# CANADIAN SICKNESS SURVEY 1950-51

No. 10

## ILLNESS FREQUENCY BY DIAGNOSTIC CLASSIFICATION

Class of Illness, Diagnostic Group and Sex

(NATIONAL ESTIMATES)

Prepared jointly

by

THE DOMINION BUREAU OF STATISTICS

and

THE DEPARTMENT OF NATIONAL HEALTH AND WELFARE

OTTAWA, CANADA

FEBRUARY, 1957

9005-515

## ACKNOWLEDGMENT

The Canadian Sickness Survey, the first nationwide study of illness in the general population of Canada, was carried out during a twelve-month period commencing in the autumn of 1950.

The Survey was initiated by the Department of National Health and Welfare and carried out by the ten provincial health departments with federal funds made available to the provinces through the National Health Program.

The planning and organization of the Survey was a joint undertaking of the Dominion Bureau of Statistics and the Department of National Health and Welfare in consultation with the provinces. Every provincial health department cooperated fully in gathering the extensive body of information which makes these publications possible.

## INTRODUCTION

### THE CANADIAN SICKNESS SURVEY 1950-51

The object of the Canadian Sickness Survey was to obtain estimates of the incidence and prevalence of illness and accidents of all kinds; the amount of medical, nursing and other health care received; the volume of family expenditures for the various types of health services; and the prevalence of permanent physical disabilities. The present bulletin is one of a series intended to provide a means of releasing interim information on the more important of the results, pending the preparation of a comprehensive publication containing more detailed information together with a fuller description of the methods used.

The survey method consisted of personal visits by trained lay enumerators — in British Columbia the enumerators were public health nurses — to a sample of approximately 10,000 households distributed throughout the ten provinces in metropolitan, small urban, and rural areas<sup>1</sup>. Less than five per cent of these households refused to participate in the Survey. Of the remaining households over 80 per cent of the individuals involved remained in the sample throughout the survey period. All information, including particulars of income, housing, and environment, was obtained by direct interview of a household informant, usually the housewife. While the starting date for the Survey varied somewhat in different provinces, in most cases a total of 14 monthly visits were made to each household in the sample. In the first visit the enumerator introduced the Survey and left a special calendar designed to help the informant keep a detailed day-to-day record of current sickness and of expenditures on health care and services for each member of the household. During each of the succeeding twelve months the enumerator interviewed the informant and recorded the sickness experienced by each person since the previous visit. The final visit was made to review the information recorded throughout the whole survey period. Uniformity of practice in the ten provinces was maintained by frequent consultation among the agencies involved, by uniform instructions to the enumerators, and by the use of three standard record forms — a Household Record, an Individual Sickness Record, and an Expenditures Form. Auxiliary schedules, also standardized, were used to record permanent physical disabilities and also health services which were desired but not obtained.

The sample was designed to obtain estimates within a sampling error of 20 per cent<sup>2</sup>. Indications are that for almost all of the estimates the error is substantially smaller. Area sampling was used for the Survey. As a first stage the following six

domains (regions) of study were established consisting of four single provinces and two groups of three provinces each:

1. Newfoundland
2. Maritimes (including Prince Edward Island, Nova Scotia, and New Brunswick)
3. Quebec
4. Ontario
5. Prairies (including Manitoba, Saskatchewan, and Alberta)
6. British Columbia

Within each domain three types of area were considered — metropolitan, urban, and rural. Within these areas multi-stage sampling was adopted. In metropolitan centres, all of which were included in the sample, and in some of the sampled urban areas, the first stage of sampling was the block, the second stage being the household. In other urban areas systematic sampling from a list of households was used. Rural areas were divided into primary sampling units and grouped into strata. Within each stratum one primary sampling unit was selected and multi-stage sampling applied. The first stage was the selection of clusters or segments within the primary sampling unit while the second stage was the selection of households within the chosen clusters.

In designing the sample extensive use was made of population, social, and economic data obtained from 1941 Census material. The results of the 1951 Census, which was taken at about mid-point of the survey period, provided the necessary distributions concerning persons and families for the calculation of weights used to inflate figures to national and provincial totals. The basic survey units for data on illness were individual persons, while the units for expenditures on health services included families, as defined in the Census, together with certain single persons living alone or with other families as roomers or relatives.

### SCOPE OF PRESENT BULLETIN

This is the tenth bulletin in the series of preliminary publications of the Canadian Sickness Survey. The first four reports dealt with family expenditures for health services, the next three with various aspects of the volume of sickness and the two after that with the volume of health care. The present bulletin deals with illness frequency by diagnostic classification. It covers much the same field as bulletin No. 7, which gave national estimates of incidence and prevalence of illness by age and sex. Disabling illness has not been shown separately in the present bulletin, but it might be possible to do so in future compilations.

The size of the sample of the Canadian Sickness Survey was not large enough to warrant an age breakdown for various diagnostic groups. However, it has been possible to give a sex breakdown in most cases. A complete age and sex breakdown may be given for the classes of illness in a later bulletin.

1. The population sampled did not include residents of institutions, military establishments, Indian reservations, and remote areas.

