- rrevised figures.

FINANCIAL STATISTICS OF MUNICIPAL GOVERNMENTS 1964 and 1965

Revenue and Expenditure

PRELIMINARY 1964 - ESTIMATES 1965

This report is the ninth of an annual series presenting estimated current revenues and expenditures of municipal governments. An analysis of estimated debenture debt charges and estimated gross debenture debt issued and outstanding at the year end has again been included.

As introduced in the sixth report the presentation of revenue and expenditure data is as follows:

- (a) "Debentures debt charges recoverable" has been deleted by netting to "Debt charges".
- (b) "Debenture debt charges for school purposes" is a component of "Education", whereas it was formerly included in the expenditure item "Debt charges".

Consequently the item "Debt charges" represents debenture and other debt charges for general municipal purposes only, whereas it previously included debenture debt charges for utility and school purposes. These changes conform with the approved method of presentation whereby the expenditure item "Education" approximates the school authority requisition and "Debt charges" is confined to that for general municipal purposes. To provide comparability with the former series and thereby maintain continuity, supplementary data on debenture debt charges of utilities and schools are shown in Tables 3, 6 and 9.

The terms "revenue" and "expenditure", used in this report indicate that transfers from other levels of government are included but that transfers from other municipalities have been excluded where possible. A residual amount remains in Ontario revenue which represents duplication of expenditures reported.

Figures for revenue and expenditure are used in this presentation to conform with the annual report "Financial Statistics of Municipal Governments—Actual", Catalogue No. 68-204. Care must be taken not to compare the data in this report with the municipal segment of our annual report "Consolidated Public Finance—Federal, Provincial and Municipal Governments", Catalogue No. 68-202, where the data are presented on a "net" basis as described in that publication and where capital expenditures are included.

These statistics of "municipal" current revenue and expenditure are confined to incorporated municipalities, special areas and districts, as opposed to the broad concept of "local government" which in addition would include health units, school boards, municipally-owned utilities, etc. Exceptions

exist in that (1) school board and health unit data are included to the amount of taxation applied at the municipal level and (2) municipally-owned utilities are included to the amount of their surpluses transferred to, or deficits assumed by, municipalities. For gross "municipal" debenture debt, presented in Table 10, the local government concept is employed as it is the general practice for municipal corporations to issue debentures on behalf of school boards, health units and municipally-owned utilities, etc.

Legislation in three provinces provides, through grants, a certain measure of relief to municipal taxpayers in regards to property taxes payable by them.

In Ontario an unconditional per capita grant is payable by the Province to the municipalities to be applied solely for the benefit of persons paying taxes on residential or farm properties. The tax levy on these ratepayers is reduced by the amount of this grant.

In British Columbia under the Home-owners Grant Act the Province provides tax relief for resident home-owners. The maximum amount of this grant was \$100.00 in 1965, and no grant is made when the tax payable is \$1.00 or less. The amount of the grant claimed by the home-owner on payment of his property taxes is credited by the municipality to reduce the home-owners tax account. The grant has no effect on the amount of taxes levied by the municipalities.

In Manitoba, commencing in 1965 a school tax rebate grant has been provided by provincial legislation. This rebate is the lesser of \$50.00 or 50% of the yearly school tax. As in British Columbia this rebate is applied at the time of payment of taxes and does not affect the tax levy of the municipalities.

For the purpose of determining trends, the estimates for 1964 and 1965 are presented in totals for each province alongside "actual" 1963 figures. These actual figures will appear in the more comprehensive report "Financial Statistics of Municipal Governments—Actual 1963". The 1964 and 1965 data are also presented in a form which will facilitate interprovincial comparison. This year, the Quebec Bureau of Statistics conducted a survey to precure revenue and expenditure information for the year 1965 and forwarded to the Dominion Bureau of Statistics estimated totals for inclusion in this report. Estimated debenture debt outstanding for Quebec was derived by projection of trend.

