## PREFACE

This publication brings together a wide range of historical consumer price indexes with major series extending back to the year 1913 and indexes for individual items for the period 1949-61. It also covers the several variations in the classification of consumer price index components, a comparison of the movement of 1937-38 weighted and 1947-48 weighted indexes over the period 1949-61, a commodities-services classification back to 1935 and a comparison of the weighting diagrams of the 1937-38, 1947-48 and 1957 weighted indexes. In addition, the appendix contains in Table 2 a retail price series which gives some indication of price movement for the period 1900-13.

While this publication constitutes a very comprehensive body of consumer price indexes, it by no means exhausts the detail which is available on request, particularly single commodity price relatives prior to 1949, extending in many cases back as far as 1914.

The publication was prepared in the Retail Prices Section of the Prices Division.

WALTER E. DUFFETT,  
*Dominion Statistician.*

 <b>BIBLIOGRAPHY</b>	

## INTRODUCTION

Until the Cost-of-Living Index (1935-39 = 100) was replaced by the Consumer Price Index (1949 = 100) in 1952 it was the practice of the Dominion Bureau of Statistics to publish an annual report entitled *Prices and Price Indexes*. These publications gave historical continuity to the principal retail, wholesale and farm index number series published in earlier years and added current year's data. In all, twenty-two such reports were released.

The last comprehensive historical volume on price statistics compiled in the Bureau, entitled *Prices and Price Indexes, 1949-52*, was released in March 1954. It contained principal price index series for the four-year period 1949-52 and in addition, brought together selected price series for earlier years. At the same time, a regular monthly publication *Prices and Price Indexes* was expanded to cover, in addition to current month price statistics, most principal series for a period of approximately the previous ten years. However, it in no way constituted a comprehensive volume of historical price indexes. This publication is designed to meet such a need for retail price indexes covering the period 1913-61. Because of the growth in the volume of price statistics available and the nature of requests for historical data, it was judged preferable to limit the present report to statistics of retail prices.

### The National Consumer Price Index

Tables 1, 2, 3, 4 and 7 contain basic historical national consumer price indexes, some back to the year 1913.

In assembling price indexes covering such lengthy periods of time, it may be helpful to say a few words about the nature of such measurement. In fact, the continuous series contained in Table 1 of the All-Items Consumer Price Index from 1913 to 1961 expressed in terms of 1949 = 100, incorporates five distinct indexes each covering part of the entire period, and "linked" together to make one continuous series. In each index the items and their weights are those appropriate to the period covered by the specific index, i.e., each index relates to a particular "basket" of commodities and services.

The primary purpose of a consumer price index is the measurement of current price movements. Therefore, the items and their weights in the index should reflect the full range and relative importance of commodities and services bought by the population group to which the index relates. As the spending habits of the population change over time, the index based on a particular pattern of expenditure becomes a less and less reliable measure of price movement. For this reason major revisions of the index basket are made periodically. Such revisions break the continuity of the index and the separate indexes must be linked to provide an historical series.

In linking, indexes for two consecutive periods of time are joined at a point in time. One index measures the movement of prices up to the link date, the other measures price movement from the link date forward. The two indexes thus are linked so as to avoid any movement in the level of the index at the link date. Because of measurement difficulties, no attempt is made to compare the level of living represented by the expenditure baskets of the two indexes and to adjust the historical index accordingly. This important qualification in interpretation of the historical indexes is not significant over a limited period of time. However, when carried to an extreme, e.g., measurement of price change between 1913 and 1961, it is obvious that expenditure patterns are significantly different and the qualification more severe.

In the Consumer Price Index 1913-61, the items priced and their relative importance in the five linked indexes are based on expenditure patterns for the years 1913, 1926, 1937-38, 1947-48 and 1957. The contrast between price measurement in 1913 including such items as buggies, ice refrigerators, gramophones and coal heating, with a 1961 measurement including automobiles, electric refrigerators, television sets and gas heating illustrates the problem. The degree of confidence with which a 1913 measurement can be linked to a 1961 measurement is open to question. Nevertheless, even with such an important qualification, the one continuous series formed by linking five separate measurements is the best available for assessing movements of consumer prices in Canada over the period 1913-61.

