronicle, has since been turned into a provincial government gazette. The Henry newsorgan was joined in Halifax by John Howe's Halifax Journal in 1781 and William Minns' Weekly Chronicle in 1786, by which time the latter title had been dropped from the Gazette. At the end of the eighteenth century the three Halifax papers enjoyed a tranquil Nova Scotia journalistic monopoly. Alike as three peas in a pod, they amiably shared in the printing patronage being given by the Halifax-centred government. Howe's paper lasted until 1870, while the Chronicle perished in 1837.

Meanwhile the only other press ventures in Nova Scotia had not been so successful. At Shelburne, the Royal American Gazette of James and Alexander Robertson and Nathaniel Mills, the Port Roseway Gazetteer and Shelburne Advertiser of James Robertson Jr. and Thomas and James Swords, and the Nova Scotia Packet and General Advertiser of James Humphreys had appeared after the founding of the Loyalist town in 1783. But when the British Government withdrew its financial aid to the centre in 1787, the town collapsed and the papers soon perished.

The second newspaper in New Brunswick was the Royal Gazette and General Advertiser, begun in 1785 by Christopher Sower III, who was made King's Printer of the new Province. When Sower left for the United States in 1799, John Ryan succeeded him in his governmentappointed office, and the paper, which underwent more than one change of name, became
known as the Royal Gazette and New Brunswick Advertiser. It lasted until at least 1814. An abortive production, the Fredericton Telegraph, was started by Ryan's son Michael in 1806, but it died early in 1807.

Even the "official" newspapers of Prince Edward Island had a most difficult early existence since government support was of the most niggardly kind. Robertson's Gazette certainly lasted no longer than 1789. W. A. Rind printed the Royal Gazette and Miscellany of the Island of St. John from July 1791 to July 1792. In 1805 James Douglas Bagnall started the Royal Herald, but it was not much longer-lasting.

In Lower Canada the Quebec Gazette was joined by a paper of comparable vigour and individuality. This was the Montreal Gazette, first published as the French-language $L a$ Gazette du Commerce et Littéraire by Fleury Mesplet in 1778, and boasting a rather tenuous connection with Benjamin Franklin. Its early vicissitudes sprang from the improvidence of Mesplet and the indiscretions of his outspoken editor, Valentin Jautard, but later, favoured with patronage somewhat similar to that enjoyed by the Quebec Gazette in Quebec City, it was able to stand off the challenge of Louis Roy who, in 1795 and 1796 , issued a journal practically identical in format and bearing the same name. Edward Edwards was the editor of the original Montreal Gazette during this period of strange competition. The older publication still flourishes as a metropolitan daily. Le Courier de Québec, published in 1788 by William Moore, lasted for only three editions but its English counterpart, the Quebec Herald, had better success. The Times-Le Cours du Tems, begun by John Jones in June 1794 and continued by William Vondenvelden, ceased to publish in July 1795. The Quebec Mercury, founded by Thomas Cary in 1805, lasted until 1903, and Le Canadien, originated by Pierre Bédard and François Blanchet in 1806, continued until 1909. Their greater prominence came during the second press period.

In what is today Ontario, the official Upper Canada Gazette was the only paper to enjoy much success until after 1807. Its chief impermanence was that of editorship, with Gideon Tiffany, Silvester Tiffany, Titus Geer Simons, William Waters, John Bennett and John Cameron serving in ill-defined editor-printer roles before the period's end. The paper lasted until at least 1845.

The Tiffany brothers established Upper Canada's second newspaper, the Canada Constellation, at Niagara in 1799. When it ceased publication in 1800, Gideon Tiffany left Canada for the United States. Silvester Tiffany began the Niagara Herald in January of the following year, but it survived only until August 1802. Upper Canada's fourth newspaper, Joseph Willcocks' Upper Canada Guardian and Freeman's Journal, appeared in September 1807 at the very close of the first journalistic era. During its short career, which ended in 1812, it was to take on the new and characteristic tone of the second British North American press period.

## Characteristics of Early Newspapers

The character of the earliest newspapers was determined largely by the conditions under which they were produced. Because the pioneer news-sheets of the six eastern colonies were dependent for existence on the revenue which government patronage provided, a large part of their content consisted of government announcements, proclamations, orders and enactments. The first editor to become established was normally King's Printer even though he did not always carry that title. Even the so-called non-government press was frequently paid for publishing governmental matter. Another type of newspaper matter that was especially prominent was foreign news. Since newspaper subscribers were isolated from the more civilized parts of the world, stories from populous places were eagerly read even though they were usually months old. Such reports were preferred to local news accounts which passed by word of mouth faster than the slow weeklies could disseminate them. Advertisements were for the most part small, unemphatic and unimaginative, but they helped to supplement meagre revenues. Insertions ranged from those offering legal services, school lessons and property for sale to the tasteless and lengthy listings of general store commodities.

The pervasive dependence of the early press on government support and patronage had an important effect on newspaper tone between 1752 and 1807. The early editor was almost completely subservient to the officials of the day; since he needed government business, he carefully avoided comment on the conduct of those in authority. With rare and rather accidental exceptions, he refrained from examining contentious political questions. Such general newspaper docility made the characteristic journal of the time a pallid, neutral, harmless sheet without any really vital role to play in the social and political life of the community.

In keeping with its innocuous character, the pages of the journal of that day looked like the dull, unbroken columns of Hansard. What few heads it used were chiefly label heads, not much larger than the body type of the stories they introduced. Illustrations were extremely small wood cuts that were generally restricted to the advertisements. Because the papers of 1752 to 1807, unlike their modern counterparts, were read thoroughly from beginning to end by most readers, because stories did not have their endings lopped off at the last minute to make room for late news, and because no overworked head-writers were kept busy supplying headlines for a constant flow of news stories, there was no reason for using the inverted pyramid writing convention common in the modern newspaper. The "lead", as the twentieth century reporter understands it, was unknown. Instead, news accounts were presented in chronological order and written in discursive, literary style. News was not departmentalized, but items were generally thrown into the paper as they came to hand, so that two issues of the same news-organ were usually quite dissimilar in format. Early journals were closer to the modern tabloid than to the modern "bedsheet" urban daily in page size, although they varied considerably in both shape and size. The Halifax Gazette, for example, started as a half-sheet of foolscap and was a two-column production. Other papers were folio or quarto, while still others were not one of the standard sizes at all. The early news-sheets rarely contained more than four pages.

Since newspaper production was usually a laborious one-man operation that used a hand-operated, flatbed press employing handset type, press-runs were small and publication no more frequent than once a week. Small populations also kept circulations low. Thus the Halifax Gazette began life with only 72 subscribers, the Royal American Gazette of Charlottetown had a circulation list of not more than 50 names, and the first issue of the Quebec Gazette had only 143 buyers. At the end of the period, the three weeklies in Halifax had a combined circulation of 2,000 .

## Magazine Journalism

The magazine press was virtually non-existent during the first journalistic period. The earliest periodical was the Nova Scotia Magazine and Comprehensive Review of Literature, Politics and News, a Halifax monthly begun in July 1789 with Rev. William Cochran as first editor and John Howe as printer. Later Howe edited it as well. The project was abandoned in March 1792. Second of its kind, The Quebec Magazine, half of which was written in French, appeared monthly in Quebec City with Alexander Spark as editor, Samuel Neilson as first, and his brother John as later printer. It existed from August 1792 to May 1794. In the same City, John Neilson also edited The British American Register throughout its short life from January to August, 1803. The Nova Scotia and New Brunswick or Historical, Literary, Theological and Miscellaneous Repository was established in Halifax in 1806, but it too did not last long.

## Second Period: Consolidation and Growth, 1807 to 1858

Whereas the first period was a time of journalistic pioneering, the 1807-to-1858 era in Canadian journalism was a time of consolidation when the transplant growth of the early years thickened and roots were sunk deeper. There was a steady proliferation of newspapers in the two Canadas and in the four maritime colonies.

## Numerical Increase

The economic basis for the accelerated newspaper growth of the first half of the nineteenth century was furnished by the great gains made in population and wealth. The suddenly rising activity of the timber trade, which was the first primary industry to provide a return-cargo situation favourable to immigration, the shipbuilding boom in New Brunswick, depressed conditions in Europe, and the postwar attraction of Americans to British North America after 1815, caused new settlers to flock into the young, developing country. They flowed into the seaport towns of Nova Scotia, the river valleys of New Brunswick, and the lakeshores and forests of Upper Canada. The latter province alone increased in population from 213,000 at the start of the influx of the 1820 's to 430,000 after 1830. In the decade of the 1840's the combined provinces of Canada gained 677,000. Particularly in Canada West there was a growing specialization in primitive manufacturing, involving a transfer from the home to the local shop. Grist millers, tanners, wagon makers, whisky distillers, brewers, cobblers, weavers and blacksmiths began to establish themselves in the new centres to serve the surrounding community. The enterprising editor found a ready welcome in the group, and as towns sprang up new journals were established.

The mortality rate among such newspapers was high, but where one news-organ died two sprang up to take its place. The result was a steady increase from fewer than 20 newssheets in 1813 to 291 in 1857. No records have been left to show the year-by-year increase in each province, but some figures from Upper and Lower Canada indicate the trend. In 1813, when many journals were casualties of the war with the United States, there were five newspapers in Lower and one in Upper Canada. In 1824 there were 12 in the former and seven in the latter province. By 1827 the combined total had dropped to 17 but by 1829 the number had grown to 27 , by 1831 to 37 , and by 1836 to 50 . Of the latter, 30 were in Upper Canada. By 1853 Canada West boasted 114 news-organs; by 1857 it had 159. Canada East supported 54 in the latter year.

Some Important Newspapers of the Period
It would be impossible even to list all the newspapers that came into existence during the first half of the nineteenth century. It is perhaps sufficient to mention only the most important. These were notable for their longevity or for their role in the political and social movements of the time or because they were pioneers in their local communities. Upper Canada newspapers boasting a continuous existence (some with name changes) right down to the present day are the Kingston Gazette, established by Stephen Miles in 1810, the Brockville Recorder (Chauncey Beach, 1820), the Christian Guardian (Egerton Ryerson, 1829), the Belleville Intelligencer (George Benjamin, 1834), the Bytown Packet (William Harris, 1844), the Toronto Globe (George Brown, 1844), the Hamilton Spectator (Robert Smiley, 1846), and the London Free Press (William Sutherland, 1849). Of these the Christian Guardian has become The United Church Observer, the Bytown Packet is now the Ottawa Citizen, and the Globe is now the Globe and Mail. Two other papers important in their day were the Colonial Advocate (1824-1834, William Lyon Mackenzie, founder and editor) and the Toronto Leader (1852-1878, James Beaty).

A significant Lower Canada paper still publishing is Le Courrier de St. Hyacinthe (J. P. Guité and A. De Grandpré, 1853). The Montreal Herald (founded by William Gray, 1811) was absorbed by the Montreal Star in 1957. La Minerve, founded by Ludger Duvernay in 1826, lasted until 1899, and the Irish Vindicator (Dr. Daniel Tracey, 1828) perished in 1837. In Nova Scotia the Novascotian (George Young, 1824) disappeared as a separate entity in 1926 when it became part of the still flourishing Chronicle-Herald of Halifax, while the Yarmouth Herald (Alexander Lawson, 1833) has retained both its name and identity. The Acadian Recorder (Anthony Holland, 1813) went out of existence in 1930. The New Brunswick paper, the Saint John Courier (Henry Chubb, 1811) lasted until 1865. The Charlottetown Examiner (Edward Whelan, 1847) ceased publishing in 1922. The Times and General Commercial Gazette (J. W. McCoubray, 1832) flourished in St. John's, Newfoundland, until 1895.

## The Growth of the Private Enterprise Press

The journalism of 1807 to 1858 differed from that of the earlier era not only in numbers but also from the standpoint of newspaper tone and subject matter. Contributing to the latter was the appearance of a new kind of editor. He was the entrepreneur who established a press independent of the revenue from government business. Unlike his predecessor, he made money chiefly by printing advertisements and selling his papers to a gradually widening circle of readers. With this shift from government patronage, he became increasingly self-sufficient and was no longer afraid to involve his newspaper in the major issues of the day. His coverage of local news was still pitifully weak by modern standards, but he more than made up for it by his forthright editorial comment on contentious social and political issues.

## Newspaper Content and Style

The subject to which the new-style editor gave most sustained attention was the 'Responsible Government' issue. The seeds of the struggle which led to the ultimate achievement of the important constitutional principle in 1849, were contained, for the Canadas at least, in the granting of Representative Government by the Constitutional Act of 1791 . For Lower Canada the concession was a gift unwanted and unasked. The French Canadians were more interested in the preservation of their language, laws and customs than in the questionable advantages of an unfamiliar parliamentary device. They used the new representation in the newly created Assembly to fight for their racial and religious aspirations. In the process they tried to get control of the public purse strings as a means of achieving their ends, and insisted on such concessions as an elected upper house and legislative appointment of judges. In the struggle over these issues there grew up a bitter enmity between the Assembly and the Governor sent out from England. In Upper Canada the battle waged by the Assembly and the people was against the nepotism and privilege of the Family Compact and the inequities of the Clergy Reserves. In the Maritimes, despite traditions of moderation and harmony, there was a similar fight waged against those in power. Out of the conflicts in all three regions came the mature and useful Responsible Government concept so important in the Canadian political system. At the beginning of the movement it is probable that no one, including newspaper editors, could foresee the constitutional consequences of their long fight. It was only very late in the story that even the most enlightened leaders saw the full shape of their achievements.

In the day-to-day campaigning, however, the press played a prominent part. First newspaper participation came just as soon as the lines of political battle were drawn, right after the turn of the nineteenth century. The increasingly bitter rivalry between the Mercury and Le Canadien in Lower Canada after 1806, the spirited anti-government strictures of Joseph Willcocks' Upper Canada Guardian or Freeman's Journal which began in Upper Canada in 1807, and the vigorous criticisms of the 'Little Compact' which Anthony Henry Holland in the Maritimes carried in the Acadian Recorder from 1813 on launched a long press consideration of the gradually evolving constitutional device. It was a matter that was to feed the fires of general newspaper debate until at least 1849 in five provinces, and was to receive attention from the Newfoundland press as late as 1855.

It was during this development that individual newspapers came to be labelled according to the political stands they took. As those who were debating the Responsible Government issue became increasingly doctrinaire in their views, the majority of the important journals came to be known either as Reform or anti-Reform. Vigorous Reform papers included Le Canadien, La Minerve, Irish Vindicator, Liberal, Colonial Advocate, Hamilton Free Press, St. Thomas Liberal, Colonial Patriot, Pictou Chronicle, Yarmouth Herald, Saint John Courier, Head Quarters, Prince Edward Island Register, Palladium, and Newfoundland Patriot. Supporters of the Tory cause had among their number the Quebec Mercury, Montreal Gazette, York Patriot, Courier of Upper Canada, Kingston Herald, Montreal Herald, Toronto Mirror, Pictou Observer, Cross and Olive Branch, Christian Messenger, Halifax Times, Saint John Herald, Loyalist and Conservative Advocate, and Islander. Newspapers which avoided the extremes of both the fiery radical and ultraconservative viewpoint and which might be designated as 'moderate Reform' were well
represented by the Quebec Gazette (when it was edited by John Neilson), Christian Guardian. Toronto Examiner and Montreal Pilot. Since it was nearly impossible to divorce politics from the conduct of a newspaper at this time, editors were usually politicians, and politicians were usually editors as well. Thus such important figures of Canadian history as Edward Whelan, Joseph Howe, James Haszard, Etienne Parent, Ludger Duvernay, Dr. Daniel Tracey, William Lyon Mackenzie and Francis Hincks were representatives of both spheres of the country's life.

Political discussion did not make up the entire newspaper content during this period. Some new features appeared. As communities became a little too large for word-of-mouth coverage, local news began slowly to occupy a somewhat larger place in the press. This was not reported in the objective fashion of the modern news story-even accounts of fires, drownings and other disasters were heavily interlarded with opinion and comment. Local items were often displaced by foreign exchanges which were frequently high in human interest value but usually of little consequence to the reader. Long abstracts from literary classics and near-classics still occupied a large part of newspaper space. But these began to share position with features of more practical interest and usefulness to British North Americans, such as the letters of Agricola and Mephibosheth Stepsure in the Maritimes. Newspaper reporting of Parliament as we know it today had its beginnings during this period. Advertising gained in prominence and importance. At this time advertisers began to get away from mere announcements of their products, and started to make extravagant claims for items they had to sell. This was particularly true of patent medicines, described in terms that can only seem highly offensive to persons living in the present-day society of Drug and Pure Food Acts and of Better Business Bureaux.

Make-up changes were extremely gradual during this period. The innovations made by James Gordon Bennett Sr. in his New York Herald had at this time small influence on the British colonies to the north. The occasional exclamatory bold-face headline-effusions of such men as Mackenzie were motivated by political passion rather than a purely commercial desire to catch the eye of the potential reader. In style and tone, editors wrote copy with an elegance and classical scholarship rarely found today. At the same time the nineteenth century editor was guilty of circumlocutions, discursiveness and, on occasion, pretentiousness. The inverted-pyramid construction of the modern news story was unknown to him. An accompaniment of his subjective news-treatment was his bitter and vituperative attacks on political foes and other persons with whom he disagreed. Invective, diatribe and billingsgate became the measure of the political hot temper of British North American constitutional debate of the period, and the newspapers reflected the spirit of the day. Such press outspokenness was not inconsistent with governmental restrictions which were imposed upon newspaper freedom up to at least the middle of the 1807-to-1858 period: the fact was that while they were most severely curbed in their attempts to discuss the behaviour of those in authority, journalists were usually allowed, for the most part by their victims' defaulting of the issue, the utmost freedom in their treatment of private individuals.

## Gains in Press Freedom

The struggle for Responsible Government and the new spirit of vigorous independence which animated the journalism of the second period had important consequences in terms of freedom of the press. Editors became daring enough to challenge the authority of officials to dictate absolutely what newspapers might or might not publish. Since those in power were unwilling to give up easily their legal right to censor the press, innumerable clashes between editors and the authorities took place. In the beginning the consequences were pretty disastrous to the journalists. Pierre Bédard, François Blanchet, Ludger Duvernay, Jocelyn Waller, Dr. Daniel Tracey, Bartimus Ferguson, Richard Cockrel, James Durand, Francis Collins, William Lyon Mackenzie, William Wilkie, Anthony Holland, James Haszard, John Hooper, Dr. Edward Barker, Henry Winton, and R. J. Parsons all suffered because of the outspoken stands they took on questions of public interest. Their story is a monotonous repetition of government victory and newspaper

Despite the predictability of result of such contests, however, there were important gains in terms of press liberty. For one thing, the authorities were finding, to their cost, that it did not pay to martyrize their newspaper enemies. They discovered that their harsh treatment of such men as Ferguson and Collins aroused bitter opposition to their rule, so that they were much more reluctant to punish Mackenzie when he levelled his strictures against their arbitrary acts. Of more critical importance still was Howe's momentous legal victory in a libel trial in Halifax in 1835. The court battle was precipitated by a letter of scathing criticism of the magistracy of the seaport centre which had appeared in Howe's newspaper, the Novascotian. Unlike John Peter Zenger in New York a hundred years before, Howe found no lawyers willing to represent him at his trial, so he undertook his own defence. Through his brilliant eloquence rather than his legal skill, he won a resounding victory. It was as significant in Canadian, if not in international, terms as such English precedents as the publication of Milton's Areopagitica, the triumph of John Wilkes, the Letters of Junius, the victories of Crosby and Oliver, and the ultimate vindication of Cobbett, Wooler, Hone and Carlile.

At the same time the Howe trial was no more consequential to the liberty of the press than were the achievements made in other British North American areas. As with England in an earlier age, many press-freedom victories were won in the political and religious arena. As the citizen of the new land gained the right to believe as he wished about God and about political matters, and as the granting of Responsible Government introduced a new climate of intellectual tolerance, journalism lost many of its shackles. Thus, topics that had been forbidden before were made proper subjects of free debate, and newspaper freedom increased accordingly.

## Mechanical Changes in the Press

There were several improvements in newspaper production by 1858. The gradual clearing of the forests and the building of roads made news-gathering somewhat easier and faster. The introduction of the magnetic telegraph into the Canadas in 1846 and into the Maritimes in 1849 made it possible for journalists to take advantage of the speed-up of communications brought about by the conversion of ocean-going vessels from sail to steam after 1838. The full effect of new invention was not felt, however, until the third press period. The printing of newspapers gained from the change from wood to iron presses and from the increasing use of power presses after 1840. Another impetus was given by the first manufacture of paper in the Canadas in 1830, but the entire mechanical operation was greatly retarded by the time-consuming handsetting of type which continued to be the method used. What inventions were introduced had the effect of increasing the costs of newspaper equipment and hence of newspapers. Thus it required five annual payments of $£ 210$ each to purchase the Novascotian in the middle of the period.

The same development that accelerated news-gathering also aided newspaper distribution. In addition to better transportation and communication, a slow increase in literacy enlarged potential readership. At the same time two factors caused difficulties for the editor. High mailing costs made news-organs more expensive and restricted circulations. Then, too, the failure of editors to require payment for subscriptions in advance left uncollected and uncollectable debts owing to them that were often ruinous. Circulations of newspapers continued to be small. The Novascotian, which was a leader in its field, was considered to be doing very well when its subscribers reached 1,500 .

Despite the introduction of the telegraph, the weekly news-organ was still more important than the daily. In 1833 the Montreal Daily Advertiser became the first paper of that frequency in British North America, but it was unusual for its time. It was not until 1849 that the first successful daily began to publish in Canada West, and not until the third press period that the daily newspaper began to surpass the weekly in importance.

## The Magazine Press

During the second journalism period the magazine press was considerably more active than during the earlier era. For all that, the periodicals that were established found survival a struggle. Every single publication founded during the first half of the nineteenth century perished after a greater or lesser tenure of life. It was only the constant appearance of new magazines that gave any kind of continuity to this form of journalism. What further weakened any contribution such publications may have made to Canadian life and letters was that much of their content was made up of borrowings from British and American writers, while Canadian writing was usually imitative, derivative, and of inferior literary merit.

Among the most important magazines to appear at this period were: The Acadian Magazine (1826-1828, J. S. Cunnabell); Halifax Monthly Magazine (1830-1833, J. S. Cunnabell); The British North American Wesleyan Magazine (1840-1844 and 1846-1847, James Hogg); The Amaranth (1841-1843, Robert Shives); The Provincial Or Halifax Monthly Magazine (1852-1853, Mrs. William Lawson); Literary Garland (1838-1851, John Gibson); Anglo-American Magazine (1852-1855, Rev. R. J. McGeorge); Canadian Journal (1852-1878, Henry Youle Hind); la Bibliothèque Canadienne (1825-1830, Michel Bibaud); le Magasin du Bas-Canada (1832, Michel Bibaud); l'Observateur (1830, Michel Bibaud); l'Encyclopédie Canadienne (1842-1843, Michel Bibaud); la Ruche litteraire et politique (1853-1859, H. E. Chevalier).

## Third Period: Spreading Growth, 1858 to (circa) 1900

Canada's third press period may be taken to have lasted from 1858 to about the end of the nineteenth century. What particularly distinguished this newspaper era from its predecessor was a movement of journalism westward. The growth, which had sunk its roots deep into the eastern soil during the second press age, spread in the wake of settlement, beyond the Great Lakes to the prairies and the Pacific Coast area. It was a new time of journalistic pioneering.

The arrival of the settler in the western provinces and northern territories made possible the introduction of the press into the Pacific Coast region and the prairies. What is today British Columbia was a land of fur-traders and explorers until the discovery of gold on the Fraser and Thompson Rivers in 1856 started an influx of settlers that was in full tide by 1858. By that time an estimated 25,000 persons had arrived from California, Oregon, Washington, Utah and other western States, as well as from Hawaii, and Central and South America. These people were largely funnelled through Esquimalt and Victoria, which suddenly became centres capable of supporting a press. Then, as more gold discoveries lured the prospector farther inland along the river valleys, conditions became propitious for the spread of journalism into the interior.

What made Manitoba ready for the new development was the ending of its long isolation from the older portions of British North America. This change of affairs was brought about by several circumstances. Fear of United States domination of the Selkirk colony, heightened by the arrival of a detachment of the American army in Pembina in 1857, caused Canada to send a body of troops to the region soon afterwards. Expeditions by Capt. John Palliser, James Ross and Prof. H. Y. Hind, and the writings of George Brown in the Globe and William McDougall in the North American aroused interest in the new settlement. When the Anson Northrup navigated the Red River to Fort Garry in 1859 the Mississippi steamboat system was extended to Rupert's Land, and when a short time later the railway reached St. Paul, the isolation was broken, and newspapermen were able to start operations.

Saskatchewan and Alberta waited for the inrush of settlers into the empty prairies in the late 1870's and 1880's before press activity began. The Homestead Act of 1872 and the establishment of the North West Council to govern the Territories in the same year; the arrival of the Canadian Pacific Railway in Calgary in 1883; development of wheat varieties more suitable to the growing conditions of the prairies; discovery of the advantages of such
better dry farming practices as deep seeding and summerfallowing; and the introduction of many greatly improved agricultural implements were some of the factors which contributed to the population growth which made prairie journalism possible.

The story of newspaper pioneering in the Canadian North was a repetition of the British Columbia experience, delayed by forty years. Gold was discovered in the Klondike in 1896 and, in consequence, 40,000 newcomers entered the new land during the eighteen months prior to 1900. The resulting establishment of such centres as Dawson City, which had a population of 20,000 in 1899, provided the conditions needed to support a viable press.

## Pioneer Newspapers of the West

Of Canada's four future western provinces the first to acquire a news-organ was British Columbia. The start was made in Victoria in 1858 when H. C. Williston and Columbus Bartlett founded the Victoria Gazette. William Buckingham and William Coldwell launched journalism in Manitoba when they began the Nor'-Wester in 1859. Patrick Gammie Laurie's Saskatchewan Herald began to serve the town of Battleford in 1878 and so became the Saskatchewan pioneer. The Province of Alberta gained its first newspaper in 1880 when Frank Oliver established the Edmonton Bulletin. In the two latter cases, of course, the appearance of the news-organ preceded the formation of the province by many years. Almost equal claim to the title of Yukon pioneer was established in 1898 by two papers to appear in Dawson City. These were the Klondike Nugget, owned and edited by George M. Allen, and the Midnight Sun, first owned and edited by G. B. Swineheart.

As might be expected, the early northern and western newspapers were at first published under conditions as primitive and precarious as those attending the introduction of the press to British North America between 1752 and 1807. Buckingham and Coldwell hauled their equipment 500 miles from St. Paul to Winnipeg, signed up an Indian Cbief named "Hole-In-The-Day" as their first subscriber, and had to thaw out frozen equipment before they began their printing operations. To carry journalism deep into British Columbia, newsmen had to drag their equipment along the rocky banks of precipitous rivers. It is little wonder that one newspaper sold for a dollar a copy. Patrick Gammie Laurie's pioneer venture involved a wagon journey that took him across rivers that did not boast a single ford or ferry. Frank Oliver paid only four dollars for what was really just a toy hand press, used the gift of type and other supplies from his friends on the Manitoba Free Press, and so spent only 821 to get his newspaper started. Lacking other power for their cumbersome drumcylinder press, the printers of the first paper in Macleod hired a dozen Indian braves to operate their unwieldy equipment in what was a colourful if back-breaking operation.

## Important Newspapers of the Period

A great many important and successful newspapers appeared during the third press period. They shared the field with such well-established journals surviving from an earlier day as the Montreal Gazette, (which was served by such journalists as Thomas, Richard and Robert Smeaton White), Quebec Gazette (Frank Carrel), Montreal Herald (Edward Goff Penny, James Brierley) and Toronto Globe (Gordon Brown, John Cameron, Sir John S. Willison, E. W. Thomson, Edward Farrer, J. A. Ewan), Hamilton Spectator (William Southam Sr.), London Free Press (Josiah Blackburn), Brantford Expositor (T. H. Preston), Belleville Intelligencer (Mackenzie Bowell) and Halifax Chronicle (William Annand, W. S. Fielding). Newspapers which started life between 1858 and 1900 and which still exist or which entered the life-stream of journals which still publish include: Mail (1872, T. C. Patteson, Kit Coleman), Empire (1887, Louis P. Kribs), Toronto Telegram (1876, John Ross Robertson, John "Black Jack" Robinson), Toronto Star (1892, Joseph E. Atkinson), Ottawa Journal (1885, P. D. Ross), St. Catharines Standard (1891), Kitchener-Waterloo Record (1878), Oshawa Times-Gazette (1871), Montreal Star (1869, Hugh Graham, later Lord Atholstan), La Patrie (1879, Honoré Beaugrand, P. M. Sauvalle, Israel Tarte), La Presse (1884, Trefflé Berthiaume, J. A. N. Provencher, C. A. Dansereau), $L^{\prime} E v$ énement (1867, Hector Fabre), Halifax Herald (1875, William Dennis, J. J. Stewart), Halifax Star

91593-59
(1873), Halifax Mail (1878), Fredericton Gleaner (1880), Saint John Globe (1858), Saint John Times (1868), Saint John Telegraph (1862, John Livingstone, J. E. B. McCready, Charles H. Lugrin, James Hannay), Saint John Journal (1865, William Elder), Moncton Transcript (1882, James Hannay, John T. Hawke), Moncton Times (1868), Weymouth, later Moncton L'Evangeline (1887, Valentine Landry), Charlottetown Patriot (1857, David Laird), Charlottetown Guardian of the Gulf (established as Presbyterian Union in the 1870's, Rev. S. G. Lawson, W. L. Cotton), St. John's Telegram (1879, W. J. Herder, T. D. Carew, P. K. Devine), St. John's Daily News (1894, Dr. J. A. Robinson, H. Y. Mott), Victoria Colonist (1858, Amor de Cosmos), Victoria Times (1881), Nanaimo Free Press (1874), New Westminster British Columbian (1860, John Robson), Vancouver Sun (1886), Vancouver Province (1894, W. C. Nichol), Manitoba Free Press (1872, W. F. Luxton, J. A. Kenny), Winnipeg Tribune (1890, R. L. Richardson), Brandon Sun (1882), Calgary Herald (1883, T. B. Braden, A. M. Armour, H. S. Cayley), Medicine Hat News (begun in 1885 as the Times by Braden and Armour), Regina Leader-Post (1883, N. F. Davin), Moose Jaw Times (1889, J. N. Macdonald) and Prince Albert Herald (1896). Some journalists who served on papers which are mentioned in an earlier section of this article as having lasted right through the third period only to perish during the fourth were J. P. Tardivel, Ernest Myrand and J. E. Cauchon of Le Canadien, H. W. Blackadar Jr. and Sr., and C. C. Blackadar of the Acadian Recorder, and Honoré Mercier of Le Courrier de St. Hyacinthe. Napoleon Aubin and L. L. Viger served on Le Pays, a paper which also originated in an earlier day and which is now extinct. Joseph Tassé and Oscar Dunn were connected with La Minerve, previously mentioned, and M. A. Plamondon served on Le National (1855-1878), J. B. E. Dorion on Le Défricheur (1862-1867) and E. T. Sanders and C. E. D. Wood on the Fort Macleod Gazette (1882-1908).

## Numerical Increase

During the third press period, the press of Western Canada was achieving much the same kind of development that the journalism of Eastern Canada had accomplished during its pioneering stages. At the same time, the newspapers in the older part of the country were making good progress on their own account. The following table shows the increase in numbers during the period.

NUMBERS OF PERIODICALS IN BRITISH NORTH AMERICA, 1857-1900
Nors.-Includes territory of present-day Canada.

[^302]
## Newspaper Content and Style

The subject matter of Canadian journalism in the last half of the nineteenth century was largely determined by the events and issues of the day. Although domestic political developments continued to occupy a significant share of newspaper attention, discussion of the Responsible Government question was replaced in turn by a consideration of Confederation, the Washington Treaty, the Pacific Scandal, the building of the Canadian Pacific Railway, the two Riel Rebellions and the Manitoba School question. In addition, particularly towards the end of the period, the press gave more attention to questions of international concern. The papers had always carried foreign news, but formerly the coverage had been that of the remote observer, and the newer reports gave a sense that readers were participants in world affairs. This change was partly caused by the fact that, with speedier news-gathering methods, foreign items no longer appeared as ancient history, and partly because increasing Canadian autonomy indicated that Canada was preparing for greater international activity. The interest and involvement of Canada in such matters as the South African War, the Alaska boundary dispute and conferences on pelagic sealing, for example, are readily understandable, but citizens the of new country showed themselves to be interested observers of such events as the Dreyfus trial-a fact which Canadian newspaper reporting amply demonstrated.

During the 1858-to-1900 period newspaper reports became freer of the editorial opinion that had marked their earlier counterpart, but the news-story still lacked the format of the twentieth century prototype. Editorial comment, now somewhat more closely confined to the editorial page, was still characterized by the vitriolic abusiveness that had disgraced earlier newspapers. A comparable blot on newspaper records was the practice of writing careless libel, of writing matter which would bring convictions for contempt of court today, and of commenting freely on questions which now would be classified as sub judice. Advertising, particularly of patent medicines, continued to be irresponsible, such matter being shamelessly disguised as news accounts with extravagent claims being made for the curative and life-saving powers of the items sold. On occasion, such deadly articles as devices to procure abortion were offered openly in the press.

While very few new kinds of stories appeared in the late Victorian press, there was a growing tendency to departmentalize the news. A cautious use of bolder headlines was made, but eight-column, 72 -point and larger banners were still rare. Label heads continued to appear fairly frequently, but the more exciting stories began to carry several decks after the fashion of the New York Herald. These gained variety through inverted pyramid and hanging indent arrangements.

Pictures, mainly line drawings, began to make their first modest appearance in the daily and weekly press. On June 3, 1871, the Canadian Illustrated News carried a photograph of Montreal's new Custom House. According to the Montreal Gazette of Oct. 13, 1956, this was the "first time that a photograph had been successfully transmitted to the printed page." However, it was not until Max Levy of Philadelphia developed the crossruled screen in 1886 that a really successful method of reproducing photographs in newspapers was achieved. In Canada the Dominion Illustrated introduced a practical form of the half-tone illustration in 1888, but the possibilities of the new device were little realized by the end of the century.

## Mechanical Changes in the Press

Many mechanical improvements in the press occurred during the 1858-to-1900 period. These included the introduction of wood pulp manufacture into Canada in 1866, the first adoption of electrically driven rotary power presses after 1890 , and the use of better folder attachments and improved inks. But perhaps the most revolutionary invention of all was Mergenthaler's linotype, first demonstrated in the New York Tribune in 1886, and available in improved form in 1889. This was to find increasing Canadian use from the 1890's onward. It was these inventions primarily that caused the dramatic transformation of the press which oharacterized Canada's fourth journalistic period.

91593-593

## The Daily Newspaper

Such inventions of the second press period as the magnetic telegraph began to produce results during the third. These improvements contributed greatly to the growing "day-to-dayness" of the newspapers of the new Dominion, and accounted in no small measure for the growing sense of nearness of distant events previously referred to. The daily paper increasingly dominated the newspaper field. Whereas there had been 20 daily newspapers in Upper and Lower Canada in 1857, the provinces that entered Confederation in 1867 had 46 dailies in 1874, 61 in 1881, 91 in 1891, and 121 in 1900. It should not be inferred from the relative increase in importance of the daily that, in absolute terms, the weekly was declining. The table on p. 930 shows otherwise. Moreover, the weekly had not completely abdicated the national and international news field in favour of the daily newspaper to become the community press as it was largely to do by the mid-twentieth century. The continuing interest of the weekly in matters of larger than regional concern was particularly evident in the press of Western Canada.

The increase in daily newspaper numbers conveys the magnitude of the change occurring only when considered in conjunction with the accompanying circulation growth, and also with the fact that a daily is issued six times as often as a weekly. In 1900 , daily newspapers had 570,000 subscribers. La Presse led the field with a circulation of 66,500 , the Montreal Star following with 50,312, the Toronto News had 43,635 and the Toronto Globe, 36,000 . It should be noted that technological change was not the only factor contributing to this rise of newspaper circulations. More advantageous postal rates, a larger population and a continuous growth of literacy had their effects as well.

Another consequence of improved press equipment was a rise in press costs. Thus, in 1883, the Regina Leader, not Canada's largest newspaper by any means, was established with a capital of $\$ 20,000$. Nor was the Vancouver Province the richest journal in Canada in 1899 when it had a capitalization of $\$ 100,000$. Such enterprises as these required larger staffs than their 1856 predecessors. In place of the publisher-printer-editor factotum who had issued his news-sheet in 1837 Rebellion days, 86 persons were employed on the News-Advertiser, World, and Telegram in Vancouver in 1892. In 1899, the Vancowver Province was produced by an editor, a subscription manager, city editor, advertising manager, three reporters, an accountant, two clerks, a composing-room foreman, six compositors, a pressroom foreman and two stereotypers. La Presse, having a circulation thirteen times as great, obviously required a larger staff.

## Press Organizations

A new element of the newspaper story during the period was the beginning of press associations. The most important of these was the Canadian Press Association, which was started in 1859. It was in no sense a closely knit professional body, but rather a loose confraternity of journalists whose main interests were social and occupational rather than business. It had as lesser counterparts the Province of Quebec Press Association, founded in 1876; Eastern Ontario Press Association, 1879; Presse Associée de la Province de Québec, 1882; Eastern Townships Press Association, 1889; Western Canada Press Association, and the Ottawa Valley Press Association.

## Gains in Press Freedom

The third press period brought important gains in newspaper freedom. Whereas earlier progress had been accomplished through court trials and a widening tolerance in related fields, the new advances were achieved through new legislation. The advantage gained was twofold: in the first place, the new laws granted certain concessions not previously permitted under common law practice; secondly, by defining what a newspaper was and by making more explicit what did and what did not constitute defamation in the press, these enactments permitted editors to see more clearly what publishing ground was safe and what was dangerous. The areas of greatest gain were in the definition of defences open against libel charges and a spelling out of the types of report which were to be privileged in the press.

The new legislation was based on Fox's Libel Act of 1792, Lord Campbell's Act of 1843, the Newspaper Libel and Registration Act of 1881, and the Law of Libel Amendment Act, 1888, all of them British legislation. Criminal law in the matter was enacted for Canada in 1892. This had, of course, a uniform, nation-wide application since the Criminal Code is an enactment of the Federal Parliament. Civil law differs from province to province, with Quebec legislation, based as it is on the Napoleonic Code, showing the widest divergence from the general pattern. Prince Edward Island, which continued to rely largely on common law practice, got its Libel Act in 1865; this was overhauled by the Statutes of Prince Edward Island of 1889. In 1892 the Criminal Code of Canada repeated those sections of the Act which dealt with criminal law. Ontario was served by an Act of 1882 which was superseded by provisions of the Revised Statutes of 1897. Since certain parts of the 1887 legislation dealing with provincial elections had reference to defamation, these provisions were also incorporated into the 1897 revision. Quebec had no libel Act, but Sections 2924 to 2938 of the Revised Statutes of 1888 laid down provisions under which newspapers might publish. Newfoundland's legislation on the question was provided by the Consolidated Statutes of 1892, and covered both criminal and civil law. The Revised Statutes of British Columbia of 1897 furnished that Province with its Libel and Slander Act. Nova Scotia's legislation came in 1900, while that of Manitoba, which had both a Libel Act and a Newspaper Act, was passed in 1902, and that of New Brunswick in 1903 as one of the Consolidated Statutes. Since Saskatchewan and Alberta were not made provinces until 1905, their newspapers did not become subject to provincial laws until after that date.

## The Magazine Press

The magazine press exhibited the same kind of discontinuity during the third journalism period that had characterized the periodical publications during the second. Without the same fecundity that marked newspaper journalism, magazines made a weaker showing in the new country, particularly because so many of the monthly, and even less frequently published ventures, were so short-lived. It is to their credit that there were still many publishing eatrepreneurs who refused to be discouraged by the examples of failure set, with monotonous regularity, by their predecessors. An impetus to the growth of Canadian magazine production was provided by the achievement of Confederation in 1867, more partieularly in English Canada, where there was a greater need than in French Canada for such a unifying event to give a sense of national identity to the literary contributors to such publications.

The more prominent magazines that came into being during this journalistic era (with their first editors or publishers and dates) included the British American Magazine (18631864, H. Y. Hind), Stewart's Quarterly (1867-1872, Dr. George Stewart), Maritime Monthly [1873- (circa) 1876, H. L. Spencer, Rev. James Bennet], New Dominion Monthly (18671879, John Dougal), Grip (1873-1894, J. W. Bengough), Saturday Night (1887- present, E. . . Shepherd), Canadian Magazine (1893-1939, J. Gordon Mowat), Canadian Monthly and National Review (1872-1882, G. Mercer Adam), Week (1883-1896, Goldwin Smith, Charles G. D. Roberts), Bystander (1880-1882, 1890-1891, Goldwin Smith), Les Soirées Canadiennes (1861-1865, H. R. Casgrain, A. Gérin-Lajoie, J. C. Taché, Dr. Hubert La Rue), Le Foyer Canadien (1863-1866, H. R. Casgrain, A. Gérin-Lajoie, J. C. Taché, Dr. Hubert $L_{a}$ Rue), La Revue Canadienne (1864-1873), L'Echo de la France (1865-1869, L. Ricard), La Revue de Montréal (1877-1881, T. A. Chandonnet), Le Canada Fransais (1888-1891, T. . . Hamel), Le Chercheur (1888-1890, M. J. F. Dumontier), La Revue Nationale (18951897, J. D. Chartrand), Le Courrier du Livre (1896-1901, R. Renault), Nation (1874-1876, Goldwin Smith), Nova Scotia Illustrated (1895, J. H. Bradford), Lake Magazine (1892-1893, D. K. Mason), Massey's Magazine (1896-1897), New Brunswick Magazine (1898-1905, W. K. Reynolds), and Prince Edward Island Magazine (1899-1905, Archibald Irwin).

The development of the journalism of Canada is a continuing story-a story of accelerating growth. Evidence of its constant progress is to be seen in the facts of increased circulation, wider readership, greater frequencies, extended areas of news coverage, speedier news-gathering services, increasing press wordage and enlarged newspaper plants, as well as in the qualitative refinements and improvements of the "art preservative of of the arts". The press of Canada today is indeed the result of the impressive technological developments of the past fifty years. Nevertheless, it may be said to have received considerable shaping from its first 150 years of life.

## PART I.--THE MOVEMENT AND MARKETING OF COMMODITIES

Domestic trade is broad and complicated; it encompasses all values added to commodities traded, provincially and interprovincially, by agencies and services connected with the storage, distribution and sale of goods, such as railways, steamships, warehouses, wholesale and retail stores, financial institutions, etc. Taken in a wide sense, it embraces various professional and personal services including those directed to the amusement of the people, such as theatres and sports. Only certain phases of this broad field are covered here and, wherever possible, cross references are given to related material appearing in other Chapters. The arrangement of material in a volume such as the Year Book is governed by the necessity of interpretation from various angles. The Index will be found useful in this respect.

## Section 1.-Merchandising and Service Establishments*

Complete coverage of the business of wholesale and retail trades and of service establishments is attempted only as part of the decennial census. The first such detailed survey was taken in connection with the 1931 Census and related to business transacted during the calendar year 1930. Similar detailed records were again secured with the 1941 and 1951 Censuses. The results of the 1930 and 1941 Censuses of Merchandising and Service Establishments are contained in Vols. X and XI of the Census reports for those years and the results of the 1951 Census of Distribution in Vols. VII and VIII of the 1951 Census reports. Summary data for 1951 are given in the 1955 Year Book, pp. 953-977.

The information collected at the census is supplemented in intercensal years by monthly, quarterly and annual surveys on the more important phases of the retail, wholesale and service trades-sample surveys for some businesses and full coverage for others. The 1951 Census formed a new base for such surveys and certain improvements have been implemented for continuance during the 1951-61 intercensal period.

Current information available on the more important phases of the distributive trades is given in the following Subsections. Estimates for the years prior to 1951 have been revised in accordance with the census base.

## Subsection 1.-Wholesale Trade

Wholesale Sales.-Estimated sales of wholesalers expanded from $\$ 5,744,355,000$ in 1951 to $\$ 7,720,353,000$ in 1956 . These figures include only wholesalers proper, i.e., they exclude agents and brokers and manufacturers' sales branches. Sales estimates are subject to revision and have not been adjusted for price changes.

[^303]
## 1.-Wholesale Sales by Kind of Business 1953-56

Nore.-Includes only wholesalers proper, i.e., firms performing the function of buying merchandise on their own account for resale.

## WHOLESALE SALES BY SELECTED GROUPS OF BUSINESS,

1951, 1953 AND 1956

Operating Results of Wholesalers.-The fifth biennial survey of the operating results of wholesalers for certain trades shows operating expenses and profits in ratio to net sales for the year 1955. Individual trades are dealt with in detail in DBS Bulletins.

## 2.-Operating Results of Selected Wholesale Trades 1955 <br> (Percentage of Net Sales)

| Household appliances and electrical supplies. | 18.67 | 6.92 | 1.88 | 7.18 | 2.69 | 0.15 | 2.84 |

## Subsection 2.-Retail Trade

The trend of retail trade is one of the best general indicators of the economic condition of the country. It is through retail stores that most goods are ultimately sold and such sales reflect the financial strength of the consumer except in times of short supply. The estimated value of retail sales increased five-fold during the 1930-56 period. These estimates, not adjusted for price changes, are shown by province in Table 3 and by kind of business in Table 4.

## 3.-Retail Trade by Province 1930-56

Retail Chain Stores.-Retail chains are defined as companies operating four or more retail outlets in the same or related kinds of business. A consistent rise in sales has been evident since statistics were first compiled on chain store operations in 1930.
5.-Retail Chain Store Statistics 1930 and 1941-56

${ }^{1}$ Includes other kinds of business not shown separately.
Operating Results of Retail Chain Stores.-The 1955 operating results of selected trades show generally higher gross profit ratios than 1954. However, operating expenses more than offset this advantage and, as a consequence, reduced ratios of net profit were reported in most cases. Table 7 gives summary data for ten kinds of business in the field of retail chain stores for 1955.

## 7.-Operating Results of Retail Chain Stores for Selected Kinds of Business 1955

(Percentage of Net Sales)

${ }^{1}$ Includes taxes and insurance, light, heat and power, repairs, maintenance, depreciation (except on delivery equipment) and rentals on rented premises. ${ }_{2}$ Includes salaries and wages and occupancy expenses. ${ }^{3}$ Net non-trading expenses.

Operating Results of Independent Retail Stores.-Figures for 1954 for twenty kinds of business are contained in Table 8. Separate ratios are shown for unincorporated and incorporated businesses. Salaries of proprietors of unincorporated stores are included in net profit while salaries of executives of incorporated stores form part of the expense item of salaries and wages.

## 8.-Operating Ratios of Independent Retail Stores by Kind of Business 1954

Motor Vehicle Sales.-There were 407,710 new passenger cars sold in 1956, an ail-time record. Sales of trucks and buses recovered from a drop in 1954 but did not pass the $1950-53$ level in number of units sold. Dollar sales were at record levels in both categories in 1956.

## 9.-Retail Sales of New Motor Vehicles 1947-56

[^305]Farm Implement Sales.-All regions registered an increase in farm implement and equipment sales in 1956 over 1955. Sales of repair parts, which are not recorded in Tables 10 and 11, amounted to $\$ 28,451,964$ in 1955 and $\$ 31,824,672$ in 1956-a slight increase in each year over the 1954 figure of $\$ 27,335,796$. Sales by province are shown for 1955 and 1956 in Table 10 and by type of equipment in Table 11.

Sales Financing.-Financing of retail instalment sales reached a record high in 1956 when it was in excess of $\$ 1,000,000,000$. Both consumer and commercial and industrial sectors contributed to the gain. Balances outstanding at the close of the year were also
higher as is shown in Table 12. The figures of motor vehicle sales and financing given in Table 13 show that a greater proportion of vehicles was financed in 1956 than in previous years.

[^306]Retail Consumer Credit.-Credit granted by retail stores forms a large part of the over-all consumer credit total. The total amount owing to retailers at the end of 1956 stood at $\$ 981,500,000$, almost double the 1951 figure of $\$ 545,800,000$. The rise in credit from 1951 to 1956 held by retailers is evident in Table 14.
14.-Retail Consumer Credit 1951-56 and by Kind of Business 1956

## Subsection 3.-Service Establishments

Service establishments as defined in the Census of Distribution include all those places of business where major source of gross income (annual turnover) was derived from the rendering of services as opposed to the sale of merchandise. The following types of service were covered: amusement and recreation such as motion-picture theatres and bowling alleys; personal services such as laundries and dry-cleaning plants, barber shops and shoe repair shops; certain business services such as advertising agencies and window display services; repair services such as automobile repair, radio repair and watch repair; burial services; photography, commercial and portrait; hotels and tourist camps; and other services such as cold storage locker rentals and taxis.

Summary statistics of the detailed coverage in 1951 are given in the 1955 Year Book at pp. 974-977. Annual data for certain services only are included here.

Theatres.-The receipts of motion-picture theatres increased steadily up to 1953 but decreased continuously since as shown by Table 15. Drive-in theatres, which showed the greatest development among theatres in recent years, appear to have reached their peak in 1955. In 1956 there were 237 drive-ins in operation as compared with 242 in the previous year.

## 15.-Motion-Picture Theatres and Receipts by Province 1953-56

Nors.-Figures include, in addition to regular theatres, establishments in which motion-picture entertainment is provided by community organizations such as churches, lodges, Boards of Trade, etc., as well as drive-in heatres. Halls serviced by itinerant operators are not included. Receipts are exclusive of amusement taxes.

## Section 2.-The Marketing of Agricultural Products

A special article covering the general movement of farm-produced foods from producer to consumer, with the exception of the grain trade and livestock, appears in the 1956 Year Book, pp. 917-922. Grain and livestock marketings are dealt with in detail in Subsections 1 and 2 following.

## Subsection 1.-Grain Trade

Marketing Problems and Policies, 1955-56
In 1955-56 production, marketings and exports of the five major Canadian grains combined were above the 1954-55 levels. Although the spring season was late, good weather conditions prevailed during most of the growing and harvesting periods and above-average yields were obtained for most crops. The higher level of production in 1955 was sufficient to offset by a considerable margin the decline that occurred in July-end carryover stocks. Marketings of wheat, oats and barley continued under the compulsory crop-year pools system of the Canadian Wheat Board. All grains in Eastern Canada and rye and flaxseed in Western Canada continued to be traded on the open market.

On July 19, 1955, the Canadian Wheat Board announced the delivery quota policy for the 1955-56 crop year. As in the preceding year, an initial quota of 100 units was to be effective at local delivery stations as announced (one unit being equivalent to three bushels of wheat, or five bushels of barley or rye, or eight bushels of oats). The initial quota was followed by general delivery quotas, based upon bushels per specified acre, the specified acreage consisting of the producer's acreage seeded to wheat (other than Durum), oats, barley and rye plus his acreage in summerfallow in 1955. Deliveries of Durum wheat and flaxseed were not subject to quota control. However, by July 31, 1955, some producers had not completed their deliveries under the final eight-bushel general quota established for the crop year 1954-55, and the Board extended this quota but with deliveries for the account of the 1955-56 pool. Eight-bushel general quotas at individual stations expired and initial delivery quotas for 1955-56 were established only after the Board was reasonably certain that deliveries under the eight-bushel general quota had been largely completed. By Sept. 2, initial unit quotas had been established at all delivery points. By the end of the crop year, delivery quotas varied between five bushels and eight bushels per specified acre.

Preliminary data indicate that total marketings of the five major grains in Western Canada in 1955-56 amounted to about $567,300,000$ bu., representing an increase of 8 p.c. over the comparable $1954-55$ total of $524,600,000$ bu. and 2 p.c. over the ten-year (1945-46-1954-55) average of $556,300,000 \mathrm{bu}$. Combined exports of the same grains, including wheat flour, rolled oats and oatmeal, malt and pot and pearl barley in grain equivalent, amounted to $406,500,000$ bu., exceeding both the $1954-55$ total of $370,700,000 \mathrm{bu}$. and the ten-year (1946-55) average of $369,900,000$ bu. Carryover stocks of the five major Canadian grains in all positions at July 31, 1956, were estimated at $827,400,000$ bu., about 13 p.c. above the 1955 figure of $731,900,000$ bu. and more than double the ten-year average of $399,600,000 \mathrm{bu}$.

## 20.-Supply and Disposition of Canadian Grain, Crop Years Ended July 31, 1955 and 1956

Nors.-Data for wheat include final revisions based on the 1956 Census but data for other crops are subject to change pending completion of intercensal revisions.
(Millions of bushels)

For footnotes, see end of table.

## 29.-Supply and Disposition of Canadian Grain, Crop Years Ended July 31, 1955 and 1956 -concluded

[^308]Wheat.-Supply and Disposition.-Stocks of wheat on hand at the beginning of the 1955-56 crop year were about 13 p.c. below those of the preceding year and represented a decline for the first time in seven years. Total crop-year supplies, consisting of carryover stocks plus 1955 production and imports, reached the unprecedented level of $1,056,000,000$ bu. Carryover stocks at the end of the 1955-56 crop year were about 8 p.c. higher than at the end of the previous crop year but still lower than the record carryover of July 31, 1954.

## 21.-Production, Imports, Exports and Domestic Use of Wheat, Crop Years Ended July 31, 1950-56

Note.-Includes final revisions based on the 1956 Census.
(Millions of bushels)

[^309]Price and Marketing Arrangements.-The marketing of Western Canada wheat during the $1955-56$ crop year was again conducted by the Canadian Wheat Board on a one-year pool basis, with the initial payment set at $\$ 1.40$ per bu., basis in store Fort WilliamPort Arthur or Vancouver. The initial payment for No. 1C.W. Amber Durum was continued at $\$ 1.50$ per bu. An interim payment (announced Feb. 2, 1956) amounting to a total of about $\$ 22,300,000$ was paid in varying amounts per bushel on the higher grades delivered in 1954-55. Final payment (announced May 18, 1956) on the 318,439,061 bu. of wheat delivered to the 1954-55 pool averaged 12.461 cents per bu. with the total payment for No. 1 Northern, basis in store Fort William-Port Arthur or Vancouver, and prior to deduction of the Prairie Farm Assistance Act levy amounting to $\$ 1.65066$ per bu. No adjustment payments on 1955-56 deliveries were made during the crop year but on Jan. 30 , 1957, an interim payment on the 1955-56 pool account for wheat was announced, amounting to 10 cents per bu. for all grades except milling grades of Durum for which the interim payment was 25 cents. The full amount of this payment was about $\$ 37,300,000$. The final payment on the $1955-56$ pool was announced on May 15, 1957, and averaged 11.912 cents per bu. on farmers' deliveries of $352,200,000$ bu. Prior to deduction of the Prairie Farm Assistance Act levy, the net price realized by producers in the $1955-56$ pool for No. 1 Northern Wheat, basis in store Fort William-Port Arthur or Vancouver, was $\$ 1.60893$ per bu.