2. With a 95 per cent confidence limit.

## CONCEPTS, DEFINITIONS AND METHODS

### DEFINITION OF ILLNESS

An illness is defined, in this Survey, as a disturbance in the state of health of an individual reported by the informant in the form of a diagnosis, a group of related symptoms, or a single symptom. Illnesses include injuries and confinements as well as diagnoses of disease and undiagnosed symptoms.

The duration of an illness is measured from the first onset of symptoms until the individual is free of symptoms pertaining to that illness. Multiple symptoms relating to the same diagnosis reported by the individual are considered one illness.

Recurring attacks, generally of long-term conditions, are counted together as one illness if such attacks are not separated by more than seven days free of symptoms relating to the condition. Where the attacks are separated by a symptom-free interval of eight days or more, they are recorded as separate illnesses.

It should be noted that illnesses were recorded as reported by informants, i.e., by the persons who actually suffered the illness(es) or by their household spokesmen. Reported illnesses, therefore, are deviations from the state of good health as recognized by particular informants rather than deviations from any clinical standards.

### DIAGNOSTIC GROUPS

The diagnostic groups in this bulletin are derived from the International Classification of Diseases, Injuries, and Causes of Death (Sixth Revision 1948). Each disease or injury is classified by a code number in the International Classification. A diagnostic group consists of one or more on these numbers, and related diagnostic groups are put together to form classes of illness. Thus illnesses have been divided into 83 diagnostic groups and 15 classes.

Some diagnostic groups include supplementary codes not covered by the International Classification. New numbers were introduced to allow the coding of undiagnosed symptoms and conditions which were, however, sufficiently clear to be assigned to a certain site or system. Otherwise many of these symptoms and conditions would have to be coded under category 795 - "ill defined and unknown causes of morbidity and mortality", whereby much of their usefulness would be lost. The following categories, not shown in the International Classification, have been added to the Sickness Survey list of Diagnostic Groups.

Diagnostic group number	Supplementary code number	
29	469	Ill-defined and unspecified diseases of the circulatory system
42	529	Ill-defined and unspecified diseases of the respiratory system
48	589	Ill-defined and unspecified diseases of the digestive system
55	639	Ill-defined and unspecified diseases of the genito-urinary system
62	719	Ill-defined and unspecified diseases of the skin and cellular tissue
66	728	"Rheumatism, arthritis" unspecified.
66	739	Ill-defined and unspecified diseases of the bones and organs of movement

Besides the above mentioned new categories, ill-defined and unspecified diseases of the nervous system, eyes and ears, have been added to the International Classification Numbers 369, 388, and 396 respectively.

### MEASURES OF ILLNESS FREQUENCY

Measures of illness frequency count the number of illnesses and ill persons. In each of the tables of this publication two sets of data are presented. One set is based on a count of illnesses, regardless of the number of persons reporting these illnesses. The other set is based on a count of persons reporting illness, regardless of the number of illnesses reported by each person.

#### Incidence

Figures for the incidence of illness during the survey year are given in Tables 1, 2, 3, 7 and appendix.

Incidence is measured by the number of new illnesses commencing during the survey year and the number of persons reporting these illnesses. A new illness is any reported disturbance of health independent of any preceding illness<sup>1</sup>. Other illnesses, i.e., those reported as recurring attacks of previous illnesses, thus are not counted in the incidence of illness. Recurring illnesses are included at various other places in the tables, however.

1. Acute and infectious diseases were always treated as new illnesses. They were composed of the following numbers in the International Classification: 040-108, 470, and 480-483

Calculation of the incidence of illness during the survey year may be illustrated as follows:

CHART 1

The example shows the illness record of Person P (with illnesses a and b), Person Q (with illnesses  $c_1$ ,  $c_2$ , and d), Person R (with illnesses e and f), and Person S (with illnesses  $g_1$ ,  $g_2$ , and h). In this case a, b, d, e, f, and h are unrelated attacks of illness;  $c_1$  and  $g_1$  are first attacks and  $c_2$  and  $g_2$  corresponding recurring attacks of illness. In terms of illnesses the incidence during the survey year is measured by the new illnesses, b, e, f,  $g_1$ , and h. Illnesses a,  $c_1$ , and d are not counted because they commenced before the beginning of the survey year. Illnesses  $c_2$  and  $g_2$  are excluded because they were recurring attacks only. Illnesses f and h are counted because they commenced within the survey year even though they extended beyond the final date of that year. In terms of persons reporting illness the incidence during the survey year is measured by Persons P, R, and S, each of whom reported one or more new illnesses commencing during the survey year.

