EXPORT AND IMPORT PRICE INDEXES, 1926 - 1948

The following price indexes for commodity exports and imports are a combination of unit valuation series from trade statistics and specified price series obtained from existing wholesale and retail records. Unit valuations were obtained by dividing quantities into values for those items of the trade statistics that showed a standardized quantity unit, sufficiently well defined to prevent changes in physical content or description from entering into and spoiling the price record. For instance, the value of wheat divided by the number of bushels of wheat gives a fairly accurate picture of the average price received per bushel, and this average price or unit valuation may reasonably be put into the form of a price relative for comparisons from year to year. Of course, wheat is sold at differential prices and the average price may go up or down because of changes in its destination, but in this case the value will also change and when the subsequent price index is divided into the changed valued index a proper quantum comparison will emerge.

One of the most important uses of these indexes will be to derive quantum comparisons by dividing them into trade values or indexes of trade values. Value and volume series for other countries are published in the United Nations' "Monthly Bulletin of Statistics" and in the monthly statistical publication of the International Monetary Fund. In view of the emphasis on volume figures, it was felt desirable to depend on unit valuation series as much as possible.

In many cases, however, the unit valuation series fall down. For example, the unit for banana imports is the "Stem". The unit valuation was found to be seven times higher than pre-war but it was known from the wholesale record that the specification price was approximately double pre-war. It then came to light that the stems currently imported were about twice as heavy as pre-war: 90 pounds instead of 40 pounds per stem. The wholesale price record for this item was therefore used. In other cases, published United States price series multiplied by a 1935-39 based index of the exchange rate, e.g. furniture, newspapers and periodicals, have been used. In still others, for example automobile exports, manufacturers were contacted for export prices of specified models.

Further difficulties in the way of perfecting a price record are as follows. Lags occur between the times at which contracts are set and at which shipments take place. The unit valuations of the trade statistics refer to the time of shipment, while wholesale price series refer to the price prevailing at the time of the contract. The latter should, therefore, be logged by varying periods throughout the year, for such commodities as are subject to contract and for which the use of a wholesale price series is necessitated. These cases are infrequent and the difficulty of obtaining information is considerable. As a consequence, the problem is merely acknowledged here. A final difficulty concerns the methods of valuation employed in the trade statistics. These concern such matters as the use of F.O.B. instead of C.I.F. valuations in the case of imports, the conversion of foreign currencies at official exchange rates and the special methods of valuation for duty purposes. In general, the resulting differences between market values and declared values will be a part of the value and price indexes and will tend to be removed in the resulting quantity indexes.

These price indexes will be improved in due course, as the refinement of the trade classification goes forward and as new price sources, such as are contemplated for capital equipment items, are obtained.

The complete list of items and the price sources utilized will be found at the end of this bulletin.

#### METHODS OF COMPILATION

The work-sheets for these indexes consist of two parts. First there is the price record, in which unit valuations or specification prices are posted and compared with their 1935-39 averages in order to get a price relative. Then there are the weighting sheets, to which the above price relatives are posted and multiplied by a percentage weighting system and added to get the sub-group, group and final indexes. The weighting system also refers to the period 1935-39. In other words the price index formula is the same as that used for wholesale and retail price indexes, a fixed weight aggregative.

Tests with current time bases and current weights are being made and their results will be available upon request. It is recommended that the attached indexes be used for deflators in deriving quantum series as well as for pure price comparisons.

The following price series cover the period 1926 to 1941 and 1946 to date. Estimates for months from 1946 to date will be available within a few months' time. It is expected that the series thenceforth will be published in "Prices and Price Indexes" (monthly), and in the monthly "Trade of Canada - Imports" and "Trade of Canada - Exports".

#### CLASSIFICATION

The existing trade statistics classification was followed as closely as possible. Groups I and II of the existing trade classification; namely, Animal and Vegetable Products, were combined in the price classification under the general heading of Agricultural and Other Primary Products. This facilitated the sampling and coverage process and, in addition, it is possible with a minimum of mechanical difficulty to separate out certain analytical combinations such as Foods or Canadian Farm Products. Other changes were minor ones, such as the removal of synthetic rubber products from agricultural to the miscellaneous group and placing ships in with iron and steel products rather than with miscellaneous.

WEIGHTING

The weighting occurs at two levels only. Individual price series are weighted by the percentage of their 1935-39 value to the 1935-39 group value. Then the group indexes are weighted by their percentage share in the 1935-39 total. The weighting system is also appended. Selection of items was based largely on their size. If they were large, an attempt was made to obtain price representation for them. In a few cases, series small in value but accurate in definition and price movement were taken to represent a broader class. In this manner, at least 70 per cent of the value of each group is represented by price series in the case of exports. In the case of imports, agricultural products, textiles and miscellaneous, have coverage of approximately 50 per cent only. The remaining groups of imports have 75 per cent or more of their value represented by price series. The uncovered residual in each group is assumed to move in the same manner as the sampled price series.

CORRECTIONS FOR USE IN CONNECTION WITH BALANCE OF PAYMENTS AND NATIONAL ACCOUNTS

The attached series require minor adjustments before they can be used to deflate commodity import and export values as published in the Balance of Payments and the National Accounts. These adjustments will include a separate series for gold, non-commercial items such as settlers' effects and for Canadian goods returned. These adjustments will be available upon request. The published figures may be used to deflate totals published in trade statistics under the following technical headings: EXPORTS - Exports of Canadian produce, excluding gold and exports of foreign produce. IMPORTS - Imports entered for consumption, excluding gold.

Table 1. EXPORT AND IMPORT PRICE INDEXES  
(1935-39 = 100)

Calendar Years	Exports of Domestic Produce	Imports for Consumption	Calendar Years	Exports of Domestic Produce	Imports for Consumption
1926	149.2	143.0	1936	98.6	97.6
