## PREFACE

Standard classification systems form the framework for integrating statistical series derived from different sources. The value of any body of statistical material is greatly enhanced when it can be used in conjunction with other related material. Those who use statistics are familiar with the difficulties that are encountered when figures relating to similar commodities or commodity groups are not assembled on the same basis and therefore cannot be added together or compared. To deal with this problem a Committee on Commodity Classification was appointed in the Dominion Bureau of Statistics. The members of the Committee have had the assistance of other officers of the Bureau, experts in other Government Departments and agencies, and help from a wide range of industry sources. This help is gratefully acknowledged and the large expenditure of time and effort by all those who have taken part in this project will be amply rewarded if the quality of the statistics is thereby improved.

The members who have served on the Committee are: Neil L. McKellar (chairman), G. P. Bourne, W. A. Deslauriers, R. J. Loosmore, J. A. Sawyer, L. A. Shackleton, and A. A. Tooms.

## PRÉFACE

Les plans de classification type servent de cadres pour l'intégration de statistiques obtenues de sources différentes. L'utilité d'un ensemble de statistiques se trouve fort accrue si on peut l'employer en conjonction avec d'autres statistiques connexes. Les usagers de la statistique connaissent bien les difficultés auxquelles on se bute lorsque des chiffres relatifs à des marchandises ou groupes de marchandises semblables ne peuvent être totalisés ou comparés parce qu'ils ne sont pas établis sur la même base. Un Comité de la classification des marchandises a été institué au sein du Bureau fédéral de la statistique afin de s'attaquer au problème. Les membres du Comité ont bénéficié de l'aide d'autres fonctionnaires du Bureau, et de spécialistes d'autres ministères, et services ainsi que du concours d'une foule d'associations industrielles. Le Bureau est vivement reconnaissant de cette collaboration et le temps et l'énergie qu'ont dépensés sans compter tous ceux qui ont pris part à l'entreprise seront amplement compensés si la statistique s'en trouve ainsi améliorée.

Les membres du personnel du Bureau qui ont fait partie du Comité sont MM. Neil L. McKellar (président), G. P. Bourne, W. A. Deslauriers, R. J. Loosmore, J. A. Sawyer, L. A. Shackleton et A. A. Tooms.

## INTRODUCTION

This Standard Commodity Classification is the result of work over a number of years by a committee of Dominion Bureau of Statistics personnel. It is intended to serve as a standard for all statistical work related to commodities, such as external trade statistics, statistics of shipments, production and materials used, inventory statistics, retail sales, price series, and any others to which it is applicable. It is so designed that the resulting data can be converted easily to the United Nations' Standard International Trade Classification. It should be noted that, particularly in certain sections of the list, the classification as drafted does not contain as detailed a listing of items as may be required for some purposes. Some 5,600 separate items are specified and the working committee felt that this degree of detail will meet present requirements for comparable commodity data from the various sources in Canada.

### Structure of the Classification

A brief description of the classification structure and the main reasons underlying the choice of this structure may assist in its application. All commodities are grouped under five main sections: I. Live Animals; II. Food, Feed, Beverages, and Tobacco; III. Crude Materials, Inedible; IV. Fabricated Materials, Inedible; V. End Products, Inedible. Some codes have been reserved at the end of the classification for the special needs of operating agencies.

Live animals were assigned a separate section because of their unique character as commodities. The practice commonly followed is to divide animals into two main categories: those chiefly for food (included with food) and those not chiefly for food (a category very difficult to place and which usually ends up in some "Miscellaneous" category). Such a classification presents a number of difficulties, the principal one being the arbitrary nature of the distinction according to purpose (i.e., principally for food and other) when like animals must be included in the same group. Such animals as sheep, poultry and horses may be used for food or otherwise and, particularly in trade statistics, the end use of a shipment of animals may be somewhat obscure. The individual user of the data may decide whether or not for his particular purposes some live animals should be included with the food total. (For obvious reasons live fish and other seafoods, except those for propagation and those commonly sold as pets, are classified with food.)