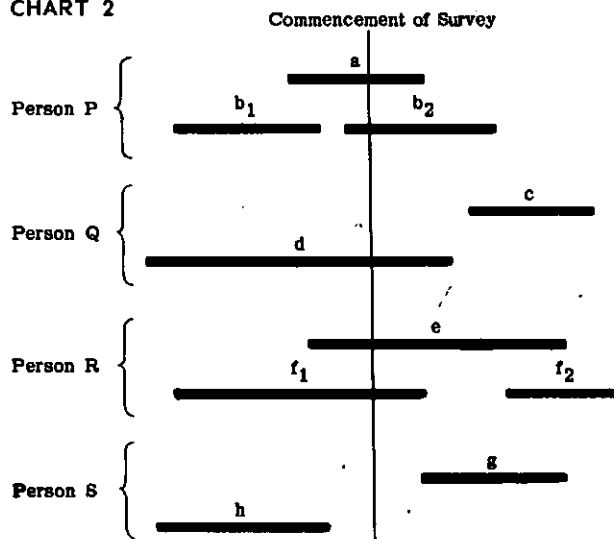

### Prevalence

Statistics of prevalence of illness at the commencement of the Canadian Sickness Survey are presented in Tables 1, 2, 4, 7 and appendix. Prevalence in this case measures the number of illnesses in progress at the exact time the Survey began and the number of persons reporting illness at that time. Prevalence thus concerns illnesses (both new and recurring) which commenced at some time prior to the beginning of the Survey and which had not yet terminated at the time the Survey began. It is, therefore, a point prevalence, the point being the beginning of the Survey. Although the dates of the beginning of the Survey varied between prov-

inces<sup>1</sup>, they all fell between the seasonal extremes of prevalence. As there was no indication of any unusual disease outbreaks during that period, the prevalence figures shown here may be taken as a reasonable indication of the amount of illness present at any time during the year.

Calculation of the prevalence of illness at the commencement of the Survey may be illustrated as follows:

CHART 2

1. The Survey started on September 1, 1950 in Quebec, Manitoba, Saskatchewan and Alberta; on October 1, 1950 in Prince Edward Island, Nova Scotia, New Brunswick, Ontario and British Columbia; and on November 1, 1950 in Newfoundland.

The example shows the illness record of Person P (with illnesses a,  $b_1$ , and  $b_2$ ), Person Q (with illnesses c and d), Person R (with illnesses e,  $f_1$ , and  $f_2$ ), and Person S (with illnesses g and h). In this case a, c, d, e, g, and h are unrelated attacks of illness;  $b_1$  and  $f_1$  are first attacks and  $b_2$  and  $f_2$  corresponding recurring attacks of illness. In terms of illnesses, the prevalence of illness at the commencement of the Survey is measured by the (new or recurring) illnesses in progress at that time, viz. illnesses a,  $b_2$ , d, e, and  $f_1$ . Illnesses  $b_1$ , c,  $f_2$ , g, and h are not counted because they either terminated before or commenced after the beginning of the Survey. In terms of persons reporting illness the prevalence of illness at the commencement of the Survey is measured by Persons P, Q, and R, each one of whom reported one or more illnesses in progress at the beginning of the Survey.

### Illness Commencing in Survey Year

The concept of illness commencing in survey year aims at presenting a picture of illness from year to year. It can be used to estimate the volume of illness over a number of years.

Figures for all illnesses commencing in survey year (or persons reporting them) are shown in Tables 1, 2, 5, 7 and appendix. They include new as well as recurring illnesses. In Chart I illness commencing in survey year is indicated by illnesses b, c, e, f,  $g_1$ ,  $g_2$ ; and h; and persons P, Q, R, and S. Illnesses b, e, f,  $g_1$ , and h are new, while  $c_2$  and  $g_2$  are recurring.

### All Illness in Survey Year

Tables 1, 2, 6, 7 and appendix give figures for all attacks of illness (and persons reporting those attacks) which, for any portion of their duration, fell within the survey year. In other words they include all illnesses that existed at the commencement of survey and also all new and recurring illnesses.

### Summary

The concepts of various measures of illness frequency may be summarized as follows:

- "Incidence" is measured by the number of —
- (a) Persons reporting new illness(es) commencing during the Survey
  - (b) New illnesses reported commencing during the Survey

- "Prevalence" is measured by the number of —
- (a) Persons reporting new and/or recurring illness(es) in progress at the commencement of the Survey

- (b) New and recurring illnesses reported in progress at the commencement of the Survey

"Illness commencing in survey" is measured by the number of —

- (a) Persons reporting new and/or recurring illness(es) commencing during the Survey
- (b) New and recurring illnesses reported commencing during the Survey

"All illness in survey" is measured by the number of —

- (a) Persons reporting new and/or recurring illness(es) in progress at the commencement of the Survey or persons reporting new and/or recurring illness(es) commencing during the Survey
- (b) New and recurring illnesses reported in progress at the commencement of the Survey plus new and recurring illnesses commencing during the Survey

## PROCESSING OF DATA

### Population Universe

The population universe from which the sample for the Canadian Sickness Survey was drawn consisted of the total population of Canada minus persons residing in institutions, military establishments, Indian reservations, and remote areas<sup>1</sup>. This population universe, estimated at 13,538,000<sup>2</sup>, was calculated from the total population of Canada, as recorded in the 1951 Census, with appropriate adjustments for the excluded sections of the population.

