NPHS Data Quality: Exploring Non-sampling Errors

Sandra Tolusso and François Brisebois

ABSTRACT

The National Population Health Survey (NPHS) is a biennial longitudinal survey that collects information on the health of the Canadian population and related socio-demographic information. NPHS also fulfilled cross-sectional needs during its first three cycles, but became purely longitudinal with its recently completed fourth cycle. This paper presents some data quality indicators such as the number of attempted contacts needed to complete a case, the length of interviews, refusal conversion, item refusal and item don't know rates, and edit failure and data inconsistencies, focussing mainly on the longitudinal panel members.

La qualité des données de l'ENSP: une exploration des erreurs non dues à l'échantillonnage

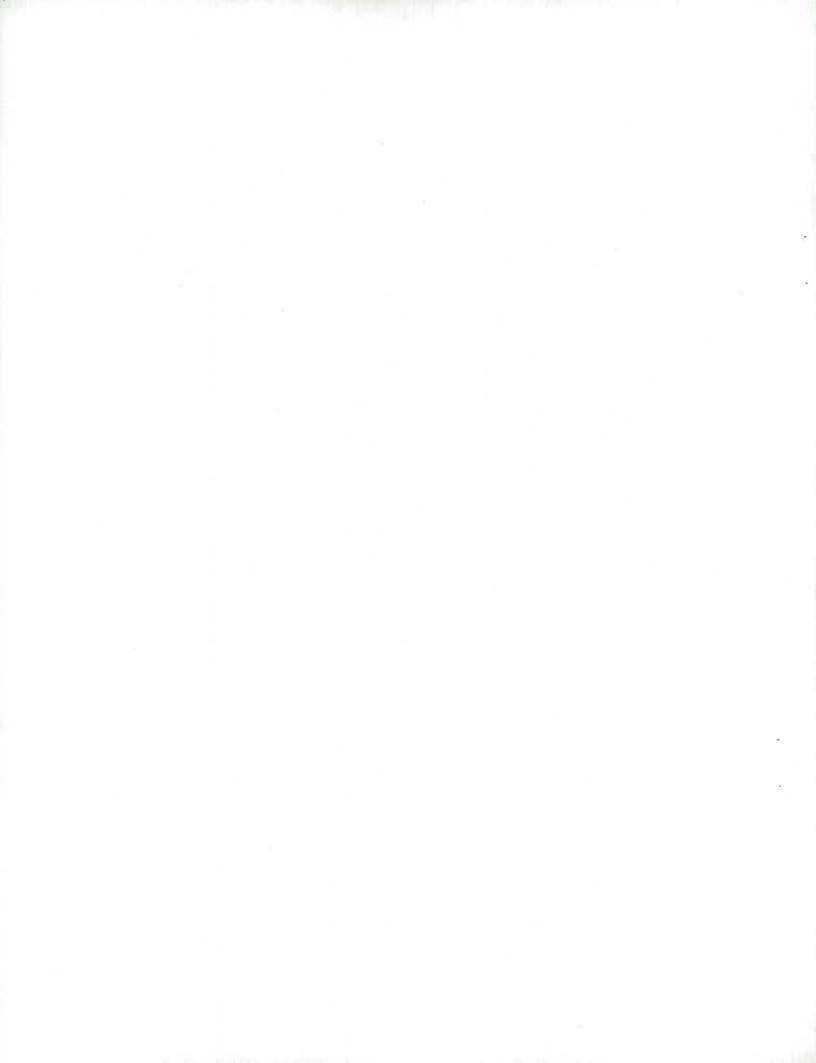

Sandra Tolusso et François Brisebois

RÉSUMÉ

L'Enquête nationale sur la santé de la population (ENSP) est une enquête biennale qui recueille des renseignements sur la santé de la population canadienne ainsi que des renseignements sociodémographiques connexes. L'ENSP a recueilli des renseignements de nature transversale durant les trois premiers cycles mais est devenue uniquement longitudinale avec le quatrième cycle qui a récemment été complété. Ce document présente des indicateurs de qualité comme le nombre d'essais nécessaires pour contacter et compléter un cas, la durée des entrevues, la conversion des refus, les taux de refus et de ne sait pas par item, les taux d'échec au contrôle et l'incohérence des données, en mettant l'accent sur les membres du panel longitudinal.

1. INTRODUCTION

1.1 Background of the Survey

The National Population Health Survey (NPHS) is designed to collect information on the health of the Canadian population and related socio-demographic information. The first cycle of data collection took place in 1994-1995, and continues every second year thereafter for 20 years. The NPHS fulfilled both cross-sectional and longitudinal needs during its first three cycles, but with Cycle 4 (2000-2001), NPHS became a strictly longitudinal survey. The NPHS is now composed of two components: the survey of households and the survey of health care institutions. This document focuses on the data from the Household component.

The Household component of NPHS includes household residents in all provinces, with the principal exclusion of populations on Indian Reserves and Crown Lands, residents of health care institutions, fulltime members of the Canadian Armed Forces, and some remote areas in Ontario and Quebec. The Health Care Institutions component includes long-term residents in health care facilities with four or more beds in all provinces (with an expected stay of longer than six months) with the principal exclusion of the territories and full-time members of the Canadian Armed Forces. If a longitudinal respondent from the Household component moves into a health care institution, the Institutions component will interview them. The Household component of NPHS has released data from the first four cycles: Cycle 1 (1994-1995), Cycle 2 (1996-1997), Cycle 3 (1998-1999) and Cycle 4 (2000-2001).

The Cycle 4 NPHS Household component collected in-depth information on the health of the 17,276 longitudinal respondents (or panel members) who were randomly selected in Cycle 1, as well as demographic information about all members of the longitudinal respondent's household. The health questionnaire includes questions related to health status, use of health services, determinants of health, chronic conditions and activity restrictions. Socio-demographic information is also collected; it includes age, sex, education, ethnicity, labour force status and household income. An entry and demographic questionnaire precedes the health questionnaire, where confirmation of the panel member's residence in that dwelling or the collection of information regarding where they may now reside takes place, as well as the collection of demographic information about all of the household members. An exit questionnaire is administered at the end of the interview, where outcome codes for the interview are assigned, reasons for refusals or non-interviews collected, and contact names recorded for tracing purposes. Data for children under age 12 are collected using a proxy respondent.

NPHS interviews are conducted using Computer Assisted Interviews (CAI). The majority of Cycle 1 interviews were conducted in person, with most panel members choosing to be interviewed by telephone in subsequent cycles. Collection for NPHS takes place every two years, starting in 1994 with Cycle 1, and the task is performed by five Regional Offices (ROs). NPHS has four quarters of collection each cycle, plus a clean-up quarter referred to as Quarter 5. Collection is done over a year, starting in June and continuing in August, November, and February, with Quarter 5 in June. Quarter 5 is used to resend whatever cases were not fully or partially complete during the first four quarters of collection. Nonrespondents in Quarter 1 may also be resent in Quarter 3, and Quarter 2 nonrespondents may be resent in Quarter 4. Cases that refuse are transferred from interviewers to senior interviewers, and to project managers, if necessary.

For more information, please refer to the Cycle 4 Longitudinal Documentation. Questionnaires for all four cycles can be found on Statistics Canada's website at http://www.statcan.ca/english/concepts/nphs/.

1.2 Non-sampling Errors

The survey produces estimates based on information collected from a sample of individuals. Somewhat different estimates might have been obtained if a complete census had been taken using the same questionnaire, interviewers, supervisors, processing methods, etc. as those used in the survey. The difference between the estimates obtained from the sample and those resulting from a complete count taken under similar conditions is called the *sampling error* of the estimate.

Errors that are not related to sampling may occur at almost every phase of a survey operation. Interviewers may misunderstand instructions, respondents may make errors in answering questions, the answers may be incorrectly entered and errors may be introduced in the processing and tabulation of the data. These are all examples of *non-sampling errors*. This document deals strictly with non-sampling errors.

Over a large number of observations, randomly occurring errors will have little effect on estimates derived from the survey. However, errors occurring systematically will contribute to biases in the survey estimates. Considerable time and effort was made to reduce non-sampling errors in the NPHS. Quality assurance measures were implemented at each step of data collection and processing to monitor the quality of the data. These measures included the use of highly skilled interviewers, extensive training with respect to the survey procedures and questionnaire, and the observation of interviewers to detect problems. Testing of the CAI application and field tests were also essential procedures to ensure that data collection errors were minimized.

1.3 Scope of this Document

While reporting measures of data quality is part of our mandate, this document does not cover every aspect of data quality. The Statistics Canada Quality Guidelines (1998) divide data quality studies into two kinds of studies. The first involves *certification* or *validation*, which is the process of reviewing the data prior to the official release to ensure that grossly erroneous data are not released, or to identify data of marginal quality. *Source of error* studies generally provide quantitative information on specific sources of error in the data. This document falls into the second group of studies.

Sections are reported in the order that they occur during the course of a cycle. Before any health information can be obtained, the panel member must be contacted. The first section presented in this document deals with the tracing of panel members, followed by a section on the number of attempted contacts and interview times for panel members. The next section deals with refusals and refusal conversions, which occur once the panel member is contacted. Once panel members (or an acceptable substitute when a proxy interview is necessary) agree to be interviewed, they provide data. Lack of data, in the form of a refusal to answer a particular question or the respondent's inability to recall the information, is presented in the following section. Finally, once collection has ended, edits are performed and data inconsistencies analyzed. These two actions are the subjects of the penultimate section, while the final section mentions forthcoming data quality studies.

Other aspects of data quality such as response rates and attrition rates can be found in the Cycle 4 Longitudinal Documentation.

2. TRACING

Between cycles, panel members may change their phone numbers or move to new residences, cities or provinces. Since this is a longitudinal survey and the goal is to follow the panel members over time, the interviewers must try to find the panel member if they are no longer at the same phone number or residence as when last interviewed. Interviewers are provided with the last known address and telephone number, as well as the name and address of one or two contacts collected in previous cycles. Interviewers are also trained to use resources such as local telephone directories and directory assistance. If unsuccessful, the case is transferred to an experienced interviewer trained specifically in tracing respondents and with access to Canada-wide directories and reverse directories.

