Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

Business Microdata Integration and Analysis

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 951-3610) or to the Statistics Canada reference centre in:

St. John's	(772-4073)	Winnipeg	(983-4020)
Halifax	(426-5331)	Regina	(780-5405)

Highlights

- This paper introduces a database on businesses in the Canadian economy. Individual businesses are tracked over time and data pertaining to them are obtained by linking income tax records and survey data.
- The business entities followed are those with paid employees in Canada, operating in either the private or public sectors.
- The information presented for each business includes its total payroll and a calculated measure of employment. These data are disaggregated by the size of the business (based upon the employment measure), by its life status (continuous, newly identified or no longer identified) and by country of control. Further, they are tabulated by province and by industry.
- Changes in employment, as recorded in any particular size category, reflect a wide variety of factors such as mergers of businesses, acquisition of part of a business by another, administrative reorganizations, and labour requirements related to the expansion or contraction of a business's economic activity.
- Future development of the database will be directed towards isolating employment changes related to a business's economic activity and thereby identifying the contribution to net employment change in the economy made by businesses in particular size categories, such as small businesses. The role played by businesses of various sizes is of ongoing interest in the study of employment and its determinants in the Canadian economy.

Acknowledgements

The longitudinal employment database evolved from initial cost recovery work done for the Department of Regional and Industrial Expansion and the Federal Business Development Bank. From its inception as an idea for integrating survey and administrative data through to the development and interpretation of the resulting database, many individuals have been intensively involved. Many others offered valuable comments and many more helped to prepare this document.

John McVey of Business Microdata Integration and Analysis led this database initiative through its various stages. Development of the database and initial documentation were undertaken by John McVey and Shawn Brennan of Small Business and Special Surveys Division. They proposed the use of payroll data as a basis for approximating employment, solved the problems inherent in linking data from survey and administrative sources and generated discussion on methods of data standardization to aid in the interpretation of this database.

Such a data standardization technique was developed by K.P. Srinath of the Business Survey Methods Division, and Professor Michael Ray from the Department of Geography, Carleton University. The methodology and its application to this database are described in K.P. Srinath and D.M. Ray, "Use of Standardization in the Analysis of Growth Rates: Multi-Factor Partitioning", Statistics Canada, forthcoming.

The interpretation of the database, its scope and limitations was carried out by Janice McMechan, International and Financial Economics Division. She defined and illustrated the employment measure, commented on the data and wrote this paper.

The section discussing the employment concept, its caveats and limitations, developed from extensive discussions with Ian Macredie of the Labour and Household Surveys Analysis Division. Ed Bunko, Jim Selley, and Jack Beauregard of the Labour Division helped with the provision and interpretation of their survey files. Many individuals associated with Statistics Canada's Business Register provided information on its concepts and operations.

Valuable comments on all aspects of this project were received from Stewart Wells, Jacob Ryten, Albert Meguerditchian, Marlene Levine, Ian Macredie, Kishori Lal and Paul Reed of Statistics Canada and Professor Lewis Soroka of Brock University.

The considerable computing skills required to build the very large and complex database and to carry out the computation for the multi-factor partitioning were provided by John Heath and Al Short, respectively, of BMIA. The many requests for tables were ably filled by Marquita Wilkinson of BMIA. Special thanks go to Denyse Payant of BMIA for her very competent, organized and patient work in coordinating the preparation and editing of this report.

1. Introduction

In fulfilling its mandate to provide information for Canadian society, Statistics Canada collects a wide variety of information on businesses and their operations. This information is gathered primarily by survey or census. Statistics Canada also has access to a wide range of administrative data from other organizations. In response to continuously changing data requirements, the Bureau is undertaking experimental work to examine the usefulness of linking these diverse data sources to provide more information on businesses without incurring additional information-gathering costs. The goal of this particular record linkage project is to develop a **longitudinal micro-database on businesses** in the Canadian economy, the database being constructed through **record linkage of administrative and survey data**.

The purpose of this paper is threefold:

- To inform potential users of this technique and to describe the process of building a longitudinal micro-database – the conceptual issues faced, the technical process of linkage and the problems inherent in bringing together information from a variety of sources.
- To describe the database as it now exists, its scope and limitations and its potential.
- To invite input from potential users regarding the types of information they would like to see produced via microdata linkage.

The database discussed here had its origins in 1972, when Statistics Canada established a group to provide statistics on multinational enterprises. This group began working with microdata files from most of the business-related surveys in Statistics Canada. By linking these files both cross-sectionally and longitudinally, a database was created which permitted analysis of the performance of foreign and Canadian controlled firms. In 1980, the Longitudinal Employment Analysis Program (LEAP) commenced as the survey-based files were supplemented with administrative microdata records obtained from Revenue Canada and Employment and Immigration Canada and linked via Statistics Canada's Business Register. As the output and mandate of the group carrying out this work expanded, it became known, in 1984, as the Business Microdata Integration and Analysis Group or BMIA.

The information on businesses brought together in this record linkage project includes payrolls, employees' social insurance numbers, premiums for Unemployment Insurance, Canada and Quebec Pension Plans, province of operation of the business, industrial classification, country of control, some indicators of financial performance and inter-corporate ownership structure of the larger corporations. This information can be categorized and tabulated by any variable, and presented for one point in time to facilitate cross-sectional studies, or over a period of time in a longitudinal database.

While choosing various subsets of the available data will result in datasets highlighting different aspects of business operations, the information in the database discussed here, and shown in the attached tables, relates total payroll and a calculated measure of employment to the individual business. The data are disaggregated by size of business (based upon the employment measure), by life status of the business (continuously identified throughout the 1978-1984 period, newly identified during this period, or no longer identified by 1984) and by country of control, and are tabulated by province and industry. The employment measure is presented as levels for the years 1978 and 1984 and as changes between the two years. The database is longitudinal on businesses -- that is, the economic units tracked through time are businesses.

Following the introduction, this paper defines the "business" as it is considered in the database and discusses its appropriateness as the economic unit being tracked over time. The use of administrative records from Revenue Canada Taxation and the role they play in building Statistics Canada's Business Register are then discussed. The businesses identified on the Business Register and the set of information attached to each business form the basis for the longitudinal database. Data collected under the Corporations and Labour Unions Returns Act (CALURA) are then linked to this existing information. At this stage, an approximate measure of employment is calculated for each business. In section 6, this "Average Labour Unit" concept, its caveats and limitations are discussed and compared with two published measures of employment. Section 7 reviews the resulting database and what it represents, followed by a

discussion in section 8 of directions for future development of the database. Of particular interest in this development is the contribution made by businesses of various sizes in providing net, new employment to the economy as they engage in productive activity. The final section briefly comments on the data presented in the attached statistical tables.

Maintaining confidentiality is an important facet of Statistics Canada operations. The fact that the Bureau has legislative authority to require information to be provided places a heavy onus on Statistics Canada to protect the confidentiality of that information. In this, and all record linkage exercises, no information is disclosed which would make it possible to relate the particulars to any identifiable individual, business or organization. Further, each such proposed exercise is formally reviewed to ensure that there is a need for, and a general interest in, the resulting data.

2. Definition of a Business

In this database, only businesses that have paid employees in Canada are considered. The term "business" is stretched to include all private or public sector businesses or organizations (including public administration) which, during the reference year, remitted social security and tax deductions on behalf of these employees to Revenue Canada.

For the corporate sector, with very few exceptions, each incorporated entity is treated separately, irrespective of whether it is the parent or the subsidiary of another corporation. For the unincorporated business sector, each filer of a T1 tax return who also has paid employees is considered to be a business. Individual tax filers who submit more than one set of financial statements are counted as one business.

These definitions do not accord well with those used in most surveys that produce industrial statistics, largely because the purpose of these surveys is to measure the activities of an operating entity known as an establishment. The establishment, while being more amenable to industrial classification because, in principle, it comprises a homogeneous set of activities, has no counterpart in Revenue Canada tax records. However, businesses may span one or more establishments, and as long as the establishment-business relationship is tracked, survey data can be related to administrative records.¹ In particular, since information on employment is recorded for each business in this database, and employment is a concept closely associated with the establishment level, these establishment-business relationships must be carefully tracked in order to interpret changes in employment as recorded on this database.

In addition to parent-subsidiary relationships, other links among businesses exist that are not recorded on this database. An important gap is in franchising, a growing feature of the relationships binding large to small business. In general, a franchise is a legal right extended by one legal entity to another permitting the holder of the franchise to carry out some business activity under a given trade name. However, since there are a wide variety of franchise arrangements with varying degrees of control exercised by the franchisor, and there is no precise, legally enforced definition accepted by both parties, the recording of the linkages is at best incomplete.

