### Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

### How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

Health Care Section,  
Health Division,

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 991-1643) or to the Statistics Canada reference centre in:

|                       |                           |
|-----------------------|---------------------------|
| St. John's (772-4073) | Sturgeon Falls (753-4888) |
| Halifax (426-5331)    | Winnipeg (949-4020)       |
| Montréal (283-5725)   | Regina (359-5405)         |
| Ottawa (990-8116)     | Edmonton (420-3027)       |
| Toronto (973-6586)    | Vancouver (666-3691)      |

Toll-free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional reference centres.

### How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Publication Sales, Statistics Canada, Ottawa, K1A 0T6.

1(613)993-7276

Toronto  
Credit Card only (973-8018)

### Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolingue et le système d'extraction de Statistique Canada.

### Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section des soins de santé,  
Division de la santé,

Statistique Canada, Ottawa, K1A 0T6 (téléphone: 991-1643) ou au centre de consultation de Statistique Canada à:

|                       |                           |
|-----------------------|---------------------------|
| St. John's (772-4073) | Sturgeon Falls (753-4888) |
| Halifax (426-5331)    | Winnipeg (949-4020)       |
| Montréal (283-5725)   | Regina (359-5405)         |
| Ottawa (990-8116)     | Edmonton (420-3027)       |
| Toronto (973-6586)    | Vancouver (666-3691)      |

Un service sans frais est offert, dans toutes les provinces et dans les territoires, aux utilisateurs qui habitent à l'extérieur des zones de communication locale des centres régionaux de consultation.

## INTRODUCTION AND BACKGROUND

The Royal Commission on Health Services (the Hall Commission of 1961) recommended that the then Dominion Bureau of Statistics (Statistics Canada) collect and publish national hospital morbidity statistics. These were first published in 1964 for the data year 1960. These statistics have been published for every year since 1960 except for the years 1963 and 1965. The data consist of a count of inpatient cases, discharged during the data year from general and allied special hospitals in Canada, excluding Yukon and Northwest Territories. Also given are days of hospital care and rates per 100,000 population for discharges and days. These statistics, unlike those of the United States and England which are derived from samples of hospitals, are a full count of cases.

### **Source and Description of Data**

The source of these data is the admission/discharge form which records one continuous stay in hospital for each patient. At the end of each stay the patient is discharged (separated) alive or dead, or is transferred to another institution. Because a patient may be admitted to, and discharged from, a hospital several times during a year, the statistics are a count of cases rather than of unique persons or patients.

The completed records from admission/discharge forms are submitted to provincial hospital insurance commissions which convert them to a computer file, a copy of which is sent to Statistics Canada. The statistics are from institutions which are, broadly, acute care, convalescence and chronic hospitals, and represent the province in which the patient was treated, which in about two per cent of cases is not the province of the patient's residence.

While the statistics give an accurate count of cases separated from hospital, the published count of diagnoses, especially for certain conditions, is, because only one diagnosis per separation is given, somewhat understated. A full count of diagnoses may be extracted from the computer file where they are retained indefinitely.

## INTRODUCTION ET HISTORIQUE

La Commission royale d'enquête sur les services de la santé (la Commission Hall de 1961) a recommandé au Bureau fédéral de la statistique (Statistique Canada) de recueillir et de publier des statistiques nationales de la morbidité hospitalière. Le premier rapport, dont les données portaient sur l'année 1960, fut publié en 1964. Par la suite, ces statistiques ont été publiées pour chaque année sauf pour 1963 et pour 1965. Les données constituent un relevé des malades hospitalisés qui, au cours de l'année à laquelle les données s'appliquent, sont sortis des hôpitaux généraux et spécialisés au Canada, à l'exclusion du Yukon et des Territoires du Nord-Ouest. Les données comprennent aussi le nombre de jours d'hospitalisation et le taux pour 100,000 habitants de départs et de jours. Ces statistiques constituent un relevé intégral des malades hospitalisés, contrairement aux États-Unis et à l'Angleterre où les données ne sont fondées que sur un échantillon d'hôpitaux.

### **Source et description des données**

La source de ces données est la formule d'admission et de départ sur laquelle est inscrit un séjour continu d'une personne dans un hôpital et qui est remplie pour chaque patient. À la fin du séjour de chaque patient, son départ est consigné comme sortie (départ) vivante, décès, ou transfert à un autre hôpital. Comme un patient peut être admis dans un hôpital, et en sortir, plusieurs fois au cours d'une même année, les chiffres indiquent les départs au cours de l'année plutôt que le nombre de personnes ou de patients qui ont été hospitalisés.