### Adjustment to Estimates of Persons

The estimates given in this bulletin were calculated from data obtained from a sample of about 33,000 persons, most of whom were reported on for the entire survey year. A few persons who were absent from the Survey for less than 31 days were also included in the sample. Persons who were born or who died during the survey year, but were otherwise not absent from the Survey for more than 30 days, were included in the sample. As they were not in the Survey for a full year, certain adjustments had to be made in order to make their experience comparable with that of persons who were in the

1. The remote areas consisted of Labrador, the Northwest Territories, the Yukon, and the northernmost stretches of Quebec, Ontario, Manitoba, Saskatchewan, Alberta and British Columbia.

2. Male 6,818,000.

Female 6,720,000.

Survey for a whole year. An appropriate small adjustment was made to estimates of numbers of persons — as distinct from numbers of illnesses — recorded in the tables of this bulletin, in order to compensate for partial absence from the Survey of the persons mentioned. In other words, all estimates pertain to person-years. These adjustments mainly affected the following diagnostic groups:

Diagnostic group number	Inter-national classification number	Diagnostic group
(3)	001-019 040-049 054-055 057-074	Other bacterial diseases (Tuberculosis, dysentery, food poisonings and other)
(9)	131-137	Fungus infections and arthropod infections
(15)	250-289	Thyroid disorders, diabetes and other endocrine, metabolic and nutritional disorders
(18)	330-353 355-357	Vascular lesions, epilepsy, and other diseases of the brain and spinal cord
(25)	400-434	Diseases of heart without hypertension, rheumatic fever
(26)	440-447	Hypertensive disease
(29)	450-456 467-468	Arterial diseases and other diseases of the circulatory system
(30)	470	Acute nasopharyngitis (common cold)
(35)	480-481, 483	Influenza with respiratory and nervous manifestations and influenza unqualified
(37)	490-493	Pneumonia
(50)	571	Gastro enteritis and colitis, except ulcerative, age 4 weeks and over
(63)	720-725	Arthritis
(76)	786,788, 789,792- 795	Other ill-defined symptoms and conditions
(77)	N820-N829	Fractures
(83)	N850-N869 N930-N936 N950-N999	Other and unspecified effects of external cause of individual foreign bodies and poisoning

In other diagnostic groups the adjustments did not produce appreciable changes.

#### Accuracy of reported data

For various reasons it was impossible to carry out complete medical verification on all personal health histories covered by the Survey. However, a check with physicians on a portion of the medically attended illnesses revealed a high degree of accuracy in the reporting of diagnoses by informants.

Some variation in the accuracy and uniformity of the data must be expected. While it was the intention to register any disturbance in the state of health of persons covered by the Survey, it is likely that some informants neglected to report minor complaints. Also, lack of uniform standards in the background and medical orientation of enumerators may have had some effect on the strict comparability of their observations and reporting.

#### Estimating

The total sample was broken down into cells, by a division into provinces, areas (metropolitan and non-metropolitan) within provinces, and age-sex groups (five male and five female age groups) within areas. The total population of each cell was taken from the 1951 Census, with appropriate adjustments for excluded sections of the population. For each cell the ratio of total population to sample population was used as a weight and applied to all sample data pertaining to the cell. Weighted figures for the various cells were appropriately combined to provide the published estimates. These estimates are provisional in the sense of being subject to minor adjustments arising from further analysis of the sample material and from study and comparison of more detailed tabulations. Continuing improvement of the estimates account for slight discrepancies between some of the figures of bulletin No. 7 and the present bulletin.

#### Sampling Error

The standard of statistical accuracy set in this bulletin for estimates concerning numbers of persons was a maximum sampling error of 22 percent<sup>1</sup>. To achieve this standard each published figure had to be based on a certain minimum frequency of persons in the sample reporting a diagnosis. Figures for numbers of persons that do not come up to the required standard of accuracy have not been shown. Corresponding figures for the number of illnesses, for rates, and for percentages have, similarly, been omitted.

#### Rounding and Additions

In the tables absolute numbers are given in thousands. Rates and averages were calculated from original full estimates, not from the rounded figures shown in the published tables. The following rates and percentages have been used for various measures of illness frequency:

1. Rates per 1,000 population
2. Percentages of total persons reporting illness(es) or illnesses reported
3. Percentages of total persons reporting a class of illness or illnesses of a class

1. With a 95 percent confidence limit, i.e., no individual figure was allowed a chance greater than one in 20 of exceeding a 22 percent margin of error.

Rates per 1,000 population were given with one decimal point except in Table 1, which has integral numbers only. Percentages drawn from the total of illnesses or persons were shown with two decimals. Percentages from the total of persons or illnesses of a class were shown with one decimal.

As each detailed and each total figure was rounded individually, addition of rounded figures may differ slightly from the rounded totals shown.

It should be noted that the number of persons in the class of illness need not be equal to the total of persons in the diagnostic groups constituting that particular class of illness, because a person can report more than one diagnosis in the same class of illness. Similarly the addition of the numbers of persons reporting various diagnoses or classes of illness will not be equal to the grand total for all sick persons. The grand totals in this bulletin give an unduplicated count of persons.

In all tables it will be found that the number of persons reporting illness(es) is either smaller than or equal to the number of illnesses reported. This results from the circumstance that some people may report more than one attack of an illness.

