No. 204, April 1993

Migratory game birds harvested in Canada during the 1991 hunting season
Hélène Lévesque^a, Brian Collins^a and André M. Legris^b
Introduction

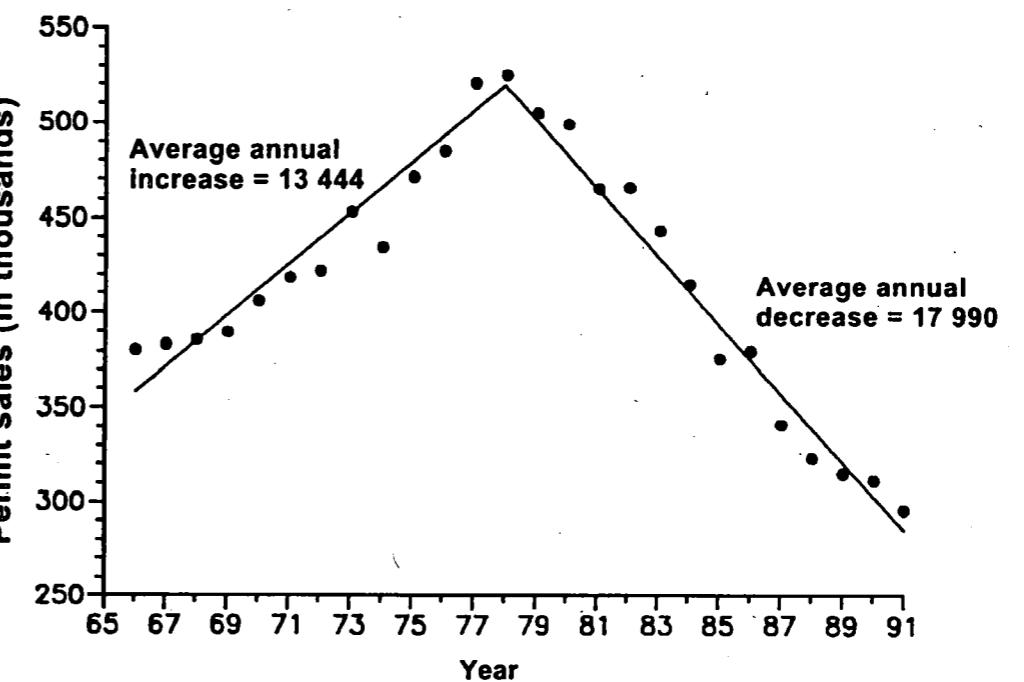

The Harvest Questionnaire Survey (HQS), and the Species Composition Survey (SCS) are conducted annually to estimate the number of migratory game birds killed by hunters in Canada. Together they make up the National Harvest Survey (NHS).

Methods

The HQS is based on a questionnaire that asks hunters to provide information on the number, location, and timing of their hunting trips and on the migratory game birds killed (for nine species groups). The questionnaire was mailed in early December 1991 to a sample selected from the lists of purchasers of migratory game bird hunting permits for the current and previous years. A

Figure 1
Total sales of migratory game bird hunting permits in Canada, 1966–91, (based on permit stubs returned^a)

^a Note that total number of stubs received in 1989, 1990, and 1991 is smaller than the reported sales by vendors (see text).

reminder was mailed to nonrespondents in early February 1992.

The SCS asks hunters to send in the wing from each duck killed and the tail feathers from each goose killed, along with the location and timing details of the harvest. This allows the species group harvest estimates from the HQS to be partitioned by species. The results of the SCS do not include estimates of illegal kill, legal hunting without permits by native people, or crippling loss. Cooch et al. (1978) give a full description of the survey methods.

Wing/tail envelopes were mailed in August 1991 to hunters selected from lists of permit purchasers in previous years. Additional wing envelopes for the SCS were sent in late December 1991 to the hunters selected in Newfoundland, as they have been since 1983. This extra mailing increases the reliability of the estimate of species composition for Newfoundland, by ensuring that wings from the winter harvest of sea ducks are adequately represented. The recent trend in kill estimates by species for this province is not comparable with the results prior to 1983. Murres are also legally taken by hunters in Newfoundland, but that kill is addressed by separate surveys (Elliot et al. 1991).

Hunters in eastern Canada were asked to send a wing from any woodcock shot. The results of this additional

wing collection can be obtained from the Canadian Wildlife Service, P.O. Box 1590, Sackville, New Brunswick E0A 3C0. For woodcock hunted in Quebec, the address is 1141 Route de l'Église, C.P. 10100, Ste-Foy, Quebec G1V 4H5.