## INTRODUCTION

La présente Classification type des marchandises est le résultat de plusieurs années de travail d'un comité composé d'employés du Bureau fédéral de la statistique. Elle est appelée à servir de norme pour tous les travaux de statistique relatifs aux marchandises, comme la statistique du commerce extérieur, la statistique des expéditions, de la production et des matières utilisées, la statistique des stocks, des ventes au détail et des prix ainsi que toute autre statistique à laquelle elle peut s'appliquer. Elle est conçue de façon que les chiffres obtenus puissent être facilement accommodés à la Classification type pour le commerce international des Nations Unies. Il est à noter que la classification, particulièrement certaines sections, ne renferme pas une liste de positions aussi détaillée que l'exigeraient certaines fins. Elle compte quelque 5,600 positions distinctes et le comité a pensé que le détail ainsi atteint répondra au besoin actuel d'obtenir des diverses sources de renseignement au Canada des données comparables au sujet des marchandises.

### Structure de la Classification

Une brève explication de la structure de la classification et des principales raisons qui en ont motivé le choix aideront peut-être à l'appliquer. Toutes les marchandises sont groupées dans cinq sections principales: I. Animaux vivants; II. Produits alimentaires, Nourriture destinée aux animaux, Boissons, et Tabacs; III. Matières brutes non comestibles; IV. Matières fabriquées non comestibles; V. Produits finals non comestibles. Des indicatifs sont réservés à la fin de la classification pour les besoins particuliers.

Une section spéciale est attribuée aux animaux vivants à cause de leur caractère tout à fait particulier comme marchandises. Il est de pratique commune de diviser les animaux en deux grandes catégories: animaux destinés principalement à l'alimentation (compris avec les produits alimentaires) et animaux non destinés principalement à l'alimentation (catégorie très difficile à classer et qui d'habitude aboutit dans quelque "Divers"). Une telle classification offre un certain nombre de difficultés dont la principale est l'arbitraire de la distinction selon la destination (i.e., principalement pour l'alimentation et l'autre destination) lorsque ces animaux doivent figurer dans le même groupe. Les animaux comme les moutons, la volaille et les chevaux peuvent servir à l'alimentation ou à d'autres fins et, particulièrement dans la statistique du commerce, l'utilisation ultime d'une expédition d'animaux peut être plus ou moins obscure. L'utilisateur de la statistique est libre de décider si, pour ses besoins particuliers, certains animaux doivent figurer dans le total des produits alimentaires. (Le poisson vivant et les autres produits comestibles de la mer, sauf ceux destinés à la propagation et ceux communément vendus comme animaux d'agrément, sont, il va de soi, classifiés dans les produits alimentaires.)

Food, Feed, Beverages, and Tobacco are established as a separate section because of the continuing interest in this category as a separate entity in trade statistics, production and related statistical series, and price series. The further subdivision of the commodities in this section provides groupings easily convertible into crude materials, fabricated materials, and end products. The creation of a separate section for foods involves some difficulties but on the whole the consequences are not serious. For example, some products such as grains may be used for purposes such as the manufacture of industrial alcohol, while some oils and fats not classified with food in this classification may, when refined, be incorporated in a food product. Beverages and tobacco are not large categories and are traditionally associated with food in a classification such as this.

Commodities other than live animals, food, feed, beverages, and tobacco are grouped into three main sections: Crude Materials, Inedible; Fabricated Materials, Inedible; End Products, Inedible. This three-way split should not be identified with the customary stage of production grouping into raw materials, simply transformed, and more elaborately transformed articles. The three-way classification serves a number of purposes, the most important being:

(a) It is a framework within which the various principles of classification can be utilized to the best advantage in a logical and consistent manner. The main criteria by which commodities can be classified are "chief component material", "purpose" and "origin" (in that order of importance, although the first two are of approximately equal value to the classifier). Ignoring "origin" as being of considerably lesser significance, the criterion of component material is most applicable to crude materials and materials in process. In the case of end products, however, the component material criterion has become increasingly less useful in recent years as alternative materials and mixtures of materials have been incorporated into finished articles. There is every indication that this tendency will continue with new uses being discovered for old materials, new materials coming into use and technological changes resulting in new combinations of materials. Thus, in the body of this classification the principle of component material has been used mainly in classifying crude materials and fabricated materials whereas end products are classified principally on the basis of their use or function.