NPHS has been incredibly successful at tracing panel members over time. Table 2.1 shows the tracing status of all 17,276 panel members for all four cycles. 96% (16,555) of all records were traced in all four cycles. Of the 296 records that first became untraced in Cycle 2, 35% (103) were traced in the next cycle, 20% (60) were traced two cycles later, and 45% (133) were untraced for three cycles in a row. Of the 169 who first became untraced in Cycle 3, 43% (73) were traced in Cycle 4.

| Cycle 1 | Cycle 2 | Cycle 3 | Cycle 4 | Number of panel members |
|---------|----------|----------|----------|-------------------------|
| Traced | Untraced | Untraced | Untraced | 133 |
| Traced | Untraced | Untraced | Traced | 60 |
| Traced | Untraced | Traced | Untraced | 19 |
| Traced | Untraced | Traced | Traced | 84 |
| Traced | Traced | Untraced | Untraced | 96 |
| Traced | Traced | Untraced | Traced | 73 |
| Traced | Traced | Traced | Untraced | 256 |
| Traced | Traced | Traced | Traced | 16,555 |

Table 2.1: Distribution of the Tracing Patterns for All 17,276 Panel Members

Table 2.2 shows the distribution of the panel members by sex and age group (based on their age in 1994) according to whether they were traced in all four cycles or not. The age groups 12–24 and 25–44 are much more likely than other age groups to be untraced at some point. For these two age groups, males in particular make up a large part of those who were untraced.

Table 2.2: Age/sex Distribution of the Panel Members Who Were Traced and Untraced

| Age/sex | Traced in all four | Not traced at some | Proportion untraced |
|---------------|--------------------|--------------------|---------------------|
| | cycles | point | at some point |
| Males 0-11 | 993 | 34 | 3.3% |
| Males 12-24 | 1,238 | 129 | 9.4% |
| Males 25-44 | 2,552 | 177 | 6.5% |
| Males 45-64 | 1,794 | 54 | 2.9% |
| Males 65+ | 1,069 | 5 | 0.5% |
| Females 0-11 | 952 | 43 | 4.3% |
| Females 12-24 | 1,338 | 94 | 6.6% |
| Females 25-44 | 2,958 | 141 | 4.5% |
| Females 45-64 | 2,007 | 32 | 1.6% |
| Females 65+ | 1,654 | 12 | 0.7% |

3. NUMBER OF ATTEMPTED CONTACTS AND INTERVIEW LENGTHS IN CYCLE 4

In Cycle 4, cases were managed by the Case Management System, which ensures efficient, reliable and secure movement of data between headquarters in Ottawa and the ROs, as well as between ROs and the interviewers. Case Event files are produced by the Case Management System, consisting of a record for each time that a case was worked on, whether tracing the panel member, attempting unsuccessfully to contact the panel member, or administering the questionnaire. Therefore, the number of contacts per panel member required to complete a case can be computed using the Case Event files. Unfortunately, the Case Management System used for collection in Cycle 4 is different than that used in previous cycles, and information on the number of contacts could only be obtained for Cycle 4.

The H6 file is an intermediate file used in processing that contains health questionnaire data. In Cycle 4, it also contained module start and end times. This file was used to compute the amount of time that it took to complete a module.

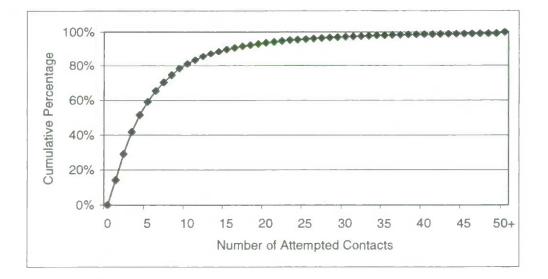

3.1 Number of Attempted Contacts in Cycle 4

The number of attempted contacts was computed using the Case Event files from all four quarters of Cycle 4, as well as the clean-up quarter. The Case Event file identifies the date, start time and end time of each contact, and includes case event status variables and the outcome code assigned by the interviewer to each contact.

Not all attempts were used to compute the number of attempted contacts for a panel member. Tracing is considered a separate phase and is thus excluded; including tracing attempts would inflate the actual number of attempted contacts with a panel member needed to obtain a full response. A tracing attempt means that the panel member has not yet been located, and therefore a response to that attempted contact by the panel member is not possible.

Of the 17,276 panel members, 16,051 were used to study the number of attempted contacts. The remaining 1,225 panel members were either institutionalized, confirmed as deceased (through a match to the mortality files) or not sent out due to a previous adamant refusal.

Figure 3.1 – Cumulative Percentage of the Number of Attempted Contacts to Fully Complete an Interview in Cycle 4

5

Figure 3.1 shows the cumulative percentage of the number of attempted contacts required to fully complete an interview. About 90% of the respondent interviews were completed in 15 attempted contacts or less. Table 3.1 displays the number of attempted contacts by response type at the RO and national levels. The number of attempted contacts for the respondents is based on the 13,968 panel members who fully completed the interview. This number differs from the 14,650 respondents on the Cycle 4 Master file since panel members who have been confirmed dead or who resided in an institution in Cycle 3 and still reside in an institution are excluded from the Case Event files. Those interviewed by the Institutions component are not on the Case Event files because the questionnaire for the Institutions component is completed on paper. Panel members who are not respondents have been divided into four groups: partial respondents, no one at home, refusals, and other nonresponse.

| Type | RO | Panel Members | Mean Number of Attempted Contacts | Median Number of Attempted Contacts | 25th Percentile | 75th Percentile |
|-------------|-----------|------------------|--------------------------------------------|----------------------------------------------|--------------------|--------------------|

| | Vancouver | 147 | 18.2 | 16 | 10 | 24 |
| | Canada | 16,051 | 9.5 | 5 | 2 | 11 |
| | Halifax | 3,990 | 9.2 | 5 | 2 | 10 |
| | Montreal | 2,834 | 8.1 | 5 | 2 | 10 |
| Total | Toronto | 3,889 | 12.5 | 5 | 3 | 13 |
| | Edmonton | 3,725 | 8.0 | 5 | 2 | 10 |
| | Vancouver | 1,613 | 9.4 | 6 | 3 | 12 |

Table 3.1 - Number of Attempted Contacts by Response Type in Cycle 4

At the national level, the median number of attempted contacts for respondents was four. The average, median, 25th and 75th percentiles of each RO are similar to those observed at the national level. The number of attempted contacts differs for the four types of nonresponse. The highest number of attempted contacts for all four types are in the Toronto RO, while the lowest can be found in Montreal or Edmonton. Of the nonrespondent groups, the highest number of attempted contacts was for panel members where no one was home, as expected, with a median of 39 contacts at the national level. This is followed by the group "other nonresponse", the refusal group, and partial responses, with medians of 23, 14 and 9 attempted contacts, respectively.

Table 3.2 shows the number of attempted contacts by type of interview, in person or by telephone, using the "type of interview" variable AM60_TEL from the Cycle 4 Master file. They are based on only 13,404 of the 13,968 respondents on the Case Event files, as 564 respondents had no interview type stated, or in a few cases, were interviewed using both methods. Personal visits were made if the respondent did not have a telephone, if the interviewer made a personal visit in the course of tracing a respondent, or upon request by the respondent. The proportion of personal interviews varies from 1.1% in the Toronto RO to 3.2% in the Halifax RO. The median number of attempted contacts at the national level is five for personal interviews, and four for telephone interviews. The median number of attempted contacts for telephone interviews is also four at the RO level, while the medians for personal interviews vary between 3 and 7. The mean and median number of attempted personal contacts is higher than for telephone interviews, with the sole exception being the median in the Montreal RO.

| Туре | RO | Panel Members | Mean Number of Attempted Contacts | Median Number of Attempted Contacts | 25th Percentile | 75th Percentile |
|----------------|-----------|------------------|--------------------------------------------|----------------------------------------------|--------------------|--------------------|
| | Canada | 13,121 | 7.1 | 4 | 2 | 8 |
| | Halifax | 3,354 | 7.5 | 4 | 2 | 9 |
| The local same | Montreal | 2,318 | 6.5 | 4 | 2 | 8 |
| Telephone | Toronto | 3,091 | 7.8 | 4 | 2 | 9 |
| | Edmonton | 3,119 | 6.5 | 4 | 2 | 8 |
| | Vancouver | 1,239 | 7.3 | 4 | 2 | 9 |
| | Canada | 283 | 10.9 | 5 | 2 | 13 |
| | Halifax | 112 | 10.7 | 7 | 3 | 14 |
| | Montreal | 66 | 7.4 | 3 | 2 | 8 |
| Personal | Toronto | 34 | 17.1 | 6.5 | 3 | 19 |
| | Edmonton | 44 | 12.5 | 7 | 3 | 14.5 |
| | Vancouver | 27 | 9.5 | 5 | 2 | 12 |

Table 3.2 - Number of Attempted Contacts by Type of Interview for Respondent Panel Members in Cycle 4

Table 3.3 shows the number of attempted contacts for all respondent panel members by sex and the five age groups (under 12, 12-24, 25-44, 45-64, 65 and older), using the panel member's age in Cycle 4. Only the groups 12-24 and 25-44 have average and median attempted contacts above those of the national level. This result is consistent with the findings of many other studies indicating that younger adults tend to be harder to contact and with the tracing results presented in section 2. The statistics for both sexes are very similar, with males having a slightly higher number of attempted contacts (with a median of 5 and an average of 7.5) than women (with a median of 4 and an average of 7.0). Males 25-44 have the highest number of contacts, with more than double the number of average contacts required for those of age 65 and older. For the under 12 and 12-24 age groups, males require, on average, a lower number of contacts than females, while the reverse is true for the three oldest age groups.

| Age Group | Panel Members | Mean Number of Attempted Contacts | Median Number of Attempted Contacts | 25th Percentile | 75th Percentile |
|---------------|------------------|-----------------------------------------|----------------------------------------------|-----------------|-----------------|
| Total | 13,968 | 7.2 | 4 | 2 | 9 |
| < 12 | 867 | 5.6 | 4 | 2 | 7 |
| 12-24 | 2,060 | 8.2 | 5 | 3 | 9 |
| 25-44 | 4,548 | 9.1 | 6 | 3 | 11 |
| 45-64 | 3,700 | 6.9 | 4 | 2 | 8 |
| 65+ | 2,793 | 4.5 | 3 | 1 | 5 |
| Total Males | 6,388 | 7.5 | 5 | 2 | 9 |
| < 12 | 437 | 5.4 | 3 | 2 | 6 |
| 12-24 | 1,025 | 8.0 | 5 | 3 | 9 |
| 25-44 | 2,063 | 9.4 | 6 | 3 | 12 |
| 45-64 | 1,772 | 7.3 | 4 | 2 | 9 |
| 65+ | 1,091 | 4.7 | 3 | 1 | 5 |
| Total Females | 7,580 | 7.0 | 4 | 2 | 8 |
| < 12 | 430 | 5.8 | 4 | 2 | 7 |
| 12-24 | 1,035 | 8.3 | 5 | 2 | 9 |
| 25-44 | 2,485 | 8.8 | 5 | 3 | 10 |
| 45-64 | 1,928 | 6.7 | 4 | 2 | 8 |
| 65+ | 1,702 | 4.3 | 3 | 1 | 5 |