Les relevés établis d'après les formules d'admission et de départ sont soumis aux commissions provinciales d'assurance-hospitalisation, qui les transfèrent sur un fichier informatique dont elles envoient un exemplaire à Statistique Canada. Les statistiques proviennent d'établissements qui sont généralement des hôpitaux consacrés aux maladies de caractère aigu, des hôpitaux de convalescence et des hôpitaux pour maladie chronique; elles sont basées sur la province où le patient a été traité, ce qui, dans environ deux pour cent des cas ne correspond pas à la province de résidence du patient.

Les statistiques fournissent le nombre exact de cas pour lesquels il y a eu sortie d'un hôpital, cependant, les chiffres publiés sur les diagnostics, en particulier sur certaines affections, sont quelque peu sous-évalués, parce qu'un seul diagnostic est indiqué par départ. On peut obtenir un relevé complet des diagnostics à partir du fichier informatique où ces renseignements sont conservés indéfiniment.

The statistics in this publication are qualified in other ways. As stated above, they cannot be used as a measure of period prevalence because the number of cases extant during the year may be both undercounted and overcounted. The number of cases may be undercounted because a less serious diagnosis may be over-riden, as the diagnosis of separation, by a more serious diagnosis. The number of cases may be overcounted by multiple admissions and separations of the same patient for the same diagnosis. Nor can these statistics be used as a measure of incidence because patients are not identified, and therefore the number of new cases cannot be determined. Undercounting because of tabulating only one diagnosis per separation will be less for the more serious diagnoses and greater for less serious conditions. Over-counting because of multiple admissions and separations during the year will be greater for chronic diagnoses.

The data do not contain cases treated as out-patients or as patients in mental hospitals. They do contain patients treated in psychiatric units of general and allied special hospitals.

All text tables, except Text Table X, exclude newborn information. Yukon and Northwest Territories are excluded from this publication.

For the fiscal year 1979-80 and subsequent years, diagnosis is coded according to the International Classification of Diseases - Ninth Revision (ICD-9). If, for purposes of continuity, it is wished to convert between the ICDA-8 and the ICD-9, conversion tables are available from the Health Care Section, Health Division, Statistics Canada.

For the years 1979-80, 1980-81, 1981-82 and 1982-83 the data are published on the Canadian Diagnostic List (CDL-211) which is an abridged list grouping ICD-9 three-digit codes. The three-digit content of the CDL-211 appears at the back of this publication. Data at the three and four-digit detail is available from the Health Care Section.

#### Note on Editing of the Data

The data files received from the provinces have already been edited. The approximately four million records are then edited again at Statistics Canada. The Statistics

D'autres réserves s'appliquent aux statistiques contenues dans la présente publication. Comme nous l'avons mentionné plus haut, on ne peut les utiliser comme mesure de prévalence parce que le nombre de cas existants pendant l'année peut être à la fois sous-évalué et surévalué. Ceci peut se produire parce qu'un diagnostic de certaines affections peut être supplanté, comme diagnostic à la sortie, par un diagnostic d'affections plus sérieuses. Le nombre de cas peut être surévalué en raison d'admissions et de départs multiples d'un même patient pour un même diagnostic. Ces statistiques ne peuvent non plus être utilisées comme mesure de fréquence parce que les patients ne sont pas identifiés et par conséquent le nombre de nouveaux cas ne peut être déterminé. La sous-évaluation attribuable au fait que les totalisations sont basées sur un seul diagnostic par sortie est moins élevée dans le cas des diagnostics pour les maladies les plus sérieuses et plus élevée dans le cas des affections les moins sérieuses. Par ailleurs, la surévaluation en raison d'admissions et de départs multiples au cours de l'année est plus grande dans le cas des diagnostics de maladies chroniques.

La présente publication ne contient pas de données sur les affections des consultants externes ni sur les cas traités dans les hôpitaux psychiatriques. Elle contient cependant des données sur les patients traités dans les unités psychiatriques des hôpitaux généraux et spécialisés.

Aucun des tableaux à l'exception du tableau explicatif X, ne présente de renseignements sur les nouveau-nés. Cette publication ne comprend pas de données sur le Yukon ni sur les Territoires du Nord-Ouest.

Pour l'année financière 1979-80 et les années suivantes, les diagnostics sont codés selon la Classification internationale des Maladies - Neuvième révision (CIM-9). S'il est nécessaire, pour fins d'uniformisation, d'effectuer la conversion entre la CIMA-8 et la CIM-9, on peut obtenir des tables de conversion en s'adressant à la Section des soins de santé, Division de la santé, Statistique Canada.

Pour les années 1979-80, 1980-81, 1981-82 et 1982-83 les données sont publiées selon la liste canadienne des diagnostics (LCD-211) qui est une liste abrégée groupant des codes à trois chiffres de la CIM-9. La liste des codes à trois chiffres de la LCD-211 figure à la fin de la présente publication. On peut obtenir des données selon des codes à trois et à quatre chiffres en s'adressant à la Section des soins de santé.