(b) It provides a framework that is not subject to fundamental change because of the introduction of new materials or new uses for old materials.

Les Produits alimentaires, la Nourriture destinée aux animaux, les Boissons, et les Tabacs sont réunis dans une section distincte parce que cette catégorie garde son importance comme entité propre dans la statistique du commerce, la statistique de la production et autres statistiques connexes ainsi que dans la statistique des prix. La subdivision des marchandises de cette section fournit des groupements de marchandises faciles à classer en matières brutes, matières fabriquées, et produits finals. La création d'une section distincte pour les produits alimentaires donne lieu à certaines difficultés, mais les conséquences n'en sont pas graves dans l'ensemble. Ainsi, certains produits comme les céréales peuvent servir à des fins comme la fabrication de l'alcool industriel, tandis que certaines huiles et graisses non classifiées dans les produits alimentaires dans cette classification peuvent, une fois raffinées, entrer dans un produit alimentaire. Les boissons et tabacs ne constituent pas des catégories considérables et c'est l'usage de les associer aux produits alimentaires dans une classification comme la présente.

Les marchandises autres que les animaux vivants, les produits alimentaires, la nourriture destinée aux animaux, les boissons, et les tabacs sont groupées en trois sections principales: Matières brutes non comestibles, Matières fabriquées non comestibles, et Produits finals non comestibles. Cette triple division ne doit pas être identifiée avec le groupement habituel, fondé sur le stade de production: matières brutes, matières ayant subi une simple première transformation, et produits ayant subi une transformation plus poussée. La classification en trois sections sert à plusieurs fins. Voici les plus importantes:

a) C'est un cadre dans lequel les divers principes de classification peuvent s'appliquer le mieux et de façon logique et uniforme. Les principaux critères qui permettent de classer les marchandises sont la "principale matière constitutive", la "destination" et l'"origine" (selon cet ordre d'importance, bien que les deux premiers soient à peu près d'égale valeur pour le classificateur). C'est le critère de la matière constitutive qui s'applique le plus aux matières brutes et aux matières en cours de transformation; l'origine y compte pour beaucoup moins. Quant aux produits finals, cependant, matière constitutive est devenue beaucoup moins utile depuis quelques années à mesure que d'autres matières et mélanges de matières sont entrés dans les articles finis. Tout indique que cette tendance continuera à mesure qu'on utilisera de nouvelles matières et que les progrès technologiques donneront lieu à de nouvelles combinaisons de matières. Voilà pourquoi dans le corps de la présente classification les matières brutes et les matières fabriquées ont été classifiées surtout d'après le principe de la matière constitutive tandis que les produits finals l'ont été principalement d'après leur utilisation ou leur objet.

b) C'est un cadre qui n'est pas sujet à subir de profonds changements du fait de l'introduction de nouvelles matières ou la découverte de nouveaux usages pour

Regardless of changes in processes or materials there will always be crude materials, fabricated materials, and end products. This should result in stability in the structure of the classification over a long period of time.

- (c) For many analytical purposes the distinction between crude materials, fabricated materials, and finished articles is useful. This is particularly true because of the flexibility introduced into the "end products" section by the application of the principle of "purpose" to a much greater extent than heretofore, resulting in smaller "n.e.s." (not elsewhere specified) items and more meaningful division and group headings. At the same time crude materials represent mainly the products of extractive industries while fabricated materials and end products are a result of manufacturing activity.