In using this definition of a business, the intent is to capture the universe of employers and the universe of income from paid employment in the database. A clearer understanding of this employee-based definition can be obtained by also knowing what it excludes vis-à-vis other employment and income data. In terms of income, an employee-based definition excludes taxable income of owners and partners of unincorporated businesses. Revenue Canada² data indicate that in 1984 the income of this group was over 3 percent of the total payroll recorded for all businesses (excluding public administration). However, the incidence of this income from unincorporated business was not uniform across industries; it was approximately equal to the total payroll in the primary industries and accounted for about 6 percent of the payroll in construction and retail trade.

¹ In addition to establishments and incorporated companies, a third level of classification is the parent enterprise. It is possible, in future work, to build a longitudinal database on enterprises since the enterprise affiliation has been included with each business's information.

² Data from Revenue Canada as reported in Corporation Taxation Statistics, 1981, Statistics Canada, Catalogue No. 61-208, annual.

In terms of an employment count, data from the Labour Force Survey (LFS)³ indicate that employers (owners and partners in unincorporated businesses), own account workers and unpaid family workers constitute about 10 percent of total LFS employment and, on occasion, can account for a much higher percentage of the year-to-year change in employment.⁴ The impact of these exclusions from the ALU measure is not uniform across size groupings of businesses. Rather, it is concentrated at the smaller end of the size spectrum. A small business often starts as an individual working on his or her own account or perhaps with a partner, progressing to employer status as the business grows. It is this type of business, with all aspects of its operations arising from one or more individuals with an ownership stake in the business, that is prominent in the discussion of "small business" in Canada. A dataset built upon an employee-based definition of a business misses many of these small unincorporated businesses and the income they generate for their owners. Further, if the employment excluded by this definition amounts to about 10 percent of total employment, and if the income excluded is approximately 3 percent of total payrolls, they would amount to much higher proportions in small businesses.

3. Revenue Canada Records

Statistics Canada has access to administrative data which originate from the application of particular government programs to individuals, families, businesses and other economic units. The building of this database relies on three administrative files in addition to the files created with T4 income tax returns.

The first of the administrative files is the PD-20 file. It is essentially a file of registrations in which each record contains the identification of an employer, the nature of business, its address and a cross reference to other payroll deduction accounts managed by the same business. An employer may have one or many PD account numbers depending on the business's perceived administrative requirements. Further, the employer may open or close PD accounts at will, the latter being restricted to cases where no monies are owing to Revenue Canada-Taxation.

The second and third administrative files relate to the payroll deduction system by which employers remit to Revenue Canada social security deductions on behalf of their employees. The first of these is the payroll deduction account file (PAYDAC), a current register of remittances. Each registered employer, identified by a number also shown on his PD-20 form, has his remitted employee deductions recorded in this file. In principle, no remittances can take place until the employer registers with a PD-20 form. In practice, the two procedures may be out of their proper sequence for awhile.

The last file, the T4 Supplementary, records in summary form all deductions for social security purposes made by an employer during the year. This file is cross-referenced to the PD-20 and PAYDAC files and includes details on each employee such as gross earnings, province where earnings accrued, and premiums paid towards Unemployment Insurance and Canada and Quebec Pension Plans.

There are both strengths and weaknesses associated with using administrative rather than survey data for statistical purposes.

Administrative data have broad (often universal) coverage of their target populations and are highly accurate for the purposes for which they are collected. Survey data may be less accurate and may include non-response error or sampling error. The additional cost of extracting statistical information from administrative sources is small in comparison with the cost of getting data of equal precision from a survey carried out for that purpose. Such a survey would also impose an additional burden to respondents. The absence of this response burden is a fairly important consideration in the context of small businesses.

Offsetting some of these factors are the following considerations. Since administrative data are not designed for statistical purposes, they may not satisfy analytical requirements of survey data due to differences in concepts, definitions, methods and target populations. Further, since administrative data are collected to meet the needs of policy, changes in policy could result in changes in coverage or in continuity of related data.

³ The Labour Force, Catalogue No. 71-001, Statistics Canada, monthly.

⁴ For example, this non-employee group accounted for almost one-half of the increase in LFS employment between 1982 and 1983.

4. Statistics Canada's Business Register

The Business Register is a central repository of the names, addresses and selected industrial characteristics of businesses in Canada. Each business has been classified according to Statistics Canada's Standard Industrial Classification. The primary function of the Business Register is to provide, in a timely manner, the statistical sampling frame required by any business survey. Its coverage is the universe of employers and hence the universe of business entities having paid employees in Canada.⁵

The major source of information for identifying this universe of employers is the PD-20 employer registration file obtained from Revenue Canada. Each new PD-20 form alerts the Business Register to the possibility of a new business coming into existence. A search is made for any existing business to which this registration relates. If the business is truly new, it is assigned a unique identification known as the Business Register Identification or BRID number. The unit defined by this BRID is the business at the incorporated company level or the unincorporated business. Structural component identifiers further identify the hierarchy of establishments and locations should these exist. It is this BRID-identified business (discussed in section 2) which is tracked in the longitudinal database.

Each BRID is matched via its PD numbers to the two Revenue Canada files pertaining to the payroll deduction system. These files provide the total wages and salaries paid for the calendar year (the annual payroll) and the number of employees to whom they were paid for each BRID.

Statistics Canada does not rely exclusively on the information contained in these administrative records. Confirming and additional data are collected through the Current Business Survey, carried out through the regional offices. Information gathered via this survey includes details of a business's activities and individual locations and information on any major legal or financial reorganizations in the recent past.

A second internal source of information for the register is the feedback received from regular survey activities. Examples include the range of commodities produced by a business, its number of employees or its control over or dependence on other businesses. This information helps to maintain the accuracy of the industrial classification, the assignment of a size to the business and its links to other businesses.

The Business Register must be updated constantly to maintain a timely, complete, unduplicated and accurately classified register of businesses. Regular updates of the file are carried out as new information is received on businesses already existing on the register or for those being newly entered. Deletions from the PAYDAC file are done once a year.

Maintaining the Business Register is a complex process. The following elements of this process are particularly important to the longitudinal database derived from the Register.

- Each month as the PAYDAC file is used to update the Business Register, the data are examined to determine if a new PD account represents a new business or an additional account of an existing business. Updates to data for existing PD accounts are done at this time. A company may be contacted directly to confirm any aspect of its data.
- The Business Register must record the many changes to which business entities are subject. The most common types of changes are the sale of part of a business's operations and its acquisition by another business, mergers, amalgamations into new companies, expansion of operations, relocations, changes in industrial activity, legal name changes, new operations and the cessation of operations.

5. Linking to CALURA Files

In order to add an indicator of the country of control of the business, data collected under the Corporations and Labour Unions Returns Act (CALURA) were linked, via the BRID number, to the existing information. This Act, passed in 1962 and amended in 1965, requires corporations to report their financial

⁵ Source: Business Register Reference Manual, Business Register sub-Division, Statistics Canada. The Business Register Master File will be expanded to the Central Frame Data Base (CFDB) in the near future.

data to Statistics Canada unless such a financial statement had been filed under the Income Tax Act, in which case Statistics Canada accesses the data from Revenue Canada. All foreign-controlled corporations in Canada are represented by these CALURA data.

The country of control of a corporation is an assignment of a geographical locus of control, representing the country of residence of the persons having the greatest potential to strategically influence⁶ the activities of the corporation.⁷ The ability to strategically influence is based upon ownership of voting equity by an individual, group, or government and is generally determined by the majority of this form of ownership. If no majority exists in any one country, control is assigned to the country with the largest block of voting equity.

Country of control is assigned at the enterprise level. Thus all corporations belonging to one global enterprise will have the same country of control.

6. Average Labour Units

Concept

One aspect of a business's operation which is not captured by linking the files described above is the amount of employment generated by the business. Revenue Canada records provide total earnings of all those persons who were employed by the business at some point during a calendar year. However, these records cannot provide either the number of persons on the business's payroll at a given point in time or the average level of employment over a period of time such as a calendar year.

There is a Statistics Canada survey -- The Survey of Employment, Payrolls and Hours, or SEPH -- which does provide information on the number of employees per reporting unit.⁸ However, this survey cannot be used to build a complete longitudinal database. Units having more than 200 employees are always surveyed, while the remainder are sampled on a rotating basis. Thus, those with fewer than 200 employees (which constitute the great majority of reporting units in the Canadian economy) cannot be followed longitudinally.