Table 3.3 - Number of Attempted Contacts by Age Group and Sex for Respondent Panel Members in Cycle 4

Figure 3.2 Cumulative Percentage of the Number of Attempted Contacts to Complete an Interview by Age Group in Cycle 4

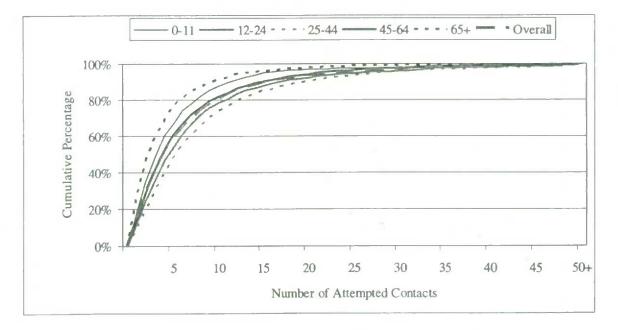

Figure 3.2 shows the cumulative percentage of the number of attempted contacts required to fully complete an interview by age group, as well as overall (as seen in Figure 3.1). Like Table 3.3, it shows that the different age groups require a different number of attempted contacts to complete an interview. For example, after 10 attempted contacts, 92% of the interviews with respondents aged 65 and older were completed, while only 74% of the interviews for the 25-44 age group were completed. Imposing a limit on the number of contacts would cause some age groups to have lower response rates than others.

3.2 Length of Interviews

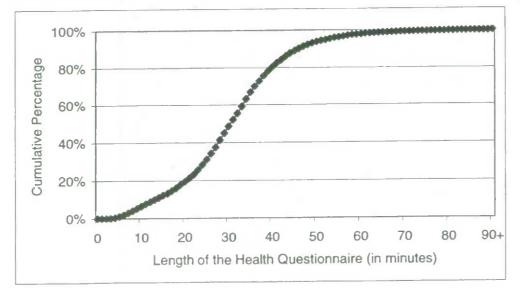

The interview lengths presented in this section were tabulated using the health questionnaire (H6) only. The entry, demographic, and exit components of the questionnaire are not included in these interview lengths. These components take an average of another four to five minutes to complete. Interviews that were interrupted and consequently completed in more than one session were excluded to ensure that the start and end times of each module were an accurate reflection of how long it took to complete the health questionnaire. 10,086 of the 13,560 fully completed Cycle 4 interviews were identified as having been completed in one session, and were used to calculate the interview lengths.

The total interview lengths obtained from the H6 file indicate that almost 90% of fully completed interviews were completed in 45 minutes or less, and 98% were completed in one hour or less. Figure 3.2 shows the cumulative percentage of the total interview lengths for fully completed interviews, while Table 3.4 displays the median, 25th and 75th percentile total interview lengths by RO.

| RO | Panel Members | Median Interview Length | 25th Percentile | 75th Percentile |
|-----------|---------------|-------------------------------|-----------------|-----------------|
| Canada | 10,086 | 30:53 | 23:13 | 38:15 |
| Halifax | 2,703 | 31:19 | 25:01 | 37:47 |
| Montreal | 1,730 | 29:31 | 20:48 | 37:11 |
| Toronto | 2,257 | 31:05 | 23:25 | 39:02 |
| Edmonton | 2,395 | 30:52 | 21:13 | 38:53 |
| Vancouver | 1,001 | 31:13 | 25:01 | 38:15 |

Table 3.5 - Cycle 4 Interview Lengths by Module

The median interview length at the national level is 30:53 (30 minutes, 53 seconds). All of the median lengths at the RO level are within 30 seconds of the national median, with the exception of the Montreal RO, which is 90 seconds shorter. Interview lengths are very similar for the ROs, although those from the Montreal RO are consistently shorter than those for the other ROs. Table 3.5 displays the interview lengths by module, in ascending order according to the median. Figure 3.3 shows the distribution of the interview lengths, for the entire H6 and by module. The stress module is by far the longest module with a median length of 5:49. Most modules have median interview lengths of under one minute.

Table 3.6 presents the interview lengths by age group, based on the panel member's age in Cycle 4. As expected, the shortest interview lengths were for the under 12 age group, as several questions and modules are not asked of this age group. The median interview length for the under 12 age group is 8:49. The median time of the 12-24 age group is 28:16, while the medians of the other three age groups vary between 31:55 and 33:38. Some questions, including the entire stress module, which as noted above, is the longest module of the interview, are not asked of panel members under the age of 18, explaining the shorter median interview length for the 12-24 age group.

| | Panel Members | Median Interview Length | 25th Percentile | 75th Percentile |
|-------|------------------|-------------------------------|-----------------|-----------------|
| Total | 10,086 | 30:53 | 23:13 | 38:15 |
| < 12 | 722 | 8:49 | 6:44 | 11:03 |
| 12-24 | 1,517 | 28:16 | 20:44 | 35:01 |
| 25-44 | 3,269 | 31:55 | 26:06 | 38:05 |
| 45-64 | 2,775 | 33:38 | 26:44 | 40:38 |
| 65+ | 1,803 | 32:24 | 24:50 | 41:59 |

Table 3.6 - Cycle 4 Interview Lengths by Age Group

Table 3.7 presents the interview lengths by sex. Female respondents tend to have interview lengths that are two to three minutes longer than male respondents. About half of the modules have average lengths that are longer for females, about one quarter have longer lengths for males, and the remaining modules have lengths that are about equal for both sexes. The preventive health and drug use modules have the largest differences between the sexes due to the fact that there are questions in these modules only asked of females.

Table 3.7 - Cycle 4 Interview Lengths by Sex

| | Panel Members | Median Interview Length | 25th Percentile | 75th Percentile |
|---------|------------------|-------------------------------|-----------------|-----------------|
| Total | 10,086 | 30:53 | 23:13 | 38:15 |
| Males | 4,557 | 29:29 | 21:46 | 36:41 |
| Females | 5,529 | 31:59 | 24:31 | 39:21 |

Table 3.8 displays the interview lengths by proxy and non-proxy interviews. Proxy reporting is when someone other than the panel member responds to questions about the panel member, and is allowed only for reasons of illness or incapacity. Proxy interviews are less than half the length of non-proxy interviews on average since many questions or entire modules are skipped in proxy interviews.

Table 3.8 - Cycle 4 Interview Lengths by Proxy Status

| | Panel Members | Median Interview Length | 25th Percentile | 75th Percentile | |
|-----------|------------------|-------------------------------|-----------------|-----------------|--|
| Total | 10,086 | 30:53 | 23:13 | 38:15 | |
| Non-Proxy | 8,519 | 32:17 | 25:52 | 39:18 | |
| Ргоху | 1,567 | 14:04 | 8:52 | 27:59 | |

Table 3.9 shows the interview lengths by interview type, i.e., telephone or in person. The statistics show that personal interviews are on average three to four minutes longer than telephone interviews, which is consistent with a study of LFS data quality conducted by Brisebois, Dufour and Lévesque (1998).

| | Panel Median Members Length | | 25th Percentile | 75th Percentile | |
|-----------|--------------------------------|-------|-----------------|-----------------|--|
| Total | 10,086* | 30:53 | 23:13 | 38:15 | |
| Telephone | 9,907 | 30:50 | 23:12 | 38:12 | |
| In Person | 177 | 33:18 | 23:39 | 42:12 | |

*2 have an interview type of "both" and are only included in the total only

4. REFUSALS

Refusals are the most substantial source of nonresponse. Refusals make up 49% of Cycle 2 nonresponse, 56% of Cycle 3 nonresponse, and 61% of Cycle 4 nonresponse. Even though the intention is to follow all 17,276 panel members over time, not all records are sent out for collection each cycle, such as the harder refusals. Cases where the panel member has been confirmed dead through a match to the mortality files are considered complete for the rest of the span of the survey, and are no longer sent to the ROs.

Two different refusal rates for each cycle can be calculated, one based only on those records that were sent out, and the other based on all 17,276 records. It can be seen in Table 4.1, which displays both of these rates for Cycles 2, 3 and 4, that both refusal rates increased with each cycle.

| | Records that went out | New Refusals | Refusal rate based on records sent out | Refusals that were not sent out | Total number of refusals | Refusal rate based on all 17,276 |
|---------|--------------------------|-----------------|----------------------------------------------|---------------------------------------|-----------------------------|----------------------------------------|
| Cycle 2 | 17,266 | 539 | 3.1% | 1 | 540 | 3.1% |
| Cycle 3 | 16,582 | 601 | 3.6% | 469 | 1070 | 6.2% |
| Cycle 4 | 16,186 | 1017 | 6.3% | 526 | 1543 | 8.9% |

Table 4.1 – Refusal Rates by Cycle

Refusal conversions can happen within a quarter, between quarters of the same cycle, and between cycles. This section is composed of four subsections, one for each type of conversion and another for reasons for refusals. In this document, a refusal conversion means a refusal that became a respondent who fully completed the questionnaire.

4.1 Refusal Conversion Between Cycles

The refusal conversion rate between cycles is the percentage of records that refused in a particular cycle and provided a full response in a subsequent cycle. Table 4.2 shows the refusal conversion rates by sex and age group, while Table 4.3 shows the rates by RO. These rates are based only on the records that were sent out for collection, since only those records that were sent out could be considered converted. The refusal conversion rate from Cycle 2 to Cycle 3 is based on only 73 records, as 467 of the 540 refusals in Cycle 2 were not sent out for collection in Cycle 3. Two panel members who fully completed the questionnaire in Cycle 2 were not sent out for collection in Cycle 3 and were assigned refusal codes, which brings the number of refusals that were not sent out in Cycle 3 to 469, as shown in Table 4.1. The refusal conversion rate from Cycle 4 is based on 539 records, with 531 of the 1070 refusals in Cycle 3 not sent out for collection in Cycle 4. Table 4.1 shows 526 refusals that were not sent out in Cycle 4. This difference of 5 is due to panel members confirmed dead in Cycle 4.