#### Contrôle des données

Les fichiers de données provenant des provinces ont déjà fait l'objet d'un contrôle. Les enregistrements, dont le nombre est d'environ quatre millions, subissent un nouveau contrôle à

Canada edit consists of a validity edit and a correlation edit. The validity edit checks that the necessary data elements are present, are consistent and are not duplicated; it also eliminates extraneous elements such as outpatient cases. The correlation edit, called the Medical Edit, checks that reported diagnoses and procedures are reasonably consistent with reported age and sex. Missing items are imputed according to a module based on past experience with the data. Edit failures with changes made are printed out as turn-around-documents to be scrutinized, accepted or changed, and then fed back into the system.

A Canada format, incorporating as many common elements as are necessary and possible, is produced for the purpose of national statistics.

Statistique Canada. La vérification effectuée par Statistique Canada comprend un contrôle de validité et un contrôle de corrélation. Par le contrôle de validité on s'assure que les éléments d'information nécessaires sont présents, qu'ils sont compatibles et qu'il n'y a pas double emploi; ce contrôle permet aussi d'éliminer les éléments étrangers tels que les cas de consultation externes. Dans le contrôle de corrélation, aussi appelé contrôle médical, on vérifie si les diagnostics et les procédures déclarées sont raisonnablement compatibles avec l'âge et le sexe déclarés. Les éléments manquants sont imputés selon un modèle basé sur l'expérience relative à ces données. Les rejets au contrôle ainsi que les modifications apportées sont imprimés sous forme de documents aller-retour, qui sont examinés, acceptés ou modifiés, puis réintroduits dans le système.

Le format canadien, qui regroupe autant d'éléments communs qu'il est nécessaire et possible, est produit pour obtenir des statistiques nationales.

2

## DEFINITIONS

**Hospital.** An institution which is operated for the medical, surgical and obstetrical care of inpatients, and which is licensed or approved as a hospital by federal, provincial or municipal governments, the latter being duly authorized under the laws of the province.

**Separation.** The discharge or death of an inpatient. The frequency counts show individual cases separated, not persons separated.

**Population.** For all provinces Statistics Canada census population estimates are used in calculating rates. Newborn rates are calculated using the total population of all ages.

**Per 100M.** The number of separations expressed as a rate per 100,000 population in each age group, total and province.

**Adults and children.** All inpatients except newborn.

**Newborn.** An infant inpatient born alive in the hospital or postnatal newborn admitted with mother for maternal care.

**Diagnoses.** The diagnoses in this publication are according to 211 categories of the Canadian Diagnostic List. In some provinces "Diagnosis" is defined as "that condition which required the most medical resources". In other provinces it is that condition which precipitated the admission to hospital.

**Province.** The province of hospitalization of the inpatient.

## DÉFINITIONS

**Hôpital.** Établissement procurant des soins médicaux, chirurgicaux et obstétriques aux hospitalisés et détenant un permis ou une approbation du gouvernement fédéral, provincial ou municipal, le dernier dûment autorisé à le faire selon les lois d'une province.

**Départ.** Sortie ou décès d'un malade hospitalisé. Les chiffres représentant les fréquences font état des cas individuels de départ et non du nombre des personnes concernées.

**Population.** Pour toutes les provinces, les chiffres de population du recensement de Statistique Canada ont servi au calcul des taux. Les taux relatifs aux nouveau-nés sont fondés sur la population totale de tous les âges.

**Pour 100M.** Le nombre de départs exprimé comme taux pour 100,000 habitants dans chaque groupe d'âges, total et province.

**Adultes et enfants.** Tous les malades hospitalisés sauf les nouveau-nés.

**Nouveau-né.** Bébé né vivant à l'hôpital ou admis avec sa mère après la naissance pour recevoir des soins maternels.

**Diagnostic.** Les diagnostics sont codés suivant la Liste canadienne de diagnostics de 211 catégories. Dans certaines provinces, le diagnostic précise l'état qui est jugé le principal état requérant le plus de ressources médicales. Dans d'autres, c'est l'état qui a entraîné l'hospitalisation.