The crop year 1955-56 coincided with the third and final year of the second International Wheat Agreement. Under its provisions, Canada had a guaranteed export quota of $153,100,000 \mathrm{bu}$. for $1955-56$ and, according to the report on the year's transactions, Canadian sales under the Agreement totalled $75,600,000$ bu. These sales continued to be quite widely distributed; 26 of the 44 importing countries included in the pact purchased wheat and/or flour from Canada. The larger purchasers were the Federal Republic of Germany, $17,600,000$ bu.; Japan, $15,900,000$ bu.; Belgium, $7,500,000$ bu.; Switzerland, $5,500,000 \mathrm{bu}$.; and the Union of South Africa, $5,000,000 \mathrm{bu}$. The greater part of Canada's wheat trade in 1955-56 was carried on in Class II wheat (wheat exported outside the provisions of the International Wheat Agreement). The United Kingdom continued as the leading importer of Class II wheat, shipments to that country accounting for $96,800,000$ bu. of wheat as grain and the equivalent of an additional $12,700,000$ bu. in the form of wheat flour. The combined Canadian exports of $309,200,000 \mathrm{bu}$. of wheat and flour went to 87 countries, territories and colonies during the crop year.

During most of $1955-56$, domestic sales of all classes of wheat were made at the same prices as those prevailing for wheat sold under the International Wheat Agreement. From Aug. 1 to Sept. 6, 1955, an additional 10 cents per bu. over the IWA price was charged on domestic sales of Durum. During the entire 1955-56 crop year, Class II prices for all grades of wheat, except Durum, coincided with the IWA and domestic quotations. The average Class II price received for No. 1 C.W. Amber Durum during the crop year was $59 \frac{1}{8}$ cents per bu. above the comparable IWA average price of $203 \frac{5}{8}$ cents.

Exports of wheat and flour (in terms of wheat) during 1955-56 amounted to $309,200,000$ bu., exceeding by 23 p.c. the $251,900,000$ bu. exported in 1954-55. The $1955-56$ total exports consisted of $269,200,000$ bu. of wheat as grain and the equivalent of $40,000,000$ bu. of wheat flour. Total domestic (commercial and farm) disappearance of wheat in 1955-56 amounted to $167,200,000$ bu. surpassing both the $1954-55$ figure of $162,200,000$ bu. and the ten-year ( $1945-46-1954-55$ ) average of $150,100,000$ bu. The carryover at July 31, 1956, amounted to $579,600,000$ bu. with a larger crop in 1955 more than offsetting the combined effect of a reduced carryover at July 31, 1955, and higher levels of both exports and domestic disappearance.

Other Grains.-Supply and Disposition.-Preliminary data on supply and disposition of the major Canadian grains for the crop year 1955-56 together with revised data for 1954-55 are set out in Table 20. Although July 31, 1955, carryover stocks of each of the five grains-wheat, oats, barley, rye and flaxseed-were below the comparable 1954 levels, production of these grains in 1955, with the exception of rye, was sufficiently large to bring the total supply of each of the grains in 1955-56 above 1954-55 crop-year level.

Reflecting decreases in exports of both oats and barley, the combined export movement of oats, barley, rye and flaxseed, plus the grain equivalent of certain products, amounted to $97,300,000$ bu., representing a decrease of 18 p.c. from the 1954-55 level of $118,800,000 \mathrm{bu}$. Exports of oats, including rolled oats and oatmeal, dropped sharply for the second successive year-from $70,700,000 \mathrm{bu}$. in 1953-54 to $22,200,000 \mathrm{bu}$. in $1954-55$ and $4,100,000 \mathrm{bu}$. in 1955-56. The $68,700,000 \mathrm{bu}$. of barley and its products exported in $1955-56$ was 15 p.c. below the 1954-55 level but was still the fifth largest amount on record. Rye exports at $12,900,000 \mathrm{bu}$. were above the $9,300,000 \mathrm{bu}$. exported in 1954-55. Exports of flaxseed amounted to $11,600,000 \mathrm{bu}$. and exceeded by 83 p.c. the $1954-55$ figure of $6,300,000 \mathrm{bu}$.

Despite increased domestic disappearance of both oats and barley, the larger available supplies of these two grains, coupled with smaller exports, resulted in July-end carryovers exceeding their respective 1955 totals. With available supplies of rye showing relatively little change and domestic disappearance only fractionally decreased, the higher level of exports resulted in a 17-p.c. drop in the July 31, 1956, carryover of this grain. Although both exports and domestic use of flaxseed increased during the 1955-56 crop year, the effect of substantially greater supplies was sufficient to cause July-end stocks to be more than double those of the preceding year.

Price and Marketing Arrangements.-The Marketing of Western Canada oats and barley was again carried on through compulsory crop-year pools administered by the Canadian Wheat Board. Initial payments for both these grains were the same as in 1954-55, i.e., on the basis of 65 cents per bu. for No. 2 C.W. oats and 96 cents per bu. for No. 3 C.W. Six-Row barley, in store Fort William-Port Arthur. No interim or adjustment payments were made on either grain during the crop year but final payments for both were announced in November 1956. Final payment on the $113,866,728$ bu. of barley delivered to the 1955-56 pool averaged 13.362 cents per bu. after deduction of payment expenses and the 1-p.c. Prairie Farm Assistance Act levy. Total prices (basis in store Fort William-Port Arthur) realized by producers for representative grades after deducting carrying charges in country and terminal elevators, Board administrative costs, etc., but before deducting the 1-p.c. PFAA levy, were $\$ 1.08848$ per bu. for No. 3 C.W. Six-Row barley and $\$ 0.99324$ for No. 1 Feed barley. Final payment on the $71,387,016$ bu. of oats delivered to the 1955-56 pool averaged 11.444 cents per bu. Total prices realized by producers for representative grades, on the same basis as for barley, were $\$ 0.79846$ for No. 2 C.W. and $\$ 0.71441$ for No. 1 Feed oats.

Preliminary data indicate that some $12,500,000 \mathrm{bu}$. of rye and $15,800,000 \mathrm{bu}$. of flaxseed were delivered by farmers in Western Canada in 1955-56, both of these grains being sold on the open market. In Eastern Canada, where commercial grain production is on a much smaller scale, all grain continued to be sold on the open market.

## Miscellaneous Grain Trade Statistics

Grain Handled at Eastern Elevators.-The volume of grain handled at eastern elevators in the 1955-56 crop year was somewhat higher than in the preceding year. Total receipts of the five grains amounted to $488,852,575$ bu., 2 p.c. greater than in 1954-55, while total shipments, at $502,749,758$, were 5 p.c. higher. The major part of the increase was accounted for by larger quantities of wheat handled, although rye and flaxseed also contributed. Deelines occurred in receipts and shipments of oats and barley.

## 22.-Canadian Grain Handled at Eastern Elevators, Crop Years Ended July 31, 1952-56

Nots.--Figures for the crop years ended 1922-51 are given in the corresponding table of previous Year Books beginning with the 1931 edition.

| Item and Crop Year | Wheat | Oats | Barley | Rye | Flaxseed | Total Grain |

Grain Inspections.-The volume of wheat, oats, barley, rye, flaxseed, buckwheat, corn and mixed grain inspected by the Board of Grain Commissioners for Canada in the crop year $1954-55$ amounted to $538,608,308$ bu., 11 p.c. below the $1953-54$ total of $602,095,068$ bu.; in the $1955-56$ crop the volume increased by about 4 p.c. to a level of $560,568,263$ bu. Quantities of the various grains inspected at eastern and western points, as well as inspections of peas, soybeans, beans, rapeseed, mustard seed and screenings, appear in Table 23.

Lake Shipments of Grain.-The 1955 navigation season opened officially on Apr. 20 and closed on Dec. 15. During that season, total vessel shipments of wheat, oats, barley, rye, flaxseed and buckwheat amounted to $262,551,436$ bu., somewhat below the 1954 total of $292,829,921$ bu. During the 1956 season of navigation, which opened on Apr. 11 and closed on Dec. 17, 367,167,969 bu. of grain were shipped by lake vessel.

${ }^{1}$ Includes following shipments direct to Europe: barley $158,337 \mathrm{bu}$. in 1955 ; wheat $18,667 \mathrm{bu}$. and barley 47,028 bu. in 1956.

Wheat Flour.-After reaching a peak of $56,033,000 \mathrm{cwt}$. in 1946-47, Canadian wheat flour production dropped to a postwar low of $39,708,000 \mathrm{cwt}$. on 1949-50. Production in each of the following three crop years was only slightly below the five-year (1945-46-1949-50) average of $47,012,000 \mathrm{cwt}$. A rather sharp drop occurred in 1953-54, however, and further slight declines occurred in both 1954-55 and 1955-56 when production amounted to $40,607,000 \mathrm{cwt}$. and $40,149,000 \mathrm{cwt}$., respectively. During the crop year 1955-56, 73.7 p.c. of milling capacity was utilized compared with 71.7 p.c. in 1954-55.

Exports of wheat flour during recent years have followed approximately the same pattern as production, dropping from the 1946-47 peak of $33,117,000 \mathrm{cwt}$. to $17,391,000 \mathrm{cwt}$. in 1955-56. The 1955-56 exports of wheat flour amounted to approximately 43.3 p.c. of production, about the same as in 1954-55 but a slightly smaller proportion than was exported during the preceding few crop years.

## Subsection 2.-Livestock Marketings*

Commercial marketings of livestock were greater in 1956 than in 1955. Increases in total movement through recorded commercial channels amounted to 8.7 p.c. in cattle, 7.0 p.c. in calves, 0.4 p.c. in sheep and lambs, and 0.7 p.c. in hogs. Slaughter classes of

[^310]steers sold at stockyards and packing plants increased 12 p.c. over 1955 to a record 783,138 . Sales of the heavier grades (over $1,000 \mathrm{lb}$.) increased 14 p.c. and sales of steers up to 1,000 lb . increased nearly 10 p.c. Heifer gradings increased 10.6 p.c. and cows increased 11.0 p.c. over the previous year. Fed calves decreased 2.5 p.c. Steers constituted the same proportion ( 35.1 p.c.) of slaughter cattle in 1956 as in 1955 . In 1956 shipments of feeder cattle and calves from yards and plants, and on through-billing to Canadian country points outside the province of origin totalled 436,489 head, an increase of 25 p.c. over 1955. There was little change in the proportion of hogs graded into each category. Grade A hogs made up 28.5 p.c. of gradings in 1956 compared to 27.1 p.c. in 1955, while Grade B hogs constituted 50.6 p.c. against 51.9 p.c. in 1955 . Grade C hogs, at 9.7 p.c. of total gradings, compared with 9.6 p.c. in 1955 , and Grade D remained at 0.5 p.c. All provinces except Manitoba indicated improved quality as measured by the proportion classified as Grade A. The Maritimes again led the provinces in the percentage of A gradings and also in the increase of A gradings in 1956. The price spread between Grades A and B1 hogs remained at $\$ 1$ throughout 1955 and 1956. There was little change in the number of sheep and lambs marketed-554, 808 in 1956 and 555,694 in 1955 . About 59 p.c. of the lambs graded alive in 1956 were "Good", as compared to 61 p.c. in 1955.

## Section 3.-Warehousing and Cold Storage*

Warehousing ranks high among the means by which the utilities of 'place', 'time' and 'possession' are added to the products of industry. Its importance has been emphasized in modern times because of the introduction of cold storage methods in the conservation of perishable foods.

The presentation of warehousing statistics is difficult because it is not an easy matter to define clearly what are to be regarded as stocks in storage. In these days of complicated business relationships and especially since the rise of the department store and chain store as characteristic institutions in the retail merchandising field, it often happens that warehousing is carried on in close relationship with merchandising. However, if the strict economic definition of warehousing is adopted, then this term should be restricted to those facilities that add the utility of 'time' to the 'form' utilities that are the product of the extraction and manufacturing industries. Because the warehouses established in close connection with retail trade are more often than not convenient places for the temporary storage of goods in process of transfer from the manufacturer or wholesaler to the consumer, they are not, in the strict economic sense, services that add the utility of 'time' to commodities already worked up into 'form'. As some clear line must be drawn and because separate statistics of the latter branch of storage are not available, it is considered practicable to interpret warehousing in this way.

[^312]The statistics of warehousing are gathered together under this Section. Subsection 1 presents statistics of the licensed storage of grain. Subsection 2 deals with cold storage facilities without which perishable foods such as meats, dairy products, fish and fruits could not be exchanged or distributed on a wide scale; it includes also figures of stocks of food on hand. Subsection 3 deals with the storage of petroleum and its products, and Subsection 4 with public warehouses and customs warehouses. The facilities that specialize in the storage of tobacco and alcoholic liquors are analysed in Subsection 5. These bonded warehouses, as they are called, are under the strict surveillance of Federal Government excise officers, who supervise all movements into and from such places of storage.

## Subsection 1.-Licensed Grain Storage

Total grain storage capacity in Canada, licensed under the provisions of the Canada Grain Act by the Board of Grain Commissioners for Canada at Dec. 1, 1955, amounted to $599,325,000$ bu., an increase of $18,356,000$ bu. over the level at Dec. 1, 1954. Some $14,650,000 \mathrm{bu}$. of this increase occurred in western country elevators. Licensed grain storage capacity in Canada reached a peak of $603,000,000$ bu. at Dec. 1, 1943, but, following the disposal of heavy wartime stocks, declined to $428,000,000$ bu. at Dec. 1, 1947. Since that date capacity has increased each year.

In contrast to 1954, grain yields were well above average in 1955 and were sufficient to offset by a considerable margin the decline in carryover stocks as at July 31. With bumper crops being harvested in four of the preceding five years, the pressure on Canada's grain storage and handling facilities remained unrelieved. As a result, farmers' marketings of western grain continued to be governed to a considerable extent by space made available in country elevators as grain moved forward into domestic and export channels. As indicated in Table 28, there was a relatively small variation in the proportion of elevator space occupied at Dec. 1, Mar. 30 and July 31 in the 1955-56 crop year. Information is given in the table for only three dates in the crop year, but weekly data on stocks of grain in various commercial positions may be obtained from the DBS bulletin Grain Statistics Weekly.

## 28.-Licensed Grain Storage Capacity and Grain in Store, Crop Years 1954-55 and 1955-56

Norz.-Because these figures are exclusive of stocks in transit or in Eastern Canada mills, they are lower than those shown in Table 22, p. 952.

## Subsection 2.-Cold Storage and Storage of Foods

Cold Storage Warehouses.-Under the Cold Storage Act (R.S.C. 1952, c. 52), as amended (R.S.C. 1952, c. 313), subsidies are granted by the Federal Government to encourage the construction and equipment of cold storage warehouses open to the public. The Act is administered by the Department of Agriculture.

There are five classifications of cold storage warehouses in Canada: (1) public warehouses that store foods and food products and where the entire space is open to the public; (2) semi-public, or those that store foods and where part of the space is retained for the products of the owner and the remainder is available to the public; (3) private, or those that store foods and food products and allot no space to the public, a classification that includes refrigerated space in connection with abattoirs, creameries, dairies, cheese factories and wholesale and retail distributing warehouses; (4) locker plant, where the total space is occupied by lockers for rental to the public and where food and food products may be cut, processed, chilled and frozen for storage in lockers; and (5) bait depots, where space is used solely or principally for the freezing and storing of bait for the use of fishermen.

No hard and fast rule can be laid down for distinguishing between public and private warehouses. In general those owned and operated by firms trading in the goods stored in the warehouse are considered as private, although most of these places rent space to the public when it is not required for their own purposes.

The figures in Tables 29 and 30, compiled by the Department of Agriculture, give some idea of the cold storage warehouse capacity in Canada, but it must be explained that it is not possible to secure completely accurate information on this subject and that the figures are approximations only.
29.-Cold Storage Warehouses by Province, Year Ended Mar. 31, 1957

Cold Storage Holdings of Fish.-The stocks of frozen fish held in Canada during 1955 followed the usual seasonal trend. Normally, stocks decrease gradually during the early months of the year and reach a low point at the beginning of May; during subsequent months they increase and reach a peak at the beginning of October or November.

Holdings of frozen fish at any particular time tend to reflect the strength of the market as well as the level of production. While the production of frozen groundfish fillets (including blocks) was higher in 1955 than in 1954, the demand for these products in the United States market was greater than in the previous year. Even so, stocks remained higher than in 1954, especially during the first half of the year. Stocks of frozen Pacific halibut were high at the beginning of the year as a result of a depressed market for this product in North America, carried over from the late months of 1954 and continuing throughout the 1955 fishing season. The market recovered, however, towards the end of the year. Production was lower than in 1954 and, on the average, stocks were also somewhat lower. The production of frozen Pacific salmon was also below that of 1954 and stocks were considerably below the 1954 level.

Average monthly holdings of the main fish products in 1954 and 1955 are shown in Table 32.

91593-61

## 32.-Storage Stocks of Fish by Month and Type 1954 and 1955

Note.-Stock totals are as at the begining of each month; stocks of individual products are monthly averages.

Cold Storage of Dairy Products.-Cold storage facilities are a necessary adjunct in the manufacture of dairy products, most of which are perishable in varying degrees. All creameries have facilities for the storing of butter, the size and type of storage depending on the size of the creamery. If the butter produced at small country plants is not printed for immediate sale, the butter solids are disposed of or are transported to larger creameries where better refrigeration is available or to private or public cold storages in the larger urban centres. Temperature control is important in the curing process for cheese as well as in the prevention of deterioration. Most cheese factories are equipped with mechanical refrigeration and are required to have storage capacity for 17 days' produce during the period of maximum manufacture. The cheese is then transferred to central warehouses. As soon as milk is bottled it is placed in storage and held until delivery. Dry whole milk and other dried milk products containing fat are usually stored in cool air chambers to prevent rancidity.

Cold Storage of Apples and Potatoes.-Cold storage space for apples in Canada has increased rapidly in recent years as a result of the promotion of orderly marketing, the extension of the marketing season generally, and increased production in some areas. The trend has followed the curtailment in shipments to traditional markets in the United Kingdom and other European countries after World War II. There has been an increase recently in the construction of both private and co-operatively owned storages, particularly in the Province of Quebec.

Potatoes are not ordinarily held in cold storage but recently there has been an increase in the construction of potato storage houses and warehouses in the commercial producing areas.

## Subsection 3.-Storage of Petroleum and Petroleum Products

Bulk storage plants for petroleum and petroleum products are established at convenient distributing centres, usually on a waterfront so that full advantage may be taken of the lower cost of water-borne traffic. From these centres the goods are transferred by boat, rail or truck to smaller distributing depots or directly to retail outlets. The principal refining and distributing centres are located at or near Halifax, Quebec, Montreal, Ottawa, Toronto, Sarnia, Fort William, Regina, Calgary, Turner Valley, Edmonton and Vancouver.

## Subsection 4.-General Warehousing

Public Warehouses.-The summary statistics of the warehousing industry in Canada presented in Table 34 cover the operations of the majority of firms offering warehousing and storage facilities to the public. The 1956 statistics include returns from 227 operators as compared with 195 reporting in 1955. Associations and organizations such as co-operatives operating warehouses or storages for their own members are not included nor are packing houses and other firms operating storage facilities in connection with their respective businesses. Many public warehousing companies also operate a local moving and cartage service and others a motor carrier business, including longdistance moving. For some firms, revenues from motor carrier activities represent a large percentage of total receipts. Small food lockers are not included except where they may be part of a general warehousing business.
34.-Summary Statistics of the Warehousing Industry 1954-56

| Item |  |  |
| :--- | :--- | ---: | ---: | ---: | ---: |

34.-Summary Statistics of the Warehousing Industry 1954-56-concluded

${ }^{1}$ Included with semi-trailer units.
Customs Warehouses.-Warehouses for the storage of imported goods are known as customs warehouses. These are divided into eight classes: (1) those occupied by the Federal Government, some of which are used for examination and appraisal of imported goods and others, known as Queen's warehouses, are used for the storage of unclaimed, abandoned, seized or forfeited goods; (2) warehouses, consisting of an entire building or part thereof properly partitioned from the remainder of the building, which are used exclusively for the storage of imported goods consigned to the operator of the warehouse; (3) buildings or parts of buildings properly partitioned off, used for storage of imported goods consigned to the operator or others; (4) sufferance warehouses operated by the owners of vessels for the storage of in-bond goods transported by water or air, those operated by railway companies and express companies, or any person or group of persons other than those specified previously; (5) yards, sheds or other suitable enclosures for the storage of imported coal and coke; (6) farms, yards, sheds, etc., which an importer of horses or sheep intends to use for the feeding and pasturing of imported animals; (7) warehouses for the storage of animals (not including horses for racing), and articles for exhibition or competition for prizes; (8) yards, sheds or other suitable enclosures which importers intend to use for the storage of goods too heavy or too bulky to be admitted to an established customs warehouse.

## Subsection 5.-Bonded Warehousing and Storage of Wines

Bonded Warehousing.-The Excise Duty Branch of the Department of National Revenue considers any premises licensed under the Excise Act to be a warehouse, whether for storage of raw materials to produce finished tobacco or cigar products or for spirits or malt used for brewing. Practically the total production of spirits is placed in bonded warehouses and only a small part of the output of beer is retained in storage. Wine, unlike spirits and beer, is not secured under bond. All imports of alcoholic beverages must go through bonded warehouses before being released to Provincial Liquor Commissions or Boards, or other agencies authorized by the Commissions or Boards to take alcoholic beverages out of bond. Similarly, tobacco, cigars and cigarettes that are not stamped and duty paid are secured in bond. In addition to these warehouses, there are those in which no manufacturing or production is carried on but which are used solely for the storage of goods upon which duty has not been paid. Goods are stored in these warehouses usually for the purpose of rapid distribution and for delivery as ships' stores.

Table 35 shows the quantities of distilled liquor, tobacco, cigars, and cigarettes in bond in recent years. In addition, the year-end inventories of beer in breweries was $27,613,682$ gal. in 1956; information for 1957 is not yet available.

## 35.-Distilled Liquor, Tobacco, Cigars and Cigarettes in Bond, Quarterly 1953-57

${ }^{1}$ Excludes Newfoundland.

Beverage spirits, as shown in Table 36, refer to spirits released for consumption but not to industrial alcohol; malt beer does not include beer made from duty-free malt; malt used is the total malt used to produce the malt beer; tobacco includes all types of manufactured tobacco products and snuff.
36.-Beverage Spirits, Malt Beer, Malt, Tobacco and Tobacco Products taken out of Bond and Destined for Consumption 1948-57

|  | 13,830,292 | \% | 404,697,177 | 292,650 | 30,149,746 | 22,338 |

[^314]Storage of Wines.-The wine industry is confined to a few localities such as the Niagara Peninsula in Ontario and the Okanagan Valley in British Columbia. Firms manufacturing native wines are not bonded, as far as the Federal Government is concerned, nor is wine in storage for maturing placed in bond. The only goods warehoused in bond in connection with wineries are sugar supplies and supplies of grape spirit distilled by the distilleries and held by the wineries for fortifying wines.
37.-Native Wine Produced and Placed in Storage for Maturing 1951-56

## Section 4.-Co-operative Organizations*

A little over 30 p.c. of all farm products marketed in Canada during the crop year ended July 31, 1956, was marketed through co-operatives. The proportion varied by type of product marketed as follows: grains, hay and seeds 62 p.c.; dairy products 24 p.c.; livestock 16 p.c.; poultry and eggs 9 p.c.; wool 78 p.c.; fruits and vegetables 25 p.c.; honey 47 p.c.; and maple products 62 p.c. These proportions apply to a business volume of marketing co-operatives of $\$ 751,000,000$, an amount slightly higher than that of $\$ 704,000,000$ for 1955. Co-operatives for the purchase of supplies reported sales of $\$ 259,000,000$ in 1956.

Marketing and purchasing co-operatives, owned and operated by farmers, make up most of the co-operative movement in Canada. The total business volume of these co-operatives in 1956 exceeded $\$ 1,000,000,000$ compared with $\$ 941,000,000$ in 1955. Membership in these organizations rose to $1,255,788$ although this total includes duplication because many persons are members of more than one organization. The total number of organizations was 2,041 .

Nearly 60 p.c. of the membership in marketing and purchasing co-operatives occurs in the Prairie Provinces, with Saskatchewan holding first place.

| Totals. | 2,694 | 932,493,552 | 2,612 | 1,009,374,779 |

${ }^{2}$ Duplication exists in this column as some associations market produce as well as handle supplies. Some associations market more than one product and some handle many of the supplies listed.

Fishermen's co-operatives, while small in number, are an important factor in the lives of Canadian fishermen. They had a membership of over 9,500 in 1956.

Service co-operatives reported revenues of $\$ 13,000,000$. This revenue was obtained by 552 organizations providing housing, medical insurance, transportation and other services. Fire and life insurance associations are not included in these figures.

The financial structure of marketing and purchasing co-operatives includes assets of $\$ 464,000,000$ and members' equity of $\$ 205,000,000$.

The ten co-operative wholesales in operation reported a business volume of nearly $\$ 188,000,000$ and assets of $\$ 55,000,000$.

## Section 5.-Interprovincial Freight Movements*

Statistics on interprovincial trade are difficult to collect because there are no controls or barriers to it. The only comprehensive statistics available are the loadings and unloadings of freight carried by the railways. Railway freight traffic is segregated into 99 classes and the differences between loadings and unloadings are the imports and exports by rail for the respective provinces. However, freight can be imported by rail and exported by water, as with western grain which may be moved to the Ontario ports of Fort Wiliam and Port Arthur. Consequently, the statistics of Table 41 must not be taken as a measure of total interprovincial trade; these figures indicate interprovincial movement of railway freight which is one aspect only of that trade.

${ }^{1}$ Figures for freight originating and freight terminating do not agree because freight that originates within a certain year does not all terminste within the same year.

## PART II.-GOVERNMENT AIDS TO AND CONTROL OF DOMESTIC TRADE

During the postwar period, the elaborate system of government control of trade that the war effort made necessary was gradually relaxed (see the 1948-49 Year Book, pp. 837-841) until, by the beginning of 1949 , only those measures to protect domestic requirements and prevent the forcing upward of prices in the Canadian market remained; since then even these have practically disappeared.

## Section 1.-Controls Affecting the Handling and Marketing of Grain

The agencies exercising control of the grain trade in Canada include the Board of Grain Commissioners which since 1912 has administered the provisions of the Canada Grain Act, and the Canadian Wheat Board which operates under the Canadian Wheat Board Act 1935. The former is a quasi-judicial and administrative body which, through the powers vested in it in matters of interprovincial transportation and patents and copyrights, gives the Federal Government complete power to control the handling of grain; it has no power or duties in respect of grain prices. The Canadian Wheat Board, which began to function in the autumn of 1935, was a natural outgrowth of government stabilization measures that were taken during the depression years of the 1930's in regard to the marketing of grain crops. During this period the Government acquired a considerable quantity of wheat and, in the 1935 session of Parliament, legislation was passed to serve the dual purpose of disposing of the holdings so acquired and at the same time arranging for the marketing of new crops.

An account of the organization and functions of the Board of Grain Commissioners appears in the 1941 Year Book, pp. 481-482. An article on the operations of the Canadian Wheat Board is commenced in the 1939 Year Book, pp. 569-580, and concludes in the 1947 edition.

## Section 2.-Combinations in Restraint of Trade*

The purpose of Canadian anti-combines legislation is to assist in maintaining free and open competition as a prime stimulus to the achievement of maximum production, distribution and employment in a system of free enterprise. To this end, the legislation

[^316]seeks to eliminate certain practices in restraint of trade, which serve to prevent the nation's economic resources from being most effectively used for the advantage of all citizens.

The first federal legislation in this field, enacted in 1889, is still effective in amended form as Sect. 411 of the Criminal Code and is the mainstay of Canadian anti-combines legislation. Generally speaking, this Section forbids suppliers (manufacturers, wholesalers, retailers) to arrange among themselves to eliminate competition over a substantial part of any market by limiting production, restricting distribution or fixing prices.

Sect. 411 of the Criminal Code and the Combines Investigation Act (R.S.C. 1952, c. 314) are complementary pieces of legislation. The latter was enacted in 1923 and amended extensively in 1935, 1937, 1946, 1949, 1951 and 1952. It repeats in Sects. 2 and 32 some of the substance of Sect. 411 but, while the latter relates chiefly to arrangements among separate firms, the former embraces any "merger, trust or monopoly" relating to a commodity, which has operated or is likely to operate to the detriment or against the interests of the public.

The Combines Investigation Act, in Sect. 34, also forbids a supplier of goods from prescribing the prices at which they are to be resold by wholesalers and retailers, i.e., the practice of "resale price maintenance" The supplier may, however, suggest resale prices as long as he does nothing to induce or require the trade to adhere to them.

Sect. 412 of the Criminal Code deals with what are commonly called "price discrimination" and "predatory price cutting". It provides that a supplier may not make a practice of discriminating among those of his trade customers who come into competition with each other, by giving one a preferred price which is not available to another if the second is willing to buy in like quantities and qualities as the first; and it also forbids a supplier from selling at prices lower in one locality than in another, or unreasonably low anywhere, if the purpose or effect of his actions is to lessen competition substantially or to eliminate a competitor.

These provisions, Sects. 411 and 412 of the Criminal Code and Sects. 2, 32 and 34 of the Combines Investigation Act, contain the substantive law relating to restrictive trade practices. The other provisions of the Combines Investigation Act relate to investigation and enforcement.

The Act provides for a Director who is responsible for investigating combines and other restrictive practices, and a Commission (the Restrictive Trade Practices Commission) which is responsible for appraising the evidence submitted to it by the Director and the parties under investigation, and for making a report to the Minister. When there are reasonable grounds for believing that a forbidden practice is engaged in, the Director may obtain from the Commission authorization to examine witnesses, search premises, or require written returns. After examining all the information available, if the Director believes that it proves the existence of a forbidden practice, he submits a statement of the evidence to the Commission and to the parties believed to be responsible for the practice. The Commission then sets a time and place at which it hears argument on behalf of the Director in support of his statement; and hears argument and receives evidence on behalf of any persons against whom allegations have been made in the statement. Following this hearing the Commission prepares and submits a report to the Minister, ordinarily required to be published within thirty days.

The Act also provides for general inquiries into restraints of trade which, while not forbidden or punishable, may affect the public interest. It further provides that the courts, in addition to imposing punishment for a contravention of the legislation, may make an order restraining persons from embarking on, continuing or repeating a contravention. The constitutionality of the Section providing for restraining orders, which was enacted in 1952. has been upheld by the Supreme Court of Canada.

In the years 1951-56, the following reports of inquiries under the legislation have been published:-
(1) Matnufacture, Distribution and Sale of Mechanical Rubber Goods; Tires and Tubes; Accessories and Repair Materials; Rubber Footwear; Heels and Soles; Vulcanized Rubber Clothing.
(2) Distribution and Sale of Bread and Other Bakery Products in the Winnipeg Area
(3) Manufacture, Distribution and Sale of Fine Papers.
(4) Distribution and Sale of Coarse Papers in British Columbia.
(5) Purchase of Maple Syrup and Maple Sugar in the Province of Quebec.
(6) Manufacture, Distribution and Sale of Electrical Wire and Cable Products.
(7) Resale Price Maintenance in the Sale of Soap and Soap Products in the Montreal District.
(8) Price Discrimination between Retail Hardware Dealers in North Bay, Ont.
(9) Resale Price Maintenance in the Sale of Certain Household Supplies in the ChicoutimiLake St. John District of Quebec.
(10) Distribution and Sale of Gasoline at Retail in the Vancouver Area.
(11) Resale Price Maintenance in the Sale of China and Earthenware.
(12) Resale Price Maintenance in the Distribution and Sale of Television Sets in the Toronto District.
(13) Manufacture, Distribution and Sale of Wire Fencing in Canada.
(14) Distribution and Sale of Coal in the Timmins-Schumacher area of the Province of Ontario.
(15) Loss Leader Selling.
(16) Manufacture, Distribution and Sale of Beer in Canada.
(17) Manufacture, Distribution and Sale of Asphalt and Tar Roofings and Related Products in Canada.
(18) Resale Price Maintenance in the Distribution and Sale of Certain Household Appliances.
(19) Manufacture, Distribution and Sale of Transmission and Conveyor Equipment and Related Products.
(20) Retail Distribution and Sale of Coal in Winnipeg.
(21) Manufacture, Distribution and Sale of Quilted Goods, Quilting Materials and Related Products.
(22) Manufacture, Distribution and Sale of Boxboard Grades of Paperboard.
(23) Production, Purchase and Sale of Flue-Cured Tobacco in Ontario.

These reports are obtainable from the Queen's Printer or from the office of the Director of Investigation and Research, Ottawa.

## Section 3.-Trade Standards*

The Standards Division of the Department of Trade and Commerce consolidates under one Director the administration of the Electricity Inspection Act, the Gas Inspection Act, the Exportation of Power and Fluids and Importation of Gas Act, the Precious Metals Marking Act, the Weights and Measures Act, and the National Trade Mark and True Labelling Act.

Commodity Standards.-On Nov. 26, 1949, Parliament passed the National Trade Mark and True Labelling Act (R.S.C. 1952, c. 191) which provides a framework for the development of the National Standard and true labelling in order to circumvent public deception in advertising. In brief, the use of the National Standard is voluntary and compliance with commodity standards affects only those manufacturers who desire to use the national trade mark. In addition, where manufacturers descriptively label any commodity or container, it must be labelled accurately to avoid public deception. The regulation applying to the labelling of fur garments, for example, has been established as a code of fair practice throughout the merchandising field.

- Prepared by R. W. MacLean, Director. Standards Division, Department of Trade and Commerce, Ottaws.

Under the terms of the Precious Metals Marking Act 1946 (R.S.C. 1952, c. 215) commodities composed of gold, silver, platinum or palladium may be marked with a quality mark describing accurately the quality of the metal. Where such mark is used, a trade mark registered in Canada, or for which application for registration has been made, must also be applied. Gold-plated or silver-plated articles may also be marked under certain conditions outlined in the Act. The inspection staff of the Standards Division is engaged in the examination of advertising matter, in verifying the quality of articles offered for sale, and in checking the marks applied.

Weights and Measures.-The Weights and Measures Act (R.S.C. 1952, c. 292) prescribes the legal standards of weight and measure for use in Canada. The Act requires control of the type of all weighing and measuring devices used for commercial purposes and their periodic verification and surveillance directed towards the elimination of sales by short weight or short measure. The number of inspections made in the year ended Mar. 31, 1957, was 481,722 compared with 480,704 in 1955-56. The more important inspections comprised the following: weighing machines including scales of all kinds, 235,245 ; measuring machines for liquids 93,950 ; weights 131,101 ; other measures 21,426 . Total expenditure was $\$ 849,102$ in $1956-57$ compared with $\$ 763,863$ in $1955-56$, and total revenue $\$ 752,196$ compared with $\$ 710,206$.

Electricity and Gas Inspection.-Responsibilities of the Standards Division under the Electricity Inspection Act (R.S.C. 1952, c. 94) and the Gas Inspection Act (R.S.C. 1952, c.129) comprise the testing and stamping of every electricity and gas meter used throughout Canada for billing purposes, the object being to ensure the correct measurement of all electricity and gas sold. Canada is divided into 21 districts for administration of the two Acts and staff numbers 181. During the year ended Mar. 31, 1957, 1,224,752 electricity and gas meters were tested as compared with $1,202,415$ in the preceding year. Revenue derived from the testing amounted to $\$ 931,288$, and expenditure to $\$ 834,638$.

## 1.-Electricity and Gas Meters in Use, Years Ended Mar. 31, 1948-57

| Year | Electricity Meters | Gas Meters |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Manufactured Gas | Natural Gas | Petroleum Gas | Total |
|  | No. | No. | No. | No. | No. |
| 1948. | 2,746,685 | 587,629 | 217,068 | 1,046 | 805.746 ${ }^{2}$ |
| 1949. | 2,972,725 | 600,923 | 227,393 | 4,006 | 832,325 ${ }^{2}$ |
| 19501. | 3,188,013 | 606,395 | 239,448 | 3,841 | 849,6882 |
| 1951. | 3,405,432 | 610,096 | 252,468 | 33 | 862.602 ${ }^{2}$ |
| 1952. | 3,590,422 | 609,262 | 263,130 | 68 | 872,465 ${ }^{2}$ |
| 1953.. | 3,779,739 | 599,140 | 277.248 | 1,270 | 877,663 ${ }^{2}$ |
| 1954. | 3,967,952 | 593.698 | 298, 166 | 429 | 892,2972 |
| 1955. | 4,175,534 | 420,432 | 486,768 | 536 | 907.736 |
| 1956. | 4,380,889 | 416,338 | 507.875 | 3.151 | 927,364 |
| 1957. | 4,571,485 | 350,558 | 599,633 | 4,843 | 955,034 |

The Exportation of Power and Fluids and Importation of Gas Act (3-4 Elizabeth II, c. 14) was passed in 1955 to replace the Electricity and Fluid Exportation Act which came into force in 1907. Under its provisions, no electric energy or fluid, whether liquid or gaseous, may be exported from Canada and no gas imported into Canada without a licence. Total exports of electric energy during the year ended Mar. 31, 1957, amounted to $5,388,135,621 \mathrm{kwh}$. There were also exports of natural gas and crude oil as well as imports of natural gas.

## Section 4.-Patents, Copyrights and Trade Marks*

Letters patent are issued subject to the provisions of the Patent Act, (R.S.C. 1952, c. 203) effective since 1935. Applications for protection relating to patents should be addressed to the Commissioner of Patents, Ottawa.
2.-Patents Applied for, Granted, etc., Years Ended Mar. 31, 1953-57

| Item | 1953 | 1954 | 1955 | 1956 | 1957 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Applications for patents................ No. | 16,405 | 18,565 | 19,448 | 21,048 | 21,763 |
| Patents granted......................... | 9,700 | 9,414 | 10,282 | 11,862 | 15,513 |
| Granted to Canadians................. | 748 | 606 | 570 | 652 | 761 |
| Caveats granted. | 243 | 288 | 337 | 289 | 245 |
| Assignments. . . . . . . . . . . . . . . . . . . . . | 12,525 | 13,127 | 20,062 | 17,783 | 19,124 |
| Fees received, net......................... \& | 756,714 | 847.874 | 1,086,278 | 1,234,810 | 1,405,136 |

The number of Canadian patents granted increased fairly steadily each year from 4,522 at the beginning of the century to a peak of 15,513 in the year ended Mar. 31, 1957. Roughly, 72 p.c. of the patents granted were to residents of the United States; 11 p.c. to residents of the United Kingdom and other Commonwealth countries and 5 p.c. to residents of Canada.

Printed copies of patents issued from Jan. 1, 1949, to date are available at a nominal fee. The Canadian Patent Office Record gives a brief digest of each patent.

Canadian and foreign patents may be consulted at the Patent Office Library. The Library has records of British patents and abridged specifications thereof from 1617 to date, and of United States patents from 1872 to date, as well as many patents, indexes, journals and reports from Australia, New Zealand, South Africa, India, Pakistan, France, Belgium, Austria, Norway, Mexico, Italy, Sweden, the Netherlands, Switzerland, Japan, Korea and Brazil.

Copyrights, Industrial Designs and Timber Marks.-Registration of copyright is governed by the Copyright Act (R.S.C. 1952, c. 55) in force since 1921. Applications for protection relating to copyrights should be addressed to the Commissioner of Patents, Ottawa.

The Act sets out the qualifications for a copyright and its duration: "Copyrights shall subsist in Canada . . in every original literary, dramatic, musical and artistic work, if the author was, at the date of the making of the work, a British subject, a citizen or subject

[^317]of a foreign country which has adhered to the Berne Convention and the additional Protocol ... or resident within Her Majesty's Dominions. The term for which the copyright shall subsist shall, except as otherwise expressly provided by this Act, be the life of the author and a period of fifty years after his death."

Copyright protection is extended to records, perforated rolls, cinematographic films, and other contrivances by means of which a work may be mechanically performed. The intention of the Act is to enable Canadian authors to obtain full copyright protection in Canada, in all parts of the Commonwealth, in foreign countries of the Copyright Union and in the United States of America.

Protection of industrial designs and of timber marks is afforded under the Trade Mark and Union Label Act and the Timber Marking Act. Registers of such designs and marks are kept by the Copyright Branch of the Patent Office and information regarding them is published in the Patent Office Record.

## 3.-Copyrights, Industrial Designs and Timber Marks Registered, Years Ended Mar. 31, 1953-57

| Item |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |

Trade Marks.-The Trade Marks Office, a Branch of the Department of the Secretary of State, administers the Trade Marks Act (1-2 Elizabeth II, c. 49) which covers all legislation concerning the registration and use of trade marks and supersedes from July 1, 1954, former legislation enacted under the Unfair Competition Act, the Industrial Design and Union Label Act and the Shop Cards Registration Act. All correspondence relating to an application for registration of a trade mark or for the use of a trade mark should be addressed to the Registrar of Trade Marks, Ottawa.

A Trade Marks Journal is published weekly giving particulars of every registration of a trade mark and every registration of a registered user, as well as other advertisements and rulings required under the Act. The required fee payable on application for registration of a trade mark is $\$ 25$ and for registration of a person as a registered user of a trade mark, \$20.

## Section 5.-Subventions and Bounties on Coal*

The major problem of the Canadian coal mining industry arises from the fact that its fields are situated far distant from the main consuming markets of the Provinces of Ontario and Quebec while these markets lie in close proximity to the bituminous and anthracite fields of the United States. Transportation subventions, which have been maintained in varying degree during the past 28 years, were designed to further the movement of Canadian coals to some portions of central Canada by equalizing as far as possible the laid-down costs of Canadian coals with imported coals. Subventions have been regulated by Orders in Council as it has not been considered practicable to fix the assistance by statute owing to the frequent changes in the competitive situation.
5.-Expenditure for Coal Subventions by Province 1952-56

The Canadian Coal Equality Act (R.S.C. 1952, c. 34), formerly known as the Coke Bounty Act, and Regulations made thereunder, provide that so long as the provisions of Tariff Item No. 1019 in Schedule B to the Customs Tariff, permitting a 99-p.c. drawback on imported coal to be converted into coke for metallurgical purpose, remain in effect, the Government will pay to the manufacturers of iron and steel 49.5 cents per ton on bituminous coal mined in Canada and converted into coke and used by the manufacturer in the smelting in Canada of iron from ore, or in the manufacture in Canada of steel ingots and steel castings. This legislation, which implements one of the recommendations of the Royal Commission on Maritime Claims (1926) is designed to assist the Nova Scotia steel industry and only incidentally affects coal.

Bounties paid under this authority for the years 1952-56 were as follows:-

## Section 6.-Control and Sale of Alcoholic Beverages

The retail sale of alcoholic beverages in Canada is controlled by provincial and territorial government liquor control authorities. Alcoholic beverages are sold directly by most of these liquor control authorities to the consumer or to licensees for resale. However, in some provinces beer and wine are sold directly by breweries and wineries to consumers or to licensees for resale. During the year ended Mar. 31, 1956, provincial government liquor control authorities operated 715 retail stores.

Table 6 shows revenue from administration of liquor control by provincial and territorial governments. Details are given in DBS report, The Control and Sale of Alcoholic Beverages in Canada.

## 6.-Provincial Revenue from Administration of Liquor Control, Years Ended Mar. 31, 1955 and 1956

Nors.-Figures include revenue collected directly by the provincial and territorial governments as well as revenue of the liquor authorities, but exclude revenue resulting from a general retail sales tax on alcoholic beverages imposed by five provinces.

## PART III.-BANKRUPTCIES AND COMMERCIAL FAILURES

The three Sections of this Part, although closely related as far as subject matter is concerned, cover different aspects of the field of bankruptcies and commercial failures; thus the statistics presented in each Section are not comparable with those given in the other Sections.

Section 1 is limited to the administration of bankrupt estates by the Superintendent of Bankruptcy under the Bankruptcy Act (including the Farmers' Creditors Arrangement Act). This Section, however, gives definite information on the amounts realized from the assets as established by debtors and indicates that values actually paid to creditors are invariably very much lower than such estimates alone would imply. It can therefore be assumed that this applies in even greater degree to the more extended fields covered in Sections 2 and 3.

Section 2 is limited to bankruptcies and insolvencies made under federal legislation (the Bankruptcy Act and the Winding-Up Act), but does not include failures, sales or seizures carried out apart from such federal legislation. The Dominion Bureau of Statistics coverage has been revised back to January 1955 to include business failures only (see p. 980). The figures of assets and liabilities are estimates made by the debtor and because they are not made uniformly should be accepted with reservations.

The statistics given in Section 3 are compiled by Dun and Bradstreet, Incorporated. This mercantile agency is interested primarily in credit information and its statistics include bankruptcies in general, insolvencies under provincial companies' Acts and such proceedings as bulk sales, bailiff's sales, landlord's seizures, etc., when loss to creditors results. On the other hand, the statistics do not include assignments of individuals, so that as a rule the totals run lower than those in Section 2. Because this agency was the only source of figures of commercial failures between the years 1875 and 1919, its statistics have an added value since they present a historical series from 1915, although the basis of classification was changed after 1933 (see text preceding Table 6, p. 984).

## Section 1.-Administration of Bankrupt. Estates*

Federal insolvency legislation now comprises the Bankruptcy Act 1949 (R.S.C. 1952, c. 14), the Farmers' Creditors Arrangement Act 1943 (R.S.C. 1952, c. 111), the Companies' Creditors Arrangement Act and to some extent the Winding-Up Act. The two Arrangement Acts are designed to avert failure and the statistics in this Section and in Section 2 therefore do not include proposals or arrangements under these Acts. When such proposals or arrangements are rejected by the creditors or fail in their purpose, the proceedings may then come under the Bankruptcy Act, the bankruptcy provisions of the Farmers' Creditors Arrangement Act or, in certain circumstances, the Winding-Up Act. There are no provisions in the Companies' Creditors Arrangement Act for the liquidation or winding-up of insolvent companies.

* Prepared by the Superintendent of Bankruptcy, Ottawa. Early bankruptcy and insolvency legislation is reviewed in the 1952-53 Year Book, pp. 914-915.

[^320]The administration of bankrupt estates is supervised by the Superintendent of Bankruptcy (first appointed in 1932) with the object of conserving as far as possible the assets of bankrupt estates for the benefit of the creditors.

## Section 2.-Returns under the Bankruptcy and Winding-Up Acts as compiled by the Dominion Bureau of Statistics

The statistics concerning bankruptcies and insolvencies published by the Dominion Bureau of Statistics cover only the failures coming under federal legislation, i.e., the Bankruptcy Act and the Winding-Up Act. Certain documents relating to estates administered under these Acts have, since July 1920, been forwarded to the Dominion Statistician for statistical analysis. The Bankruptcy Act of 1949 altered the administration of bankruptcies by providing for proposals from insolvent persons. Since July 1950, agreements made under this method have not been included with the statistics of bankruptcy, so that subsequent figures are not strictly comparable with those for previous years. In Table 2 the number of proposals for recent years is shown so as to give a general impression of the trend.

Recently, a major revision has been made in the compilation and presentation of commercial failures statistics by the Dominion Bureau of Statistics. Previously, although these statistics covered only failures coming under federal legislation, they included assignments of individuals. The coverage of the revised series has been limited to business failures only, excluding failures of individuals such as wage-earners, salesmen and executive personnel. This revision was extended back to January 1955.

Failures of wage-earners (which are not classed as commercial failures in the revised DBS statistics) rose substantially to 973 in 1956 as compared with 657 in 1955. Most of the wage-earner failures occurred in Quebec in both years, the total for that Province in 1956 being 950.

In Table 2, bankruptcies and insolvencies for the year 1955 are given on both the old and the new bases, so as to show the extent to which the series has been altered. This practice is also followed in Tables 3 and 4.

The disparity in the number of cases closed in 1956 as compared with 1955 results from the fact that a change in the policy previously applied was made with effect from Jan. 1, 1956. Instead of considering, as heretofore, an estate closed upon the receipt
of the trustees final statement, the matter was considered as remaining under administration until discharge was granted by the court.

Three estates were reported during 1955 and one in 1956 under the provisions of the Farmers' Creditors Arrangement Act. Of the cases under administration at the inception of each year, two were completed in 1955 and two in 1956.

## 2.-Bankruptcies and Insolvencies under Federal Legislation by Province 1947-56

Nors.-Figures from 1923 are given in the corresponding table of previous Year Books beginning with the 1941 edition.

## Section 3.-Statistics of Industrial and Commercial Failures from Private Sources

A table showing commercial failures by class for the years 1915 to 1935 (and for Newfoundland for 1915 to 1932) is given in the 1936 Year Book, p. 969 . In 1936 Dun and Bradstreet, Incorporated, from whose reports these figures were taken, adopted a new method of classification. The principal changes consisted of setting up a new group of construction enterprises previously included in manufacturing, and a new class for commercial service. Real estate companies, holding and other financial companies, and agents of various kinds were omitted. These changes had the effect of confining the failure records more to industrial and commercial lines of activity, and liabilities were reduced more in proportion to the number of failures, since the companies eliminated usually ran high in indebtedness. This series extends back to 1934.

## 6.--Industrial and Commercial Failures by Class 1950-56 and by Province 1955 and 1956

Note.-The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

The subject of foreign trade covers more than the treatment of imports and exports of commodities, important though this is. In its broader sense foreign trade is made up of the total international exchanges of goods, services, securities and other financial exchanges, all of which are presented in their proper relationship in this Chapter. Following Part I, which is a review of Canada's trade during recent years, Part II gives detailed statistics of external commodity trade. Part III summarizes external transactions from the standpoint of the balance of international payments. Part IV outlines the various ways in which the Federal Government promotes and encourages trade relationships, and contains a brief review of the Canadian tariff structure.

## PART I.-REVIEW OF FOREIGN TRADE*

There has been a marked general increase in international trade in the postwar years, although the rate of growth has not been steady. The prewar volume of trade had been regained by 1948 and there was a sharp value upswing in 1951, caused mainly by the high prices of the Korean boom. A period of readjustment then followed, but by the second half of 1954 economic activity and trade were again generally on the increase. In 1955 the volume of world trade was 18 p.c. higher than the previous record of 1951 and in 1956 was about 10 p.c. higher than in 1955 ; the increase in value in the latter year was 11 p.c. The rate of increase was fairly constant in the two years, but declined sharply in 1957 so that the relative change in that year was slight. It is interesting to note that while the advance in 1955 kept roughly in line with world production, trade in 1956 increased at a rate almost double that of industrial production. Also of interest in the general development of

[^323]trade in 1956 were the continued relative decline of trade between industrial and nonindustrial areas and the increased importance of North America in the trade of industrial areas.

In 1956 Canada ranked fourth among the trading nations, while the United States aud the United Kingdom retained first and second positions. Canada has been fourth every year since 1954 when the Federal Republic of Germany recovered its prewar strength and took third place among the world's traders. The Canadian share of world trade was about 6 p.c. in 1956, and on a per capita basis this placed Canada first, ahead of Belgium and Luxembourg, as in 1953. In 1954 and 1955, Canada was second to New Zealand.

[^324]Canadian Trade in Recent Years.-Following the readjustment of the latter part of 1953 and the beginning of 1954, Canadian trade showed signs of recovery in the second half of 1954. Both imports and exports recovered sharply in 1955 and the value of total trade was a record at 12.7 p.c. above the value of 1954 . In 1956 the trend continued upward and reached a value almost 17 p.c. greater than in the previous year. In 1957 trade was again high but was changed little relative to that of 1956.

The value of total exports in 1956 was $\$ 4,860,000,000$, 11 p.c. higher than in 1955 . The value of imports rose more sharply to $\$ 5,700,000,000$ or 21 p.c. above 1955 and thus the import balance increased to $\$ 840,000,000$. Although both import and export prices
were higher, about three-quarters of the export and nine-tenths of the import value gains resulted from changes in volume. In 1957 total exports were around $\$ 4,936,000,000$, while imports declined slightly to $\$ 5,623,000,000$.

At $\$ 840,000,000$, the import balance was at its highest ever in 1956 and, in relative terms, represented about 15 p.c. of total imports, almost double the comparable percentage for 1955. This ratio was surpassed only in the early years of the century, most notably in 1910, 1911 and 1912 when the balance ranged from over 30 p.c. to over 40 p.c. of total imports. The explanation of a high level of the import balance is, of course, to be found, as in the early 1900's, in the pattern and pace of economic growth.

There were general import value gains in 1956 for all main commodity groups and records were set for all but the animal products and textile groups. In 1957, although individual commodities recorded diverse and sometimes fairly sharp movements, the general import changes were moderate compared with those of 1956. The 1956 gains were most marked in the iron and steel group which rose by about 39 p.c., almost doubling the 1955 increase, and thus recorded the largest absolute and relative gain among the major commodity groups. The share of iron and steel products in the import total rose from one-third to two-fifths, and the group accounted for three-fifths of the total import gain. This relates to the fact that the major impetus to domestic expansion came from a $33-$ p.c. increase in investment in new construction, machinery and equipment. In addition, and notwithstanding the increased relative importance of investment, the rates of growth of both consumer expenditures and exports were maintained and the total supply of goods available in 1956 was more than 12 p.c. higher than in 1955 . The high level of demand for iron and steel products, the stable increase in consumer spending and exports, and the relative scarcity of labour and materials made it essential to supplement significantly the total supply of goods and services, and imports provided about one-third of the increase. In 1957 the imports of iron and steel products reflected the levelling off of industrial activity and declined somewhat as compared with 1956. Contrary to the general trend in this group, imports of pipes, tubes and fittings, on account of the extensive pipeline construction activities, rose by over 30 p.c. and displaced both tractors and parts and passenger automobiles in individual commodity ranking.

On the export side, the outstanding feature of 1956 was the strong recovery of wheat sales (partly as a result of poor European crops in the winter of 1955-56 and of unusually large shipments to the Soviet Union and Eastern Europe) which, together with a sharp increase in barley sales, resulted in a 14-p.c. advance for grains and farinaceous products over 1955. The regular European wheat market and the special Soviet market were much softer in 1957 and there was consequently a marked decline in wheat sales and thus in grains as a whole. Wheat itself, notwithstanding the decline, remained in second place among commodity exports, a position it regained in 1956 from planks and boards as a result of a 50-p.c. gain. Newsprint, the leading export commodity in every postwar year except 1949 and 1952 (when wheat was in top place) again ranked first in 1956 and 1957, increasing in value in both years, but more moderately in the latter. Forest products as a whole declined in value in 1956 and 1957, the decrease in 1957 being especially marked for planks and boards which suffered from the decline in housing construction in the United States. In 1956 the values of animals and animal products, and fibres, textiles and products also declined, but all the other commodity groups gained. Record values were established for iron and its products, non-ferrous metals, non-metallic minerals, and chemicals and allied products. In 1957 the major export gains were made by such minerals as petroleum, uranium and nickel, and by cattle and seeds.

The accelerated pace of exploration and development of Canada's natural resources and the increased capacity of other industries during 1955 and 1956 contributed strongly to the greater import demand for machinery and equipment and was also reflected in the upsurge in foreign sales of such 'new' exports as oil, iron ore and uranium. Compared with 1954, the 1956 exports of these three commodities increased by 1,545 p.c., 264 p.c. and 568 p.c., respectively; their respective shares in the export total in 1956 were 2.2 p.c., 3.0 p.c. and 1.0 p.c.

## 2.-Summary Statistics of Canadian Trade 1952-56

The Canadian deficit on visible trade (like that on invisible trade) was financed by a marked upsurge in the net inflow of foreign capital. This upsurge sustained the high demand for the Canadian dollar, which continued to be at a premium over the United States dollar throughout 1956. The Canadian price of the U.S. dollar declined continuously until December when, averaging 96.05 cents, it reached its lowest postwar monthly level since the Canadian dollar was freed from exchange control in October 1950. This development is all the more noteworthy when it is considered that the impressive increase in imports from the United States might have been expected to have had an equilibrating influence on the exchanges.