To obtain approximate uniformity in the concepts of municipal governments between provinces, estimated data of special areas, districts, boards, etc., were compiled and included in the provincial totals. In some instances the revenue and expenditure detail was not available. Consequently, some estimates were made in composite form and the combination of such items, which renders interprovincial comparison impossible except in the combined forms, are denoted by footnotes. This situation occurs in the detail of taxation as well as elsewhere and is caused by two sets of circumstances: (1) the detail was not available for each municipality but only in group totals (a form unsuitable to the estimating procedure); and (2) the required detail was not provided even in totals.

The statistics presented here are applicable to the calendar year, the exceptions being education data in three provinces and certain city data in Quebec. In both Prince Edward Island and Quebec education data have been included for the fiscal year ended June 30 of each year presented, e.g. 1963-1964 fiscal year data are included in 1963. British Columbia rural district school taxes were

extracted from the Provincial Public Accounts and Estimates for the fiscal year ending the following March 31. A few Quebec cities have fiscal years ending after December 31, but are included with those ending December 31.

As illustrated in the following summary tables of revenue and expenditure, in most instances increases occurred each year from 1961 to 1965 in all itemized classifications of current revenues and expenditures. Exceptions occurred with a slight decline in "Special assessments", and "Interest and tax penalties" for 1963 and in "Other revenue" for 1964. Although total revenues and expenditures showed a succession of increases, the rate of increase was irregular but within a narrow range and averaged almost eight per cent per year.

The percentage distribution tables illustrate the consistency of the relationship of the items of revenue and expenditure to their respective totals each year. Sources of revenue and functions of expenditure, with minor exceptions, increased at the same rate as total revenues and expenditures.

ESTIMATING AND SAMPLING PROCEDURES

Estimations

Basically the method of estimating is the percentage change in sample data from base to current year applied to total data for the base year. The link or index of change is computed and applied within each "cell" for each item of revenue, expenditure, etc.

The principle might more readily be expressed as follows:

 $\frac{\text{Sample (current)}}{\text{Sample (base)}} \times \text{Total (base)} = \frac{\text{Estimate of total (current)}}{\text{Estimate of total (current)}}$

However, because we wish to estimate for two years from the same base, a single ratio that can be applied to sample data for both years' estimates is desirable. This ratio is obtained by a minor transposition in the above formula.

Total (base) Sample (current) = Estimate of total (current)

The relationship of Total (base) to Sample (base) is the ratio that may be compiled prior to receipt of current information and may then be applied against the questionnaire data for the two years.

Note 1. This method of estimating does not provide for non-response. It is therefore necessary to substitute data of the base year for missing data of the current year, providing the rate of non-response is not too great. An alternative is to adjust the data of the base year to exclude information of the non-respondents, but this is not practicable. If the rate of non-response is too high, substitution of base year data for the non-respondents would deflate any reported changes to the point where the estimate would differ only slightly from the base. It is therefore more straightforward to substitute base year data in total for the estimate of total for such "cells".

Note 2. Estimates are made only for specific items of revenue and expenditure. Totals and subtotals are not estimated but obtained by addition of their estimated components. Due to changes in the proportions of these components to the totals from year to year, or the failure of the sample to reflect these changes, the total of the estimates does not equal the estimated totals. Consequently, estimates of surplus and deficit are not made because they would necessarily contain all the errors of estimating. Preliminary investigation has disclosed the possibility of obtaining more accurate estimates by combining the procedures of (a) estimating for some specific items and totals by the ratio method; and (b) distributing the items in the residual according to their respective proportions to total in the base year. As an example, in one test, the ratio method of estimation provided excellent estimates for two principal sources of taxation as well as for the total of taxation, but very poor estimates of the remaining sources of taxation. It was found that a breakdown of the residual items of taxation according to their respective proportions to total taxation, derived from base year data, provided a much greater degree of accuracy.

Where the estimate is considered unreliable for any one item in any one "cell", due to under-representation of the sample, it is necessary to depart from the standard procedure. Under the circumstances whereby the base is zero, or the percentage change of the ratio is very high, the change in the item should be considered as absolute rather than proportionate.