In the case of prevalence of illness for individual diagnosis the number of persons is equal to the number of illnesses because, at any one point of time, a person cannot have more than one attack of the same illness.

#### Arrangement of Tables and Charts

The bulletin consists of seven tables, the first two of which are summary tables. Table I gives rates per thousand persons in the survey population for the classes of illness. In this table all measures of illness frequency are compared with one another. Rates are given both for persons reporting illness(es), and illnesses reported. In the

second table the same data are broken down by diagnostic groups. No sex breakdown is shown in the first two tables.

Each one of the next four tables deals separately with a measure of illness frequency, and contains two sets of rates and percentages, one for persons and the other for illnesses. All information in these four tables is broken down by sex.

The last table contains the estimated absolute number of persons reporting illness(es) and illnesses reported under all measures of illness frequency used in this bulletin.

The appendix shows the results of combining related symptoms with the respective classes of illness.

Two types of charts are used in this bulletin. Pie charts show the percentage distribution of illnesses of some important classes under various measures of illness frequency. All those classes of illness which were at least two percent of the total have been shown.

Bar charts show rates per thousand population for various diagnostic groups. Both persons and illnesses have been shown. All those diagnostic groups which had an average of twenty-five or more persons per thousand population were chosen for graphic illustration.

#### Analysis

It is the purpose of these bulletins to release certain basic data as soon as possible and to leave more extensive tabulations and interpretations to a more comprehensive report (to be issued at a later date). For that reason no attempt is made in the present series of bulletins to analyse the data in detail. However, a brief commentary on the immediate significance of the figures presented in this bulletin is given below.

## FINDINGS

### SUMMARY COMMENT

#### INCIDENCE OF ILLNESS DURING SURVEY YEAR

(Table 3, Charts 3 and 4)

##### Classes of illness

Incidence of illness consists of new attacks of illness and persons reporting those attacks. It is, therefore, of special interest to the epidemiologist.

Diseases of the respiratory system claimed more victims (635.5 per 1,000 population) than any other disease. Indeed they had the singular distinction of having an average of more than one illness per person (1,310.1 per 1,000 population). They contributed as high a proportion as 58.70% of all new illnesses reported in 1950-51. In terms of

persons reporting new illness(es), 84.19% reported diseases of the respiratory system. This is not surprising if one considers that diseases of the respiratory system include such common afflictions as common cold and influenza. Moreover, the situation was aggravated by the epidemic of influenza in the spring of 1951.

Diseases of the digestive system were the second largest class of illness. They constituted 7.40% of all new illnesses. More than 165 (165.2) new illnesses of the digestive system were reported for every thousand persons in the population and more than 130 (130.7) persons in every thousand suffered from these diseases. Of the people reporting new illness(es) 16.84% reported diseases of the digestive system.

CHART 3

INCIDENCE OF ILLNESS DURING SURVEY YEAR  
PERCENTAGE DISTRIBUTION OF NEW ILLNESSES BY CLASS  
(SOURCE: TABLE 3)

CHART 4

# INCIDENCE OF ILLNESS DURING SURVEY YEAR

## RATES PER 1,000 POPULATION FOR PRINCIPAL DIAGNOSTIC GROUPS

(SOURCE: TABLE 3)

Other classes of illness which deserve mention in the count of incidence were accidents, poisonings and violence (accounting for 5.79% of all new illnesses), infective and parasitic diseases (5.19%), diseases of the nervous system and sense organs (3.29%), and diseases of the skin and cellular tissue (2.06%).

#### Diagnostic groups

The common cold was the most frequently experienced disease. Out of every one thousand persons in the population 398.8 persons caught a cold. Colds alone constituted 29.54% of all new illnesses reported during the survey year, and accounted for more than half (50.4%) of all new illnesses of the respiratory system. More than half (51.38%) of all persons reporting new illness(es) reported a cold as one of their complaints some time or other during the year. The average number of attacks of common cold for every one thousand persons in the population was as high as 659.9.

The next biggest diagnostic group consisted of influenza with respiratory and nervous manifestations, and influenza unqualified. These kinds of influenza affected 348.4 persons per thousand population, and represented 18.99% of the total of new illnesses. An average of 423.7 attacks per 1,000 population was recorded for this diagnostic group.

Of the other diagnostic groups, disorders of function of stomach and other diseases of stomach and duodenum affected 67.7 persons in every one thousand population. Headaches, symptoms referable to limbs and back, and influenza with digestive manifestations had an average of less than 43 persons affected per thousand population.

#### PREVALENCE OF ILLNESS AT COMMENCEMENT OF SURVEY

(Table 4, Charts 5 and 6)

##### Classes of illness

A prevalence count of illness depicts the state of ill health in a community at a given point of time, e.g., the day on which the Sickness Survey began. If the first day of the Survey is regarded as a representative day, a similar picture of illness may be visualized for any other day of the year after an appropriate allowance has been made for seasonal variations.