The nature of the three-way split mentioned above may be more fully understood with a few words of explanation. The concept of "crude materials" is fairly clear. It includes raw products and those that have been subjected to preliminary processing for the purposes of cleaning or ease in shipping, e.g., cotton ginning, wool scouring, ore milling. In addition, waste and scrap materials which are used mainly as crude materials are included in this section.

Similarly, the identification of "end products" is not too difficult. This class consists of articles rather than materials, i.e., finished commodities that are usually dealt in and thought of in terms of units, dozens and similar measures as against the pounds, tons, barrels and similar quantity designations usually applied to materials. In practice, of course, a great deal of controversy could develop regarding the proper allocation of specific items but if it is accepted that anything which forms a part of something else (except machine parts and accessories which are most usefully classified with the appropriate machine) or is commonly incorporated into something else in a further production process is a material, and that anything which retains its individual identity (even though it may be used for further production) is an end product, little serious difficulty is found in allocating items. The working committee found it useful at this stage to refer back again and again to the difference between a nail and a needle. The nail is of no use by itself; it becomes useful only in connection with other materials and then it has lost its identity as a nail by being incorporated with those other materials into something quite different from any of them. The needle, on the other hand, is used with other materials but emerges from that function as a needle useful again for the same purpose. In this sense the nail is a fabricated material and the needle an end product.

When crude materials and end products have been identified, fabricated materials remain. Under this definition there are fabricated materials (such as

de vieilles matières. Peu importe les changements de procédés ou de matières, il existera toujours des matières brutes, des matières fabriquées, et des produits finals. Cela devrait assurer la stabilité de la structure de la classification durant longtemps.

- c) La distinction entre matières brutes, matières fabriquées, et articles finis est utile à une foule de fins d'ordre analytique. Cela est particulièrement vrai à cause de la flexibilité donnée à la section des "produits finals" par l'application plus poussée que jamais encore du principe de la "destination", ce qui a pour effet d'alléger les positions "n.e.s.: not elsewhere specified" (non désigné ailleurs) et de donner plus de sens aux en-têtes des divisions et groupes. En outre, les matières brutes représentent surtout les produits des industries extractives tandis que les matières fabriquées et les produits finals sont l'aboutissement de l'activité manufacturière.

Quelques mots d'explication feront mieux comprendre la nature de la triple division susmentionnée. Le concept de "matières brutes" est assez clair. Elles comprennent les matières qui ont subi un premier traitement aux fins de les nettoyer ou d'en faciliter l'expédition, comme l'égrenage du coton, le dessuintage de la laine ou le broyage du minerai. En outre, les déchets et rebuts qui sont surtout employés comme matières brutes entrent dans cette section.

De même, la détermination des "produits finals" n'est pas trop difficile. Cette classe comprend des articles plutôt que des matières, c'est-à-dire des marchandises finies qui se vendent et se comptent d'ordinaire en unités, douzaines et autres mesures semblables alors que les matières sont habituellement exprimées en livres, tonnes, barils et autres désignations quantitatives semblables. Dans la pratique, il va de soi, on pourrait longtemps se disputer au sujet du classement de certaines marchandises particulières, mais s'il est admis que tout ce qui forme partie de quelque autre chose (sauf les pièces et accessoires de machines qui sont, pour la plupart, classés avec la machine en cause) ou est ordinairement incorporé à autre chose en étant encore soumis à un autre procédé de production est une matière, et que tout ce qui conserve son identité propre (même s'il peut servir à une autre production) est un produit final, le classement des marchandises ne présente guère de grandes difficultés. Le comité a trouvé avantageux, à cette étape, de revenir sans cesse à la différence entre un clou et une aiguille. Le clou n'est en lui-même d'aucune utilité; il ne devient utile qu'en conjugaison avec d'autres matières et alors il perd son identité propre en étant incorporé avec ces autres matières dans un produit bien différent. L'aiguille, par contre, est utilisée avec d'autres matières, mais elle demeure encore, une fois qu'elle a servi à son objet, une aiguille qui peut encore servir à la même fin. C'est en ce sens que le clou est une matière fabriquée et que l'aiguille est un produit final.

