ASSET CONDITION REPORTING SYSTEM

FINAL STATUS REPORT

BY 96

DECEMBER 1996

REAL PROPERTY SERVICES FOR INAC

ACRS STATUS REPORT

BASE YEAR 1996/97

General

Asset Condition Reporting System (ACRS) is a computerized system which holds information on current (updated every year) physical conditions of assets funded for Operation and Maintenance, (O&M), by INAC. The data has been useful in planning and budgeting for, as well as decision-making, on these capital assets.

The asset data is presented in the following sections on a national and regional basis by categories or classifications of assets.

Asset Condition

Assets are inspected and rated by professional teams based on the General Condition Rating, (GCR), which ranges from 0 = Closed, to 10 = New. The GCRs are shown in a table and graph format for each asset category/classification. Since users generally refer to asset condition as "poor" or "fair", etc., the 0 to 10 ratings are also grouped as: 0 = Closed, 1-3 = Poor, 4-6 = Fair, 7-9 = Good, and 10 = New.

Some asset subclasses have different units of measurement, (e.g., in the water supply subclass, water mains [B1B] are measured in "metres", while water treatment systems [B1C] are measured in "each"). Therefore, these asset subclasses cannot be assessed as a single group. Where this is the case, the subclasses are grouped by the units of measurement and shown on separate tables.

Identification of need

The original scope of ACRS was to identify only "Maintenance Projects" which were "proposals (or needs) intended to restore the functional integrity and established levels of service of the asset. These include major repair and component replacement / reconstruction".

However, during inspections, it frequently proved difficult to exclude O&M (minor repairs) and Upgrade needs from those of maintenance projects, because of grey areas in distinguishing them. The needs are therefore grouped under O&M, Maintenance Projects (as defined above), and Others (includes Study, Asset Replacement/Reconstruction, and Upgrade).

The identified needs may not necessary become projects, as they are subject to programming and budgetary limitations.

How urgent should the needs be implemented is designated by year 0 to 4, i.e., for immediate (current year) through to year four (Current year + 4).

Asset Inspection Ratio

The portion of total assets that has been inspected is expressed by the ratio of ACRS inspected assets to CAIS inventory.

The table - Summary of ACRS/CAIS Quantities, compares the total quantity of each asset category inspected up to March 31, 1996 with the respective asset inventory in CAIS. However, the figures provide only an approximate magnitude of the assets that has been inspected, as a number of reasons contribute to the disparity in the data. These include:

- Assets entered into CAIS when constructed, but may not be subject to an ACRS inspection for some time, depending on the inspection cycle.
- Assets deleted from previous inventory or was reclassified due to new usage or data error.

Completed Maintenance Projects

A summary of completed maintenance projects is in the last section of this report. It shows the number of completed projects and their total value by region and by asset category / subclass.

Conclusion

While the quality of ACRS data varies with the region, district, tribal council or band, and with asset type, we expect it to continuously improve with the increased involvement of and commitment from First Nations. Trends can only be detected when we are well into the reinspection cycle.

Care must be exercised when interpreting these data. A clear understanding of the ACRS objective, methodology, CAIS definitions and funding details is essential prior to analysis and conclusions drawn. Real Property Services for INAC specialists and regional staff may be consulted when data reviews are undertaken.