The small size of the sample prevented the presentation of reliable estimates of prevalence for a large number of diagnostic groups and classes of illness. At the commencement of the Survey 85.4 persons were sick per thousand population. As usual, diseases of the respiratory system claimed the highest number of victims (16.7 per 1,000), and constituted the largest class of illness (17.28%

of all illnesses reported at the commencement of the Survey). Nearly one-fifth (19.53%) of the sick persons reported an illness of the respiratory system as one (or the only one) of their complaints. However, compared with incidence of illness, diseases of the respiratory system formed a comparatively smaller proportion of the total prevalence. This might be attributed to the fact that many respiratory diseases, especially common cold and influenza comprises short term illnesses.

Diseases of the circulatory system were the second largest class of illness which prevailed at the commencement of the Survey (Chart 5). They contributed 12.91% of all illnesses in progress at that time. The appearance of diseases of the circulatory system as the second largest class of prevalence of illness seems to suggest that they were mostly composed of long term ailments, and so had in proportion to their number a greater chance of being found present at a given point of time. In other measures of illness frequency the second place was occupied by diseases of the digestive system, which took a fourth place in the count of prevalence of illness. Diseases of the circulatory system affected 12.5 persons per thousand population.

It is interesting to note that accidents, poisoning and violence which formed the third largest class of illness in all other measures of illness frequency were conspicuous by their absence in the count of prevalence of illness. In prevalence of illness the sample frequency of the number of persons reporting illness(es) on account of accidents was so small that reliable estimates could not be prepared.

In prevalence nearly half of all illnesses were composed of the diseases of the respiratory, circulatory, and digestive systems, and diseases of the bones and organs of movement. The prominent position occupied by diseases of the circulatory system and diseases of the bones and organs of movement is an evidence of their long term nature.

##### Diagnostic Groups

Among diagnostic groups the largest rate of prevalence was reported for common cold (8.5 per thousand population), but the prominence of this diagnostic group was less pronounced for prevalence than for other measures of illness frequency. Common cold represented 8.72% of all prevalent illnesses and 50.4% of the prevalent illnesses of the respiratory system.

Diagnostic groups which were comparatively more important in prevalence than in other illness frequency measures included symptoms referable to limbs and back (5.3 persons per thousand population) and diseases of heart (without hypertension), and rheumatic fever (5 persons per thousand population).

(Table 5, Charts 7 and 8)

**Classes of illness**

Illness commencing in the survey year includes both new and recurring illnesses but it excludes illnesses found in progress at the commencement of the Survey. It is therefore a useful concept for measuring illness frequency from year to year without a duplicate count of illnesses lasting from one year into the next.

The chart for classes of illness commencing during the Survey (Chart 7) contains all the classes shown on the incidence chart (Chart 3) plus diseases of the bones and organs of movement. Probably the explanation is that the diseases of the bones and organs of movement, including many chronic conditions, did not have many new attacks, but they emerged on the chart for illness commencing during the survey year which shows new as well as recurring illnesses.

This class contributed 2.15% of all illnesses commencing during the survey year and 5.04% of all persons reporting illness(es) commencing during survey year. The averages per thousand population were estimated to be 39.8 persons and 51.8 illnesses.

The general pattern of illness commencing in the survey year for the more important classes of illness was not unlike that of incidence. Diseases of the respiratory system accounted for a smaller proportion of illnesses in the former than in the latter measure (54.96% as against 58.70%), but the reverse was the case for diseases of the digestive system (7.80% as against 7.40%). The smaller proportion of illnesses of the respiratory system in the measure for illness commencing in the survey year is explained by the fact that they stemmed from diseases which seldom included recurring conditions (common cold, influenza with respiratory and nervous manifestations, and influenza unqualified. (See footnote 1, page 6).

**Diagnostic Groups**

For illness commencing in survey year a rate of more than 25 persons per thousand population was recorded for 15 diagnostic groups. Apart from

the addition of other diseases of the ear, these were the same diagnostic groups which appeared on the incidence chart (Chart 4). The rates for acute and infectious diseases like common cold, influenza with respiratory and nervous manifestations, influenza unqualified, influenza with digestive manifestations and measles, etc., remain unchanged. In other diagnostic groups the rates are higher for illness commencing in survey year.

**ALL ILLNESS IN SURVEY YEAR**

(Table 4, Charts 9 and 10)

**Classes of illness**

All illness in the survey year includes illnesses that were found present at the commencement of the Survey plus new and recurring illnesses recorded during the survey year. This measure of illness frequency is useful for estimating the volume of sickness in a calendar year.

Diseases of the circulatory system which accounted for 12.91% of prevalence of illness (Chart 5), appeared again on the chart for all illness in survey year with a much reduced proportion (2.21%). They did not appear at all on the charts for incidence or illness commencing in survey year. It might be inferred that they were long term illnesses. On the average 55.4 illnesses and 44.1 persons per thousand population were recorded for diseases of the circulatory system. Of the people reporting any illness(es) 5.48% suffered from these diseases. For most other classes of illness under the measure "all illness during survey year" the pattern of illness remained approximately the same.

**Diagnostic Groups**

There is not much change in the position of principal diagnostic groups under all illness during survey year. Common cold, influenza with respiratory and nervous manifestations and influenza unqualified continue to remain well ahead of all other groups. Besides these two groups disorders of functions of stomach and other diseases of stomach and duodenum, acute pharyngitis, and symptoms referable to limbs and back were the only three diagnostic groups which had rates in excess of 50 persons per thousand population.