In the absence of complete longitudinal data on employment in all businesses, a calculation was done to convert each business's payroll into an approximation of the annual average level of employment it represented. This artificial measure, labelled Average Labour Units or ALUs permits businesses to be categorized by size, where size is defined in terms of approximate number of employees.

This ALU measure is thus useful for categorizing businesses by employment size in the database but is not meant to be used as a new measure of aggregate employment at the industry, provincial or national levels.

Calculation of Average Labour Units

In theory, if the annual total payroll and average annual earnings per employee of a business are known, one can then derive a measure of the annual average employment level in that business. That is,

$$\text{estimate of annual average employment} = \frac{\text{annual total payroll}}{\text{average annual earnings per employee}}$$

⁶ Strategic influence is the ability to affect the corporate strategic decision-making process on issues such as the acquisition and disposal of assets, the appointment of the chief executive officer, the allocation of resources or the diversification of activities. If the country of control of a business has varied over the 1978-1984 period, the most recently available country of control classification has been assigned to the business for the entire period.

⁷ Krause, W.E., J. Lothian and C.F.J. Richards, "The Ownership, Control and Country of Control of Corporations", unpublished document, CALURA sub-Division, Statistics Canada, June 5, 1987.

⁸ Although the establishment is the basic statistical unit used for comparisons across many business surveys, it may occasionally be subdivided into reporting units. This sub-division may be carried out for the purpose of detailed geographical statistics or may be done by the respondent for its own reasons. While the reporting unit is not capable of reporting all basic industrial statistics, it can report employment, payrolls and hours data.

This is basically the method used to obtain the employment measure known as average labour units or ALUs.

In the numerator is the annual total payroll of a business, identified by its BRID on the Business Register. Information attached to the BRID gives the location (province) and industrial classification of the business. Thus,

$$AP_{b(k,l)} = \text{Total annual payroll for business } b \text{ which is located in province } l \text{ and classified at the company level in industry group } k.$$

This annual payroll of a business ideally should be matched with information on average annual earnings per employee from the same business to accurately estimate employment. Such data, however, are not available. Instead, these earnings have been represented by the estimated average annual earnings per employee of the same⁹ industry-province group.

Monthly payroll and employment data obtained from the Survey of Employment, Payrolls and Hours (for 1983-1984) and the ES-1 establishment survey (for 1978-1982) are used to estimate average monthly earnings per employee for each 3-digit industry group in each province. This calculation is done at the level of the establishment, or the reporting unit if such a subdivision has been made.

For 3-digit industry-province group kl , let

MP_{ijkl} = payroll for i th establishment during month j , in 3-digit industry group k and province¹⁰ l

$$i = 1 \dots I \quad k = 1 \dots K;$$

$$j = 1 \dots 12 \quad l = 1 \dots 13$$

E_{ijkl} = number of employees in the i th establishment during month j in 3-digit industry group k and province l .

Then, the estimated average monthly earnings per employee in 3-digit industry group k and province l , or AME_{kl} , is the sum of the monthly payrolls¹¹ for each establishment during each month divided by the sum of the number employed in each establishment during each month of the year.

$$AME_{kl} = \frac{\sum_{j=1}^{12} \sum_{i=1}^I MP_{ijkl}}{\sum_{j=1}^{12} \sum_{i=1}^I E_{ijkl}}$$

⁹ The group is the 3-digit Standard Industrial Classification (SIC) level. The SIC system arranges producing units (establishments) into industries. In any one industry class, either the units produce a homogeneous set of goods or service or, alternatively, the units are engaged in the same or similar kind of economic activity. The 3-digit level used here represents an industry group such as fruit and vegetable processing industries. The 2-digit or major group level in this example is Food and Beverage Industries and the 1-digit or division level is Manufacturing Industries. Firms that alter their major industry of activity over time are classified according to the latest 1970 SIC reported.

¹⁰ "Province" here refers to 10 provinces, 2 territories and outside Canada for a total of 13 geographical areas.

¹¹ Note that since some businesses are located in several different provinces, the average earnings of the industry in the appropriate province are used in conjunction with the payroll subtotals of each province.

Multiplying by 12 annualizes this monthly average, giving estimated average annual earnings (AAE) for the 3-digit industry group k and province l .¹² That is,

$$AAE_{kl} = AME_{kl} \times 12$$

Thus, Average Labour Units calculated on an annual basis for business b , located in province l and classified at the company level in industry k equals the total annual payroll of that business divided by the estimate of average annual earnings for the same province and industry group:

$$ALU_b = \frac{AP_{b(kl)}}{AAE_{kl}}$$

Obtaining Earnings Data

For 1983 and 1984, the earnings data are obtained from the Survey of Employment, Payrolls and Hours (SEPH). This establishment survey, which covers businesses of all sizes, measures, on a monthly basis the levels and month-to-month trends of employment, paid hours and earnings.¹³

The SEPH earnings series used is the monthly payroll. These earnings represent gross pay before deductions for taxes, Unemployment Insurance contributions, etc. Gross pay includes salaries, wages, overtime pay, piece-work and regular commissions, regular incentives, cost of living and other bonuses, and payments to persons absent with pay. The monthly payroll includes some special payments not included in the SEPH weekly earnings data. Since these payments are also included in the Revenue Canada payroll data used in the ALU calculation, it was felt that the monthly earnings were conceptually more appropriate to use than the published weekly earnings data.

For the 1978 to 1982 period, monthly payroll data were obtained from the ES-1 establishment survey. This survey, covering all businesses having 20 or more employees, was discontinued with the commencement of SEPH. Since the ES-1 survey did not provide any information on average earnings in smaller businesses, the estimates were biased towards larger businesses which tend to have higher average earnings than smaller businesses.¹⁴ Data from SEPH, which cover all sizes of businesses, were used to make an

¹² Annualizing the monthly average is equivalent to calculating average annual earnings directly.

Let AP_{kl} = annual payroll for industry-province group k 1
 AAE_{kl} = average annual earnings per employee for industry-province group k 1
 $AAEmp_{kl}$ = annual average employment for industry-province group k 1
 E_{ijkl} = employment in establishment i during month j for industry-province group k 1

Then average annual earnings can be expressed as

$$AAE_{kl} = \frac{AP_{kl}}{AAEmp_{kl}} = \frac{AP_{kl}}{\frac{\sum_i \sum_j E_{ijkl}}{12}} = \frac{\sum_i \sum_j MP_{ijkl}}{\sum_i \sum_j E_{ijkl}} = \frac{\sum_i \sum_j MP_{ijkl}}{\sum_i \sum_j E_{ijkl}} \times 12 = AME_{kl} \times 12$$

¹³ For further information on concepts and methods of SEPH, see Employment, Payrolls and Hours, Statistics Canada, Catalogue No. 72-002, monthly.

¹⁴ This differential between large and small business earnings is shown in unpublished tabulations from SEPH as well as numerous studies on the subject. These differences can arise from factors such as a different composition of part-time and full-time employees and differing wage rates.

approximate adjustment to the ES-1 average earnings for the 1978-1982 period. Using SEPH data from 1984 (the earliest complete year of data) a ratio R was calculated for each 3-digit industry group k in province l . Where AAE = average annual earnings as calculated above

$$R_{kl} = \frac{AAE_{kl} \text{ for all surveyed units}}{AAE_{kl} \text{ for units with more than 20 employees}}$$

This ratio was applied to the ES-1 annual average earnings for the 1978-1982 period to make an approximate adjustment to the bias in the ES-1 survey earnings.

This adjustment was complicated by the fact that a few 3-digit industry groupings were not surveyed in ES-1. For these industries, the earnings at each industry/province level were obtained from SEPH for 1983 (using the 10 months of data available). The series was estimated for 1978-1982 by applying the movements in the ES-1 industrial composite average earnings for the appropriate province to the 1983 industry/province earnings figure.

In order to include in the database industries such as agriculture, fishing and trapping, private household services, religious organizations and military services which SEPH does not survey, (but for which payroll data were available at the level of the individual business), the industrial composite average earnings by province were used to represent average earnings in these industries for the entire period.

Some caveats related to the average earnings series should be noted:

- The method of obtaining small business information for the 1978-1982 period is very approximate; it assumes that the relative magnitudes of earnings in small and large businesses have remained unchanged between 1978 and 1983, and that movements in the industrial composite are representative of movements in the average earnings in industries for which the composite is used. There is at present no estimate of the impact these assumptions have on the ALU calculation.
- There is a discontinuity in the average earnings series between 1982 and 1983 arising from two factors. First, the conversion to the 1970-based Standard Industrial Classification changed the composition of some industries and reduced the comparability of their earnings series. Second, there was a change from the ES-1 to SEPH surveys as the source of earnings data. This involved a switch from a census of all reporting units of more than 20 employees to a combination of sample (for units of fewer than 200 employees) and census (for units with more than 200 employees). Changes in survey coverage and methodology such as these typically result in a break in the resulting data series and, as discussed above, the adjustments made for some of the more obvious sources of difference are approximate.