The refusal conversion rate has remained stable at around 30% between cycles. Of the 22 individuals who refused in Cycle 2 and were converted in Cycle 3, 14 were also fully complete in Cycle 4. Two individuals refused in Cycle 4, while the remaining six were either partially complete or another form of nonresponse in Cycle 4. Of the 26 panel members who refused in both Cycles 2 and 3, eight were converted in Cycle 4. Females have slightly higher conversion rates than males for all cycles, except for those who refuse in both Cycles 2 and 3.

As for the other comparisons, the age used for the refusal rates by age group is the panel member's age in Cycle 4. When looking at the rates by age group for conversions from Cycle 2 to Cycle 3 and conversions from Cycle 2 to Cycle 4, the number of records in each age group is small, making it difficult to compare rates. The number of records in each age group for the conversions from Cycle 3 to Cycle 4 are much larger. The 25-44 age group has the lowest refusal conversion rate at 24%, while the two highest refusal conversion rates come from the oldest and youngest age groups with rates of 43% and 41%, respectively.

| | Number of Refusals | Number Converted in Cycle 3 | Number Converted in Cycle 4 | Number Not Converted |
|--------------------------------------------|-----------------------|---------------------------------------|--------------------------------|-------------------------|
| Cycle 2 Total | 73 | 22 (30%) | 16 (22%) | 35 (48%) |
| Males | 33 | 9 (27%) | 7 (21%) | 17 (52%) |
| Females | 40 | 13 (33%) | 9 (23%) | 18 (45%) |
| Under 12 | 6 | 3 (50%) | 1 (17%) | 2 (33%) |
| 12-24 | 15 | 5 (33%) | 6 (40%) | 4 (27%) |
| 25-44 | 26 | 8 (31%) | 5 (19%) | 13 (50%) |
| 45-64 | 18 | 5 (28%) | 2 (11%) | 11 (61%) |
| 65+ | 8 | 1 (13%) | 2 (25%) | 5 (63%) |
| Cycle 3 Total | 539 | - | 14 (30A) | 375 (70%) |
| Males | 240 | - | 72 (30%) | 168 (70%) |

| Under 12 | 37 | - | 15 (41%) | 22 (59%) |
| 12-24 | 78 | - | 22 (28%) | 56 (72%) |
| 25-44 | 234 | - | 57 (24%) | 177 (76%) |
| 45-64 | 127 | - | 43 (34%) | 84 (66%) |
| 65+ | 63 | - | 27 (43%) | 36 (57%) |
| Refusals to both Cycles 2 and 3 – Total | 26 | - | 8 (31%) | 18 (69%) |
| Males | 12 | - | 5 (48%) | 7 (58%) |
| Females | 14 | · · · · · · · · · · · · · · · · · · · | 3 (21%) | 11 (79%) |
| Under 12 | 1 | - | 0 (0%) | 1 (100%) |
| 12-24 | 7 | - | 4 (57%) | 3 (43%) |
| 25-44 | 8 | - | 2 (25%) | 6 (75%) |
| 45-64 | 6 | - | 1 (17%) | 5 (83%) |
| 65+ | 4 | | 1 (25%) | 3 (75%) |

Table 4.2 - Refusal Conversion Rates by Sex and Age Group

Table 4.3 - Refusal Rates by RO

| | Number of Refusals | Number Converted in Cycle 3 | Number Converted in Cycle 4 | Number Not Converted |
|--------------------------------------------|-----------------------|--------------------------------|--------------------------------|-------------------------|
| Cycle 2 Total | 73 | 22 (30%) 24 | 16 (22%) | 35 (48%) |
| Halifax | 11 | 2 (18%) | 4 (36%) | 5 (46%) |
| Montreal | 12 | 5 (42%) | 1 (8%) | 6 (50%) |
| Toronto | 37 | 12 (32%) | 5 (14%) | 20 (54%) |
| Edmonton | 7 | 1 (14%) | 2 (29%) | 4 (57%) |
| Vancouver | 6 | 2 (33%) | 4 (67%) | 0 (0%) |
| Cycle 3 Total | 539 | | 164 (30%) | 375 (70%) |
| Halifax | 113 | - | 30 (27%) | 83 (73%) |
| Montreal | 127 | - | 44 (35%) | 83 (65%) |
| Toronto | 100 | - | 21 (21%) | 79 (79%) |
| Edmonton | 138 | - | 52 (38%) | 86 (62%) |
| Vancouver | 61 | - | 17 (28%) | 44 (72%) |
| Refusals to both Cycles 2 and 3 – Total | 26 | - | 8 (31%) | 18 (69%) |
| Halifax | 6 | - | 3 (50%) | 3 (50%) |
| Montreal | 4 | - | 0 (0%) | 4 (100%) |
| Toronto | 10 | - | 2 (20%) | 8 (80%) |
| Edmonton | 5 | - | 2 (40%) | 3 (60%) |
| Vancouver | 1 | - | 1 (100%) | 0 (0%) |

As with the age groups, it is difficult to compare the refusal conversion rates from Cycle 2 to Cycle 3 and from Cycle 2 to Cycle 4 by RO due to the small number of records (see Table 4.3). For the Cycle 3 refusals, the Toronto RO has the lowest conversion rate at 21.0%, and the Edmonton RO has the highest at 37.7%.

4.2 Refusal Conversion Within Cycle 4

In Cycle 4, a status code was assigned during the processing of each quarter to determine if the panel member was a fully complete, a refusal, or neither. Panel members not sent out for collection or with data collected by the Institutions component are excluded, leaving 16,071 records for use in the study of Cycle 4 refusal reasons (section 4.4) and refusal conversion rates within Cycle 4.

Most panel members who refuse in Quarter 1 are resent for collection in Quarter 3, while most panel members who refuse in Quarter 2 are resent for collection in Quarter 4. The majority of those who refuse in Quarters 3 or 4 are resent in Quarter 5, as well as some of the stronger refusals from Quarters 1 and 2 who were not resent in Quarters 3 and 4. Table 4.5 shows the refusal rates by quarter.

| Quarter | Records that went out | Refusals | Refusal rate |
|---------|--------------------------|----------|--------------|
| | 3,434 | 238 | 7% |
| | 3,610 | 208 | 6% |
| | 4,734 | 333 | 7% |
| | 4,640 | 330 | 7% |
| 5 | 2,935 | 911 | 31% |

Table 4.5: Cycle 4 Refusal Rates by Quarter

The refusal rate is highest in Quarter 5, with a rate of 31%, not surprising since Quarter 5 contains only two kinds of panel members: nonrespondents from the previous four quarters of the cycle, or adamant refusals to a previous cycle that are only sent out for collection in Quarter 5.

There were 1,311 panel members who were classified as a refusal at the end of at least one quarterly collection period in Cycle 4. Of those, 235 fully completed the questionnaire in a later quarter, for a refusal conversion rate of 18%. Tables 4.6, 4.7 and 4.8 show the refusal conversion rates by sex, age group, and RO.

Table 4.6 - Cycle 4 Refusal Conversion Rates by Sex

| | Total | Conversions | Non-Conversions | Conversion rate |
|---------|-------|-------------|-----------------|-----------------|
| Canada | 1,311 | 235 | 1,076 | 17.9% |
| Males | 650 | 117 | 533 | 18.0% |
| Females | 661 | 118 | 543 | 17.9% |

Table 4.7 - Cycle 4 Refusal Conversion Rates by Age Group

| | Total | Conversions | Non-Conversions | Conversion rate |
|----------|-------|-------------|-----------------|-----------------|
| Canada | 1,311 | 235 | -1,076 | 17.9% |
| Under 12 | 31 | 9 | 22 | 29.0% |
| 12-24 | 152 | 27 | 125 | 17.8% |
| 25-44 | 539 | 88 | 451 | 16.3% |
| 45-64 | 383 | 62 | 321 | 16.2% |
| 65+ | 206 | 49 | 157 | 23.8% |

| RO | Total | Conversions | Non-Conversions | Conversion rate |
|-----------|-------|-------------|-----------------|-----------------|
| Canada | 1,311 | 235 | 1,076 | 17.9% |
| Halifax | 339 | 68 | 271 | 20.0% |
| Montreal | 225 | 43 | 182 | 19.1% |
| Toronto | 356 | 54 | 302 | 15.2% |
| Edmonton | 253 | 38 | 215 | 15.0% |
| Vancouver | 138 | 32 | 106 | 23.2% |

Table 4.8 - Cycle 4 Refusal Conversion Rates by RO

The refusal conversion rates by sex are almost identical at roughly 18%. As with the between-cycle conversion rates, the oldest and youngest age groups have the highest within-Cycle 4 conversion rates, with rates of 24% and 29%, respectively. The Edmonton and Toronto ROs have the lowest conversion rates at 15%, while the Vancouver RO has the highest rate at 23%.

Table 4.9 shows the quarters in which the 1,311 panel members who refused went out for collection. There were 216 records who were converted in the next quarter, and 19 were converted two quarters later. Of these 235 conversions, 26 were converted in Quarter 3, 12 in Quarter 4 and 197 in Quarter 5. Those records that went out in two quarters had a refusal conversion rate of 32%, while those that went out in three quarters had a rate of 16%. These rates show that it is worth it to resend refusals for collection.

| Quarters sent out | Total | Converted | Not converted | Conversion rate |
|-------------------|-------|-----------|---------------|-----------------|
| Q1 only | 40 | n/a | n/a | n/a |
| Q1, Q3 | 31 | 26 | 5 | 83.9% |
| Q1, Q5 | 97 | 23 | 74 | 23.7% |
| Q1, Q3, Q5 | 70 | 14 | 56 | 20.0% |
| Q2 only | 14 | n/a | n/a | n/a |
| Q2, Q4 | 21 | 12 | 9 | 57.1% |
| Q2, Q5 | 125 | 33 | 92 | 26.4% |
| Q2, Q4, Q5 | 48 | 5 | 43 | 10.4% |
| Q3 only | 20 | n/a | n/a | n/a |
| Q3, Q5 | 258 | 67 | 191 | 26.0% |
| Q4 only | 16 | n/a | n/a | n/a |
| Q4, Q5 | 267 | 55 | 212 | 20.6% |
| Q5 only | 304 | n/a | n/a | n/a |
| Total | 1,311 | 235 | 1,076 | 17.9% |

Table 4.9 - Quarters of Attempted Collection for Cycle 4 Refusal Cases

4.3 Refusal Conversion Within a Quarter

The interviewer assigns an outcome code for each contact within a quarter. Some panel members refused in an early contact(s) of a quarter, but became fully complete during a contact later in the same quarter. Table 4.13 shows the number of panel members who refused at some point during a given quarter, the number of refusals that converted to fully completed within that quarter, and the rate.

| Table 4.13 - | Cycle 4 | Conversion | Rates | Within | Quarters |
|--------------|---------|------------|-------|--------|----------|
|--------------|---------|------------|-------|--------|----------|

| Quarter | Number that refuse at some point within a quarter | Number that convert in that quarter | Conversion Rate |
|---------|---------------------------------------------------|-------------------------------------|-----------------|
| 1 | 304 | 45 | 15% |
| 2 | 279 | 43 | 15% |
| 3 | 413 | 39 | 9% |
| 4 | 459 | 75 | 16% |
| 5 | 920 | 38 | 4% |

4.4 Reasons for Refusal

When an interview is coded as a refusal, the interviewer assigns a code identifying the reason for the refusal. Not all of those records considered as refusals have a reason for their refusal. In some cases, the outcome code of "refusal" was not assigned to the record by the interviewer, but was changed to a refusal during processing. Table 4.10 shows the reasons for refusal given by quarter. "Not interested / doesn't want to participate" is the reason that is given the most often, with "Same household, refusal maintained", "Doesn't want to continue the survey" and "Adamant refusal" following.