TABLE 7: Illness Frequency — Estimates of Persons and Illnesses — Class — Diagnostic Group — Sex — Continued

Class and diagnostic group number	Class of illness and diagnostic group	International classification number	Sex	Persons reporting (Thousands)				Illnesses reported (Thousands)			
				Any illness(es)	Illness(es) commencing	Incidence	Prevalence	All illnesses	Illnesses commencing	Incidence	Prevalence
4.	Diseases of the blood and blood-forming organs.	290-299	Both sexes	114	81	70	..	121	87	72	..
			Male	..	..	..	..	..	..	..	..
			Female	94	67	57	..	98	71	58	..
	(16) Anaemias and other diseases of the blood and blood-forming organs.	290-299	Both sexes	114	81	70	..	121	87	72	..
			Male	..	..	..	..	..	..	..	..
			Female	94	67	57	..	98	71	58	..
5.	Diseases of the nervous system and sense organs.	330-398	Both sexes	1,017	945	872	82	1,359	1,275	993	84
			Male	450	416	390	41	543	502	444	41
			Female	567	530	482	42	815	772	549	43
	(17) Migraine .....	354	Both sexes	45	44	..	..	173	172	..	..
			Male	..	..	..	..	..	..	..	..
			Female	..	..	..	..	..	..	..	..
	(18) Vascular lesions, epilepsy, and other diseases of the brain and spinal cord.	330-353, 355-357	Both sexes	64	..	..	..	81	..	..	..
			Male	..	..	..	..	..	..	..	..
			Female	..	..	..	..	..	..	..	..
	(19) Neuralgia and neuritis .....	360-369	Both sexes	144	133	110	..	178	166	116	..
			Male	54	47	..	..	63	57	..	..
			Female	90	86	72	..	115	110	74	..
	(20) Conjunctivitis and ophthalmia .....	370	Both sexes	50	50	50	..	60	60	51	..
			Male	24	24	24	..	29	29	24	..
			Female	..	..	..	..	..	..	..	..
	(21) Hordeolum and other inflammatory eye diseases.	371-379	Both sexes	249	240	234	..	281	270	258	..
			Male	120	116	113	..	131	126	122	..
			Female	129	124	121	..	150	144	136	..
	(22) Other diseases of the eye .....	380-389	Both sexes	91	66	63	..	98	73	68	..
			Male	..	..	..	..	..	..	..	..
			Female	53	..	..	..	58	..	..	..
	(23) Otitis and mastoiditis .....	390-393	Both sexes	67	64	62	..	79	77	64	..
			Male	36	..	..	..	36	..	..	..
			Female	..	..	..	..	..	..	..	..
	(24) Other diseases of ear .....	394-398	Both sexes	356	348	337	..	407	397	374	..
			Male	163	160	154	..	189	184	172	..
			Female	192	188	183	..	218	213	202	..
6.	Disease of the circulatory system.....	400-468	Both sexes	597	450	265	169	750	580	282	171
			Male	226	167	105	66	273	207	112	66
			Female	372	284	160	103	477	373	170	104
	(25) Diseases of heart, without hypertension, rheumatic fever.	400-434	Both sexes	237	176	99	68	298	230	104	68
			Male	112	76	44	..	134	96	47	..
			Female	125	101	52	..	163	134	57	..
	(26) Hypertensive disease .....	440-447	Both sexes	146	103	54	45	183	138	56	45
			Male	..	..	..	..	..	..	..	..
			Female	113	78	..	..	143	106	..	..
	(27) Varicose veins of lower extremities .....	460	Both sexes	72	49	..	..	86	59	..	..
			Male	..	..	..	..	..	..	..	..
			Female	61	42	..	..	72	50	..	..
	(28) Haemorrhoids, phlebitis and other diseases of veins.	461-466	Both sexes	83	70	49	..	91	77	50	..
			Male	45	..	..	..	49	..	..	..
			Female	..	..	..	..	..	..	..	..
	(29) Arterial diseases and other diseases of circulatory system.	450-456, 467, 468	Both sexes	86	70	57	..	93	75	58	..
			Male	..	..	..	..	..	..	..	..
			Female	53	44	..	..	56	47	..	..
7.	Diseases of the respiratory system.....	470-527	Both sexes	8,916	8,877	8,847	226	18,161	17,933	17,735	229
			Male	4,332	4,308	4,296	109	8,576	8,467	8,399	109
			Female	4,584	4,569	4,551	117	9,585	9,466	9,336	119
	(30) Acute nasopharyngitis (common cold) ....	470	Both sexes	5,459	5,400	5,400	115	9,049	8,934	8,934	115
			Male	2,599	2,580	2,580	51	4,322	4,271	4,271	51
			Female	2,857	2,816	2,816	64	4,727	4,663	4,663	64

TABLE 7. Illness Frequency - Estimates of Persons and Illnesses - Class - Diagnostic Group - Sex - Continued

