## DOMINION BUREAU OF STATISTICS - CANADA

Dominion Statistician: R. H. Coats, B.A., F.S.S. (Hon.), F.R.S.C.

## Mining, Metallurgical and Chemical Branch

Chief: W. H. Losee, B.Sc.

[illegible]

THE ABRASIVES INDUSTRY IN CANADA, 1931.

A report just issued by the Mining, Metallurgical and Chemical Branch of the Dominion Bureau of Statistics at Ottawa, contains the following information concerning the abrasives industry.

The abrasives industry in Canada includes two main divisions: (1) The Natural Abrasives Industry, covering the production of natural abrasives such as grindstones, pulpstones and scythestones, corundum, diatomite, volcanic dust, etc., and (2) The Artificial Abrasives and Abrasive Products Industry, which covers the manufacture of silicon carbide, fused alumina, abrasive wheels, abrasive paper, etc.

## 1. NATURAL ABRASIVES

CORUNDUM - Corundum crystals are found in an area embracing several townships in Renfrew and Hastings counties in the province of Ontario. The corundum mining industry made its appearance in this area in 1900 and production reached a maximum in 1906. Corundum mining practically ceased with the perfection and production of artificial abrasives by the electric furnace. In 1921 grain corundum amounting to 403 tons valued at \$55,965 was exported to the United States; since that time no shipments of corundum have been reported.

DIATOMITE - Diatomite shipments in 1931 made from deposits at East New Annan and Little River, Digby county, Nova Scotia; Baysville, Ontario; and Quesnel, British Columbia, totalled 1,610 tons valued at \$32,789 as compared with a total Canadian production of 554 tons worth \$13,247 in 1930.

V. L. Eardley-Wilmot of the Department of Mines, Ottawa, describes diatomite as prepared for the market as fluffy, white powder, remarkably light in weight - it weighs only 10 to 15 pounds per cubic foot, or one-tenth as much as sand. Being extremely porous and inert, it is in large and increasing demand for insulation and filtration purposes, as a general filler and for many other uses. Diatomite is composed of silicious shells of aquatic plants and may be either of marine or fresh water origin; no marine deposits are known in Canada. The present day chief use of diatomite is not as an abrasive but mainly as a filtering and clarifying agent, as an insulating medium, a filler, as an admixture in concrete and an absorbent. Diatomite should contain for most purposes at least 80 per cent diatom silica and be free from grit and non-diatom silica, low in iron, lime and alumina and contain a large proportion of clean, unbroken diatoms.

The Ontario Bureau of Mines states that Diatomite Products Ltd. advanced construction work and machinery installation on a diatomite plant in Draper township, Ontario. This company plans to produce 20 tons of finished product daily. Dominion Diatomite Limited was incorporated in August 1931 to operate a dry diatomite deposit west of Novar, Perry township, Ontario. Production from this property is expected early in 1932. Imports into Canada of diatomaceous or infusorial earth (kieselguhr) ground or unground amounted to 17,000 cwt. valued at \$25,788 in 1931 as compared with

6,582 tons worth \$12,004 during 1930. 1931 closing prices in the United States for diatomite were - per ton, f.o.b. Nevada, crude, dried in bags, \$10; minus mesh, \$15; 300 mesh, \$20; high temperature insulation, \$30.

GARNETS - There was no production of garnets in Canada in 1931. The Labelle Nickel and Garnet Co. Ltd. conducted development and construction work at a garnet property at Labell, Canton de Joly, in the province of Quebec. About 90 per cent of the garnet mined throughout the world is used for the manufacture of abrasive papers and cloths which have a higher cutting efficiency than sandpaper. Powdered garnet is used for grinding purposes, particularly for grinding plate glass. 1931 closing prices in the United States for garnet were: per ton, f.o.b. New Hampshire mines, concentrate, \$40; washed grades, \$125. New York Adirondack garnet concentrates, \$85.

GRINDING PEBBLES - No shipments from Canadian deposits of pebbles suitable for use as grinding material have been reported since 1926; during that year 64 tons were produced from deposits occurring on the north shore of Lake Superior, near Jackfish, Ontario.

Imports of flint and ground flint stones in 1931 totalled 52,330 cwt. valued at \$23,653. Of these 16,428 cwt. valued at \$9,248 came from the United States and 34,220 cwt. worth \$13,869 from Denmark.