**Province.** La province d'hospitalisation de la personne hospitalisée.

## HIGHLIGHTS

- . In 1981-82 there were 3,919,096 separations including 369,831 newborns. In 1982-83 there were 3,970,490 separations including 370,503 newborns.
- . Excluding newborns and obstetrics there were 41,349,942 days of care in 1981-82 and 40,241,197 days of care in 1982-83. In both years 46 per cent of these days were incurred by males and 54 per cent were incurred by females.
- . The insured population aged 65 and over which comprises less than 10 per cent of the total insured population, accounts for over one-fifth of all separations and nearly one-half of all days of care. The age group 75 and over, just under four per cent of the insured population, accounts for more than 10 per cent of separations and nearly one-third of days. In contrast to the above two age groups, the group 45-64 which consists of nearly one-fifth of the population, also accounts for approximately one-fifth of both separations and days.
- . In line with the observations under the above highlights, the two age groups 65-74 and 75 and over have the highest average length-of-stay, and the age group 45-64 has an average length-of-stay close to the average for all age groups. In 1982-83 the average length of stay for all age groups was 11.8 days, for 65-74, 12.0 days and for 75 and over, 31.8 days.
- . The five leading causes of hospitalization by separations in 1982-83 for males were:
  - (1) Ischemic heart disease excluding myocardial infarction
  - (2) Inguinal hernia
  - (3) Other forms of heart disease
  - (4) Pneumonia
  - (5) Acute myocardial infarction
- . Excluding separations for obstetrics the five leading causes of hospitalization for females were:
  - (1) Other diseases of female genital organs
  - (2) Cholelithiasis
  - (3) Other forms of heart disease
  - (4) Ischemic heart disease excluding myocardial infarction
  - (5) Chronic diseases of tonsils and adenoids

## FAITS SAILLANTS

- . En 1981-82, le nombre de départs était de 3,919,096, y compris 369,831 nouveau-nés. En 1982-83, ce nombre s'est élevé à 3,970,490, y compris 370,503 nouveau-nés.
- . Le nombre de jours de soins, exception faite des accouchements et des cas d'obstétrique, a été de 41,349,942 en 1981-82 et de 40,241,197 en 1982-83. Au cours de ces deux années, 46 pour cent des malades traités étaient des hommes et 54 pour cent, des femmes.
- . Les personnes assurées âgées de 65 ans et plus, qui représentent moins de 10 pour cent de l'ensemble de la population assurée, ont compté pour plus d'un cinquième de tous les départs et près de la moitié de tous les jours d'hospitalisation. Les personnes âgées de 75 ans et plus, qui représentent un peu moins de quatre pour cent de la population assurée ont compté pour plus de 10 pour cent des départs et pour près du tiers des jours d'hospitalisation. Par opposition aux deux groupes d'âges mentionnés ci-dessus, le groupe de personnes âgées de 45 à 64 ans, qui constitue près d'un cinquième de la population, a aussi compté pour environ un cinquième des départs et des jours d'hospitalisation.
- . Il s'ensuit donc que la durée moyenne du séjour à l'hôpital est la plus longue pour les deux groupes d'âges de 65 à 74 ans et de 75 ans et plus et que, pour le groupe des personnes âgées de 45 à 64 ans, elle se rapproche de la moyenne pour tous les groupes d'âges. En 1982-83 la durée moyenne d'hospitalisation pour tous les groupes d'âges était de 11.8 jours, pour les personnes âgées de 65 à 74 ans elle était de 12 jours et pour les personnes âgées de 75 ans et plus, de 31.8 jours.
- . Pour les hommes, les cinq principales causes d'hospitalisation, selon le départ, en 1982-83 étaient:
  - (1) Maladies ischémiques du coeur, à l'exclusion de l'infarctus du myocarde
  - (2) Hernie inguinale
  - (3) Autres formes de cardiopathie
  - (4) Pneumonie
  - (5) Infarctus aigu du myocarde
- . À l'exclusion des départs dans les cas d'obstétriques, les cinq principales causes d'hospitalisation pour les femmes sont les suivantes:
  - (1) Autres maladies des organes génitaux féminins
  - (2) Lithiase biliaire
  - (3) Autres formes de cardiopathie
  - (4) Maladies ischémiques du coeur, à l'exclusion de l'infarctus du myocarde
  - (5) Affections chroniques des amygdales et des végétations adénoïdes

## DISCUSSION OF HOSPITAL MORBIDITY DATA

### **Apparent Anomalies in the Data**

Frequently, the number and rate of separations or days will exhibit a marked change from one year to the next. Extreme changes usually do not reflect real changes in the incidence or prevalence of a condition, (except perhaps in the case of infectious diseases) but rather some administrative artifact in the collection and processing of data at the provincial level. Unfortunately, it is not possible to keep abreast of all the changes that occur in the provinces. Nor is it possible, in the time available between the receipt of processed and edited data, and its submission for publication to investigate all apparent anomalies. The more extreme changes are examined and analysis of the data is continued after publication.

One example of an apparent anomaly occurs in the Saskatchewan 1981-82 data. The number of days for Chapter V (Mental Disorders) was, in 1981-82, two and one half times the number in 1980-81. The reason for the increase was the transfer of approximately 700 long-stay patients from the responsibility of the Saskatchewan Hospital Services Plan to Saskatchewan Social Services. All of these patients were administratively discharged and re-admitted July 1, 1981.

