# URBAN RETAIL FOOD PRICES

1914 - 59

## INTRODUCTION

Urban retail food prices have been collected by the Dominion Bureau of Statistics for some thirty-five years for purposes of measuring changes in living costs which result from changes in retail prices. These prices have been used in the calculation of cost-of-living and consumer price indexes. Some of these were published in earlier years in The Labour Gazette and more recently in the monthly publication Prices and Price Indexes.

The purpose of this publication is to make readily available in one publication, as complete a record as possible of urban average retail food prices in Canada for as lengthy a time period as the price data warrant. It should be noted that price data in it may not be comparable with previously published figures due to changes in coverage, specifications and calculating techniques.

This publication brings together in tabular and chart form a comprehensive review of some 70 food items which were priced in 1959 and for which continuous series are available for varying periods of time from 1914 to 1959. Price averages are shown annually for all years for which data are available as well as monthly for current years. In addition to price averages, price relatives are provided as a continuous series on a time base 1949 = 100.

### Items for which Price Data are Provided

In assembling a publication containing an historical record of food prices, certain decisions had to be made regarding the actual items to be included. For purposes of measuring price change over the thirty-five year period, for which urban retail food prices have been collected, continuous revisions have taken place in the nature and number of items priced. Each revision in price indexes has meant substantial changes in the list of food items priced and lesser changes have occurred more frequently. Thus, while the Cost-of-Living Index on a 1935-1939 base included dry beans, salt, cocoa, rolled oats and rice, these items were discontinued with the introduction of the current Consumer Price Index on the base 1949 = 100. At the same time such items as baby food, grapefruit, fresh tomatoes, canned salmon, peanut butter and margarine were added to the coverage of the food budget. In 1958, prices were collected for frozen fruits and vegetables, eviscerated broilers, beef liver, tea bags and instant coffee, but were not incorporated in the Consumer Price Index.

It will be obvious from the above that historical prices exist for a number of items which are not currently priced. While these undoubtedly have value for some purposes, it was decided that this publication should include only those items for

which it is possible to include current prices and to exclude items which have been priced from time to time but have been discontinued because they are no longer of the same significance as when originally selected. A list of discontinued items is contained in the Appendix and price data for them are available on request.

Of the some 70 items included in this publication for which prices are available up to and including the year 1959, 12 extend from 1914, 13 from 1920-23, 9 from 1940-47, 21 from 1949 and 17 from 1950-56. By food groups the 1959 item coverage is as follows:

Beef.....	7 items
Pork.....	5 items
Other meats, fish, poultry .....	7 items
Eggs .....	1 item
Fresh fruits .....	4 items
Canned & dried fruits .....	6 items
Fresh vegetables.....	8 items
Canned vegetables .....	5 items
Dairy, fats and oils.....	7 items
Cereals .....	5 items
Frozen foods .....	4 items
Other groceries .....	13 items

### Changing Description of Food Items through Time

Any price series on foods through time is complicated by fairly continuous revision in the commodity descriptions of items priced in retail establishments. Such revisions subject "pure" price comparisons for most items to a high degree of qualification and in many instances destroy any semblance of comparability through time. They increase the element of approximation which is always present in historical comparisons of price averages and at the same time point up the particular usefulness of the continuous price relative series which removes the factor of revised commodity descriptions.

For many items the change in the variety of the commodity priced is considerable. In 1914 bread was priced in terms of a 16 oz. unwrapped and unsliced loaf sold through independent food stores. As consumer preference changed, the original specification was also revised to allow for successive changes in the size of the loaf sold to consumers as well as changed methods of merchandising bread. Thus, the current specification in most cities relates to a 24 oz. wrapped and sliced loaf of white bread. In turn the price series for bread from 1941 to 1959 relates to a single specification on its most current basis, namely "bread, plain, white, wrapped, sliced 24 oz. loaf" priced in independent food stores, chain food stores

and bakeries with home delivery service. In relating the price series to its current description rather than to each of its variations, it is possible to have comparable prices over a lengthy period of time. Otherwise, an average price series would have little meaning as it fluctuated with specification changes. Most users prefer to have such a price series worked back from the current commodity rather than forward from an outdated item.