Changes in the Structure of Trade.*-The direction of Canadian trade in the postwar period has remained reasonably consistent although there have been some changes in relative shares. The United States has long been Canada's leading trading partner and in 1956 accounted for 66.0 p.c. of the total trade ( 59.0 p.c. of the export total and 73.0 p.c. of the import total). The United Kingdom, in second place, was responsible in 1956 for 16.8 p.c. of Canadian exports and 8.5 p.c. of Canadian imports, while the share of total trade was 12.3 p.c. In 1946 the United States had 55.0 p.c. of Canadian trade against 17.6 p.c. recorded by the United Kingdom; by 1948 the respective figures had become 57.9 p.c. and 17.2 p.c., and in 1955 they were 66.9 p.c. and 13.0 p.c. From 1946 to 1956, the share of the Commonwealth (excluding the United Kingdom) in Canadian trade fell from 9.4 p.c. to 4.5 p.c., whereas the European portion remained more constant, declining from 8.6 p.c. to 7.9 p.c. Latin American trade was even more consistent at just over 5 p.c. in both years.

The nature and volume of any country's international trade are both functions of a complex of factors which vary, more or less, over time. The more important of these factors are the natural endowment of a country, the stage it has reached in its economic development, the number and nature of institutional impediments to trade, and the general condition of the world economy. Canada has always been dependent on trade, but the pattern of trade has changed somewhat with changing circumstances, as is indicated by a comparison of the figures for 1939, 1955 and 1956. In 1939 the level of economic activity represented only a partial recovery on that of 1929 , but the comparison is, nonetheless, useful because 1939 is something of a half-way mark in economic change since 1929, and also because it relates directly postwar and prewar conditions.

In 1939 the gross national product stood at $\$ 6,166,000,000$ (in current prices) and by 1956 had risen to $\$ 29,866,000,000$. Exports of goods and services and gross domestic investment were respectively 25 p.c. and 16 p.c. of the gross national expenditure in the

[^325]former year and 21 p.c. and 25 p.c. in the latter year. Imports of goods and services, in proportion to the total domestic demand for goods and services, remained relatively stable, accounting for 24 p.c. in 1939 and 25 p.c. in 1956 . These figures, as a broad measure, suggest that there has been only a slight decline in the place of trade in the Canadian economy; and that the increased importance of investment, coupled with a comparatively stable domestic consumption and level of imports, is reflected in the slight relative decline in exports.

Although the general importance of trade has remained steady, there have been some significant changes that reflect developments in the domestic economy and changes in the pattern of world trade. Most of these changes represent a steady continuation of trends that had been evident in the period from 1929, but several represent quite sharp accentuations of earlier trends. On the average, in the years 1936 to 1939, 38.4 p.c. of Canada's domestic exports originated on the farms. By 1955 the relative share of farm produce had fallen to 20.3 p.c. and although the figure was somewhat higher in 1956 at 22.7 p.c. it was still markedly below the average of $1936-39$. Behind this decline was the decrease in the importance of wheat which had earlier been the leading export commodity and which had accounted for about 50 p.c. of the export total. It should, however, be remembered that the decline in wheat is but relative-in 1939 a total of $163,000,000$ bu. of wheat were exported at a value of $\$ 109,000,000$ whereas in $1956,302,000,000$ bu. were exported at a value of $\$ 513,000,000$-and that the main reason for the decline is simply that the world and Canada were trading more widely in other commodities in 1956 than they were in 1939.

Contrary to the trend in products of farm origin, products in the forest and mineral origin groups have shown relative gains-those of the former being more sharp between 1936-39 and 1956 than between 1926-29 and 1936-39. Forest products in 1936-39 accounted for 24.7 p.c. of total domestic exports, whereas in 1955 the share had risen to 35.5 p.c., as against 31.6 p.c. in 1956. Mineral products, standing at 29.1 p.c. in 1936-39, moved upwards to 35.3 p.c. in 1955 and still further to 36.7 p.c. in 1956. The changed standing of forest products-part of which is attributable to relatively greater price increasesreflects the increased importance of newsprint which from 1951 to 1954 averaged 14 p.c. of total exports and replaced wheat as the leading export commodity. The changed standing of newsprint is the result of the increasing size of newspapers, the greater allocation of space to advertising, and the absence of a U.S. tariff. The growth of mineral products reflects the increased diversification of the Canadian economy and technological progress. Non-ferrous metals and products, which in 1926-29 accounted for only 7.4 p.c. of the domestic export total, had by 1951-54 increased its proportionate share to 16.5 p.c.-a development resulting partly from the very marked development in the Canadian aluminum industry.

On the whole, the import pattern has been more consistent than that of exports although, here too, significant changes have been recorded in commodities of farm and mineral origin. Farm commodities contributed 34.8 p.c. of the import total in 1936-39 but only 18.5 p.c. in 1956 , while the share of commodities of mineral origin increased from 49.8 p.c. in $1936-39$ to 58.5 p.c. in 1955 and 62.8 p.c. in 1956 . This increase stems from the fact that 1955 and 1956 were years of very marked economic growth, with consequently a high demand for capital goods and structural materials. Historically, manufactured goods have always played a large part in Canadian imports, but there is, nevertheless, significance in the increased share of the import total shown by the chiefly manufactured products group which advanced from 62.2 p.c. in 1936-39 to 77.1 p.c. in 1956. Although Canada has moved from the position of being predominantly a primary producer, it has not thereby become an overwhelmingly industrial country in the sense that the United Kingdom is an industrial country. The share of raw materials in the domestic export total fell from 46.7 p.c. in $1926-29$ to 32.2 p.c. in $1936-39$ but has been reasonably consistent since; and while wheat is no longer in a position of relative preeminence, Canada's farms and forests were still, in 1956, the origin of 54.3 p.c. of the total domestic exports.

## PART II.-FOREIGN TRADE STATISTICS*

## Section 1.-Explanations re Canadian Trade Statistics

Certain problems of procedure arise in recording trade statistics and require explanation. For the correct interpretation of the statistics of foreign trade, it is necessary that the following definitions and explanations of terms used be kept in mind:-

Quantities and Values.-In all tables of imports and exports the quantities and values are based upon the declarations of importers (import entries) and exporters (export entries), as subsequently checked by customs officials.

Imports: Valuation.-"Imports" means imports entered for consumption. "Entered for consumption" does not necessarily imply that the goods have been actually consumed in Canada but that they have passed into the possession of the importer and that duty has been paid on that portion liable for duty.

Under the main provisions of the law, the value of merchandise imported into Canada is the fair market value or price thereof when sold for home consumption in the principal markets of the country from which said merchandise was exported. (See Sects. 35 to 45 and 55 of the Customs Act.)

Canadian Exports: Valuation.-"Canadian produce" exported (domestic exports) includes Canadian products or manufactures, also exports of commodities of foreign origin that have been changed in form or enhanced in value by further manufacture in Canada, such as sugar refined in Canada from imported raw sugar, aluminum extracted from imported ore, and articles constructed or manufactured from imported materials. The value of exports of Canadian merchandise is the actual amount received in Canadian dollars exclusive of freight, insurance and other handling charges.

Foreign Exports: Valuation.-"Foreign produce" exported (re-exports) consists of foreign merchandise that has previously been imported (entered for home consumption) and is exported from Canada unchanged in form. The value of such commodities is the actual amount received in Canadian dollars exclusive of freight, insurance and other handling charges.

Countries to which Trade is Credited.-Imports are classified as received from the countries whence they were consigned to Canada. These countries are not necessarily the countries of actual origin of the goods, since goods produced in one country may be imported by a firm in another country and later re-sold to Canada. In such cases the second country would be the country of consignment to which the goods would be credited.

There is one exception to this rule. An attempt is made to classify by country of actual origin imports produced in Central and South America but consigned to Canada from the United States. The effect of this procedure, which has been in force since 1946, is to reduce slightly the imports credited to the United States and to increase those credited to Central and South American countries. (See Table 5.)

Exports are always credited to the country to which they are consigned.
Discrepancies in Trade Statistics between Canada and Other Countries.-Canada's statistics of exports are rarely in exact agreement with the import statistics of its customers and parallel differences occur with Canadian imports. Among the chief factors contributing to these discrepancies are:-
(1) Differences in the system of valuation used by Canada and those of other countries, especially with respect to the treatment of transportation charges.
(2) Differences in the statistical treatment of special categories of trade, such as armaments and military supplies, government-financed gift or mutual aid shipments, postal and express shipments, or warehouse trade.
(3) Differing definitions of territorial areas.
(4) Differing systems of geographical classification of trade, notably the consignment system used by Canada and the actual origin or ultimate destination system in use by some other countries.
(5) Differences in the time at which trade is recorded in the statistics of partner countries caused by the time required for goods to move from one country to another.

Treatment of Gold in Trade Statistics.-The general use of gold as a money metal gives it peculiar attributes that distinguish it from other commodities in trade. In particular, international movements of gold are determined largely by monetary factors

[^326]rather than by ordinary trade or commercial considerations．Gold is generally acceptable； it does not have to surmount tariff barriers and is normally assured a market at a fixed minimum price．Also，gold may be bought or sold internationally without any physical movements of the metal，such transactions being recognized by simply setting aside or ＇ear－marking＇the metal in the vaults of some central bank．

For these reasons movements of gold in a primary or semi－fabricated state are excluded from the statistics of Canada＇s commodity trade．However，since gold is produced in Canada primarily as an export commodity，a series showing new gold production avail－ able for export is published as a supplement to the trade statistics．Because this series is calculated on a production basis，a division of the figures into transactions with individual countries is not possible．

[^330]The proportion of imports subject to duty varies widely between countries and geographic areas. Generally the Canadian tariff imposes duties on a greater proportion of manufactured goods than of natural products. Countries supplying chiefly manufactures to Canada tend to have duties charged on a greater proportion of their goods and also to have relatively higher average ad valorem rates of duty charged on their goods than is the case with countries supplying chiefly natural products. Variations in the proportion of imports dutiable as between different countries, or in the average ad valorem rates of duty charged on imports from different countries therefore do not necessarily indicate differences in the tariff relations between Canada and these countries.

## FOREIGN TRADE BY COMMODITIES,1952-56

AGRICULTURAL AND VEGETABLE PRODUCTS

WOOD AND WOOD PRODUCTS

CHEMICAL AND ALLIED PRODUCTS

IRON AND IRON PRODUCTS

MISCELLANEOUS COMMODITIES

## 12.-Leading Imports 1939, 1946 and 1953-56

Norz.-Commodities are arranged in order of value in 1956.

| Commodity | 1939 | 1946 | 1953 | 1954 | 1955 | 1956 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | \$'000 | \$'000 | \$'000 | \$'000 | \$'000 | \$'000 |
| Machinery (non-farm) and parts. | 42,831 | 130,287 | 401,856 | 380,219 | 445,875 | 628,521 |
| Automobile parts (except engines). | 25,308 | 66,453 | 222,284 | 180,433 | 246,505 | 284,788 |
| Petroleum, crude and partly refined. | 39,650 | 89,483 | 213,094 | 212,787 | 229,779 | 271,291 |
| Electrical apparatus, n.o.p. | 27,891 | 47,788 | 198.275 | 207,539 | 226,715 | 257,292 |
| Rolling-mill products (iron and steel) | 32,336 | 53,376 | 124,813 | 97,563 | 129,679 | 234,709 |
| Tractors and parts. | 15,003 | 45,620 | 126,354 | 82,814 | 115,375 | 159,627 |
| Automobiles, passenger | 13,725 | 25,209 | 79,454 | 60.846 | 83.726 | 125,539 |
| Pipes, tubes and fittings (iron and steel). | 2,340 | 8,411 | 58,327 | 59,680 | 50,290 | 123,088 |
| Engines, internal combustion, and parts. | 7.096 | 19,650 | 107,736 | 84,914 | 100,917 | 120,986 |
| Coal, bituminous. | 19,640 | 77,052 | 94,680 | 70,445. | 74,453 | 96,516 |
| Aircraft and parts (except engines) | 5,550 | 9,448 | 111,803 | 100,397 | 138,091 | 91,304 |
| Non-commercial items. | 5,430 | 14,173 | 60,923 | 56,763 | 72,929 | 83,098 |
| Fuel oils. | 1,650 | 33,066 | 65,151 | 70,921 | :7,754 | 81,593 |
| Tourist purchases | 9,487 | 9,125 | 73,840 | 68,767 | 71,467 | 75,205 |
| Farm implements and machinery (except tractors) and parts. | 5,915 | 22,732 | 82,795 | 60,351 | 62,874 | 72,522 |
| Coffee, green | 4,110 | 15,473 | 57,595 | 64,214 | 57,010 | 62,657 |
| Cotton fabrics | 10,935 | 54,163 | 55,906 | 46,012 | 53,400 | 62,130 |
| Paperboard, paper and products. | 8,654 | 18,834 | 39,208 | 43,558 | 52,690 | 61,954 |
| Principal chemicals (except acids) n.o.p | 12,321 | 16,734 | 54,505 | 46,193 | 57,677 | 61,871 |
| Cotton, raw . | 17,176 | 42,812 | 55.434 | 52,441 | 61,031 | 58,748 |
| Sugar, unrefined | 9,983 | 32,416 | 47,491 | 51,519 | 52,312 | 55,828 |
| Parcels of small value | 4.185 | 14,460 | 32,396 | 40.637 | 41,639 | 49,371 |
| Synthetic plastics, primary forms. | 2,506 | 15,386 | 32,498 | 34,893 | 41,072 | 47,092 |
| Automobiles, freight | 1,949 | 6,493 | 17,304 | 15,134 | 30,442 | 45.846 |
| Apparel (except hats) of all textiles. | 6.941 | 12.222 | 35,672 | 33,860 | 39,039 | 44,793 |
| Relrigerators and freezers | 1,189 | 5,201 | 55,530 | 38.863 | $\div 3.935$ | 44,622 |
| Vegetables, fresh | 6,150 | 25,748 | 29,250 | 33,028 | 38,852 | 43.694 |
| Cooking and heating apparatus and parts. | 2,332 | 10,462 | 33,538 | 31.557 | 36,324 | 41,717 |
| Rubber, crude and semi-fabricated | 12,860 | 10,013 | 26,408 | 24,267 | 44, 10 | 40,610 |
| Logs, timber and lumber | 3.767 | 6,035 | 23,585 | 23,995 | 32,773 | 40,555 |
| Wool fabrics | 10,408 | 20,115 | 41,743 | 32,367 | 31,948 | 40,191 |
| Iron ore. | 4.179 | 6,467 | 28,194 | 20,416 | 31.563 | 38.722 |
| Scrap iron and steel. | 2,064 | 2,163 | 3,477 | 2,048 | 14,356 | 36,299 |
| Gasoline. | 7,998 | 14,912 | 48.650 | 34,564 | 35,831 | 35,217 |
| Newspapers, magazines and advertising matter | 8.436 | 13,434 | 33,446 | 34,067 | 34,794 | 34,435 |
| Tools | 2.377 | 10,135 | 31,004 | 23.599 | 26,739 | 32.779 |

| Coal, anthracite. | 21,938 | 41,987 | 40.079 | 33,144 | 30,124 | 29,896 |
| Books, printed. | 4,238 | 11,272 | 21.378 | 23,891 | 26,035 | 27,950 |
| Drugs and medicines. | 3,992 | 9.440 | 22.877 | 25.328 | 25.018 | 26,560 |

## 13.-Leading Domestic Exports 1939, 1916 and 1953-56

Note.-Commodities are arranged in order of value in 1956.

| Commodity | 1939 | 1946 | 1953 | 1954 | 1955 | 1956 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | \$'000 | \$'000 | \$'000 | 8'000 | 8'000 | \$'000 |
| Newsprint. | 115,687 | 265,865 | 619,033 | 635,670 | 665,877 | 708,385 |
| Wheat | 109.051 | 250,306 | 567.907 | 375,339 | 338,216 | 513,081 |
| Planks and boards | 48,829 | 125,391 | 282,736 | 324,724 | 385,313 | 326,445 |
| Wood pulp. | 31,000 | 114,021 | 248,675 | 271,418 | 297,304 | 304,536 |
| Aluminum, primary and semi-fabricated | 25,950 | 51,390 | 173,378 | 182,392 | 210.971 | 234,806 |
| Nickel, primary and semi-fabricated. | 57,934 | 55,205 | 162,542 | 182,154 | 215,169 | 222,909 |
| Copper, primary and semi-fabricated. | 52,396 | 34,940 | 117,351 | 127,334 | 163,924 | 194,206 |
| Iron ore | 43 | 4,353 | 30,843 | 39,719 | 99.814 | 144,443 |
| Petroleum, crude and partly refined. | 1 | - | 6,228 | 6,318 | 36,253 | 103,923 |
| Asbestos, unmanufactured. | 2,902 | 23,839 | 83,973 | 82,566 | 94,804 | 99,895 |
| Barley. | 7,882 | 9,688 | 136,729 | 89,363 | 76,461 | 94,977 |
| Zinc, primary and semi-fabricsted | 9,922 | 27,659 | 57,572 | 58.392 | 70,558 | 74,011 |
| Whest flour. | 16,378 | 126,733 | 102,160 | 88.029 | 74,442 | 71,549 |
| Whisky. | 7,914 | 29,650 | 63,086 | 59,156 | 60,682 | 68,680 |
| Farm implements and machinery (except tractors) and parts.. | 6,975 | 28,662 | 67,821 | 70,819 | 72,206 | 63,937 |
| Fish, fresh and frozen | 10.212 | 31,110 | 51,219 | 56,650 | 55,263 | 59,594 |
| Pulpwood. | 10,901 | 28,731 | 45,859 | 45,766 | 48,655 | 49,794 |
| Aircraft and parts (except engines) | 347 | 9,507 | 40,247 | 28,442 | 19,906 | 49,545 |
| Fertilizers, chemical. | 9,179 | 32,108 | 42,633 | 42,342 | 56,296 | 49,211 |
| Machinery (non-farm) and parts. | 11,6682 | 16,675 ${ }^{2}$ | 38,6182 | 38,1722 | 35,789 | 47, 130 |
| Uranium ores and concentrates | .. | .. | .. | 8,056 | 26,533 | 45,777 |
| Flaxseed (chiefly for crushing). | 1 | 11 | 11,546 | 13,717 | 31,279 | 43,624 |
| Platinum metals, unmanufactured. | 6,178 | 15,450 | 26,290 | 27,640 | 26,315 | 35,656 |
| Lead, primary and semi-fabricated. | 9,850 | 16,715 | 37,835 | 40,530 | 37, 194 | 35,025 |
| Non-commercial items. | 2,402 | 39,951 | 20,295 | 21,054 | 25,227 | 34,000 |
| Scrap iron and steel. | 1,021 | 166 | 15,877 | 15,868 | 20,936 | 30,427 |
| Plywoods and veneers. | 1,608 | 12,026 | 19,025 | 21,855 | 30,104 | 29,020 |
| Abrasives, artificial, crude | 4,380 | 11,727 | 28,976 | 27, 222 | 26,942 | 28,389 |
| Synthetic plastics, primary forms. | 351 | 1,540 | 9,456 | 19,994 | 27,365 | 26,577 |
| Fur skins, undressed. | 14,130 | 30,928 | 21,070 | 22,997 | 28.287 | 25,893 |
| Rolling-mill products (iron and steel) | 3,864 | 7,528 | 16,863 | 5,393 | 20,313 | 25,719 |
| Shingles. | 8,225 | 11,211 | 20,913 | 24,182 | 29,145 | 24,546 |
| Fish, cured. | 3,884 | 13,808 | 22,271 | 23,341 | 23,939 | 22,835 |
| Electrical apparatus, n.o.p | 3,229 | 20,939 | 37,705 | 22,913 | 20,700 | 21,407 |
| Ferro-alloys. | 2,477 | 9,485 | 17,207 | 6,648 | 13,165 | 21,177 |
| Oil seed cake and meal. | 279 | 58 | 8,222 | 7,746 | 15,431 | 20,891 |
| Pigs, ingots, blooms and billets (iron | 2,691 | 3,328 | 29,508 | 11,212 | 33,695 | 20,749 |
| Molluses and crustaceans..... | 3,542 | 14,162 | 17,588 | 17,322 | 20,246 | 20,554 |

## Section 5.-Imports and Exports by Degree of Manufacture, by Origin and by Purpose

The tables in this Section present Canada's trade according to three alternative classifications other than the classification by component material used in Section 4.
16.-Imports according to Degree of Manufacture by Leading Countries 1955 and 1956

| Country | 1955 |  |  | 1956 |  |  |

## Section 6.-Comparison of Value, Price and Volume of Foreign Trade

In the postwar period there has been a substantial increase in the value of Canada's exports and imports. Changes in the value of trade, however, are the joint product of changes in the volume of goods traded and of the prices at which transactions are conducted. To assess the significance of value changes it is desirable to isolate the contributions made to them by the price and volume factors.

Special indexes of export and import prices have been developed to provide this information. These indexes are based chiefly on unit values (average prices) calculated from the trade statistics, supplemented by information on wholesale and retail prices. Price relatives are calculated for a sample of commodities representing the greater part of export and import trade, and these relatives are weighted by the percentage of 1948 trade represented by each commodity in the sample in obtaining group and total indexes. By dividing these price indexes into the trade values the effects of price change are removed from the values, or by dividing the price index into an index of values on the same time-base an index is obtained showing changes in the volume of trade from year to year.

The grouping of commodities used in these calculations differs slightly from that of the regular trade statistics, changes being desirable to simplify the pricing problem. The chief difference is that the first two main groups of the trade statistics have been combined into one group, "agricultural and animal products", and that the sub-group "rubber and its products" has been transferred from this group to the "miscellaneous group"

The import totals differ from those usually published by the exclusion of certain goods brought into Canada by the governments of the United Kingdom and other NAT0 countries for the use of their defence forces. Table 22 shows the value of trade adjusted for pricing purposes, and the value, price and volume indexes of Canadian trade for 1953-56. In the period covered by this table there was relatively little change in import prices; they remained at around the level of 1952 to which they fell from a sharp peak in 1951. Export prices, also at a record level in 1951, declined gradually during the following three years but turned upward in 1955. The role of somewhat lower prices in accentuating a volume decline of about the same magnitude is illustrated for exports in 1954. But in 1955 and 1956 it was higher volume that contributed most to the significant value gains of both exports and imports.

${ }^{1}$ Groups, though classified by component material, differ slightly from conventional groups (see text, p. 1042). ${ }^{2}$ Exeludes imports for the use of the United Kingdom and other NATO Governments. ${ }^{3}$ Exeludes exports of foreign produce. $\quad 4$ Revised for 1954 to 1956: uranium ores and concentrates transferred from chemicals to non-ferrous metals as of Jan. 1, 1957.

## PART III.-EXTERNAL TRANSACTIONS*

## Section 1.-Canadian Balance of International Payments

A summary of Canada's total commercial and financial transactions with other countries is presented in statements of the Canadian Balance of International Payments. The current account statement, covering all current exchanges of goods and services, indicates the main categories of transactions giving rise to receipts from and expenditures abroad, and the extent to which these are out of balance. The capital account presents an analysis of the movements of short-term and long-term capital that have occurred during a comparable period.

Each year since 1950, with the exception of 1952, Canada's current expenditures abroad exceeded external current receipts. The resulting current account deficits that occurred in this period of rapid Canadian development were financed by inflows of capital. Current account deficits have customarily been associated with periods of Canadian prosperity and once again the rate of recent Canadian growth with the development of new resources has been the underlying element in the strength of Canadian demands for imported goods and services. High levels of investment at a time when defence expenditures were also very heavy, together with rising levels of consumption, contributed to the deficits. Before 1955 the deficits in recent years were not large in proportion to the high levels of total current transactions and, until then, capital inflows of a long-term type were large enough to finance the deficits in most periods. But in 1955 the current deficit rose to $\$ 698,000,000$, and this deficit was substantially more than the net inflow of longterm capital. In 1956, as the result of continuing high levels of investment and consumption, the deficit rose to the unprecedented peak of $\$ 1,372,000,000$. At the same time, inflows of capital in long-term forms more than tripled those of the previous year and were almost sufficient to finance the record deficit.

[^341]Current Account Transactions.-The relatively stable current account deficits of some $\$ 400,000,000$ in 1953 and 1954, were followed by a widening of such deficits to $\$ 698,000,000$ in 1955 and $\$ 1,372,000,000$ in 1956. The growth in the deficit over these two years of rapid expansion in the Canadian economy was primarily related to a larger imbalance on merchandise trade. Of the $\$ 940,000,000$ rise in the deficit between 1954 and 1956 , almost $\$ 750,000,000$ was the result of larger net payments for imported commodities, and the remainder reflected growth in the non-merchandise or 'invisible' items. From the end of the War until 1955, there was a relatively consistent pattern of surpluses on adjusted merchandise trade transactions,* and some of these surpluses were substantial. The pattern was broken only in 1951 and 1953 , and the 1953 deficit of $\$ 58,000,000$ was replaced by a small surplus in 1954, with exports contracting relatively less than imports as economic activity slackened in that year. Towards the end of 1954, however, the slow-down came to an end, and a period of unprecedented growth and development began.

The deficit on merchandise transactions grew to $\$ 211,000,000$ in 1955 and $\$ 734,000,000$ in 1956 , largely as a result of $\$ 2,200,000,000$ additional imports. The expansionary forces that were evident throughout the two years permeated almost every area of economic activity but the major area of expansion and development was investment. During 1955 and 1956, public and private domestic investment increased by 13 p.c. and 24 p.c., respectively. This rise included utility and resource development, machinery and equipment for manufacturing and service industries, including government investment expenditures on highways, and services incidental to the growth in house building. In recent years a large part of the equipment and supplies for Canada's investment program has been obtained from the United States. In 1955 and 1956 the record levels of expenditure in this sector resulted in tremendous growth of imports of machinery, equipment and construction materials, and of raw materials for the Canadian capital goods industries. At the same time, high levels of personal income and consumption resulted in larger imports of consumer goods, and materials and supplies for Canadian industry producing consumer goods. Gains in almost every phase of the economy in 1955 and 1956 exerted heavy pressure on Canadian productive capacity, and shortfalls in the face of these demands were met for the most part with imported goods, largely from the United States.

At the same time, economic activity over these two years grew apace in most countries, including such important markets for Canadian production as the United States, the United Kingdom and Western Europe. In the two years Canadian exports increased by about $\$ 400,000,000$ and $\$ 900,000,000$ respectively; gains in a large number of traditional export categories were accompanied by some extraordinary increases. Exports of grain in 1956 were exceptionally large as a result of shortages in local supplies in Western Europe. In addition, there were marked advances in exports of some raw materials following increased productive capacity.

Export and import prices rose almost 7 and 4 p.c., respectively, during 1955 and 1956 and, as a result, the terms of trade became slightly more favourable.

There was also a significant and persistent advance in the deficit on non-merchandise account although this was smaller than on commodity trade. From $\$ 445,000,000$ in 1954 this deficit, from a wide range of transactions in services with other countries, rose to $\$ 487,000,000$ in 1955 and to $\$ 638,000,000$ in 1956 . The over-all expansionary influences of a fast-growing economy were evinced by increased payments abroad in 1955 and 1956 for the whole range of invisible imports; the most notable of these were for travel by Canadians outside of Canada, interest and dividend payments on the growing amount of foreign capital invested in Canada, freight and shipping, and business and other miscellaneous services. Another group of rising expenditures abroad included the cost to the

[^342]Federal Government of maintaining armed forces in Europe as part of Canada's contribution to the North Atlantic Treaty Organization defence plans, and goods and services financed by Canada's contribution to the Colombo Plan. In addition, there was a marked growth in overseas remittances from Canada, particularly by recent immigrants from Western Europe. By the end of 1956, total immigration to Canada in the postwar years had reached $1,400,000$.

At the same time, there were increased receipts of migrants' funds as the result of a large inflow of immigrants to Canada in 1956. Total receipts for non-merchandise transactions also rose over the two years, although not as much as payments. The major increases were for freight and shipping services, particularly earnings of inland freight on new exports of bulk commodities, and for expenditures by the United States on defence establishments in Canada.

An important feature of the growth of Canada's current account deficit in 1955 and 1956 was the growth in the deficit with the United States. The deficit with all countries increased by about $\$ 940,000,000$ from 1954 to 1956 ; the deficit with the United States rose by $\$ 833,000,000$. The predominant role played by the United States reflected the growth in imports of investment and consumer goods, and in larger payments by Canadians for non-merchandise items. These included expenditures for travel, substantially larger remittances of interest and dividends arising in part from an increased non-resident participation in Canadian equity capital, and larger net payments for freight and shipping services.

The bilateral account with overseas countries showed a decline in surplus from $\$ 375,000,000$ in 1954 to $\$ 268,000,000$ in 1956 . These totals conceal a variety of divergent movements. In 1955, the surplus with the United Kingdom rose by almost $\$ 100,000,000$ to $\$ 330,000,000$, largely as a result of increased exports from Canada. By 1956 most of this increase in surplus over 1954 had disappeared as a result of increased merchandise imports, particularly investment goods, a dropping off in exports of lumber to the United Kingdom, and larger net payments for non-merchandise items. The surplus with the remainder of the Sterling Area changed little from 1954 to 1956, although there was a notable rise in exports to Commonwealth countries in 1955, which somewhat increased the surplus in that year.

The surplus with other OEEC (Organization for European Economic Co-operation) countries declined from $\$ 93,000,000$ in 1954 to $\$ 12,000,000$ in 1956. There were roughly comparable absolute increases in both exports and imports from this group of countries, stimulated by high levels of activity both in Canada and overseas. The decline in the surplus relates to increased net payments for a majority of non-merchandise transactions, including travel expenditure, remittances of investment income, payments for freight and shipping services, other miscellaneous payments for services, and government defence expenditures abroad in connection with Canada's participation in NATO. In addition to the above direct military expenditures, there was Canada's contribution of Mutual Aid to NATO countries, which amounted to some $\$ 222,000,000$ in 1955 and $\$ 157,000,000$ in 1956, bringing the total contribution from 1950 to over $\$ 1,300,000,000$. Being a contribution of military aid in this form, Mutual Aid has not been taken into the current account balance, although the item may be included as a credit for exports and offset by a debit representing the contribution.

The small surplus with other overseas countries in 1954 became a deficit of $\$ 79,000,000$ in 1955 and $\$ 36,000,000$ in 1956. The major factor in this was the development of deficits on merchandise trade. In 1955 exports declined and imports rose; in 1956 both exports and imports rose but the export gains were relatively larger, and the deficit declined somewhat. At the same time there was a larger surplus on non-merchandise account, primarily as a result of increased income receipts.

Capital Movements.-The forms of capital movements that financed the greatly enlarged current deficits in 1955 and 1956, and the related monetary background, were quite different in the two years. The greatest of these changes was the wide fluctuation in the
net inflow of capital in long-term forms. These inflows declined to $\$ 410,000,000$ in 1955 , less than 60 p.c. of the current account deficit, whereas in preceding years long-term inflows of capital were more than sufficient to finance current deficits. But again in 1956 longterm types of inflow rose sharply to some $\$ 1,350,000,000$ and financed almost all of the record-size deficit. Underlying influences affecting these changes included the greater inducements to borrow in the United States through the sale of new Canadian issues in capital markets there, as monetary pressures tightened towards the end of 1955 and intensified in 1956. Consequently, a great increase occurred in inflows to Canada from new issues of Canadian securities sold abroad along with reduced outflows for the repatriation of outstanding Canadian bonds held in the United States which had been prominent in 1955. But, at the same time, inflows of capital into equities in Canadian industry continued to grow in both years for direct investment in non-resident-controlled firms in Canada and for investment in outstanding Canadian stocks.

As a result of these developments, Canada obtained in 1955 additional physical resources from abroad to carry out an expanding investment program by falling back on an excess of long-term inflows over the postwar years. Short-term inflows of capital therefore played a more important part in financing the deficit in 1955 than in earlier years, or in the following year. A major part of the increase in short-term inflows in 1955 originated in the account with the United States. Of net inflows of $\$ 425,000,000$ from that country more than one-half were in short-term forms. The latter inflows included a rise in the holdings of Canadian dollars by non-residents, a reduction in official holdings of gold and foreign exchange, and changes in international commercial receivables and payables. Inflows from the United Kingdom reached a postwar peak at $\$ 199,000,000$ and the increase in inflows from that country in the year was largely the result of a drawing down of sterling balances previously acquired by Canadians.

In contrast, inflows of long-term capital in 1956 financed almost all of the current account deficit as the extraordinary rate of growth in the Canadian economy resulted in mounting pressures of demand for capital as well as goods and services. An unprecedented volume of capital investment, coupled with an already generally high level of economic activity, subjected the Canadian economy to special strains in 1956, and these had important effects on international capital movements. It has already been noted that the physical impact of these pressures was felt in the substantial deficits incurred on current account as the Canadian economy supplemented its own output with large net drafts on the goods and services of other countries. Strong pressures were also created on Canada's capital market, and there were sharp increases in interest rates. Higher interest rates were also characteristic of foreign capital markets but the differential between rates in Canada and the United States widened somewhat. This development contributed to a very large volume of financing abroad by provincial governments, municipalities and corporations. These inflows were superimposed on the persistent inflows in recent years for direct investment in foreign-controlled enterprises in Canada and for portfolio investment in Canadian equities, both of which reached new heights in 1956. For the year as a whole, the inflow for direct investment was placed at $\$ 595,000,000$. Transactions in Canadian securities led to a further inflow of $\$ 748,000,000$, which included $\$ 265,000,000$ of equities. These two groups of transactions alone added $\$ 1,343,000,000$ to Canadian external liabilities in long-term forms. In addition to other smaller long-term inflows such as foreign security sales and loan repayments, there was a $\$ 110,000,000$ outflow for direct investment abroad. This brought the total inflows of a long-term type to $\$ 1,350,000,000$, as compared with $\$ 410,000,000$ a year earlier.

Canadian direct investment abroad established a record at $\$ 110,000,000$. About 70 p.c. of the net movement was to the United States, and involved the acquisition of control over existing enterprises abroad, particularly in merchandising. In addition there was a disposition of Canadian interests in utilities in Latin America.

The United States continued to be the major source of long-term external capital for Canada in 1956. Indeed, the net movements in long-term forms were somewhat more than two-thirds from the United States in 1956 in contrast to just under one-half in 1955 when
there was a significant volume of repatriation of Canadian funded debt from that country. Although overshadowed by the size of the tremendous inflows of more than $\$ 900,000,000$ from the United States, which were about four times larger than in 1955, the movements in long-term forms in 1956 from the United Kingdom and from other overseas countries also rose sharply. While overseas countries have not, as a general rule, been an important source of debt capital for Canada for many years past, their demand for Canadian portfolio equities, together with some major direct investments in Canada and the placement of some new Canadian issues in European markets, brought the total inflow in long-term forms to more than $\$ 425,000,000$ for the year. This was more than double the figure for 1955 and was far in excess of any year since the commencement of regular official balance of payments statistics in 1926.

Again in contrast to 1955, there was a decline in 1956 in the Canadian dollar holdings of foreigners, and an increase in official holdings of gold and foreign exchange; all other capital movements in 1956 were, on balance, about half the net movement in the previous year. A great variety of transactions, mainly short-term in character, comprise this latter group. Although outflows were substantial they were more than offset by inflows. Among the outflows was a rise in Canadian holdings of short-term assets abroad. Inflows included borrowing by finance companies, other capital transfers by financial institutions and an apparently large rise in net payables on commercial account.

Closely related to the developments described above was the persistent strengthening in the exchange rate for the Canadian dollar during 1956 which contrasts with the weakening that occurred in 1955. The monthly trend in the value of the United States dollar in Canada for some years is presented in Table 3 of Part I of this Chapter.

Comments and statistics on the effects of the unprecedented capital inflows of recent years upon the ownership of investments in Canada will be found in the Section on Canada's International Investment Position in Chapter XXV.

## Section 2.-Travel between Canada and Other Countries

A new record was set in volume of travel between Canada and other countries in 1956. Visits to Canada by residents of other countries numbered 27,700,000 while Canadians reciprocated with $27,200,000$ visits to other countries. The volume of all travel amounted to $54,900,000$ visits as compared with $53,200,000$ visits in 1955, an increase of approximately 3 p.c.; the 1955 increase over 1954 was nearly 7 p.c.

While the increase in the number of Canadians travelling to other countries in 1956 was about $2,400,000$ or 9 p.c. as compared with 1955 , which in turn was $1,500,000$ over 1954, the entries into Canada by residents of other countries declined by 614,300 or nearly 2 p.c. This included approximately 616,900 fewer visits from the United States but 2,600 additional entries direct from overseas countries. The 1955 figure was an increase of nearly $2,000,000$ over 1954.

Regardless of the fewer number of visitors coming to Canada in 1956, visitor expenditures in this country reached an all-time high of $\$ 337,000,000, \$ 9,000,000$ above the expenditure figure for 1955 or an increase of nearly 3 p.c. The 1955 total was an increase of about $\$ 23,000,000$ over 1954. At the same time, Canadians spent nearly $\$ 500,000,000$ travelling in other countries during $1956, \$ 49,000,000$ or 11 p.c. more than in 1955 . Thus the debit balance on travel account which had been $\$ 121,000,000$ in 1955 was extended by $\$ 40,000,000$ to $\$ 161,000,000$ in 1956 , almost double the 1954 figure.

Travel by Residents of the United States in Canada.-Receipts from residents of the United States advanced to a record of $\$ 309,000,000$ in 1956, 2 p.c. higher than in 1955 even though 2 p.c. fewer visits were recorded. The increase was accounted for by the tourists travelling by automobile who spent $\$ 172,000,000$ in Canada as compared with $\$ 165,000,000$ in 1955. There were $8,400,000$ non-resident automobiles in Canada during 1956, about 241,000 more than in 1955 . However, this increase was more than accounted for by a 5 -p.c. increase in the non-permit or local class of vehicles entering-the number of foreign vehicles entering on travellers' vehicle permits was between 1 and 2 p.c. lower than in 1955, but these expenditures were slightly higher. Average expenditure per visit in 1956 was higher in most of the provinces and the aggregate for all provinces was up between 3 and 4 p.c. Receipts from the non-permit or local classification of automobile traffic were also substantially higher in 1956. Receipts from visitors arriving by other forms of transportation were practically unchanged from the previous year, although there was a substantial decrease in their numbers.

Motorists entering Canada on travellers' vehicle permits contributed about 44 p.c. of the total travel receipts from residents of the United States during 1956. Although no direct record of their movement within Canada is maintained, a study of the ports of entry and exit give some indication of the routes within Canada that attract the greatest number of American motorists. This information represents minimum interprovincial or interregional travel and does not include cars entering or leaving by the same province or region after visiting other provinces or other areas within the province of entry. During 1956, 5,376 cars entered Canada through ports in the Maritime Provinces and returned to the United States through ports in the Province of Quebec, whereas 8,611 vehicles entered Canada through ports in Quebec and returned to the United States through ports in the Maritime Provinces. From 75 to 77 p.c. of these visitors remained in Canada for three or more days. The most popular route for travel in each direction lies between the ports of St. Stephen, N.B., and Blackpool, Que.

The interchange of entries and exits between Ontario and Quebec accounts for a substantial segment of the number of Americans travelling in these Provinces. During 1956, some 33,380 foreign vehicles entered Canada on customs permits through ports in Quebec and returned to the United States through Ontario ports. This represented about 8 p.c. of all the vehicles entering Canada through Quebec ports. Approximately 82 p.c. of these motorists stayed in Canada for three or more days. Travel in the opposite direction
was somewhat heavier as 50,939 vehicles entered through Ontario ports and returned through Quebec ports. Automobiles returning through Quebec represented between 3 to 4 p.c. of all entries into Ontario on travellers' vehicle permits and 85 p.c. of the vehicles travelling in that direction remained in Canada for three or more days. The volume of traffic between Quebec and Ontario is heavier on routes between Blackpool and Niagara Falls than between any other combination of ports.

Within Ontario, which normally accounts for about 60 p.c. of the entries into Canada on travellers' vehicle permits, there are several routes that appear to be popular with foreign motorists. The highways between Fort Erie and Niagara Falls on the east of southern Ontario and the St. Clair and Detroit River ports on the west carry the heaviest volume of traffic. During 1956, 189,200 vehicles travelled from east to west between these ports and 200,900 from west to east. The fact that well over half of these vehicles were in the country only one day shows the extent of in-transit traffic over this route. The trip across southern Ontario is about 250 miles long, and is more than 100 miles shorter than the route south of Lake Erie. Because Ontario has such a high proportion of in-transit travel, average expenditure per visit is lower than in the other provinces.

The route between Fort Erie-Niagara Falls and the St. Lawrence River ports is a better source of travel receipts since it often involves a trip north of Lake Ontario and perhaps a visit to Toronto or some of the tourist resorts in central Ontario. In 1956, 37,800 automobiles used this route either way, and two-thirds of them were in Canada three or more days.

Travel across the northern areas of Ontario has not developed to any extent because of the distance involved and the condition of many parts of the highways. However, 827 vehicles entered Ontario somewhere east of Port Arthur and returned to the United States through Pigeon River, Fort Frances or Rainy River after staying in Canada for three days or longer. The number of cars travelling in the opposite direction was 1,082 .

In 1956 some 5,126 cars entered Canada through ports in Ontario west of Port Arthur and returned to the United States through ports in Manitoba, nearly 75 p.c. of them staying three or more days. Travel in the opposite direction totalled 4,919 but 80 p.c. of the permits covered visits of three or more days.

Almost 36 p.e. of the longer-term group of foreign automobiles entering through ports in Alberta returned to the United States through British Columbia. The ports of Carway, Alta., and Kingsgate, B.C., appear more frequently than any other combination of ports in the exchange of travel between the two provinces, and the number of cars travelling in both directions was 20,765 .

Residents of the United States visiting Alaska usually enter through Alberta or British Columbia and continue in-transit through Yukon Territory to their destination. The journey involves more than 2,000 miles of travel through Canada and therefore requires a length of stay in this country. This in-transit travel to Alaska no doubt contributes to the high averages of tourist expenditures in Alberta and British Columbia.

During 1956, about 8,500 cars entered Canada through ports in Alberta or British Columbia and left mainly through the port of Snag Creek in Yukon Territory. About 38 p.c. of them entered at Coutts in Alberta, and 28 p.c. entered through Huntingdon or Aldergrove in British Columbia. The return trip usually followed the same route.

Canadian Travel in the United States.-Travel to the United States by residents of Canada reached a new high in 1956 when there were $2,300,000$ more crossings than in 1955. Total re-entries of Canadians returning from visits to the United States amounted to $27,100,000$. Short-term traffic increased by 10 p.c., while an increase of between 5 and 6 p.c. was shown in the long-term visits. The movement of visitors from Canada to the United States was almost equal to the corresponding movement from the United States to Canada. There were, for example, some 4,276,900 Canadians in the longer-term group of re-entries as compared with $4,407,400$ visits of the same duration from residents of the

A record amount was spent on travel in the United States by residents of Canada during 1956; the total of $\$ 391,000,000$ represents an additional $\$ 28,000,000$ as compared with the previous record spent in 1955. Most of the additional expenditure appeared in the long-term traffic where the increase amounted to $\$ 24,000,000$; short-term travellers spent an extra $\$ 4,000,000$ during 1956. The average expenditure was $\$ 78.79$ per long-term visit, a 2-p.c. increase over 1955, and $\$ 2.37$ per short-term visit, a 2-p.c. decrease over 1955. The average expenditure for all visits was $\$ 14.44$. On a per capita basis, residents of Canada spent $\$ 24.32$ for travel in the United States in 1956. This is a higher figure than the average per visit because, besides the effect of commuters, many Canadians make several trips to the United States in a year. The Canadian averages are all much higher than corresponding rates for United States visitors. Per capita expenditures of Americans on travel in Canada averaged about $\$ 1.85$ in 1956, while the average expenditure per visit to Canada was \$11.18.

Canadian expenditures in the United States included purchases of merchandise. Declarations made under the $\$ 103$ customs exemption privilege during 1956 totalled close to $\$ 73,000,000$, an increasa of $\$ 3,600,000$ over the provious year and nearly 19 p.c. of the total amount spent by Canadians while travelling in the United States. This latter percentage was about the same as in 1955.

A special study on characteristics of Canadian travel to the United States shows that, in 1956,38 p.c. of the respondents reported recreation as the purpose of visit, 30 p.c. went to visit friends or relatives, 19 p.c. went to shop and 10 p.c. went on business or for educational purposes. Information on the destination of longer-term visitors to the United States showed that the State of destination varies with the season of the year. During the first three months of 1956, nearly 24 p.c. of the Canadian visitors covered in the sample went to Florida. The proportion dropped to 10 p.c. in the second quarter, 4 p.c. in the third and 5 p.c. in the fourth. Altogether for the year, between 9 and 10 p.c. gave Florida as their destination, a figure which changed little from 1955. New York drew over 28 p.c., which was the greatest number of Canadian visitors to any State during the year; during the second and fourth quarters the percentage was somewhat higher, which suggests a seasonal pattern influenced by holiday periods. The State of Washington was the destination of 11 p.c., Michigan 9 p.c. and California 5 p.c. Visitors to California preferred the first quarter of the year when the proportion was nearly 8.5 p.c.

It was also found that the States immediately south of the border attract the greater percentages of re-entries to bordering provinces. Thus, from the Atlantic Provinces over 38 p.e. of the Canadian visitors reported visits to Massachusetts, 28 p.c. to Maine and 15 p.c. to the State of New York. More than 39 p.c. of the residents of Canada returning through Quebec and Ontario visited New York State without going farther south. Many re-entries through Quebec also visited Massachusetts, Vermont and Florida. Michigan attracted over 17 p.c. of the Ontario visitors and Florida nearly 14 p.c. Almost 64 p.c. of the visitors returning to Manitoba and 48 p.c. returning to Saskatchewan had been to Minnesota and North Dakota. Of the re-entrants to Alberta, 41 p.c. had not travelled beyond Montana, 11 p.c. remained in the State of Washington and 9 p.c. visited California. Canadians who re-entered British Columbia stayed very close to the Pacific Coast; over 59 p.c. had been in Washington and 33 p.c. had visited California, Oregon and Idaho.

Travel between Canada and Overseas Countries.-Travel between Canada and overseas countries continued to show considerable expansion during 1956, particularly in the number of visits to overseas countries by residents of Canada. The expenditures of Canadians in overseas countries rose more rapidly than the receipts of visitors from overseas, resulting in a record deficit of $\$ 79,000,000$, which was about half of Canada's travel deficit for the year.

Residents of Canada returning direct from overseas countries via Canadian ports numbered 106,100 , about 18,100 more than in the previous year. These direct re-entries were supplemented by an estimated 33,000 who travelled via the United States, making a
total of 139,100 , which was an increase of 22,100 over 1955 . More than 53 p.c. of the direct travel by air is covered by the ports of Gander, Nfld., Dorval, Que., Malton, Ont., and Vancouver, B.C., and there were 14,800 more re-entries through these ports in 1956 than in 1955. Re-entries by ship came mainly through St. John's, Nfld., Halifax, N.S., Saint John, N.B., Quebec and Montreal, Que., and Vancouver, B.C. The number of re-entries at these ports numbered 3,300 .

The expenditures of Canadians in overseas countries reached a record of $\$ 107,000,000$ in $1956, \$ 21,000,000$ higher than in 1955. The United Kingdom receives the major portion of overseas expenditure, although other European countries are gradually claiming more of the Canadian travel dollar. The United Kingdom received about $\$ 46,000,000$ in 1956 as compared with $\$ 40,000,000$ in 1955 , and other European countries $\$ 41,000,000$ as against $\$ 32,000,000$. Higher averages per visit were reported by persons visiting other European countries than by those visiting the United Kingdom, and persons visiting both the United Kingdom and the Continent reported that more than 50 p.c. of their expenditures were made in Continental Europe. Thus there was little difference in the expenditures in the two areas, although substantially more visits to the United Kingdom were reported,

Data on destinations of Canadians returning directly show that, in 1956, 36 p.c. visited the United Kingdom only, 33 p.c. visited the United Kingdom and other European countries, about 12 p.c. visited European countries other than the United Kingdom only, 4 p.e. visited Bermuda, 4 p.c. went to the British West Indies, 5 p.c. to Mexico, nearly 3 p.c. to Hawaii, 2 p.c. to countries not specified, and less than 1 p.c. to other countries.

Length of stay abroad varied according to destination. The average stay in the United Kingdom was close to 63 days; persons travelling by vessel stayed about 80 days and those travelling by air averaged about 41 days. Persons visiting the United Kingdom and other European countries averaged approximately 71 days, 38 days in the United Kingdom and 33 days on the Continent. Here again persons travelling by ship averaged approximately 93 days, and those travelling by air about 48 days. Visits of longer duration were reported by persons visiting only European countries other than the United Kingdom. The average length of visit by ship passenger to Continental Europe only was 91 days, and by air travellers about 47 days. The average length of stay in Bermuda was 16 days, and in the British West Indies around 24 days. Much longer visits were reported by Canadians who visited other parts of the Commonwealth. For other countries visited the average length of stay was: Mexico, 20 days; Central America, 26 days; Hawaii, 28 days; and South America, 47 days.

Non-resident travellers (other than immigrants) arriving direct from overseas countries through Canadian ports of entry in 1956 numbered about 30,600 , about 2,600 more than in 1955. In addition, an estimated 22,000 visitors from overseas entered Canada by the United States. The total was thus 52,600 , or 4,600 more than in the previous year.

Expenditures in Canada by overseas visitors were estimated at $\$ 28,000,000$ in 1956, a record amount $\$ 3,000,000$ above the 1955 total. Included were transportation costs paid to Canadian carriers which accounted for about 50 p.c. of the total receipts from residents of overseas countries. Expenditures of overseas travellers in Canada are higher than the volume indicates because of higher transportation costs and usually longer visits.

Tourist Information.-Tourist information generally is supplied by the Canadian Government Travel Bureau, Ottawa, and detailed information on the National Parks and Historic Sites is available from the Department of Northern Affairs and National Resources, Ottawa. For advice regarding specific provinces or particular cities or resorts, application should be made to the Provincial or Municipal Bureau of Information concerned.

## 6.-Number and Expenditure of Foreign Travellers in Canada and Canadian Travellers Abroad 1955 and 1956

## PART IV.-THE GOVERNMENT AND FOREIGN TRADE

## Section 1.-Foreign Trade Service and Associated Agencies concerned with the Development of Foreign Trade*

Foreign trade contributes substantially to the welfare and prosperity of Canadians, largely because the productive capacity of Canada is greater than the ability of its population to consume the output of farms, factories, forests, fisheries and mines. Every effort is made, therefore, to establish and maintain close commercial relations with other countries whose markets are essential to the Canadian economy. It is appreciated, however, that two-way trade should be encouraged in order that goods and services may be accepted in partial payment for the products Canada is in a position to export. Furthermore, many commodities that are not indigenous to this country must be imported. Some of these are required for industrial processes and others may be classed as consumer goods necessary for the maintenance of the Canadian standard of living.

Although many private firms have established connections in other countries that enable them to maintain a steady flow of goods in either direction, others require the assistance of government agencies in finding markets or sources of supply. Import and export controls imposed by many countries for a variety of reasons, together with postwar foreign exchange difficulties, present problems that no single firm or even an association of manufacturers, exporters or importers can solve without assistance from government representatives.

The Department of Trade and Commerce and associated agencies are at the disposal of exporters and importers engaged directly in the development of Canada's commercial relations with other countries. Services obtainable from the various branches, divisions and agencies are described below.

Canadian Trade Commissioner Service.-The Canadian Trade Commissioner Service is one of the important instruments in the continuous effort to increase Canadian international trade, to give world-wide distribution to Canadian products and to locate the best sources of supply for imports. Headquarters are at Ottawa, and 58 offices are maintained in 45 countries, staffed with trained Canadian trade officials and commodity specialists. The work of the Trade Commissioners in the field is co-ordinated in Ottawa by five Area Trade Officers. These Officers are familiar with every aspect of foreign trade

[^345]in their geographical or political areas and are responsible to the Director of the Service for the collection, preparation and presentation of information on all trade matters in their respective territories.

Trade Commissioners bring together exporters and importers of Canada and other countries. They study potential markets for specific Canadian products and report on the exact kind of goods in demand, prices, competitive conditions, trade and exchange regulations, tariffs, shipping and packaging requirements, labelling, etc. Inquiries for Canadian goods are forwarded to the Department at Ottawa or directly to interested Canadian firms. For Canadian importers, Trade Commissioners seek sources of supply of a wide variety of goods. The preparation of economic and other reports for departmental use is an important activity for the Trade Commissioner. Assistance is given to Canadian exhibitors at overseas trade fairs and constant liaison is maintained with the trade departments of foreign governments.

In countries where Canada maintains a diplomatic mission and a trade office, Trade Commissioners form an integral part of the mission and assume the title of Commercial Counsellor or Commercial Secretary. In some foreign countries they act as Consuls General, Consuls or Vice-Consuls, according to their status as Foreign Service Officers.

In order to provide Canadian manufacturers, exporters and importers with up-to-date information concerning their territories more effectively than is possible by correspondence, tours of Canadian industrial centres are arranged from time to time for Trade Commissioners. Such direct contacts enable specific problems to be discussed and at the same time serve to bring into focus for the Trade Commissioner the Canadian industrial picture as a whole.

## CANADIAN FOREIGN TRADE OFFICES ABROAD AS AT JAN. 1, 1958

Argentins.-Commercial Counsellor, Canadian Embassy, Bartolome Mitre 478, Buenos Aires.
Adstralis.-Commercial Counsellor for Canada, 7th Floor, Berger House, 82 Elizabeth Street, Sydney, N.S.W.

Commercial Counsellor for Canada, 83 William Street, Melbourne.
Adstrin.-Commercial Secretary for Canada, Opernringhof, Opernring 1, Vienna 1. Territory includes Czechoslovakia and Hungary.

Belgian Congo.-Canadian Government Trade Commissioner, Forescom Bldg., Leopoldville 1. Territory includes Angola and French Equatorial Africa.

Brigium.-Commercial Counsellor, Canadian Embassy, 35 rue de la Science, Brussels. Territory includes Luxembourg.
Brazul.-Commercial Secretary, Canadian Embassy, Edificio Metropole, Av. Presidente Wilson 165, Rio de Janeiro.
Consul and Trade Commissioner, Canadian Consulate, Edificio Alois, Rua 7 de Abril 252, Sào Paulo.

Ceryon.-Commercial Secretary, Office of the High Commissioner for Canada, 6 Gregory's Road, Cinnamon Gardens, Colombo.
Chile.-Commercial Secretary, Canadian Embassy, 6th Floor, Av. General Bulnes, 129, Santiago.
Corombia.-Commercial Secretary, Canadian Embassy, Avenida Jimenez No. 7-25, Office 613, Bogota. Territory includes Ecuador.
Cuba.-Commercial Secretary, Canadian Embassy, Edificio Ambar Motors, Avenida Menocal 16, Havana.