Four diagnostic groups: senile and pre-senile organic psychiatric conditions, schizophrenic psychosis, other psychosis, and mental retardation account for an increase of 336 separations in 1981-82. These same four groups account for an increase of 350,740 days, or 93 per cent of the total increase in days for Chapter V in 1981-82. One group, schizophrenic psychosis, alone accounts for more than half the increase in days for that chapter and year.

As would be expected, the average length-of-stay for the four diagnostic groups increased markedly between 1980-81 and 1981-82; from 80.3 days to 225.4 days. Also, because patients discharged in 1982-83 had accumulated days only since July 1, 1981, the average length-of-stay decreased in 1982-83 to 26.5 days.

Days and separations for mental disorders in Quebec and Prince Edward Island also showed large increases in 1981-82. These increases were the result of cases being reported to the Hospital Morbidity System which previously were not.

## ANALYSE DES DONNÉES SUR LA MORBIDITÉ HOSPITALIÈRE

### **Anomalies apparentes des données**

Il arrive souvent que le nombre et le taux de départs ou de jours d'hospitalisation présente une différence marquée d'une année à une autre. Habituellement, les écarts extrêmes ne reflètent pas des changements réels dans l'incidence ou la prévalence d'une affection (sauf peut-être dans le cas des maladies infectieuses), mais plutôt une modification artificielle causée au niveau administratif lors de la collecte ou du traitement des données au niveau provincial. Il est malheureusement impossible de se tenir au courant de tous les changements qui se produisent dans les provinces. Pas plus qu'il n'est possible, pendant le temps dont nous disposons entre la réception des données traitées et contrôlées et leur publication, d'étudier toutes les anomalies apparentes. Les écarts les plus importants sont examinés et l'analyse des données se poursuit après publication.

Comme exemple d'anomalies apparentes, on peut citer les données de la Saskatchewan pour 1981-82. Au cours de cette période, le nombre de jours, selon le chapitre V (troubles mentaux), était deux fois et demi celui de 1980-81. Cette augmentation est due au fait que la responsabilité d'environ 700 patients de séjour prolongé, a été transférée du Saskatchewan Hospital Services Plan à celle des Saskatchewan Social Services. Pour des fins administratives, tous ces patients ont été radiés des établissements et y ont été ré-admis le 1<sup>er</sup> juillet 1981.

Quatre groupes de diagnostics: états psychotiques séniles et préséniles, psychoses schizophréniques, autres psychoses et retard mental, présentent une augmentation de 336 départs en 1981-82. Selon le chapitre V, ces mêmes quatre groupes présentent, en 1981-82, une augmentation de 350,740 jours, soit 93 pour cent de l'augmentation totale des jours d'hospitalisation. Un groupe, celui des psychoses schizophréniques, compte, à lui seul, pour plus de la moitié de l'augmentation des jours d'hospitalisation pour ce chapitre et cette année.

Comme on pouvait s'y attendre, la durée moyenne d'hospitalisation pour ces quatre groupes de diagnostics a augmenté considérablement entre 1980-81 et 1981-82, passant de 80.3 jours à 225.4 jours. Cependant, étant donné que les patients sortis en 1982-83 ont accumulé des jours seulement depuis le 1<sup>er</sup> juillet 1981, la durée moyenne d'hospitalisation a diminué en 1982-83, passant à 26.5 jours.

Il y a aussi eu une augmentation considérable dans le nombre de jours d'hospitalisation et de départs pour cause de troubles mentaux, au Québec et à l'Île-du-Prince-Édouard en 1981-82. Cette augmentation est attribuable au fait que certains cas ont été déclarés au système de morbidité hospitalière pour cette période, alors qu'ils ne l'avaient pas été auparavant.

As stated above, because of time constraint, only the most pronounced discrepancies are thoroughly investigated before publication. The two conditions which must be met to warrant this preliminary investigation are: the difference in the statistics from one year to the next must exceed 10 per cent and the number of cases involved must be greater than 100. The reason for the later criterion is that small numbers of cases may exhibit rather large differences which may be due only to random statistical variation.

### **Hospitalization of Non-residents**

In each province a number of patients are hospitalized each year who are not residents of that province. In some provinces the number of these non-residents is substantial. Text Table I shows that, for the 10 provinces, the non-residents average just under two per cent of all patients separated during a year. If non-resident separations are used to calculate population rates of separations, these rates will be over-stated more in the provinces with the higher percentage of non-residents. This overstatement will be even more pronounced for some diseases if a province has special treatment facilities that are not available at a reasonable distance, in surrounding jurisdictions.

