APPARENT PER CAPITA DOMESTIC DISAPPEARANCE OF FOOD IN CANADA, 1971

The accompanying tables set forth the apparent per capita consumption of major foods consumed in Canada in the year 1971 with comparable figures for 1970.

The general approach for arriving at per capita figures is to prepare annual balance sheets showing supplies and disposition for each food. For all foods produced domestically, production statistics are the basis for calculating per capita consumption. Production statistics for crops and livestock estimates are derived from producer (farmer) sample surveys, supported with reports from firms engaged in the business of handling the product in question.

Once statistics indicating domestic production are available for each food, adjustments are necessary to incorporate changes in supply resulting from trade with other countries, and changes in supply due to changes in inventory over the year. Deductions from the basic commodities are also made for the use of foodstuffs by the food processing industry, where they re-appear; furthermore, deductions in supplies are also necessary to take into account non-food uses. In the case of some foods consideration must also be given to losses due to wastage and shrinkage. For all products of which there is no domestic production, import statistics become the starting point, the same adjustments, where applicable are made.

In the accompanying tables the consumption of each commodity, except meats, is shown in terms of retail or product weight. In addition, with the exception of cereals, the apparent disappearance is indicated for each food on the basis of a common denominator such as fat content or sugar content.

The population figures used in the calculations were 21,324,000 for 1970^r and 21,595,000 for 1971^p.