GRINDSTONES, PULPSTONES AND SCYTHESTONES - The production of grindstones, pulpstones and scythestones from Canadian quarries during 1931 amounted to 621 tons valued at \$38,103 as compared with 830 tons worth \$62,021 in 1930. Grindstones were produced at Stonehaven, New Brunswick; scythestones at Shediac and Stonehaven, New Brunswick, and pulpstones in British Columbia and New Brunswick. The United States Bureau of Mines states that the tonnage of grindstones produced has gradually declined, undoubtedly because of the substitution of manufactured abrasive wheels for natural stones. Segmental pulpstones, which are constructed of artificial abrasives and attached to a core of concrete or metal are finding increasing use as substitutes for natural pulpstones. The manufacture of artificial grindstones from crushed sandstone, sand, and cement, shaped in moulds of desired size, is also being considered.

Imports into Canada in 1931 of grinding wheels manufactured by the bonding together of either natural or artificial abrasives amounted in value to \$125,673; imports of grinding stones or blocks, manufactured by bonding together of either natural or artificial abrasives were appraised at \$28,969; grindstones, n.o.p., \$7,228. Imports of grindstones, not mounted and not less than 36 inches in diameter totalled \$111,770 in value as against a valuation of \$229,436 in 1930. Exports of manufactured grindstones totalled \$10,776 in value during 1931 as against \$11,674 during 1930.

VOLCANIC DUST (Pumicite) - Volcanic dust is used in manufacturing, cleansing and scouring compounds, abrasive hand soaps, and, to a limited extent, metal polishes. It is used in construction as an admixture in concrete and to a less extent as an insulating material for packing steam and water pipes, lagging boilers; lining cold storage rooms, in filter cells, and as a filler in paints and sweeping compounds. Volcanic ash is mined from an ash bed occurring in the bed of Swift Current creek near Waldeck, Saskatchewan. Volcanic ash rock occurring at Williams Lake in British Columbia was mined during 1930. The total Canadian production of volcanic dust for 1931 came from the province of Saskatchewan and amounted to 128 tons valued at \$2,560. The total sales of pumice and pumicite in the United States during 1930 totalled 56,843 tons valued at \$336,099. Imports of pumice and pumice stone, lava and calcareous tufa not further manufactured than ground, in 1931 were valued at \$34,542. Imports of soap, n.o.p., including pumice, silver and mineral soaps, sapolio and like articles amounted to \$54,260 as against \$88,289 in 1930.

## 2. ARTIFICIAL ABRASIVES AND ABRASIVE PRODUCTS.

Manufactures of artificial abrasives and abrasive products in Canada during 1931 were valued at \$4,857,914, a decline of 25 per cent from the total of \$6,450,351 reported for the previous year. In 1929 the corresponding selling value amounted to \$8,961,951. The principal products in this industry were: fused alumina, 35,781 tons at \$3,007,307; crude silicon carbide, 10,754 tons at \$1,060,712; and abrasive wheels worth \$347,345. Other products of lesser value included refractories, ferrosilicon, abrasive cloths and papers, sharpening stones and files, artificial pulpstones, tiles and magnesia.

For 1931 reports were received from 14 plants of which 13 were located in Ontario and 1 in Quebec. Capital employed by these firms amounted to \$6,070,652 of which over one-half represented the value of land, buildings, machinery, tools and other equipment. An average of 691 people were given work the year round and were paid \$982,820 in salaries and wages. Purchased materials for manufacturing, exclusive of fuel and electricity, cost \$1,709,983 and the value added to these materials by manufacturing processes was \$3,147,931.

Notes: - Prices given for the different NATURAL ABRASIVES were taken from the "Engineering and Mining Journal" and "Metal and Mineral Markets."

## 3. IMPORTS AND EXPORTS OF ABRASIVES.

Imports of abrasives and abrasive products into Canada during 1931 were valued at \$1,221,274, a decrease of 55 per cent from the 1930 total of \$2,694,494. Diamond dust or bort and black diamonds accounted for 26.8 per cent of the total imports of abrasives; United States firms supplied 86 per cent of these diamonds. Importations of grindstones were valued at \$118,998; these came mainly from the United States although minor shipments were received from the United Kingdom. Sand paper and other abrasive paper or cloth imported into Canada reached a value of \$201,277, a decline of 41.3 per cent below the imports in 1930.

Exports of abrasives in 1931 declined 30 per cent to a total of \$2,026,250. Artificial abrasives, crude, including carborundum, made up 97.8 per cent of the total exports.