Ideally, non-residents' separations should be allocated back to the province of residence. Unfortunately, only four provinces return the out-of-province separations of their own residents to their data before it is sent to Statistics Canada. The rest of the provinces return data containing the separations of non-residents, but exclude separations of their own residents hospitalized outside the province. Therefore, the only solution available, in the interest of consistency of data, is to calculate rates by the province of hospitalization rather than residence. To accomplish this, the out-of-province separations of the four provinces that include them are removed.

This choice disproportionately distorts the population rates of a province such as Manitoba which has, at nearly five per cent, the highest percentage of non-residents of any province.

### **High Utilization by Older Age Groups**

As noted in the "Highlights" the age group 65 and over consumes a disproportionate amount of hospital care as measured by both separations and days. That this trend is

Comme nous l'avons dit plus haut, à cause de contraintes de temps, seuls les écarts les plus marqués sont étudiés à fond avant la publication des statistiques. Deux conditions doivent être satisfaites pour justifier cette étude préliminaire, à savoir, l'écart entre les statistiques d'une année et celles de l'année suivante doit dépasser 10 pour cent, et le nombre de cas doit être supérieur à 100. Ce dernier critère a été établi en raison du fait que de petits nombres de cas peuvent présenter des écarts assez importants, écarts qui peuvent être seulement dus à une variation accidentelle.

### **Hospitalisation des non-résidents**

Chaque année, un certain nombre des patients hospitalisés dans chaque province ne sont pas des résidents de la province. Dans certaines provinces, le nombre de ces non-résidents est important. Le tableau explicatif I montre que, pour les 10 provinces, la moyenne des non-résidents est à peine supérieure à deux pour cent de tous les patients qui sont sortis des hôpitaux au cours d'une année. L'utilisation des sorties des non-résidents pour calculer les taux de population selon les départs donne lieu à une plus grande surévaluation de ces taux dans les provinces où le pourcentage de non-résidents est élevé. Cette surévaluation peut être encore plus prononcée pour certaines maladies lorsqu'une province dispose d'installations qui permettent d'assurer des traitements spéciaux qui ne sont pas disponibles, à une distance raisonnable, dans les juridictions voisines.

Idéalement, les sorties des non-résidents devraient être ajoutées aux totaux de la province de résidence. Malheureusement, seulement quatre provinces ajoutent à leurs données les sorties de leurs résidents hospitalisés dans d'autres provinces, avant de les faire parvenir à Statistique Canada. Les autres provinces font parvenir à Statistique Canada des données qui comprennent les sorties des non-résidents, mais non celles de leurs propres résidents hospitalisés dans d'autres provinces. Par conséquent, la seule solution possible pour assurer la compatibilité des données, est de calculer les taux selon la province d'hospitalisation plutôt que selon celle de résidence. Pour ce faire, les sorties des patients traités hors province sont supprimées des données fournies par les quatre provinces qui les incluent.

Ce choix déforme d'une façon disproportionnée les taux de départs par rapport à la population d'une province, telle que le Manitoba dont le pourcentage de non-résidents hospitalisés est, à près de cinq pour cent, le plus élevé de toutes les provinces.

### **Grande utilisation des hôpitaux par les personnes plus âgées**

Comme nous l'avons fait remarquer dans les "Faits saillants", les personnes âgées de 65 ans et plus reçoivent une quantité disproportionnée de soins hospitaliers, lorsqu'on les mesure selon

TEXT TABLE I. Number of Non-residents and the Percentage of Total Separations that were Non-residents by Province

TABLEAU EXPLICATIF I. Nombre de non-résidents et le pourcentage par rapport au total des départs selon la province

| Province                                        | Year                    |                                  |                         |                                  |

| <b>TOTAL</b>                                    | <b>77,840</b>           | <b>1.97</b>                      | <b>74,657</b>           | <b>1.87</b>                      |

well-established, and is not due solely to a more rapid growth of this age group in the population, is indicated by the following observations.

Between 1961 and 1982-83 the number of persons 65 and over in the insured population has increased 76 per cent, compared to an increase of 49 per cent in the 45-64 age group during the same period. This more rapid growth of the older population has accounted for a modest part of the increase in its proportion of total hospital care, but by far the larger part of the increase is the result of its greater and more intensive use of facilities. Thus, for the older age group, the rate per 100,000 population of separations increased over the period by 39 per cent, and of days by 37 per cent. By contrast the rate of separations of the age group 45-64 increased by only 11 per cent and the rate of days decreased by nine per cent.

Text Table II: Changes in Major Indicators of Hospital Utilization, Canada, 1971 to 1982-83, provides a synopsis of changes in hospital utilization in Canada over the last 11 years.

Text Table III: Changes in Major Indicators of Hospital Utilization by Age Group, 1971 to 1982-83, presents the contents of Text Table II by five age groups.

Text Table IV: Percentage Distribution of Separations and Days, by Age Group and ICD-9 Chapter, 1981-82 and 1982-83, demonstrates the extent to which age groups exhibit different utilization across the Chapters of the ICD-9.