Table 4.11 shows the refusal reasons given upon the panel member's first, second and third refusals (if applicable). The "Not interested / doesn't want to participate" reason is the reason given the most often for a respondent's first refusal, making up 24% of the first refusal reasons. This percentage drops to near 15% for the second and third refusals. "Same household, refusal maintained" makes up 16% of the first refusal reasons, making it the third most common. However, not surprisingly, it becomes the top reason given for both second and third refusals, making up 25% and 31% of the refusal reasons, respectively. Of the 635 panel members that refused at least twice, 153 (24%) gave the same reason twice, while only 4 of the 74 (5%) that refused three times gave the same reason three times.

| Reason for refusal | Q1 | Q2 | Q3 | Q4 | Q5 | Total |
|------------------------------------------------------------------------------------|-----|-----|-----|-----|-----|-----------|
| Not interested / doesn't want to participate | 57 | 55 | 72 | 93 | 149 | 426 (21%) |
| Same household, refusal maintained (for follow-ups only) | 41 | 8 | 38 | 48 | 254 | 389 (19%) |
| Doesn't want to continue the survey (no more follow-ups) | 35 | 49 | 76 | 46 | 86 | 292 (15%) |
| Adamant refusal (no specific reason, include shuts the door or hangs up the phone) | 36 | 43 | 36 | 48 | 104 | 267 (13%) |
| Doesn't have the time | 14 | 18 | 39 | 25 | 71 | 167 (8%) |
| Doesn't want to give out personal information | 6 | 8 | 6 | 2 | 46 | 68 (3%) |
| Doesn't believe in or want to hear about statistics | 0 | 6 | 20 | 4 | 27 | 57 (3%) |
| Against the government or Statistics Canada | 5 | 3 | 4 | 6 | 20 | 38 (2%) |
| Doesn't want to be disturbed | 3 | 2 | 7 | 12 | 12 | 36 (2%) |
| Doesn't believe in or want to hear about surveys | 6 | 4 | 5 | 2 | 8 | 25 (1%) |
| Dangerous / rude attitude | 0 | 1 | 2 | 7 | 14 | 24 (1%) |
| Doesn't believe the info is secure (confidentiality) | 1 | 0 | 2 | 3 | 11 | 17 (1%) |
| Says not obligated / wants legal proof | 7 | 2 | 2 | 2 | 3 | 16 (1%) |
| Won't answer the door | 0 | 0 | 1 | 1 | 3 | 5 (<1%) |
| Recently completed a survey (doesn't want to again) | 1 | 0 | 1 | 1 | 0 | 3 (<1%) |
| Why me? Tells you to choose someone else | 0 | 1 | 0 | 0 | 0 | 1 (<1%) |
| Can get info somewhere else (e.g. Revenue Canada) | 0 | 0 | 0 | 0 | 1 | 1 (<1%) |
| Other – Specify | 13 | 3 | 5 | 12 | 11 | 44 (2%) |
| Not stated (were not initially classified as refusals, so no reason assigned) | 13 | 5 | 17 | 18 | 91 | 144 (7%) |
| Total | 238 | 208 | 333 | 330 | 911 | 2,020 |

Table 4.10 - Cycle 4 Refusal Reasons by Quarter

Table 4.11 - Cycle 4 Refusal Reasons

| Reason for refusal | First refusal | Second refusal | Third refusal |
|---------------------------------------------------------------------------------------|---------------|-------------------|---------------|
| Not interested / doesn't want to participate | 312 (24%) | 103 (16%) | 11 (15%) |
| Same household, refusal maintained (for follow-ups only) | 205 (16%) | 161 (25%) | 23 (31%) |
| Doesn't want to continue the survey (no more follow-ups) | 217 (17%) | 72 (11%) | 3 (4%) |
| Adamant refusal (no specific reason, include shuts the door or hangs up the phone) | 178 (14%) | 82 (13%) | 7 (10%) |

| Doesn't believe in or want to hear about surveys | 2 | 0 | 0 | 8% |
| Other - Specify | 8 | 0 | 0 | 18% |
| Not stated (were not initially classified as refusals, so no reason assigned) | 14 | 1 | 1 | 11% |
| Total | 216 | 19 | 13 | 12% |

*Sums to only 13 since some were nonrespondent but not a refusal during the second quarter that they were contacted and therefore do not have a refusal reason

Table 4.12 shows the refusal reasons of those panel members who initially refused and then became fully completed in a subsequent quarter. It is interesting to note that 17% of individuals who were an adamant refusal at some point in Cycle 4 fully completed the questionnaire in a subsequent quarter. Panel members who say that they do not want to give out personal information are the least likely to fully complete the questionnaire in a subsequent quarter, with only 3% doing so.

5. ITEM REFUSAL AND DON'T KNOW RATES

A major source of non-sampling errors in surveys is the effect of nonresponse on the survey results. The extent of nonresponse varies from partial nonresponse (failure to answer just one or several questions) to total nonresponse. Partial nonresponse to NPHS was minimal: once the questionnaire was started, it tended to be completed with very little nonresponse. In most cases, partial nonresponse to the survey occurred when the respondent did not understand or misinterpreted a question, refused to answer a question, could not recall the requested information, or could not provide personal or proxy information. Total nonresponse mainly occurred because it was impossible to trace the respondent, no member of the household was present or able to provide the information, or the respondent refused to participate in the survey. Total nonresponse was handled by adjusting the weight of persons who responded to the survey to compensate for those who did not respond. Note that this adjustment was done by nonresponse class, using many of the following variables to group similar units together, in order to minimize the bias associated with nonresponse. For more details on this adjustment, please refer to the Cycle 4 Longitudinal Documentation.

This section examines two types of partial non-response: item *refusals* and *don't knows*. Item refusal rates and don't know rates were calculated for each Cycle 4 variable by age group, sex and overall. Don't know rates were also computed and compared for those whose information was collected directly from the respondent and for those collected through an intermediary person (proxy). The variables were grouped into modules (and submodules when possible), and refusal and don't know rates by module were calculated. The module and submodule rates were computed by dividing the total number of refusals obtained for all questions in the module (or submodule), by the total number of questions asked to all panel members specifically in that module (or submodule). A rate based on the entire questionnaire was also computed using the same method. Note that within a given module or submodule, not all questions were necessarily asked to the same group of panel members. The calculation of the refusal and don't know rates are based on the 12,575 panel members who fully completed the questionnaire in all four cycles, which excludes panel members who died or became institutionalized during the course of the survey.

5.1 Item Refusal Rates

The refusal rate based on the entire questionnaire is 0.09%. Table 5.1 displays the refusal rates by module and some submodules. The 24 chronic condition submodules and the 9 health status submodules all have refusal rates of 0.03% or lower, and have been excluded from the table. The income module is by far the module with the highest refusal rate, with a rate of 0.62%. The labour force module is made up of eight submodules, and four of these submodules have the highest refusal rates after the income module. These four submodules are job description (0.36%), looking for work (0.25%), weeks worked (0.16%) and absence/hours (0.14%).

Table 5.2 shows the ten variables with the highest refusal rates. The top three rates are all variables from the income module. The only other variable with a refusal rate above 1% at the national level is the variable CCC0_G2M, which represents the month that the respondent's migraines disappeared for those who said that they were diagnosed with migraines in a previous cycle but no longer have them. This variable is based only on 171 respondents, whereas the three income variables are all based on over 10,000 respondents.

The stress module is made up of 6 submodules, and 3 of them (self-esteem, mastery, recent life events) have refusal rates among the top 10 highest. The first question in each of the self-esteem and mastery submodules of the stress module are among the highest refusal rates for individual variables, with rates of 0.58% and 0.64% respectively. The refusal rates of the other variables in the submodules are all below 0.05%, since if a respondent refuses to answer the first question, the rest of the module is skipped.

5.1.1 Sex

Table 5.3 shows the ten modules and submodules with the highest refusal rates by sex. Refusal rates based on the entire questionnaire were fairly similar, with males having a slightly higher refusal rate of 0.10% compared to 0.08% for females. Nine of the ten modules and submodules with the highest refusal rates are

the same for both sexes, although their order within the top 10 and their actual rates differ. The majority of the modules and submodules have higher refusal rates for males than females, and in the cases where the rate for females is higher, it is never by more than 0.03 percentage points.

Table 5.4 shows the variables with the ten highest refusal rates for each sex. Of the ten highest refusal rates by variable, five are common to both sexes, three of them being income variables. The first variable from the mastery and self-esteem submodules, PY_0_M1A and PY_0_E1A, respectively, are both among the top 10 refusal rates for males, at approximately double the female rates.