Denmark.-Commercial Counsellor, Canadian Embassy, 4 Trondhjems Plads, Copenhagen. Territory includes Greenland and Poland.
Dominican republic.-Commercial Counsellor, Canadian Embassy, Edificio Copello 408, Calle El Conde, Ciudad Trujillo. Territory includes Puerto Rico.
91593-67

Egrpt.-Commercial Secretary, Canadian Embassy, 6 Sharia Rouston Pasha, Garden City, Cairo. Territory includes Aden, Sudan, Cyprus, Ethiopia, Saudi Arabia, and Yemen.

France.-Commercial Counsellor for Canada, 3 rue Scribe, Paris. Territory includes Algeria, French West Africa, Morocco, Tangier and Tunisia.

Germany, Federal Republic of.-Commercial Counsellor, Canadian Embassy, 22 Zitelmandstrasse, Bonn. Consul, Canadian Consulate, 69 Ferdinandstrasse, Hamburg.

Ghana.-Commercial Counsellor, Office of the High Commissioner for Canada, Post Office Bor No. 1639, Accra. Territory includes Gambia, Nigeria and Sierra Leone.

Grecte.-Commercial Secretary, Canadian Embassy, 31 Vassilissis Ave., Athens. Territory includes Israel and Turkey.

Guatemala.-Canadian Government Trade Commissioner, 5 a Avenida Sud, 10-68, Guatemala City. Territory includes Costa Rica, El Salvador, Honduras, Nicaragua, Panama and Canal Zone.
*Harri.-Chargé d'Affaires ad interim and Consul, Canadian Embassy, Route du Canape Vert, St. Louis de Turgeau, Port au Prince.

Hong Kong.-Canadian Government Trade Commissioner, Hong Kong and Shanghai Banking Corporation Bldg., Hong Kong. Territory includes Taiwan, Cambodia, Laos, Vietnam, Macao and China.

India.-Commercial Counsellor, Office of the High Commissioner for Canada, 4 Aurangzeb Road, New Delhi.
Canadian Government Trade Commissioner, Gresham Assurance House, Mint Road, Bombay. Territory includes Goa.

Indonesia.-Commercial Secretary, Canadian Embassy, Djl. Budi Kemuliaan No. 6, Djakarta.
Ireland.-Commercial Secretary for Canada, 66 Upper O'Connell St., Dublin.
Italy.-Commercial Counsellor, Canadian Embassy, Via G. B. de Rossi 27, Rome. Territory includes Libya, Malta and Yugoslavia.

Jamarca.-Canadian Government Trade Commissioner, Barclays Bank Building, King Street, Kingston. Territory includes Bahamas and British Honduras.
Japan.-Commercial Counsellor, Canadian Embassy, Tokyo. Territory includes South Korea.
Lebanon.-Commercial Secretary, Canadian Legation, Alpha Building, Rue Clemenceau, Beirut. Territory includes Iraq, Jordan, Persian Gulf Area, and Syria.
Mexico.-Commercial Counsellor, Canadian Embassy, Melchior Ocampa 463, 7th Floor, Mexico 1, D.F.

Netherlands.-Commercial Counsellor, Canadian Embassy, Sophialaan 5-7, The Hague.
New Zealand.-Commercial Counsellor, Office of the High Commissioner for Canada, Government Life Insurance Bldg., Wellington. Territory includes Fiji and Western Samoa.

Norway.-Commercial Counsellor, Canadian Embassy, Fridtjof Nansens Plass 5, Oslo. Territory includes Iceland.

Pakistan.-Commercial Secretary, Office of the High Commissioner for Canada, Hotel Metropole, Victoria Road, Karachi. Territory includes Afghanistan and Iran.

Peru.-Commercial Secretary, Canadian Embassy, Edificio Boza, Carabaya 831, Plaza San Martin, Lima. Territory includes Bolivia.
Primppines.-Consul General and Trade Commissioner, Canadian Consulate General, Ayala Bldg., Juan Luna Street, Manila.
Portugal.-Commercial Counsellor, Canadian Embassy, Rua Marques de Fronteira, No. 8-4 ${ }^{\circ} D^{\circ}$, Lisbon. Territory includes Azores, Cape Verde Islands, Madeira, and Portuguese Guinea.

[^346]Rhodesia and Nyasaland, Federation or.-Canadian Government Trade Commissioner, Offices 110-113 Central Africa House, Corner First St./Gordon Ave., Salisbury. Territory includes Kenya, Seychelles Islands, Tanganyika, Uganda and Zanzibar.

Sngapore.-Canadian Government Trade Commissioner, Room E-3, Union Bldg., Singapore. Territory includes Brunei, Burma, Federation of Malaya, North Borneo, Sarawak and Thailand.

South Aprica.-Canadian Government Trade Commissioner, Mutual Bldg., Harrison Street, Johannesburg. Territory includes (Natal, Transvaal, Orange Free State), Madagascar, Mauritius, Mozambique, and Reunion.
Canadian Government Trade Commissioner, 602 Norwich House, The Foreshore, Cape Town. Territory includes (Cape Province), St. Helena, and Southwest Africa.

Spans.-Commercial Counsellor, Canadian Embassy, Edificio Espana, Avenida de Jose Antonio 88, Madrid. Territory includes Balearic Islands, Canary Islands, Gibraltar, Rio Muni and Rio de Oro.

Sweden.-Commercial Secretary, Canadian Embassy, Strandvagen, 7-C, Stockholm. Territory includes Finland.

Switzerland,-Commercial Counsellor, Canadian Embassy, Kirchenfeldstrasse 88, Berne.
Trinidad.-Canadian Government Trade Commissioner, Colonial Bldg., 72 South Quay, Port-ofSpain. Territory includes Barbados, Windward and Leeward Islands, British Guiana, Dutch Guiana, French Guiana, French West Indies, Guadeloupe and Martinique.

Unitzd Kingdom.-Commercial Counsellor, Office of the High Commissioner for Canada, Canada House, Trafalgar Square, London, S.W.1.
Canadian Government Trade Commissioner, Martins Bank Building, Water Street, Liverpool. Canadian Government Trade Commissioner, 36 Victoria Square, Belfast, Northern Ireland.

Untred States.-Minister (Commercial), Canadian Embassy, 1746 Massachusetts Avenue N.W., Washington 6, D.C.
Deputy Consul General (Commercial), Canadian Consulate General, 620 Fifth Avenue, New York City 20, N.Y.
Consul and Trade Commissioner, Canadian Consulate General, 532 Little Bldg., 80 Boylston Street, Boston 16, Mass.
Consul and Trade Commissioner, Canadian Consulate General, 1412 Garland Bldg., 111 North Wabash Avenue, Chicago, Ill.
Consul and Trade Commissioner, Canadian Consulate, 1139 Penobscot Bldg., Detroit 26, Mich. Consul and Trade Commissioner, Canadian Consulate General, 510 West Sixth Street, Los Angeles 14, Cal.
Consul and Trade Commissioner, Canadian Consulate General, 215-217 International Trade Mart, New Orleans 12, La.
${ }^{*}$ Consul General, Canadian Consulate General, 3rd Floor, Kohl Bldg., 400 Montgomery Street, San Francisco 4, Cal.
${ }^{*}$ Consul General. Canadian Consulate General, The Tower Bldg., Seventh Avenue at Olive Way, Seattle 1, Wash.

Uruguay.-Commercial Counsellor, Canadian Embassy, No. 1409 Avenida Agraciada, Piso $7^{\circ}$, Montevideo. Territory includes Paraguay and Falkland Islands.

Venezuela.-Commercial Secretary, Canadian Embassy, Edificio Pan American, Avenida Urdaneta, Puente Urapal, Candelaria, Caracas. Territory includes Netherlands Antilles.

## Agricultural Representatives

Argentina.-Agricultural Secretary, Canadian Embassy, Bartolome Mitre 478, Buenos Aires.
United Kingdom.-Commercial Counsellor (Agricultural), Office of the High Commissioner for Canada, Canada House, Trafalgar Square, London, S.W.1.

United States.-Agricultural Counsellor, Canadian Embassy, 1746 Massachusetts Avenue N.W., Washington 6, D.C.

[^347]
## Fisheries Representatives

Dominican Republic.-Assistant Commercial Secretary (Fisheries), Canadian Embassy, Edificio Copello 408, Calle El Conde, Ciudad Trujillo. Territory includes Puerto Rico.

Italy.-Commercial Secretary (Fisheries), Canadian Embassy, Via G. B. de Rossi 27, Rome.

## Timber Representative

United Kingdom.-Commercial Counsellor (Timber), Office of the High Commissioner for Canada, Canada House, Trafalgar Square, London, S.W.1.

Commodities Branch.-The Commodities Branch is responsible for maintaining the liaison with industry and with export and import trades essential to the foreign trade promotional work of the Department. The Branch assembles trade information and data on products for use by Trade Commissioners in posts abroad, and officers of the Branch maintain contact with industry through personal visits and by exchange of correspondence with this purpose in view Officers of the Branch follow conditions in foreign markets for the benefit of Canadian traders.

The Branch contains commodity specialists organized in four Divisions: the Machinery and Metals Division, the Forest Products Division, the Chemicals Division, and the Consumer Goods Division. Within these Divisions individual commodity specialists are concerned with such particular groups of products as machine tools and plant equipment, non-ferrous metals, steel, chemicals, lumber, leather and rubber, as well as a very wide range of consumer products. It is the function of the commodity specialist to direct attention of Trade Commissioners to changes in supply conditions and to products available for export, and to relay market news received from Trade Commissioners to Canadian manufacturers and exporters.

The trade promotion work of the Branch begins at the point of finding Canadian products on which to concentrate promotional efforts. Detailed reports on such products are sent to Trade Commissioners throughout the world to encourage market research and promotion and exporters are informed about regulations governing foreign trade.

Agriculture and Fisheries Branch.-The main functions of this Branch include: (1) trade promotion relating to agricultural and fisheries products; (2) the programming, receiving and distributing of information on foreign agriculture and fisheries; and (3) acting as a focal point for liaison on agricultural and fisheries trade matters with the Department of Agriculture, the Department of Fisheries, the Canadian Wheat Board, and other government departments and boards.

In the field of trade promotion, the Grain Division, the Food and Agriculture Division and the Fisheries Division assist Canadian exporters of agricultural and fisheries products in finding markets in other countries. Canadian firms are supplied with information concerning market conditions and requirements in foreign markets, competition from other sources of supply, exchange and tariff restrictions and other related information. Trade Commissioners are kept fully informed on such matters as production and price trends in Canada, quantities of commodities available for export and sources of supply.

The Grain Division assists foreign governments and other buyers in the purchase of Canadian wheat, flour and other cereals. Close contact is maintained with the flour millers as well as daily liaison with the Canadian Wheat Board.

The Commodity Officers concerned with livestock, livestock products, meat, dairy and poultry products, fruits and vegetables, and fish and fisheries products keep in contact with the trade and trade organizations dealing with these commodities. They are in close touch with the officers of other departments of government concerned with the disposition of Canadian production surplus to domestic requirements, and those responsible for such items as health standards, grading and inspection.

A great deal of information pertaining to foreign agriculture and fisheries is received from the Canadian Trade Commissioners. This material, which reflects foreign government policy, production trends and market information, is processed in the Branch and distributed to the departments of government concerned and others interested. Much of it is published in Foreign Trade. The Trade Commissioner Service includes a number of officers who deal specifically with agricultural and fisheries matters. Some of these officers are located in Canada's most important export outlets and others in those countries with which Canada competes on world markets, particularly in such commodities as wheat, coarse grains, livestock, meats and dairy products. The information received from the agricultural officers and other Trade Commissioners on foreign agricultural developments is distributed in Canada through publications issued by the Economics Division of the Department of Agriculture and by direct communication with producers and exporters. Fisheries information from abroad is passed immediately to the Department of Fisheries, the provincial departments concerned, the Fisheries Council, and to fish exporters.

International Trade Relations Branch.-This Branch deals with a wide variety of current trade issues, ranging from the analysis of developments in international commercial relations to assisting in the reopening of dollar markets for Canadian products and to finding practical solutions for tariff and other difficulties encountered by Canadian exporters. The Branch has under constant review Canada's trading relations with other countries, and participates in conferences and negotiations under the General Agreement on Tariffs and Trade. In addition, the Branch is concerned with the effects of the work of such international organizations as the Organization for European Economic Cooperation on Canadian and world trade.

Trade treaties are under continuous examination by the Branch, which is responsible for the preparation of material for trade and tariff negotiations with other countries. Material is collected on foreign tariffs, customs legislation, taxes affecting trade, import licensing, exchange regulations, documentation, sanitation, marking and labelling requirements, and measures pertaining to quotas, embargoes and other import restrictions. These data are analysed, interpreted, clarified and made available in easily comprehensible form to exporters, government officials and other export interests.

Exporters who encounter difficulties resulting from the trade policies or regulations of other countries are given expert advice and interpretation of foreign regulations. Also the Branch initiates official consultations with other governments respecting such problems.

Economics Branch.-The Economics Branch maintains a continuous review of business conditions in Canada and conducts special studies on particular industries or on any aspect of Canada's economic development as required. Aspects of the general economic situation considered include foreign trade, investment, consumption, production, prices, incomes and employment, as well as conditions in industries and localities.

Industrial Development Branch.-This Branch co-ordinates the assistance offered by the Federal Government in the establishment of new industries in Canada. Acting in this capacity, information is provided on a multiplicity of matters pertaining to industry establishment. The Branch assists also in solving the variety of problems encountered by Canadian and foreign businessmen. It also aids those established firms that wish to expand into new lines of production. Inquiries from foreign firms and individuals regarding the manufacture of products in Canada under licence or royalty are screened and brought to the attention of Canadian manufacturers interested in producing additional items.

The Branch acts in an advisory capacity to the Immigration Branch of the Department of Citizenship and Immigration regarding the admission of individuals, other than those from Commonwealth countries, who wish to establish new industries in Canada. It also works in close co-operation with a widespread network of organizations throughout Canada, including industrial development departments of the provinces, municipalities, railways, banks, power companies, chambers of commerce, boards of trade, and the Canadian Manufacturers' Association.

Trade Publicity Branch.-The principal function of the Trade Publicity Branch is to furnish the commercial community of Canada with information concerning the assistance that exporters and importers may obtain from the Department of Trade and Commerce. The Branch is responsible also for stimulating a better appreciation by the general public of the importance of trade to the welfare of Canada. The attention of exporters and potential exporters is directed to opportunities for the disposal of their products in markets abroad, and of importers to the sources of supply for raw materials and consumer goods unobtainable in Canada. Its principal educational and informative medium is Foreign Trade, fortnightly publication of the Foreign Trade Service, in which are reproduced reports of Canadian Trade Commissioners on conditions in their respective territories, articles by Head Office personnel and economists of the Dominion Bureau of Statistics, news items and charts portraying trade trends. Press releases are prepared and distributed to newspapers at home, and material of similar character dispatched to Canadian Trade Commissioners for distribution to newspapers abroad. Pamphlets and brochures are prepared to supplement other information on foreign markets, sources of supply, documentation, regulations and trade restrictions. Assistance is rendered to correspondents of newspapers and periodicals at home and abroad in the preparation of articles pertaining to various phases of Canada's foreign trade. The educational and promotional work of this Branch is supported by moderate advertising at home and abroad through the daily press, periodicals and trade papers, and by films and radio.

Canadian Government Exhibition Commission.-The Canadian Government Exhibition Commission publicizes Canada by graphic media of all kinds and helps to sell Canadian products abroad. The Commission is solely responsible for the construction and administration of Federal Government exhibits at international expositions, trade fairs and displays outside Canada and of international trade fairs in Canada sponsored by the Government of Canada. The Commission also co-operates with Canadian exporters in securing representation for goods at trade fairs and trade promotional displays, and is equipped to advise individual Canadian companies in the preparation of exhibits. At its various presentations the Commission distributes literature produced by other government departments and agencies.

Export Credits Insurance Corporation.-The Export Credits Insurance Corporation was established under the provisions of the Export Credits Insurance Act 1944 (amended in 1946, 1948, 1954 and 1957). The Corporation, which is administered by a Board of Directors including the Deputy Minister of Trade and Commerce, the Deputy Minister of Finance and the Governor of the Bank of Canada, insures persons carrying on business in Canada against risks involved in the export, manufacture, treatment or distribution of goods or the rendering of engineering, construction, technical or similar services. The main risks covered include: insolvency or protracted default on the part of the buyer; exchange restrictions in the buyer's country preventing the transfer of funds to Canada; cancellation of an import licence or the imposition of restrictions on the importation of goods not previously subject to restrictions; the occurrence of war between the buyer's country and Canada, or of war, revolution, etc., in the buyer's country.

The insurance is available under three main classifications: general commodities capital goods, and services. Coverage for general commodities may be procured by exporters under two types of policies: (1) the Contracts Policy, which insures an exporter against loss from the time he books the order until payment is received; or (2) the Shipments Policy, obtainable at lower rates of premium and covering the exporter from the time of shipment until payment is received. These policies are issued on a yearly basis, covering exporters' sales to all countries.

Insurance of capital goods offers protection to exporters dealing in plant equipment, heavy machinery, etc., where extended credit for lengthy periods is often necessary. Specific policies are issued for transactions involving capital goods but the general terms and conditions are the same as those applicable to policies for general commodities. Specific
policies are also issued to cover engineering, construction, technical or similar services contracts entered into between Canadian firms and persons in foreign countries who have agreed to purchase such services.

The Corporation insures exporters on a co-insurance basis up to a maximum of 85 p.c. of the gross invoice value of shipments. This co-insurance basis also operates in the distribution of recoveries obtained after payment of a loss, and these recoveries are shared by the Corporation and the exporter in the proportions of 85 and 15 p.c., respectively.

The Corporation, from its inception to Dec. 31, 1956, insured export sales valued at $\$ 376,000,000$. Premium income was $\$ 3,207,751$, and gross claims paid to exporters during the same period amounted to $\$ 7,821,612$. A large majority of these claims resulted from exchange transfer difficulties with relatively few arising from insolvencies. Recoveries made amounted to $\$ 4,306,132$. The balance at credit of the underwriting reserve as at Dec. 31, 1956, was \$1,418,103.

International Economic and Technical Co-operation Division.-The administration of Canada's participation in the Colombo Plan, a co-operative effort to help the peoples of South and Southeast Asia to raise their standards of living and productivity, is the responsibility of this Division. This contribution is of two types-capital aid and technical co-operation. Under capital assistance, grants of goods or services are made to countries in the area on a government-to-government basis. Technical co-operation embraces the training of Asian peoples in a variety of fields in Canada and the supplying of Canadian technical and professional personnel to advise and instruct abroad. The Division also assists the United Nations and its specialized agencies in the recruiting of technical experts and in the arrangement of courses of instruction for trainees sent to Canada for study. For the year ended Mar. 31, 1957, $\$ 34,400,000$ was voted by Parliament for Colombo Plan capital aid and technical assistance.

## Section 2.-The Development of Tariffs

A short sketch of trade and tariffs prior to Confederation is given in the 1940 Year Book, pp. 480-482. The 1942 Year Book, pp. 427-428, traces the development from Confederation to the adoption in 1904 of the present form of preferential tariff.

Limitations of space in the Year Book has made it necessary, in regard to tariffs, to adopt the policy of confining any detail regarding commodities and countries to tariff relationships in force at present and to summarize as much as possible historical data and details of preceding tariffs, giving references to those editions of the Year Book where extended treatments may be found.

## Subsection 1.-The Canadian Tariff Structure*

The Canadian Tariff consists, in the main, of three sets of tariff rates-British Preferential, Most-Favoured-Nation, and General.

British Preferential Tariff rates are, with some exceptions, the lowest rates. They are applied to imported dutiable commodities shipped direct to Canada from countries of the Commonwealth and from the British colonies and other dependent overseas territories. Some Commonwealth countries have trade agreements with Canada which provide for rates of duty, on certain specified goods, lower than the British Preferential rates.

Most-Favoured-Nation rates are usually higher than the British Preferential rates and lower than the General Tariff rates. They are applied to commodities imported from countries outside the Commonwealth with which Canada has made trade agreements. The most important trade agreement concerning the effective rates applied to goods imported from countries entitled to Most-Favoured-Nation rates is the General Agreement on Tariffs and Trade (GATT).

[^348]General Tariff rates are applied to goods imported from the few countries with which Canada has not made trade agreements.

There are numerous goods which are duty free under the British Preferential Tariff, or under both the British Preferential and Most-Favoured-Nation Tariff, or under all Tariffs.

Valuation.-Sect. 35 of the Customs Act provides that, when any ad valorem duty is imposed, the valuation of the goods for purposes of calculating the duty basically "shall be the fair market value, at the time when and place from which the goods were shipped to Canada, of like goods when sold in like quantities for home consumption in the ordinary course of trade under fully competitive conditions and under comparable conditions of sule" or "the amount for which the goods were sold by the vendor abroad to the purchaser in Canada, exclusive of all charges thereon after their shipment from the place from which they were exported direct to Canada", whichever is the greater. There are further provisions for determining the value for duty when the fair market value, in accordance with the foregoing, cannot be ascertained. Internal taxes in the country of export (when not incurred on exported goods), the cost of shipping the goods to Canada, and similar charges however are not included in the value for duty.

Dumping.-Sect. 6 of the Customs Tariff provides that when the actual selling price of goods being imported is less than their fair market value and the goods are of a class or kind made or produced in Canada, a special or dumping duty shall be collected. This duty is to be equal to the difference between the actual selling price and the fair market value of the goods, except that it may not be more than 50 p.c of the value for duty. These provisions are designed to offset the advantage foreign exporters may achieve by exporting to Canada at less than the going prices.

Drawback.-There are provisions in the Customs and Excise Tax Acts for the repayment of a portion of the duty, sales and/or excise taxes paid on imported goods used in the manufacture of products later exported. The purpose of these drawbacks (as these repayments are called) is to assist Canadian manufacturers to compete in foreign markets with foreign producers of similar goods. A second class of drawback, known as "home consumption" drawbacks, is provided for under the Customs Tariff Act and applies to imported materials and/or parts used in the production of specified goods to be consumed in Canada.

The Tariff Board.-The Tariff Board, constituted by the Tariff Board Act 1931, consists of five members, one of whom is chairman and two are vice-chairmen. The duties and powers of the Board derive from three Statutes of Canada: the Tariff Board Act, the Customs Act, and the Excise Tax Act.

Under the Tariff Board Act, the Board makes inquiry into and reports upon any matter in relation to goods that, if brought into Canada or produced in Canada, are subject to or exempt from duties of customs or excise and on which the Minister of Finance desires information. The investigation into any such matter may include inquiry as to the effect that an increase or decrease of the existing rate of duty upon a given commodity might have upon industry or trade and the extent to which the consumer is protected from exploitation. It is also the duty of the Board to inquire into any other matter in relation to the trade and commerce of Canada that the Governor in Council sees fit to refer to the Board for inquiry and report. Usually the references take one of two forms: authority for review of sections of the Customs Tariff relating to an entire industry, or for investigation in respect of specified commodities. Reports are tabled in Parliament.

Under the provisions of the Customs Act and the Excise Tax Act, the Tariff Board acts as a court to hear appeals from rulings of the Department of National Revenue in respect of matters of administration including those of excise taxes, tariff classification, value for duty, and drawback of customs duties. Declarations of the Board on appeals on questions of fact are final and conclusive, with provision for appeal on questions of law
to the Exchequer Court of Canada. Tariff references and appeals receive public hearings at which interested parties submit oral statements and written briefs relating to matters under consideration.

## Subsection 2.-Tariff and Trade Arrangements with Other Countries as at Oct. 1, 1957

Canada's tariff arrangements with other countries fall into three main categories: trade agreements with a number of Commonwealth countries; the General Agreement on Tariffs and Trade (GATT); and other agreements and arrangements.

The Commonwealth countries with which Canada has trade agreements are as follows: Australia, British West Indies, Ireland, New Zealand, Union of South Africa and the United Kingdom and Colonies. A preferential arrangement is also in force with respect to the Federation of Rhodesia and Nyasaland and preferences are accorded by Canada to India and Pakistan. Tariff relations between Canada and Ceylon, Ghana and the Fuderation of Malaya are governed by the Canada-United Kingdom agreement. These argeements and arrangements have been modified and supplemented by the GATT. Canada exchanges most-favoured-nation treatment with 34 countries under the General agreement on Tariffs and Trade. The Protocol of Provisional Application of the General Agreement on Tariffs and Trade was signed by Canada on Oct. 30, 1947, and brought the Agreement provisionally into force on Jan. 1, 1948.

The GATT is a multilateral trade Agreement providing for scheduled tariff concussions and the exchange of most-favoured-nation treatment among the contracting parties and laying down rules and regulations to govern the conduct of international trade. Under the system of multilateral tariff negotiations initiated under the GATT, four general rounds of negotiations have taken place: at Geneva, Switzerland, in 1947; at Annecy. France, in 1949; at Torquay, England, in 1950-51; and again at Geneva in 1955. The tariff concessions Canada granted and received at the first Geneva Conference are described in the 1948-49 Year Book, pp. 875-877, and those negotiated at Annecy are discussed in the 1950 Year Book, pp. 968-970. The Torquay negotiations are discussed in the 1952-53 edition, pp. 996-997. The existing tariff concessions remain in force until Jan. 1, 1958, and thereafter unless modified in accordance with the terms of the Agreement.

Canada already had most-favoured-nation trade agreements with a number of GATT members prior to the effective date of the General Agreement. These agreements with individual countries continue in force in conjunction with the General Agreement. As an exception, however, the Canada-U.S. Trade Agreement of 1938 is suspended for so long as both countries continue to be contracting parties to GATT.

Tariff and Trade Arrangements with Commonwealth Countries as at Oct. 1, 1957

| Country | Agreement | Principal Terms |

| Cппв...................... | Trade Agreement signed Sept. 10, <br> 1941; provisionally in force Oct. 15, 1941, and definitively on Oct. 29, 1943. GATT effective Mar. 16, 1948. | Exchange of most-favoured-nation treatment. May be terminated on six months notice. |
| China....................... | Modus vivendi signed Sept. 26, 1946; in effect since Sept. 28, 1946. <br> China withdrew from GATT on May 5, 1950. | Exchange of most-favoured-nation treatment. May be terminated on three months notice. |

## Tariff and Trade Arrangements with Non-Commonwealth Countries as at <br> Oct. 1, 1957-continued

Tariff and Trade Arrangements with Non-Commonwealth Countries as at
Oct. 1, 1957-continued

| Country | Agreement | Principal Terms |
| :---: | :---: | :---: |
| Greece. . . . . . . . . . . . . . . | Modus vivendi by exchange of notes of July 24-28, 1947; effective Aug. 28, 1947. GATT effective Mar. 1, 1950. | Exchange of most-favoured-nation treatment. May be terminated on three months notice. |
| Greenland. . . . . . . . . . . . . | (See Denmark.) |  |
| Guatemala................. | Trade Agreement signed Sept. 28 , 1937; in force Jan. 14, 1939. | Exchange of most-favoured-nation treatment. May be terminated on six months notice. |
| Harts. ...................... | Trade Agreement signed Apr. 23, 1937; in force Jan. 10, 1939. GATT effective Jan. 1, 1950. | Exchange of most-favoured-nation treatment. May be terminated on six months notice. |
| Honduras................. | Exchange of notes signed July 11, 1956, effective July 18, 1956. Ratified in Honduras Sept. 5, 1956. | Exchange of most-favoured-nation treatment. May be terminated on three months notice. |
| Ickiand.................... | Although there is no contractual obligation, Canada and Iceland adhere to the terms of a treaty originally concluded between Denmark and the United King. dom on Feb. 13, 1660. | Exchange of most-favoured-nation treatment. |
| Indonesia .................. | GATT effective Mar. 1, 1948. | Exchange of most-favoured-nation treatment. |
| Iran......................... | Special arrangement by Order in Council effective Feb. 1, 1951. | Canada grants most-favoured-nation tariff rates as long as Iran accords reciprocal treatment. |
| Iraq.......................... | Special arrangement by Order in Council effective Sept. 15, 1951. | Canada grants and receives most-favoured-nation tariff rates. |
| Istagl. . . . . . . . . . . . . . . . . | Canada-United Kingdom Agreement of 1937 applied under the British Palestine Mandate. | Since the creation of the State of Israel in May 1948, Canada has continued to grant most-favourednation rates. |
| Italy. | Modus virendi by exchange of notes of Apr. 23-28, 1948; effective Apr. 28, 1948. <br> GATT effective Jan. 1, 1950. | Exchange of most-favoured-nation treatment. May be terminated on three months notice. |
| Japan . | ```Agreement on Commerce signed Mar. 31, 1954; effective June 7, 1954. GA'TT effective Sept. 10, 1955.``` | Exchange of most-favoured-nation treatment. Remains in force for one year from ratification and thereafter unless terminated on three months notice. |
| Laos. | Franco-Canadian TradeAgreement of 1933 applied to Laos. | Since the creation of Laos as an independent State in 1955, Canada has continued to grant most-favoured-nation rates. |
| Lebanon. | Special arrangement by Order in Council of Nov. 19, 1946. <br> Lebanon withdrew from GATT Mar. 1, 1951. | Canada grants most-favourednation tariff rates as long as Lebanon accords reciprocal treatment. |
| Liberia. | Special arrangement by Order in Council of June 3, 1955. <br> Liberia withdrew from GATT June 1, 1953. | Canada grants most-favoured nation tariff rates as long as Liberia accords reciprocal treatment. |

## Tariff and Trade Arrangements with Non-Commonwealth Countries as at Oct. 1, 1957-continued

| Country | Agreement | Principal Terms |
| :---: | :---: | :---: |
| Liechtenstein. | (See Switzerland.) |  |
| Luxembourg............... | (See Belgium.) |  |
| Mexico.. | Trade Agreement signed Feb. 8, 1946; in force provisionally same date. Ratifications exchanged on May 6, 1947; definitively in force 30 days from that date. | Exchange of most-favoured-nation treatment. May be terminated on six months notice. |
| Morocco. . . . . . . . . . . . . . . . | Various agreements applied to French, Spanish and International Zones of Morocco. | Since the creation of Morocco as an independent State in 1956, Canada has continued to grant most-favoured-nation rates. |
| Netherlands. . . . . . . . . . . | Convention of Commerce of July 11, 1924. Suspended during war: reinstated by exchange of notes Feb. 1 and 5, 1946. Includes Netherlands Antilles and Surinam. <br> GATT effective Jan. 1, 1948. | Exchange of most-favoured-nation treatment. May be terminated on one years notice. |
| Nicaragua................. | $\begin{gathered} \text { Trade Agreement signed Dec. 19, } \\ \text { 1946; in force provisionally same } \\ \text { date. } \\ \text { GATT effective May } 28,1950 \text {. } \end{gathered}$ | Exchange of most-favoured-nation treatment. Provisional application may be terminated on three months notice. |
| NORWAY. . . . . . . . . . . . . . . | Convention of Commerce and Navigation with United Kingdom of Mar. 18, 1826, applied to Canada. GATT effective July $10,1948$. | Exchange of most-favoured-nation treatment. Convention of Msy 16, 1913, provides means for separate termination by Dominions on one years notice. |
| Panama.................... | Order in Council of July 20, 1935. accepted Article 12 of United Kingdom-Panama Treaty of Commerce of Sept. 25, 1928. Treaty terminated in 1942. | While contractual obligation has expired, Canada and Panama continue to exchange most-favourednation treatment. |
| Paraguay.................. | Exchange of notes of May 21, 1940; in force June 21, 1940. | Exchange of most-favoured-nation treatment. May be terminated on three months notice. |
| Perv....................... | GATT effective Oct. 8, 1951. | Exchange of most-favoured-nation treatment. |
| Philippines.................. | No agreement at present. United States-Canada Agreement of 1938 (now suspended) applied to Philippines until Philippines attained independence in 1946. | Canada and Philippines continue to exchange most-favoured-nation treatment but without contractual obligation. |
| Poland..................... | Convention of Commerce signed July 3, 1935; in force Aug. 15, 1936. | Exchange of most-favoured-nation treatment including scheduled reductions. May be terminated on three months notice. |
| Portugal, Portuguese <br> Adjacent Islands and <br> Portugcese overseas Provinces. | Trade Agreement signed May 28, 1954, provisionally in effect July 1,1954 , definitively in force on ratification Apr. 29. 1955. | Exchange of most-favoured-nation treatment. Remains in effect for two years from ratification and thereafter unless terminated on three months notice. |

## Tariff and Trade Arrangements with Non-Commonwealth Countries as at Oct. 1, 1957-continued

| Country | Agreement | Principal Terms |
| :---: | :---: | :---: |
| Spain and Spanish Possessions. | Since Aug. 1, 1928, Canada has adhered to the United KingdomSpain Treaty of Commerce of Oct. 31, 1922. | Exchange of most-favoured-nation treatment. May be terminated on six months notice. |
|  | Trade Agreement signed May 26, 1954, provisionally in effect July 1,1954 , definitively in force on ratification June 30, 1955. | Supplements and amends United Kingdom-Spanish Treaty of Commerce. Remains in effect for three years from ratification, and thereafter unless terminated on three months notice. |
| SWEDEN.................... | United Kingdom-Sweden Convention of Commerce and Navigation of Mar. 18, 1826, applies to Canada. <br> GATT effective May $1,1950$. | Exchange of most-favoured-nation treatment. Declaration of Nov. 27, 1911, provides means for separate termination by Dominions on one years notice. |
| SWITZERLAND............... | United Kingdom - Switzerland Treaty of Friendship, Commerce and Reciprocal Establishment of Sept. 6, 1855, applies to Canada. By exchange of notes Liechtenstein included under terms of this Agreement, effective Aug. 2, 1947. | Exchange of most-favoured-nation treatment. Convention of Mar. 30, 1914, provides means for separate termination by the Dominions on one years notice. |
| SYRIA....................... | Special Arrangement by Order in Council of Nov. 19, 1946. <br> Syria withdrew from GATT Aug. $6,1951$. | Canada grants most-favoured nation tariff rates as long as Syria accords reciprocal treatment. |
| Tunisia..................... | Franco-Canadian Trade Agreement of 1933 applied to Tunisia (Tunisia is in customs union with France). | Since the creation of Tunisia as an independent State in 1956, Canada has continued to grant most-favoured-nation rates. |
| Turkey. | Exchange of notes signed Mar. 1, 1948; in effect Mar. 15, 1948. GATT effective Oct. 17, 1951. | Exchange of most-favoured-nation treatment. May be terminated on three months notice. |
| Unton of Soviet Soclalist Republics. | Trade Agreement signed Feb. 29, 1956. Ratifications exchanged May 26, 1956 . | Exchange of most-favoured-nation treatment and undertaking by U.S.S.R. to purchase determined quantity of Canadian wheat. In force for three years from date of signature and may thereafter be extended by mutual agreement. |
| Untied States. | Trade Agreement signed Nov. 17, 1938; suspended as long as botb countries continue to be contracting parties to GATT. GATT effective Jan. 1, 1948. | Most-favoured-nation treatment exchanged under 1938 Agreement is continued under GATT. |
| Uruguay. | Trade Agreement signed Aug. 12, 1936; in force May 15, 1940. Additional Protocol signed Oct. 19, 1953. <br> GATT effective Dec. 16, 1953. | Exchange of most-favoured-nation treatment. May be terminated on six months notice. |
| Vietnam. | Franco-Canadian Trade Agreement of 1933 applied to Vietnam. | Since the creation of Vietnam as an independent State, Canada has continued to accord most-fa-voured-nation rates. |

Tariff and Trade Arrangements with Non-Commonwealth Countries as at Oct. 1, 1957-concluded

## Section 1.-Index Numbers of Wholesale Prices

The term "wholesale prices" refers in this Chapter to sales transactions that occur below the retail level; it has more of a connotation of bulk purchase than of any homogeneous level of distribution. Ingredients for the general wholesale price index are obtained mainly from manufacturers but include prices from wholesalers proper, assemblers of primary products, agents and the other types of commercial enterprises who trade in commodities of a type or in quantities characteristic of primary marketing functions. Wholesale price indexes are grouped according to a commodity classification scheme based on chief component material similarities. In addition, indexes classified according to degree of manufacture are available. For the latter, however, because significant groups of manufactured products are not directly included, tabulations are not attempted on narrower bases than "Raw and Partly Manufactured" and "Fully and Chiefly Manufactured" commodity groups. Wholesale price indexes are regularly released in the DBS monthly publication Prices and Price Indexes which contains related current series on retail and security prices. Volume 23 of that publication is a historical summary reaching back to the year 1867 for some series and, together with DBS Reference Paper 24, Wholesale Prices Indexes 1930-1950, contains an explanation of index construction and meaning.

The number and identity of commodities contained in the index has been virtually fixed since 1951 when the index was placed on a 1935-39 base. Commodities were included either because they bulked large in total marketings at that time or because they were

[^349]considered reliable indicators of price change for commodity groups that did. Price movements displayed by the commodities priced are combined in such a way that they influence composite indexes in the proportions of total marketings including imports and exports during the base period.

General wholesale price indexes have been calculated by most countries for many years but the question "What does a general wholesale price index measure?" cannot be given a precise answer. A retail price index can be identified with consumer expenditure, but a general wholesale index covers a much wider range; yet it is not a measure of the purchasing power of money since it does not include prices of land, labour, securities or services, except in so far as prices of these things enter into commodity prices. As a conventional summary figure its use has tended toward a reference level against which to observe the behaviour of particular price groups such as farm products, raw materials and building materials. Thus, special wholesale groupings and commodity price relatives are now considered to be of greater importance than the general index itself.

Component indexes and individual price series have numerous uses. One of the most important is in escalator contracts which contain a price adjustment clause. Other major uses include: studies of replacement and construction costs in investment projects; analysis of price movements of both individual items and commodity groups in relation to purchases and sales; industrial planning and market analysis; valuation for tax purposes and inventory analysis; and studies in changes of physical volume. They are also used by business firms abroad in connection with sales and purchases in Canada.

The general wholesale price index declined moderately during 1957 after a continuous climb beginning in December 1954 and culminating in a postwar peak of 229.2 in January 1957. However, in the last month of the year the index showed some strength, rising to 226.1 from 224.1 in November.

Lower prices for vegetable products, animal products and non-ferrous metals were mainly responsible for the downward movement. Vegetable products began falling off gradually, followed by sharp losses in August to November. The December index, though, was two points above November. Animal products showed little change until June, and then rose to 246.0 in August, the highest point since October 1953. From then until November, lower prices for livestock and meats caused a sharp decline in the index. Prices of copper, lead and zinc have been tumbling since their postwar peak reached in 1956, as indicated by a drop in the group index from 190.4 in December 1956 to 169.3 in December 1957.

Textile products moved slightly higher in the first half of 1957 but lower prices for raw wool at the end of the year brought the index down a little below the December 1956 level. Wood products experienced somewhat the same adjustment but ended slightly above the December 1956 level. Higher steel prices at mid-year resulted in the index for the iron group reaching a peak of 256.5 in September, but a gradual decline placed the December index slightly below that for December 1956. Non-metallic minerals registered slight advances throughout the year, and chemical products changes, while higher on balance, were insufficient to have any effect on the total index.

## 1.-Annual Index Numbers of Wholesale Price Groups 1948-57 and Monthly Indexes 1956 and 1957

$(1935-39=100)$

| Year and Month | General Wholesale | Raw and Partly Manufactured Goods | Fully and Chiefly Manufactured Goods | $\begin{gathered} \text { Indus- } \\ \text { trial } \\ \text { Materials } \end{gathered}$ | Canadian Farm Products ${ }^{1}$ |  |  |

[^350]Index Numbers of Building Materials Prices.-Price movements of materials entering into building construction are currently measured by two special-purpose series: price index numbers of residential building materials and price index numbers of nonresidential building materials* for which the base years are 1935-39 and 1949, respectively.

[^351]Details of weighting and construction and historical series may be found in the special bulletins* prepared at the time the indexes were first published. More recently the composite indexes have been calculated on an annual basis back to 1913; current indexes are published monthly in DBS Bulletin Prices and Price Indexes.

Advances and declines in building material prices in 1957 cancelled each other out so that the index remained fairly steady throughout the year. The residential building material index showed a fractional drop and the non-residential series moved up 2 p.c.

[^352]

## Section 2.-Consumer Price Index

The Consumer Price Index was constructed to replace the Cost-of-Living Index and was first published in October 1952. The purpose of the new index was the same as that of the old-to measure the average percentage change in retail prices of goods and services bought by a large and representative group of Canadian urban families. DBS report The Consumer Price Index, January 1949-August 1952 contains detailed information on such aspects of the new index as purpose, family coverage, base period, and details of items included as well as their relative importance. It also gives the formula used in calculating the index, outlines methods of price collection and explains special features, such as methods of incorporating seasonal variations in food consumption, and changes in the price element of home-ownership costs.

Since the base year, 1949, the consumer price index has experienced several distinct periods of varying price movement which are summarized below.

Years 1950-51.-This was a period of first moderate and then accelerating price increases during which the index rose from 100.1 in January 1950 to 106.6 in December 1950 and to 118.1 by December 1951. Much of this price movement resulted from the impact of the Korean war.

Years 1952-53.-After continuing to rise to 118.2 in January 1952, a sequence of generally downward adjustments occurred bringing the index to 114.4 in May 1953, the lowest point since June 1951, 3.2 p.c. below the January 1952 peak. Minor increases brought the index back to 115.8 by December 1953.

Years 1954-55.-This two-year period proved to be the most stable since the end of World War II as the index moved narrowly around the 116 level, averaging 116.2 in 1954 and 116.4 in 1955. Monthly movements throughout these two years were mainly seasonal and reflected no clearcut upward or downward trends.

Years 1956-57.-After a continuance of the stability of 1954-55 in the early months of 1956, with the May index at 116.6, a moderate but continuing upward trend developed. The previous postwar peak was passed when the index reached 118.5 in July and the trend continued upward to 120.4 by December and to 123.4 by the following October, dropping slightly to 123.1 in December of 1957.

Throughout the period since 1949, significant variations in movement took place in the major components of the consumer price index. Some of the trends, by groups, are examined below.

Food.-Following a fairly steady period in the first half of 1950, foods started a rapid and continuous climb to a peak of 122.5 in November-December of 1951, a level not equalled again up to mid-1957. Fairly sharp declines throughout the first half of 1952 brought the index back to around 116 and it held remarkably steady at about that level, except for seasonal changes, until early 1956 when it dropped to 109.1 in March. However, by May it had risen to 109.3 and recorded a steady advance to 121.9 in September 1957 but dropped again to 118.8 by the end of the year.

Non-food.-This group also climbed to a peak in the latter half of 1951, but to a somewhat lower level of about 116. It then experienced a long but very gradual decline to reach a low point of 110 in mid-1955. Subsequently it developed a steady, gradual trend upwards, standing at about 115 in December 1957.

Services (excluding shelter).-Unlike both food and non-food commodity groupings which reflected considerable price adjustments to lower levels following the Korean war peak of late 1951, services experienced an uninterrupted rise throughout the entire period 1949 to the end of 1957, showing toward the end of that period a distinct tendency to increase at an even more rapid rate. As of December 1957 services recorded the largest over-all increase since 1949 of all groups discussed here.

Shelter.-This component, which covers rents only, rose steadily from 1949 to December 1957. However, though continuing to rise throughout the period, there was a flattening in the rate of increase after late 1955.

Table 6 provides single commodity price relatives on the base $1949=100$ for a number of important foods entering into the food component of the consumer price index. It also provides a record of average prices based on the actual average level of prices prevailing in October 1952 and calculated for the other months on the basis of the price relatives.

Consumer Price Indexes for Regional Cities.-Table 7 gives regional consumer price indexes for ten cities or city combinations. These indexes are not designed to show whether it costs more or less to live in one city than in another and should not be used for that purpose. Their function is to measure percentage changes in retail prices-over a certain time in each city or city combination-of a fixed basket of goods and services representing the level of consumption of a particular group of families.

1 Explanation of methods used in compiling St. John's, Nfld., index (June 1951=100) is given in DBS Reterence Paper No. 28.

World Retail Price Indexes.-In order to place changes in Canadian retail prices in perspective with those occurring elsewhere, Table 8 provides retail price indexes for selected countries for 1955 and 1956. These indexes measure price change only within each country and should not be used to compare actual levels of living costs from country

## Section 3.-Index Numbers of Security Prices

Investors price indexes for common stocks are calculated on the 1935-39 base and published weekly and monthly for a sample of issues, broadly classified under the headings: industrials, public utilities and banks. Within the first category the sample is further classified by industries for which indexes are available. Monthly indexes of mining stocks including both golds and base metals are calculated and published separately, as are indexes of preferred stocks.

For purposes of index calculation, ${ }^{r}$ Thursday closing prices are used for the issues of companies listed on either or both the Montreal and Toronto stock exchanges. Weights are applied to each issue on the basis of the number of shares currently outstanding. The list of stocks included in the various security series, currently totalling 95 for the investors index and ${ }^{2}{ }^{7}$ for mining stocks index, are revised annually so that issues which have become important in stock market activity may be included and those of declining interest removed. Provision is also made for stock splits, mergers and the exercise of 'rights'. The indexes are designed to reflect weekly and monthly changes of interest to the investor, rather than day-to-day changes of more speculative interest. For that reason the historical record of indexes dating back to January 1914 on a monthly basis* is of significance in any analysis of the degree of fluctuation in stock prices through time.

Investors Index.-A continuation of the strong upward trend inaugurated with the inception of the bull market in December 1953 culminated in an all-time peak in the investors total index of 291.8 in August 1956; the September 1929 peak was 197.8. Subsequent sharp declines, which brought the level to 262.3 by November 1956 were reversed in December and by May 1957 losses had been largely recouped. Prices broke sharply in mid-summer, however, and by December the composite index had reacted to 216.2 for a net loss of 19.3 p.c. over the year. Among major groups, industrials moved to a postwar peak of 308.9 by August 1956, but by December 1957 stood at 224.0. Utilities reached a peak of 216.8 in June 1957 and then dropped to 173.9. Banks, pursuing a similar course to industrials, moved to 295.4 in August 1956 and back to 234.9 by December 1957. Sub-groups registering greatest losses in 1957 were industrial mines, transportation, machinery and equipment and oils. One group, foods and allied products, moved higher.

| December | 587.9 | 808.1 | 120.8 | 194.9 | 151.4 | 198.7 | 482.6 | 373.4 | 151.0 | 224.0 | 272.5 | 102.4 | 198.4 | 173.9 | 234.9 | 216.2 |

Mining Stocks.-Mining stocks, paralleling industrials and utilities, recorded major declines during 1957 as the composite index fell 30.9 p.c. from 129.4 in December 1956 to 89.4 in December 1957. A substantial change in base metal shares, where a drop of 41.4 p.c. from 267.8 to 156.8 was recorded, was chiefly responsible. Golds declined a relatively modest 12.9 p.c. from 68.9 to 60.0.

## Section 1.-Combined Statistics of Public Finance for All Governments

Combined statistics of public finance for all governments in Canada-federal, provincial and municipal-are presented in this Section. Additional information is provided for each level of government in Sections 2, 3 and 4.

Combined Revenue and Expenditure.-Tables 1 and 2 give details of the federal, provincial and municipal net combined revenue by sources and net combined current and capital expenditure by services, respectively, for 1954 and 1955. This net basis has been prepared by deducting from revenue, and the appropriate expenditure, certain specified amounts such as grants-in-aid and shared-cost contributions from other governments, institutional revenue, certain other sales of commodities and services, and interest, premium, discount and exchange revenue. Amounts provided for debt retirement are excluded to avoid duplication since all expenditure resulting from capital borrowings is included.

Inter-governmental transfers such as subsidy payments by the Federal Government to the provincial governments are unconditional grants and therefore cannot be offset against any specific expenditure. These are set out separately in Tables $\mathbf{1}$ and $\mathbf{2}$ in order to prevent duplication and to provide additive totals. Because of the differing accounting practices of governments and variations in fiscal year-ends, discrepancies appear between the amounts recorded as inter-governmental transfers in the two tables.

Tables $\mathbf{3}$ and 4 show combined revenue of all governments and combined expenditure of all governments, respectively, for the years 1951-55, both exclusive of inter-governmental transfers. Figures for Yukon Territory and the Northwest Territories are not included.

[^356]
## 1.-Combined Revenue of All Governments 1954 and 1955

Nore.-Figures are for the fiscal years ended nearest Dec. 31.

Consolidated Debt.-The term "Consolidated" has been substituted for "Combined", where applicable, because it is considered more appropriate in view of the elimination of inter-governmental debt. Table 5 gives details of combined debt of all governments for 1954 and 1955 with the aggregate debt of the federal, provincial and municipal governments; the inter-governmental debt is deducted to arrive at a consolidated government figure. This table was prepared according to the classifications and concepts that have been the subject of discussions and agreements at federal-provincial conferences on provincial and municipal finance statistics, so that some items are not strictly comparable with corresponding items given in previous editions of the Canada Year Book.

## Section 2.-Federal Public Finance

A sketch of public finance from the French régime to the outbreak of World War I appears in the 1941 Year Book, pp. 742-743. Detailed sketches re tax changes from 1914 to 1938 will be found in issues of the Year Book beginning with the 1926 edition. An outline of the financing of Canada's war effort, including the more important changes in taxation during the war years from 1939 to 1945, is given in the 1945 Year Book, pp. $918-923$. The postwar financial policy of the Government of Canada is outlined in the 1954 Year Book at pp. 1061-1064 and tax changes proposed in the 1954-55 and 1955-56 Budgets in the 1955 and 1956 editions, pp. 1130 and 1051, respectively.

The 1956-57 Budget.-The Budget for 1956-57 was presented to Parliament on Mar. 20, 1956. It made no significant changes in tax rates. A special excise tax of 20 p.c. on advertising revenues of Canadian editions of foreign magazines was introduced to take effect Jan. 1, 1957.

The 1957-58 Budget.-The Budget for 1957-58 was brought down on Mar. 14, 1957. It did not change rates of personal income tax, but provided for extension of the privilege of tax postponement on earned income to persons additional to those in employer-employee pension plans through deduction, up to certain limits, of the purchase price of approved annuities. Provision was made for any taxpayer to claim a "standard deduction" of one hundred dollars per year without submission of receipts for charitable donations, medical bills, union dues and professional membership dues, and there were other small changes in exemption provisions. A number of commodities were relieved of sales tax, including tea and coffee, and the last three of special excise taxes imposed at the time of the Korean war were removed from candy, soft drinks and motorcycles. Some small changes in excise tax were effected.

On Dec. 6, 1957, the Minister of Finance announced in Parliament that legislation would be introduced to implement changes in taxation, including: the raising from $\$ 20,000$ to $\$ 25,000$ the profit figure below which the corporation income tax rate of 20 p.c. would apply; the increase of personal income tax exemptions from $\$ 150$ to $\$ 250$ for children of family allowance age, and from $\$ 400$ to $\$ 500$ for others, with reduction of the rate of personal income tax in the two lowest taxable brackets to 11 p.c. and 14 p.c. from 13 p.c. and 15 p.c.; reduction of the excise tax on automobiles from 10 p.c. to 7.5 p.c.

## Subsection 1.-Balance Sheets of the Federal Government

Table 6 shows the balance sheets of the Federal Government as at Mar. 31, 1955-57. The figures of this table are on a basis not strictly comparable to those in previous Year Books.

## Subsection 3.-Analysis of Revenue from Taxation

The following analysis of taxation revenue is confined to excise duties, excise taxes, income tax and succession duties; customs receipts constitute a single item in the Public Accounts and are not analysed here.

## Excise Duties

Excise duties proper are presented below with a summary of the excise tariff and statistics arising as a by-product of administration, such as the quantities of grain and other products used in distillation and the quantities of goods taken out of bond and subject to excise tax.

Canadian Excise Tariff.-The following is a statement of the Canadian excise tariff, as at Aug. 15, 1957:-

Spirits. $\qquad$
Spirits used by licensed bonded manufacturers. $\qquad$ per proof gal. 1.50
Spirits used in bond for manufacture of perfume. per proof gal. Free
Spirits used in bond for manufacture of approved chemical compositions.
per proof gal. 0.15
Spirits sold to druggists licensed under the Excise Act to be used exclusively in preparation of prescriptions for medicines and pharmaceutical preparations.... per proof gal. 1.50
Spirits distilled from wine produced from native fruits, and used in any bonded manufactory for the treatment of domestic wine. $\qquad$ per proof gal. Free
Spirits imported and taken into a bonded manufactory (in addition to duties otherwise imposed).... per proof gal. 0.30

Spirits used directly in the manufacture of toilet preparations or cosmetics on which excise tar is applicable under Schedule I of the Excise Tax Act.
per proof gal. Free
Canadian brandy.................. per proof gal. $\$ 10.00$
Malt, all, when brought into a brewery. per lb. Free

Tobacco, manufactured, all des-
criptions except cigarettes........ per lb. 0.35
Cigarettes, weighing not more than
two and one-half pounds......... per M 4.00

Cigarettes, weighing more than two and one-half pounds......... per M 5.00

Cigars, all.......................... per M 1.00
Canadian raw leaf tobacco, when sold for consumption.............. per lb.
0.10

A drawback of 99 p.c. of the duty may be granted when domestic spirits, testing not less than 50 p.c. over proof, are delivered in limited quantities for medicinal or research purposes to universities, scientific or research laboratories, public hospitals, or health institutions in receipt of federal and provincial government aid.

| Wheat and other grain........... " | 17,996,080 | 828,440 | 26,448,064 | 3,013,785 | 803,480 |
| Totals, Grain Used............ lb. | 273,200,160 | 302,202,523 | 338,054,879 | 350,073,169 | 379,371,780 |
| Molasses used. . . . . . . . . . . . . . . . . lb . | 22,614,185 | 21,965, 692 | 31,922,119 | 35,793,467 | $35,471,876$ $4,114,008$ |
| Wine and other materials. | 4,674,714 | 3,696,117 | 5,721,010 | $5,303,650$ 409 | 368,070,334 |
| Sulphide liquor.................. gal. | 98,380,740 | 394,040,231 | 370,916,068 | $409,830,302$ $28,535,869$ | 30,028,834 |
| Proof spirits manufactured...proof gal. | 22,517,166 | 24,710,625 | 27,330,433 | 28,535,809 | 30,20, |

The quantity of spirits manufactured has fluctuated greatly since 1920, varying from a low of $2,356,329$ proof gal. in that year to a high of $35,555,059$ proof gal. recorded in 1945. The total for 1957 was $30,028,834$ proof gal.

Alcohol and Tobacco Taken Out of Bond.-The amounts of beverage spirits, malt beer, malt, cigars, cigarettes and other tobacco taken out of bond for consumption are given in Table 36, p. 965.

## Excise Taxes Collected

The statistics given in Table 11 represent gross excise tax collection by the Excise Division of the Department of National Revenue.
11.-Excise Taxes Collected by Commodity, Years Ended Mar. 31, 1953-57
(Accrued Revenue)

${ }^{1}$ Includes tar on television sets and tubes of $\$ 11,340,860$ in $1954, \$ 16,668,388$ in $1955, \$ 17,627,314$ in 1956 and $\$ 12,413,101$ in 1957.

