LABOUR INCOME

OCTOBER - DECEMBER 1968

Total labour income was estimated at \$3,070.7 million in October, \$3,095.2 million in November and \$3,022.1 million in December.

During the fourth quarter, total labour income, seasonally-adjusted, increased by 3.4 per cent representing the largest quarterly gain since the first quarter of 1966. Both the goods-producing and the service-producing industries contributed to this gain. The goods-producing industries advanced by 2.4 per cent representing about 30 per cent of the total gain. The service-producing industries increased by 4.1 per cent and accounted for the remaining 70 per cent.

The gain of 2.4 per cent in the goods-producing industries was notably higher than the average quarterly increases in 1967 and 1968. In manufacturing the total wages and salaries rose by 3.3 per cent, reflecting about equally increases in employment and average earnings. Employment in this industry went up by over 1-1/2 per cent following a period of about a year and a half of declines or slight increases. Average earnings continued the steady increase of the last few years, going up almost 2 per cent. In construction, wages and salaries increased only slightly. Employment increased by about 1 per cent, with an increased emphasis on building construction but average weekly earnings declined, with less overtime and a change in the mix of employment in construction industries with different average earnings levels. In the primary industries, wages and salaries remained virtually unchanged.

The gain of 4.1 per cent in the service-producing industries was also higher than the preceding quarters. Transportation, storage, communication and other utilities increased by 6.2 per cent with slightly larger increases in average earnings than in employment. All other industries increased by about 4 per cent.

ANNUAL REVIEW - 1968

During 1968, total labour income, seasonally-adjusted, increased by 8.8 per cent, mainly the result of increased average earnings which, like last year, advanced by almost 7 per cent. Employment also increased by about 2 per cent. The increase in total income was only slightly less than the gain of 9.2 per cent recorded in 1967. However, the quarterly movements for the two years were quite different with a decreasing trend in 1967 and an increasing one in 1968.

In the goods-producing industries, average earnings increased at a slightly faster rate than last year while the number employed remained about constant. This resulted in an overall increase of 5.4 per cent as compared with 5.8 per cent in 1967. Wages and salaries in Manufacturing increased by 6.6 per cent, in Construction by 2.0 per cent, and in the Primary industries by 4.5 per cent. In Manufacturing average earnings increased at a slightly faster rate than last year while employment averaged about the same in spite of an acceleration in the last half of the year. The relatively lower gains recorded in Construction and the Primary industries were the result of lower rates of increase in average earnings and decreases in numbers of employees.

Wages and salaries in the service-producing industries increased by 11.0 per cent as compared with 11.9 per cent in 1967. Increases in employment and average earnings of 4-1/2 and 6-1/2 per cent, respectively, were slightly lower than those recorded in 1967. All industry groups increased at almost the rates of last year except Finance, insurance and real estate and Transportation, storage and communication. The former increased at a considerably faster rate following larger increases in both average earnings and employment while the latter advanced less rapidly because of less expansion in employment and in average earnings.

During 1968, the population 14-years-and-over continued to increase at about 3 per cent but the rate of growth in the labour force was less than in 1967 and unemployment rose reflecting the lack of employment increases in the goods-producing industries and a slight growth drop in the service industries.

(1) Includes post office.

(2) The difference between the sum of the provinces and these totals, which include Yukon, Northwest Territories and Canadian residents abroad, contains a residual error resulting from seasonally adjusting by province and by industry.

(r) Revised figures.

Note: Estimates may not add to totals due to rounding.

TABLE 2. Wages and Salaries by Industry, and Supplementary Labour Income, Canada, Adjusted for Seasonal Variation

Basis: Unrevised Standard Industrial Classification

Year and month	Wages and salaries												Supple- mentary labour income	Total labour income

EXPLANATORY NOTES

CONCEPTS AND METHODS

Wages and salaries is specified to include living allowances, bonuses, commissions, and "tips" and is measured prior to deductions of all kinds (income tax, employees' contributions to the Unemployment Insurance Fund and to welfare and pension funds, etc.). Both money payments and payments in kind (i.e. free board and lodging) made to, or on behalf of, residents of Canada, excluding military pay and allowances, are included in the total of wages and salaries. Retroactive wage payments are included in the month in which they are paid. Supplementary labour income comprises payments made by employers on behalf of their employees in order to provide them with future benefits, either definite or contingent. Specifically, these payments include employers' contributions to employee welfare and pension funds, to workmen's compensation and industrial vacation funds, and to the Unemployment Insurance Fund. Contributions to armed forces pension funds are also included. Labour income is defined as the total of wages and salaries and of supplementary labour income.

The annual estimates of labour income are based in most cases on survey data collected by DBS, published accounting records, or information otherwise obtained directly from business or government agencies. In a few cases information is not available for non-census years and projections from census "benchmarks" are made using the best available related indicators. Comprehensive notes on concepts and methods relating to the preparation of labour income estimates are contained in the reference paper Labour Income 1926-58. Information relating labour income estimates to the national accounts may be found in National Accounts, Income and Expenditures: 1926-56.

About four-fifths of current labour income is estimated by applying payroll indexes to the latest available annual benchmarks. These payroll indexes are obtained from a monthly survey of establishments normally employing fifteen or more persons (see the DBS monthly publication Employment and Payrolls). For industries not covered by this survey the estimates are based on indexes which are either derived from other sources of payroll information or specially constructed on the basis of related data. A constant number of working days is assumed for each month in order to avoid the effects of differences in numbers of holidays and week-ends.

STATISTICAL PRESENTATION

In order to obtain a historical record of labour income statistics, the following publications should be consulted: Estimates of Labour Income (December 1967 to November 1968) for the year 1964; (December 1966 to November 1967) for the year 1963; (December 1965 to November 1966) for the year 1962; (December 1964 to November 1965) for the year 1961; (December 1963 to November 1964) for the year 1960; (December 1962 to November 1963) for the year 1959; (December 1961 to November 1962) for the year 1958 and (December 1960 to August 1961) for the year 1957. The reference paper Labour Income 1926-58 contains a record of data on labour income to the end of 1956. Monthly data on provincial wages and salaries for the months prior to January, 1963 are available upon request.

The latest monthly figures are preliminary and subject to revision in the next issue. In addition, all figures for recent years are subject to further minor revisions as new annual source materials become available.

The monthly figures in this report are presented with one digit after the decimal point, i.e. to the nearest tenth of a million dollars. This is done in order to avoid sudden changes in estimates for small provinces or industries which would occur if the figures were rounded to the nearest million, and it should not be assumed that the estimates are accurate to the nearest tenth of a million.