5.1.2 Age groups

The panel members were grouped into five age groups based on their age in Cycle 4: under 12, 12-24, 25-44, 45-64, 65+. The refusal rates based on the entire questionnaire vary little, between 0.06% for the 12-24 age group and 0.14% for the 65+ age group. Table 5.5 shows the modules with the ten highest refusal rates for each age group. Income is the module with the highest refusal rate for all five age groups, with the 65+ group having the highest rate at 1.05%. The questionnaire for those under 12 is completed by proxy, and

only two modules, income and socio-demographic, have refusal rates above 0%. All other modules either have a refusal rate of 0% or were not asked. Due to the fact that the under 12 age group is so different from the other four age groups, it is excluded from the discussion that follows.

| 0-11 | | 12-24 | | 25-44 | |
|----------------------------|---------------------------|--------------------------------------|---------------------------|----------------------------|---------------------------|
| Module or submodule | Refusal rate (in %) | Module or submodule | Refusal rate (in %) | Module or submodule | Refusal rate (in %) |
| Overall | 0.10 | Overall | 0.06 | Overall | 0.09 |
| Income (INC) | 0.50 | Income (INC) | 0.60 | Income (INC) | 0.43 |

Table 5.5 - Modules with the Highest Rates by Age Group

| 45-64 | | 65+ | |
|----------------------------|---------------------------|--------------------------------|---------------------------|
| Module or submodule | Refusal rate (in %) | Module or submodule | Refusal rate (in %) |
| Overall | 0.07 | Overall | 0.14 |
| Income (INC) | 0.62 | Income (INC) | 1.05 |
| Looking for work | 0.38 | Job description | 0.43 |
| Job description | 0.38 | Self-esteem | 0.29 |
| Weeks worked | 0.24 | Mastery | 0.28 |
| Absence/Hours | 0.18 | Recent life events | 0.25 |
| Labour force (LSC, LFC) | 0.14 | PY Self -esteem and mastery | 0.25 |
| Self-esteem | 0.10 | Ongoing problems | 0.23 |
| Recent life events | 0.09 | Stress | 0.18 |
| Mastery | 0.08 | Work stress | 0.15 |
| PY Self-esteem and mastery | 0.08 | Social support (SSC) | 0.15 |

When looking at the module and submodule level, most of the ten highest refusal rates for each age group are found in submodules of the labour force and stress modules. Income and job description are the only module or submodules found among the ten highest refusal rates for all four age groups.

The blood pressure submodule of the preventive health module has a much higher refusal rate in the 12-24 age group than the other groups, with a rate of 0.18%, while the highest rate in the other three age groups is 0.04%. This is due mostly to the variable BPCO_10, which asks if the respondent has ever had their blood pressure taken, with a refusal rate of 0.23% for the 12-24 group, compared to rates of 0% for the three other groups.

The self-esteem and mastery submodules have higher refusal rates in the 65+ age group. Two other submodules from the stress section (recent life events and ongoing problems) also have refusal rates that are about three times higher than those of the other age groups.

The social support module is among the top ten refusal rates by module only for the 65+ group. Most of the variables that make up this module have refusal rates that increase by the age of the group.

Table 5.6 displays the ten variables with the highest refusal rates for each age group. Not surprisingly, an income variable has the highest refusal rate for each of the age groups, ranging from 2.68% for the 25-44 group to 5.72% for the 65+ group. Many of the variables that are among the ten highest refusal rates for a particular age group but are not found among the highest rates of the other three groups are based on a small number of respondents. Therefore, when looking at refusal rates, the number of respondents should be taken into account.

Table 5.6 - Variables with the Highest Refusal Rates by Age Group

| 65+ | | | | | |
|----------------------|----------------------------------------------|----------------|---------------------------|--|--|
| Variable | Concept | Sample Size | Refusal Rate (in %) | | |
| INC0_3 | Total hhld inc. – best estimate | 2,219 | 5.72 | | |
| INC0_3A | Total hhld inc <\$20,000 or >=\$20,000 | 2,219 | 2.88 | | |
| INCO_4 | Total pers. inc. – best estimate | 2,066 | 2.57 | | |
| MHC0_3 | Depr usual duration | 97 | 2.06 | | |
| MHC0_14 | Depr no. of weeks in past 12 months | 53 | 1.89 | | |
| MHC0_12 | Depr felt down on self | 56 | 1.79 | | |
| PY_0_M1A | Stress/mastery – lack of control | 2,122 | 1.32 | | |
| LSC0F33 | Flag for name of employer | 76 | 1.32 | | |
| PY_0_E1A | Stress/self-esteem - have good qualities | 2,124 | 1.18 | | |
| INC0_1A - INC0_1N | Source of income | 2,263 | 1.15 | | |

The majority of the variables among the ten highest refusal rates for the 12-24 group are from the income module. It is interesting to note that the variables with the ten highest rates for the 25-44 age group fall into three categories: income, labour force, and women's health. In the 45-64 age group, the majority of the variables with the ten highest rates were income and labour force variables. Income, mastery, self-esteem and depression represent the majority of the variables with the ten highest rates for the 65+ group.

5.1.3 Other cycles

Of the variables that are common to Cycle 4 and one or more previous cycles, those with high refusal rates in Cycle 4 also tend to have high refusal rates in previous cycles. Income variables, for example, have high refusal rates in all cycles. Many of the same patterns seen with the Cycle 4 variables are also seen in previous cycles, such as an increase in refusal rates to mastery and self-esteem variables as age increases.

Some variables that were only part of one cycle have high refusal rates compared to the other variables of that cycle. Many of the Alberta buy-in variables and the Manitoba buy-in variables in Cycle 1, which were about coping with day-to-day demands, have high refusal rates. The sexual health variables in Cycle 2 have refusal rates that are quite high, as well as the sexual health variables that were part of the Alberta buy-in questionnaire only.

5.2 Don't Know Rates

The don't know rate based on the entire questionnaire is 0.28% for all respondents. Table 5.7 shows the don't know rates by module and submodule.

At the module level, income (1.82%) and insurance (1.88%) clearly have higher rates than the other modules. At the submodule level, 4 of the 22 chronic conditions submodules have substantially higher rates: heart disease (1.23%), focus content (1.02%), arthritis (0.89%), and high blood pressure (0.82%).

Five of the 17 variables in the heart disease submodule are responsible for its high don't know rate: the age of the respondent at the time of the most recent heart attack (5.79%), age at the time of first heart attack (3.36%), the number of heart attacks (2.24%), whether the respondent has congestive heart failure (1.56%), and has been referred to a cardiac rehabilitation program (1.12%).

Table 5.7 - Don't Know Rates by Module and Submodule

For the arthritis submodule, the high don't know rate is largely due to the fact that 11.42% of respondents who have arthritis responded don't know when asked what kind of arthritis they have. The high blood pressure submodule's high rate is due primarily to three variables: the respondent's age when first diagnosed (2.51%), and the year (8.96%) and month (16.42%) that the condition disappeared. It is worth

noting that many of the other variables dealing with the month or year that a particular condition disappeared have don't know rates between 5% and 30%, but are based on very few panel members. The focus content submodule is made up of the focus content variables from several chronic condition modules, including the heart disease, arthritis and high blood pressure module, so it is not surprising that its don't know rate is one of the highest rates.

5.2.1 Proxy vs. non-proxy

The don't know rate based on the entire questionnaire is 63% higher for the proxy respondents than the non-proxy respondents. The proxy group is made up of 1,257 respondents, while the non-proxy group has 11,318 respondents. Table 5.8 displays the modules with the ten highest don't know rates by interview type. Five modules or submodules are among the ten highest don't know rates for both types: insurance, income, weeks worked, and two chronic conditions submodules (heart disease, arthritis/rheumatism).

Most of the modules and submodules have higher don't know rates for proxy respondents than for nonproxy respondents. The weeks worked submodule shows the biggest gap at with a difference of 2.02 percentage points.

Table 5.9 lists the variables with the ten highest don't know rates by proxy and non-proxy interview. On the proxy side, two variables from the income module have the highest don't know rates. For non-proxy interviews, all top 10 variables but one come from the chronic conditions module.

| Р | гоху | Non-Proxy | | |
|----------------------|------------------------|-------------------------------------|------------------------|--|
| Module or submodule | Don't Know Rate (in %) | Module or submodule | Don't Know Rate (in %) | |
| Overall | 0.44 | Overall | 0.27 | |

| Job description | 1.46 | High blood pressure | 0.81 | |
| Arthritis/Rheumatism | 1.46 | Mastery* | 0.46 | |
| Smoking (SMC) | 1.31 | Stomach ulcers 0.42 | | |
| Cataracts | 1.25 | Weeks worked | 0.42 | |

Table 5.8 – Modules With The Highest Don't Know Rates By Interview Type

*Not asked in proxy interviews

When looking more specifically at the variables with these high rates, eight of them involve the month or year that a particular condition disappeared, which is understandable. Note that this type of question is not asked of proxy respondents. Finally, the variable CC_0D1 (kind of arthritis/rheumatism) is one of only two variables among the ten highest rates for both proxy and non-proxy interviews, the other being total household income.

| | Proxy | | | | Non-Proxy | | | |

|-------------|-----------|----------|---------|-------|------|---------|-------------|------|
|-------------|-----------|----------|---------|-------|------|---------|-------------|------|

5.2.1 Sex

Table 5.10 displays the modules with the ten highest don't know rates by sex. The differences between the sexes are more pronounced when analyzing the don't know rates than the refusal rates, despite the fact that the don't know rate for the entire questionnaire is identical for both sexes at 0.28%. Of the modules and submodules with the ten highest rates for each sex, seven are the same for both sexes, although not in the same order. The heart disease submodule shows the biggest difference in don't know rates between the sexes, with females having triple the rate of males.

Table 5.10 - Modules with the Highest Don't Know Rate by Sex

| Ma | ales | Females | | | |
|----------------------------------------|------------------------|----------------------------------------|------------------------|--|--|
| Module or submodule | Don't know rate (in %) | Module or submodule | Don't know rate (in %) | | |
| Overal1 | 0.28 | Overall | 0.28 | | |
| Insurance (ISC) | 2.21 | Income (INC) | 1.94 | | |
| Income (INC) | 1.67 | Heart Disease | 1.89 | | |
| CC chronic conditions focus content | 1.17 | Insurance (ISC) | 1.61 | | |
| Arthritis/Rheumatism | 0.98 | CC chronic conditions focus content | 0.94 | | |
| High blood pressure | 0.87 | Arthritis/Rheumatism | 0.84 | | |
| Other job | 0.84 | High blood pressure | 0.79 | | |
| Heart Disease | 0.62 | Other job | 0.78 | | |
| Looking for work | 0.52 | Weeks worked | 0.50 | | |
| Asthma | 0.49 | Mastery | 0.47 | | |
| Stomach Ulcers | 0.47 | Women's health (WHC) | 0.40 | | |

Table 5.11 shows the modules with the ten highest don't know rates specifically for proxy interviews of both sexes. Here again, the overall rates are similar between both sexes. Five modules or submodules (insurance, smoking, arthritis/rheumatism, absence/hours, and looking for work) are among the ten highest rates for both sexes. Note that the sex reported in the table is the sex of the panel member, and not that of the proxy respondent.

| | Proxy inter | rviews only | | |
|----------------------|------------------------|-------------------------------------|------------------------|--|
| N | fales | Females | | |
| Module or submodule | Don't Know Rate (in %) | Module or submodule | Don't Know Rate (in %) | |

| Absence/Hours | 1.38 | Alcohol (ALC) | 1.42 | |
| Looking for work | 1.37 | Arthritis/Rheumatism | 1.42 | |
| Back problems | 1.31 | High blood pressure | 1.42 | |
| Smoking (SMC) | 1.16 | CC chronic conditions focus content | 1.40 | |

Table 5.11 - Modules with the Highest Don't Know Rates by Sex for Proxy Interviews

Table 5.12 shows more results, but at the variable level. The table presents results for both proxy and nonproxy interviews by sex. The only variable found among the top 10 highest rates for all four proxy/sex groups is INCO_3 (total household income) with rates ranging between 14.00% and 19.93%. Although the rates are high, most of the other variables in the top 10 are based on a relatively small number of respondents. For both male and female non-proxy groups, all variables but one (total hhld income) are from the chronic conditions module, and the majority of them are related to the month or year when the condition disappeared.