Les matières brutes et les produits finals étant déterminés, il reste les matières fabriquées. D'après cette définition, il existe des matières fabriquées

sawn lumber and cotton yarn) which have undergone rather simple processing, others (such as metal windows and nylon fabrics) which are the result of complicated industrial processes. Yet they have in common the characteristic of materials, i.e., they will be involved in further processing before reaching the form in which their end use is served.

For some purposes it may be desirable to classify commodities in a different manner from that shown in the main body of the classification. For example, in the case of ores, statistics on their metallic content are needed for most purposes and so in the main classification it is the metallic content of ores which is classified. For transportation statistics, however, it is the ore itself which is classified and to meet this need Appendix I of this classification provides an alternative classification of division 25. To indicate that it is an alternative classification, the letter A has been included in the code for each item. The items in the alternative classification have not been included in the alphabetical index.

#### Coding System

The coding does not adhere strictly to a decimal system because this would have required more than the five digits used. Limiting the code to five digits reduces the risk of error in using numbers and decreases the work involved in punching and otherwise transcribing code numbers. In so far as possible, however, the code number consisting of five digits distinguishes sections, divisions, and groups by unique combinations of the first three digits with the additional two digits identifying the commodity item. Thus the first digits 0 and 1 identify Live Animals and Food, Feed, Beverages, and Tobacco; 2 indicates Crude Materials; 3 and 4 Fabricated Materials; and 5 to 9 End Products.

In general, logically contiguous items within a group have been listed consecutively regardless of alphabetical considerations. Where there is sufficient space related items within a group are assigned the same fourth digit, so that, in effect, sub-groups are created. Where no other arrangement seems preferable, the items within a group are arranged alphabetically. Wherever possible, code numbers are reserved so that items can be added.

Wherever practicable, miscellaneous or "n.e.s." items have a code number ending in 9. In the Machinery groups of the End Products section, the "Parts and Accessories" item is coded wherever possible with a number ending in 95. If a group consists of a single item having the same title as the group, the item code is the group code with the digits 00 added.

(comme le bois scié et les filés de coton) qui ont subi un traitement plutôt simple, d'autres (comme les fenêtres en métal et les tissus de nylon) qui sont l'aboutissement de procédés industriels compliqués. Et pourtant elles ont toutes le caractère propre aux matières: elles seront soumises à plus ample traitement avant d'atteindre la forme sous laquelle elles sont finalement utilisées.

Il serait peut-être souhaitable pour certaines fins de classer les marchandises de façon différente de celle du corps principal de la classification. Ainsi, dans le cas des minerais, la statistique de leur teneur en métal suffit à presque toutes les fins et c'est pourquoi c'est la teneur en métal des minerais qui est classifiée. Quant à la statistique des transports, cependant, c'est le minerai lui-même qui est classifié; pour répondre à ce besoin, l'Appendice I de la présente classification fournit une classification alternative de la division 25. Afin d'indiquer qu'il s'agit d'une classification alternative, la lettre A figure dans l'indicatif de chaque position. Les positions de cette classification alternative ne sont pas incluses dans l'index alphabétique.

#### Codification

La codification ne s'en tient pas strictement à un système décimal parce que cela aurait exigé l'emploi de plus de cinq chiffres. L'indicatif à cinq chiffres réduit les risques d'erreurs numériques et diminue le travail qu'entraîne la transcription par perforation ou autrement des indicatifs. Autant que possible, cependant, l'indicatif à cinq chiffres établit la distinction entre les sections, divisions, et groupes au moyen de combinaisons particulières des trois premiers chiffres auxquels s'ajoutent les deux autres chiffres propres à la position de la marchandise. Ainsi, les premiers chiffres 0 et 1 se rapportent aux Animaux vivants ainsi qu'aux Produits alimentaires, à la Nourriture destinée aux animaux, aux Boissons, et aux Tabacs; le chiffre 2 aux Matières brutes; les chiffres 3 et 4 aux Matières fabriquées; et les chiffres 5 à 9 aux Produits finals.