ALUs: An Approximate Measure

The ALU measure is not an exact measure of annual average employment levels in the businesses on the database. Rather it is a calculated measure which may be biased in total and in some of its sub-totals and may vary over time for a number of reasons. The following are some factors which may affect the ALU calculated values:

- a) The accuracy of the ALU measure in relation to actual annual average employment, will be reduced:
 - *essentially true for bus. businesses*
If payroll earnings as reported to Revenue Canada include some categories of earnings not included in SEPH monthly payroll data (such as taxable benefits or irregular bonuses). These additional earnings appear in the numerator of an ALU calculation but are not included in the average annual earnings (the denominator of the ALU calculation). This would result in an upward bias to the calculated ALUs. The bias may not be uniform throughout the database but may vary across industry and size groups. For any given business, this may also vary over time.
 - If there is some systematic survey undercoverage of businesses or establishments in a 3-digit industry-province group for which average annual earnings are higher/lower than the overall average for the group. By biasing the average annual earnings downwards/upwards, the calculated ALUs at any level using the average earnings value would be too high/low. Other types of sampling error may also affect the average earnings and thus the ALU calculation.

- **To the extent that multi-establishment businesses have establishments in more than one industry.** Such a multi-industry business is assigned an SIC code based on the establishment with the greatest value added. This means that a corporation and its total payroll as reported to Revenue Canada are assigned to a single SIC even if that corporation is engaged in several different industrial activities. As discussed above, the average earnings were calculated for the SIC assigned at the establishment level and thus represent earnings for a fairly homogeneous group of activities. Therefore, when Revenue Canada payroll totals for a given SIC are used in conjunction with average earnings for the same SIC to form Average Labour Units, there may be some differences in the activities represented in the numerator and denominator. To the extent that a business includes some establishments with average annual earnings above or below the average of the company level SIC, ALUs will overestimate or underestimate annual average employment.
- b) At the business level, calculated ALUs will vary from actual annual average employment to the extent that a business's actual average annual earnings differ from the average at the 3-digit SIC industry-province level due to:
- A different part-time/full-time composition in the business compared to the industry-province group.
 - A difference in the standard full-time workweek.
 - A different employee mix of white collar/blue collar or professional/unskilled labour.
 - A higher or lower level of wages paid to particular groups such as full-time or part-time employees.
- c) ALUs can vary from one year to the next in any given business, even when an establishment survey would show no change in employment if:
- A shift in relative wages occurred within a business that did not occur throughout the rest of the 3-digit SIC industry-province group.
 - The composition of the business's workforce shifted among groups with different wage rates.
 - More overtime was worked in the business, but not in the industry-province group.

In general, the ALU calculation will be more accurate for a business which is representative of the average business in its 3-digit SIC-province group.

One limitation of this method of approximating employment is that it results in biased ALU estimates by size of business. The average annual earnings are not sensitive to size; one average earnings figure represents all sizes of businesses in a particular 3-digit industry-province group. Data relating earnings to size of business show that earnings per employee are generally lower in small businesses than in large businesses. This could be due to factors such as lower wage rates paid in smaller businesses or to a higher proportion of part-time employees in small businesses. Therefore, using this method of estimating employment underestimates the number of ALUs in smaller businesses, overestimates the number of ALUs in large businesses, overestimates the number of small businesses and underestimates the number of large businesses.

Comparison with the Labour Force Survey

The basis of an employment concept is its representation of a flow of labour services used to carry out the production reflected in a measure such as Gross National Product. Employment data published by Statistics Canada originate primarily from two surveys that cover two different universes and that were designed to meet different needs.¹⁵ A better understanding of the ALU measure can be facilitated by comparing it with these other published employment measures.

¹⁵ A complete picture of a labour market includes information from individuals (who supply the labour) and employers (who use the labour). Household surveys and establishment surveys complement each other by each providing data that the other cannot. Individuals are surveyed monthly by the Labour Force Survey, a household survey that provides comprehensive data on the labour force (the employed and unemployed) and its characteristics such as age, sex, family relationships and occupation. It also provides data on the characteristics and past work experience of those not currently in the labour force. Employers are surveyed by the Survey of Employment, Payrolls and Hours, a monthly establishment survey that provides details of payroll, employment, average earnings, and average hours worked. For further information on these surveys and the differences between the two resulting employment estimates, see H. Pold, "A Note on the Differences Between Employment Estimates from Household and Establishment Surveys", The Labour Force, Catalogue No. 71-001, June 1987, Statistics Canada.

The Labour Force Survey (LFS) is a monthly household survey that provides data pertaining to the entire labour force (including the unemployed) by such characteristics as age, sex, marital status and family characteristics. It is essentially a "head count" and determines whether individuals were employed during the reference week and, if yes, by which employer and at what type of job. The standard LFS employment measure includes individuals in both incorporated and unincorporated businesses and includes employers (such as owners and partners in unincorporated businesses), own account workers and unpaid family workers. However, with the LFS it is possible to obtain, as a subset of total employment, information on "paid workers", or individuals who are strictly employees (of incorporated or unincorporated businesses). This group does not include working owners of unincorporated businesses or unpaid family workers.

The ALU measure is similar to LFS paid workers in that both are employee measures and both are obtained by approaching the individual rather than by approaching the employer. The LFS measure does this through a survey of individuals and the ALU measure through a record of the earnings of these individuals.

The ALU measure will differ from LFS paid workers at the national and provincial levels because ALUs are an approximate, calculated measure, sampling and non-sampling errors exist in the LFS estimates and LFS does not cover the Yukon and Northwest Territories. LFS counts multiple job holders only once and includes individuals on unpaid leave from a job, while ALUs reflect each paid worker job held and exclude those on unpaid leave. At the industry level, inaccuracies in SIC coding of the LFS arise due to the self-identification of the employing industry by each respondent.

Many approximations and assumptions underlie the calculated ALU measure. It is virtually impossible to measure the impact of each one. Despite the particular differences between LFS paid workers and ALUs, the general similarities suggest that the annual average paid workers employment series can be used to provide an approximate check on the ALU measure at the aggregate level.¹⁶ As can be seen in Text Table 1 and Chart 1, the level and movements of the two series are similar over the 1978-1984 period.

TEXT TABLE 1. Comparison of Labour Force Survey Paid Worker Employment and Average Labour Units, 1978-1984

	LFS Paid Workers	ALUs ¹ (adjusted)	Difference %	Year-to-Year Percent Change		Cumulative Percent Change ³	
				LFS Paid Workers	ALUs (adjusted)	LFS Paid Workers	ALUs (adjusted)
1978	8948	9078	1.4				
1979	9321	9563	2.5	4.2	5.3	4.2	5.3
1980	9651	9874	2.3	3.5	3.3	7.9	8.8
1981	9932	10143	2.1	2.9	2.7	11.0	11.7
1982	9576	9840	2.7	-3.6	-3.0	7.0	8.4
1983	9624	*					
1984	9847	9985	1.4	2.8 ²	1.5 ²	10.0	10.0

* There is a break in the series in 1983, as discussed above.

¹ The ALUs of the Northwest Territories, Yukon and outside Canada have been subtracted from total ALUs in order to make the coverage comparable to that of the Labour Force Survey.

² Percent change for 1982-1984.

³ The cumulative percent change indicates the total percentage change between the initial year of a series and any other year. When comparing two or more series, it facilitates a comparison of the total change over a period of several years, highlighting similarities or differences in movement which may not be obvious from a comparison of year-to-year changes in the series.

¹⁶ As stated earlier, ALUs are theoretically equal to annual average employment. That is,

$$\begin{aligned}
 \text{ALU} &= \frac{\text{annual payroll}}{\text{average annual earnings per employee}} \\
 &= \text{annual payroll} \div \frac{\text{annual payroll}}{\text{annual average employment}} \\
 &= \text{annual payroll} \times \frac{\text{annual average employment}}{\text{annual payroll}} \\
 &= \text{annual average employment.}
 \end{aligned}$$

CHART 1
Comparison of LFS Paid Workers and Average Labour Units (ALU), 1978-1984

Note: The ALUs of the Northwest Territories, Yukon and outside Canada have been subtracted from total ALUs in order to make the coverage comparable to that of the Labour Force Survey.