## Income Tax

Income Tax Collections by the Department of National Revenue on a Fiscal Year Basis. Statistics of income tax collections are gathered at the time the payments are made and are therefore up-to-date. Over 85 p.c. of individual taxpayers are wage or salary earners who have almost the whole of their tax liability deducted at the source by their employers. All other taxpayers are required to pay most of their estimated tax during the taxation year. Thus, the greater part of the tax is collected during the same year in which the related income is earned and only a limited residue remains to be collected when the returns are filed. The collections for a given fiscal year include tax deductions and instalments for twelve months, embracing portions of two taxation years, and a mixture of year-end payments for the first of these years and for the preceding year, and cannot therefore be closely related to the statistics for a given taxation year. As little information about a taxpayer is received when the payment is made and as a single cheque from one employer may frequently cover the tax payments of hundreds of employees, the payments cannot be statistically related to taxpayers by occupation or income. Descriptive classifications of taxpayers are available only from tax returns but collection statistics, if interpreted with the current tax structure and the above factors in mind, indicate the trend of income in advance of the final compilation of statistics.

## 91593-70

The statistics given in Table 12 pertain to tax collections by the Taxation Division of the Department of National Revenue. The collections are for fiscal years ended Mar. 31.

## 12.-Taxes Collected by the Taxation Division of the Department of National Revenue, Years Ended Mar. 31, 1947-56

Norg.-Figures for 1917-34 are given in the 1947 Year Book, pp. 999-1000; for 1935-46 in the 1951 edition, p. 994.

## CANADIAN TAXPAYERS BY INCOME GROUP, 1954

Corporation Income Tax Statistics.-Corporation statistics presented in Tables 15 and 16 are on a taxation-year basis prior to assessment. The data were extracted and compiled from the returns shortly after they were filed and are as declared by the taxpayer without the scrutiny or revision of the Department of National Revenue. Provincial figures contain an unavoidable bias in favour of Ontario and Quebec because many large corporations operating across Canada file their returns in one or other of these two provinces.

## 15.-Summary Statistics for Corporations Reporting a Proft, Taxation Years 1953 and 1954

| Item | 1953 |  |  | 1954 |  |  |

## Succession Duties

A history of succession duties in Canada, together with examples of the occurrences of federal duty on typical estates and of combined federal and provincial duties on typical estates, is given in the 1956 Year Book, pp. 1064-1068.

At Dec. 31, 1957, only Ontario and Quebec among the provinces remained in this field. The deduction in the federal duty in respect of provincial duty was raised in 1957 for the estates of all persons dying on or after Apr. 1, 1957, to one-half of the federal duty on doubly taxed property and one-half the federal duty on pensions in the estates of persons domiciled in Quebec or Ontario.

An Agreement between Canada and Ireland came into effect on Dec. 20, 1955.

Table 17 shows the receipts of the various governments from succession duties for 1954-57.

## 17.-Federal and Provincial Net Revenue from Succession Duties, Years Ended Mar. 31, 1954-5\%

Note.-Statistics for 1948-52 are given in the 1954 Year Book, p. 1080, and for 1953 in the 1956 edition, p. 1064.

| British Columbia................................. | - | - | - | - |

${ }^{1}$ Under terms of the 1952 Dominion-Provincial Taxation Agreements all provinces except Ontario and Quebee refrain from levying succession duties; amounts shown for other provinces are arrears. Provincial figures for 1957 are preliminary.

The federal legislation was amended, effective for the estates of persons dying on or after Apr. 1, 1957, by allowing a full 50 -p.c. reduction of the federal duty on any property which had been taxed by Canada and a prescribed province (Ontario and Quebec) and a similar 50 -p.c. reduction in the federal duty on pensions in the estates of persons dying domiciled in the said provinces. Another amendment provides that charitable successions may be deducted from the aggregate net value of the estate so that the amount of such items will not result in increasing the rates of duty paid by other successors.

If gift tax payable under the provisions of the Income Tax Act has been paid in connection with the transfer made by a deceased person during his lifetime, then no succession duty is payable in respect of such gift except to the extent that succession duty thereon is in excess of the gift tax.

## Subsection 4.-Subsidies and Taxation Agreements with the Provinces

Subsidies.-A summary history of certain annual payments made by the Federal Government to the provinces under the provisions of the British North America Act and subsequent arrangements entered into from time to time appear in the 1956 Year Book, pp. 1068-1069.

The following table shows individual subsidy allowances by province for the years ended Mar. 31, 1956 and 1957.

Taxation Agreements.-Early in World War II, in order to provide revenue for heavy national expenditures and at the same time control inflationary tendencies, the provincial governments vacated the income and corporation tax fields in favour of the Federal Government for the duration of the War and a limited period thereafter, after agreeing to the terms of a tax rental fee from the Federal Government. These Agreements of 1942 were succeeded by Tax Rental Agreements 1952. Under the 1952 Agreements, all provinces except Ontario and Quebec agreed to lease their personal and corporation income taxes, special corporation taxes and succession duties to the Government of Canada in exchange for a rental fee. Ontario, which had not entered into the 1947 Agreements, also agreed to lease personal and corporation income taxes and special corporation taxes
but retained the right to levy succession duties. In 1952 the nine provinces received $\$ 303,000,000$ in tax rental fees compared with $\$ 96,000,000$ received by the eight provinces in 1951.

The Wartime Tax Agreements of 1942 are outlined in the 1946 Year Book, pp. 900-901. The 1947 and 1952 Tax Rental Agreements are outlined at pp. 1087-1090 of the 1954 edition.

With the 1952 Rental Agreements expiring at Mar. 31, 1957, conferences were held with the provinces in April and October 1955 and March 1956 to discuss new financial arrangements. At the October meeting the Federal Government put forward certain suggestions for discussion. These were revised and became part of the actual proposals made by letter on Jan. 6, 1956. Some further revisions in detail were made following a meeting with the provinces on Mar. 9, 1956, and the final proposals were incorporated in a Bill presented to Parliament in July 1956, entitled the Federal-Provincial Tax-Sharing Arrangements Act. This Act received Royal Assent on July 31, 1956.

The new proposals differ substantially in principle from those previously in effect, for, while provision is still made for tax rental agreements in the fields of individual and corporation income tax and succession duties, the rental fee payable is directly related to the return from these fields at agreed rates in the province concerned.

The fiscal aid subsidies which were formerly contained in the tax rental fees will now be separated from such fees and contained in specific payments called "tax equalization payments". These payments are to be used to bring the per capita yield from standard taxes in a province in a year up to the level of the two provinces for which the per capita standard taxes for that year are greatest.

The standard taxes involved are: (a) individual income tax at 10 p.c. of the Federal tax; (b) corporation income tax at 9 p.c. of corporation taxable income; and (c) succession duties at 50 p.c. of the federal duties averaged over a three-year period.

In addition, provincial revenue stabilization payments are provided which will support the payments to a province at a level determined by the greatest of: (a) the adjusted 1957 tax rental payment which is the amount payable in 1956-57 to any province whether under an agreement or not, adjusted for any population changes in the year in question; (b) the projected tax rental payment which is the amount that would be payable to any province in a year if the 1952 tax rental agreements were to be extended into the year in question; and (c) the basic stabilization amount which for 1958-59 is 95 p.c. of the amount of tax equalization payments, provincial revenue stabilization payments and current tax rental payments applicable to the province in 1957-58; and, for subsequent years, 95 p.c. of the average of such payments in the two previous years.

The tax equalization payments and the provincial revenue stabilization payments are payable to a province regardless of any action they may take in these tax fields. Tax rental payments are subject to agreement.

Rental agreements have been entered into with all provinces except Quebec and Ontario in all three tax fields. Ontario has rented the individual income tax to the Federal Government but levies its own corporation income and corporation taxes and succession duties. Quebec continues to levy all three taxes. Where a province levies its own taxes, there is a reduction of federal tax provided at the standard rate noted above.

Following a Dominion-Provincial Conference in November 1957, an interim measure covering the fiscal year commencing Apr. 1, 1958, was introduced in the House of Commons on Jan. 27, 1958, increasing from 10 p.c. to 13 p.c. that portion of the "standard individual income tax" which the ten provinces were entitled to receive under the Federal-Provincial Tax-Sharing Arrangements Act of 1956. Linked with the above was a second measure providing Atlantic adjustment grants of $\$ 25,000,000$ for each of four fiscal years and divided as follows: Nova Scotia, New Brunswick and Newfoundland each $\$ 7,500,000$, and Prince Edward Island $\$ 2,500,000$.

## Subsection 5.-National Debt

A brief commentary dealing with the national debt of the Government of Canada from 1914 appears at p. 1091 of the 1954 Year Book. The following table summarizes the debt position during the period 1948-57 as to interest and amount outstanding. Details of unmatured debt and treasury bills outstanding and information on new security issues of the Federal Government may be found in the Public Accounts of Canada. They are summarized by standard classifications in DBS publication Financial Statistics of the Government of Canada.

## 19.-Summary of the Public Debt and Interest Payments Thereon, Years Ended Mar. 31, 1948-57

Norz.-Statistics for 1867-1913 are given in the 1942 Year Book, p. 775; those for 1914-35 in the 1947 edition, p. 972; and those for 1936-47 in the 1951 edition, p. 1009.

[^361]Guaranteed Debt.-In addition to the direct debt of the Federal Government already dealt with, there are large indirect obligations arising mainly out of the guarantee of securities by the Federal Government of the railway lines that now form the Canadian National Railways and the subsequent extensions thereof. Since 1932, guarantees of certain bank loans have been made under the various Relief Acts, the National Housing Act, the Farm Improvement Loans Act, and the Veterans Business and Professional Loans Act. When the Bank of Canada commenced business on Mar. 11, 1935, the guarantee of the deposit required to be maintained in the Bank of Canada by every chartered bank came into force. This guarantee must be implemented "in the event of the property and assets of the Bank being insufficient to pay its liabilities and/or if the Bank suspends payment of any of its liabilities".

## 20.-Guaranteed Debt of the Government of Canada-Amounts Held by the Public

Nore.-These contingent liabilities are expressed in Canadian dollars; stocks and bonds payable solely in Sterling are converted on the basis of $£ 1=\$ 2.80$, and United States dollars are considered at par with the Canadian dollar.

## Section 3.-Provincial Public Finance

Provincial government accounting and reporting practices vary considerably so that certain adjustments to the Public Accounts figures are required in order to produce comparable statistics. For example, transactions relating to a specific function are sometimes excluded from ordinary account; therefore special or administrative funds of this nature have been added to provincial ordinary account in the tables of this Section.

Fiscal periods are as nearly coincident as possible in view of the variations in provincial fiscal year-ends prior to the 1951 fiscal year; as of 1952 the fiscal years of all provinces end on Mar. 31. Figures for Newfoundland are included from 1949, for Yukon Territory from 1950, and for the Northwest Territories from 1955.

## Subsection 1.-Revenue and Expenditure of Provincial Governments

The figures of revenue and expenditure presented in this Subsection do not agree with those given in Tables 1 and 2, pp. 1087-1088, mainly because of differences in the methods used to compute net figures and because of the slightly different classification of items. Net general revenue as shown in Tables 21 and 22 is achieved by deducting from gross general (ordinary and capital) revenue ( $a$ ) all institutional revenue, ( $b$ ) revenue in the form of interest, premium, discount and exchange, (c) grants-in-aid and shared-cost cointributions, and (d) all capital revenue. These revenues are then offset against the related functions of expenditure to arrive at net general (ordinary and capital) expenditure, shown in Tables 21 and 23.

The following statement gives some indication of the increase in the revenue collected and services rendered by the provincial governments in 1953 and 1955 compared with 1949, the year that Newfoundland entered Confederation.

## 21.-Gross and Net Revenue and Expenditure of Provincial Governments, Years Ended Mar. 31, 1954-56

23.-Details of Net General Expenditure of Provincial Governments, Fiscal Years Ended Mar. 31, 1955 and 1956

## Subsection 2.-Debt of Provincial Governments

Table 24 reveals a steady increase in total bonded debt despite the decreases registered in Quebec, Alberta and British Columbia in the later years. Table 25 shows that the majority of bond issues are payable in Canada only ( 66 p.c. in 1952, increasing to 67 p.c. in 1956) and that the portion payable in New York only increased from 12 p.c. in 1952 to 18 p.c. in 1956. Tables 26 and 27 provide details of total direct and indirect debt of provincial governments as at Mar. 31, 1955 and 1956.
24.-Gross Bonded Debt (exclusive of Treasury Bills) of Provincial Governments as at Mar. 31, 1952-55

## Section 4．－Municipal Public Finance

## Subsection 1．－Municipal Assessed Valuations

Because of the lack of integrated municipal assessment systems and uniform standards for establishing values，the figures in Table 28 are not entirely comparable on an inter－ provincial basis．The provinces operate under their own assessment laws which are not at all similar．Although considerable progress has been made in recent years towards uniformity and improved procedure，there is still a variation in methods，schedules and rates，not only between provinces but also between municipalities within the same province．

${ }^{1}$ Includes the following: N.S.-household tax, Halifax; N.B.-occupancy tax, Fredericton, and rentals tax, Moncton; Sask.-special franchise. ${ }^{2}$ Total of valuations assessed but exempt from taxation. Excludes exempt property not assessed. ${ }^{2}$ Taxes are levied on rental values in some municipalities using a property base. $\quad$ \& Includes estimated values for some municipalities; total exemptions are incomplete. ciudes personal property tax for local improvement districts and commissions, not separable.

- Excludes rural municipalities; information not available.

## Subsection 2.-Municipal Taxation

Table 29 shows the local taxes levied by municipalities and by some school authorities in the years 1951-55 and the total taxes outstanding at the end of those years.

## 29.-Municipal Taxation by Province 1951-55

${ }^{1}$ Excludes certain provincial and other special taxes (see text following this table).

Because of the considerable differences in the division of responsibility for services between the provincial governments and their respective municipalities, extreme caution should be exercised in using the figures in Table 29 as a basis for interprovincial comparisons of the relative burden of municipal taxation. Also, in Saskatchewan municipalities are required to levy certain taxes for and on behalf of the provincial government and for
other special purposes for which there is no comparable situation in other provinces. The amounts of such taxes excluded in the Saskatchewan municipal levies in Table 29 are as follows:-

| Tax | 1951 | 1958 | 1958 | 1954 | 1955 |

## Subsection 3.-Municipal Debt

Tables 30 and 31 set out the direct and indirect debt of local governments for the years 1954 and 1955. The amounts shown include debt incurred by municipalities for general purposes, schools and utilities, as well as debenture debt incurred directly by utilities, school authorities and certain special areas organized to provide specific local services.

Comparison with debt figures for previous years indicates that there has been a sustained upswing in municipal borrowing since 1946, largely because civic growth has increased demand for services, but also, to some extent, attributable to the inflationary factor.

## 30.-Debt of Municipal and School Corporations by Province for their Fiscal Years Ended in 1954

Note.-Figures shown are compiled from published reports of provincial Departments of Municipal Affairs, auditor reports and financial statements of municipalities, and information secured from other official sources.

For footnotes, sec end of table, p. 1118.

# CHAPTER XXV.-NATIONAL ACCOUNTS AND CANADA'S INTERNATIONAL INVESTMENT POSITION 

CONSPECTUS

Note.-The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

## Section 1.-National Accounts*

The national accounts constitute a set of accounting summaries for the nation as a whole and portray economic activity in terms of transactions taking place between different sections of the economy. By combining and summarizing these operations into their various classes, information may be obtained on the functioning of the economy which is of particular interest to governments concerned with problems of full employment, taxation and prices, and to businessmen concerned with programs of investment and marketing.

This measurement of the nation's output is in terms of established market prices; hence it is necessary to keep in mind that the value of the nation's production may change because of price variations as well as increase or decrease in volume of output.

Data are available showing volume changes in gross national expenditure in addition to the value figures. Gross national expenditure is shown in Table 3 in constant dollars (i.e., in terms of 1949 prices). Because the gross national expenditure equals the gross national product, these data also reflect volume changes in the production of goods and services as measured by the gross national product. For all other tables the data are expressed in current dollars so that year-to-year changes must be considered in relation to price changes over the period.

National accounts calculated on a quarterly basis are a logical extension of the annual national accounts and have been published since 1953. However, their preparation on a reliable and analytically useful basis is rather more difficult because of the scarcity of quarterly data, special problems arising from the measurement of farm production and problems in connection with seasonal variation.

The tables in this Section cover the more important aspects of the national income analysis in annual terms. Tables 1 and 2 show the main aggregates of national income, gross national product, gross national expenditure and their components and other tables are included to show the source and disposition of personal income, government revenue and expenditure and personal expenditure on consumer goods and services.

National income figures from 1926 have been revised since the publication of the 1956 Year Book. The complete new series is published in DBS bulletin National Accounts, Income and Expenditure, 1926-1956, which contains also a review of economic trends during that period.

National Income. - Net national income at factor cost measures the current earnings of Canadian factors of production (i.e., land, labour, capital) from productive activity. It includes wages and salaries, profits, interest, net rent and net income of farm and nonfarm unincorporated business.

[^367]Gross National Product.-Gross national product, by totalling all costs arising in production, measures the market value of all final goods and services produced in the current period by Canadian factors of production. It is equal to national income plus net indirect taxes (indirect taxes less subsidies), plus capital consumption allowances and miscellaneous valuation adjustments.

Personal Income.-Personal income is the sum of current receipts of income whether or not these receipts represent earnings from production. It includes transfer payments from government such as family allowances, unemployment insurance benefits, and war service gratuities, in addition to wages and salaries, net income of unincorporated business, interest and dividends and net rental income of persons. It does not include undistributed profits of corporations and other elements of the national income not paid out to persons.

Gross National Expenditure.-Gross national expenditure measures the same aggregate as gross national product, namely, total production of final goods and services at market prices, by tracing the disposition of production through final sales to persons, to governments, to business on capital account (including changes in inventories) and to non-residents (exports). Imports of goods and services, including net payments of interest and dividends to non-residents, are deducted since the purpose is to measure only Canadian production.

## Economic Activity in 1955 and 1956

Gross National Product and National Income.-In the year 1955 there was a sharp recovery from the mild contraction in economic activity that characterized the period mid-1953 to mid-1954. Output of goods and services, which was beginning to rise in the latter part of 1954, expanded rapidly throughout 1955, and for the year as a whole was approximately 9 p.c. higher than in 1954. The upswing lifted the gross national product from $\$ 24,871,000,000$ in 1954 to $\$ 27,070,000,000$ in 1955 . With prices virtually unchanged, this increase represented the largest gain of any postwar year in the volume of production.

The expansion of output in the various industrial groups was widely dispersed and substantial in size. Manufacturing output showed an increase of 7 p.c., with relatively large increases in almost all those sub-groups that had been affected by the contraction of activity in 1953-54 (iron and steel products, electrical apparatus and supplies, and textiles). Sharp gains were also recorded in wood products, non-ferrous metal products and non-metallic mineral products.

These developments in production were associated with an increase of 4 p.c. in the number of persons with jobs in the non-farm sector. The expansion in employment, together with higher average earnings, raised labour income to $\$ 13,215,000,000,6$ p.c. higher than in 1954.

Accrued net income of farm operators from farm production rose from $\$ 1,017,000,000$ to $\$ 1,261,000,000$, largely as a result of a better crop of grain; farm cash income, however, was slightly lower than in the previous year. Net income of non-farm unincorporated business rose 8 p.c., with the increases concentrated in construction and retail trade.

Corporate profits, which had been declining year by year from their postwar peak in 1951, rose to a new high of $\$ 2,489,000,000$, a gain of 27 p.c. Other investment income continued to rise.

Sustained expansion in economic activity in 1956 again raised the level of gross national product, which reached a total of $\$ 30,098,000,000,11$ p.c. higher than in 1955. Prices resumed their upward trend and the gain in the physical volume of output was 7 p.c.-not much short of the 9 p.c. achieved in 1955.

The most striking increases in production in non-agricultural industries occurred in transportation, mining and construction. In manufacturing industries the increase was about 6 p.c., with an 8-p.c. increase in durable goods industries and a 4.5-p.c. increase in non-durables; gains were relatively large in those industries manufacturing producer and consumer durables, construction materials, and basic export products.

91593-71

This expansion in output was associated with a 5 -p.c. increase in the number of persons with jobs in the non-agricultural sector of the economy. The magnitude of this increase was accounted for by a drop in unemployment, an unusually large growth in the labour force and a further decline in farm employment. Higher average earnings, up 5 p.c., were somewhat more important than increased employment in raising labour income to $\$ 14,719,000,000$, an increase of 11 p.c. over the previous year.

Accrued net income of farm operators from farm production in 1956 was $\$ 1,468,000,000$, a gain of 16 p.c. over the previous year; the rise in farm cash income was somewhat smaller. As in 1955, the rise mainly reflected a larger grain crop. Net income of non-farm unincorporated business was higher by 8 p.c.; retail trade and construction were again prominent among the industries registering increases.

Corporate profits were $\$ 2,802,000,000$ in 1956 compared with $\$ 2,489,000,000$ in 1955, though the rate of increase was significantly lower than in the earlier year. Other investment income was also higher.

Gross National Expenditure.-The major expansionary force in the economy in 1955 was consumer expenditure, together with housing; these two closely related sectors accounted for about two-thirds of the increase in gross national expenditure in that year. At the same time, expansionary influences were present in every other major segment of demand.

Personal income was up 8 p.c. and, since consumer prices remained virtually unchanged, there was a parallel rise in real income; on a per capita basis, the gain was the largest of any postwar year. Consumer expenditure also rose 8 p.c., with an especially large increase in purchases of durables, which were up 16 p.c. Gains were also widespread in non-durable groups and in services. The rise in personal income, together with a larger supply of mortgage funds, was reflected in rising expenditures on housing; 138,366 housing units were started during the vear and 127,929 units completed, representing substantial increases
over the previous year. Business outlays on non-residential construction and on machinery and equipment also continued their upward course, rising 11 p.c. and 6 p.c. respectively. Together they amounted to $\$ 3,832,000,000$, equal to their previous high in 1953.

The rising level of activity prompted a shift to accumulation of business inventories, in contrast to liquidation in 1954, and the larger grain crop led to increased investment in farm inventories. The shift in inventories alone accounted for about one-fifth of the increase in gross national product. Government expenditure on goods and services rose to $\$ 4,780,000,000,7$ p.c. higher than in the previous year. While defence expenditures were slightly higher, most of the increase was attributable to larger capital outlays and to higher wages and salaries.

Exports of goods and services rose to $\$ 5,764,000,000$ in 1955, an increase of 12 p.c. over 1954. The renewed up-turn of activity in the United States and continued expansion in overseas countries accounted for the strength of demand in foreign markets. The increase in imports of goods and services, particularly evident in the latter part of the year, was 16 p.c., to a total of $\$ 6,443,000,000$. Thus the deficit on current account of $\$ 679,000,000$ was substantially in excess of the $\$ 427,000,000$ recorded in 1954. Export prices were higher by 4 p.c. and import prices by about 2 p.c., so that there was a slight improvement in Canada's terms of trade with other countries.

Economic activity continued to expand in 1956, and of paramount importance in that expansion was the extraordinarily large increase in business outlays for plant and equipment, which accounted for more than 40 p.c. of the rise in the nation's total spending. The increases in consumer expenditure, housing and exports approximated those of 1955 in percentage terms.

Business outlays for plant, machinery and equipment amounted to $\$ 5,103,000,000$; the advance of 33 p.c., in value terms, over 1955 was the largest percentage increase in any postwar year except 1947. After taking account of the advance in prices, which was especially marked in the investment goods sector, the rise in physical terms was 25 p.c. The gains were heavily concentrated in projects related to resource development, fuel and energy requirements and the processing of primary commodities.

At $\$ 1,526,000,000$, outlays on housing were higher in 1956 than in 1955 by 11 p.c.; taking into consideration the rise in prices, the increase in volume was 7 p.c. Higher costs and more limited supply of mortgage funds caused falling off in the rate of housing starts during the year, and it was the carryover of houses under construction at the end of 1955 and early 1956 that contributed to the record of 135,700 completions in 1956.

The high and rising level of final demand, and possibly also expectations of higher prices, made for heavy investment in business inventories. Investment in inventories, added to business outlays for plant and equipment, accounted for well over half the increase in the nation's total spending in 1956.

Personal expenditure on consumer goods and services, amounting to $\$ 18,697,000,000$, was up 7 p.c. in value but somewhat less in volume. This increase, which was associated with an 11-p.c. rise in personal income, was well distributed over the various categories, but the rise in purchases of durables was much less pronounced than in 1955.

Government expenditure on goods and services was $\$ 5,266,000,000,10$ p.c. higher than in 1955. The increase was mainly accounted for by larger capital outlays, notably by provincial governments, and by larger wage and salary payments.

Continuing strength of foreign demand, greater productive capacity in the export industries, and a decided improvement in sales of wheat resulted in exports of goods and services valued at $\$ 6,339,000,000$. This was also a 10 -p.c. increase, and higher prices accounted for a little less than one-third of that increase.

Imports of goods and services were $\$ 7,697,000,000$ in 1956,19 p.c. higher than in 1955; this increase represented a larger volume of goods and services sold. The heavy demands of the huge investment program were reflected in relatively large increases in machinery and equipment and in basic materials related thereto; for example, imports of iron and its products advanced 39 p.c.

91593-71 $\frac{1}{2}$

The deficit on international current account climbed to $\$ 1,358,000,000$ in 1956 , twice the figure for 1955 .

## Section 2.-Canada's International Investment Position*

Exceptional increases have been occurring in the amounts of foreign capital invested in Canada. As these changes have been under way for a number of years, the accumulated amounts of investments in Canada owned by non-residents have shown a rapid rise, and the balance of Canadian indebtedness to other countries has risen even more sharply as Canadian assets abroad have increased more moderately than the liabilities. The rise in non-resident investments has been particularly pronounced in the period since 1948, having doubled from $\$ 7,506,000,000$ to $\$ 15,400,000,000$ in 1956 , and the balance of international indebtedness in the same period has risen from $\$ 3,700,000,000$ to $\$ 9,500,000,000$.

[^371]Particularly significant is the fact that direct investments in Canadian businesses controlled in the United States and elsewhere have risen at an even greater rate than total investments and there have also been large increases in other types of investment in Canadian equities. In contrast, the increase in non-resident portfolios of Canadian Government, municipal and corporation bonds has been relatively moderate.

Investments of non-resident capital have been closely related to the high rate of growth in Canada. Large development projects have been initiated and financed by investors from other countries and the growth effects from this investment have, in turn, led to Canadian borrowing in capital markets outside of Canada. While capital inflows have been the principal source of the increased indebtedness abroad, another substantial contributor has been the earnings from non-resident-controlled branches and subsidiaries which were retained in Canada. New resource industries depending to a large extent on non-resident financing include all branches of the petroleum industry, iron ore and other mining, aluminum, nickel, pulp and paper, and chemicals. In addition, secondary industry has also benefited from non-resident investment.

Foreign Investments in Canada.-Dependence upon external sources of capital for financing in earlier periods of heavy investment activity has been characteristic of Canadian development. During the exceptional growth period that occurred before World War I the rate of increase in non-resident investment was very high and dependency upon external sources of capital was greater than in later periods. Total non-resident investments in Canada increased from an estimated $\$ 1,232,000,000$ in 1900 to $\$ 3,837,000,000$ by 1914, mainly in the form of bonded debt for railway and other expansion guaranteed by the Canadian Government. This was the period when the principal external source of capital was London, and by 1914 British investments in Canada, estimated at $\$ 2,778,000,000$, were at about their highest level. By the same date, United States investments, although they had been increasing rapidly, had only about one-third of the value of British-owned investments.

During the first part of the inter-war period the United States became the principal source of external capital, and by 1926 the United States-owned portion of Canada's international debt exceeded that owned in the United Kingdom which had not increased since 1914. Growth in United States investments in Canada continued for some years but was interrupted in the 1930's when the total was reduced by repatriations of securities and other withdrawals of capital. Increases began again in the 1940's and by the end of World War II, United States investments of $\$ 4,990,000,000$ compared with British investments of $\$ 1,750,000,000$. The latter had been reduced by wartime repatriation measures and the proceeds were used in financing British expenditures in Canada. Following the War, up to 1948, some further declines occurred in British investments in Canada but since then they have increased.

United States investments have risen each year since the end of the Second World War, particularly since 1948. Between that year and 1956 the total more than doubled. At $\$ 11,651,000,000$, United States investments in 1956 continued to represent more than three-quarters of all non-resident investments in Canada and also made up a similar ratio of the increase during this recent period. The main rise occurred in direct investments in companies controlled in the United States, which are prominent in many branches of Canadian industry. In 1956 portfolio investments in Canada owned in the United States were about one-half as high again as in 1949. A considerable part of this latter rise occurred in 1956 when large sales of new issues of securities were made in that country.

British investments in Canada totalled $\$ 2,675,000,000$ in 1956 and were at a new postwar peak which was not far below the earlier maximum levels maintained for several decades following 1914. But these investments now account for only 17 p.c. of the total non-resident investments in Canada compared with 36 p.c. at the end of 1939 before most of the wartime repatriations. The rise in British investments in Canada from the low point in 1948 was more than $\$ 1,000,000,000$ up to 1956 , particularly concentrated in direct investments which have more than doubled since then and which now represent a
much larger portion of the total than in the prewar period. In absolute terms, this rise in total British investments in Canada is more than the rise in investments by all other overseas countries in the same period, although the rate of increase has been lower.

Investments of countries other than the United States and the United Kingdom reached a record total of $\$ 1,075,000,000$ at the end of 1956 . Being almost three times the corresponding 1950 figure, this represents a much higher rate of increase than has occurred in either United States or British investments and large increases have taken place in portfolio holdings of securities as well as in direct investments. At 7 p.c. of the total, this group of countries, mostly in Western Europe, makes up a larger portion of total investments than ever before. About 90 p.c. of the direct investments, which totalled $\$ 315,000,000$ in 1955, also came from Western Europe; more than one-third was of Belgian origin with French and Swiss making up the next largest groups. Since then German direct investments have risen significantly.

The degree of dependence upon non-resident capital for financing Canadian investment has been relatively much less in the postwar period than in the earlier periods of exceptional expansion, even though the rise in non-resident investments has been so great. Thus, from 1950 to 1956 the net use of foreign resources amounted to about one-fifth of net capital formation in Canada, and direct foreign financing amounted to about one-third. But in the year 1956 when these ratios had increased considerably to about one-third and two-fifths respectively, they were still less than the corresponding ratios in the short period 1929 to 1930 when inter-war investment activity was at its highest point. In that period more than one-half of net capital formation was financed from outside of Canada, and in the period of heavy investment before World War I an even larger ratio of investment was financed by external capital. In considering these changes it should be noted that for a decade and a half, between 1934 and 1949, Canada was a net exporter of capital and that Canadian assets abroad have been rising over a long period.

It should also be noted that the above ratios relate to the place of non-resident investments in all spheres of development including those where Canadian sources of financing predominate such as in merchandising, agriculture, housing, public utilities, and other forms of social capital. Thus non-resident financing of industry and mining has been much higher than the over-all ratios indicate, and has provided the major portion of the capital investment in this field in the period since 1948. The most comprehensive calculation of the ratios of non-resident ownership in Canadian manufacturing, mining and petroleum is for the year 1954, and it should be noted that subsequent changes are likely to have increased non-resident ownership even more. In that year the Canadian manufacturing industry was 48 p.c. owned by non-residents but capital subject to foreign control was 54 p.c. These proportions compared with 44 p.c. and 48 p.c., respectively, as recently as at the end of 1951 . In the broad field of mining, smelting and petroleum, exploration and development companies, non-resident ownership and control each amounted to 59 p.c. at the end of 1954, whereas at the end of 1951 non-resident ownership and control had amounted to 51 p.c. and 53 p.c. respectively. However, resident-owned Canadian capital continued to play a leading role in the financing of such areas of business as merchandising, railways and other public utilities. Hence non-resident ownership in the broad area of business, including industry, mining, merchandising and railways and utilities as a whole, remained just under one-third for a period of some years up to 1954 (the last year for which the calculation has been made). But, in the same years, companies subject to non-resident control increased to some extent their share of the total even in this broad area of business, a trend also evident in many subdivisions of the manufacturing and extractive industries.

The same type of analysis has been applied to investments in the petroleum industry including exploration and development, refining, merchandising, pipelines and other transportation. This industry has been the largest single recipient of capital inflows in the postwar period, accounting directly for more than one-half of the net inflow of United States capital for direct investment in Canada. By the end of 1955, investments in Canadian petroleum concerns controlled in the United States made up 74 p.c. of the

91593-72
total, having increased sharply from the previous year. Another 6 p.c. of the investment was controlled in overseas countries. Investments owned in the United States and overseas were 59 p.c. and 5 p.c. respectively of the total.

Another basis of judging the place of foreign-controlled business in Canadian industry is provided by a special study of production and employment in the larger Canadian manufacturing establishments controlled in the United States. Such establishments having an investment of $\$ 1,000,000$ or more accounted for about 30 p.c. of Canadian manufacturing production in 1953 and 21 p.c. of employment in that field. These ratios in non-resident-controlled plants were considerably higher than in 1946-the previous year for which a study of this kind was made.

In some industries the proportions of production and employment in plants controlled in the United States were much higher than this. Automobiles, for example, are mainly produced in United States-controlled plants, but this is exceptional. Among other industries where well over one-half of the production is in United States-controlled firms are the smelting and refining of non-ferrous metals, petroleum refining, rubber products, and motor vehicle parts. In several major industries like electrical apparatus and supplies and non-ferrous metal products the distribution of control between Canadian and United States-controlled companies is more evenly divided. In other industries the non-resident share is large although less than one-half the total. These include pulp and paper, other paper products, chemicals, medicinal and pharmaceutical products, sheet metal products, and certain branches of the machinery industry.

There are, however, many industries where much the largest part of production is in Canadian-controlled plants. Prominent among these are such important branches of industry as primary iron and steel, and some other sub-divisions of the iron and steel industry, textiles, clothing, and divisions of the foods and beverages industry, such as bakery products, beverages, and dairy products.
10.-Estimate of the Canadian Balance of International Indebtedness as at Dec. 31, 1939-56

Nore.-Totals are rounded and may not represent the sum of their components. They are exclusive of shortterm commercial indebtedness and blocked currencies.

[^373]Canadian Assets Abroad.-While there has been a great growth in non-resident investment in Canada and in the balance of indebtedness to other countries, it will be noted that Canadian assets abroad, shown in Tables 13 and 14, have continued to rise in value each year. These now represent a larger proportion of liabilities abroad than was the case before World War II, but most of the increase since then has been in governmentowned assets such as the official reserves and the loans by the Canadian Government to other governments which were extended during the War and early postwar years. In 1955 the government credits outstanding had a value of $\$ 1,635,000,000$ while official holdings of exchange amounted to $\$ 1,910,000,000$ in terms of Canadian dollars. Other official Canadian assets include Canada's subscriptions to the capital of the International Bank and the International Monetary Fund which, by March 1956, amounted to $\$ 70,900,000$ and $\$ 299,700,000$ respectively. Later in 1956 there was a subscription to the International Finance Corporation of $\$ 3,500,000$.

The portion of the assets in private investments, particularly in the form of direct investments abroad by Canadian companies, is still small in relation to the corresponding non-resident stake in equities in Canada. Private long-term investments abroad by Canadians in 1955 were made up of direct investments of $\$ 1,776,000,000$ and portfolio investments of $\$ 989,000,000$. More than two-thirds of the privately owned investments were located in the United States. Direct investments in that country by Canadian businesses have been growing particularly rapidly and are mainly in the beverage, farm implement and chemical industries and in railways.

Private investments in overseas countries are widely distributed. About one-half of the total in 1955 were located in Commonwealth countries, divided fairly evenly between the United Kingdom and the remainder of the Commonwealth. Most of the direct investments in the United Kingdom were in industry, while in other Commonwealth countries there were investments in mining and petroleum as well as in industry. In foreign overseas countries the largest part is in the countries of Latin America-some $\$ 320,000,000$ in 1954-made up mainly of holdings in public utilities.

## 13.-Canadian Assets Abroad 1939-55

Nors.-Excludes investments of insurance companies and banks, Canads's subscriptions to international financial institutions and short-term asseta, other than official holdings of gold and foreign exchange. Holdings of stocks are at book values as shown in the books of issuing companies; holdings of bonds are shown at par values. Foreign currencies are converted into Canadian dollars at currevt market rates. The series for portfolio investment was reconstructed in 1952 and is not strictly comparable with preceding years.

## PART I.-CURRENCY AND BANKING*

A historical sketch of currency and banking in Canada appears in the 1938 Year Book, pp. 900-905.

## Section 1.-The Bank of Canada

The Bank of Canada was incorporated under the Bank of Canada Act 1934 and commenced operations on Mar. 11, 1935.

The Bank of Canada is Canada's central bank and as such its main function is to regulate the total volume of money and credit. The normal way in which this function is performed is through changes in the cash reserves of the chartered banks. Each chartered bank is required by the Bank Act to maintain, on the average during each calendar month, an amount of cash reserves, in the form of Bank of Canada notes and deposits with the Bank of Canada, equal to not less than 8 p.c. of its Canadian dollar deposit liabilities. (Prior to July 1, 1954, each chartered bank was required to maintain at all times, cash reserves equal to not less than 5 p.c. of its Canadian dollar deposit liabilities; in practice the chartered banks normally attempted to maintain a ratio of about 10 p.c.) An increase in cash reserves encourages banks to expand their assets (mainly by purchasing securities and making loans), with a resultant similar increase in their deposit liabilities; a decrease in cash reserves tends to discourage expansion and may result in some contraction. Therefore, by taking steps to alter the volume of cash reserves available to the chartered banks, the Bank of Canada is able to influence the total of chartered bank assets and the total of their Canadian dollar deposit liabilities. The deposit liabilities of the banks, except for those payable to the Government, are of course assets of the general public and, together with currency, comprise their most liquid assets. (See Table 7, p. 1142, for Canadian dollar currency and bank deposits held by the general public.)

Open market operations in Government of Canada securities constitute the chief means by which the Bank of Canada influences the volume of chartered bank reserves. When the Bank of Canada purchases a security it issues a cheque in settlement which, after it is cashed at, or deposited with, a chartered bank by the recipient, is in turn deposited by that chartered bank in its account with the Bank of Canada, thereby increasing its eash reserves. Conversely, when the Bank of Canada sells a security the cheque which

[^374]it receives in payment is charged against the account of the chartered bank on which it is drawn, thus decreasing that bank's cash reserves. Increases or decreases in other assets and liabilities of the Bank of Canada also have an effect on the chartered banks' cash reserves. For example, an increase in the amount of Bank of Canada notes held by the general public tends to reduce the banks' cash reserves.

The powers of the Bank are set forth in the Bank of Canada Act 1934 (R.S.C. 1952, c. 13), revisions in which were made in 1936, 1938 and 1954. Some of these powers are outlined below.

The Bank of Canada may vary the minimum cash reserve requirements of the chartered banks between 8 p.c. and 12 p.c. of their Canadian dollar deposit liabilities, provided that the chartered banks are given a minimum notice period of one month before each increase becomes effective and that any increase is not more than 1 p.c. during any one month. When this legislation became effective on June 1, 1954, the initial requirement was 8 p.c. and it has since remained at that level.

The Bank may make loans or advances for periods not exceeding six months to chartered banks, or to banks to which the Quebec Savings Bank Act applies, on the pledge or hypothecation of certain classes of securities. Loans or advances on the pledge or hypothecation of readily marketable securities issued or guaranteed by Canada or any province may be made to the Government of Canada or the government of any province for periods not exceeding six months. Other loans may be made to the Government of Canada or the government of any province in amounts not exceeding a fixed proportion of such government's revenue; such loans must be repaid before the end of the first quarter after the end of the fiscal year of the borrower.

The Bank of Canada is required to make public at all times the minimum rate at which it is prepared to make loans or advances. This rate, known as the Bank Rate, stood at 2 p.c. per annum from Oct. 17, 1950, to Feb. 14, 1955, when it was reduced to $1 \frac{1}{2}$ p.c. It was raised to 2 p.c. on Aug. 5, 1955, to $2 \frac{1}{4}$ p.c. on Oct. 12, 1955, to $2 \frac{3}{4}$ p.c. on Nov. 18, 1955, to 3 p.c. on Apr. 4, 1956, to $3 \frac{1}{4}$ p.c. on Aug. 10, 1956, and to $3 \frac{1}{2}$ p.c. on Oct. 17, 1956. Effective Nov. 1, 1956, the Bank of Canada announced that henceforth until further notice the Bank Rate would be established weekly at a fixed margin of $\frac{1}{4}$ of 1 p.c. above the latest weekly average tender rate for 91-day treasury bills. The Bank Rate rose from 3.92 p.c. at the end of 1956 to a high of 4.33 p.c. in August 1957 and then declined to 3.87 p.c. at the year-end.

The Bank has the sole right to issue paper money for circulation in Canada. Details regarding the note issue are given on p. 1140.

The Bank acts as the fiscal agent for the Government of Canada in the payment of interest and principal and generally in respect of the management of the public debt of Canada.

The Bank may buy and sell securities issued or guaranteed by Canada or any province, short-term securities issued by the United Kingdom, treasury bills or other obligations of the United States, and certain classes of short-term commercial paper. The Bank is authorized by the Industrial Development Bank Act to purchase bonds and debentures issued by the Industrial Development Bank. The Bank may buy and sell gold, silver, nickel and bronze coin, and gold and silver bullion, and may also deal in foreign exchange. The Bank may accept deposits that do not bear interest from the Government of Canada, the government of any province, any chartered bank or any bank to which the Quebec Savings Bank Act applies. The Bank does not accept deposits from individuals and does not compete with the chartered banks in commercial banking fields.

Sect. 23 of the Bank of Canada Act provides that the Bank shall maintain a reserve of gold equal to not less than 25 p.c. of its outstanding notes and deposit liabilities. This requirement was suspended in 1940 when, under the terms of the Exchange Fund Order, the Bank's gold holdings were transferred to the Exchange Fund Account to form part of Canada's official gold and United States dollar reserves. The Currency, Mint and Exchange Fund Act passed in 1952 provides that, notwithstanding Sect. 23 of the Bank of Canada Act, the Bank of Canada is not required to maintain a minimum or fixed ratio of gold or foreign exchange to its liabilities unless the Governor in Council otherwise prescribes.

The Bank is under the management of a Board of Directors composed of a Governor, ${ }_{3}$ Deputy Governor and twelve Directors. The Governor and Deputy Governor are appointed for terms of seven years each by the Directors, with the approval of the Governor General in Council. The Directors are appointed by the Minister of Finance, with the approval of the Governor General in Council, for terms of three years each. The Deputy Minister of Finance is a member of the Board but does not have the right to vote. There is an Executive Committee of the Board composed of the Governor, the Deputy Governor, one Director and the Deputy Minister of Finance (who is without a vote) which has the same powers as the Board except that its every decision must be submitted to the Board at its next meeting. In addition to the Deputy Governor who is a member of the Board, there may be one or more Deputy Governors appointed by the Board of Directors to perform such duties as are assigned by the Board.

The Governor is the chief executive officer of the Bank and Chairman of the Board of Directors. The Governor has the power to veto any action or decision of the Board of Directors or of the Executive Committee but such veto is subject to confirmation or disallowance by the Governor General in Council. In the absence of the Governor, the Deputy Governor, who is a member of the Board, exercises all the powers and functions of the Governor.

The capital of the Bank is $\$ 5,000,000$ and is entirely held by the Minister of Finance. The Bank of Canada Act as amended in 1954 provides that each year 20 p.c. of the Bank's annual profits (after provision for depreciation in assets, pension funds and such matters) shall be allocated to the Rest Fund until the Rest Fund reaches an amount five times the paid-up capital of the Bank and the remainder shall be paid to the Receiver General and placed to the credit of the Consolidated Revenue Fund. At the end of 1957, the Rest Fund of the Bank reached its maximum of $\$ 25,000,000$ so that, since that date, the whole of the Bank's profits have been transferred to the Receiver General.

The head office of the Bank is at Ottawa. It has agencies at Halifax, Saint John, Montreal, Ottawa, Toronto, Winnipeg, Regina, Calgary and Vancouver and is represented in St. John's and Charlottetown. The agencies are chiefly concerned with the functions of the Bank as fiscal agent for the Government of Canada and with the issue and redemption of currency. The Industrial Development Bank, which is described on pp. 1138-1139, is a subsidiary of the Bank of Canada.

The Bank of Canada Act requires that statements of the assets and liabilities of the Bank on each Wednesday and the last day of each month be published in the Canada Gazette. A summary of the statement as at Dec. 31, 1955-57, appears in Table 1.

The Industrial Development Bank.-The Industrial Development Bank, a subsidiary of the Bank of Canada, was incorporated by Act of Parliament during 1944 and its banking operations commenced on Nov. 1, 1944. Its functions are described in the preamble to the Act as follows:-
"To promote the economic welfare of Canada by increasing the effectiveness of monetary action through ensuring the availability of credit to industrial enterprises which may reasonably be expected to prove successful if a high level of national income and employment is maintained, by supplementing the activities of other lenders and by providing capital assistance to industry with particular consideration to the financing problems of small enterprises."
The President of the Industrial Development Bank is the Governor of the Bank of Canada and the Directors are the Directors of the Bank of Canada. The $\$ 25,000,000$ capital stock of the Bank (completely paid up) was subscribed by the Bank of Canada. The Industrial Development Bank may also raise funds by the issue of bonds and debentures provided that its total direct liabilities and contingent liabilities in the form of guarantees and underwriting agreements do not exceed three times the aggregate of the Bank's paid-up capital and Reserve Fund.

The lending powers of the Bank may be extended only to industrial enterprises in Canada with respect to which it is empowered to:-
(1) lend money or guarantee loans;
(2) enter into underwriting agreements with regard to any issue of stock, bonds or debentures;
(3) acquire stock, bonds or debentures from the issuing corporation or any person with whom the Bank has entered into an underwriting agreement.
Industrial enterprises as defined by the Act (amended in 1956) include: (1) manufacturing, processing, assembling, installing, overhauling, reconditioning, altering, repairing, cleaning, packaging, transporting or warehousing of goods; (2) logging, operating a mine or quarry, drilling, construction, engineering, technical surveys or scientific research; (3) generating or distributing electricity or operating a commercial air service, or the transportation of persons, or (4) supplying premises, machinery or equipment for any business mentioned in (1), (2) or (3) under a lease, contract or other arrangement whereby title to the premises, machinery or equipment is retained by the supplier.

The Bank may accept any form of collateral security against its advances, including real property.

The Industrial Development Bank is intended to supplement the activities of other lending agencies, not to compete with them, and the Act of incorporation requires that it should extend credit only when the Board of Directors is of the opinion that similar credit would not be available elsewhere on reasonable terms and conditions. The Bank is specifically prohibited from engaging in the business of deposit banking.
2.-Authorized and Outstanding Loans and Investments of the Industrial Development Bank by Province and Industrial Enterprise as at Sept. 30, 1956 and 1957

## Section 2.-Currency

## Subsection 1.-Notes and Coinage

Note Circulation.-The development by which bank notes became the chief circulating medium in Canada prior to 1935 is described in the 1938 Year Book, pp. 900-905. Those features of the development which then became permanent are outlined in the 1941 Year Book, pp. 809-810.

When the Bank of Canada commenced operations in 1935 it assumed liability for Dominion notes outstanding. These were replaced in public circulation and partly replaced in cash reserves by the Bank's legal tender notes in denominations of $\$ 1, \$ 2, \$ 5, \$ 10, \$ 20$, $\$ 50$ and $\$ 100$. Deposits of chartered banks at the Bank of Canada completed the replacement of the old Dominion notes of $\$ 1,000$ to $\$ 50,000$ denomination that had previously been used as cash reserves.

The chartered banks were required under the Bank Act of 1934 to reduce gradually the issue of their own bank notes during the years 1935-45 to an amount not in excess of 25 p.c. of their paid-up capital on Mar. 11, 1935. Bank of Canada notes thus replaced chartered bank notes as the issue of the latter was reduced. Further restrictions introduced by the 1944 revisions of the Bank Act cancelled the right of chartered banks to issue or re-issue notes after Jan. 1, 1945, and in January 1950 the chartered banks' liability for such of their notes issued for circulation in Canada as then remained outstanding was transferred to the Bank of Canada in return for payment of a like sum to the Bank of Canada.

The classification of Bank of Canada notes in circulation by denomination shown in Table 3 for 1953-57 is not strictly comparable with the classification for earlier years. Dominion notes have been excluded from the denomination classification and the total only is shown. Also an item has been added showing the outstanding chartered bank notes issued originally for circulation in Canada. The statistics of total notes in the hands of the general public are comparable with earlier years.

## 3.-Bank of Canada Notes by Denomination and Other Notes in Circulation as at Dec. 31, 1953-57

## 4.-Note Circulation in the Hands of the Public as at Dec. 31, 1948-57

Nore.-Newfoundland has long used Canadian bank notes so that when that Province united with Canada in 1949 no adjustment was necessary in the circulation figures. but the effect of including the population of Newfoundland from 1949 was to reduce the per capita note circulation by an estimated $\$ 1$.

| Year Ended Dec. 31- | Bank of Canada Notes ${ }^{1}$ | Chartered Bank Notes ${ }^{2}$ | Total | Per Capita ${ }^{3}$ |
| :---: | :---: | :---: | :---: | :---: |
|  | $\varepsilon$ | \$ | \$ | \$ |

| 1957. | $1,555,115,143$ | 4 | 1,555, 115, 143 | 93.74 |

[^376]Coinage.-Under the Currency, Mint and Exchange Fund Act (R.S.C. 1952, c. 315), gold coins may be issued in denominations of twenty dollars, ten dollars and five dollars (nine-tenths fine or millesimal fineness, 900 ). Subsidiary coins include: silver coins in denominations of one dollar, 50 cents, 25 cents, 10 cents (eight-tenths fine or millesimal fineness, 800); pure nickel five-cent coins; and bronze (copper, tin and zinc) one-cent coins. Provision is made for the temporary alteration of composition in event of a shortage of prescribed metals. A tender of payment of money in coins is a legal tender in the case of gold coins for the payment of any amount; in the case of silver coins for the payment of an amount up to $\$ 10$; nickel coins for payment up to $\$ 5$; and bronze coins up to 25 cents.

## 5.-Canadian Coin in Circulation as at Dec. 31, 1948-57

Nors.-The figures shown are of net issues of coin. Figures from 1901 are shown in the corresponding table of previous Year Books beginning with the 1927-28 edition.

| Year Ended Dec. 31- | Silver | Nickel | Tombac ${ }^{1}$ | Steel | Bronze | Total | Per Capita ${ }^{2}$ |

${ }^{1}$ Tombac, a copper-zinc alloy, was used to conserve nickel for war purposes; no coins of this metal have been issued since 1944. $\quad 2$ Per capita figures are based on estimates of population as given at p. 119.

The Royal Canadian Mint.-The Mint at Ottawa was established as a branch of the Royal Mint under the (Imperial) Coinage Act 1870 and opened on Jan. 2, 1908. In 1931 (21-22 Geo. V, c. 48) it was constituted a branch of the Canadian Department of Finance and has since operated as the Royal Canadian Mint. From 1858 the British North American provinces, and later Canada, obtained their coins from the Royal Mint at London or from The Mint, Birmingham. Before that date, coins were mainly British, United States and Spanish. In its earlier years the operations of the Mint in Canada
were confined to the production of gold, silver and bronze coins for domestic circulation and of British sovereigns and small coins struck under contract for Newfoundland and Jamaica.

Before 1914 only small quantities of gold bullion were refined but during World War I the Mint came to the assistance of the British Government by establishing a refinery in which nearly $20,000,000$ oz. t. of South African gold were treated on Bank of England account. The subsequent development of the gold mining industry in Canada resulted in gold refining becoming one of the principal activities of the Mint. Fine gold produced from the rough bullion shipments received from the mines is purchased by the Mint and later delivered to the Bank of Canada for account of the Minister of Finance in bars of approximately 400 oz . t. each or, for those mines authorized to sell gold in the open market, the bullion is shipped to various domestic and foreign processors. The fine silver extracted from the rough gold is generally used for coinage purposes.

## 6.-Annual Receipts of Gold Bullion at the Royal Canadian Mint and Bullion and Coinage Issued 1948-57

${ }^{1}$ Less total float, i.e., cheques and other items in transit (net). Excludes Government of Canada deposits.

## Section 3.-Commercial Banking

As one of the chief functions of the early banks in Canada was to issue notes to provide a convenient currency or circulating medium, it has been expedient to cover both currency and banking in one historical sketch, which is given in the 1938 Year Book, pp. 900-905. A list of the banks at Confederation appears in the 1940 Year Book, p. 897, and bank absorptions since 1867 are given in the 1941 edition, pp. 812-813. A table in the 1937 Year Book, pp. 894-895, shows the insolvencies from Confederation; the last insolvency occurred in 1923. The more important of the revisions in banking legislation contained in the 1954 Bank Act are outlined in Subsection 1.

## Subsection 1.-Chartered Banks

Canadian commercial banks are chartered or lisensed by the Government of Canada and operate under one federal statute-the Bank Act-which is revised every ten years and brought into line with changing economic conditions. In addition to conducting a commercial banking business the chartered banks hold most of the public's savings deposits. The last revision of the Bank Act took place in 1954. An outline of the revisions made at that time is given in the 1956 Year Book, pp. 1109-1110.

Liquid Asset Ratio.-In the course of discussions with the chartered banks in November and December 1955, the Bank of Canada urged the adoption of a standard practice regarding the maintenance of a minimum ratio of liquid assets (cash, day-to-day loans and treasury bills) to deposits. The purpose of this suggestion was to establish a working principle of bank operations which would help the central bank in the task of restraining inflationary pressures that might threaten in the future. After discussion the banks agreed to work to achieve by May 31, 1956, a minimum liquid asset ratio of 15 p.c. which they would endeavour to maintain on a daily average basis from June on. On this basis, fluctuations above or below 15 p.c. might occur from day to day or week to week, but for the month as a whole the average would not be below the target ratio. From June 1956 the banks have maintained a daily average ratio of at least 15 p.e.

Branches of Chartered Banks.-Although there are fewer chartered banks now than at the beginning of the century, there has been a great increase in the number of branch banking offices. As a result of amalgamations, the number of banks declined from 34 in 1901 to 10 in 1931, and remained at that figure until the incorporation of a new bank-the Mercantile Bank of Canada-in 1953 brought the total to 11. Since then the amalgamation in 1955 of the Bank of Toronto and the Dominion Bank as the Toronto-Dominion Bank, and the amalgamation of Barclays Bank (Canada) with the Imperial Bank of Canada in 1956 has reduced this number to nine. The number of branches of chartered banks in each province from 1868 is given in Table 8.

## 8.-Branches of Chartered Banks by Province as at Dec. 31 for Certain Years 1868-1957

Norz.-Figures for 1920 and subsequent years include sub-agencies in Canada receiving deposits for the banks employing them; there were 718 such sub-agencies in 1957.

Financial Statistics of the Chartered Banks.-The classification of chartered bank assets and liabilities was revised by the Bank of Canada Act 1954, so that some of the statistics given in the following tables are not comparable with those appearing in earlier editions of the Year Book. Figures shown in Tables 11 to 13 prior to July 1954 have been adjusted to comply with the new classification. Month-end data are available from Dec. 31, 1954, to date in the Bank of Canada Statistical Summary.