Aside from INC0_3, the only common variable for both male groups is CC_0_D1 (kind of arthritis/rheumatism), with similar don't know rates near 14%. The female don't know rates for this variable are lower, but still quite high, near 10%. Finally, LSC0_43 (preferred number of hours) has a much higher proxy rate with a combined don't know rate of 10.29% for both sexes, compared to 0.52% for the non-proxy respondents.

5.2.2 Age groups

The don't know rates for the entire questionnaire vary from 0.16% for the 25-44 age group to 0.59% for the 12-24 age group. There were 819 under-12-year-old proxy interviews conducted, while the number of proxy interviews for the other three groups varies between 51 (25-44) and 172 (12-24). Because of these small numbers, a single response of Don't Know in the proxy group influences the percentage of don't knows much more than in non-proxy groups.

Table 5.13 shows the modules with the highest don't know rates by age group and type of interview. Note that there are no non-proxy results reported for the younger than 12 age group. Interviews for this group are supposed to be done by proxy, however 14 interviews were non-proxy, and have not been included in this analysis.

The number of chronic condition submodules among the ten highest don't know rates for an age/proxy group increases with the older age groups, while the number of labour force submodules among the ten highest rates decreases with the older age groups.

Table 5.12 - Variables with the Highest Don't Know Rates by Sex and Interview Type

The income module is among the ten highest rates for all 9 age/proxy groups. The don't know rate for the income module for the proxy group is higher than that of the non-proxy group for the age groups 25-44, 45-64 and 65+. The non-proxy rate is higher for the 12-24 group, due mostly to the fact that the variable INCO_3 (total household income) has a rate of 41.33%. The insurance module is also among the highest rates for all age/proxy groups, with the 12-24 non-proxy group having the highest rate at 7.03%. In fact,

the four variables that make up the insurance module have rates that vary from 5.59% to 13.59% for the 12-24 non-proxy group. The insurance and income modules have the highest rates for the under 12 group at 1.08% and 0.96%, which are clearly higher than all other modules that have rates below 0.25% for this group.

The self-esteem and mastery submodules, which are only asked in non-proxy interviews, have higher don't know rates in the 65+ age group. Two other submodules from the stress section (recent life events and ongoing problems – not shown in table) also have rates that are about three times higher than those of the other age groups.

Several labour force submodules are among the ten highest rates for the various age/proxy groups. With a rate of 1.26%, the entire labour force module has a much higher rate for the 12-24 non-proxy group, compared to the next highest rate for this module among the other groups at 0.19%.

For most chronic condition submodules, the older the age group, the higher the don't know rate. The chronic conditions focus content is among the ten highest rates of all four non-proxy groups, as well as the proxy group for the 45-64 group. The rate for the Alzheimer's/dementia submodule is strongly correlated to age, at 0% for all age groups with the exception of the 65+ group, which has a proxy don't know rate of 2.13%, putting it among the ten highest. The heart disease submodule shows a similar pattern with low rates for all groups except 65+, which has a proxy don't know rate of 1.75% and a non-proxy don't know rate of 1.83%.

Finally, it is interesting to note that the alcohol module has don't know rates for the 12-24 and 25-44 proxy groups that are twenty times higher than their non-proxy counterparts. The smoking module has higher proxy don't know rates that are three to six times higher than non-proxy don't know rates, varying from 0.79% to 1.83%, compared to 0.22% to 0.55% for the non-proxy interviews. For all of the questions in the drug module that ask if a respondent took a particular medication in the past month (DGC0_1A to DGC0_1V), the 65+ proxy group has a much higher rate than the other groups.

*Not asked in proxy interviews

Table 5.14 shows the variables with the highest don't know rates by age group and interview type. It is no surprise that five income variables and two insurance variables are among the ten variables with the highest don't know rates for the under 12 group as these two modules have by far the highest rates for this group. For the 12-24 age group, alcohol and labour force related variables make up most of the top 10 for the proxy interviews. As for the ten highest 12-24 non-proxy don't know rates, four are income variables and two are insurance variables.

Three income variables, three alcohol variables and two labour force variables have don't know rates among the ten highest for the 25-44 proxy interviews. For the 25-44 non-proxy, the list is made up mostly of variables from the chronic condition submodules, and again often relate to the month or year that a condition disappeared. The top four are based on only a handful of respondents and are included only for completeness.

For the 45-64 proxy group, three income variables and three smoking variables are among the ten highest. The non-proxy group, like the 25-44 group, contains several chronic condition variables among the ten highest. PAC0_2D (number of times participated in bicycling) has a proxy don't know rate of 80%, but is based on only five respondents.

Finally, for the 65+ proxy group, four income, three chronic conditions and two smoking variables are among the ten highest don't know rates. As with the 25-44 and 45-64 age groups, chronic condition variables make up the majority of the ten highest non-proxy rates.

5.2.3 Other cycles

As with the refusals, variables with high don't know rates in Cycle 4 that were asked in previous cycles also have high don't know rates. For example, the majority of the variables representing the month that a particular chronic condition disappeared also have high don't know rates in Cycles 2 and 3.

Many of the Manitoba buy-in and Alberta buy-in variables (day-to-day demands) that were only part of Cycle 1 have high don't know rates. Of the content unique to Cycle 2, the sexual health variables in Alberta had high don't know rates, as well as two of the three variables in the emergency services module. Virtually all of the variables in the family medical history module, which is only part of Cycle 3, have high don't know rates.

5.3 Respondent Level Rates

Refusal and don't know rates were also calculated at the person level to determine the percentage of questions an individual refuses to answer or answers Don't Know. Table 5.15 shows the proportion of panel members who did not refuse any questions, who refused less than 1% of the questions asked, and who refused less than 3% of the questions asked. Don't know rates, which show much more variation than refusal rates when separated into sex, age groups and interview type, are also shown.

Of the 12,575 fully completes, 11,676 have refusal rates equal to 0%, meaning that 92.9% of the respondents did not refuse to answer any of the questions. Over 99% have refusal rates less than 3%. As for don't know rates, 8471 (67.4%) have don't know rates of 0%. Over 99% have don't know rates less than 5%, and 95% have don't know rates less than 1%. This shows that almost everyone who refuses or responds Don't Know does so for only a few questions.

Only 48.4% of the 12-24 group did not answer Don't Know to any questions, which is not surprising. As reported earlier, a large proportion responded Don't Know to the household income question. The under 12 and 65+ age groups tend to answer Don't Know more often than the other three age groups.

| | Refusals to 0% of questions | Refusals to less than 1% of questions | Refusals to less than 3% of questions | Don't know to 0% of questions | Don't know to less than 1% of questions | Don't know to less than 5% of questions |
|-----------|-----------------------------------|---------------------------------------------|---------------------------------------------|-------------------------------------|--------------------------------------------------|--------------------------------------------------|

Table 5.15 - Refusal and Don't Know Rates at the Respondent Level

6. EDIT FAILURES AND DATA INCONSISTENCIES

6.1 Cycle 4 Edit Failures

Editing is the identification of inconsistencies between data items, with some sort of corrective action usually implemented at the same time. Two sets of edits are applied to the NPHS data. First, Computer Assisted Interviewing (CAI) edits are programmed into the application and are performed in the field during collection. Next, head office (HO) edits are performed at Statistics Canada after the data is received.

There are two types of CAI edits, hard edits and soft edits. Hard edits check that programming restrictions are met, such as whether or not the value falls within the minimum/maximum range or that the selected category is valid. If a hard edit fails, a message appears on the screen during collection. The interviewer must enter a valid value or category to proceed to the next question. Soft edits check to see if a response is less than the maximum allowed for that variable, but still high enough to raise suspicion. When a soft edit fails, a message appears on the screen. To continue to the next question, the interviewer must then confirm the response with the respondent and either change the value or leave it as a valid response.

HO edits are performed after the receipt of data. If a HO edit fails, the inconsistency is left as is, because data from previous cycles are never changed, and, unlike with CAI edits, the respondent is not available to verify if this cycle's data are correct. The exception to this are the relationship edits, in which inconsistencies go through a manual correction process.

CAI and HO edits can be classified into three categories: validity edits, consistency edits, and longitudinal edits. Validity edits check that only valid or allowable responses are given for each question, and that range restrictions are respected. Consistency edits check that expected or known relationships between variables are not contradicted. These edits involve two or more variables for the same respondent or more than one respondent. Longitudinal edits check that expected or known relationships between variables across cycles are not contradictory. These edits involve comparing one variable between at least two cycles to ensure that the data is consistent.

In the case of Cycle 4 data, edits were created for four different files that make up the interview: household (H3HH), members (H3MM), relationships (REL) and health (H6). The H3HH is made up of household info, such as address, phone number and dwelling type, and contains information from all 17,276 panel members. The H6 file contains information from the health component for the 13,774 panel members whose interviews were either fully or partially completed, or who were institutionalized. The H3MM contains information on each household member, such as date of birth, age, sex and marital status, for a total of 38,178 individuals. The relationship file contains the relationship of each person in the household with each of the other members in the household, for a total of 100,081 records.

Table 6.1 shows the number of edit rules for each of the four files, as well as the number of times that an edit rule failed. Table 6.2 shows the H6 counts separated by module. Soft edit failures are much more common than hard edit failures for both CAI validity edits and CAI consistency edits. Table 6.3 lists the nine HO longitudinal consistency edits, as well as the number of failures for each. These tables present only Cycle 4 data since the processing systems changed for Cycle 4, making comparisons to previous cycles difficult.