There is a break in the ALU series in 1983; no point has been plotted for that year.

Comparison with the Survey of Employment, Payrolls and Hours

The Survey of Employment, Payrolls and Hours (SEPH) is a monthly survey of public and private sector reporting units. It provides data on employment, wages, salaries and the number of hours worked. The survey is employee based (conceptually the same as LFS paid workers) and does not include owners or partners of unincorporated businesses, individuals working on own account or unpaid workers. It does include all working owners of incorporated businesses as they are considered to be employees of a legal entity.

The ALU measure will be similar to SEPH to the extent that they are both employee measures, they both include multiple job holders (counted once in each job) and both exclude those on unpaid leave from a job. They will differ because of the approximate nature of ALUs, because of sampling and non-sampling error in the SEPH survey, because some industries are excluded from SEPH and because of the lag in getting new businesses onto the sampling frame from which they can be drawn for inclusion in the survey.

As shown above, ALUs represent average employment on an annual basis. In the case of SEPH it can be shown that ALUs are equivalent to average employment (as defined by the universe and methodology of SEPH) adjusted by the ratio of the annual payroll, as obtained from Revenue Canada records, to the annual payroll from SEPH.

ALUs for the 3-digit industry-province group k 1 can be expressed as:

$$ALU_{kl} = \frac{AP_{kl}}{AAE_{kl}}$$

Substituting for AAE_{kl}

$$\begin{aligned}
 &= AP_{kl} \div (AME_{kl} \times 12) \\
 &= AP_{kl} \div \frac{\sum_j \sum_i MP_{ijkl}}{\sum_j \sum_i E_{ijkl}} \times 12 \\
 &= AP_{kl} \times \frac{\sum_j \sum_i E_{ijkl}}{\sum_j \sum_i MP_{ijkl}} \times 12 \\
 &= \frac{AP_{kl}}{\sum_j \sum_i MP_{ijkl}} \times \frac{\sum_j \sum_i E_{ijkl}}{12} \\
 &= \frac{AP_{kl}}{\sum_j \sum_i MP_{ijkl}} \times AAE_{SEPH}
 \end{aligned}$$

That is, at the 3-digit industry-province level, annual average employment as reported by SEPH is adjusted by the ratio of total annual payroll (from Revenue Canada records) to the annual payroll reported (on a monthly basis) to SEPH.

ALUs will have an inexact relationship with SEPH employment at the 3-digit industry-province level, varying with factors which affect the ratio of the two payroll totals. For example, income reported on Revenue Canada records may be excluded from SEPH because of the time lag in getting new businesses onto the sampling frame and into the survey. In such cases there will not be a constant relationship between the missing income and the uncounted employees. A given amount of income could represent many lower paid employees or fewer highly paid employees. The proportionate increase calculated by the above expression may not accurately reflect the true number of employees.

For 1984, the only year in common for the ALU measure and SEPH employment, ALUs (adjusted to the same industrial coverage as SEPH) totalled 9,928 thousand and SEPH employment was 8,654 thousand, about 13 percent lower.

7. Resulting Database

By linking data from many sources, a wide variety of information on businesses can be gathered. Several types of datasets, focussing on different aspects of these entities can be devised. Examples include:

- A database focussing on the labour used by businesses, represented by measures of payroll or employment.
- A database providing financial information such as assets, liabilities, sales, profits, etc.
- A database focussing on the inter-corporate structure and changes in this structure, tabulated by some measure of performance such as profitability.
- A database following enterprises rather than corporations.

The subset of data chosen for publication here focusses on the labour used by businesses, measured through payroll and a derived measure of employment. The database is longitudinal on businesses – that is, the economic units tracked over time are businesses. The data include:

- number of businesses,
- total payroll,
- number of average labour units or ALUs.

These data are disaggregated by:

- size of business (based upon the calculated ALU employment measure),
- life status of business (continuous, newly identified or no longer identified) and
- country of control

and are tabulated

- by industry and
- by province.

Data are presented as levels for the years 1978 and 1984 and as changes between the two years.

The data are presented in five statistical tables. Statistical Tables 1 and 2, present the number of businesses, total payroll of these businesses, calculated ALUs for 1978 (the initial year of the study) and 1984 (the terminal year) and the change between the two years. This information is given for:

- Six size categories based on number of ALUs in 1978.
- Nine industrial divisions (which include an aggregation of agriculture, forestry, and fishing and trapping into a primary industries group, a disaggregation of trade into its retail and wholesale components, plus a breakdown of community, business and personal services into several sub-groupings).
- Ten provinces, two territories and outside Canada.

For each size group, the information is presented by life status--that is, those businesses which were continuously identified on the database over the 1978-1984 period (and further divided into those recording an increase in ALUs and those recording a decrease), those which were newly identified during the period and those which were no longer identified on the database in 1984.

Statistical Table 3 adds a further category to the data--country of control, designated as Canadian or foreign control.

Statistical Table 4 presents transition matrices that further categorize the data by the size of the business (in terms of ALUs) in 1984, the terminal year of the database, cross-classified by its size in 1978.

Statistical Table 5 presents data by province and region.

The database contains a variety of information on the level and change in businesses, payrolls and ALUs. Focussing on the change in ALUs, the type of information on continuously identified businesses includes:

- Increases or decreases in ALUs as a business increased or decreased the amount of labour it used to produce goods and services over the 1978-1984 period.
- Increases in ALUs as one business merged with a second business, or acquired part of the operations of another business. In 1984 the expanded business is listed under the BRID of one of the businesses (generally the acquiring business in the case of an acquisition and the dominant business in the case of a merger). The continuing BRID thus does not represent a consistent group of operations over the entire 1978 to 1984 period. The change in ALUs associated with the continuing BRID reflects the merger or acquisition as well as any change directly related to labour requirements for production. Further, the size-industry-province category from which the ALUs disappear in the case of a merger or acquisition is not necessarily the one in which they reappear.

- Administrative changes: On occasion, a provincial, local or hospital administrative unit centralizes several of its operating units. These previously may have functioned fairly independently and been assigned separate BRIDs by the Business Register. The changes in ALUs for the continuing BRID will reflect these changes.

For example, in Statistical Table 1, the change in ALUs of 586 thousand listed for continuously identified businesses includes additions to ALUs for the above factors. These factors behind ALU changes can exist to different degrees in different size categories, industries and possibly provinces. The transition matrix (Statistical Table 4) provides some idea of where these factors are likely to have their greatest impact by size category. Continuous businesses that were large in 1984 (and recorded an increase of 525 thousand ALUs) include many instances of changes in ALUs arising from mergers, acquisitions and administrative changes. To a lesser extent, this activity is reflected in the ALUs of continuous businesses that were medium in 1984. At this stage of the database's development it is not possible to quantify or separate the above effects on ALUs or to state where on the database results can be interpreted as predominantly representing one particular factor.

Again focussing on the level and change in ALUs, the information on newly identified businesses includes:

- Amalgamations of two or more corporations into one new corporation. The original corporations (and their ALUs) disappear from the database while the new BRID and its ALUs are newly identified.
- Businesses operating on an unincorporated basis and that are subsequently incorporated receive a new payroll deduction account and are often identified under a new BRID. These are generally small businesses with fewer than 20 ALUs. The Business Register attempts to match the "old" and "new" businesses and maintain the same BRID. However, name changes and the extremely large number of incorporations of small businesses per year make it difficult to achieve all these matches.
- Some newly identified businesses that are truly new and did not function before. Their ALUs represent net new employment and their production represents a net addition to the production of goods and services in the economy.¹⁷

For example, in Statistical Table 1, of the 961 thousand increase in ALUs recorded for newly identified businesses of fewer than 20 ALUs, a large (although currently unestimated) proportion are due to incorporations of previously unincorporated businesses.

At the larger end, the transition matrix (Statistical Table 4) again provides an example. Newly identified businesses that had more than 100 ALUs in 1984 recorded an increase of 330 thousand ALUs from 1978 to 1984. Virtually all of these businesses did not exist one year and had more than 100 ALUs the next, suggesting a large incidence of corporate amalgamations.

Again, it is difficult to quantify the contribution to changing ALUs made by the various factors listed above. The factors may have different impacts on different size groups and industries.

8. Future Development of the Database

This database currently reflects changes in ALUs arising from different situations. Each situation is useful to study for its own purposes. However, the near-term goal is to identify the level and changes of employment provided by businesses in the production of goods and services, separating the changes arising from this activity from changes arising from organizational and administrative reasons, and to disaggregate this employment by size of business.