${ }^{2}$ Before provision for income tare and 1
${ }^{3}$ Includes capital profits and losses and non-recurring items. 4 After deduction of re-transfers from inner reserves to undivided profits and rest account amounting to $\$ 17,000,000$ in $1953, \$ 48,000,000$ in $1954, \$ 4,000,000$ in 1955, $\$ 19,000,000$ in 1956 and $\$ 18,700,000$ in 1957.
${ }^{5}$ Includes provision for income taxes on the taxable portion of additions to inner reserves and on that portion of the funds re-transferred from inner reserves not taxed previously. Includes foreign income taxes. a ${ }^{6}$ Includes increase of $\$ 400,000$ in rest account and $\$ 1,500,000$ in capital paid up which represented the capital of a bank that commenced business in December 1953.

Cheque Payments.-A monthly record of the amounts of cheques charged to customer accounts at all chartered bank offices in 35 major clearing-house centres of Canada is available from 1924. Except for a minor setback in 1938, the value of cheques cashed shows a continuously upward trend from 1932, the low point of the depression years. The total of $\$ 205,558,447,000$ in 1957 was a record, 565 p.c. greater than in 1938 ; the increase almost equalled the gain in gross national production during the same period. The advance was well distributed throughout Canada's five economic areas. British

Columbia showed the largest gain in this comparison with an increase of 758 p.c. The Prairie Provinces recorded the second largest advance of 601 p.c., followed in order by Ontario, the Atlantic Provinces and Quebec.* As compared with 1956, all five areas showed gains, with Ontario and Quebec accounting for nearly 78 p.c. of the $\$ 13,000,000,000$ advance.

Value of cheques cashed in 29 centres was higher in 1957 than in 1956. Payments in the two leading centres reached all-time peaks, Toronto advancing over 11 p.c. and Montreal nearly 5 p.c. In the same comparison Winnipeg decreased by 2 p.c. and Vancouver increased by almost 8 p.c.

[^379]
## Subsection 2.-Government and Other Banking Institutions

There are three distinct types of savings banks in Canada in addition to the savings departments of the chartered banks and of trust and loan companies: (1) the Post Office Savings Bank, in which deposits are a direct obligation of the Government of Canada; (2) Provincial Government savings banking institutions in Newfoundland, Ontario and Alberta, where the depositor becomes a direct creditor of the province; and (3) two important savings banks in the Province of Quebec-the Montreal City and District Savings Bank and La Banque d'Économie de Québec-established under federal legislation and reporting monthly to the Federal Department of Finance. In addition, co-operative credit unions encourage savings among low-income classes and extend small loans to its members.

Post Office Savings Bank.-The Post Office Savings Bank was established under the Post Office Act of 1867 (31 Vict., c. 10) to "enlarge the facilities now available for the deposit of small savings, to make the Post Office available for that purpose, and to give the direct security of the nation to every depositor for repayment of all money deposited by him together with the interest due thereon". Branches of the Government of Canada's Savings Bank under the Department of Finance were gradually amalgamated with this Bank over a period of 50 years and the amalgamation was completed in March 1929. Summary financial statistics for the years ended Mar. 31, 1953-57, follow. Figures back to 1868 are available in previous editions of the Year Book.

| Less: Transfer to reserves. | 31,065 | 31,074 | 31,118 |
| Net Income. | 179,665 | $\underline{174,661}$ | $\underline{\underline{136,918}}$ |

The number of accounts increased from 36,512 at Mar. 31, 1956, to 36,561 in 1957; deposits decreased from $\$ 28,637,052$ to $\$ 28,343,120$ in the same comparison. On Apr. 1, 1957, the interest rates payable on deposits of private individuals, trust funds and estates, were increased from $2 \frac{1}{2}$ p.c. to 3 p.c. per annum in respect of all amounts in excess of $\$ 5,000$.

Ontario.-The establishment of the Province of Ontario Savings Office was authorized by the Ontario Legislature at the 1921 Session and the first branches were opened in March 1922. Interest at the rate of $2 \frac{1}{2}$ p.c. and $2 \frac{3}{4}$ p.c. per annum, compounded halfyearly, is paid on accounts, and deposits are repayable on demand. Total deposits at Mar. 31,1957 , were $\$ 80,500,000$ and the number of depositors was approximately 96,000 . Twenty-one branches were in operation throughout the Province.

Alberta.-Savings deposits are accepted at 50 Provincial Treasury Branches throughout Alberta. The total of these deposits at Mar. 31, 1957, was $\$ 23,398,702$, payable on demand and bearing interest at 2 p.c. per annum.

The Provincial Treasury has issued demand certificates bearing interest at $1 \frac{1}{2}$ p.c. or term certificates for one, two, three, four or five years in denominations of $\$ 25$ and upwards, bearing interest at 2 p.c. for one or two years, $2 \frac{1}{4}$ p.c. for three or four years and $2 \frac{1}{2}$ p.c. for five years. The total amount in savings certificates at Mar. 31, 1957, was $\$ 8,030$, made up of $\$ 5,680$ in demand certificates and $\$ 2,350$ in term certificates. Deposits from the public for the purchase of such certificates were discontinued as from April 1951.

Quebec Savings Banks.-The Montreal City and District Savings Bank, founded in 1846 and now operating under a charter of 1871 had, at Mar. 31, 1957, a paid-up capital and reserve of $\$ 8,500,000$, savings deposits of $\$ 219,764,429$ and total liabilities of $\$ 229,030,219$. Total assets amounted to $\$ 229,030,219$, including over $\$ 153,000,000$ of federal, provincial and municipal securities. La Banque d'Économie de Québec, founded in 1848 (as La Caisse d'Économie de Notre-Dame de Québec) under the auspices of the St. Vincent de Paul Society, incorporated by Act of the Canadian Legislature in 1855 and given a federal charter by 34 Vict., c. 7, had at Mar. 31, 1957, savings deposits of $\$ 35,235,882$ and a paid-up capital and reserve of $\$ 3,000,000$. Liabilities amounted to $\$ 43,410,151$ and total assets of a like amount.

The following statement shows the combined savings deposits in the Montreal City and District Savings Banks and La Banque d'Économie de Québec for the years ended Mar. 31, 1948-57. Figures back to 1868 are available in previous editions of the Year Book.

| Year | Deposits | Year | Deposits |

Credit Unions.*-During the past decade credit unions have become quite important among the savings and loan institutions in Canada since they are used by one Canadian in every eight. This is a self-help movement in which small savings of nearly $2,000,000$ people have resulted in assets of $\$ 768,000,000$, or an average per member of about $\$ 400$. The number of credit unions has almost doubled during the postwar period and the membership has increased almost threefold. The bulk of the membership is in Quebec and Ontario. In the former province assets is mostly held in the form of deposits, while in Ontario the major part of the assets are in shares.

Loans are granted to members for provident and productive purposes from the accumulated pooled savings and are mostly secured by personal notes. Loans in 1956 amounted to $\$ 319,000,000$.

There were 27 central credit unions in 1956 receiving deposits from and making loans to individual credit unions. These centrals are incorporated under provincial legislation to facilitate the flow of funds to credit unions that cannot meet the demand for local loans.

A Canadian Co-operative Credit Society serves as a central for all Canada.

## Section 4.-Foreign Exchange

The dollar, established officially as the currency of the united provinces of Canada on Jan. 1, 1858, and extended to cover the new Dominion by the Uniform Currency Act of 1870 , was defined as $15 / 73$ of the British gold sovereign.* That is, the par rate of exchange between the dollar and the pound sterling was fixed at $\$ 4.866$, making the Canadian currency the equivalent of the United States dollar at parity. With minor variations between the import and export gold points representing the cost of shipping gold in either direction, the value of the pound sterling in Canada remained at this level until the outbreak of World War I. The United States dollar, on the other hand, was at a discount in terms of Canadian funds for the first eleven years after Confederation since it was not redeemable in gold from February 1862 to January 1879. On the basis of gold equivalents it would appear that the greatest monthly average discount on the United States dollar after Confederation was approximately 31 p.c., reached in August 1868. From 1879 to 1914 the dollars of the two countries remained at par, varying only within the gold points or under $\$ 2$ per thousand.

On the outbreak of World War I, Canada and the United Kingdom suspended the gold standard. For some weeks both the pound and the Canadian dollar rose to a premium in New York. Subsequently both fell back with the pound going to a slight discount. In January 1916 the pound was officially pegged at $\$ 4.76$ in American funds. This level was maintained with the help of funds realized by sales of United States securities owned by residents of the United Kingdom, by borrowing in the United States and, after the American entry into the War, by the United States Government financing Allied purchases in that country.

From 1915 to the end of 1917 fluctuations in the rate of exchange between the Canadian and United States dollars did not exceed 2 p.c. on either side of parity; the pound was stable in terms of United States dollars during this period. In 1918 the Canadian dollar began to weaken. After the pound was unpegged in 1919 the Canadian dollar declined further and in 1920 it fell to 82 cents in New York with sterling going as low as $\$ 3.18$.

By the latter half of 1922 the Canadian dollar had returned practically to par in New York. Despite some further weakness in sterling, the dollar remained close to that level during the next two years, averaging 98.04 and 98.73 cents in terms of the United States dollar in 1923 and 1924, respectively, and fluctuating between a discount of about 3.6 cents and a premium of approximately 0.4 cents. After the United Kingdom resumed gold payments in April 1925, the range of fluctuation of the Canadian dollar narrowed further. From Canada's return to the gold standard July 1, 1926, to January 1929, the exchange rate remained within the gold points. The Canadian dollar then went to a slight discount in New York. With the exception of the period July to November 1930, when it went to a small premium in New York, the dollar remained below parity until the United Kingdom abandoned the gold standard in September 1931. After that month the pound sterling depreciated sharply and the Canadian dollar followed, reaching lows $\dagger$ in New York of 80.5 cents in December 1931 and 82.6 cents in April 1933.

Following the prohibition of gold exports in the latter month by the United States, the pound and the Canadian dollar strengthened rapidly in terms of American funds. By November 1933, both currencies had reached a premium in New York. Meanwhile in a series of steps beginning with permitting the export of newly mined gold in August

[^382]1933, the United States moved towards resumption of the gold standard. As of Feb. 1, 1934, the United States Treasury undertook to buy all gold offered at $\$ 35$ per ounce. After that the exchange rate between the Canadian and United States dollar stabilized. Until the outbreak of war in 1939 much of the trading was conducted within one cent of parity although the Canadian dollar in New York did go as high as 103.6 cents (September 1934) and as low as 98.0 cents (September 1938).*

On the outbreak of World War II in September 1939, the United Kingdom and other sterling countries introduced foreign exchange control involving fixed buying and selling rates of $\$ 4.02 \frac{1}{2}$ and $\$ 4.03 \frac{1}{2}$ respectively in terms of the U.S. dollar. The Canadian dollar in New York declined until Sept. 16, 1939, when the Government instituted foreign exchange control $\dagger$ in Canada and established fixed buying and selling rates of $\$ 1.10$ to $\$ 1.11$ for the U.S. dollar and $\$ 4.43$ to $\$ 4.47$ for sterling. As compared with previous months the depreciation of the Canadian dollar in terms of United States funds was approximately half as great as that of the pound sterling.

Apart from a minor adjustment on Oct. 15, 1945, when selling rates for U.S. dollars and sterling were lowered to $\$ 1.10 \frac{1}{2}$ and $\$ 4.45$, respectively, the official rates for the Canadian dollar remained unchanged until July 5, 1946. At that time the rate on the U.S. dollar was restored to par, with buying and selling rates for that currency of $\$ 1.00$ to $\$ 1.00 \frac{1}{2}$ and for sterling $\$ 4.02$ to $\$ 4.04$. These rates continued in effect until Sept. 19, 1949, when, following a 30.5-p.c. reduction by the United Kingdom in the value of sterling to $\$ 2.80$ U.S. (an action which was paralleled in varying degrees by numerous other currencies) Canada returned to the former official rates of $\$ 1.10$ and $\$ 1.10 \frac{1}{2}$ for United States funds. Sterling was quoted at $\$ 3.07 \frac{1}{4}$ and $\$ 3.08 \frac{3}{4}$ on the basis of the New York cross rate.

On Sept. 30, 1950, the Minister of Finance announced that official fixed foreign exchange rates which had been in effect at varying levels since 1939 would be withdrawn effective Oct. 2. Since then the Government's policy has been to allow the rate to be determined by the normal play of economic forces without official intervention by the Exchange Fund Account except to ensure orderly conditions in the foreign exchange market. No attempt is made to reverse persistent trends, but only to smooth out excessive short-run fluctuations.

Until Dec. 14, 1951, this policy was carried out within the framework of exchange control. On that date the Foreign Exchange Control regulations were revoked by the Governor in Council and new regulations were passed which exempted all persons and transactions from the various requirements of the Foreign Exchange Control Act. These actions terminated exchange control in Canada and the Foreign Exchange Control Act was repealed in 1952.

The movements of the U.S. dollar in Canadian funds from January 1951 to the end of 1957 are shown on the following chart. After the major change that occurred in the latter half of 1951 and the first three quarters of 1952, the U.S. dollar fluctuated within a comparatively narrow range between a low of 95.9 cents in September 1952 and a high of 100.1 cents in November 1955. In the second quarter of 1956, however, the U.S. dollar began to weaken and this movement continued into the third quarter of 1957. The previous postwar low ( 95.9 cents) was passed in November 1956 and by August 1957 the U.S. dollar had fallen to 94.2 cents, a record low for the present century. In the last four months of 1957 the U.S. dollar rose again to close the year at 98.4 cents.

## PART II.-MISCELLANEOUS COMMERGIAL FINANCE Section 1.-Loan and Trust Companies*

An outline of the development of loan and trust companies in Canada from 1844 to 1913 is given in the 1934-35 Year Book, p. 993. The laws relating to loan and trust companies were revised by the Loan and Trust Companies Acts of 1914 (R.S.C. 1952, ce. 170 and 272), with the result that the statistics of provincially incorporated loan and trust companies ceased to be collected. However, summary information has been supplied by provincial companies since 1922 and figures for the years 1955 and 1956 are included in Table 1 in order to complete the statistics for loan and trust companies throughout Canads. It is estimated that more than 95 p.c. of the business of provincial companies is represented in the figures, so that they may be accepted as fairly inclusive and representative of the volume of business transacted as compared with the federally licensed companies.

The statistics of Tables 2 and 3 refer to those companies incorporated both by the Government of Canada and by the provinces. Included in the statistics of federal companies are data of loan and trust companies incorporated by the Province of Nova Scotia and brought by the laws of that Province under the examination of the federal Department of Insurance, as well as data for trust companies in New Brunswick and Manitoba.

The progress of the aggregate of loan company business in Canada is indicated by the increase in the book value of the assets of all loan companies from $\$ 188,186,072$ in 1923 to $\$ 437,169,171$ in 1956. The assets of trust companies (not including estates, trust and agency funds, which cannot be regarded as assets in the same sense as company and guaranteed funds) increased from $\$ 154,202,165$ in 1928 to $\$ 745,038,679$ in 1956. In the former year the total of estates, trust and agency funds administered amounted to $\$ 1,077,953,643$ and in 1956 to $\$ 5,133,928,228$.

Functions of Loan Companies.-The principal function of loan companies is the lending of funds on first-mortgage security, the money thus made available for development purposes being secured mainly by the sale of debentures to the investing public and by savings department deposits. The extent of investments in mortgages by federal and provincial loan companies may be gauged by the following figures: total assets of such companies for the years 1955 and 1956 amounted to $\$ 410,593,640$ and $\$ 437,169,171$, respectively, which amounts include mortgage loans of $\$ 296,466,101$ and $\$ 331,433,425$, respectively; thus, the resulting percentages of mortgages to total assets for those years were approximately 72 p.c. and 76 p.c., respectively.

Functions of Trust Companies.-Trust companies act as executors, trustees and administrators under wills or by appointment, as trustees under marriage or other settlements, as agents or attorneys in the management of the estates of the living, as guardians of minor or incapable persons, as financial agents for municipalities and companies, as transfer agents and registrars for stocks and bond issues, as trustees for bond issues, and, where so appointed, as authorized trustees in bankruptcy. Such companies receive deposits for investment but the investing and lending of such deposits and of actual trust funds are restricted by law.

[^384]Statistics of Loan and Trust Companies.-A summary of operations of provincial and federal loan and trust companies is given in Table 1. As a result of the nature of the operations of the latter companies, which are intimately connected with the matter of probate, the larger trust companies usually choose to operate under provincial charters and the provincial figures represent much larger amounts than those of the federal companies.

The figures for federal loan companies include companies chartered by the Government of Nova Scotia which, by arrangement, come under inspection by the federal Department of Insurance. The data for federal trust companies cover companies chartered by the Governments of Nova Scotia, New Brunswick and Manitoba for the same reason.

## Section 2.-Licensed Small Loans Companies and Licensed Money-Lenders*

Licensed small loans companies and licensed money-lenders are subject to the provisions of the Small Loans Act (R.S.C. 1952, c. 251), an enactment of the Parliament of Canada regulating personal loans not in excess of $\$ 500$ made on the security of promissory notes of borrowers. Most of these notes are additionally secured by endorsements or chattel mortgages. The Act permits maximum rates of cost of loan, including charges of every kind, of 2 p.c. per month to licensed lenders and 12 p.c. per annum to unlicensed lenders. The small loans companies-four in number-were incorporated by special Acts of the Parliament of Canada, the first such company commencing business in 1928. Money-lenders, of which there are 66, are made up of companies otherwise incorporated and include a few partnerships and individuals. Table 5 gives the combined financial experience of small loans companies and licensed money-lenders for the years 1953-56.

[^389]5.-Assets and Liabilities of Small Loans Companies and Money-Lenders 1953-56

The combined companies showed a moderate decrease in the number and amount of small loans made during 1956 as compared with 1955, and reported a slight increase in the number and amount of small loans balances outstanding in the same comparison. During 1956, 844,348 small loans valued at $\$ 184,293,692$ were made as against 860,134 loans amounting to $\$ 191,248,350$ in 1955 . The average small loan was approximately $\$ 210$ in 1956. At the end of that year small loans outstanding numbered 543,394 for an amount of $\$ 88,428,203$ or an average of $\$ 163$; at the end of 1955 the outstanding loans numbered 529,704 and amounted to $\$ 88,844,506$ or an average of $\$ 168$ per loan.

## Section 3.-Sales of Canadian Bonds*

Previous editions of the Year Book trace the sales of Canadian bonds to the end of 1954. This review continues through 1955 and 1956 the record of new issues placed.

During the period under review, the principal trend was caused by a harder monetary policy which began in the latter part of 1955 and was continued during the following year. A decline in prices and a rise in yields, particularly in the short-term and medium-term issues, provided an opportunity for discerning investors to increase the proportion of high-grade bonds in their portfolios. This development constituted a 'prime movement' on the bond market which was felt particularly by large institutional investors.

In the flotation of new issues, offerings of Canadian bonds and debentures in 1955 (excluding issues with a term to maturity of less than one year) totalled $\$ 2,661,516,323$, down sharply from 1954. In 1956, however, the comparable total increased considerably to $\$ 3,093,670,267$ although it was still under the all-time peak of $\$ 4,468,983,364$ in 1954 . These declines were mainly the result of a sharp drop in Government of Canada financing from $\$ 3,200,540,900$ in 1954 to $\$ 1,348,500,000$ in 1955 and $\$ 1,357,000,000$ in 1956. On the other hand, provincial financing (including provincial guaranteed issues) and municipal financing (including parochial school issues) were both higher in 1955 and 1956 than in 1954. In this respect, all provincial financing totalled $\$ 434,165,000$ in 1955 and $\$ 557,888,000$ in 1956 compared with $\$ 400,916,000$ in 1954, while all municipal financing (exclusive of that guaranteed by the provinces) totalled $\$ 293,055,423$ in 1955 and $\$ 318,597,867$ in 1956 compared with $\$ 260,993,664$ in 1954 . As far as new issues in the corporate field were concerned, there was a decrease in 1955 at $\$ 585,795,900$ but a marked increase in 1956 at $\$ 860,184,400$ when compared with the total of $\$ 606,532,800$ in 1954.

In the field of federal financing for 1955 and 1956, very considerable new capital was acquired by public subscription to Canada Savings Bonds Series Ten (Nov. 1, 1955) and Series Eleven (Nov. 1, 1956). In common with all other Canadian Savings Loan issues, these flotations were limited to purchases by individuals only, as distinct from both corporate and individual purchases allowed for the Victory Loan issues of 1941 to 1945 inclusive, and the two War Loans of 1940.

As a distinctive feature, not found in previous issues, the Series Eleven Savings Loan issue of 1956 paid interest on a sliding scale-the first payment being made after six months and annually thereafter. This scale called for a rate of $3 \frac{1}{4}$ p.c. payable on two coupons for the first year and a half; $3 \frac{1}{2}$ p.c. payable on two coupons for the next two years; $3 \frac{3}{4}$ p.c. payable on two coupons for the next two years; and 4 p.c. payable on seven coupons thereafter to a maturity on May 1, 1969. Altogether, an average rate of 3.76 p.c. made this security a most attractive issue and caused a greater exchange of previous issues into Series Eleven than for any of the former Savings Loans.

[^390]6.-Sales of and Applications for Federal Government Bonds, Feb. 1, 1940 to Nov. 1, 1956
(Sourcs: The Monetary Times)

${ }^{1}$ Department of Finance figures. ${ }^{2}$ Total subscriptions were limited to $\$ 2,000$ for any one individual for the 1946 issue, $\$ 1,000$ for the issues of $1947-50$ inclusive and $\$ 5,000$ for the issues of $1951-56$. Figures for the issues 1946-55 are for the entire loans, i.e., either to the year-end or to the closing date within the year or in subsequent years. The figure for Series Eleven (1956) is approximate as at mid-July 1957.

Excluded from Table 6 on federal financing are the short-term issues in the form of treasury bills with a maturity of less than one year. These totals amounted to $\$ 4,580,500,000$ in 1955 and $\$ 6,420,000,000$ in 1956. If included, they would bring the grand total of all federal borrowing to $\$ 5,929,000,000$ in 1955 and $\$ 7,777,000,000$ in 1956. Comparable figure for 1954 was $\$ 6,980,540,900$.

Although Canadian short-term financing of less than one year dates back to the 1930's when Government of Canada treasury bills were first introduced, it did not become of particular importance outside the banking system until 1954. This development arose because an increasing number of corporations and other investors turned to securities of less than one year for the profitable employment of short-term surplus funds not required for immediate business needs. An expanding market for treasury bills, in turn, has enabled the Government of Canada to increase substantially the total of bills outstanding with important gains in terms of convenience and economy.

On Nov. 1, 1956, the Bank of Canada announced that there would no longer be periodic changes in the Bank Rate but that it would be maintained at one-quarter of one percent above the average yield price received at each week's sale of 91 -day treasury bills. This change was intended to make the Bank Rate more flexible and responsive to changing conditions in the short-term money market. It was also felt by some observers that the previous method of making changes in the Bank Rate caused certain disturbances and dislocations that could be avoided by continuous smaller adjustments.

In the field of combined direct and guaranteed financing by Canadian provinces, the totals for both 1955 and 1956 were higher than the total of 1954. Total financing in this category amounted to $\$ 434,165,000$ in 1955 of which $\$ 222,349,000$ was direct and $\$ 211,816,000$ was guaranteed municipal financing by various provincial governments. Comparable figures for 1956 show total financing of $\$ 557,888,000$ of which $\$ 279,350,000$ was direct and $\$ 278,538,000$ was guaranteed by various provincial governments. These totals compare with $\$ 400,916,000$ in 1954 of which $\$ 226,032,000$ was direct and $\$ 174,884,000$ represented guaranteed provincial financing.

Provinces which directly entered the bond market in 1955 and 1956 were:-

| Province | Month | Amount | Province | Month | Amount |

In the field of direct municipal financing (i.e., exclusive of municipal financing guaranteed by various provinces) the market for new issues held up well in both 1955 and 1956, continuing the postwar trend. Local improvements constituted the principal purposes for such borrowing with the most important needs for new schools and waterworks. There were instances, however, when tight money conditions created problems for investment dealers so that some issues had to be postponed or the terms of the offerings altered to make them more attractive to buyers. When flotations for municipal parochial school purposes are included, total municipal sales amounted to $\$ 293,055,423$ in 1955 and $\$ 318,597,867$ in 1956 , both up from a total of $\$ 260,993,664$ in 1954 . The municipalities of Montreal, Toronto, Winnipeg, Hamilton, Regina, Vancouver, Kingston and Ottawa were among the most important borrowers.

During 1955 and 1956 , corporate financing totalled $\$ 585,795,900$ and $\$ 860,184,400$, respectively, compared with $\$ 606,632,800$ in 1954 . Among issues of particular interest, the International Bank for Reconstruction and Development offered $\$ 15,000,000$, $3_{4}^{\frac{1}{4}}$ p.c., ten-year Canadian dollar bonds which were very well received by investors. During the same period, there was a more active new issue market in uranium corporate bonds with a number of fairly large flotations. Debenture issues of pipeline and oil-producing companies were also popular in 1956 as a result of further discoveries in Western Canada and also perhaps of unsettled conditions in the Middle East.

A noteworthy issue in the miscellaneous field consisted of $\$ 15,000,000$ Commonwealth of Australia, 4 p.c., fifteen-year bonds. This issue was offered in November 1955, the first time an Australian bond issue was ever placed in Canada.

During the tight money period of the latter part of 1955 and 1956, underwriters of many new bond issues displayed considerable ingenuity in tailoring them to meet the requirements of the market and the needs of the issuer. In this regard, a growing number of conversion privileges and stock purchase warrants were attached to assist in the sale of securities while a number of major Canadian corporations raised equity capital through the issuance of rights to shareholders. In addition, a growing number of borrowers 91593-74눌
accepted the exchange risk by going to the New York market where，at times，funds were more readily available．As a result，Canadian bond sales in the United States increased considerably in 1956 although they were down somewhat for the entire year 1955 compared with 1954．Total sales on the American market for the three years were $\$ 470,532,982$ in $1956, \$ 154,563,000$ in 1955 and $\$ 173,598,000$ in 1954．The drop in 1955 was accounted for by the fact that money was fairly plentiful in Canada in the earlier months of that year．Indeed，most of the 1955 total of sales in the United States came in the latter months after the effect of credit restrictions was felt．

As a general result of monetary restrictions，the year 1956 was a most unusual one for new bond sales in Canada．In face of an expanding economy，the demand for money became so strong that not only did the cost factor rise very substantially but，in some instances，ready funds were not obtainable at any price．As a result，many borrowers found it difficult or impossible to finance issues they would have regarded as normal borrowing in previous years．Indeed，it is necessary to go back a quarter of a century or more to find a year when Canadian corporations and municipalities were forced to postpone new capital issues because of the shortage and consequent high cost of funds on the Canadian bond market．

## 7．－Sales of Canadian Bonds by Class of Bond and Country of Sale 1947－56

## CHAPTER XXVII.-INSURANCE*

## CONSPECTUS

Nore.-The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this solume.

Insurance, for the purpose of statistical analysis, is usually classified as life, fire and casualty. Most companies operate under Federal Government registration although some have provincial licences only. Also many fraternal orders and societies are engaged in this kind of business. The special articles relating to insurance that have appeared in previous editions of the Year Book are listed in Part II of Chapter XXIX under the heading "Insurance".

## Section 1.-Life Insurance $\dagger$

Life insurance in force in Canada with companies registered by the Federal Government (exclusive of fraternal benefit societies) was over $\$ 25,452,000,000$ at the end of 1956 , an increase of over $\$ 2,317,000,000$ during the year. The ratio of gain in business in force expressed as a percentage of the amount in force at the beginning of the same year, which ranged between 9.0 and 11.2 during the $1946-55$ period, reached 14.3p.c. in 1956 its highest point since the end of World War II.

[^394]
## Subsection 2.-Operational Statistics of Life Insurance Companies under Federal Registration

The amount of life insurance in force in Canada has shown an almost continuous advance year by year since the beginning of the record in 1869 . The amount per capita of the estimated population has almost doubled since 1947-evidence of the general recognition of the value of life insurance for the adequate protection of dependants against misfortune. During 1956, life insurance business was transacted in Canada by 82 active companies having federal registration, including 32 Canadian, 8 British and 30 foreign companies. In addition there were 5 British and 5 foreign companies which wrote no new insurance during the year, their business being confined to policies already on their books. Two foreign companies registered in 1956 had written no business in Canada.

The operations analysed in the tables of this Subsection, with the exception of Table 6, include only those companies under federal registration and are exclusive of fraternal organizations and provincial licensees. However, as indicated in Table 1, operations of the companies included account for about 93 p.c. of the life insurance in force in Canada.

## 2.-Life Insurance in Force and Effected in Canada by Companies under Federal Registration, Decennially 1880-1940 and Annually 1941-56

Note.-Figures for 1869-1900 are given at p. 958 of the 1938 Year Book, and for 1901-39 at p. 855 of the 1942 edition. Statistics of fraternal society insurance, excluded here, are given at pp. 1172-1174.

## 8.-Total Revenue and Expenditure of Canadian Life Insurance Companies under Federal Registration and Revenue and Expenditure in Canada of British and Foreign Life Insurance Companies 1954-56.

Note.-Owing to a change in sctuarial practice, these figures are not strictly comparable with those for earlier years published in previous editions of the Year Book.

## Subsection 4.-Life Insurance Effected through Fraternal Benefit Societies

In addition to life insurance, some fraternal benefit societies grant other insurance benefits to members, notably sickness benefits, but these are relatively unimportant. Table 9 gives statistics of life insurance effected through fraternal benefit societies by

Canadian members, together with statistics of assets, liabilities, income and expenditure relating to all business of Canadian societies and to the business in Canada of foreign societies. The rates charged by these societies are computed to be sufficient to provide the benefits granted, having regard for actuarial principles. The benefit funds of each society must be valued annually by a qualified actuary (Fellow, by examination, of the Institute of Actuaries of Great Britain, of the Faculty of Actuaries in Scotland, or of the Society of Actuaries) and a readjustment of rates or benefits must be made, unless the actuary certifies to the solvency of each fund. The statistics of the first section of Table 9 relate to the 16 Canadian societies reporting to the Department of Insurance of the Federal Government, of which only one does not grant life insurance benefits.

Under an amendment to the Insurance Act, effective Jan. 1, 1920, all foreign fraternal benefit societies were required to obtain authority from the Federal Government prior to transacting business in Canada. However, any such societies which at that date were transacting business under provincial licences, though forbidden to accept new members, were permitted to continue all necessary transactions in respect of insurance already in force. Most of these societies and some foreign societies that had not previously been licensed by the provinces have since obtained federal authority to transact business. Of both classes of societies, 32 transacted business in Canada during 1956; two of the societies do not grant life insurance benefits.

${ }^{1}$ Includes business outside Canada.

## Subsection 5.-Life Insurance in Force Outside Canada by Registered Canadian Companies

Tables 10 and 11 give summary statistics of insurance in force as at Dec. 31, 1954 and 1955, in currencies other than Canadian, classified by companies and by the currencies in which business was written. The data given here are in Canadian dollars, mainly at
par rates of exchange, for the countries concerned, but there are several exceptions where, for purposes of account, certain companies have converted foreign currencies at rates other than par, particularly where the current rate differs substantially from the par rate. Approximately 70 p.c. of all such business in force was written in United States currency and 16 p.c. in sterling. From another standpoint approximately 25 p.c. was written in currencies of Commonwealth countries outside Canada and 75 p.c. in currencies of foreign countries.

Canadian life insurance companies operating under Federal Government registration at Dec. 31,1955 , had life insurance in force amounting to $\$ 7,892,914,084$ in countries outside Canada. Insurance in force in currencies other than Canadian amounted to $\$ 7,845,488,568$ and the difference between these figures is presumably the net amount of non-Canadian business transacted in Canadian currency. As against the total non-Canadian business, including annuity business, the Commonwealth and foreign investments of Canadian life insurance companies as at Dee. 31, 1955 amounted to $\$ 2,226,851,749$. As the business in force in Canada of these companies at Dec. 31, 1955 amounted to $\$ 17,401,229,498$, the total business on their books, Canadian and non-Canadian, amounted to $\$ 25,294,143,582$. Thus over 31 p.c. of the total business in force was outside Canada.
10.-Life Insurance Effected and in Force of Canadian Companies (excluding Fraternal Societies) operating under Federal Registration, in Currencies other than Canadian, by Company 1954 and 1955.

## Subsection 6.-Total Registered Life Insurance in Canada and Business of Canadian Organizations Abroad

Table 12 summarizes the business outside Canada of Canadian life companies and fraternal benefit societies. If to these figures is added the business in Canada of these organizations, as shown in Table 1, p. 1166, total business, domestic and external, of all Canadian life insurance companies and fraternal societies may be obtained. Again adding the business in Canada of British and foreign companies and fraternal societies, a grand total is obtained of all life insurance in Canada and of the life insurance business abroad of Canadian organizations; this total is shown in Table 13.

## 12.-Business of Registered Canadian Life Companies and Fraternal Societies Abroad 1954-56

Notr.-Figures for business in Cansda will be found in Table 1, p. 1166.

## Section 2.-Fire and Casualty Insurance

Most companies carrying on fire insurance in Canada also transact casualty insurance. At the end of 1956 there were 309 companies registered by the Federal Government to transact fire insurance ( 79 Canadian, 89 British and 141 foreign). Of that number, 295 companies ( 73 Canadian, 88 British and 134 foreign) were also registered to transact casualty insurance. At the same date, there were 88 companies registered to transact casualty insurance but not fire insurance ( 17 Canadian, 6 British and 65 foreign). In addition to the number registered to transact casualty insurance, there were 23 fraternal benefit societies carrying on accident and sickness insurance. Also a certain amount of business is done by companies under provincial registration. These companies generally confine their operations to the province of incorporation but may be allowed to sell insurance in other provinces.

Table 14 shows the division of all business in this field and indicates that the bulk of it (about 85 p.c. of the net premiums written) is transacted by companies having Federal Government registration. The fire insurance business and the casualty insurance business of federally registered companies are treated separately in Subsections 1 and 3 following. but finances for these classes cannot be segregated and are therefore covered together in Subsection 4. Fire losses are shown in Subsection 2.

## Subsection 1.-Fire Insurance Business Transacted by Companies under Federal Registration

The amount of fire insurance written has increased very rapidly in recent years, having more than doubled since the end of the War. The percentage of claims incurred to premiums written has remained fairly constant during the period, as shown in Table 15.

## 15.-Fire Insurance by Companies Operating under Federal Registration, Decennially 1880-1940 and Annually 1941-56

Nots.-Figures for 1869-1900 are given in the 1939 Year Book, p. 973, and for 1901-39 in the 1942 edition, pp. 847848

[^399]

The relationship of claims incurred to premiums written is shown by province in Table 16.

## Subsection 2.-Fire Losses

The information in Tables 18 to 21, which deals with the loss of property and life caused by fire, has been summarized from the annual Statistical Report of Fire Losses in Canada prepared by the Dominion Fire Commissioner, Department of Public Works. Federal and other property losses not included in these figures amounted to $\$ 8,621,910$ in 1956 from 2,412 fires.

## 18.-Statistics of Fire Losses 1945-56

Norg.-Figures for 1926-44 are given in the 1947 Year Book, p. 1078. Figures from 1898 may be obtained from the Dominion Fire Commissioner, Department of Public Works.

| Year | Fires Reported | Property Loss ${ }^{1}$ | Loss per Capita | $\begin{gathered} \text { Deaths } \\ \text { by } \\ \text { Fire } \end{gathered}$ | Year | Fires Reported | $\begin{aligned} & \text { Property } \\ & \text { Loss }^{1} \end{aligned}$ | $\begin{gathered} \text { Loss } \\ \text { per } \\ \text { Capita } \end{gathered}$ | Deaths by Fire |

${ }^{1}$ Excludes forests, and federal and other property losses.
${ }^{2}$ Includes Newfoundland.

The provincial property losses for 1953-56 given in Table 19 inelude both insured and uninsured losses. The percentages of the provincial totals uninsured in 1956 were: Prince Edward Island 43; Nova Scotia 25; New Brunswick 33; Quebec 15; Ontario 13; Manitoba 17; Saskatchewan 3; Alberta 40; British Columbia 43; and the Yukon and Northwest Territories 69. Uninsured losses formed 21 p.c. of the total losses for Canada.

## 19.-Fire Losses by Province 1953-56

| 1956. |  | 10,828,472 | 7,640,860 | $-362,076$ |

## Subsection 4.-Finances of Fire and Casualty Insurance Companies under Federal Registration

Tables 23 to 25 show the assets, liabilities, income and expenditure of registered companies transacting fire and casualty insurance in Canada from 1954 to 1956. Totals only are given because it is impossible for such companies to allocate their assets and liabilities and their general income and expenditure among the various types of business transacted.

## 23.-Assets of Canadian, British and Foreign Companies Transacting Fire and Casualty Insurance under Federal Registration 1954-56

## Section 3.-Government Insurance

In addition to the insurance provided by private insurance companies, various types of government insurance schemes have been adopted in recent years by the federal and provincial governments.

Information on unemployment insurance, health insurance, veterans insurance, export credits insurance, etc., will be found in the appropriate Chapters on Labour, Health and Welfare, Foreign Trade, etc.

Provincial Insurance Schemes.*-Saskatchewan.-The Saskatchewan Government Insurance Office, a Crown corporation established by the Saskatchewan Government Insurance Act 1944, commenced business May 1, 1945; it deals in all lines of insurance other than sickness, life and hail.

It administers the Automobile Accident Insurance Act which provides compensation for the victims of automobile accidents as well as property damage in such accidents. The Act provides Saskatchewan residents with personal injury coverage without regard to liability and, in addition, all Saskatchewan motorists enjoy public liability and comprehensive protection including fire, theft and collision coverages.

The Office, in co-operation with the Saskatchewan Department of Natural Resources, administers a trust fund made up of a portion of hunting licence fees and insurance premiums, to compensate farmers for damage done to their crops by certain forms of wildlife, chiefly ducks, geese and deer.

Information regarding the operation of the Saskatchewan Government Insurance Office or the Automobile Accident Insurance Act may be obtained from the Promotion and Advertising Department of the Saskatchewan Government Insurance Office, 11th and Cornwall Streets, Regina, Sask.

Alberta.-Provincial Government insurance in Alberta, coming within the purview of the Alberta Insurance Act, relates firstly to the Alberta General Insurance Company, in which the entire business of the fire branch of the Alberta Government Insurance Office was vested by the Legislature on Mar. 31, 1948, and secondly to the Life Insurance Company of Alberta, which was constituted on the same date to take over the life branch of the Alberta Government Insurance Office. Each company is administered by a separate board of directors. The Lieutenant-Governor in Council appoints the members to the respective boards but the charter of the Life Insurance Company of Alberta provides for the election of two policyholder directors. While both companies are Crown corporations, they are not entitled to the usual immunities of the Crown, since they may sue and be sued in any court of competent jurisdiction.

A variety of agencies in Alberta offer forms of prepaid protection corresponding to insurance but the nature of the enabling legislation governing these plans emphasizes the fact that they do not constitute insurance. Because such exemptions are specifically provided by the insurance laws of the Province, reference to these plans is necessary only to make it clear that they do not come within the scope of the Alberta Insurance Act.

It should be noted that the Alberta Hail Insurance Act is administered by the Provincial Treasurer but none of the provisions of the Alberta Insurance Act apply to the Alberta Hail Insurance Board.

Information on insurance matters additional to that set out above may be obtained from the Superintendent of Insurance, Department of the Provincial Secretary, Edmonton, Alta.

| Subsection 3. The Royal Canadian Air Force. | 1199 | Part III.-Civil Defence................. | 1210 |

## PART I.-THE ARMED SERVICES AND DEFENCE RESEARCH* Section 1.-The Department of National Defence

The Minister of National Defence exercises control over and management of the Canadian Armed Forces, the Defence Research Board and other matters relating to national defence. Under his direction the three Chiefs of Staff are responsible for the control and administration of their respective Services and the Chairman of the Defence Research Board is responsible for the Defence Scientific Service. The Chairman of the Chiefs of Staff Committee, appointed in 1951, is responsible to the Minister ensuring that all matters of joint defence and defence policy, in its widest sense, are carefully examined and co-ordinated before decisions are made.

The civilian administration of the Department is organized under the Deputy Minister and is constituted on a functional basis. The Deputy Minister maintains a continuing review and control over the financial aspects of operational policy, logistics, and personnel and administration. The Deputy Minister is assisted by an Associate Deputy Minister and four Assistant Deputy Ministers each of whom administers a division of the Deputy Minister's branch responsible for matters of : administration and personnel; construction, engineering and properties; finance; and supply. Also responsible to the Deputy Minister are: the Controller General of Inspection Services, the Judge Advocate General, the Chief Secretary and, where staff matters are concerned, the Director of Public Relations.

A number of committees meet at regular intervals to consider and advise on joint issues. These include:-
(1) Defence Council.--Composed of the Minister of National Defence (Chairman), the Associate Minister of National Defence (Vice-chairman), the Parliamentary Assistant to the Minister, the Deputy Minister, the Chairman of the Chiefs of Staff Committee, the three Chiefs of Staff, the Chairman of the Defence Research Board and the Associate Deputy Minister; its purpose is to advise the Minister on administrative and other matters.

[^405](2) Chiefs of Staff Committee.-Composed of the Chairman of the Chiefs of Staff, the three Chiefs of Staff and the Chairman of the Defence Research Board. The Deputy Minister of National Defence attends regularly and the Secretary to the Cabinet and the Under Secretary of State for External Affairs attend when required. The purpose of the Committee is to maintain a continuous review of all operational problems; sub-committees consider various aspects of these problems and report to the parent committee.
(3) Personnel Members Committee.-Composed of the Chief of Naval Personnel, the Adjutant-General, the Air Member for Personnel, the Assistant Deputy Minister (Administration and Personnel), the Assistant Deputy Minister (Finance) and a representative of the Chairman of the Defence Research Board. The purpose of the Committee is to examine personnel problems of the three Services with the general aim of achieving uniform personnel policies; subcommittees consider various aspects of personnel problems and report to the parent committee.
(4) Principal Supply Officers Committee.-Composed of the Chief of Naval Technical Services, the Quartermaster-General, the Air Member for Technical Services, the Assistant Deputy Minister (Requirements) and a representative of the Chairman of the Defence Research Board. The purpose of the Committee is to consider logistical problems; sub-committees consider various aspects of these problems and report to the parent committee.

Defence Supply Committee.-An inter-departmental committee composed of the Deputy Ministers of National Defence and of Defence Production and the senior military and civilian supply officers of the two departments has been established to review interdepartmental procurement and production problems and consider various policy aspects of the procurement of ammunition, armament, aircraft, etc. Eleven panels consider various aspects of these problems and report to the parent committee.

Liaison Abroad.-The Chairman of the Chiefs of Staff, who is the Canadian military representative in the North Atlantic Treaty Organization, is responsible for co-ordinating all NATO military matters and acts as a military adviser to Canadian NATO delegations. For purposes of liaison and the furtherance of international co-operation in defence, Canada also maintains: (1) Canadian Joint Staff (Washington) representing the three Services and the Defence Research Board; (2) Canadian Joint Staff (London) representing the three Services and the Defence Research Board; (3) Canadian Military Mission, Far East; and (4) Service Attachés in various countries throughout the world. In addition, a number of defence matters of concern to both Canada and the United States are considered by the Permanent Joint Board on Defence which is composed of representatives from the two countries.

Mutual Aid.-Canada's contributions to NATO are outlined on p. 113.
Rates of Pay and Allowances.-The entire pay structure for comparable ranks in the different Services is on a uniform basis. Monthly rates for pay and allowances are given in Table 1.
(2) Chiefs of Staff Committee.-Composed of the Chairman of the Chiefs of Btaif, the three Chiefs of Staff and the Chairman of the Defence Research Board. The Deputy Minister of National Defence attends regularly and the Eecretary to the Cabinet and the Under Secretary of State for External Affairs attend when required. The purpose of the Committee is to maintain a continuous review of all operational problema; sub-committoes consider various aspects of these problems and report to the parent committee.
(3) Personnel Members Committee.-Composed of the Chief of Naval Personnel, the Adjutant-General, the Air Member for Persondel, the Assistant Deputy Minister (Administration and Personnel), the Asaistant Deputy Minister (Finance) and a representative of the Chairman of the Defence Research Board. The purpose of the Committee is to examine personnel problems of the three Services with the general aim of achieving uniform personnel policies; subcommittees consider various rapects of personnel problems and report to the parent committee.
(4) Principal Supply Officers Committee.-Composed of the Chief of Naval Technical Services, the Quartermasler-General, the Air Member for Technjeal Services, the Assistant Deputy Minister (Requirements) and a representative of the Chairman of the Defence Research Board. The purpose of the Committee is to consider logistical problems; sub-committees consider various aspects of these problems and report to the parent committee.

Defence Supply Committee.-An inter-departmental committee composed of the Deputy Ministers of National Defence and of Defence Production and the senior military and civilian supply officers of the two departmenta has been established to review interdepartmental procurement and production problems and consider various policy sapects of the procurement of ammunition, armament, aircraft, etc. Eleven panels conaider various aspects of these problems and report to the parent committee.

Liaison Abroad.-The Chairman of the Chiefs of Staf, who is the Canadian military representative in the North Atlantic Treaty Organization, is responsible for co-ordinating all NATO military matters and acts as a military adviser to Canadian NATO delegations. For purposes of liaison and the furtherance of international co-operation in defence, Canada also maintains: (1) Canadian Joint Staff (Washington) representing the three Services and the Defence Research Board; (2) Canadian Joint Staf (London) representing the three Services and the Defence Research Board; (3) Canadian Military Mission, Far East; and (4) Service Attaches in various countries throughout the world. In addition, a number of defence matters of concers to botb Canada and the United States are considered hy the Permaneat. Joint Board on Defence which is compossed of representatives from the two countries.

Mutual Ald.-Canada's contributions to NATO are outlined on p. 113.
Rates of Pay and Allowances.-The entire pay structure for comparable ranks in the different Services is on a uniform basis. Monthly rates for pey and allowances are given in Tahle 1.

## Subsection 1.-The Royal Canadian Navy

Role and Organization.-The primary role of the Royal Canadian Navy is antisubmarine warfare in all its aspects. Because of the prospect of long-range submarines capable of launching nuclear missiles hundreds of miles off-shore against coastal and inland targets, the RCN and the RCAF have placed primary emphasis on the development of forward operational systems and new techniques for locating and dealing with hostile submarines far out at sea.

The Royal Canadian Navy comes under the central authority of the Chief of the Naval Staff at Naval Headquarters in Ottawa. The Flag Officer, Atlantic Coast, at Halifax, N.S., and the Flag Officer, Pacific Coast, at Esquimalt, B.C., exercise operational and administrative command of ships and establishments within the Atlantic and Pacific Coast Commands. The Naval Comptroller organization was established in 1956 to assist in the effective control of the use of manpower, material and financial resources of the Navy. The recruiting and training of officers and men of the Royal Canadian Navy (Reserve) is conducted mainly through 22 Naval Divisions across Canada under the overall command of the Flag Officer, Naval Divisions, with Headquarters at Hamilton, Ont. There are naval missions in London, England, and Washington, U.S.A., to maintain liaison with the Royal Navy and the United States Navy. As a result of Canada's NATO commitments, officers of the Royal Canadian Navy serve on the Staffs of: the Supreme Allied Commander, Atlantic, at Norfolk, Va., in the United States; the Commander-inChief, Eastern Atlantic Area, at Northwood in the United Kingdom; and the Commander-in-Chief, Western Atlantic Area, at Norfolk, Va. The Flag Officer, Atlantic Coast, holds the appointment of Commander, Canadian Atlantic Sub-Area.

The strength of the RCN on July 31, 1957, was 19,228 officers and men in the Regular Force and 5,156 in the Reserve Force.

Operations at Sea 1956.-The first of the RCN's new anti-submarine escort vessels, HMCS St. Laurent, commissioned late in 1955, participated in the Royal Escort of Her Majesty the Queen on the occasion of her state visit to Sweden in June 1956. This was the first occasion on which a ship designed and built in Canada had been so honoured. Earlier in the year important evaluation trials were carried out on the St. Laurent, not only by the RCN but also in co-operation with the Royal Navy and the United States Navy. These tests proved conclusively that the anti-submarine requirements of this class of vessel had been met and in certain instances expectations were exceeded. Three additional warships of the St. Laurent class-HMC Ships Assiniboine, Ottawa and Saguenay -joined the fleet during the year.

The Arctic patrol ship, HMCS Labrador, carried scientific parties into the icebound Gulf of St. Lawrence in February for the purpose of gathering marine data and conducting Gulf Stream surveys. During the summer months the Labrador surveyed hitherto uncharted waters in the Arctic and provided navigational aids for United States and Canadian ships carrying equipment and stores for supply of the Distant Early Warning radar system.

Goodwill missions were combined with normal training in the visit of RCN ships to more than 60 foreign ports in cruises ranging from the Arctic to South America and from Europe to Japan. During March, 16 warships from the Atlantic and Pacific Commands held combined exercises in the Caribbean area. Sailing from the Great Lakes Training Centre at Hamilton, Ont., ten ships provided sea training for more than 1,000 officers and men of the naval reserve. Canada provided an aircraft carrier, five destroyers and three submarines for the important NATO exercises "New Broom V" and "New Broom VI" in the spring and late summer. The RCN's new Bay class minesweepers participated in exercises with both NATO forces and the USN.

By the latter part of 1956 the RCN's light fleet carrier Bonaventure had successfully completed contractor's trials in anticipation of commissioning on Jan. 17, 1957. The Bonaventure, the first Canadian-owned aircraft carrier, incorporates an angled deck of the
latest design, mirror landing aids and steam catapults to enable her to handle modern high-speed aircraft. Naval fixed-wing aircraft and helicopters flew approximately 40,000 hours during 1956. The year was marked by the progressive replacement of Sea Fury fighters by Banshee all-weather jets and Avengers by Canadian-built anti-submarine Trackers. International interest was shown in experimental flights of helicopters from a landing platform on the frigate HMCS Buckingham. These experimental flights were sufficiently successful to warrant continuation. Late in 1956 naval helicopters, co-operating with the RCAF in transport duties during the construction of the Mid-Canada radar line, delivered 2,052 tons of air cargo and 1,176 persons in the Knob Lake area of Quebec.

During the Suez crisis in the late autumn of 1957, Canada's decision to participate in the United Nations Emergency Force, Middle East, resulted in the immediate recall from Scotland of the light fleet carrier Magnificent to Halifax, where she was stripped of armament and transformed into a troop and equipment transport. The prompt manner in which the Magnificent was made ready provided commendable evidence of top-level co-ordination between the Services and between naval planners and the dockyard staff at Halifax. The Magnificent sailed for the Middle East on Dec. 29 carrying troops, vehicles, aircraft and supplies for the United Nations Emergency Force.

During the Springhill, N.S., mine disaster in November naval helicopters flew more than 50 missions in three days, carrying injured miners, doctors, medical supplies, blood plasma, oxygen and other stores.

Training.-The major shore training establishments are HMCS Stadacona at Halifax, N.S.; HMCS Naden at Esquimalt, B.C.; HMCS Cornwallis near Digby, N.S.; and HMCS Shearwater near Dartmouth, N.S. Facilities at Stadacona and Naden include schools for general and specialized training, drafting depots, hospitals and accommodation facilities necessary for the maintenance of the ships based on each Coast. New-entry or re-entry training, 20 weeks in duration, is conducted at the basic training establishment HMCS Cornwallis and, during 1956, 2,349 men were enrolled. The new-entry training establishment HMCS D'Iberville at Quebec City gives all French-speaking personnel a basic knowledge of English and preliminary training in seamanship and professional naval subjects. After completing the course at D'Iberville, French-speaking new entries join classes at Cornwallis.

Trade and specialist training is conducted in various schools and training centres, including the naval supply school at HMCS Hochelaga at Montreal, which was re-commissioned Oct. 1, 1955. During 1956 a total of 2,592 men received such training. Certain specialized training in new equipment is undertaken at the manufacturing centres by men who later become instructors.

A three-year course for technical apprentices is given in the specially equipped training ship HMCS Cape Breton. Forty-four apprentices who commenced training in August 1952 were the first graduates of the course. They were assigned to duty in April 1956. The school of music in Naden conducts a two-year course for apprentice bandsmen; the first graduates of this course concluded training in February 1957.

Under the Regular Officer Training Plan, 27 graduate cadets were assigned to duty with the Navy during the year and another seven went on to the final year at university in special courses. There were 212 naval cadets in training under the Plan at the end of 1956, including six naval reservists. In addition, 16 cadets formerly from the lower deck received similar training.

Under the Venture Plan, which was introduced in 1954 to train young men for sevenyear short-service appointments and which offers the opportunity of permanent commissions, 93 cadets graduated in August 1956 and were promoted to midshipmen. The midshipmen graduates underwent further training afloat or in shore establishments, 32 of them as naval aircrew by arrangements with the United States Navy. At the end of 1956, there were 127 cadets in training at Venture and 138 midshipmen in training ashore or afloat.

New Construction and Modernization.-At the end of 1956, 16 fighting ships and 14 auxiliary craft were under construction; the aircraft carrier Bonaventure had been completed during the year and was commissioned at Belfast, Northern Ireland, on Jan. 17, 1957. Of the 14 -ship destroyer-escort program, four were in service at the end of 1956 and four more were scheduled to be commissioned during 1957.

One coastal minesweeper was completed in 1956 and five others were under construction for commission in 1957. These vessels will replace six ships of their class transferred to the French navy under Mutual Aid in 1954. Three inner patrol craft, two storesammunition lighters and one ocean-going tug were also completed in 1956. Five escort frigates were being modernized, four of them to be completed in 1957, and a coastal escort was being converted as an oceanographic survey vessel for purposes of research.

In naval aviation, a contract was placed in February 1954 for the production of 100 CSFF-1 Tracker twin-engined anti-submarine aircraft, for delivery at the rate of two per month. These aircraft, of which the first five were delivered in 1956, are replacing the single-engined anti-submarine Avengers. The CSEF-1 represents a considerable advance in this aspect of naval aviation. A parallel contract for Wright engines for these aircraft was also placed; 57 were completed by Dec. 13, 1956.

Twenty-six out of 38 F2 H3 Banshee twin-jet fighters, supplied by arrangement with the United States Navy, had been received by the end of 1956.

Royal Canadian Navy (Reserve).-Naval Divisions are established in the following centres:-

St. John's, Nfld., HMCS Cabot
Corner Brook, Nfld., HMCS Caribou
Charlottetown, P.E.I., HMCS Queen Charlotte
Halifax, N.S., HMCS Scotian
Saint John, N.B., HMCS Brunswicker
Quebec, Que., HMCS Montcalm
Montreal, Que., HMCS Donnacona
Toronto, Ont., HMCS York
Ottawa, Ont., HMCS Carleton
Kingston, Ont., HMCS Cataraqui
Hamilton, Ont., HMCS Star

Windsor, Ont., HMCS Hunter London, Ont., HMCS Prevost<br>Port Arthur, Ont., HMCS Griffin Winnipeg, Man., HMCS Chippawa Regina, Sask., HMCS Oueen Saskatoon, Sask., HMCS Unicorn Calgary, Alta., HMCS Tecumseh Edmonton, Alta., HMCS Nonsuch Vancouver, B.C., HMCS Discovery Victoria, B.C., HMCS Malahat Prince Rupert, B.C., HMCS Chatham

Royal Canadian Navy (Reserve) Naval Divisions, commanded by reserve officers, are responsible for specialized training in one or other of the various phases of naval activity, such as Gunnery, Torpedo and Anti-Submarine and Seaward Defence, in addition to training in engineering, supply, electronics, etc. Assistance in instruction is provided by RCN officers and men. During 1956, the Great Lakes Training Centre at Hamilton undertook new-entry reserve training afloat in three coastal escort ships. A continuous aviation training program was implemented during the year in the five $\mathrm{RCN}(\mathrm{R})$ Squadrons: VC 920 (HMCS York, Toronto); VC 921 (HMCS Cataraqui, Kingston); VC 922 (HMCS Malahat, Victoria); VC 923 (HMCS Montcalm, Quebec); and VC 924 (HMCS Tecumseh, Calgary).