Adjustments and Additions

The total estimates for each province represent a projection of the data presented in the provincial reports of municipal statistics. To make these estimates comparable in concept with the "actual" series, adjustments and additions are necessary. For both the adjustments and additions, the same methods are used as are used in the "actual" compilations. However, where possible, the most recent data available are used when applying these methods.

Non-Response

Although the cooperation on the part of municipalities sampled was highly commendable, there were a few instances where failure to complete the questionnaire required a change in the estimating procedure. For the most part such situations occurred in groups which were known to change little from year to year, thus permitting the substitution of the most recent data available. An optional method (because the projection was made on a matched municipality basis) would have been to omit the non-respondents from the base data. This method is used only when the proportion of non-respondents to total respondents is low and the lessening representation is permissible.

Limitations

Although the specific items of revenue and expenditure, classified by sources and by function respectively, are common to nearly all municipalities, their relative significance within the financial structure of each municipality differs to varying degrees. As an example, towns within a certain population size range in a given area might all have real property tax and business tax revenue. But the proportion of real property tax and business tax to

total taxation could differ markedly from one town to another within the group. Therefore, the problem occurs whereby it is possible to have a sample representation of twenty per cent for the group by number with varying degrees of representation for each item of revenue and expenditure. It is therefore necessary to consider that the estimates of items most common to all municipalities are less subject to error, due to higher representation, than are the items that are not common to all municipalities within a given group. This circumstance was anticipated prior to the compilations of the estimates and special attention was given in an effort to minimize errors resulting from under-representation of this nature.

Inconsistencies between base and current data also increase the probability of error. Base information was submitted by the municipal auditors, to the provincial governments for publication, and the current information was reported on questionnaires by the municipal officials. Because the data from which the estimates were compiled were obtained from two different sources, differences in method of reporting or interpretation of requirements occurred. Extreme care was exercised to adjust or compensate for differences arising from this cause. As an example of such an occurrence, a municipality might report an expenditure less certain revenue when the base information had shown both revenue and expenditure as gross.

The amount of error was further minimized, relative to the respective provincial totals, by the large representation of the self-representing municipalities. As an example, if the provincial total of any one item was comprised of sixty per cent through self-representation (within which no error of estimate could occur) and forty per cent through estimation, containing an error of five per cent, the relative error to the provincial total would be only two per cent.

With this information, it will be possible to appraise the estimates with an approximation of the probable error contained in the various estimates. Highly variable items, not common to all municipalities, and which do not occur primarily in the large self-representing municipalities, are more subject to error.

Description of Revised Sample

The revised sample introduced in 1957-58 was based on 1956 Census of Population data and has been revised annually to take into account changes in municipal government structure and the latest Census of Population data. It was selected with the intention of overcoming the limitations of the original sample based on data of the 1951 Census of Population. The use of population as the most appropriate basis of selection has been retained, and consequently, all the larger municipalities are again included. A description of the original sampling technique may be found in the 1959-60 report.

Method of Selecting Revised Sample

As it was unlikely that there would be any substantial change in the format of provincial municipal reports, it was decided that the classification of municipalities used in each provincial report would form the basis for the selection of sample municipalities in each province. The arrangement was desirable in order that base information might be procured readily. The change to a classification within each province therefore constituted the prime difference between the "original" and "revised" samples.

The basis of selection, namely population, differed only slightly in application. Rates of selection in the population size ranges remained unchanged:

Population of 5.000-14,999 with selection rate of 1 in 3.

Population of 2,000 - 4,999 with selection rate of 1 in 10.

Population of 1,000 - 1,999 with selection rate of 1 in 20.

Population of under 1,000 with selection rate of 1 in 45.

The above rates, of course, apply only to the non-self-representing groups and were applied only as accurately as the various provincial classifications of municipalities would permit. In most instances, through the use of Census of Population bulletins, it was possible to arrange municipalities in descending order of population size. Exceptions, in some instances, were of course necessary, but little or no loss of accuracy occurred. Within the size ranges, sample municipalities were selected on a random basis without provision for replacement but allowance was made for sufficient variation in the rate of selection to accommodate non-response.

