SYMBOLS

The following standard symbols are used in Statistics Canada publications:

- ... figures not available.
- ... figures not appropriate or not applicable.
- nil or zero.
- amount too small to be expressed.
- p preliminary figures.
- r revised figures.
- * confidential to meet secrecy requirements of the Statistics Act.

SIGNES CONVENTIONNELS

Les signes conventionnels suivants sont employés uniformément dans les publications de Statistique Canada:

- ... nombres indisponibles.
- ... n'ayant pas lieu de figurer.
- néant ou zéro.
- nombres infimes.
- p nombres provisoires.
- r nombres rectifiés.
- * confidentiel en vertu des dispositions de la Loi sur la statistique relatives au secret.

INTRODUCTION

The contents of this statistical publication provide a summary of data pertaining to food and its relative importance to the consumer.

A residual approach is used in calculating quantities of food available for human use. The starting point is the preparation of annual balance sheets which show the supply and disposition of each food item. To obtain gross supply, imports and beginning stocks are added to production estimates. This figure minus exports and ending stocks produces net supply. Fresh and frozen food stocks statistics are based in quantities held in cold storage and wholesale warehouses. Stocks of other manufactured goods represent inventories held at the plant level.

The approximate amount of food available for human consumption is found by subtracting seed requirements, manufacturing inputs, livestock feed and waste where applicable from net food supply.

The data for the components of the food balance sheets are mainly derived from farm surveys and reports by firms engaged in producing and marketing in the food industry. The net food figure represents the supply of food leaving the wholesale level destined for retail distribution.

The per capita estimates of supplies of food are shown as retail or product weight with the exceptions of meat and poultry which are calculated on a cold dressed carcass and eviscerated weight basis. The waste factors used for specific commodities attempt to account for waste up to the retail level but do not allow for losses in stores, households, private institutions or restaurants. Per capita values for meat also include features such as bone in and fat weight as well as the amounts of meat used in canned goods and pet foods.

Per capita values do not represent total food supplies actually consumed by an individual or specific group of individuals but provide data on what is available for consumption on the average by the total Canadian population as of July 1. The population figures used in this publication are 22,125,000, 22,479,000 and 22,831,000 for 1973, 1974, and 1975 respectively.

The measurement of per capita retail weight values in other forms such as sugar content, fresh equivalent weight, milk solids and nutritional value involves the use of average conversion factors. No information about the nutritional adequacy of food consumption of individuals or specified groups is provided by the nutritional data. All quantities are expressed in Imperial and metric units to facilitate domestic and international usage.

Le contenu de cette publication statistique constitue un résumé des données se rapportant aux aliments et à leur importance relative pour le consommateur.

Pour calculer les quantités d'aliments disponibles pour la consommation humaine, on utilise une méthode indirecte. Le point de départ est la préparation de bilans annuels, qui montrent les ressources et emplois de chaque produit alimentaire. Pour obtenir les ressources brutes, on ajoute les importations et les stocks initiaux aux estimations de la production. En soustrayant de ce chiffre les exportations et les stocks de fermeture, on obtient les ressources nettes. Les statistiques des stocks d'aliments frais et congelés sont fondées sur les quantités détenues en entreposage frigorifique et dans les entrepôts de gros. Les stocks des autres biens fabriqués représentent les stocks détenus à l'usine.

On obtient la quantité approximative d'aliments disponibles pour la consommation humaine en soustrayant des ressources alimentaires nettes, les semences requises, les aliments destinés à l'utilisation industrielle, les aliments pour animaux et le gaspillage, lorsqu'il y a lieu.

Les données sur les composantes des bilans alimentaires sont tirées surtout des enquêtes agricoles et des déclarations des entreprises qui s'adonnent à la production et la commercialisation dans l'industrie alimentaire. Le chiffre de la quantité nette d'aliments représente les ressources alimentaires qui partent du niveau de gros pour la distribution au détail.

Les estimations par personne des ressources alimentaires sont présentées selon le poids au détail ou le poids du produit, sauf dans le cas de la viande et de la volaille, où elles sont calculées selon le poids habillé froid et le poids éviscétré. Les facteurs de perte utilisés dans le cas de certains aliments visent à tenir compte de la perte qui se produit avant le niveau de détail, mais ne tiennent pas compte des pertes dans les magasins, les ménages, les institutions privées et les restaurants. Les valeurs par personne pour la viande tiennent compte également des caractéristiques telles que le poids des os et du gras de même que des quantités de viande entrant dans les boîtes de conserve et les aliments pour animaux de maison.

Les valeurs par personne ne représentent pas les ressources alimentaires totales effectivement consommées par une personne ou par un groupe de personnes en particulier, mais constituent des données sur ce qui est disponible à la consommation en moyenne pour la population totale du Canada au 1er juillet. Les chiffres de population utilisés ici sont 22,125,000, 22,479,000, et 22,831,000 pour 1973, 1974 et 1975 respectivement.

La mesure des valeurs par personne des poids de détail sous d'autres formes telles que le contenu en sucre, le poids de l'équivalent en produits frais, la teneur en matières solides du lait et la valeur nutritive comporte l'utilisation de facteurs moyens de conversion. Les données nutritionnelles ne fournissent pas de renseignements sur la suffisance nutritive de la consommation d'aliments par des personnes ou des groupes particuliers. Toutes les quantités sont exprimées en unités impériales et en unités métriques, ce qui fait qu'on peut les utiliser facilement au Canada comme à l'étranger.

STATISTICAL TABLES

TABLEAUX STATISTIQUES

Apparent Per Capita Domestic Disappearance of Food in Canada, 1975

| No. | Commodity Produit | Supply - Ressources | | | | | | |