University Naval Training Divisions.-The University Naval Training Division program is designed to give instruction to students attending universities across Canada with the object of providing well-trained junior officers for the RCN and the RCN(R). The total training period is three years and cadets are required to complete three winter training periods, two summer periods and certain specified courses, after which suitable candidates receive promotion to Acting Sub-Lieutenant or Sub-Lieutenant, depending on academic status. During the year, UNTD cadets were in attendance at 31 universities and colleges across Canada.

The Royal Canadian Sea Cadets.-Royal Canadian Sea Cadets sponsored by the Navy League of Canada and supervised by the Royal Canadian Navy comprised 148 authorized corps in 1956. These were divided into seven Sea Cadet areas, supervised 91593-76 $\frac{1}{2}$
by 16 naval officers, responsible to the Flag Officer, Naval Divisions. Instruction is carried out by RCSC officers. During the summer of 1956, two RCSC training establishments, one on each Coast, were activated, accommodating a total of 94 officers and 2,690 sea cadets. Thirteen seven-week courses, for 460 cadets were held in naval establishments and sea training was provided for 91 cadets in cruises ranging from two to 13 weeks. The strength of the corps on Dec. 1, 1956, was 1,021 Sea Cadet officers and 9,691 Sea Cadets.

## Subsection 2.-The Canadian Army

Organization.-Army Headquarters at Ottawa, organized as the General Staff Branch, the Adjutant-General Branch and the Quartermaster-General Branch, conducts the planning and policy for the administration and training of the regular and reserve forces of the Canadian Army. Public relations, cadet services, military intelligence, chaplain services, provost and associated activities are directed through Commands by Army Headquarters. The five Commands and eight Areas are located as follows:-

| Commands | Headquarters |  | Areas and Headquarters |
| :---: | :---: | :---: | :---: |
| Eastern Command | Halifax, N.S. | (1) | New Brunswick Area, Fredericton, N.B. Newfoundland Area, St. John's, Nfld. |
| Quebec Command | Montreal, Que. |  | Eastern Quebec Area, Quebec, Que. |
| Central Command. | Oakville, Ont. | (4) <br> (5) <br> (6) | Eastern Ontario Area, Kingston, Ont. Central Ontario Area, Oakville, Ont. Western Ontario Area, London, Ont. |
| Prairie Command. | Winnipeg, Man. |  | Saskatchewan Area, Regina, Sask. |
| Western Command. | Edmonton, Alta. | (8) | British Columbia Area, Vancouver, B.C. |

The two main components of the Canadian Army are the Canadian Army (Regular) and the Reserves. The components of the Reserves are the Canadian Army (Militia), the Supplementary Reserve, the Canadian Officers' Training Corps (COTC), the Cadet Services of Canada and the Reserve Militia. Additional to but not an integral part of the Canadian Army are the Services Colleges (see pp. 1203-1205), officially authorized cadet corps, rifle associations and clubs.

The strength of the Canadian Army on July 31, 1957, was 46,440 officers and men in the Regular Force and 42,632 in the Rescrve Force.

In 1953 the 1st Canadian Infantry Division was formed and, with the exception of a few units not required under present conditions, the Division has been activated. Divisional Headquarters and two-thirds of the Division are stationed and trained in Canada. The remaining third, one brigade group, is based in Germany.

Operations in 1956.-During early 1956 Canada and the other Commonwealth countries providing troops for service with the United Nations Command in Korea decided to reduce their contribution from a brigade group to a battalion group entitled the Commonwealth Contingent, Korea. The Canadian element of the Contingent was a detachment of approximately 30 officers and men of the Royal Canadian Army Medical Corps and the Royal Canadian Dental Corps.

As a result of Canadian membership in the International Supervisory Commissions for Vietnam, Laos and Cambodia, the Canadian Army continued to provide 125 officers and men for truce supervisory duties in Indo-China. In the late summer, after a one-year tour of duty, a man-for-man replacement program was carried out.

In connection with Canada's military obligations under NATO, the 2nd Canadian Infantry Brigade Group was still stationed in Germany in the area of Soest, Werl, Hemer and Iserlohn. It was to be relieved by the 4th Canadian Infantry Brigade Group in the autumn of 1957. Canadian troops continued to participate in training exercises with other NATO forces.

At the request of the United Nations, a force of approximately 800 officers and men of the Canadian Army was provided for service with the United Nations Emergency Force in the Middle East. The force consisted of supporting arms and services whose function was to provide communications, repair, maintenance and other administrative services for the United Nations Emergency Force. Part of the Canadian Army Force was sent to the Middle East by air in late November 1956, and the remainder, together with the equipment for the force, sailed aboard HMCS Magnificent on Dec. 29, 1956.

A parachute element of infantry, supporting units and an RCAF component continued training preparations to deal effectively with possible small invasions by an aggressor anywhere in Northern Canada.

Equipment.-The Canadian Army Equipment Development Program continues to concentrate on those fields particularly suited to Canadian capabilities and in which there are special Canadian needs. Particular attention has been given to the problem of living and operating in the North under the most severe and adverse conditions. The development and evaluation of defence equipment for atomic, biological and chemical warfare continued in close co-operation with the RCN, RCAF and Defence Research Board. The standardization program in the United States, United Kingdom and Canada and within NATO continues to promote the exchange of knowledge to the mutual advantage of the Armies concerned. Additional agreements were reached affecting procedures and equipment. The equipping of the Canadian Army with the new self-loading FN rifle, which fires the standard NATO 7.62 mm calibre round, began during 1957.

Training.-The policy of training is determined at Army Headquarters. General Officers Commanding Commands implement the training policy within their Commands, except for that conducted at Army and corps schools, which are under the direct supervision of Army Headquarters. The basic training of 6,540 recruits and the corps training of officers and men of the Canadian Army (Regular) was carried out at regimental depots, units, and corps schools. During 1956, 7,940 personnel attended courses at the schools of instruction. Promotion qualification examinations consisting of written and practical tests were held to qualify Regular and Militia officers for the ranks of Captain and Major; 61 candidates passed qualification examinations for selection to attend the Canadian Army Staff College, and 12 passed the entrance examination for the Royal Military College of Seience. A training program was conducted during the winter months for all Regular officers to assist them in their professional knowledge. Militia Staff Course examinations were conducted for Militia officers to qualify Captains and Majors for Command and Staff appointments. Qualifying courses for Junior NCO's were conducted under General Officers Commanding Commands. Senior NCO courses were conducted at corps schools in accordance with training standards.

French-and English-language training which is available to all ranks of the Canadian Army was conducted by Commands and AHQ. The Canadian Army Training School conducted six-month French-language courses for English-speaking officers and NCO instructors. A number of French-speaking potential NCO's have also received Englishlanguage training.

Officers from the United States, the United Kingdom, Australia, Pakistan, India, Norway, France and Italy attended courses at Canadian Army schools of instruction.

Trade and specialty training is given at corps schools and units. Where feasible the facilities of civilian schools are used to supplement training at Army establishments. Training is conducted in accordance with the appropriate training standard for each trade
or specialty. When required by technical developments in the Army, trades are revised and new trades are introduced. Trades relating to aircraft maintenance and repair are being studied in keeping with the decision that the Army will use certain aircraft.

The apprentice training program, inaugurated in January 1953, is designed to train selected young men as soldier tradesmen and to provide them with the requisite academic background to enable them to advance to senior non-commissioned ranks in the Army. A high entry standard has been set to ensure that the prospective soldier apprentice will be capable of absorbing trade and academic training, and also of developing the leadership qualities essential in senior NCO's. During 1956 an additional 486 apprentices were enrolled and 39 civilian teachers were employed to provide academic instruction for about 700 apprentice soldiers. Academic credits are obtained from the educational authorities of the province where the training is conducted. Apprentices receive trades training as clerks, cooks, carpenters, electricians, wireless operators, radar operators, radio mechanics, storemen, gun mechanics, vehicle mechanics and armourers. A balanced training program is designed to stimulate the interest of the apprentice. Military, trade, academic and recreational training are integrated. Separate messing, canteen and sleeping arrangements are provided for apprentices.

The training of the Mobile Striking Force continued throughout 1956. Airborne continuation training was carried out by each unit in conjunction with unit exercises. Mobile Striking Force units carried out exercises during the winter under cold weather conditions. Parachute and air supply courses were conducted at the Canadian Joint Training Centre at Rivers, Man., and courses in Arctic training at Fort Churchill, Man.

Collective training for units in Eastern Canada was conducted at Camp Gagetown, N.B., under the General Officer Commanding 1st Canadian Infantry Division, during the summer months and for units from Western Canada at Camp Wainwright, Alta., under the General Officer Commanding Western Command. All arms training was begun on the sub-unit and unit level, and culminated in exercises on the brigade and divisional level.

The Reserves.-Funds were provided to permit a maximum of 60 days training for the Militia during 1957, of which up to 15 days were to be camp training as determined by General Officers Commanding Commands. In the summer of 1956 a total of 21,000 all ranks attended summer camp training. The aim of training is to prepare the Militia for its role to assist in any future mobilization for active service or civil defence.

The Regular Officer Training Plan (ROTP).-The Regular Officer Training Plan is in effect at the three Canadian Services Colleges and at all Canadian universities and affiliated colleges which have contingents of the COTC. The purpose of the Plan is to train selected students for commissions in the Canadian Army (Regular). Students enrol in the Canadian Army (Regular) with a special rate of pay; tuition and the essential fees are paid and grants are given for books and instruments needed for study. In the period Jan. 1, 1954 to Dec. 31, 1956, 86 of these sponsored students graduated and were commissioned in the Canadian Army (Regular). Training consists of military studies, drill and physical training during the academic year; the summer term is devoted to practical training at military establishments.

The Canadian Officers' Training Corps (COTC).-In addition to the Regular Officer Training Plan, units of the Canadian Officers' Training Corps are maintained at Canadian universities to produce primarily, from among university undergraduates, officers for the reserve components of the Army. University graduates who have been members of the Canadian Officers' Training Corps are also eligible for commissions in the Canadian Army (Regular). Members of the COTC undertake the same training as members of the ROTP. In the period Jan. 1, 1954 to Dec. 31, 1956, 24 officers who had trained with the COTC were awarded commissions in the Canadian Army (Regular.)

Army Cadets.-The number of Royal Canadian Army Cadets training during 1955-56 was 61,480 , enrolled in 560 cadet corps. Training was conducted by 1,382 Cadet Services of Canada officers and 968 civilian instructors assisted by Canadian Army Regular and

Militia personnel. During the summer of 1956, 5,968 cadets spent seven weeks at cadet summer camps located at Aldershot, N.S., Farnham, Que., Camp Borden, Ont., Ipperwash, Ont., Dundurn, Sask., and Vernon, B.C. During these summer camps cadets were qualified as either cadet leaders, cadet leader instructors, drivers mechanical transport or infantry signallers. In addition, 604 cadets of the minimum age of 14 years attended two-week summer camp at Aldershot, N.S., Picton, Ont., or Vernon, B.C. During these camps, cadets were qualified as Junior Leaders. The National Cadet Camp, operated annually at Banff, Alta., is an award camp for first class or master cadets who are selected from across Canada; in 1956, 229 such cadets attended. A total of 963 Cadet Services of Canada officers and civilian instructors attended cadet summer camps throughout Canada in 1956; of this number, 496 were undergoing training courses and 467 were employed on instructional duties.

## Subsection 3.-The Royal Canadian Air Force

Organization.-Air Force Headquarters at Ottawa conducts the planning and policy for administration and training of the Regular and Reserve Forces of the RCAF. Organization is divided into four categories-resource controls, personnel, logistics, and plans and operations. The major formations and their headquarters locations are as follows:-

| Formation | Headquarters |
| :---: | :---: |
| Air Defence Command | St. Hubert, Que. |
| 5 Air Division. | Vancouver, B.C. |
| 1 Air Division. | Metz, France |
| Air Transport Command | Lachine, Que. |
| Air Material Command. | Rockcliffe, Ont. |
| Maritime Air Command | Halifax, N.S. |
| Training Command. | Trenton, Ont. |
| 1 Tactical Air Comma | Edmonton, Alta. |
| 14 Training Group. | Winnipeg, Man. |

The organization of the planned total of 40 squadrons was completed by December 1956 when 3,140 aircraft were in operation. Eighteen of the squadrons were for the air defence of Canada; 12 squadrons were stationed in France and Germany as No. 1 Air Division; six squadrons were required for RCAF transport operations at homeand abroad; three maritime squadrons operated in conjunction with other forces for the defence of Canada's East and West Coasts; a photographic squadron of Transport Command, No. 408, flew about 598,000 miles during 1956 carrying out aerial survey operations, including special aerial survey work in conjunction with the Mid-Canada Early Warning radar system.

The strength of the Royal Canadian Air Force on July 31, 1957, was 50,931 officers and men in the Regular Force and 4,823 in the Auxiliary Air Force.

Operations in 1956-57.-During 1956, Air Defence Command continued its planned build-up. The Mid-Canada Early Warning system was well on the way toward completion. DEW line sitings were also completed and construction on the selected sites started. The RCAF Ground Observer Corps, which acts as a supplement to the radar system, included approximately 55,000 civilian volunteer members.

The $C F-100 I V$ has been replaced in Canada by the $C F-100 \mathrm{~V}$, a version of the same aircraft with improved high-altitude performance. Improvements continued in air defence operational procedures. By the end of 1956 one of the $F-86$ squadrons which was disbanded in No. 1 Air Division was re-formed in Canada using CF-100 aircraft. Three additional squadrons were also re-formed in 1957.

No. 1 Air Division in Europe continued to fill Canada's commitment to NATO's integrated fighter force. The Air Division comprises eight $F-86$ and four $C F-100$ squadrons. Maritime Air Command aircrews participated in several NATO exercises in the Western Atlantic area in conjunction with United States and United Kingdom forces. National
anti-submarine exercises were also conducted with the RCN on both the East and West Coasts. The two RCAF East Coast squadrons were fully equipped with $P$-2V7 Neptunes while the West Coast squadrons retained the Lancasters. The Argus, the newest maritime patrol aircraft and largest aircraft built in Canada, made its inaugural flight early in 1957.

Air Transport Command continued to provide support to the Air Division in Europe using its North Star aircraft. Fairchild C-119's of the Command were engaged in cargo and personnel carrier operations in Canada, and paratroop training for the Canadian Army. Both types were used for operations in support of Arctic weather stations. Toward the end of 1956, C-119's of Air Transport Command were assigned to the air element of Canada's contribution to UNEF and commenced operations using Naples, Italy, as a base.

The 1957 Shoran Program of 408 Photographic Squadron of Air Transport Command completed the geodetic trilateration of the Arctic Islands. This completed the basic geodetic survey undertaken by the Squadron in 1948, under direction of the Dominion Geodesist.

In 1957, ice reconnaissance in support of United States Navy ships supplying DEW line stations between $128^{\circ} \mathrm{W}$. longitude and Boothia Peninsula was undertaken jointly by 408 and 407 Squadrons. An ice reconnaissance detachment was established at Cambridge Bay and daily reconnaissance flights were carried out from July 15 to Oct. 1, 1957.

During the year ended Mar. 31, 1957, search and rescue operations required the RCAF to fly in excess of 7,948 hours; 29 major searches and 143 mercy missions were conducted, some well inside the Arctic Circle.

Training and Equipment.-During the year ended Mar. 31, 1957, NATO aircrew training in Canada continued at a brisk pace. As of Dec. 31, 1956, 4,483 aircrew had been graduated under this plan since its inception in 1951. In addition, the RCAF was engaged in training aircrew for its own requirements. Basic trades courses for non-flying list officers produced 140 graduates and basic trade schools graduated 4,676 tradesmen during 1956-57.

Flight cadets entering the service received officer development training and primary flying training at Centralia, Ont. Basic flying training was conducted at flying training schools located at Claresholm, Alta., Moose Jaw, Sask., and Penhold, Alta. Advanced flying training on twin-engine aircraft was given at Saskatoon, Sask., and advanced flying training on jet aircraft was conducted at Portage La Prairie, Gimli, and MacDonald, Man. Flying instructor training was given at Trenton, Ont., and instrument rating courses were conducted at Saskatoon, Sask. Radio officers and observers received their basic and advanced training at Winnipeg, Man.

Formal trade courses for newly commissioned non-flying list officers were conducted at RCAF schools in aeronautical engineering, armament, supply, telecommunications and flying control. Aircraft system trainers were used extensively to support technician and aircrew training programs at field technical training units and the operational training units. Trade advancement training programs, continued at all units, both regular and auxiliary. To help tradesmen advance into the qualified trade group levels, semi-annual trade examinations were written under the direction of a Central Examination Board. Language training programs were conducted where necessary.

The aircraft procurement program during 1956 and 1957 is dealt with under Defence Production at pp. 1205-1209.

RCAF Reserve.-The sub-components of the RCAF reserves are designated as: (1) the Auxiliary; (2) the Primary Reserve; and (3) the Supplementary Reserve.

During the year ended Mar. 31, 1957, officer development courses were conducted for university flight cadets of the Primary Reserve. They participated in their first summer training program at the Reserve Officers School, St. Johns, Que., and at the Regular Officers School, London, Ont. Following this initial training, pilot trainees received flying training at various training schools while observer trainees were trained at the

Air Observers School, Winnipeg, Man. Non-flying list flight cadets continued with basic courses in aeronautical engineering, telecommunications, armament, supply and accounts. Flight cadets in the medical, air services and personnel lists were employed at Regular Force units on contact training and second and third-year flight cadets continued with formal or contact training as applicable. Third-year cadets were commissioned after successfully completing their period of training.

Refresher flying training was provided during the year for 500 Reserve pilots, to build up a pool of flying instructors. In addition, 475 Reserve officers and senior NCO's received contact training for mobilization assignments. The Reserve Tradesmen Training Plan was continued and approximately 1,739 recruits, both high school students and air cadets, completed training during 1956.

To provide a reserve of fighter pilots proficient in handling jet aircraft the RCAF maintains six Auxiliary Fighter squadrons. Three Auxiliary Transport squadrons are maintained to train a reserve of transport aircrew and two Auxiliary squadrons are equipped with Mitchell light bombers to operate, as required, with Canada's Mobile Striking Force. In addition, the RCAF maintains 17 Auxiliary Medical units, 17 Aircraft Control and Warning squadrons, 8 Technical Training units and 4 Auxiliary Intelligence units.

Royal Canadian Air Cadets.-Air cadet activities in Canada are sponsored and administered by the Air Cadet League of Canada. The League is a voluntary civilian organization formed in 1940 to provide preliminary aviation training for potential members of the Royal Canadian Air Force. The RCAF works jointly with the League and provides training personnel, syllabi and equipment.

During the War, the Royal Canadian Air Cadets reached a peak enrolment of 30,000 . The authorized peacetime strength ceiling has recently been increased to 25,500 and the strength in April 1957 was approximately 22,000, enrolled in 297 squadrons across Canada. Air cadet training is carried out in more than 225 communities from Newfoundland to British Columbia.

During the summer of 1957 camps for air cadets were held at RCAF Stations at Greenwood, N.S., Clinton, Ont., and Sea Island, B.C. More than 5,400 cadets attended camp along with their officers and instructors. A seven-week course for senior leaders and drill instructors was held for 200 cadets at RCAF Station Camp Borden, Ont. A precision drill team of 40 cadets selected from the drill instructor course competed in the international drill competition at Toronto.

The International Exchange Visits Program in 1957, sponsored jointly by the RCAF and the Air Cadet League, was very successful. Fifty-eight cadets were exchanged with the United Kingdom, the United States, Denmark, the Netherlands, Norway and Sweden.

Two hundred and fifty senior air cadets receive flying training annually at flying clubs through scholarships awarded by the RCAF. Additional flying training scholarships were awarded by the Air Cadet League and other organizations. Under the Reserve Tradesmen Training Plan, air cadets receive trades training in a nine-week summer course in addition to preparatory training with their respective squadrons during the school year.

## Subsection 4.-The Defence Research Board

The activities of the Defence Research Board in 1956 were concerned primarily with naval, armament, telecommunications, Arctic, special weapons, operational, medical, seronautical and materials research problems of specific interest to Canadian defence. To conduct this program of research, the Defence Research Board operates 11 specialized research and development establishments, and organizes and supports research on problems of defence interest in universities and other agencies. Research on naval problems is carried out at the Naval Research Establishment, Dartmouth, N.S., and at the Pacific Naval Laboratory, Esquimalt, B.C. Both stations are located adjacent to Royal Canadian

Navy bases and work closely with the RCN, particularly on problems related to antisubmarine devices. Other major naval research investigations undertaken concern corrosion, marine paints, and underwater sound behaviour.

Research and development of weapons and armament is undertaken by the Defence Research Board in co-operation with the Armed Services at various establishments. The largest of these is the Canadian Armament Research and Development Establishment near Valcartier, Que. Its principal activities include research on new explosives and propellants, and development and testing of new and improved weapons.

Research on telecommunications is carried out in two laboratories-the Radio Propagation Laboratory at Shirley Bay, Ottawa, and the Electronics Laboratory on the Montreal Road, Ottawa. These two laboratories, known collectively as the Defence Research Telecommunications Establishment, are primarily concerned with research in problems of communications and air navigation, with particular emphasis on basic research in the Gields of radio propagation and electronic component development.

Research dealing with problems in Arctic operations is conducted at the Defence Research Northern Laboratory, Fort Churchill, Man. The activities of DRNL have recently changed considerably. Its major effort has been devoted to the Canadian Geophysical Year (IGY) program and the associated United States IGY rocket program at Churchill.

Special weapons is the generic term used to cover research on the defensive aspects of chemical, biological, and atomic weapons. This work is carried out at the Defence Research Chemical Laboratories at Ottawa; the Suffield Experimental Station at Ralston, Alta.; the Defence Research Kingston Laboratory at Barriefield, Ont.; and at the Department of Agriculture isolation station at Grosse Ile, near Quebec City.

Military, psychological, clothing and food research is carried out at the Defence Research Medical Laboratories near Toronto, and in Canadian universities by means of a grant-in-aid program. Aviation medicine is an important field of activity but investigations include naval and army problems as well as studies on blood substitutes, infection and immunity, burns and wounds, the effects of noise on hearing, and other factors likely to affect a military man's efficiency and health.

Most of the basic aeronautical research program is carried out in Canadian universities. The principal fields covered are aerodynamics, aircraft propulsion and engineering materials. Applied research is carried out at the National Aeronautical Establishment at Ottawa, and by contracts with industry. A titanium research program continues to be the major investigation in the materials field. This is carried out by the Mines Branch of the Department of Mines and Technical Surveys, and the Universities of Toronto, Laval and Montreal, in co-operation with various industrial firms.

Another field receiving increased emphasis is the radio propagation problem caused by the disturbances in the upper atmosphere. This distinctly Canadian problem has been recognized as an important one with relation to military communications in the North, and the Defence Research Board has granted assistance to the University of Saskatchewan for the establishment of an Institute of Upper Atmosphere Physics, where research on fundamental problems of the upper atmosphere will be conducted, and where postgraduate training will be given.

Thus, the Board continues to support those fields of research that are of foremost interest to the Canadian Armed Services, and the program is under continual review to ensure that cognizance is taken of all changes in emphasis in defence requirements. Close liaison is maintained between the Defence Research Board and the Department of Defence Production to ensure that research and development activities are closely integrated with production.

## Section 2.-Services Colleges and Staff Training Colleges

Canadian Services Colleges.-The three Canadian Services Colleges are the Royal Military College of Canada founded at Kingston, Ont., in 1876, Royal Roads which was established in 1941 near Victoria, B.C., as a school for naval officers and Collège Militaire Royal de Saint-Jean established at St. Johns, Que., primarily to meet the needs of Frenchspeaking cadets. The Royal Military College and Royal Roads were constituted as the Canadian Services Colleges in 1948, and College Militaire Royal de Saint-Jean was opened in 1952.

The purpose of the instruction and training at the Services Colleges is to impart the knowledge, to teach the skills and to develop the qualities of character and leadership essential to officers of all three Armed Services. The courses of instruction provide a sound and balanced liberal, scientific and military education; the organization and training give cadets the opportunity to command and to exercise judgment.

For cadets entering the Royal Military College and Royal Roads the course is of four years duration. As the third and fourth years of the college course are given only at the Royal Military College, cadets entering Royal Roads must proceed to that College for the final two years of the general or engineering courses. For cadets entering Collège Militaire Royal, which gives a preparatory year, the course is of five years duration. Cadets take the preparatory, first and second years at that institution and complete the final two years at the Royal Military College.

The College year is eleven months, divided into three terms: autumn, winter and summer. The months September to April are devoted to academic training supplemented by such military studies as drill and physical training. The summer term, May to midAugust, is spent in practical training at an establishment of the Service in which the cadet is enrolled. Academic requirements for admission to the first year at the Royal Military College and Royal Roads is senior matriculation (or its equivalent) in the following subjects: English, physics, mathematics (algebra, geometry and trigonometry), chemistry and either history or a language, preferably French. French-speaking candidates having a B.A. degree from a classical college may be accepted directly into the first year at Collège Militaire Royal. For admission to the preparatory year at that institution the academic requirement is junior matriculation (or its equivalent) in English, French, algebra, geometry, physics and chemistry, although consideration is given candidates who do not possess the standing in French. Candidates from the classical colleges require at least sixth-year standing.

To be accepted a candidate must be single, a Canadian citizen or British subject normally resident in Canada and physically fit in accordance with the medical standards of the Service in which he enrols. The age limits for admission to the first year are between 16 and 21 years as of Jan. 1 of the year of entry; for admission to the preparatory year a cadet must have reached his 16 th but not his 20th birthday on Jan. 1 of the year of entry. Personal interview and medical examination of candidates is carried out by tri-Service boards located at six regional centres across Canada. Three officers representing the Services and a representative of the Services Colleges sit on each interview board. Fifty per cent of the cadets entering the first year at the Services Colleges are selected on the basis of provincial quotas as determined by population and the remainder are selected in open competition. The interview boards base their recommendations on the physical and personal qualifications of the candidates, with responsibility for final selection resting with a board appointed by the Minister of National Defence.

Since September 1954 virtually all cadets entering the Services Colleges have been required to enrol under the Regular Officer Training Plan. Under this Plan applicants accepted for entry enrol, according to their choice, as naval cadets in the Royal Canadian Navy, as officer cadets in the Canadian Army or as flight cadets in the Royal Canadian Air Force. All costs of tuition, board, lodging, uniforms, books, instruments and other essential fees are borne by the Department of National Defence, and cadets are paid at the
rate of $\$ 63$ a month. On successfully completing their academic and military training cadets are granted permanent commissions in the regular force but may, if they so wish, apply for release after three years of service following completion of academic training.

The only cadets now accepted at the Services Colleges in a reserve capacity are those who qualify for Dominion Cadetships, which are awarded by the Government in recognition of sacrifice of a candidate's father. A maximum of 15 Cadetships may be awarded in any one year, five in each Service. Each is valued at $\$ 580$, which covers first-year fees.

During the 1956-57 academic year, 963 cadets were in attendance at the Canadian Services Colleges; 421 of them at Royal Military College, 194 at Royal Roads and 348 at College Militaire Royal de Saint-Jean. Of the total, 192 were enrolled in the Navy, 394 in the Army and 377 in the Air Force.

Staff Training Colleges.-The Canadian Army Staff College at Kingston, Ont., trains officers for staff appointments in field formations and commands. The course extends from January to November. Though most of the student body is comprised of Canadian Army officers, officers from the other two Services and from the armies of other Commonwealth and NATO countries also attend. Canadian Army officers must pass a searching entrance examination before being considered eligible for staff training. The system of instruction is based upon the study of précis and other references, demonstrations and lectures, indoor and outdoor exercises. Most of the work is carried on in syndicates, each under a member of the directing staff. Attention is paid to both individual and team work. Aside from purely military subjects such as the study of modern tactics, the curriculum includes world affairs and lectures by prominent guest speakers.

The National Defence College at Kingston, Ont., opened on Jan. 5, 1948, is a senior defence college providing an eleven-month course of study covering the economic, political and military aspects of the defence of Canada. Senior officers and civil servants from the Armed Forces and government departments attend as well as a few representatives from industry. An extensive lecture course is provided, with lecturers chosen from leaders in various fields in Canada, the United States, the United Kingdom and other countries. In addition, educational tours and visits to certain parts of Canada, the United States, Europe and the Middle East are made to give students more knowledge of conditions and influences in their own and other countries. The ninth course, from September 1955 to July 1956, was attended by 29 students, three from the Royal Canadian Navy, four each from the Canadian Army and the Royal Canadian Air Force, one from the Defence Research Board, two from the Department of External Affairs, one each from the Department of National Defence, the Department of Trade and Commerce, the Department of Transport (Air), the Royal Canadian Mounted Police, the Canadian Broadcasting Corporation, The Bell Telephone Company of Canada and the Canadian Pacific Railway. Representation from outside Canada included one member each from the Royal Navy, the Royal Air Force, the British Army, the Foreign Office of the United Kingdom, the United States Navy, the United States Air Force, the United States Army and the State Department of the United States.

The Royal Canadian Air Force Staff College at Armour Heights in Toronto, Ont., is a permanent establishment preparing officers for staff appointments in the Air Force. The course affords advanced Service education for officers normally of Wing Commander and Squadron Leader ranks, fitting them for appointments appropriate to their present ranks and preparing them to assume higher appointments. The Directing Staff selected from the Royal Canadian Air Force is augmented by an exchange officer from the Canadian Army and one from the Royal Air Force. The student body in addition to Royal Canadian Air Force officers has one or two representatives each from the Royal Canadian Navy, the Canadian Army, the Royal Air Force and the United States Air Force. The objective of the course is to assist the student to think logically and express his ideas with precision both orally and in writing, to know his Service and understand the employment of air forces, to keep abreast of scientific and technical development that may affect the employment of air forces and to gain a perspective of national and international problems.

Lecturers are drawn, when desirable, from industry, the Armed Forces, the diplomatic corps and universities. Instructional visits are made to commercial and military establishments at home and abroad.

## PART II.-DEFENCE PRODUCTION*

The Department of Defence Production was established on Apr. 1, 1951, under the provisions of the Defence Production Act (R.S.C. 1952, c. 62 as amended) with exclusive authority to procure the goods and services required by the Department of National Defence and to ensure that the necessary production capacity and materials would be available to support the defence production program. The Department also buys material for the civil defence program and serves as procurement agent for the Canadian Commercial Corporation, a Crown company primarily responsible for the purchase in Canada of defence goods required by other governments and of supplies needed to meet Canadian commitments under the Colombo Plan and other international agreements. Military construction is the main responsibility of Defence Construction (1951) Limited, a Crown company reporting to Parliament through the Minister of Defence Production.

During the period Apr. 1, 1951, to the end of 1957, the Department of Defence Production and Defence Construction (1951) Limited placed defence contracts on behalf of the Department of National Defence to a total net value of $\$ 6,753,000,000$. Against these contracts, and some $\$ 400,000,000$ worth of contracts taken over in 1951 from other agencies, expenditures amounting to $\$ 6,690,000,000$ were made from appropriations of the Department of National Defence. The significant role of procurement and construction in Canada's defence preparedness program is shown by the fact that 58 p.c. of total defence expenditures by the Department of National Defence since Apr. 1, 1951, was made against contracts placed by the Department of Defence Production and Defence Construction (1951) Limited. In addition, the Department assisted defence contractors in meeting these requirements by making available specialized capital assets worth $\$ 183,500,000$ and also approved accelerated depreciation on capital assets having an estimated value of $\$ 737,000,000$. The aircraft program (including miscellaneous government-furnished aircraft equipment) accounted for 37 p.c. of the total net value of contracts placed from Apr. 1, 1951 to Dec. 31, 1957, the construction program for 12.5 p.c., the electronics and communication equipment program for 10.3 p.c., and the ship program for 7.4 p.c.

The following procurement and construction review covers the years 1956 and 1957, continuing that for 1954 and 1955 given in the 1956 Year Book, pp. 1169-1175.

The net value of contracts placed in 1956 totalled $\$ 746,500,000$, which was an increase of 2.8 p.c. over the $8726,200,000$ placed in 1955 , but dropped 18.8 p.c. in 1957 to a level of $\$ 606,100,000$. Contracts and amendments placed under the aircraft program amounted to $\$ 194,000,000$ in 1957 as compared with $\$ 236,200,000$ in 1956 , accounting for almost one-third of the total net value of contracts placed in both years. A substantial portion of the contracts and amendments issued in connection with the aircraft program during these two years was for the CF-105 jet interceptor fighter, the CP-107 maritime reconnaissance aircraft, the CC-106 military transport aircraft and Sparrow II guided missiles for the Royal Canadian Air Force; and for the Grumman CSFF carrier-based aircraft for the Royal Canadian Navy. The value of contracts placed for the electronics and communication equipment program increased during 1956 and 1957 primarily as a result of equipment and management requirements for the Mid-Canada Early Warning radar line. The value of procurement for fuels and lubricants increased 17 p.c. in 1956 over 1955 but fell off slightly in 1957. Other programs such as ships, tank-automotive, weapons, and clothing and equipage recorded declines in both years. Construction contracts declined from $\$ 138,400,000$ in 1955 to $\$ 125,000,000$ in 1956 , and, as a result of the completion of the Mid-Canada line and Camp Gagetown, fell to $\$ 60,300,000$ in 1957. The net value of contracts placed, as used here, includes the value of new contracts issued as well as the value of amendments which increase or decrease commitments under existing contracts.

[^406]
## 1.-Net Value of Canadian Government Defence Contracts Placed, by Program 1956 and 1957 with Cumulative Totals from 1951

| Program | 1956 | 1957 | Total Apr. 1, 1951Dee. 31, 1957 |
| :---: | :---: | :---: | :---: |
|  | \$'000 | \$'000 | \$'000 |
| Aircraft. | 236,175 | 193,950 | 2,502.804 |
| Ships............. | 61,160 | 55,743 | 2.499,804 |
| Tank-automotive. Weapons. . | 13,464 | - 12.277 | 296,484 |
| Weapons................. | 9,551 8,042 | Cr. 18,064 | 176,314 298,103 |
| Electronics and communication equipm | 105,304 | 123,209 | 698,069 |
| Fuels and lubricants. | 64,156 | 58,231 | 336.757 |
| Clothing and equipage. | 12.108 | 7,614 | 254,335 |
| Construction. | 125,052 | 60,316 | 846,657 |
| Other. | 111,489 | 106,279 | 843,547 |
| Totals. | 746,501 | 606,054 | 6,752,874 |

The value of expenditures on defence procurement and construction, which reached a peak in 1953, continued to decline in 1956 and 1957. Expenditures in 1956 decreased by 2.4 p.c. from the preceding year to $\$ 958,500,000$ and by a further 9.3 p.c. in 1957 to $\$ 869,600,000$. In the aircraft and ships programs, expenditures declined in 1956 but increased slightly in 1957. In electronics and communication equipment and in construction the reverse movement took place, with expenditures increasing in 1956 and decreasing in 1957. The tank-automotive, weapons, ammunition and explosives, and clothing and equipage programs all registered declines in both years. Expenditures on defence construction increased 45 p.c. in 1956 over 1955 but declined by one-third to $\$ 105,400,000$ in 1957.

## 2.-Value of Expenditures on Canadian Government Defence Contracts, by Program 1956 and 1957 with Cumulative Totals from 1951

| Program | 1956 | 1957 | Total <br> Apr. 1, 1951- <br> Dec. 31, 1957 |
| :---: | :---: | :---: | :---: |
|  | \$'000 | \$'000 | \$'000 |
| Aircraft. | 329.671 |  | $2,548,4366$ |
| Ships............ | 80,759 22,398 | 83,579 13,992 | $\begin{aligned} & 567,725 \\ & 287,140 \end{aligned}$ |
| Weapons........ | 18,423 | 15,628 | 150,418 |
| Ammunition and explosives | 46,558 | 31,085 | 270.856 |
| Electronics and communication equipm | 129,670 | 98,676 | 628,659 |
| Fuels and lubricants. . . . . . . . . . . . . . | 47,775 | 47,826 | 276.104 |
| Clothing and equipage | 16,004 | 10,652 | 257, 954 |
| Construction......... | 159.403 | 105,380 | 915,162 |
| Other...... | 107.829 | 116.382 | 788,020 |
| Totals | 958,489 | 869,636 | 6,690,463 |

The ability of Canadian industry to produce a greater variety of defence items made it possible to place 96.5 p.c. of the value of defence contracts in this country in 1956 and 91.0 p.c. in 1957. This represents a significant achievement over earlier periods of the defence program when industry in Canada received a much smaller proportion of the defence contracts. Contracts placed abroad are for items that cannot be economically produced in Canada within the limits of current and anticipated defence requirements.

#### Abstract

Aircraft.-The F-86 Sabre jet fighter program for the RCAF was completed in 1957, but production continued on a contract for the West German Air Force. In 1956, Sabre production had been reduced slightly from the level of 1955 though a reduction in deliveries to the RCAF was partly offset by company export sales to the Union of South Africa and to Colombia. The CF-100 jet interceptor continued in production at a reduced rate throughout 1956 and 1957. A reduction in the quantity of CF-100 aircraft delivered to the RCAF, and the termination of the Mark-6 program in 1957, were more than offset by a United States Mutual Aid purchase of a large number of these aircraft for Belgium. The output of jet powered T-S3 Silver Star training aircraft was maintained at a minimum level during these two years. The first deliveries of the CS2F Tracker aircraft to the Royal Canadian Navy took place in 1956 as scheduled and continued in production through 1957. This aircraft, powered by twin $R-1820-82$ piston engines, is designed for the detection and destruction of submarines. Both airframe and engines are being built in this country to United States designs, and the work is being shared widely by Canadian industry through a broad sub-contracting program. During the two years under review, rapid strides were made in the development and production of the $C F-105$ supersonic jet fighter, the first of which came off the line on schedule late in 1957. The speed and altitude capability demanded of this aircraft necessitate the highest standards in equipment and materials, and Canadian industry has had to develop special manufacturing techniques to meet this need. The first flight of the long-range maritime reconnaissance aircraft, the CP-107 Argus, was made in 1957. This craft is a re-design of the Bristol Britannia civil aircraft. A transport version of the Argus, designated the CC-106, was introduced for engineering and tooling during 1957; its engines and associated propellers are of

 British make.In the aero engine field, activity paralleled that for airframes. Production of Orenda engines for the Sabre and CF-100 aircraft continued at reduced rates. Development of the more powerful PS-13 Iroquois engine, to be fitted in the CF-105, proceeded satisfactorily and a prototype was air tested in 1957. In the Canadian piston engine facility, the production of $R-1340$ Wasp engines for the Mutual Aid Program was completed late in 1956, with the manufacture of long-term maintenance parts continuing throughout that year. During 1957 the production of Wasp engines was largely replaced by the production of R-1820-82 engines for the CS2F Tracker aircraft. The manufacture of $43 D 51$ propellers for the Tracker also proceeded satisfactorily.

The repair and overhaul of aircraft, aircraft engines, instruments, systems and accessories occupy a position of increasing importance. The repairs and overhaul needs of older items of equipment increase with the passage of time and, at the same time, the growing complexity and more stringent operational requirements of newer equipment impose new demands on the repair and overhaul facilities. These facilities were kept abreast of new developments, and relatively stable work loads were maintained through a system of progressive overhaul followed by the Department of National Defence.

Early in 1956, the Sparrow II missile, developed in the United States, was chosen to meet RCAF requirements for air-to-air guided missiles, superseding the Canadian weapon, Velvet Glove. As a result of this decision, work among the Canadian contractors employed on the Velvet Glove program was limited to the minimum needed to keep intact the engineering complex which had been developed and to maintain a nucleus of essential personnel. By the end of 1957, the bulk of the drawings, technical data, and other information relative to Sparrow $I I$ had been received from the United States, thus permitting certain activity among manufacturers of special equipment in Canada. This missile is to be modified for use in the CF-105 Arrow aircraft.

Electronics.-The procurement and production of electronic equipment for defence reached a peak in 1956. The completion of the Mid-Canada radar line, the postponement of production for the radar improvement program and the approaching completion of some existing production contracts together with a slow-down caused by the change-over from the Kelvet Glove to the Sparrow missile caused a decline in 1957. This decline, however, was partially offset by activity on the development of the electronics system for the CF-105
aircraft, begun in mid-1956 and continued through 1957. Although this development is taking place in the United States, production of the system will be in Canada with the most practical degree of Canadian content. The electronics program for the Sparrow missile started early in 1957 and involved limited tooling and pre-production. Some missile fuze development work was also continued pending a decision on the production requirements for the Sparrow fuze; this is a specialist skill which has been built up in Canada since 1951. Delivery of the $C F-100$ flight simulators, which began in 1956, continued throughout 1957.

The ultra high frequency (UHF) conversion program for the RCAF progressed, with ground-based equipment procurement nearing completion and on-site installation well under way by the end of 1957. A production program for modern multi-channel airborne UHF equipment was started. A contract for airborne radar equipment for the CS2F aircraft was completed by the end of 1957, leaving only support spares to be provided. Canadian industry, sponsored by a development contract, produced airborne doppler navigational equipment which is considered to be a forerunner in this field. The MidCanada radar line, a significant achievement of the defence program, was completed early in 1957 and is now an integral part of the North American defence network. The line, which was completely financed by Canada, lies between the joint Canadian-United States-financed Pinetree line to the south and the United States-financed Distant Early Warning (DEW) line to the north. In 1957, two civilian contractors were selected to be responsible for carrying out maintenance and to supply supporting services on the Mid-Canada line for the RCAF. Maintenance contracts, to provide back-up support for RCAF-manned Pinetree line stations, were in effect during this period.

Shipbuilding.-The light fleet carrier, HMCS Bonaventure, was commissioned on Jan. 17, 1957. The Bonaventure was built in Northern Ireland and is one of the most modern light fleet carriers afloat. It is equipped with an angled flight deck, mirror landing aids, steam catapult, and the latest electronic equipment. Three destroyer escorts were commissioned during each of the years 1956 and 1957. These are sister ships of HMCS St. Laurent, the lead ship of this Canadian design class which was completed in 1955. The lead ship of the second group of destroyer escorts, HMCS Restigouche, was also scheduled for commissioning in 1957 but was damaged in a collision during sea trials. Work continued on the other six ships of the second group. During 1957, authority was granted for the construction of two additional destroyer escorts and for the procurement of long lead components for four ships.

The first of six MCB-class coastal minesweepers was commissioned late in 1956 and the other five were commissioned in 1957. These ships, an advanced version of the earlier AMC-class, were designed in Canada to cope with the latest developments in mines. The second program for modernizing World War II frigates was nearly completed, with four of the five ships commissioned by the end of 1957. Various auxiliary craft were produced, including 150 -foot sea-going tugs, steel crane lighters, inner patrol vessels, clearance diving vessels, power barges, and ammunition lighters. Fifty-two small boats were completed in 1956 and 40 in 1957, varying in size from 27 -foot motor sea boats to 14 -foot dinghies. Delivery of a later type United States torpedo manufactured in Canada began in 1957.

Weapons and Ammunition.-During 1956, final deliveries were made to the Canadian Army of the first order for 105 mm howitzers, and a second order was placed with deliveries to begin in 1958. The delivery of 155 mm howitzers to the Army was completed during 1957. A combined order for 105 and 155 mm lifetime spares was placed during 1957 and deliveries will run concurrently with the main equipment. This action will eliminate the high costs involved in start-and-stop manufacture of small quantities of components. The production for the Army of rocket launchers and associated range finder sights was completed. In the small arms category, Canadian Arsenals Limited began delivery of the new 7.62 mm C-1 (FN) rifle in October 1956. A. 7.62 mm light machine
gun was approved in 1957 and production will run concurrently with the rifle. Early in that year, a contract was placed in Canada for a British sub-machine gun adopted by Canada.

The production of ammunition generally declined in both 1956 and 1957. However, ammunition production for the 7.62 mm rifle was increased to permit general issue. A propellant for this ammunition, which has met NATO standards, was developed by Canadian Arsenals Limited, extending the storage life of the ammunition. Production continued on other types of small arms ammunition: $.30, .303,9 \mathrm{~mm}, 20 \mathrm{~mm}$, and numerous pyrotechnics and explosive stores for the three Services; $40 \mathrm{~mm}, 3^{\prime \prime} 50,4^{\prime \prime}$, and anti-submarine devices for the Navy; $2^{\prime \prime}, 60 \mathrm{~mm}, 81 \mathrm{~mm}$ mortar and 105 mm howitzers for the Army; $2.75^{\prime \prime}$ air-to-air rockets and marine markers for the RCAF. Canadian production of Army mines, fuze 410, certain anti-submarine projectiles, double-base rocket propellant grains, echo ranging bombs, and certain pyrotechnics occurred for the first time. A production program for 20 -pdr. tank ammunition, incorporating three years of preproduction work on improvement, got under way.

Construction.-Defence construction activity in 1956 was exceeded only in 1952, mainly as a result of work on the Mid-Canada radar line and the Army bome station development program. The completion of the Mid-Canada project and reduced work required for the home station development program caused a significant drop in defence construction in 1957. The Mid-Canada line was the largest single project undertaken by Defence Construction (1951) Limited on behalf of the Department of National Defence, and construction of Camp Gagetown, N.B., one of the seven home stations, was the largest project undertaken on a single site. The other home stations under construction were at Valcartier, Que., London and Petawawa, Ont., Winnipeg, Man., and Edmonton and Calgary (Camp Sarcee), Alta.

General Purchasing.-The general purchasing program is primarily concerned with the clothing, equipping, feeding, maintaining and servicing of the Canadian Armed Forces, and the purchase of certain supplies for the Defence Research Board and the Inspection Services of the Department of National Defence. These general purchases of supplies and services not normally requiring special production facilities include such items as: textiles and all types of clothing, footwear and leather goods, transport equipment (military and commercial) together with parts and replacements, the repair and reconditioning of all types of service vehicles, food and catering services, furniture and furnishings, petroleum products and hard fuels, medical and dental stores, aerial surveys, building supplies, and all types of barrack stores. Some of the major contracts placed during 1956 and 1957 were for electrical aircraft spares for $F-86$ Sabre aircraft, shipboard cable for the destroyer-escort program and for normal maintenance needs, certain requirements for the Mid-Canada project, fuel for aircraft, equipment for winter maintenance of airdromes, refueling and crash fire trucks for the RCAF, maintenance equipment for the Air Division in Europe, and a number of aerial surveys.

The fourteen district offices maintained by the Department of Defence Production across Canada continued to purchase food and other defence supplies and services of a local or urgent nature needed by defence establishments in the vicinity of such offices. Other purchases included hardware and building materials, electrical and electronic equipment, petroleum products, furniture, and barrack stores. Service contracts were arranged for minor repairs to ships, minor alterations and repairs to buildings, laundry and dry cleaning, coal hauling, disposal of ashes and refuse, snow removal, transportation, consulting engineering services, and repairs to footwear and clothing.

## PART III.-CIVIL DEFENCE

The continuing threat of armed aggression, coupled with the increasing power of thermo-nuclear weapons, has forced upon Canada a constant development of new civil defence techniques and training methods. Civil defence planning is integrated with the over-all plan for national defence with the aim of survival in the event of direct attack. A further role is the provision of aid to the civil powers in times of natural disaster.

In October 1948, the Minister of National Defence appointed a Co-ordinator for Civil Defence whose duty it is to plan for civil defence. Assisting in this program are the Federal Civil Defence Planning Committee, an Interdepartmental Committee and a Federal-Provincial Advisory Committee composed of the federal Minister responsible for civil defence, as chairman, and the provincial Ministers responsible for civil defence within the provinces.

Since February 1951, when the administration of civil defence was transferred to the Department of National Health and Welfare, the Minister of that Department has been charged with the responsibility in matters of federal policy. After study of organizations in the United Kingdom, the United States and NATO countries, a plan for national survival was established, based on the evacuation of probable urban target areas. The Minister of National Health and Welfare announced the plan as government policy in the House of Commons on July 28, 1956, when he stated, "Our civil defence policy should now be based on the development and testing of plans for the orderly evacuation on short notice of the main target areas in Canada should the possibility of attack on such areas by nuclear weapons appear to be imminent".

On the basis of population density and industrial potential, Canada's probable target areas are: Victoria, Vancouver, Edmonton, Winnipeg, Windsor, Hamilton, Niagara Falls, Toronto, Ottawa-Hull, Montreal, Quebec City, Saint John and Halifax.

Canadian civil defence is organized at all levels of government-federal, provincial and municipal-each with its own sphere of responsibility. The provinces are selfcontained units and are subdivided into areas or regions for the purpose of providing mutual support to any disaster region. Because of geographical location in relation to target centres, certain areas have been designated as mutual aid or reception areas. Administrative and organization responsibilities for each are: federal-planning, policy and financial assistance; provincial-organization and implementation; municipalexecution of plans and policy.

A Federal Civil Defence Headquarters is established in Ottawa and comprises the Civil Defence Co-ordinator and staff plus the following Services: Planning and Operations, Training and Education, Health, Welfare, Information, Communications and Transportation. Certain other government agencies are also involved, such as the Royal Canadian Mounted Police, the Armed Services, the Departments of Agriculture and Transport, and the Defence Research Board.

Through direct liaison with the RCAF an early warning system has been established. In 1957, high-power sirens supplied by the Federal Government were installed and tested in vulnerable target areas. An extensive health supply stockpiling program was completed with the co-operation of the Departments of National Defence and Veterans Affairs.

Civil defence training courses, begun in 1951, have been continually expanded. More than 9,000 persons from across Canada have attended courses at the Canadian Civil Defence College at Arnprior, Ont., since its establishment in 1954. Thirteen basic courses are available dealing with such subjects as: health, welfare, communications, transportation, staff duties, casualty simulation, rescue, and radiation detection. In addition, special forums have been held for groups representing the press, clergy, mayors, police, fire fighters, national organizations such as the Canadian Red Cross Society, and industrial groups. Training is conducted under provincial auspices with British Columbia, Alberta, Saskatchewan and New Brunswick operating civil defence schools. On Mar. 31, 1957, the total enrolment of civil defence workers was 224,146.

Under the Financial Assistance Program of the Federal Government each province is provided with a money quota based on population and vulnerability; 50 p.c. of the cost of an approved project is contributed by the Federal Government and the remainder shared between the municipality and the province. A minimum of 25 p.c. is contributed direct to a municipality for projects in which the provincial government does not share in the cost. Training aids, fire and rescue equipment, and educational material continue to be supplied by Federal Headquarters to further provincial and municipal programs.

A fire-hose coupling standardization program, to which the Federal Government contributed one-third of the cost, has been completed in British Columbia, Alberta and Ontario. Payments for workmen's compensation for civil defence workers are shared by agreement on an equal basis between the Federal Government and all provinces except Quebec, Nova Scotia and Prince Edward Island.

Many technical and training manuals, booklets and brochures have been produced by Federal Civil Defence Headquarters. In addition, pamphlets, folders, training aids, films, slides, newsclips and radio, newspaper and television material have been produced and distributed as part of the continuing public information program. The first National Civil Defence Day in Canada held on Friday, Oct. 4, 1957, was primarily designed to further acquaint the citizens of the country with the aims, organization and planning for civil defence. Provincial and municipal organizations from coast to coast took part. Over $2,000,000$ pieces of informational material and literature were distributed by Federal Headquarters in this national and co-operative program.

Civil defence development and problems are constantly under discussion and study with the United States, the United Kingdom and other NATO countries. As the result of an agreement made between Canada and the United States in 1951, a United StatesCanada Civil Defence Committee meets at regular intervals to further the bond of mutual assistance in the event of enemy attack.

# CHAPTER XXIX.-SOURCES OF OFFICIAL INFORMATION AND MISCELLANEOUS DATA 

## CONSPECTUS

## PART I.-SOURCES OF OFFICIAL INFORMATION

## Section 1.-Federal Government Information Services

The chief source of statistical information on all phases of the economy of Canada is the Dominion Bureau of Statistics where the ten-year and five-year censuses of Canada are planned and statistical information of all kinds-federal and provincial-is centralized. Information that is not mainly statistical may be secured from the individual Department concerned with the particular subject as indicated in the Directory at pp. 1217-1246. Certain government bodies and national agencies, because of the nature of their work and the appeal it has to broad sections of the population, are organized primarily as information or publicity agencies. Among these are: the Information Division, Department of External Affairs, which deals with questions about external affairs originating in Canada and with general requests originating abroad for information on Canada and Canadian affairs; the Trade Publicity Branch, Department of Trade and Commerce; the Information Services Division, Department of National Health and Welfare; the Canadian Broadcasting Corporation; and the National Film Board. (See Index.) The Departments of Agriculture, Northern Affairs and National Resources, and Mines and Technical Surveys, and such agencies as the National Gallery of Canada, the National Museum of Canada, the National Library, and the National Research Council, while not thus classed, are interested in the dissemination of information to a greater extent than most of the remaining government departments, though several of the latter have publicity branches or public relations divisions.

Government departments, with few exceptions, issue their own lists of reports and publications. Departments are required by statute to publish annual reports, which are tabled each year in the House of Commons by their respective Ministers. However, for the purpose of this Section, only the services of the six information agencies mentioned above are described.

Section 2 has been prepared for the purpose of presenting to the reader a directory of all sources of information, federal and provincial, thereby directing him to the proper channels from which he may draw published material relating to any particular subject.

The Dominion Bureau of Statistics.-The Dominion Bureau of Statistics was set up by statute in 1918 as a central statistical department for Canada (8-9 Geo. V, c. 43). In 1948 this statute, which had been consolidated as the Statistics Act (R.S.C. 1927, c. 190), was repealed and replaced by the Statistics Act (R.S.C. 1952, c. 257), subsequently amended in March 1953 (1-2 Elizabeth II, c. 18).

The chief aims of the Dominion Bureau of Statistics are: (1) to furnish statistical data bearing on Canada for government and administration, whether municipal, provincial, national or international; and (2) to assist in meeting the needs of non-governmental users of statistics, arising from a growing awareness of the value of statistics to business efficiency and social planning.

Inquiries.-Hundreds of individual requests for information are received in the Information Services Division of the Bureau each day, routed through the appropriate divisions and answered as expeditiously as possible. Since the field of effort from the statistical side deals with all phases of the national economy, there is scarcely a subject upon which the Bureau is not able to give some information. Nevertheless only inquiries of a statistical nature should be directed to the Dominion Bureau of Statistics.

Publications.-The Dominion Bureau of Statistics is the principal publication agency of the Federal Government; the subjects of its statistical reports cover all aspects of the national economy, and its Canada Year Book and Official Handbook Canada constitute authoritative compendiums of information on the institutions and economic and social development of Canada.