¹⁷ Determining the size of a new business according to its estimated number of ALUs is problematic since the payroll data represent a business's total payroll for a calendar year. If a business came into existence later in a year and its ALU size were calculated as if it had existed all year, then its size would be underestimated. In the subsequent year, when the payroll data were representative of an entire calendar year, part of the apparent growth of the business would be due to the improper initial sizing. In the absence of any information that suggests new businesses commence operations at a particular time of the year, the mid-point was chosen. It was assumed that, on average, each new business was operating for six months during the year it commenced operations. Businesses no longer identified on the database by 1984 were treated in the same manner. It should also be noted that the average size of a particular category of businesses shown in the statistical tables may be outside the range defining that size category. This is because the sizing of businesses was carried out in the initial time period and by 1984 a great deal of ALU change in the businesses constituting a particular group may have substantially altered the average size of this group.

The issue of the role played by businesses of various sizes¹⁸ is of ongoing interest in the study of employment and its determinants in the Canadian economy. Examples of questions raised are:

- Do smaller or larger businesses contribute more to employment growth over time in relation to their initial share in total employment?
- Are there size group differences in employment growth or decline in recessionary periods?
- What are the contributions to employment growth in expansionary periods by size group of businesses?
- Has there been a structural shift in the contribution to employment growth by size group of business?
- Does the contribution to employment change by size of business vary across industries or provinces?

The OECD, among others, has stressed the need for longitudinal data to track net employment changes over time and to provide gross data on the dynamic processes that underlie the net results. A longitudinal database permits an examination of the influence of business size on employment change by identifying a business in the initial time period and following it across size boundaries as it expands or contracts. The net employment change is then attributed to the business as defined by its size in the initial time period (or when a new business comes into existence). If a series of static or "snapshot" data points were used instead, they would show shifts in the cross-sectional distribution of employment by business size but would not give the source of newly created or disappearing employment.

In addition to tracking net employment change by business, the longitudinal method also provides gross data on the dynamic processes that underlie the net results. Two "snapshots" of employment in an industry may suggest a moderate pace of employment growth for that industry, masking large, offsetting movements in various sub-categories of classification. A longitudinal database provides data on new businesses, those that cease operating and expanding and contracting businesses, including those moving from one size class to another. This breakdown of the component processes of employment change allows the roles of the various factors to be explored in greater depth.¹⁹

One issue to be dealt with is: at what level of organization should the "business" be identified and sized if the data are to be used for the above purpose? Employment is usually considered at the establishment level since the basis of an employment concept is the flow of labour services used in the production of goods and services and the establishment level is closely associated with economic production. Tracking establishments and their related employment longitudinally avoids the situation described in Section 7 above: data related to production at the establishment level (such as the labour input), which are then aggregated and reported at the company level may show changes over time related to organizational and administrative changes as well as to changes in production.

However, an establishment does not "stand alone" as it expands or contracts its output in response to economic factors. The management and financial structure of the parent company are very relevant when considering the operations of businesses by size group. For example, a business may be better able to survive a difficult economic period (such as a recession or a large increase in domestic or foreign competition) because of the management or financial resources of the parent company. On the other hand, a smaller business without a large management structure might be able to respond more quickly to changing economic conditions in its product market. Thus, it is felt that categorizing business size at the company level can be useful in the context of employment by business size as long as the establishment-business relationships can be carefully tracked.

The next step in developing the database for use in the study of employment by firm size is to identify and track these establishment-business relationships. This would then permit a separation of changes in ALUs related more directly to production activity from those recorded for other reasons. Much of this can be achieved using information attached to the businesses identified on the Business Register. This information

¹⁸ David Birch of M.I.T. was one of the first economists to track individual establishments over time in order to see how their behaviour caused employment change. See David L. Birch, "The Job Generation Process", M.I.T., Cambridge, Mass., 1979.

¹⁹ A method of data standardization known as Multi-Factor Partitioning has been developed for use with longitudinal data. It permits an evaluation of the extent to which some structural characteristic accounts for differences between categories of an overall population. See K.P. Srinath and D.M. Ray, "Use of Standardization in the Analysis of Growth Rates: Multi-Factor Partitioning", Statistics Canada, forthcoming.

takes the form of "type of change" indicators that link the BRIDs involved in changes such as sale and acquisition of parts of operations, amalgamations, mergers and corporate reorganizations. Situations in which these indicators cannot differentiate changes in ALUs for the reasons outlined above would have to be examined on an individual basis.

It is also possible to improve the accuracy of the ALU measure in particular industry groups and size categories or, alternatively, to estimate the magnitude of the bias caused by certain assumptions used in calculating the measure.

One such area of possible improvement concerns the current use of an industrial composite earnings measure to represent average earnings when this information is not available from the SEPH or ES-1 surveys for part or all of the 1978-1984 period. In industries such as agriculture or fishing--known to have fairly low average earnings--an industrial composite may not be the most appropriate substitute for average earnings. Data from alternative sources or the average earnings series from related 3-digit SIC groups could be used to provide a proxy to the missing average earnings series and thus permit a more accurate calculation of ALUs in these industries.

Another area of possible bias in the ALU measure arises from the use of a constant ratio to adjust for the absence of businesses with fewer than 20 employees in the ES-1 survey from 1978 to 1982.

Recall that for 3-digit industry group k in the province l , where AAE is average annual earnings, the ratio R_{kl} is calculated from SEPH data in 1983 as

$$R_{kl} = \frac{\text{AAE}_{kl} \text{ for all reporting units}}{\text{AAE}_{kl} \text{ for reporting units with more than 20 employees}}$$

This ratio is applied to the ES-1 average earnings from 1978-1982 in order to approximately adjust for the exclusion of businesses with fewer than 20 employees from the ES-1 survey and the upward bias to the average which that implies. This method assumes that no variation occurred between 1978 and 1983 in the relationship between small business earnings and earnings of all businesses. Such variation could arise from, for example, a change in the employment weight of small businesses in their SIC group or a change in the level of small business wages vis-à-vis large business wages. It is quite likely that there was some variation in these factors over this period.

In order to make an adjustment for a possible change in the employment weight of small businesses, one ideally would like to obtain data at the 3-digit industry-province level. It is possible to obtain some data which approximate the employment weights of different size groups. However these data are only available at the 1-digit industry-province level. At this level it may be useful to use these weights to calculate revised average annual earnings for the 1978-1982 period. These earnings can then be compared with those obtained using the constant ratio method in order to estimate the bias to the ALU calculation for a particular 1-digit industry and perhaps, to make adjustments at the 3-digit industry level.

The insensitivity of average earnings to business size is a further source of bias in the ALU measure that can be reduced as further work is carried out on this database. At present, one average earnings figure represents all sizes of businesses in a particular 3-digit industry-province group. Tabulations from the Survey of Employment, Payrolls and Hours, based upon average weekly earnings, indicate the average earnings for reporting units with fewer than 20 employees was .70 of the average for all sizes and the average for units with more than 200 employees was 1.15 times the overall average. For total average weekly earnings of \$408 which existed in December, 1984,²⁰ these ratios imply that the average earnings of the larger group were 64 percent higher than those of the smaller group, a considerable variation from the average. Obtaining this type of information at a more detailed level would permit adjustments to the calculated ALUs for each size group. Such adjustments would increase (decrease) the number of ALUs in each business in which average earnings were lower (higher) than the overall average and would further change the number of ALUs in each size group to the extent that some businesses would move into the adjacent size categories.

9. Illustrative Comments

The attached statistical tables include a great deal of information on businesses, either at one point of time or over a period of time, with the data categorized by size²¹ and industry. This section presents some highlights of the data.

Text Table 2 presents a profile of the businesses in 1978. Small businesses, with an average of 3 ALUs, accounted for 93 percent of all businesses and 18 percent of total ALUs. The community, business and personal services group and retail trade together accounted for about one-half of the small business ALUs.²² Medium-sized businesses had an average of 40 ALUs each and accounted for 6 percent of businesses and 16 percent of ALUs. Large businesses, having on average 668 ALUs in 1978 accounted for only 2 percent of all businesses and 66 percent of the ALUs. Manufacturing and the public sector contained more than 40 percent of large business ALUs.