On the other hand, specifications for certain items have remained virtually unchanged over lengthy periods of time, and the problem of maintaining a strictly comparable series is at a minimum. When the pricing of butter was initiated in 1920, the original specification called for "butter, creamery, first grade, sold in one pound prints". The current specification for this item is almost identical with the 1920 specification. The tables of average prices and price relatives contain brief but basic descriptions of each item as related to current specifications. In addition Appendix I, page 75, contains a complete historical record of the changes in actual commodity specifications through time for a number of selected items from the initial pricing of any item up to the current year.

#### **Calculation Techniques**

In building up to the published urban average price of a commodity, unweighted averages for each of thirty-three cities are first obtained separately for chain and independent stores. A simple all-city average independent store price is then calculated. The corresponding average urban Canada price for chain stores is obtained by weighting each average city price according to 1951 Census of Distribution city chain food store retail sales. To obtain the published prices, these average independent and chain prices are weighted in the ratio of 44 for chain stores to 56 for independent stores in accordance with the 1951 relative value of total chain to independent retail food sales. There are exceptions to this procedure for bread and milk, where door-to-door delivery prices are employed as well as chain and independent store prices, and the independent and home delivery prices for each city are weighted using population data. For these two items, the published price is obtained by weighting the three averages by the relative value of retail sales for the three types of outlets.

Calculation of these average prices is designed to achieve the primary objective of measuring, as between months and years, any change in price which has occurred. A by-product of this activity is the determining for any one month or year, the level of prices being paid by consumers (and received by retailers) in urban retail markets. These two objectives are sought by calculating, from collected prices, an actual average price for a specific month. This was done in October 1952 for most of the food items covered in this series, with this date being tied to the initial pricing of a relatively large number of new food items introduced into the revised Consumer Price Index. These prices are then adjusted month by month on the

basis of price change as determined from collected prices. Similarly, prices prior to October 1952 have been calculated back month by month and year by year on the basis of price change as determined from collected prices. This procedure ensures comparability as between months and years in the published averages, but means that for any specific month or year, they may differ fractionally from straight averages based solely upon prices collected in any one month or year. For example, straight averages will be affected by changes in store samples, but published averages will not. Again, changes in specifications will affect straight averages but not published averages. In instances where significant changes in specifications have occurred since October 1952, price averages relate to the current specifications, and have been calculated for earlier periods on the basis of price changes recorded by the prior specifications.

#### **Comparable Price versus Actual Price**

As already indicated in previous sections dealing with changes in item description and calculation techniques, any historical money price series is bound to be subject to certain limitations. So long as it is possible to obtain directly comparable prices for an item for each successive pair of pricing periods, a reliable historical record of price change expressed in percentage price relatives can be maintained even though these limitations on price averages exist.

However, for certain purposes, estimated money price averages are preferred to percentage price relatives. Again, such a series can be maintained over many years by simply applying the percentage relative change to some actual money price average at some selected point in time and then proceeding to calculate estimated money price averages both forward and backward from that point in time. The entire price average series will then be tied to the actual specification at the selected date, and will not be related to the variety of specifications which may exist through time, for each item. This, in fact, has been the technique followed for all items included in this series, with the specifications referring basically to those in existence as of October 1952.

The difficulty with these estimated or "comparable" price averages is that differences from actual money price averages may become substantial through time with successive changes in specifications. If the August 1939 actual price of bread based on the 1939 specification is compared with the comparable August 1939 price based on the October 1952 specifications, it will be noted that the comparable price is 0.4 cents higher than the actual price. In percentage terms this is a 7.0% difference. The magnitude of such differences are considerable from time to time depending on the nature of the changes and the time period involved. A series of price differences between actual and comparable have been calculated for a number of items and are shown in part 2 of the Appendix.

### Coverage in Terms of Cities, Store Samples and Number of Price Quotations per Item

The published prices currently relate to 33 cities having populations of 30,000 or over in 1951, with the monthly average price for each item based on approximately 500 quotations. Prices are obtained each month from all chain food companies, a representative sample of independent food stores, and in the case of bread and milk, from a group of manufacturing bakeries and dairies engaged in sales direct to householders. A sample of independent food stores has been built up using Census of Distribution data as well as knowledge acquired by the field agents engaged in collecting prices. Revision of store samples within each city are made continuously in the light of changing store population and merchandising practices. For example, the growth of supermarkets operating in voluntary chain groups has resulted in a decided shift from the "corner store" type of food store to this type of food outlet. One of the most significant store sample changes took place in 1939 when chain store prices were introduced. The size of the sample of independent stores ranges from 8 in smaller cities to 20 in major urban centers. Chain store averages are based on prices obtained from specific chain store outlets in the larger cities with some use being made of head office prices.