Table 6.4 shows the ten edits with the highest number of failures. The edit dealing with the consistency across cycles of the respondent's ethnic or cultural groups has by far the highest number of failures. This is due to the fact that if the respondent does not list exactly the same group(s) in each cycle, the edit fails. For example, if a respondent lists four different groups in one cycle and only three of the four in another cycle, the edit fails.

A detailed document on the editing process entitled "NPHS Cycle 4: Production Edit Specifications and Documentation" covers all of the Cycle 4 edits in depth. Readers who wish to obtain more information on edits should consult this document.

| CAI Validity Soft | Number of times the respondent has seen or talked to a dentist or orthodontist in the past 12 months (HC_Q02E) is greater than 4. | 434 |
| CAI Validity Soft | Number of times the respondent has seen or talked to a family doctor or general practitioner in the past 12 months (HC_Q02A) is greater than 12. | 407 |
| CAI Validity Soft | Number of times the respondent gardened or did yard work (PA_Q2B) is greater than 60. | 276 |
| CAI Validity Soft | Number of times the respondent has seen or talked to any other medical doctor in the past 12 months (HC_Q02C) is greater than 15. | 269 |
| CAI Validity Soft | Number of close friends and close relatives (SS_Q01) is greater than 20. | 261 |

6.2 Data Inconsistencies

While some variables have edit rules to flag inconsistencies, other variables do not. This section discusses inconsistencies between cycles, some of which are identified by questions that flag inconsistencies to the respondent during the interview, others by comparing variables between cycles once the data is back at Head Office.

A study in an issue of Health Reports (Shields) described inconsistencies that occurred when people who reported having a particular condition (having not reported having it in the previous cycle) were asked when the condition was first diagnosed. Some people reported diagnosis dates from before the previous interview, leading to many inconsistencies. In this section, the reverse is examined - that is, when a particular condition was present in an earlier cycle and is no longer present in the current cycle.

Eight of the chronic conditions have questions programmed into the application that point out inconsistencies to the respondent. If the respondent says that they do not have the condition, but reported in a previous cycle that they did, they are reminded that they reported the presence of the condition during the previous interview and are asked if it has disappeared since then. This question can only be asked of non-proxy respondents, except when the panel member is a child. This is done to ensure the confidentiality of the panel member's data provided in a previous cycle; asking somebody who is providing a proxy response if a condition has disappeared would reveal that the panel member reported the condition in the previous cycle. Several respondents reported that they had never had the condition. Most respondents who report having a condition in one cycle and report that they never had it in a subsequent cycle have given these inconsistent responses personally; at least 70% were non-proxy in the previous cycle. Table 6.5 shows the number of cases where the respondent reported never having the condition, as well as the proportion of these cases that were proxy interviews in the previous cycle.

Some of the chronic conditions do not have checks programmed into the application to see if a reported condition has disappeared. For these conditions, frequencies of those that said they did not have a particular condition but did have it in a previous cycle were computed by proxy type for both cycles. Table 6.6 displays these frequencies. The number of panel members asked each question is slightly lower than the maximum number of interviews shown in the table as some partial respondents stopped answering partway through. Also, some questions are only asked if the respondent is over a certain age, or are not asked if the respondent is part of the institutions component. It should be noted that these inconsistencies could very well be valid (i.e. the condition has really disappeared) but it is also likely that some of them are true inconsistencies, as with the chronic conditions examined earlier.

Three smoking questions identify inconsistent responses when it comes to identifying a respondent as a smoker or a non-smoker. Respondents who were smokers in a previous cycle and report that they do not smoke in the current cycle are asked why they quit (SMCn_9). A few respondents report that they have never smoked, even though it was reported in a previous cycle that they did. Respondents who reported being non-smokers in the previous cycle and now report being smokers are asked why they started to smoke (SMCn_10). Several respondents asked this question reported that they smoked at the time of the last interview. Smokers who reported smoking daily in a previous cycle and now report smoking occasionally are asked why they cut down (SMCn_11). One person who reported being a daily smoker in a previous cycle and an occasional smoker in the current cycle responded that they did not smoke at the time of the last interview. Table 6.7 shows the number of inconsistent responses for these three questions.

| Cycle 3 Cycle 4 | 43 16 6 our interview in (month and year), you are reporting th | 59 79 87 at you smoke less. Why did you cut down? | | |

Respondents who say that they presently do not smoke cigarettes at all are asked if they have ever smoked cigarettes. In Cycles 3 and 4, if they say that they have never smoked but the data shows that they have reported smoking in a previous cycle, they are reminded that they stated in a previous interview that they had previously smoked, and asked again if they have ever smoked. This probing only occurs for non-proxy interviews. In Cycle 3, 37.6% of these respondents then reply that yes, they have previously smoked, as did 34.0% of the Cycle 4 respondents. This shows that probing the respondent does have an effect on the consistency of the data. This probe question did not exist in Cycle 2, however a comparison between the Cycle 1 and 2 questions asking if the respondent ever smoked shows that there are a few inconsistencies. Table 6.8 shows the frequencies for the Cycle 3 and 4 "ever smoked" probe questions, while Table 6.9 shows the number of respondents who in Cycle 2 said that they had never smoked, but said that they had in Cycle 1.

There is a longitudinal edit, mentioned in the previous subsection, that identifies if the data on whether or not the respondent ever smoked are not consistent across all cycles. This edit fails if a respondent answers no to both the "ever smoke" and "ever smoke" (probe) questions, but in a previous cycle was a daily smoker who smoked at least one cigarette a day. This different definition is why the longitudinal edit has only 8 failures for Cycle 4, compared to the 200 inconsistencies for the "ever smoke" (probe) question.

Women above a certain age are asked if they have ever had a PAP smear or a mammogram, and both sexes are asked if they have ever had their blood pressure taken. These three items have probe questions in Cycle 3 similar to the "ever smoke" probe questions, that is, those that say no but said yes in a previous cycle are reminded of that fact and asked again. As with the smoking question, many respondents change their answer to yes, especially for the blood pressure question where 60.7% of the respondents change their answer from no to yes. The frequencies can be seen in Table 6.8. Since there are no probe questions for these variables in Cycle 2, a comparison between the Cycle 1 and 2 responses similar to that done for the "ever smoked" question in Cycle 2 can be seen in Table 6.9. There are no probe questions for these variables in Cycle 4, since if they said yes in a previous cycle, yes was pre-filled by the application.

Just as there is a question asking if the respondent has ever smoked, there is one asking if the respondent has ever smoked daily. As there are no probe questions for smoking daily, the number of people who say no in one cycle and yes in the previous cycle was calculated. These individuals were separated into four groups based on their proxy status from two cycles. Almost all respondents who said that they have not smoked daily but said yes in the previous cycle were non-proxy interviews in both cycles. Table 6.9 shows

the number of respondents who said no in a cycle despite saying yes in the previous cycle. It should be noted that Cycle 4 is treated differently than Cycles 2 and 3 in that if a respondent said yes in a previous cycle, yes is filled in by the application. The three people who said yes in Cycle 3 and no in Cycle 4 are cases who were interviewed by the Institution component, where the yes response was not pre-filled as it is in the household component.

Table 6.8 - Responses to the Probe Questions

Table 6.10 - Restriction of Activities Inconsistencies

If a respondent has no activity restriction or disability, but had one in the previous cycle, they are asked to what this change is due (RACn_2B). Some respondents said that they never had the restriction, or that it was not present at the time of the last interview. As with the other questions compared for inconsistencies, most respondents were non-proxy interviews in both cycles. Respondents who did not have a restriction or disability in the previous cycle but have one now are asked if it is due to a new condition, a worsening of a condition, or the same as before (RACn_2A). Several respondents say that it is the same restriction or disability as before, even though a restriction had not been reported in the previous cycle. Table 6.10 shows the distribution of both of the restriction of activities inconsistencies by proxy type.

7. SUMMARY OF FINDINGS AND RECOMMENDATIONS

The various data quality indicators that were presented in this document help us to understand what is necessary to successfully complete an interview for the NPHS. They show areas in which we are successful, as well as areas where there is room for improvement. Here are some of the highlights and recommendations for each topic covered.

Tracing

- Untraced individuals are most likely to be in the 12-44 age group. Males are slightly more likely to be untraced than females.
- It is good to note that even for records untraced in both Cycles 2 and 3, interviewers successfully traced 31% of them in Cycle 4.
- \Rightarrow Tracing attempts are worthwhile and should continue.

Contacts and Length of Interviews

- 90% of fully completed interviews are completed in 45 minutes or less, the target time for NPHS.
- The median number of attempted contacts for fully completed interviews is 4.
- \Rightarrow These observed results are acceptable.

Refusal Conversion

- The refusal conversion rate between cycles is roughly 30%.
- \Rightarrow Refusal conversion attempts should continue, even after a series of refusals.

Item Refusal and Don't Knows

- The income module had a high refusal rate, while the refusal rates for other modules are negligible.
- The income and insurance modules had substantially higher don't know rates than the other modules.
- As expected, interviews that are done by proxy tend to have more don't knows than non-proxy interviews.
- The questionnaire appears to be quite clear for respondents since there is a low amount of don't knows.
- Respondents aged 12-24 have exceptionally high don't know rates for income (7.03%) and insurance (6.53%) modules.
- ⇒ Existing procedures should be improved in order to reduce the high don't know rates for the income and insurance modules, particularly for the 12-24 age group.

Edits and Inconsistencies

- Almost two-thirds of all cases fail the edit that identifies if the respondent's ancestors' ethnic or cultural group(s) are not consistent across all cycles.
- For variables without prompts, it is impossible to verify if there has been an actual change between cycles, or if an incorrect response was provided (either in the current cycle or a previous cycle)
- ⇒ More prompts confirming the respondent's responses in the current cycle compared to their responses from previous cycles would eliminate some discrepancies and edit failures. The downside is that the programming of the application more complicated. The literature also shows that this could decrease the amount of change observed as some respondents may choose to stick with the response given in a previous cycle, even when there is actual change.

8. FUTURE STUDIES

Other aspects of data quality involving the profiles and characteristics of certain panel members are also of interest. Some internal studies involving data quality have been conducted. These include the profiles of nonrespondents, refusals, individuals who are unable to be traced, proxy respondents, those who are unwilling to share their data and those unwilling to have their data linked to other files. While some of these profiles, such as the profiles of nonrespondents at the time of weight creation in order to adjust for nonresponse have already been investigated, more formal studies will be completed in the future.

9. ACKNOWLDEGEMENTS

The authors would like to thank John Rowland, France Bilocq and Johane Dufour for their comments while this paper was developing. They would especially like to thank Douglas Yeo and Barbara Armstrong for their comments and suggestions that helped to improve this paper.