Two factors involved in the measurement of changes in consumer prices through time may be distinguished, viz., the changing nature or "quality" of commodities and services purchased and the varying relative importance of them in consumer expenditures. The displacement of the ice-box by the refrigerator, the horse and buggy by the automobile, and the introduction of new products such as frozen foods, radio and television illustrate the first. Indicative of the second factor were the doubling in importance of fuel oil for home heating and the halving of that for coal between 1947-48 and 1957. Many of these changes are illustrated in the weighting diagrams of the 1937-38, 1947-48 and 1957 weighted indexes presented in Table 8.

As stated above, no attempt is made to determine whether or not the old and the new baskets resulting from the periodic major revisions are equivalent. Between such comprehensive revisions, however, changes in varieties of individual commodities and services are introduced into the index as new models replace old ones and new varieties become important in consumer purchases. With substitutions of this kind an assessment of the relative qualities of the new and old is made and the substitution effected by splicing. While no

universally acceptable method of evaluating relative qualities has been devised, it is believed that over the relatively short period to which a basket pertains both close equivalence in the quantity and quality of goods and services within the basket and essential substitutions have been achieved.

The effect of comprehensive revisions of the items and weights appears to be minimal at the overall or total index level but of more consequence for indexes of component groups or sub-groups. Evidence of this was derived from experimental work (described below) in which an index calculated for the period 1949-61 using the 1937-38 weighting system showed little difference at the total level from that using the 1947-48 weights (see Table 7). For groups and sub-groups within the total, however, differences tended to be greater. It should be emphasized, however, that in the experiment essential substitutions, as outlined in the preceding paragraph, were incorporated into the 1937-38 basket over the entire period 1935 to 1961.

The five indexes linked to produce a national Consumer Price Index for Canada covering the period 1913-61 are designated in the following table in terms of the period for which each constitutes the measure of price movement. The successive weight base periods are also indicated. The beginning and ending months of each index are specific link dates.

Index	Base Weight Period
1913, January 1914 - January 1926	1913
January 1926 - January 1935	1926
January 1935 - January 1949	1937-38
January 1949 - January 1961	1947-48
January 1961 forward	1957

### Classification

Items in the index are classified into groups, with the principal basis of classification being the type and use of commodity or service, for example, food and clothing. Over the full historical record of consumer price indexes, the main component groupings have altered from time to time either as a result of combining some components or by subdividing a component into homogeneous groups and assigning titles indicative of their content. Such changes took place with the 1961 index revision when the 1949 classification of Shelter and Household Operation were combined to form a Housing component and the Other Commodities and Services component was sub-divided into its four principal components.

For the convenience of users, the 1957 classification system has been carried back to 1949 in Table 2 while the 1949 classification is shown for the period 1926-61 in Table 1. A similar presentation has been incorporated in Tables 5 and 6 for the regional city indexes.

### Supplementary Classifications

As a part of the 1961 revision a series of supplementary classifications of the Consumer Price Index were introduced from January 1949 forward. This involved regrouping components of the index on a basis other than that described under "Classification" above. One primary division was that of All-Items into (1) Commodities and (2) Services, with the intention of distinguishing between these two main classes of item content.

Such main division is available prior to 1949 on a less clearly defined basis than that established at the time of the 1961 revision when all items were reviewed and classified as either commodity or service. Indexes for the full period 1935-61 are presented in Table 4.

### City Indexes

Two tables, 5 and 6, show the movement of retail prices in ten regional cities over the period for which these have been calculated (1939-61). The indexes are presented using component classifications of 1949 and 1957.

Although prices from these cities have been used in calculating the Canada index back to 1913, actual city indexes were not calculated until much later. The reasons for this include the fact that each city has a distinct spending pattern which must be established and used in constructing the regional indexes. In addition, regional indexes of price movement have rather limited use compared with that of the national index.

The notes in the previous section on the Canada index are relevant to the city indexes as well. Revisions of the city indexes have followed closely on revisions of the Canada index.

### A Comparison of the 1937-38 Weighted and 1947-48 Weighted Indexes

With the introduction of the post-war Consumer Price Index in October 1952, the old pre-war 1937-38 weighted Cost-of-Living Index was officially replaced and its publication ceased with the September 1953 index. As time permitted however, its calculation was continued throughout the entire period up to 1961 with a view to providing an insight into the effect of weight and item changes on measurement of price change. Thus, for the period 1949 to 1961, two separate and distinct measurements of price movement are available, one relating to the items and their relative importance based on 1937-38 expenditure patterns and the other based on 1947-48 expenditure patterns. These results are provided in Table 7 and in graph form in Chart 2.