Dominion Bureau of Statistics publications are listed in its catalogue of Current Publications and in the Queen's Printer's Catalogue of Canadian Government Publications. The DBS Daily Bulletin and Weekly Bulletin, available from the Bureau's Information Services Division at an annual subscription of $\$ 1.00$ each, are designed to serve persons wishing to keep closely informed on the full range of published information issued by the Bureau. Subscription orders for DBS publications or orders for single copies should be addressed to the Information Services Division, Dominion Bureau of Statistics, Ottawa, and should contain the necessary remittance in the form of a cheque or money order made payable to the Receiver General of Canada.

Information Division, Department of External Affairs.-The Information Division has two functions: to promote within Canada interest in and knowledge of international affairs, and to make Canada and Canadian policies better known and understood abroad.

To perform the first function the Division produces and distributes various documents on external affairs-statements of government policy and reports on related developments abroad and on the work of the Department generally. The Division also answers inquiries from Canadian sources on these subjects (except for inquiries from the press which are handled by the Department's Press Office) as well as requests for information about Canada made by Diplomatic Missions at Ottawa, by Canadian posts abroad, and by individuals and organizations in other countries.

Most of the information work abroad is done, however, by officials at Canadian posts. The Information Division assists by formulating and advising on information policy abroad in an effort to ensure that this policy is related to the general objectives of Canadian foreign policy, and by producing and procuring material to keep Missions informed of developments within Canada. Journalists and others who visit Canada to write of Canadian affairs are given assistance from time to time by the Division; its responsibilities also include the co-ordination of the Government's activities in the field of cultural relations.

Trade Publicity Branch, Department of Trade and Commerce.-For details see p. 1062.

Information Services Division, Department of National Health and Welfare.The responsibility of this Division, in co-operation with other divisions of the Department of National Health and Welfare and provincial authorities, is the production and distribution of educational material on health, welfare, social security and civil defence, for use throughout the country. This information, issued in the English and French languages, includes books, pamphlets, periodicals, posters, exhibits, displays, radio dramatizations, press and magazine features and releases, as well as films and film-strips prepared in co-operation with the National Film Board. Books, pamphlets, posters and displays are distributed in Canada through provincial authorities. The most important periodicals published by the Division are Canada's Health and Welfare (monthly), Canadian Nutrition Notes (monthly), Occupational Health Bulletin (monthly), Industrial Health Review (semiannually) and Nutrition Bulletin (annually).

Canadian Broadcasting Corporation.-Television and radio broadcasting are important mediums of information to the public along with newspapers, films and other means of communication. Broadcasting in Canada combines, in one national system, publicly owned stations and privately owned local community stations, many of which are affiliated with the Canadian Broadcasting Corporation's networks.

Since its establishment in 1936 the Canadian Broadcasting Corporation has become one of the most effective channels through which information, official and unofficial, is broadcast to the people of Canada. Radio is relatively more important in Canada than in most countries because of the widely distributed population and the number of sparsely peopled areas, and the CBC has gradually bridged the gaps with high-powered transmitters designed to serve rural as well as urban areas. The CBC has also pioneered in the development of low-powered repeater stations attached to the network lines, which serve areas unable, because of topographical conditions, to receive an adequate signal from any existing station.

News broadcasts and information programs occupy a considerable proportion of national and regional network time. All CBC schedules include news, music, drama, informative talks, children's programs, school broadcasts, public service broadcasts, sports, women's activities, etc. There is a very wide range of radio and television fare, since the CBC not only produces its own programs in the various production centres across Canada but brings in selected programs from the networks of the United States, the British Broadcasting Corporation and other national radio and television systems. The CBC maintains a bureau at London, England, and at United Nations Headquarters in New York, and is credited with having done more to inform listeners of United Nations activities than any other broadcasting system.

Through the International Service operated by the CBC on behalf of the Canadian Government, programs are broadcast over shortwave in 16 languages: English, French, German, Dutch, Danish, Norwegian, Swedish, Italian, Spanish, Portuguese, Czech, Slovak, Russian, Ukrainian, Polish and Hungarian. The CBC International Service broadcasts information abroad on life and economic conditions in Canada as part of the general information plan for promoting a better understanding of Canada in other countries. In addition to this regular shortwave program service, the International Service provides special programs for transmission by broadcasting systems in other countries by means of shortwave relays or recordings on tape or disc. A library of musical and spoken-word programs is made available to foreign broadcasting systems through processed transcriptions for wide distribution.

National Film Board.-The National Film Board produces films, film-strips and still photographs on a great variety of subjects. In keeping with its terms of reference, the Board's products are both informative and interpretative and are widely distributed, theatrically and non-theatrically. (See also Educational and Cultural Functions of the National Film Board, pp. 365-366.)

As a servic to government departments, the Board maintains a preview library of 5,000 prints from many sources; 500 film-strips are also catalogued. Special libraries of films on such subjects as health, sociology, medicine and industry have also been established for the use of the government departments concerned and for special interest groups.

Films and film-strips produced by the National Film Board are shown in Canada and abroad. In Canada, the films are shown through the television network, through neighbourhood theatres and through the widespread network of community film libraries. In most communities voluntary organizations, called film councils, arrange the local facilities for use of films by community groups. Abroad, more than 29,000 prints are circulated to the Departments of External Affairs and of Trade and Commerce through the Board's offices in New York and Chicago in the United States, New Delhi, India, and London, England. In several countries distribution of the Board's films are handled by commercial and other loan agencies.

The Board's library of approximately 100,000 still photographs serves government departments, commercial photographers, newspapers, periodicals and many other organizations in Canada and abroad.

## Section 2.-Directory of Sources of Official Information (Federal and Provincial)

To make the best use of the Directory of Sources of Government Official Information, it is necessary that the reader understand the broad differences in function between federal and provincial departments and their separate fields of work.

Certain fields of effort, such as trade and commerce, customs and excise, currency and banking, navigation, transportation, radio, census of population and national defence are constitutionally federal affairs and in such fields the respective Departments at Ottawa are the proper sources with which to communicate. Other fields of effort such as the administration of lands and natural resources, education, roads and highways, and health and hospitals are the responsibility of the provinces but certain Federal Departments are also concerned with specific aspects of these subjects and, as is the case of the Dominion Bureau of Statistics, in the co-ordination and presentation of the material for Canada as a whole.

As a general guide to the public, it may be pointed out that questions relating to the actual development and administration of resources should be forwarded to the particular provinces concerned. The Government of Canada, while not administering the resources within provincial boundaries, co-operates closely with the provinces and is in a position to furnish material for Canada, especially production data on a national basis, marketing data on international, national and provincial bases, research work and experimental station data on a national basis, and also on a provincial basis from Federal Government stations located within particular provinces. In agriculture, for instance, data on the breeding of livestock and the improvement of strains, on agricultural marketing and on crop yields are cases in point; in forestry, questions of forest research, forest fire protection and reforestation offer good examples. Inquiries directed to federal sources for information not of a statistical nature should as a general rule be sent to the individual Departments listed in the Directory; inquiries for information of a statistical nature should be addressed to the Information Services Division, Dominion Bureau of Statistics, Ottawa.

Sale of Official Publications.-Under the provisions of the Public Printing and Stationery Act, the Queen's Printer and Controller of Stationery, Ottawa, has charge of the sale of all official publications of Parliament and the Government of Canada that are issued to the public, as well as of the free distribution of all public documents and papers to persons and institutions (libraries) entitled by statutory provisions to receive them. The Dominion Bureau of Statistics acts as the agent of the Queen's Printer with respect to the sale of DBS publications.

The regulations relating to the distribution and sale of government publications made in accordance with the provisions of Sect. 7 of the Public Printing and Stationery Act and Sect. 7 (e) of the Financial Administration Act were brought up to date and approved by Treasury Board on Mar. 31, 1955.

In compliance with these regulations, the Queen's Printer and Controller of Stationery issues the Daily Checklist of Government Publications which records for the information of the public service, libraries, etc., all Federal Government publications immediately upon release. Those authorized by law or regulation to receive free copies of government publications receive the Daily Checklist without charge; others desiring the service may purchase an annual subscription to be forwarded daily or in weekly batches as requested.

The Queen's Printer and Controller of Stationery also issues the Monthly Catalogue of Canadian Government Publications, a comprehensive listing of all official publications, public documents and papers not of a confidential nature published at government expense, an Annual Catalogue (in January) listing all publications issued during the previous year, as well as sectional catalogues and selected titles bulletins advertising new government publications.

Most provincial government publications may be obtained from the Queen's Printer of the province concerned. Inquiries should be addressed to the provincial capital cities:-

| Newfoundland | ohn's | Ontario.....................Tworonto |
| :---: | :---: | :---: |
| Prince Edward Islan | Charlottetown | Manitoba...................Winnipeg |
| Nova Scotia | Halifax | Saskatchewan............... Regina |
| New Brunswick | Fredericton | Alberta......................Edmonto |
| Quebec. | Quebec | British Columbia............Victoria |

Inquiries about the Yukon and Northwest Territories should be addressed to the Northern Administration and Lands Branch, Department of Northern Affairs and National Resources, Ottawa.
(Detailed Directory of Sources of Official Information follows, pp. 1217-1246.)

## PART II.-SPECIAL MATERIAL PUBLISHED IN FORMER EDITIONS OF THE CANADA YEAR BOOK

It is not possible to include in any single edition of the Year Book all articles and descriptive text of previous editions. Therefore the following list has been compiled as an index to such miscellaneous material and special articles as are not repeated in the present edition. This list links up the 1957-58 Year Book with its predecessors in respect of matters that have not been subject to wide change. Those Sections of Chapters, such as "Population", which are automatically revived when later census material is made available and to which adequate references are made in the text, are not listed unless they are in the nature of special contributions. The latest published article on each subject is shown, except when an earlier article includes material not repeated in the later one. When an article covers more than one subject it is listed under each appropriate heading.

The articles marked with an asterisk (*) are available in reprint form from the Information Services Division, Dominion Bureau of Statistics, at the price quoted.

## PART IV.-FEDERAL LEGISLATION 1956-57

This classified list of federal legislation has been compiled from the Statutes. Naturally in summarizing material of this kind it is not always possible to convey the full implication of the legislation. The reader who is interested in any specific Act is therefore referred to the Statutes of Canada in the given volume and chapter.

## Legislation of the Third Session of the Twenty-Second Parliament, Jan. 10 to Aug. 14, 1956

| Subject, Chapter and Date of Assent |  |  | Synopsis |
| :---: | :---: | :---: | :---: |
| 4-5 Elizabeth II |  |  |  |
| Agriculture- |  |  |  |
| 1 | Mar. | 7 | Prairie Grain Producers Interim Financing Act, 1956, provides short-term credit for groin producers in the Prairie Provinces to meet temporary financial difficulties arising from inability to deliver grain to elevators. |
| 2 | Mar. | 7 | Temporary Wheat Reserves Act provides for payment of carrying costs on temporary wheat reserves owned by the Canadian Wheat Board, if over $178,000,000$ bu. at commencement of the crop year. |

Kellock, a Judge of the Supreme Court of Canada since October 1944, resigned due to ill health. Feb. 1, United States Army successfully launched first American earth satelliteExplorer. Feb. 4, Kellock Royal Commission declared that firemen were unnecessary on diesel engines used by the CPR in its freight and yard operations. Feb. 16-20, The Canadian Conference on Education met in Ottawa under the Chairmanship of Dr. Wilder Penfield. Feb. 17, Rt. Hon. Louis S. St. Laurent, Prime Minister of Canada from 1948-1957, announced his retirement from active politics. Mar. 25, Successful maiden flight of the Canadian-built supersonic interceptor CF-105, described as the ultimate in manned fighter aircraft. A pr. 5 , Ripple Rock in Seymour Narrows near Campbell River, B.C., worst underwater
shipping hazard on the West Coast, removed by underwater explosion. Apr. 15-16. Twenty-one-storey Queen Elizabeth Hotel in central Montreal first CNR hotel to be built in 20 years, officially opened. Apr. 24 May 20, Trade mission from the United Kingdom toured Canads exploring ways of expanding British sales in this country. Apr. SO, Celebration in Montreal of the 300th anniversary of the first school established in that city by Marguerite Bourgeoys in 1658. May 28-June 4, President Theodor Heuss of the Federal Republic of Germany made state visit to Canada, the first German Head of State ever to do so. June 12, Prime Minister Macmillan of the United Kingdom addressed a joint session of the Senate and the House of Commons during a visit to Ottawa. June 21-July 9, Celebrations in Quebec City marking the 350 th anniversary on July 1 of its founding in 1608 by Samuel de Champlain. July 1, Canadians celebrated the 91 st anniversary of Confederation. Blasting of the cofferdam holding back the waters of the St. Lawrence River touched off the creation of the $100-\mathrm{sq}$. mile St. Lawrence power pool, permitting, within a few days, the operation of the first generators of the new hydro development and the use of two seaway locks on the U.S. side of the River and of the Canadian seaway lock at Iroquois. Insuguration of Canada's new microwave relay system, completed from coast to coast.

## PART VI.-STATISTICAL SUMMARY OF THE PROGRESS OF CANADA 1871-1956

Newfoundland entered Confederation in 1949 and figures for that Province have since been included with Canadian statistics as they have become available. Under each item in the following Summary, the inclusion of Newfoundland data for the first time is indicated by a black dot ( ${ }^{\bullet}$ ). If no dot is shown on any of the years from 1951-56 for a particular item, Newfoundland is excluded throughout. In some instances the symbol does not apply. Revisions of figures published in previous editions of the Year Book are not indicated in this Summary.

## STATISTLCAL SUMMARY OF THE PROGRESS OF CANADA

Note.-The interpretation of the symbols used in the table will be found facing p. 1 of this volume.

${ }^{1}$ At every census the previous post-censal estimates made at June 1 each year are adjusted to the newly recorded population figures. ${ }^{2}$ Includes 485 members of the Royal Canadian tercensal estimate-excludes households in institutions, hotels, camps, etc. reporting hospitals only; private and federal hospitals excluded.

STATISTICAL SUMMARY OF THE PROGRESS OF CANADA-continued
Nots.-The interpretation of the symbols used in the table will be found facing $p .1$ of this volume.

## Page 60, Provincial Governments

With reference to the footnote to page 60, a provincial election was held in only one province between Mar. 31, 1957, and the date of going to press (July 1, 1958)-Manitoba on June 16, 1958. The Ministry as at July 1 was as follows:-

## Fifteenth Ministry-Manitoba

(Party standing at latest General Election, June 16, 1958: 26 Progressive Conservatives, 19 Liberal-Progressives, 11 Co-operative Commonwealth Federation and 1 Independent.)

Premier and Acting Provincial Treasurer
Deputy Premier, Minister of Agriculture and Acting Minister of Public Works.
Attorney General.
Provincial Secretary........................................................
Minister of Labour and Acting Minister of Municipal Affairs.
Minister of Education.
Minister of Health and Public Welfare.
Minister of Mines and Resources and Acting Minister of Industry and Commerce
Minister of Public Utilities.

Hon. Cehrles Dufferin Roblin
Hon. Errick F. Whllis
Hon. Stering Lyon
Hon. Mafcel Boulic
Hon. John W. W. Thompson
Hon. Stewart McLean
Hon. George Johnson
Hon. Gurney Evans
Hon. Jack Carrouls

## Page 76, Federal Royal Commissions

To inquire into the Export of Energy and sources

To inquire into the extent and causes of the price spreads on fish and farm products between producer and consumer.

To inquire into the dispute between the Canadian Pacific Railway and the Brotherhood of Locomotive Firemen and Enginemen.

To inquire into the distribution of railway box-cars for prairie grain movement.

[^0]:    proof gallon.
    1 Short ton $=2,000$ pounds.
    1 Long ton $=2,240$ pounds.
    1 Barrel crude petroleum $=35$ Imperial gallons.

[^1]:    * Prepared in the Research and Development Division, Dominion Bureau of Statistics.

[^2]:    ${ }^{1}$ Not exact, because of rounding of figures.

[^3]:    * Prepared by the Geographical Branch, Department of Mines and Technical Surveys, Ottawa.

[^4]:    - United Nations Statistical Yearbook 1956.
    † United Nations Population and Vital Statistics Reports, January 1967.

[^5]:    ${ }^{1}$ Areas are approximate and are exclusive of those portions of the basins of all rivers that lie in United States territory, and of areas of interior drainage.

[^6]:    Mainland-
    Atlantic, 6,110; Pacific, 1,580; Hudson Strait, 1,245; Hudson Bay, 3,155; Arctic, 5,770; total, 17,860 miles.
    Islands-
    Atlantic, 8,680; Pacific, 3,980; Hudson Strait, 60; Hudson Bay, 2,305; Arctic, 26,785; total, 41,810 miles.

[^7]:    ${ }^{1}$ Includes Gatineau Park ( 86 sq . miles) and Quebec Battlefields Park ( 0.36 sq . mile) which are under Federal jurisdiction but are not technically National Parks. ${ }^{2}$ Less than one square mile.
    ${ }^{3}$ Includes 952,849 sq. miles set aside by Order in Council as native game preserves in which only Indians and Eskimos may hunt, but which are not regarded as National Parks. 4 Includes Wood Buffalo Park ( 13,675 sq. miles) which, although reserved by the Federal Government, is not administered as a National Park. 13,075 sq. miles) which ${ }_{7}$ Thurfolo Park in N.W.T. ${ }^{6}$ A forest experiment area of 25 sq . miles is included in National Parks figure. ${ }^{7}$ Three provincial forest reserves in Manitoba with a total area of $3,094 \mathrm{sq}$. miles are considered as Provincial Parks though not set up as such; duplication is omitted from totals.

[^8]:    ${ }^{1}$ Administered by the Northern Administration and Lands Branch, Department of Northern Affairs and National Resources.

    Provincial Parks.-In addition to the National Parks described above, most of the Provincial Governments have established parks within their boundaries. These parks, in the same way as the National Parks, are areas of special scenic or other interest, preserved and maintained for the benefit of the public but many of them are still undeveloped. A detailed list of Provincial Parks, showing location, year established, area and a short description of each, is given in the 1954 Year Book, pp. 26-30. The more important parks in each province are mentioned briefly-in the following outline.

[^9]:    * Prepared by the Canadian Wildlife Service, Department of Northern Affairs and National Resources, Ottawa.

[^10]:    * Prepared by Dr. D. C. Rose, Chairman of the Co-ordinating Committee, Canadian IGY Program, National Research Council, Ottawa.

[^11]:    ${ }^{1}$ Members of Her Majesty's Privy Council for Canada take rank inter se according to the dates of their being sworn in.
    ${ }^{2}$ Ranks as a Member of the Cabinet.
    ${ }^{3}$ Ranks as the Prime Minister of Canada.

[^12]:    ${ }^{1}$ The ordinary legal limit of duration for each Parliament is five years.
    ${ }^{2}$ Duration of Parliament in years, months and days. The life of a Parliament is counted from the date of return of election writs to the date of dissolution, both days inclusive (B.N.A. Act, Sect. 50). ${ }^{3}$ Date of general election. 4 Writs returnable. $\quad$ Dissolution of Parliament. $\quad$ During the war years Parliament was kept in almost continuous session. When prorogation took place it was followed immediately by a new session. During long adjournments provision was made whereby the Speaker could reconvene Parliament before the date previously set for reassembly. ${ }^{7}$ Includes long adjournment from Nov. 29, 1956 to Jan. 8, 1957.

[^13]:    ${ }^{1}$ Resigned Sept. 20, 1957.

[^14]:    ${ }^{2}$ Each voter in the double-member constituency of Queens County, P.E.I. had two votes; in 1957, 24,834 voters on the list cast 41,853 votes. ${ }^{2}$ Each voter in the double-member constituency of Halifax, N.S. had two votes; in 1957, 108,433 voters on the list cast 163,067 votes. ${ }^{3}$ Electoral District of Yukon. ${ }^{4}$ Electoral District of Mackenzie River.

[^15]:    ${ }^{1}$ One vacancy at Oct. $15,1957$.
    ${ }^{2}$ First appointed as a Judge of the Supreme Court, July 20, 1935.

[^16]:    * More detailed information concerning provincial judiciaries is given in the 1954 Year Book, pp. 48-55.

[^17]:    - The information given in Subsections 1 to 10 of this Section is brought up to Mar. 31, 1957, except where otherwise indicated. Provincial elections held between the date shown in each case and the date of going to press are covered in an Appendix to this volume.

[^18]:    ${ }^{1}$ The Ministries from 1933-57 were: 12th Ministry sworn in Sept. 5, 1933 under the leadership of Hon. Angus L. Macdonald; 13th Ministry sworn in July 10, 1940 under the leadership of Hon. A. S. MacMillan; 14th Ministry sworn in Sept. 8, 1945 under the leadership of Hon. Angus L. Macdonald; 15th Ministry sworn in Apr. 13, 1954 under the leadership of Hon. Harold Connolly; 16 th Ministry sworn in Sept. 30, 1954 under the leadership of Hon. Henry D. Hicks; 17th Ministry sworn in Nov. 20, 1956 under the leadership of Hon. Robert L. Stanfield.
    ${ }^{2}$ Life of Legislature not expired at Mar. 31, 1957.

[^19]:    ${ }^{1}$ The Ministries from 1935-57 were: 16th Ministry sworn in July 8, 1920 under the leadership of Hon. L. A. Taschereau; 17th Ministry sworn in June 11, 1936 under the leadership of Hon. A. Godbout; 18th Ministry sworn in Aug. 24, 1936 under the leadership of Hon. Maurice L. Duplessis; 19th Ministry sworn in Nov. 10, 1939 under the leadership of Hon. A. Godbout; 20th Ministry sworn in Aug. 30, 1944 under the leadership of Hon. Maurice L.

[^20]:    ${ }^{1}$ The Ministries from 1934-57 were: 6th Ministry sworn in July 19, 1934 under the leadership of Hon. J. G. Gardiner; 7th Ministry sworn in Nov. 1, 1935 under the leadership of Hon. W. J. Patterson; 8th Ministry sworn in July 10, 1944 under the leadership of Hon. T. C. Douglas. $\quad 2$ Life of Legislature not expired at Apr. 1, 1957.

    $\dagger$ As at May 31, 1957.

[^25]:    * Not all Crown corporations are subject to the provisions of the Financial Administration Act. For example, the Canadian Wheat Board, the Bank of Canada and its subsidiary, the Industrial Development Bank, because of the special nature of their functions, are escluded from operations of the Crown corporations Part of the Act and are governed by their own Acts of incorporation, as are such joint enterprises of the Federal and Provincial Governments as the Eastern Rockies Forest Conservation Board and the Halifax Relief Commission. Though not included in the Schedules to the Financial Administration Act, certain provisions of the Act apply to the Northern Ontario Pipe Line Crown Corporation, set up on June 7, 1956, to oversee the building of a cross-country natural gas pipeline. The Canada Council was set up under the Canada Council Act (assented to Mar. 28, 1957) as a Crown corporation but has been declared not an agency of the Crown and hence is not included in the Schedules to the Financial Administration Act.

[^39]:    ${ }^{1}$ Includes "Hutterite".
    91593-10
    2 Includes "Other Greek Catholic".

[^40]:    * Census definitions are briefly as follows: Dwecingas.-A Dwelling is defined as a structurally separate set of living premises with private entrance from outside the building, or from a common hallway or stairway inside. A Single Detached Dwelling, commonly called a single house, is a house containing one dwelling unit and completely separated on all sides from any other building or structure. A partments and Flats include dwelling units in apartment blocks, suites in duplexes or triplexes, suites in structurally converted houses, living quarters located in business premises, janitor's quarters in schools, etc. In determining the number of Rooms in a dwelling, only those used or suitable for living purposes including rooms occupied by servants, lodgers, or members of lodging families are counted.

    Housing.-A Household is a person or group of persons occupying one dwelling unit, the number of households thus equalling the number of occupied dwellings. Every person must be a member of some household, whether it consists of a family group with or without servants, lodgers, etc., a group of unrelated persons sharing a dwelling, or one person living alone. A dwelling is classed in need of Major Repair if it possesses any one of the following defects: sagging or rotting foundations indicated by cracked or leaning walls; faulty roof or chimney; unsafe outside steps or stairways; interior badly in need of repair. A Crowded Dwelling (or Household) is defined as one in which the number of persons exceeds the number of rooms occupied.

    FAnur.-A husband and wife (with or without children who have never married), or a parent with one or more children never married, living together in the same dwelling. Adopted children and step-children have the same status as natural children and, in fact, a family, for census purposes, may comprise a man or woman living with a guardianship child or ward under 21 years of age.

[^41]:    ${ }^{1}$ Exclusive of institutions, hotels, camps, etc.

[^42]:    ${ }^{1}$ Includes a few families with heads never married.

[^43]:    * Prepared in the Indian Affairs Branch, Department of Citizenship and Immigration, Ottawa.

[^125]:    Forty years of scientific research on a national basis have made it possible for Canada to keep pace with the exploitation of its own vast resources as well as with the accelerated economic development noticeable in all parts of the world.

    History and Organization.-Organized research in Canada on a national basis dates from 1916 when the Government of Canada established the Honorary Advisory Council for Scientific and Industrial Research under a Committee of the Privy Council. Provision was made for the planning and integration of research work, organization of co-operative investigations, postgraduate training of research workers, and prosecution of research through grants-in-aid to university professors. This was the basis of the Council's work from 1916 to 1924.

    * Prepared by John R. Kohr, Public Relations Branch, National Research Council of Canada, Ottawa.

[^126]:    * Of particular current interest in the field of scientific research is the International Geophysical Year. Canada's part in the program is dealt with in detail at pp. 35-38.

[^139]:    ${ }^{1}$ Total values for eight principal field crops are contained in Table 11; the total values for the remaining field crops and the values by province may be obtained from the Quarterly Bulletin of Agricultural Statistics. 2Includes British Columbia.

[^140]:    ${ }^{1}$ Cows and heifers, two years old or over, kept for milk purposes.

[^141]:    For footnotes, see end of table, p. 438.

[^142]:    ' Census data; annual estimates are not available.

[^143]:    ${ }^{1}$ Farm value (to pickers in the case of blueberries) for unpacked fruit.

[^144]:    ${ }^{1}$ Five-year average prices are derived from actual figures but quantities and values are rounded to the nearest thousand.

    Fibre Flax.-The demand for fibre flax was heavy during World War II when exports increased to many times the prewar volume. After the War however exports of fibre flax to Canada's principal market, the United Kingdom, dropped sharply and acreage devoted to this crop decreased.

[^145]:    ${ }^{1}$ Initial payments plus additional payments to producers.
    ${ }^{2}$ Based on cash closing prices, Winnipeg Grain Exchange. From Aug. 1, 1944 to Oct. 22, 1947 prices of oats and barley remained at or near the governmentimposed ceiling prices. From Oct. 23, 1947 to July 31, 1949 open market trading again prevailed. Equalization payments to producers are included for the crop years 1944-45 to 1947-48, inclusive. ${ }^{2}$ Average cash closing price, Winnipeg Grain Exchange, except where otherwise noted.
    ${ }^{4}$ Fixed price to growers.
    $5 \$ 5$ fixed price to growers plus 50 cents participation paym other cash and futures on Aug. 16, 1948. The Canadian Wheat Board was authorized to buy all flaxseed offered to it during the 1948-49 crop year on the basis of $\$ 4$ per bushel for No. 1 C.W. in store Fort William-Port Arthur, Ont.

[^146]:    ${ }^{1}$ No sales reported.

[^147]:    ${ }^{1}$ Fluctuations in apparent per capita flour consumption are partly caused by unavailability of complete data on flour inventories in all positions. ${ }^{2}$ Includes soybean flour. ${ }^{3}$ Exclusive of Newfoundland. ${ }^{4}$ Breakdown according to current classification not available. ${ }_{5}^{5}$ Includes process cheese. ${ }^{6}$ Includes cream expressed as milk.

[^148]:    ${ }^{1}$ Includes the Yukon and Northwest Territories.

[^149]:    ${ }^{1}$ Estimated totals are rounded to millions and include allowances for missing data for countries shown and data for producing countries not shown. Hungary, Poland and Romania.

[^150]:    ${ }^{1}$ Estimated totals are rounded to millions and include sllowances for missing data for countries shown and for other producing countries not shown. Hungary, Poland and Romania.

[^151]:    * Sections of this Chapter that deal with forestry and the federal forestry program were revised in the Forest Economics Section, Forestry Branch, Department of Northern Affairs and National Resources. Provincial forestry programs were prepared by the forestry officials of the respective provincial governments. Sections dealing with forest and allied industries, except as otherwise noted, have been revised in the Forestry Section, Industry and Merchandising Division, Dominion Bureau of Statistics.
    $\dagger$ A more detailed discussion of forest regions is given in Bulletin No. 89, A Forest Classification for Canada by W. E. D. Halliday, a publication of the Forestry Branch, Department of Northern Affairs and National Resources, Ottawa. Accounts of variations in Canadian physiography, climate. etc., are given in Chapter I of this volume.

[^152]:    * Obtainable from the Queen's Printer, Ottawa, price $\$ 1.50$.

[^153]:    ${ }^{1}$ Does not include wastage caused by agencies other than fire, such asinsects, disease and natural mortality, for which no reliable estimates are available.

[^154]:    ${ }^{1}$ Includes federal lands within provincial boundaries.
    ${ }^{2}$ Newfoundland excluded; no records available prior to 1949. ${ }^{2}$ Newfoundland included. $\quad$ Figures do not include such values as damage to soil, stream-flow, wildife. recreation and tourist facilities, or the enhanced values resulting from silviculture and management practices.

[^155]:    ${ }^{1}$ Includes federal lands within provincial boundaries.
    prior to 1949. $\quad$ Newfoundland included.

[^156]:    ${ }^{1}$ Roundwood only; wood residues used for pulping excluded.

[^157]:    ${ }^{1}$ In eatimating the annual drain on Canada's forest resources, certain converting factors have been used, each of which represents in cubic feet the quantity of merchantable wood used to produce one unit of the material in question. The factor for logs and bolts for the British Columbia coastal region is 175 and for the remainder of Canada 200. Other factors: pulpwood 85, fuelwood and wood for distillation 80 , poles and piling 15 , round mining timber 95 , hewn railway tiea 5, fence posts 1.2 and fence rails 1 . ${ }^{2}$ Converted to rough cords and included with pulp${ }^{W}$ ood. Chiefly Christmas trees but also includes balsam gum, cascara bark, etc.

[^158]:    ${ }^{1}$ Includes production in British Columbia, Manitoba, New Brunswick and Nova Scotia.
    ${ }^{2}$ Newfoundland
    incladed from 1949.

[^159]:    ${ }^{1}$ Newfoundland included from 1949.

[^160]:    *See Chapter XV for further particulars regarding the pulp and paper and paper-converting industries.

[^161]:    ${ }^{\bullet}$ For reasons given in Section 1, Part II of the Foreign Trade Chapter, gold is excluded from Canadian trade statistics.
    $\dagger$ Prepared by Mr. Rielle Thomson, Information Manager, Canadian Pulp and Paper Association, Montreal, Que. 91593-32

[^162]:    ${ }^{\bullet}$ Prepared by the Forest Products Laboratories, Forestry Branch, Department of Northern Affairs and National Resources, Ottawa.

[^163]:    * Furniture; sash, door and planing mills; veneer and plywood; hardwood flooring; boxes, baskets and crates; wood-turning; coffins and caskets; cooperage; woodenware; lasts, trees and wooden shoefindings; beekeepers' and poultrymen's supplies; excelsior; and other wood-using industries.

[^164]:    - Paper boxes and paper bags; roofing paper; miscellaneous paper goods.

[^165]:    * Except where otherwise indicated, this review was prepared under the direction of Dr. Mare Boyer. Deputy Minister of the Department of Mines and Technical Surveys, by Mary J. Giroux of the Department's Editorial and Information Staf.

[^166]:    ${ }^{\bullet}$ Prepared by M. F. Goudge, Chief, Industrial Minerals Division, Department of Mines and Technical Surveys.

[^167]:    * Prepared under the direction of Dr. Marc Boyer, Deputy Minister of the Department of Mines and Technical Surveys, by R. B. Toombs, Head, Mineral Economics Section, Mineral Resources Division. A survey of oil and gas pipelines will be found in the Transportation Chapter.

[^168]:    * Revised, under the direction of the Deputy Minister, in the Editorial and Information Division, Department of Mines and Technical Surveys, Ottawa.

[^169]:    - Prepared under the direction of W. E. Uren, O.B.E., Chairman of the Dominion Coal Board.

    91593-34

[^170]:    - See pp. 510-515.

[^171]:    - Compiled from material supplied by the respective provincial governments.

    91593-34 $\frac{1}{2}$

[^172]:    - Compiled from material supplied by the provincial governments.

[^173]:    ${ }^{1}$ Beginning with 1931, exchange equalization on gold production is included. production included from 1949.

[^174]:    -The construction of this inder, which is a component of the revised index of industrial production, is described in DBS Reference Paper, Revised Inder of Industrial Production, 1935-51.

[^175]:    ${ }^{1}$ Includes one ton valued at $\$ 536$ produced in N.W.T. Nova Scotia and 3 tons valued st $\$ 1,969$ produced in N.W.T.
    ${ }^{2}$ Includes 383 tons valued at $\$ 218,663$ produced in I Includes 788 tons valued at $\$ 171,962$ produced in Nova Scotia.
    ${ }^{4}$ Includes 991 tons valued at $\$ 577,868$ produced in Nova Scotia. valued at $\$ 757,758$ produced in Nova Scotis and 35 tons valued at $\$ 26,290$ produced in New Brumswick. cludes 357 tons valued at $\$ 295,846$ produced in Nova Scotia and 16 tons valued at $\$ 12,896$ produced in New Brunswick.

[^176]:    ${ }^{1}$ Includes also iridium, rhodium, ruthenium.

[^177]:    ${ }^{1}$ The sum of Cansdian cosl mines' aales, colliery consumption, coal supplied to employees and coal used in making coke, etc., less the tonnage of coal exported. ${ }^{2}$ Includes small tonnages from countries other than the United Kingdom and the United States. Deductions have been made from this column to take account of foreign coal re-exported from Canada and bituminous coal ex-warehoused for ships' stores.
    ${ }^{3}$ Figures based on estimates of population given at p. 119 .

[^178]:    ${ }^{1}$ Coal reaching Canadian ports whether or not it is cleared through customs, exclusive of 117,508 tons of imported

[^179]:    ${ }^{1}$ Includes minor items not specified.

[^180]:    ${ }^{1}$ Includes freight and smelter charges and cost of ores treated. process supplies, fuel, electricity, freight and smelter charges. and Saskatchewan credited to both provinces.

[^181]:    ${ }^{2}$ Gross value of shipments less cost of ${ }^{3}$ One plant on the border between Manitobs

[^182]:    ${ }^{1}$ Includes freight and amelter charges and cost of ores treated. process supplies, fael, electricity, freight and smelter charges. natural abrasivea.

[^183]:    ${ }^{1}$ Includes Ruanda－Urundi．${ }^{2}$ Smelter production．${ }^{5}$ Exports．${ }^{4}$ Consists of Gold Coast （now Ghana），Nigeria and Sierra Leone．${ }^{5}$ Shipments．${ }^{5}$ Includes lignite．${ }^{7}$ Estimate for Chins（Mainland） $102,702,000$ tons． 8 Includes natural gasoline．${ }^{\circ}$ Includes the Saar which became part of Weat Germany Jan．1， $1957 . \quad{ }^{10}$ Included with British West Africa．${ }^{11}$ Includes ferro－titanium． ${ }^{21}$ lncludes content of iron pyrites．${ }^{12}$ Entirely shale oil．${ }^{14}$ Great Britain only．Excludes coal pro－ duced at quarries but includes open－cast cosl
    ${ }^{15}$ Includes Alagka
    ores．

[^184]:    * Revised by the Water Resources Branch, Department of Northern Affairs and National Resources, Ottawa.

[^185]:    ${ }^{1}$ Includea only hydro-electric stations that develop power for sale. $\quad{ }^{2}$ Includes only water power actually developed by pulp and paper companies. ${ }^{2}$ Includes only water power actually developed by industries other than central electric stations and pulp and paper companies.
    installed.

    4 Includes water wheels and hydraulic turbines

[^186]:    * Revised in the Public Finance and Transportation Division, Dominion Bureau of Statistics.

[^187]:    ${ }^{1}$ Excludes duplication.
    ${ }^{2}$ Newfoundland included from 1949.
    ${ }^{2}$ Excludes employees engaged on new construction. ${ }^{\text {E }}$ Not comparable with previous years; figure excludes revenue from exports to U.S.A. and includes revenue from interprovincial transfers. The total comparsble with other years is $\$ 560,383.000 \quad{ }_{5}$ Not comparable with previous years; only ultimate customers now included. Including customers who purchased for resale, the total is $4,225,558$.

[^188]:    *The information included under the provincial headings of this Subsection has been revised by the various provincial commissions or authorities concerned.

[^189]:    ${ }^{1}$ Newfoundland included from 1949. $\quad{ }^{2}$ Not comparable with previous years; only ultimate customers now included. Including customers who purchased for resale, the total is 2,923,131.

[^190]:    ${ }^{1}$ Figures include Newfoundland since 1949.
    ${ }^{2}$ Not comparable with previous years; only ultimate customers now included. Including customers who purchased for resale, the total is 1,302,427.

[^191]:    ${ }^{1}$ Figures for 1955 are not comparable with those for 1954 and previous years; ultimate customers only are now included. Including customers who purchased for resale, the total is $1,302,427$, and provincial totals are:Newfoundland, 50,657 ; Prince Edward Island, 12,691; Nova Scotia, 109,266; New Brunswick, 28,127; Quebee, 611,222; Ontario, 38,486 ; Manitoba, 3,746; Saskatchewan, 11,969; Alberta, 119,632; British Columbia, 313,619; Yukon and Northwest Territories, 3,012.

[^192]:    ${ }^{1}$ Started operation July 1955.
    ${ }^{2}$ Kilowatts.

[^193]:    ${ }^{1}$ Dependable peak capacity-the amount of power subject to periodic change as equipment and water conditions vary, which the source is expected to be able to supply at the time of the system's peak demand. For the Commission owned or Commission operated generating stations, it is presumed that all units are available and that the supply of water is normal. Contractual stipulations govern the capacities of sources of purchased power.

[^194]:    ${ }^{1}$ Sum of the maximum 20 minute coincident peak loads (primary plus secondary) of each of the systems operated hy the Commission, given in terms of net output of the sources of supply to each System for the last month of each fiscal year.

[^195]:    ${ }^{1}$ Includes power generated by electric railways for their own use.

[^196]:    ${ }^{1}$ Includes halibut and other flatfish species together with cod, haddock, hake, pollock, cusk, redfish, wolffish, dogfish, and Pacific "cod" species and rockfishes. ${ }^{2}$ Excludes fish livers, seaweeds, bait worms and seals.

[^197]:    * Revised by the Department of Fisheries, Ottawa.

[^198]:    - Prepared by the respective provincial departments responsible for fisheries administration.

[^199]:    ${ }^{1}$ Excludes livers.

[^200]:    ${ }^{1}$ Classification of craft not available for British Columbia; total of 12,836 included for this Province in sea fisheries total. ${ }^{2}$ British Columbia draggers included with vessels for 1953 and 1954.

[^201]:    *Provincial information received from the respective provincial governments and that for the Yukon and Northwest Territories from the Northern Administration and Lands Branch of the Department of Northern Affairs and National Resources, Ottawa.

[^202]:    * Revised in the Agriculture Division, Dominion Bureau of Statistics.

[^203]:    ${ }^{1}$ Approximate. $\quad{ }^{2}$ Wildlife pelts for Newioundland included from 1952.

[^204]:    ${ }^{1}$ Figares for one fox farm in Newfoundland and two in British Columbia are included in the total for Canada but are excluded from provincial totals.

[^205]:    ${ }^{1}$ Includes Newioundland.

[^206]:    ${ }^{*}$ Prepared in the Animal Products Section, Industry and Merchandising Division, Dominion Bureau of Statistics.

[^207]:    ${ }^{1}$ For 1924-51, inclusive, the value added by manufacture is computed by subtracting the cost of fuel, electricity and materials from the gross value of products; for 1952 and 1953 the deduction is made from value of factory shipments and for 1954 and 1955 from the calculated value of production. Figures prior to 1924 are not comparable because statistics for cost of electricity are not available. $\qquad$ In 1952 gross value of products was replaced by value of factory shipments; see text immediately preceding this table.
    ${ }^{3}$ A change in the method of computing the number of wage earners in the years 1925 to 1930 , inclusive, increased the number somewhat over that which the method otherwise used would have given. In 1931, however, the method in force prior to 1925 was re-adopted. ${ }^{\text {a }}$ Newfoundland included from 1949 but fish processing in that Province was excluded in 1949 and 1950.

[^208]:    ${ }^{1}$ See footnote 1, Table 1.
    ${ }^{2}$ In 1952 gross value of products was replaced by value of factory shipments; see text on p. 634. ${ }^{2}$ See footnote 3. Table 1.

[^209]:    ${ }^{1}$ See footnote 1, Table 1. ${ }^{2}$ In 1952 gross value of products was replaced by value of factory shipments, see text on p. 634. ${ }^{3}$ See footnote 3, Table 1. 4 Ineludes Yukon Territory.

    The figures in Table 3 trace the tendencies in manufacturing industries as clearly as possible from 1917 to 1955. In analysing statistics of production and materials used, price changes should be borne in mind, particularly the inflation of values in the years immediately following World War I. the drop in prices of commodities during the depressions

[^210]:    ${ }^{1}$ A change in the method of computing the number of production workers in the years 1925 to 1930 inclusive increased the number aomewhat over that which the method otherwise used would have given. There was therefore a proportionate reduction in the averages for 1925-30 per employee as compared with what these averages would have been under the other method. In 1931 however the method in force prior to 1925 was re-adopted. The figures for 1931 and later years are therefore comparable with those for 1924 and earlier years.
    ${ }^{2}$ Net value of products; see footnote 1, Table 1, p. $634 . \quad{ }^{2}$ In 1952 gross value of products was replaced by value of factory shipments; see text on p. 634. $\quad$ Collected only every five years; 1953 figure latest available.

[^211]:    - For a description of the methods used in constructing the index and a description of its scope, see DBS Reference Paper No. 34, Revised Index of Industrial Production, 1995-1951.

[^212]:    For footnote. see end of table o. 646.

[^213]:    ${ }^{1}$ Includes miscellaneous transportation equipment items.

[^214]:    ${ }^{1}$ Includes excise taxes on prime cost of spirits and tobacco products.

[^215]:    ${ }^{1}$ Four main categories of ownership only; the non-classifiable group is not included.

[^216]:    - Statistics of earnings and hours of work in manufactaring will be found in Chapter XVIII on Labour.

[^217]:    Nore.-Figures are based on returns received from establishments employing 15 or more persons; figures for 1946 and 1947 refer to the last week in November whereas those for later years refer to the last week in October.

[^218]:    ${ }^{1}$ Includes only those head offices that are not located at a plant．

[^219]:    ${ }^{1}$ For confidential reasons these figures cannot be published since there are fewer than three establishments.

[^220]:    For footnotes, see end of table, p. 684.

[^221]:    For footnotes, see end of table, p. 684.

[^222]:    ${ }^{1}$ Cannot be published separately for confidential reasons and therefore included in "Miscellaneous industries". ${ }^{2}$ Publication authorized by the firms concerned.
    ${ }^{3}$ Includes all groups for which figures cannot be publiahed. ${ }^{4}$ Cannot be published separately for confidential reasons and therefore included in "All other groaps" ${ }^{5}$ Includes printing, publishing and allied trades, iron and steel products, non-ferrous metal products, producta d petroleum and coal, and chemicals and allied products.

[^223]:    * Information is given in greater detail in the Department of Trade and Commerce annual report, Private and Public Investment in Canada.

[^224]:    ${ }^{1}$ Includes air transport, warehousing and oil and gas pipelines.
    91593-45 $\frac{1}{2}$

[^225]:    ${ }^{-}$An explanation of sources and methods is given in the 1955 Year Book, $\mu$. 727 , and DBS annual report Construction in Canada.

[^226]:    ${ }^{1}$ Work done by the labour forces of utility, manufacturing, mining and logging firms and government departments, home-owner builders and other persons or firms not primarily engaged in the construction industry.

[^227]:    ${ }^{*}$ Prepared in the Information Division, Central Mortgage and Housing Corporation, Ottawa.

[^228]:    * Prepared in the Business Statistics Section, Research and Development Division, Dominion Bureau of

[^229]:    Alberta.-Alberta's net value of production advanced to $\$ 1,273,000,000$ in 1955 , more than 73 p.c. above the 1950 total. The Province's contribution to the national aggregate was 8.0 p.c. in 1955, compared with 6.8 p.c. in 1950 . Agriculture has declined

[^230]:    ${ }^{1}$ Excludes agriculture.

[^231]:    * Except as otherwise noted, this Chapter has been revised under the direction of A. H. Brown, Deputy Minister, Department of Labour, Ottawa.
    $\dagger$ Statistics and details of administration under this Act are given at pp. 274-276.

[^232]:    * Statistics on numbers and earnings of prevailing rate and other groups of federal employees exempt from the Civil Service Act are given on pp. 98-102.

    91593-48

[^233]:    ${ }^{1}$ Rates apply to 48 or 54 hours in factories; 48 hours in offices; 54 hours in laundries, shops, beauty parlours sad theatres; 60 hours in hotels. ${ }^{2}$ Applies only to canning or processing of fish, vegetables or fruit. ${ }^{3} \mathrm{Chail}$. feurs, watchmen, stationary enginemen and firemen 60 cents; bell boys 35 cents.
    ${ }^{4}$ Dollars per week.

[^234]:    ${ }^{1}$ Employers, 'own account' and unpaid family workers.

[^235]:    *Prepared in the Employment Section, Labour and Prices Division, Dominion Bureau of Statistics.

[^236]:    ${ }^{1}$ Consists mainly of hotels, restaurants, laundries, dry-cleaning establishments and business and recreation service. $\quad{ }^{2}$ Newfoundland included from 1949. $\quad{ }^{3}$ The proportion of employees reported in the industries to the total reported by all employers making returns in Canada (12-month average).

[^237]:    ${ }^{1}$ Exclusive of Newfoundland prior to 1951.

[^238]:    ${ }^{1}$ The durable goods group includes wood products, iron and steel products, transportation equipment, non-ferrous metal products, electrical apparatus and supplies, and non-metallic mineral products; the non-durable goods group includes all other manufacturing industries. ${ }_{2}$ Mainly hotels, restaurants, laundries, dry-cleaning
    establinhments and business and recreation service.

[^239]:    ${ }^{1}$ The durable goods group includes wood products, iron and steel products, transportation equipment, nonferrous metal products, electrical apparatus and supplies, and non-metallic mineral products; the non-durable goods group includes all other manufacturing industries.

[^240]:    ${ }^{1}$ New Westminster included in 1956.

[^241]:    ${ }^{1}$ Maximum rates based on length of service.

[^242]:    ${ }^{1}$ Includea a small number of employees in plants reporting alternate weeks of 5 and $5 \frac{2}{3}$ days.
    ${ }^{2}$ Establishments accounting for 63 p.c. of the employees reported regular shift work; in those employing 15 p.c., shifts were worked occasionally.

    91593-50출

[^243]:    ${ }^{1}$ Includes a small number of employees in establishments reporting alternate weeks of 5 and $5 \frac{1}{3}$ days, ${ }^{2}$ Meal allowances are sometimes reported as given in addition to other types of overtime compensation; or as the sole type of overtime compensation.

[^244]:    ${ }^{1}$ Less than an estimated 100 persons.

[^245]:    ${ }^{1}$ October to December only for 1955; for January to September duration was calculated on a 'day' basis. Total number of days for that period was $52,408,092$.

[^246]:    ${ }^{1}$ Jan. 1 to Apr. 15.

[^247]:    Norz.-Figures by provinces from 1920-54 are given in the corresponding table of previous Year Books beginning with the 1926 edition. Totals for $1920-37$ are given in the 1938 edition, p. 766; for 1938 in the 1939 edition, p. 802 ; and for 1939-46 in the 1951 edition, p. 686.

[^248]:    - More detailed information is given in the annual report, Canadian Vocational Training Branch, publisbed as a supplement to the annual report of the Department of Labour.

[^249]:    More detsiled information is given in the Department of Labour publication, Workmen's Compensation in Canada, $A$ Comparison of Provincial Lave.

[^250]:    ${ }^{1}$ Accidents requiring medical treatment but not causing disability for a sufficient period to qualify for compensation; the period varies in the several provinces.
    ${ }^{2}$ Includes, except where noted otherwise, payments to compensate for lost earnings, medical aid payments, cost of rehabilitation and hospitalization (not including capital expenditures), pensions paid (not total pensions awarded) for temporary and permanent disabilities. ${ }^{1}$ Does not include payments by employers who make direct compensation to their employees; such employers come under Schedule II of the Ontario and Quebec Workmen's Compensation Acts.
    ${ }^{4}$ Not including hospitalization

[^251]:    ${ }^{1}$ Duplications in columns 1 and 2 eliminated.

[^252]:    *Prepared by Dr. Eugene Forsey, Director of Research, Canadian Labour Congress, Ottawa.

[^253]:    ${ }^{1}$ Figures for 1949 and previous years are as at Dec. 31; figures from 1951 are as at Jan. 1.

[^254]:    'Amalgamated as at May 1, $1956 . \quad$ 2 Estimated membership at the founding of the Canadian Labour
    Congresa. ${ }^{2}$ 2 The atimated memberahip at the founding of the Canadian Labour
    Congress on Oct. 1, 1956.
    91593-51 $\frac{1}{2}$

[^255]:    - A complete review of strikes and lockouts occurring in each year is given in Department of Labour reports.

[^256]:    *The Board's judgments are reported in Canadian Railway Cases and Canadian Railway and Transport Casal. and its judgments, orders, rulings and regulations are published fortnightly by the Queen's Printer, Ottaras, in what is known as J.O.R. \& R.

[^257]:    *Revised in the Public Finance and Transportation Division, Dominion Bureau of Statistics; more detailed information is given in the annual reports of the Division. Certain of the financial statistics were compiled in co-operation with the Department of Transport.

[^258]:    ${ }^{1}$ Newfoundland included from 1950.

[^259]:    * Statistics for individual railways are given in DBS annual report, Railway Transport, published in five parts.

[^260]:    'Includes $\$ 121,230,690$ Quebee North Shore and Labrador Railway investment in road and property not previomaly reported. $\quad$ Details given in DBS report, Railway Transport.

[^261]:    ${ }^{1}$ Less than carload lots.

[^262]:    *The Hudson Bay Railway is a direct responsibility of the Federal Government and has been opersted by the CNR for the Government since Apr. 1, 1935; statistics relating to the operation of this line are not incladed in the data for the CNR.

[^263]:    ${ }^{1}$ Includes the Central Vermont Railway, Incorporated.
    ${ }^{2}$ Contributed by or paid to the Federal Government.

[^264]:    ${ }^{2}$ Includes appropriations for insurance fund.

[^265]:    ${ }^{1}$ Over railways, boat lines and motor carrier and aircraft routes.
    ${ }^{2}$ Amounts paid by express companies to the cariers元,290 aircrat miles were reported by the Canadian National Express, 4,286 and 1,194 aircraft miles reported by Canadian National Express and Railway Express Agency, Inc., respectively.

[^266]:    ${ }^{1}$ Includes $35,147,070$ passengers carried by the Toronto subway in 1955, 36,224,003 passengers in 1956 add $36,579.014$ in 1957.
    and 6,981,792 in 1957.

[^267]:    ${ }^{1}$ Decrease from 1951 accounted for by the re-capitalization of the Winnipeg Electric Company; transit facilitiea : that Company were transferred to the Greater Winnipeg Transit Company.

[^268]:    ${ }^{\bullet}$ Except as otherwise indicated, the material in this Part has been revised in the Public Finance and Transportation Division, Dominion Bureau of Statistics.
    $\dagger$ The information in this Section has been revised from material provided by the officials in charge of the sdministration of motor vehicle and traffic Acts and Regulations in the individual provinces and territories.

[^269]:    ${ }^{1}$ Includes payments from railways and contributions from the Railway Grade Crossing Fund toward elimination of grade crossings, etc., amounting to $\$ 1,443,009$ in $1951-52, \$ 925,580$ in 1952-53, $\$ 712,523$ in $1953-54, \$ 1,237,237$ in 1954-55 and $\$ 1,116,876$ in 1955-56. 2 Includes federal administrative costs re Trans-Canada Highway amounting to $\$ 282,652$ in $1951-52, \$ 298,230$ in 1952-53, $\$ 399,834$ in $1953-54$, $\$ 131,002$ in $1954-55$ and $\$ 462,600$ in 1955-56. ${ }^{2}$ Federal administrative costs only.

[^270]:    * Statistics are given in more detail in DBS annual report Highway Statistics.

[^271]:    ${ }^{1}$ Includes registrations in the Yukon and Northwest Territories. $\quad{ }^{2}$ Registered farm tractors were excluded for the first time in 1956 resulting in smaller increases and even a decrease in Prince Edward Island as compared with 1955.
    

[^272]:    ${ }^{1}$ Factory shipments since 1952.

[^273]:    ${ }^{1}$ Includes other items not shown such as transfer of motor vehicles, garage and service station licences, and fines for infractions of motor vehicle laws. ${ }^{2}$ Included with trucks. ${ }_{3}$ Included with other motor vebicles. 4Included with passenger automobiles.

[^274]:    - Statistics are given in more detail in DBS annual report Motor Carriers, Freight-Passenger.

[^275]:    ${ }^{1}$ Incomplete coverage.

[^276]:    ${ }^{1}$ Incomplete coverage. ${ }^{2}$ Included with "Other"

[^277]:    - Information and statistics dealing with this subject have been supplied as follows: aids to navigation, cansls, harbours, administrative services, and marine services by the Department of Transport and the National Harbours Board; the St. Lawrence Seaway by the St. Lawrence Seaway Authority; part of the financial statistics by the Department of Public Works; shipping subsidies by the Director of Subsidized Steamship Services, Cansdisn Maritime Commission; Panama Canal by the Governor of the Panama Canal Zone; other canal traffic and statistics of shipping by the Public Finance and Transportation Division, Dominion Bureau of Statistics.

[^278]:    ${ }^{1}$ Exclusive of passenger service.
    ${ }^{2}$ Sea-going and inland international.

[^279]:    ${ }^{1}$ Sea-going and inland international.

[^280]:    ${ }^{1}$ Subsidy payments have been completed.

[^281]:    * A special article on the Canals of the St. Lawrence Waterway appears in the 1954 Year Book, pp. 830-833.

[^282]:    ${ }^{1}$ Included with United States.

[^283]:    ${ }^{1}$ Figures for the United States include small amounts of traffic from other foreign countries.

[^284]:    Channel dredging taking place in Montreal Harbour, Lake St. Louis, Lake St. Francis, in the channels at Cornwall Island and in the Thousand Islands section, and in the Welland Ship Canal was proceeding on schedule at the end of 1957.

[^285]:    ${ }^{*}$ Sections 1 and 2 of this Part were revised in the Department of Transport and Section 3, except where otherwise indicated, in the Transportation Section, Public Finance and Transportation Division, Dominion Bureau of Statiatics. For military air transportation, see Chapter XXVIII on Defence of Canada.

[^286]:    ${ }^{1}$ Includes Canadian trans-border, transatlantic and transpacific services.

[^287]:    *Prepared by R. B. Toombs, Petroleum Engineer, Department of Mines and Technical Surveys, Ottawa.