TEXT TABLE 2. Profile of Businesses and Employment by Initial Business Size, 1978¹

	Average No. of ALUs per business	% of Total Businesses	% of Total ALUs
SIZE			
Small (0-19.9)	3	93	18
Medium (20-99.9)	40	6	16
Large (100+)	668	2	66
INDUSTRY			
Goods-Producing	17	28	31
Services-Producing ²	15	69	68
Private sector, commercial services-producing ³	11	60	44

TEXT TABLE 3. Change and Percent Change in Businesses and Average Labour Units (ALUs), 1978-1984

	Total Change, 1978-1984			Share of Total Change in ALUs ¹
	No. of Businesses (000s)	ALUs (000s)	% Change in ALUs	
SIZE				
Small	178.8	756.2	46	82
Medium	1.8	39.5	3	4
Large	0.1	121.1	2	13
INDUSTRY				
Goods-Producing	31.3	-100.9	-4	-11
Services-Producing ²	125.5	1004.2	16	110
Private sector, commercial services-producing ³	108.2	628.0	16	68

¹ May not sum to 100 percent due to rounding and the exclusion of unclassified businesses.

² Includes public administration.

³ Excludes non-commercial services and public administration from total services-producing industries.

²¹ For ease of exposition, the six size groupings shown in the statistical tables have been collapsed into three groups, arbitrarily defined as "small" for those with fewer than 20 ALUs in 1978, "medium" for those having between 20 and 99.9 ALUs and "large" for those with more than 100 ALUs in 1978. The size groupings are defined relative to each other within this population of businesses providing employment and do not represent an absolute definition of business size groups.

²² The industry composition of each size category is calculated from the attached statistical tables.

Businesses in the goods-producing industries had an average of 17 ALUs. Services-producing businesses were slightly smaller with 15 ALUs on average. These two industry groups accounted for 28 percent and 69 percent respectively of businesses and employed similar shares of total ALUs.

Text Table 3 summarizes the changes in the number of businesses and ALUs over the 1978 to 1984 period. Small businesses accounted for virtually all of the change in the number of businesses, and their increase of 756.2 thousand ALUs (a 46 percent increase) represented 82 percent of the change in ALUs. Large business ALUs advanced 121.1 thousand or 2 percent and accounted for 13 percent of total ALU change.

Although the number of businesses recorded in the goods-producing industries rose by 31.3 thousand between 1978 and 1984, the total number of ALUs fell 100.9 thousand. This 4 percent decline equalled -11 percent of total ALU change. The services-producing industries experienced a substantial increase in businesses and a 16 percent rise in ALUs which totalled more than the net change in ALUs. Excluding the public sector and non-commercial services from total services-producing industries gives a private sector, commercial subtotal that accounted for 44 percent of ALUs in 1978 and 68 percent of the change between 1978 and 1984.

These net changes over the 1978-1984 period were not the cumulation of steady year-to-year movements in the direction of the final results. The total change masks two distinct sub-periods during which the changes in ALUs by size and industry were quite different. The source of these two sub-periods is the economic conditions between 1978 and 1984. This period began with two years of fairly strong growth as the Canadian economy reached a cyclical peak in economic activity. Two recessions followed--a mild one during the first two quarters of 1980 and the most severe of Canadian post-war recessions during the last two quarters of 1981 and throughout 1982. Recovery from the widespread effects of this latter recession commenced in early 1983 and continued beyond the terminal year of this database.

During the 1978 to 1981 sub-period, all size categories of businesses recorded an increase in ALUs, with the relative increase in small business ALUs being slightly greater than those for the medium and large categories. Chart 2 shows these results: small businesses accounted for 18 percent of total ALUs in 1978 and 24 percent of the change between 1978 and 1981, medium businesses represented 16 percent of the 1978 level and 12 percent of the three-year change and large businesses constituted 66 percent of the 1978 level and 64 percent of the three-year change.

The economic conditions existing in the 1981 to 1984 period resulted in very different developments by size category: the ALUs of small businesses continued to grow quite strongly but ALUs in medium and large businesses declined. These developments altered the shares of the change in ALUs quite dramatically from those that existed in 1978 to 1981 (Chart 2). For the entire period, small businesses accounted for 82 percent, medium for 4 percent and large for 13 percent of the total change in ALUs. Thus, the net results for the six year period are very much shaped by the conditions in the latter half of the period.

Similarly, the goods-producing and services-producing industries both recorded increases in ALUs between 1978 and 1981 (with the latter showing the stronger increase). From 1981 to 1984, there was a further small increase in the services-producing industries and a decline in the ALUs of the goods-producing industries. This decline offset the increases of the earlier period resulting in a net decline in the goods-producing industries' ALUs equal to 11 percent of the total change. The increase in the ALUs of the services-producing industries thus accounted for 110 percent of the total change (Chart 3).

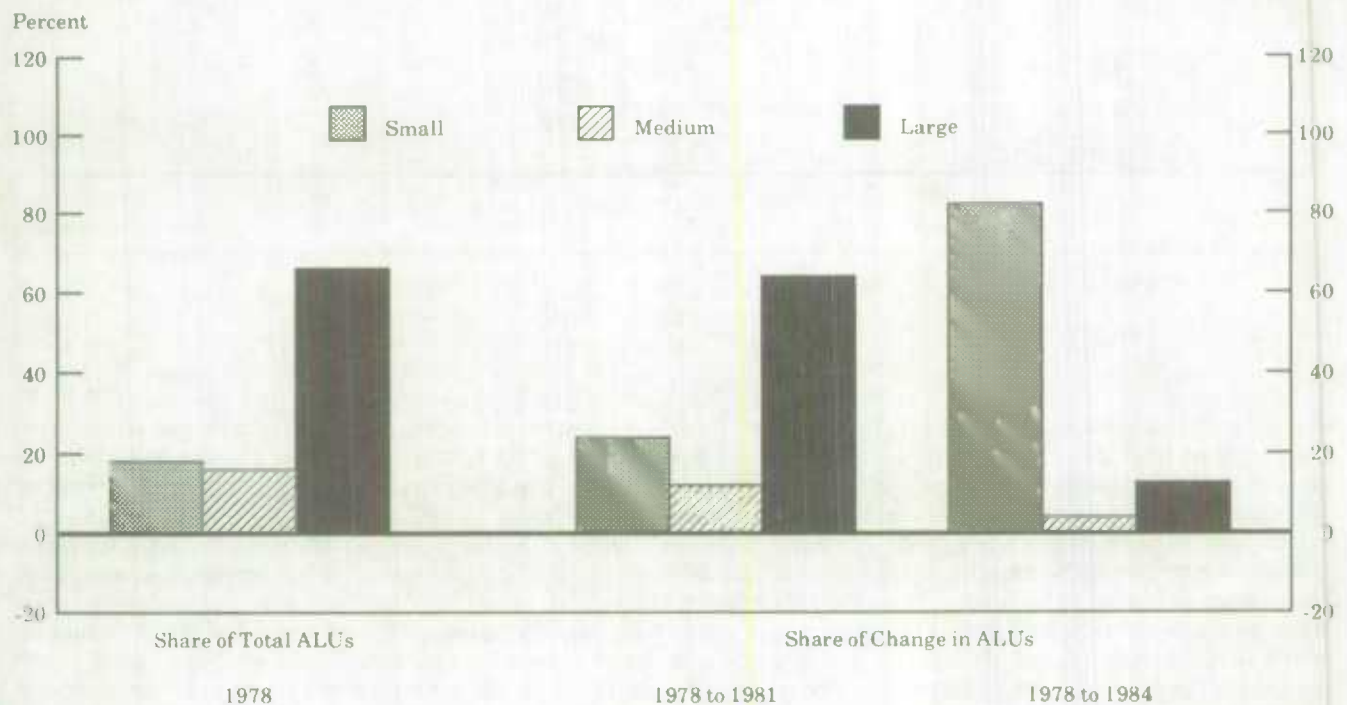

As discussed earlier in this paper, ALU changes in size or industry categories cannot be attributed to one particular reason. These changes arise from an expansion or contraction of output in a business (and the associated change in labour requirements) or from mergers, acquisitions or administrative changes in corporations. The factors behind ALU changes can exist to different degrees in different size-industry groups and, as indicated in Section 8, future development of the database will focus on isolating ALU changes relating to changes in output.

The attached statistical tables also contain information on ALU change by life status of businesses--that is, those that were identified on the database throughout the 1978 to 1984 period (and recorded either an increase or decrease in ALUs), those that were newly identified during the period and those that disappeared from the database and were no longer identified by 1984. The breakdown of ALU change into these

component gross movements can facilitate a more detailed examination of the factors underlying the net changes.²³

As shown in summary Text Table 4 and in Statistical Table 1, the net change of 916.8 thousand ALUs included 585.5 thousand ALUs from continuously identified businesses. This latter change is the net result of businesses which recorded an increase of 1,692.1 thousand ALUs and businesses which had a total decrease of 1,106.6 thousand ALUs. The balance of 331.3 thousand arose from ALU increases in newly identified businesses (1,539.7 thousand) which more than offset the ALUs lost (1,208.4 thousand) from businesses no longer identified in the database. For medium and large businesses, these continuously identified businesses accounted for more than the total net change in ALUs, while they did not play such a dominant role in small businesses.