It is clear that at the All-Items level, there is very little difference in the two measurements. Between 1949 and 1961, the 1937-38 weighted Cost-of-Living Index rose 28.8% while the 1947-48 weighted Consumer Price Index rose 29.2%. The average difference in measurement for the entire 13

year period was only 0.3%. The largest difference occurred in July 1951 when the two measurements were 2.1% apart while in many months and in some years the two were identical. Actually, the largest single factor causing the two measurements to pull apart in particular months was the use of constant weights for foods in the 1937-38 weighted index in contrast with seasonal weights in the 1947-48 weighted index. While this affected the measurement in particular months it was not a factor in annual comparisons.

Although the two series remained remarkably close over the period 1949-61 and appear to indicate that weight and item changes are not significant in measuring price change at the All-Items level, a different pattern emerges at the component level, as illustrated in the comparisons of the 1947-48 and 1957 weighted components in Table 3 of the Appendix.

While it can be stated that the 1937-38 weighted index has been maintained throughout the period 1949-61, there are certain qualifications which should be emphasized. A number of items were dropped from the pricing programme; these included life insurance (excluded from the Consumer Price Index), a scatter of food items, and some items of clothing. Price movement for these was based on related items and other sources such as special surveys. Another qualification may be illustrated by the following example. Mattresses are included in both baskets. The price measurement for a mattress during the more recent years was based on a mattress specified as: innerspring, pre-built border; 220 to 252 coils. Formerly, the descriptions priced were a blown filled mattress with converted material filling and a layer felt mattress. Neither of these had innersprings. Thus, although the same generic class of item is still being priced, viz., a mattress, price measurement for the Cost-of-Living index in the latter years of the 1949-61 period was based on the modern description rather than the one prevalent in 1935-39.

With the publication of these comparisons, it is the intention to cease calculating the 1937-38 weighted index, as has already been done with the 1947-48 weighted index. The 1957 weighted index will be continued until the next periodic revision of the weighting system is completed.

#### Weighting Diagrams

The weight of an item in an index is a measurement of the influence that the price change of the item has on the movements of the index. As spending habits change and as items become obsolete and new items appear in the market, the weights of items are subject to change. The pattern of expenditures is checked through periodic sample surveys of households in major cities across Canada and when necessary, the entire weighting pattern is revised,

old items are deleted and new items added. This has occurred four times in the Canadian Index since the original base of 1913, namely, in 1926, 1937-38, 1947-48 and 1957. The weighting diagrams of the latter three periods are shown in Table 8 and give a clear indication of the change in item content as well as the shifting relative importance of items. The effect of imputation whereby the weights of items not priced are allocated to the weights of related items which are priced, presents some problems of comparability between weighting diagrams. In the 1937-38 column, weights for food items were converted from quantity and price data to the percentage distribution of expenditures among items for comparability with the 1947-48 and 1957 data.

#### Appendix

Table 1 contains the Consumer Price Index for the period 1913-26 with a system of classification used only during that period. It provides detail of price movement not otherwise available in other series.

Table 2. Although official indexes of consumer price change have dated from 1913, there are some measurements available for the period 1900-13. A Board of Inquiry into Cost-of-Living issued a report in 1915 which drew on retail prices collected by the Department of Labour and published in the Labour Gazette. The items priced were basically "necessaries" including thirty foods, coal, wood, starch and oil. The records available illustrated the price rise from 1909-13. Price movements over the period 1900-08 were based on less complete coverage, with interpolation used to fill in some of the gaps. Although fragmentary and rough by today's yardsticks, this measurement is the best available for the period 1900-13 and may be drawn on to complete the record back to 1900.

Table 3 presents a comparison of 1947-48 and 1957 weighted indexes at the All-Items and component group levels for the period January 1957 to December 1960, which was originally included in the technical paper on the 1957 revision (*The Consumer Price Index for Canada*, DBS Catalogue No. 62-518). It is repeated here to provide a basis for examining the effect of weight revisions on consumer price indexes, particularly indexes of groups within the All-Items index.

#### Bibliography

For further information on Canadian consumer price indexes, a list of reference works and current periodical publications has been included at the end of this volume. For detailed information on the methods and techniques used in the current Consumer Price Index see *The Consumer Price Index for Canada 1949 = 100*, (Revision based on 1957 Expenditures) DBS Catalogue No. 62-518.