En général, les marchandises qui sont logiquement contiguës au sein d'un groupe sont énumérées consécutivement, sans égard à leur ordre alphabétique. Lorsque l'espace le permet, le même quatrième chiffre est attribué, aux positions connexes au sein d'un même groupe, ce qui a pour effet de créer des sous-groupes. Lorsqu'une autre disposition ne paraît préférable, les positions sont classées alphabétiquement au sein d'un même groupe. Là où cela est possible, des indicatifs sont réservés afin de permettre d'ajouter d'autres positions.

Partout où il y a moyen, un indicatif terminé par 9 est attribué aux positions "divers" ou "n.e.s.". Dans les groupes de Machines de la section des Produits finals, un indicatif terminé par 95 est attribué à la position "Pièces détachées et accessoires" chaque fois que cela est possible. Si un groupe comprend une seule position portant le même titre que le groupe, l'indicatif de la position est celui du groupe auquel sont ajoutés les chiffres 00.

## Acknowledgments

The Committee on Commodity Classification has been fortunate in receiving the ready co-operation of a large number of different individuals, industry and trade associations, and representatives of business firms. It would not be possible to list all of those who have contributed to some degree in the development of this classification. The preparation of a standard commodity classification for a rapidly developing economy, such as that of Canada, is no easy task. In addition to the requirements for commodity data in general economic analysis, the increasing use of statistics by industrial and trade associations and business firms must be taken into account. For many of these purposes detailed information is required on relatively small groups or classes of commodities, while for others the broad picture is most appropriate. At the same time the structure of the classification must be such that it can be expanded where necessary and can be adapted otherwise to changing technological and other circumstances. In order that all of these considerations could be taken into account, and the views of a wide variety of users be brought to bear on the classification, the earlier drafts were given wide circulation. At the same time it must be made clear that the Committee made the final decisions as to what items could or could not be separately designated. Thus, omissions or errors in the classification are the responsibility of the Committee.

## Remerciements

Le Comité de la classification des marchandises a bénéficié de la collaboration empressée d'un grand nombre de particuliers, d'associations industrielles et commerciales et de représentants d'établissements commerciaux. Il serait impossible de mentionner tous ceux qui ont contribué de quelque façon à dresser la présente classification. Ce n'est pas une tâche facile que d'établir une classification type des marchandises appropriée à une économie qui se développe rapidement comme celle du Canada. Il faut tenir compte, non seulement du besoin de données sur les marchandises pour les fins des études économiques en général, mais aussi des nécessités des associations industrielles et commerciales ainsi que des établissements commerciaux qui utilisent de plus en plus la statistique. Dans bien des cas il ne faut de renseignements détaillés qu'à l'égard de groupes ou classes relativement peu considérables de marchandises, tandis que dans d'autres cas c'est un aperçu général qui s'impose. En outre, il faut que la structure de la classification permette de l'amplifier au besoin et de l'adapter aux changements d'ordre technologique et autres. Afin de répondre à tous ces impératifs et de tenir compte du sentiment de toute la foule des usagers de la classification, les premières rédactions ont été soumises à une multitude de gens. Il faut préciser, cependant, que c'est le Comité qui a arrêté définitivement les positions qu'il fallait ou ne fallait pas désigner séparément. Voilà pourquoi les omissions ou les erreurs que peut comporter la classification sont imputables au Comité.

APPENDIX I

ALTERNATIVE CLASSIFICATION FOR  
DIVISION 25

METALLIC ORES, CONCENTRATES,  
AND SCRAP METALS

(for statistics of tonnages mined,  
transported etc.)

Division 25 of the Standard Commodity Classification is intended for use in cases where the primary interest is in the metallic content of the ore. For some purposes, such as statistics of tonnage of ore mined or quantities of ore transported, the primary interest is in the ore itself, and for such purposes this alternative classification may be used.