Class and diagnostic group number	Class of illness and diagnostic group	International classification number	Sex	Persons reporting (Thousands)				Illnesses reported (Thousands)			
				Any illness(es)	Illness(es) commencing	Incidence	Prevalence	All illnesses	Illnesses commencing	Incidence	Prevalence
(31) Acute pharyngitis .....	472	Both sexes	816	811	808	..	942	936	927	..	..
		Male	326	325	325	..	368	367	365	..	..
		Female	490	486	483	..	575	569	562	..	..
(32) Acute tonsillitis, peritonsillar abscess (quinsy) .....	473,511	Both sexes	131	128	122	..	146	143	129	..	..
		Male	54	52	51	..	60	57	55	..	..
		Female	77	76	71	..	87	86	74	..	..
(33) Acute laryngitis and tracheitis .....	474	Both sexes	92	91	90	..	100	99	97	..	..
		Male	..	..	..	..	..	..	..	..	..
		Female	57	57	56	..	60	60	58	..	..
(34) Acute upper respiratory infection of multiple or unspecified sites .....	475	Both sexes	296	292	291	..	329	324	320	..	..
		Male	122	120	120	..	133	132	130	..	..
		Female	174	172	171	..	195	193	190	..	..
(35) Influenza with respiratory and nervous manifestations, and influenza unqualified .....	480,481, 483	Both sexes	4,724	4,717	4,717	..	5,749	5,737	5,737	..	..
		Male	2,316	2,312	2,312	..	2,797	2,794	2,794	..	..
		Female	2,411	2,405	2,405	..	2,952	2,942	2,942	..	..
(36) Influenza with digestive manifestations .....	482	Both sexes	574	570	570	..	639	635	635	..	..
		Male	262	259	259	..	295	292	292	..	..
		Female	312	311	311	..	344	343	343	..	..
(37) Pneumonia .....	490-493	Both sexes	137	134	134	..	145	141	140	..	..
		Male	74	72	72	..	75	74	74	..	..
		Female	64	61	59	..	70	67	66	..	..
(38) Bronchitis .....	500-502	Both sexes	469	445	400	..	535	509	439	..	..
		Male	227	213	194	..	255	240	213	..	..
		Female	242	232	206	..	280	269	226	..	..
(39) Hypertrophy of tonsils and adenoids .....	510	Both sexes	158	143	130	..	174	159	135	..	..
		Male	79	68	63	..	87	77	66	..	..
		Female	80	75	67	..	87	82	70	..	..
(40) Chronic sinusitis .....	513	Both sexes	125	112	78	..	154	140	84	..	..
		Male	43	38	..	..	47	42	..	..	..
		Female	82	74	51	..	107	98	56	..	..
(41) Pleurisy and other diseases of lungs .....	471,512,	Both sexes	184	168	154	..	198	177	159	..	..
(42) and upperrespiratory tract, and pleural cavity .....	514-527	Male	91	80	72	..	97	84	74	..	..
		Female	94	88	82	..	101	93	84	..	..
8. Diseases of the digestive system .....	530-587	Both sexes	1,992	1,907	1,770	111	2,662	2,545	2,236	117	..
		Male	941	893	823	59	1,241	1,180	1,029	61	..
		Female	1,051	1,015	947	53	1,420	1,364	1,208	56	..
(43) Toothache and dental caries .....	530,534	Both sexes	312	308	307	..	357	353	352	..	..
		Male	152	150	150	..	176	174	173	..	..
		Female	160	158	158	..	181	179	179	..	..
(44) Abscesses and other diseases of teeth and supporting structures .....	531,532 535	Both sexes	68	64	63	..	71	67	66	..	..
		Male	..	..	..	..	..	..	..	..	..
		Female	..	..	..	..	..	..	..	..	..
(45) Disorders of occlusion, eruptions and tooth development .....	533	Both sexes	145	145	145	..	162	161	159	..	..
		Male	69	69	69	..	77	77	75	..	..
		Female	76	76	76	..	85	85	84	..	..
(46) Stomatitis and other diseases of buccal cavity and oesophagus .....	536-539	Both sexes	67	66	66	..	70	69	69	..	..
		Male	..	..	..	..	..	..	..	..	..
		Female	40	40	40	..	43	43	42	..	..
(47) Ulcer of stomach and duodenum .....	540-542	Both sexes	85	73	..	..	115	99	..	..	..
		Male	65	57	..	..	92	80	..	..	..
		Female	..	..	..	..	..	..	..	..	..
(48) Disorders of function of stomach and other diseases of stomach and duodenum .....	543-545	Both sexes	979	951	917	33	1,210	1,177	1,080	33	..
		Male	461	446	429	..	578	561	507	..	..
		Female	518	505	488	..	632	616	572	..	..
(49) Diseases of appendix, herniae, intestinal obstruction .....	550-553, 560-561, 570	Both sexes	162	139	119	..	168	145	121	..	..
		Male	86	71	57	..	90	74	58	..	..
		Female	75	68	62	..	78	71	63	..	..
(50) Gastro-enteritis and colitis except ulcerative, age 4 weeks and over .....	571	Both sexes	104	102	101	..	125	123	117	..	..
		Male	49	49	48	..	58	58	58	..	..