Because the stratification differed markedly from one province to another due to their respective peculiarities, detailed explanations must be set out for each province.

Newfoundland:

All municipalities (other than the self-representing) were consolidated into one group regardless of size and type of incorporation because they are similar in character and perform highly similar functions. In addition, the sampled portion is only a small part of the total.

Prince Edward Island:

There is no municipal report of base information for this province. Therefore the City of Charlotte-town and the seven towns were all selected as self-representing. No estimate was made for villages as no data was available. The omission was small in volume.

Nova Scotia:

The self-representing municipalities are (a) those comprising the Metropolitan Area of Halifax and the Major Urban Area of Sydney-Glace Bay (b) other urban municipalities with population of 15,000 and over, and (c) other rural municipalities with population of 15,000 and over. The non-self-representing groups of urban as well as those of rural municipalities were each consolidated to facilitate estimating procedures.

New Brunswick:

This year, for the first time, a special combined reporting form was used to accommodate the needs of both the New Brunswick Department of Municipal Affairs and the Dominion Bureau of Statistics and the survey was conducted on a full coverage basis.

Quebec:

Arrangements initiated with the Quebec Bureau of Statistics three years ago, whereby the Q.B.S. conducted a survey of a sample of Quebec municipalities, were extended this year with the Q.B.S. providing estimated total data derived from the survey.

Ontario:

The stratification used for the revised sample was derived from the classification used in the Ontario Department of Municipal Affairs Annual Report of Municipal Statistics. The classification contained in this report is by type of incorporation within population size grouping, with municipalities listed in descending order of population. This form of presenting basic information proved unsuitable for estimating without limited consolidation. For convenience, without a significant loss of accuracy. the report was used to select the Ontario sample. Assessed population figures were used in place of Census of Population data after a check showed that there was sufficient similarity between these two sets of figures. Of the 97 municipalities in the seven metropolitan areas, and 10 major urban areas only 14 were set out separately; the remainder were contained in their respective groupings of type of incorporation within population size ranges. Cities, separated towns, counties and selected municipalities with population of 15,000 and over comprised the other self-representing municipalities. The remaining municipalities with population of under 15,000 were divided into two size-group categories, and sample municipalities were selected from the various groupings of type of incorporation within each of these two major categories. The basis of selection was random with rates determined by population size ranges derived from the original sample.

Manitoba:

The municipal information for Manitoba is compiled by the Dominion Bureau of Statistics and is classified in the recommended form. Therefore the only change required was to supplement those "cells" which were considered under-represented, by arbitrarily increasing the rates of selection.

Saskatchewan:

Stratification of the sample is designed to coincide with the classification used in the provincial report of municipal statistics. The stratification used is primarily the type of incorporation with further groupings of towns into three population size-ranges. Cities formed the only self-representing group. The remaining groups (towns of 2,000 and over, towns of 1,000 to 1,999, towns of under 1,000 population, villages and rural municipalities) were each sampled on a random basis applying rates derived from the original sample. After an analysis of total taxation of municipalities, it was found that the cities accounted for only 25% of the provincial total. This fact, in addition to the very high ratios due to low-representation, resulted in the decision to arbitrarily increase the rates of selection for the middle-sized and smaller towns and villages. Villages were too numerous to list in descending order of population. In order to make the required selection a frequency distribution with expulation ranges of 100 was made to determine at which size levels the rates should be applied. The concentration and consequent higher rate of selection occurred in the range with populations from 100 to 199.

Alberta:

Classification by type of incorporation, as used in the provincial report of municipal statistics, was used as the basis of selection. The 10 urban and rural municipalities of the two metropolitan areas, other cities, and counties, were treated as self-representing. Counties warranted self-representation due to the continuation of their formation in Alberta and a high probability that more will be formed in the next few years. Towns, villages and municipal districts were sampled at rates determined by population, and selection was made on a random basis.

British Columbia:

To conform to the provincial report of municipal statistics, type of incorporation was used to replace the population size range classification used originally. The only self-representing municipalities were within the two metropolitan areas. The remaining cities, villages, and rural districts were sampled randomly at various rates.