Text Table V: Twenty Leading Causes of Hospitalization by Number of Separations and Sex, by Canadian Diagnostic List, 1979-80 to 1982-83, presents a more detailed examination of the diagnostic dimension of hospital morbidity data. For the purpose of ranking the causes of hospitalization by importance, it was decided that the 211 sub-groups would provide the most appropriate classification.

The figures in this Table and Text Table VI: Twenty Leading Causes of Hospitalization by Days of Care and Sex, by Canadian Diagnostic List, 1979-80 to 1982-83, are absolute counts of separations and hospital days; they have not been adjusted for population growth or change.

les départs et les jours d'hospitalisation. Les observations suivantes démontrent que cette tendance est bien établie et qu'elle n'est pas due seulement à la croissance rapide de ce groupe d'âges par rapport à la population totale.

Entre 1961 et 1982-83 le nombre de personnes âgées de 65 ans et plus, au sein de la population assurée, a augmenté de 76 pour cent, comparativement à 49 pour cent pour les personnes âgées de 45 à 64 ans au cours de la même période. Cette croissance rapide de la population plus âgée compte pour une faible part de l'augmentation de la proportion de soins hospitaliers reçus, mais une grande part de cette augmentation est attribuable à l'utilisation plus grande et plus intensive des installations par ce groupe de personnes. Ainsi, pour les personnes plus âgées le taux de départs pour 100,000 habitants a augmenté de 39 pour cent au cours de cette période et le nombre de jours d'hospitalisation de 37 pour cent. Par contre, le taux de départs des personnes âgées de 45 à 64 ans n'a augmenté que de 11 pour cent et le taux des jours d'hospitalisation a diminué de neuf pour cent.

Le tableau explicatif II: Changements des principaux indicateurs de l'utilisation des hôpitaux, Canada, 1971 à 1982-83, donne un aperçu des changements qui se sont produits dans l'utilisation des hôpitaux au Canada au cours des 11 dernières années.

Le tableau explicatif III: Changements des principaux indicateurs de l'utilisation des hôpitaux, selon le groupe d'âges, 1971 à 1982-83, présente le contenu du tableau explicatif II selon cinq groupes d'âges.

Le tableau explicatif IV: Répartition en pourcentage des départs et des jours de soins, selon le groupe d'âges et le chapitre de la CIM-9, 1981-82 et 1982-83, illustre la mesure dans laquelle les divers groupes d'âges enregistrent diverses utilisations dans les chapitres de la CIM-9.

Le tableau explicatif V: Vingt principales causes d'hospitalisation en fonction du nombre des départs et du sexe, selon la Liste canadienne des diagnostics, 1979-80 à 1982-83, présente une étude plus détaillée de l'aspect diagnostique des données sur la morbidité hospitalière. Pour les besoins du classement des causes de l'hospitalisation selon leur importance, on a décidé que les 211 sous-groupes constitueraient la classification la plus appropriée.

Les chiffres de ce tableau et le tableau explicatif VI: Vingt principales causes d'hospitalisation en fonction des jours de soins hospitaliers et du sexe, selon la Liste canadienne de diagnostics, 1979-80 à 1982-83, représentent un compte absolu des départs et des jours d'hospitalisation, ils ne tiennent pas compte des changements ou de l'augmentation de la population.

The list of leading causes of hospitalization for females is complicated by the presence of conditions related to childbirth.

In the "Highlights", causes related to pregnancy and childbirth were removed before the ranking was done. This removal produced a much different picture of leading causes for females than that shown in Text Table V. In this table the first four leading causes are related to pregnancy and childbirth.

When leading causes for females are ranked by days in Text Table VI only two of the first five leading causes relate to pregnancy and childbirth.

Text Tables VII and VIII: Standardized Hospital Separation Rates, by Chapter and Sex, Canada, 1971 to 1978(1) and 1979-80 to 1982-83(2). The purpose of standardization is to statistically remove the effects of demographic changes on population separation rates so that these can be directly compared over time. Thus, the 1978 standardized separation rate is that rate which the 1978 population would have had if there had been no change in the age and sex structure of the population between 1971 and 1978.

In general, Text Tables IX and X contain little information that has not already been presented. However, they serve both as valuable summaries of hospital morbidity data and as a prelude to the strictly numerical tables which follow in the main body of this publication.

Text Table IX: Summary Table of Separations and Days of Care, by Age Group and Sex, Canada, 1981-82 and 1982-83, contains both actual counts and population rates of hospital utilization in terms of both separations and days for age groups and sex. Previously, Text Table III documented the relationships between average length of stay and age. Text Table IX extends this analysis by presenting average length of stay with age and sex simultaneously.

