No. 83, March 1978

The 1976 kill of migratory game birds other than waterfowl by hunters in Canadaby F.G. Cooch,¹ K. Newell,¹ S. Wendt¹**Introduction**

The kill of migratory game birds by hunters in Canada is estimated from the National Harvest Survey. On the average a 7% sample is drawn from 450 000 migratory game bird hunting permits according to 23 geographic zones across Canada. Mail questionnaires returned for use in the Harvest Survey represent approximately 4% of the licensed hunters in that year.

Information is requested in the survey on hunting activity associated with all migratory game birds. Increasing hunter interest in species other than waterfowl makes it useful to report separately on the estimated annual kill and amount of recreation afforded hunters by these species.

Methods

The non-waterfowl category in the National Harvest Survey includes American Woodcock, Common Snipe, American Coot, Sandhill Crane, Mourning Dove and Band-tailed Pigeon.

The number of hunters who indicate on their Harvest Survey questionnaire that they hunted non-waterfowl at least one day is used to estimate the total number of active hunters of non-waterfowl. The present survey design does not provide any means of estimating the number of active hunters of each non-waterfowl species. The number of successful hunters can be determined by species, however, from the questionnaire, as each hunter is asked for the number that he shot of each species.

The Harvest Survey is designed primarily to estimate the harvest of waterfowl, and the numbers and method of distribution of questionnaires are not necessarily those that would be selected for a non-waterfowl survey. Consequently, there is a considerably smaller sample of hunters responding to the questions about non-waterfowl than to the portion of the questionnaire dealing with waterfowl. Under such a sampling scheme the standard errors associated with the estimates of harvest will normally be large and the estimates likely biased. The 90% confidence intervals computed for the 1976 harvest estimates for non-waterfowl are American Woodcock $\pm 13.2\%$, Common Snipe $\pm 12.0\%$, American Coot $\pm 15.5\%$, Sandhill Crane $\pm 39.4\%$, Mourning Dove $\pm 51.6\%$ and Band-tailed Pigeon $\pm 51.5\%$. Comparable confidence limits for national harvest estimates of ducks and geese are ± 2.5 and $\pm 4.5\%$ respectively.

Results

Table 1 is a summary of national totals by species for the period 1972-76 inclusive. Tables 2-7 give the estimates of retrieved kill, numbers of successful hunters and average kill per successful hunter, by species, province and zone. Sample sizes from which the estimates were made and the percent sampled of the total estimate are also given.

Table 8 provides an estimate of the number of recreation days spent by Canadian hunters in pursuit of non-waterfowl. On a national basis the results of the 1976 season are as follows: 76 000 hunters were active, 45 000 were successful, and they harvested 325 000 birds. Active non-waterfowl hunters represented 15.7% of potential migratory game bird hunters, and shot 6.4% of the migratory game birds killed in Canada in that season. The number of persons hunting non-waterfowl increased by 4.6% in 1976 when compared with 1975 and the kill increased by 9.4%.

From 1972 to 1976 the total kill of non-waterfowl and waterfowl has increased 24.9 and 21.6%, respectively; while recreation days for non-waterfowl and waterfowl have increased by 20.3 and 15.9%, respectively. In terms of both kill and recreation, the use made of non-waterfowl is increasing in magnitude faster than that made of waterfowl.

Acknowledgements

The work of R. Baroni, L. Teevens and S. Quinn in mailing and editing the Harvest Survey questionnaires and of the Production Division, Computing and Applied Statistics Directorate was essential in providing the information included in this publication.