This takes a different approach to the classification of metallic ores, dealing with the ore itself rather than with its metal content. For example, if an ore bears both nickel and copper, it would be classified under the alternative code as "25A 2 15, nickel-copper ore". Under the main code, the nickel content would be classified as "25 5 10, nickel in ore and concentrates" and the copper would be classified as "25 3 10, copper in ore and concentrates".

The whole of division 25 is rearranged, with the result that different code numbers have been given to some items, such as steel scrap, which are not directly affected by the change in definitions. It is assumed that those who work with the alternative classification would probably use it for the whole of division 25. Since the numbers in the alternative classification are identified by the letter A, it would be possible to continue to use the standard code numbers for items which have the same definitions under both classifications. These are indicated by giving the standard code reference in parentheses after the item designations.

CLASSIFICATION ALTERNATIVE POUR LA  
DIVISION 25

MINERAIS METALLIFERES, CONCENTRES,  
ET DECHETS DE METAUX

(pour la statistique des tonnages  
extraits, transportés, etc.)

La division 25 de la Classification type des marchandises est destinée à servir dans les cas où l'on s'intéresse d'abord à la teneur en métal du minerai. Pour certaines fins, comme la statistique des tonnages de minerai extrait ou des quantités de minerai transporté, on s'intéresse d'abord au minerai lui-même; cette seconde classification peut être utilisée à ces fins.

Il faut pour cela procéder différemment à la classification des minerais métallifères et s'occuper du minerai lui-même plutôt que de sa teneur en métal. Ainsi, si un minerai renferme du nickel et du cuivre, il serait classé "25A 2 15, minerai de nickel-cuivre" d'après le second code. D'après le code principal, la teneur en nickel serait classée "25 5 10, nickel contenu dans des minerais et concentrés" et la teneur en cuivre serait classée "25 3 10, cuivre contenu dans des minerais et concentrés".

L'ensemble de la division 25 est remanié, de sorte que des indicatifs différents sont attribués à certaines positions, comme les déchets d'acier, qui ne sont pas directement atteints par le changement apporté aux définitions. On a pensé que les usagers de la seconde classification l'emploieront probablement pour toute la division 25. Comme les indicatifs de la classification alternative sont distingués par la lettre A, il serait possible de continuer d'utiliser les indicatifs de la classification type pour les positions qui répondent à la même définition dans les deux classifications. Pour indiquer ces positions, l'indicatif de la classification type est mis entre parenthèses après leur désignation.

## ALPHABETICAL INDEX

This index contains all items in the classification (excluding the Appendices), cross-indexed according to the principal words in the designations. The titles of divisions and groups are classified in the same way. They can easily be distinguished since divisions have only two code digits and groups three. All five digit codes apply to items.

Where wording coincides (for example, group and item titles), only the longest code is shown.

After finding the item in the alphabetical index, it is advisable to look over the corresponding part of the classification, since some items are subdivided further by additional specifications, measures, or characteristics, not shown in the alphabetical index.

It is intended to publish a more comprehensive alphabetical index, showing for a much greater number of items the codes under which they should be classified.

## INDEX ALPHABETIQUE

Cet index renferme toutes les positions de la classification (sauf celles des Appendices) recoupées selon les mots principaux des désignations. Les titres des divisions et des groupes sont recoupés de la même façon. Il est facile de les distinguer parce que les divisions n'ont que des indicatifs à deux chiffres et les groupes, des indicatifs à trois chiffres. Tous les indicatifs à cinq chiffres sont des indicatifs de positions.

Lorsque la désignation est la même (par exemple, lorsque le titre du groupe et de la position est le même), seul l'indicatif le plus long est indiqué.

Après avoir trouvé la position dans l'index alphabétique, il est bon d'examiner la partie correspondante de la classification puisque certaines positions sont d'avantage subdivisées par des précisions, des mesures ou des caractéristiques qui ne figurent pas dans l'index alphabétique.

Le Bureau a l'intention de publier un index alphabétique plus complet qui indiquera, pour un bien plus grand nombre de positions, les indicatifs à leur attribuer.