The 1991 HQS questionnaire used the same concise format as in 1990. A section on rails was added to the question on harvest of species groups in 1989, and the rail data for the last three years are presented for the first time in Table 14.

Analysis

The analysis of the data was changed substantially in 1992. In previous years, all data processing for the survey was done on a mainframe computer. In 1992, the survey results were processed on microcomputers. Transferring the survey processing to microcomputers was done to reduce costs, to streamline operations, and to update the analysis programs. Survey analysis was done using the statistical package SAS. Use of the new data analysis programs on data from previous years results in harvest estimates that are somewhat different from those previously published.

There are several possible sources for these differences: i) differences in the decision rules for inputting missing values or excluding observations with missing values, ii) differences in the algorithms used for the calculations, and iii) differences caused by rounding of variables. However, differences in the estimates obtained with the two analyses approaches were small compared to the variance in the data. More details on the new estimation procedures including variance for the NHS are available in: Collins, B.T. "Estimation procedures for the Migratory Bird Harvest Surveys" in prep.

The algorithm that partitions the number of parts received into time periods has been modified so that each time period must include at least five parts. This modification affects only those hunting zones from which few parts were received. The advantage of this modification is that it stabilizes the estimates of harvest by species by reducing the amount of partitioning into time periods that had too little information to precisely assign the group harvest among species.

Many of the tables in this report set out the estimates from previous years alongside the current year estimates. To enhance comparability of the current year results with those from previous years, all data from previous years that appear in this Progress Note were reanalyzed using the new data analysis programs. Because of this, the estimates of harvest are somewhat different from those published in earlier Progress Notes.

Results

In the past 26 years, the number of permits sold has changed markedly (Fig. 1). The decrease in sales since 1978 should be noted by those who use kill statistics as

indices of trends in migratory game bird populations and harvest characteristics. The permit sale totals for each province are given in Table 1. Note that Table 1 and Figure 1 report the total sales based on permit stubs returned to CWS. Traditionally we have observed a slight discrepancy (1%) between the reported number of permits sold by vendors and the number of stubs returned. Since 1989 however this difference appears to be in at least the 5% range which implies that numbers presented here for 1989, 1990, and 1991 underestimate the total number of permits sold. Estimates of migratory birds harvest are based on permit stubs received, harvest estimates for 1989-91 may also be underestimated.

The survey results are summarized for the same 23 geographic zones for which the survey sample selection is stratified (Fig. 2).

The distribution of permit sales between those who purchased a permit the previous year (renewals) and those who did not, and between resident and non-resident (non-Canadian) purchasers, is shown in Table 2.

Table 3 gives the number of permit purchasers who were sampled and who responded to the 1991 HQS. This is compared with earlier years in Table 4. Tables 5 through 16 present the results of the HQS questionnaire. Indications of the amount of recreational activity provided by hunting are presented in Tables 6 and 15.

Table 17 shows the number of permit purchasers who were sampled and who responded to the 1991 SCS. Results of the SCS are used to assign species-specific proportions to the estimated duck and goose kills. The most recent four years of estimated harvests for each species are summarized for Canada (Table 18) and by province and zone (Tables 19 through 30), based on data from both the HQS and the SCS.

In some areas, Canada Geese are further identified to groups of subspecies based on size differences. In the western provinces the tables show kills for Large and Small Canada Geese; elsewhere, subspecies that could not be separated are recorded simply as Canada Geese.

In the process of calculating estimates, rounding to significant digits took place at the last step in the analyses. It should not be expected that rounded column totals will equal the sum of values that have also been rounded.

^a Number of questionnaires sent out.

^b Sample as a percentage of permit sales.

^c Percentage of sampled population who responded.

^d Percentage of respondents who bought a permit.

^e Percentage of permit purchasers who hunted.

^f Percentage of permit purchasers who hunted successfully.

* In 1989 and 1990, only two thirds of the records of successful rail hunters could be used in the data analysis. Numbers for these years must therefore be used as preliminary estimates of the rail hunting success and total harvest. If further editing of this file is possible, improved estimates will be reported in subsequent publications.

^a The percentage of selected hunters who submitted a part sample.

^b The percentage of successful hunters who submitted a part sample, obtained using the SCS response rate and the proportion of successful waterfowl hunters in the HQS sample selected from the previous year.

^c The percentage of the total hunting population who submitted a part sample, obtained using number of responses/estimated active hunters.
