UUL 10 1938 of Hon. M. M. Stevens, M.P., Trace and Commerce DOMINION BUREAU OF STATISTICS - CANADA D. . . . Deminton Statistician: R. H. Coats, B.A., F.S.S. (Hon.), F.R.S.C. Mining, Metallurgical and Chemical Branch Unief: W. H. Losee, B.Sc. and stry CHMUNT, 1932. Revised statistics just issued by the Mining, Metallurgical and Chemical Branch of the Dominion Bureau of Statistics at Ottawa, show that shipments from Canadian cement plants during 1932 totalled 4,498,721 barrels valued at \$6,930,721 as compared with 10,161,653 barrels worth \$15,826,243 in 1931. Cement was produced in 1932 at plants located in Quebec, Ontario, Manitoba, Alberta and British Columbia. Quebec mills produced 49.1 per cent of the total Canadian shipments, Ontario 35.6 per cent, Manitoba 5.4 per cent, Alberta 4.3 per cent. and British Columbia, 5.6 per cent. Imports of Portland cement into Canada during 1932 amounted to 21,350 barrels (estimated at 350 pounds each) averaging \$2.72 per barrel as against 38,392 barrels averaging \$3.74 in 1931. Exports of Portland cement were recorded at 53,333 barrels valued at \$38,921 as compared with 114,064 barrels valued at \$124,267 in 1931. Cement made available for consumption in Canada amounted to 4,466,738 barrels in 1932. The selling prices in 1932, f.o.b. Canadian works, were: high, \$2.55 per barrel and low 21.25 per barrel. In 1932 the Canadian cement industry consumed for all purposes 120,296 short tons of Canadian bituminous coal valued at 4652,734 and 90,718 short tons of imported coal at \$440,546; gasoline consumption totalled 87,050 gallons valued at \$15,856 and 7,386 gallons of fuel and diesel oil worth \$960 were also used. Electricity purchased totalled 85,630,342 k.w.h. valued at \$590,891. Electric motors with a total power rating 75,493 h.p. were operated on purchased power. Canadian cement plants operated 41 rotary kilns in 1932, possessing a total daily capacity of 43,622 barrels. The industry consumed 1,141,376 tons of limestone and 27,537 tons of gypsum. Six cement plants operating in Canada during 1932 employed the wet process while five used the dry, one plant manufactured cement from purchased clinker. The total apparent consumption of cement in Canada declined approximately 55 per cent from 1931; this followed very closely the fall in building permits. Some of the Canadian cement plants operated during the year at less than 30 per cent of their capacity. Considerable interest has been recently taken in the utilization of cement in the manufacture of centrifugally spun re-inforced concrete sewer pipe. These are made in machined metal moulds which are poured while revolving on spinning machines. It is stated that the concrete is sufficiently hard immediately after spinning to resist any ordinary pressures; other advantages claimed are that the pipes are impervious to moisture and unaffected by extreme climatic changes, and have a The interior of this proportionally greater resistance to acids and soil alkalies. type of pipe approaches a glazed surface in smoothness.

More recent developments in concrete construction reveal the increasing consumption of light weight aggregate. This type of material includes such trade products as "haydite", "cell concrete" and "aerocrete." These cellular concrete products are produced either mechanically or by the chemical aeration of the mix. The recent development of the mixed-in-transit system of concrete service is proving, for certain types of construction, to possess very distinct advantages over the older system of mixing on the job.

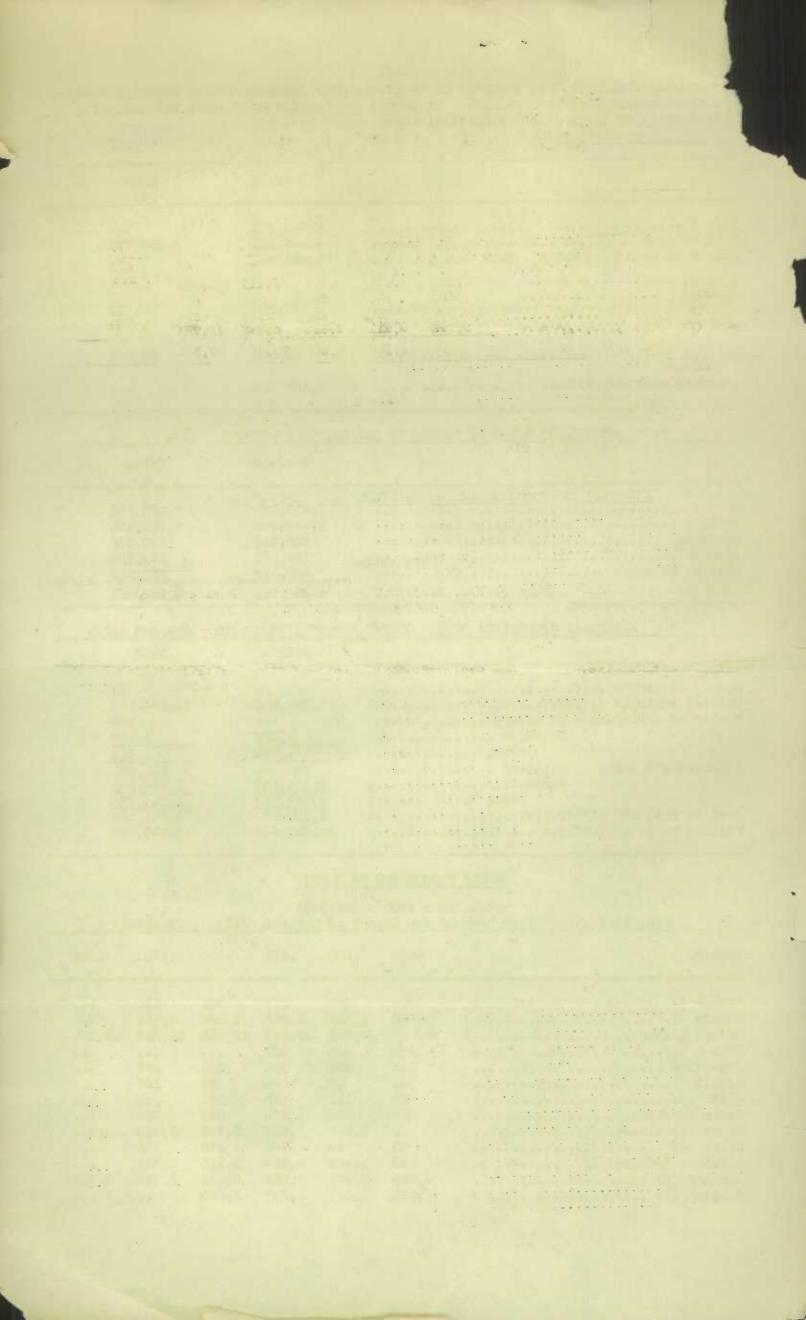

A new Canadian-designed machine for producing multiple concrete conduits is now on the market. This is capable of manufacturing conduits for high tension caples in 8 duct, 6 duct, 4 duct, 3 duct, and 2 duct sections in three foot lengths and for low tension telephone cables in 6 duct, 4 duct, 3 duct and 2 duct sections less in three foot lengths.

It is noteworthy that coment enamel was selected as an interior finish for American Life Assurance Building recently completed in Toronto; cement surface application of Portland cement combined with various chemicals, the addition of solour which when it hardens, produces a vitreous

and-like figign that is reported to be practically indestructible, securely bonded, mitary, washable and non-fading. By proper combination of texture and colouring a mide range of effects is easily attainable.