### Method of Pricing

Each item of food is priced according to a fairly detailed description, which is illustrated by the following "specifications" for canned peas and sirloin steak. Detailed specifications for all food items included in this publication are available on request from Prices Division.

<b>PEAS</b>	<b>Type:</b>	Sweet or sugar peas
	<b>Grade:</b>	Choice
	<b>Size:</b>	Ungraded as to size; or 4 to 5 combined
	<b>Unit:</b>	15 fluid oz. tin
	<b>Exclude:</b>	Special process or sugar pod; premium sizes 1, 2 and 3
	<b>Cut:</b>	From the section of the hindquarter next to the short loin; bone in
<b>SIRLOIN STEAK</b>	<b>Grade:</b>	(1) Choice; Grade A or Red Brand (2) Good; Grade B or Blue Brand (3) Grade C or Commercial (brown)
	<b>Unit:</b>	One pound

Prices are collected for such specifications to ensure, insofar as possible, that the measure of price change based on reported prices is not affected by changes in the quality of items priced,

such as would result from shifting from "standard" to "fancy" canned peas. Where a fairly wide range of quality is permitted by the specifications, measurement is restricted to "pure" price change by continuing to price the same quality in each store. In designing specifications, the ideal is to prepare a description which relates to a large proportion of total urban sales of each item, and which at the same time is narrow enough to be identified as far as possible with a unique quality. In practice, this ideal objective is difficult to achieve because of the gradual shading in qualities of many items or because of the widespread consumption of various qualities. As described later, prices are collected by both mail and by personal interview, and specification pricing is adhered to more rigorously where prices are collected by the latter method.

In interpreting published average prices, users should consider the following effects of specification pricing:

- (1) Published price averages exclude qualities which fall outside the range of specifications and which will usually sell for higher or lower prices. Thus, the price average for canned peas relates only to choice quality, and excludes prices of both standard and fancy qualities.
- (2) The specifications encompass a range of qualities, which varies from item to item, and a corresponding range of prices. Thus, the specification for sirloin steak covers red, blue and commercial grades of beef, and the published average price for sirloin steak incorporates the range of prices associated with these varying grades. On the other hand, the specification for bread permits only the range of quality found within bread which is prepared from white flour and which is sliced and wrapped.

Thus, the published prices are not based on prices of all qualities of the various items of food as sold in urban retail stores, and neither are they for a unique quality. Extreme care should be used in comparing these retail price averages with wholesale or farm prices which may be for different qualities. Similar limitations exist in attempting to make comparisons of retail prices as between Canada and other countries. This procedure of pricing specific qualities and excluding others affects the level of the published average prices, which would be somewhat different if prices were collected for different qualities. On the other hand, the use of specifications ensures that within extremely narrow limits, changes in the published averages are not influenced by shifts in the quality of merchandise being sold or priced.

### Price Collection

Prices are collected by field officers of the Dominion Bureau of Statistics in seventeen of the larger cities, and are obtained by mail for independent stores in the other cities. Chain store prices for cities where field officers are not located are

obtained from the Head Office of chain store organizations. Prices collected by field officers are those being charged to consumers on those days prices are collected. Where "special" or "sale" prices are in effect, and where reasonable quantities of merchandise are available at such prices, these are obtained; price collection is not confined to "regular" prices, although this was not the case prior to 1957. Multiple unit prices, e.g., 2 for 37 cents, are collected where merchandise is sold on this basis. For chain stores, prices are collected on the first Friday of each month, and for independent stores during the first five business days of the month. Within outlets, brands priced represent volume sales, and as between outlets, brand coverage is diversified.

### Charts

A full range of charts has been prepared in conjunction with the tables and are shown on pages 58 to 74. Attempts have been made to represent items both in their normal groupings, e.g. beef, pork, fresh fruits and fresh vegetables, as well as in alternate groupings. In addition, groupings have been made for such items as tea and tea bags; regular coffee and instant coffee. The line charts are intended to show changes in money prices by items, while the corresponding bar charts show percentage changes for selected time periods. The use of semi-log scales in these line charts should be noted. Bar charts are on standard scale.