Text Table X: Summary Table of Separations and Days of Care, by Province and Sex, 1981-82 and 1982-83, is the only table in the text which distributes hospital

La liste des principales causes d'hospitalisation pour les femmes est compliquée par les états reliés à la maternité.

Les causes reliées à la grossesse et à l'accouchement ont été supprimées des "Faits saillants" avant que le classement ne soit effectué. En raison de cette suppression, l'image des principales causes d'hospitalisation pour les femmes est très différente de celle que donne le tableau explicatif V, dans lequel les quatre premières causes d'hospitalisation sont reliées à la grossesse et à l'accouchement.

Dans le classement des causes principales d'hospitalisation des femmes selon le nombre de jours d'hospitalisation du tableau explicatif VI, seules deux des cinq premières causes se rapportent à la grossesse et à l'accouchement.

Les tableaux explicatifs VII et VIII: Taux comparatifs des départs des hôpitaux, selon le chapitre et le sexe, Canada, 1971 à 1978(1) et 1979-80 à 1982-83(2). Le but de la standardisation est de supprimer, par des méthodes statistiques, les effets des variations démographiques sur les taux de départ de la population de façon que les taux soient plus directement comparables dans le temps. Le taux comparatif des départs de 1978 est donc celui qu'aurait enregistré la population de 1978 s'il n'y avait eu aucun changement dans la structure d'âge et de sexe de la population entre 1971 et 1978.

De façon générale, les tableaux explicatifs IX et X renferment peu de renseignements qui n'ont pas déjà été donnés. Toutefois, ils servent à la fois de résumés importants des données sur la morbidité hospitalière et d'introduction aux tableaux strictement numériques qui suivent le texte de cette publication.

Le tableau explicatif IX: Tableau sommaire des départs et des jours de soins, selon le groupe d'âges et le sexe, Canada, 1981-82 et 1982-83, présente à la fois des comptes réels et des taux de population de l'utilisation hospitalière du point de vue départs et jours de soins selon le sexe et par groupe d'âges. Auparavant, le tableau explicatif III indiquait les rapports entre la moyenne des jours d'hospitalisation et l'âge. Le tableau explicatif IX assure la continuité en présentant à la fois la durée moyenne du séjour, l'âge et le sexe.

Le tableau explicatif X: Tableau sommaire des départs et des jours de soins, selon la province et le sexe, 1981-82 et 1982-83, est le seul dans le texte qui présente la ventilation des données

(1) Standardized to 1971 Canada population using five-year age groups.

(2) Standardized to the 1981 Canada population using five-year age groups.

(1) Standardisé en fonction de la population du Canada en 1971, en utilisant des groupes d'âges de cinq ans.

(2) Standardisé en fonction de la population du Canada en 1981, en utilisant des groupes d'âges de cinq ans.

morbidity data by province. Because of inter-provincial variations in both medical health care systems and age-sex population profiles, it is difficult to directly compare and interpret provincial differences in hospital utilization indicators.

This is also the only table which contains any information on hospital utilization by newborns.

sur la morbidité hospitalière par province. En raison des variations entre provinces à la fois au niveau des systèmes de soins médicaux et des profils âge-sexe de la population, il est difficile de comparer et d'interpréter les différences entre les indicateurs d'utilisation hospitalière des diverses provinces.

Il s'agit également du seul tableau qui renferme des renseignements sur l'utilisation des hôpitaux par les nouveau-nés.

TEXT TABLE II. Changes in Major Indicators of Hospital Utilization, Canada, 1971 to 1982-83

TABLEAU EXPLICATIF II. Changements des principaux indicateurs de l'utilisation des hôpitaux, Canada, 1971 à 1982-83

| Year    | Separations | Separations per 100,000 population | Days of care   | Days of care per 100,000 population   | Average length of stay             |
|---------|-------------|------------------------------------|----------------|---------------------------------------|------------------------------------|
| Année   | Départs     | Départs pour 100,000 habitants     | Jours de soins | Jours de soins pour 100,000 habitants | Durée moyenne de l'hospitalisation |
| 1971    | 3,568,887   | 16,587                             | 41,228,313     | 191,610                               | 11.6                               |
| 1972    | 3,634,706   | 16,671                             | 42,027,231     | 192,760                               | 11.6                               |
| 1973    | 3,693,552   | 16,749                             | 41,590,230     | 188,598                               | 11.3                               |
| 1974    | 3,714,932   | 16,582                             | 41,841,489     | 186,766                               | 11.3                               |
| 1975    | 3,677,274   | 16,165                             | 40,924,511     | 179,904                               | 11.1                               |
| 1976    | 3,623,140   | 15,783                             | 39,619,300     | 172,254                               | 10.9                               |
| 1977    | 3,586,233   | 15,446                             | 39,993,644     | 172,254                               | 11.2                               |