CHART 2
Size Category Shares of Level and Change in ALUs

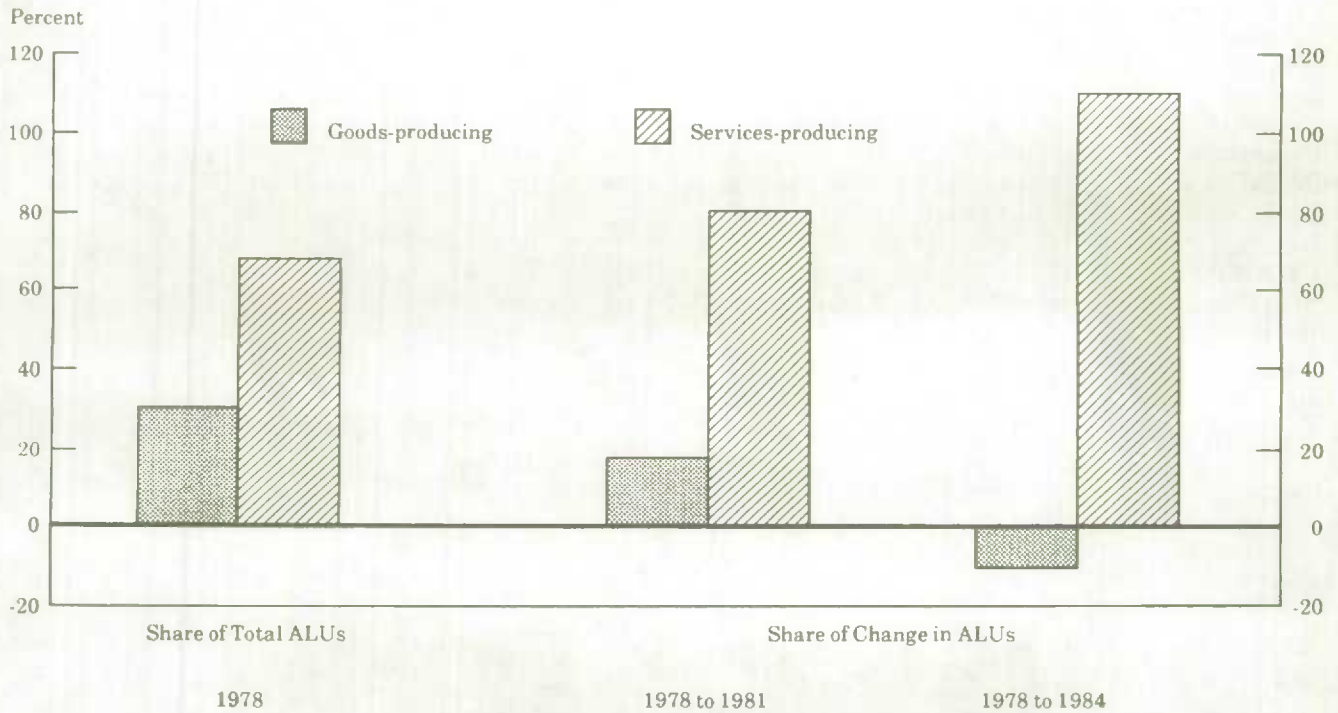

TEXT TABLE 4. ALU Change by Life Status of Businesses, 1978-1984 (000s)

	All Businesses	Small	Medium	Large
Total	916.8	756.2	39.5	121.1
Continuously identified	585.5	337.1	90.8	157.7
- increasing ALUs	1692.1	570.9	308.7	812.6
- decreasing ALUs	-1106.6	-233.7	-218.0	-654.9
Newly identified	1539.7	960.8	281.2	297.6
No longer identified	-1208.4	-541.8	-332.4	-334.2

²³ Only those businesses identified in at least one of the terminal years (1978 or 1984) are included in the information presented in the attached tables. For example businesses categorized as newly identified on the database include only those that were first identified between 1979 and 1983 inclusive and were still identified in 1984. That is, a business newly identified in 1979 would be included in the database only if it continued to operate for five years and was still recorded in 1984. The businesses that appeared and disappeared between the terminal years may be quite numerous since it is believed that a new business which fails does so within the first few years of operations. In a similar manner, only those businesses that were recorded on the database in 1978 and were no longer identified on the base before 1984 are in the no longer identified category.

CHART 3
Industry Group Shares of Level and Change in ALUs

In the tables discussed thus far, the changes in ALUs for any given business are attributed to the size class of that business in 1978, the initial year of the database. The transition matrix (Statistical Table 4) shows ALU changes further cross-classified by the size class of the businesses in 1984, the terminal year of the database. The transition matrix has the potential to show movements across size boundaries as businesses expand or contract. For example, as shown in Text Table 5, of the change in ALUs of 756.2 thousand attributed to small businesses (by initial year sizing), 380.2 thousand or one-half arose from businesses that still remained in the small size category in 1984. The other half arose from businesses that were medium or large by 1984. Using terminal year sizing, small businesses accounted for 108.9 thousand or 12 percent of the total change in ALUs while the large category accounted for 544.2 thousand or 59 percent of the total change. The results are quite different from the 82 percent and 13 percent contributions to change of small and large businesses, respectively, on the basis of initial year sizing. This apparent "strong growth" of businesses through the size classes is to a considerable extent attributable to the impact of the mergers, amalgamations and administrative changes recorded on the database.

TEXT TABLE 5. Transition Matrix: Change in ALU Employment for all Businesses by Initial and Terminal Year Business Size, 1978-1984

Size in 1978 or initial year of identification	Size in 1984			Total
	Small	Medium	Large	
	(000 ALUs)			
All Businesses	108.9	263.7	544.2	916.8
Small	380.2	276.9	99.0	756.2
Medium	-179.0	78.2	140.3	39.5
Large	-92.4	-91.3	304.8	121.1

The attached five statistical tables also contain payroll and ALU employment data by size, industry and life status of business for the ten provinces, two territories and outside Canada.²⁴ In all ten provinces, the ALUs attributed to the small size category made the greatest contribution to the total change, with particularly large contributions in Newfoundland, New Brunswick, Quebec, Manitoba and British Columbia (Text Table 6). These five provinces also recorded declines or very small increases in the ALU employment of large businesses over the period. Quebec had a particularly large decline in large business ALU employment. As was the case at the national level, data for most provinces show two distinct sub-periods and the net results were largely shaped by the 1981-1982 recession and its aftermath.

TEXT TABLE 6. Change in ALU Employment and Contribution to Change by Size Category and Province, 1978-1984¹

	Change in ALUs (000s)	Percent Contribution to Total ALU Change		
		Small	Medium	Large
Newfoundland	6.6	138	12	50
Prince Edward Island	4.8	79	2	21
Nova Scotia	35.4	61	4	35
New Brunswick	9.4	151	17	-68
Quebec	82.5	219	-22	-97
Ontario	446.0	63	12	25
Manitoba	24.5	96	4	0
Saskatchewan	53.5	62	5	33
Alberta	145.9	66	-3	37
British Columbia	97.1	92	1	6
Yukon	-2.1	-24	24	100
Northwest Territories	10.4	33	9	58
Outside Canada	3.0	13	-3	90
TOTAL	916.8	82	4	13

¹ May not sum to totals due to rounding.

²⁴ For those businesses with operations in more than one province, the sizing shown in statistical Table 5 is based upon the size at the national level. However, such multi-province businesses are treated as a separate business within each province in which they operate.

Every week

the numbers that make
decisions

Every week

the data that highlight
national economic trends

Infomat is a digest of the most important statistics of the week. It is invaluable for business planners, policy makers and members of the media who take an interest in the Canadian economy.

Articles cite the most recent economic and social data available, describe current trends and point out significant changes. Regular features include a complete list of publications released by Statistics Canada during the reference week, a table of key economic indicators and a list of upcoming data releases. The text is concise, easy-

to-read and complemented by tables and charts.

Infomat, Catalogue No. 11-002E (weekly), is available for \$2.00 per copy/\$100.00 annually (in Canada); \$3.00 per copy/\$150.00 annually (elsewhere), from:
