MONTHLY TEMPERATURE FORECAST

*Normal temperatures for
mid-June to mid-July, °C*

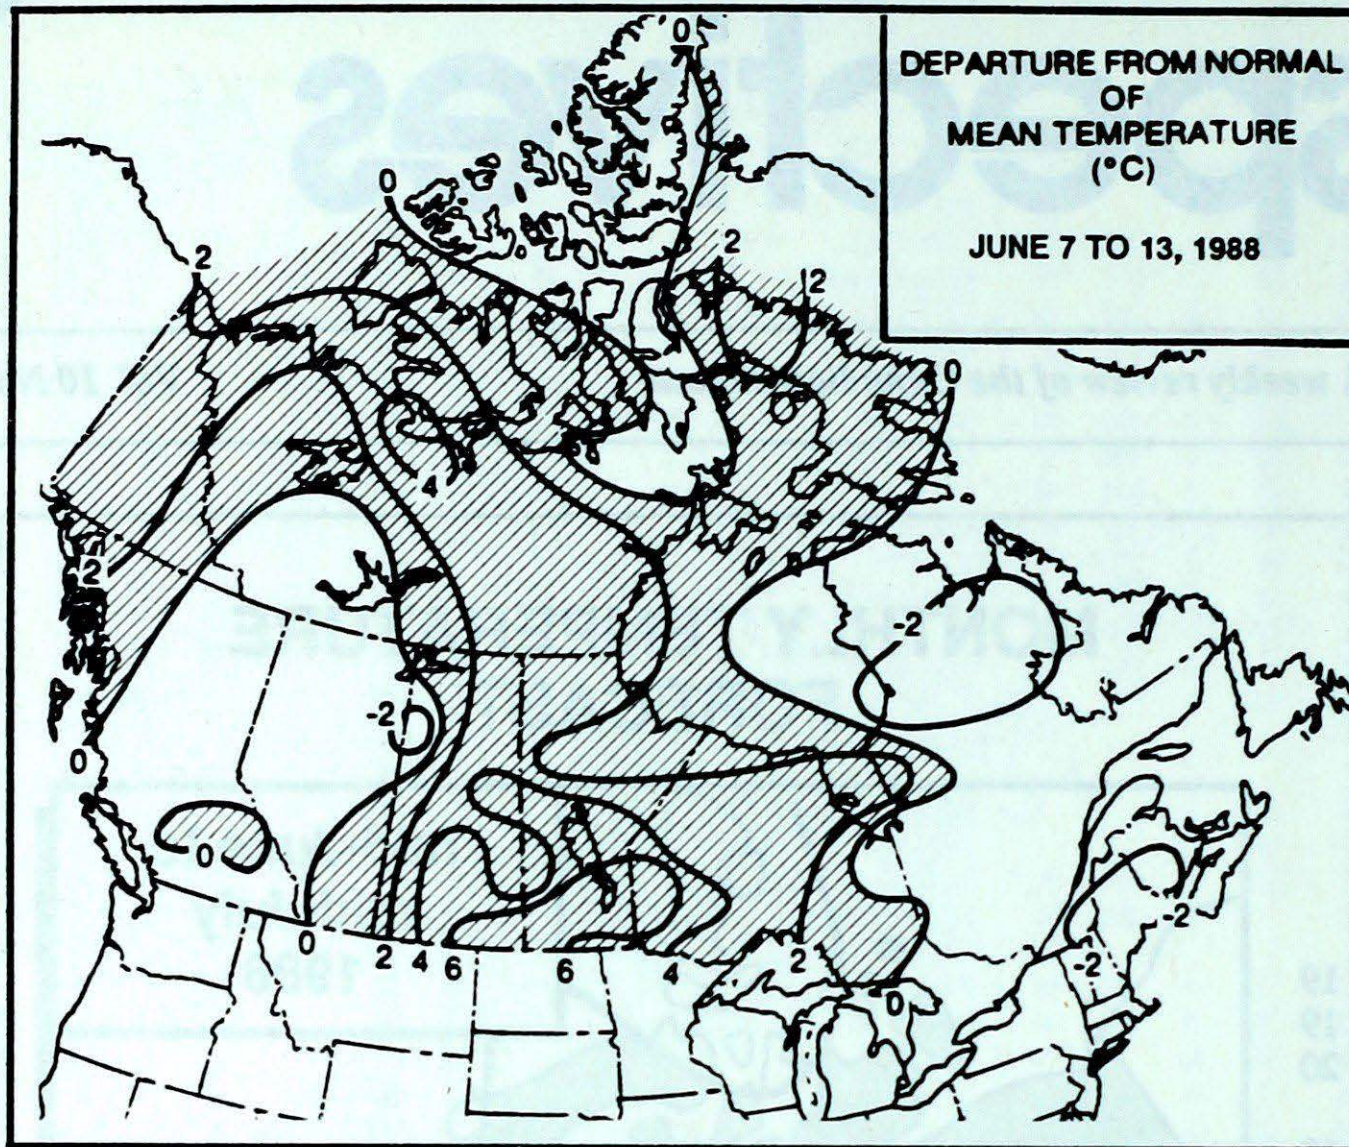

Whitehorse	13	Toronto	19
Yellowknife	15	Ottawa	19
Iqaluit	6	Montreal	20
Vancouver	16	Quebec	18
Victoria	15	Fredericton	18
Calgary	15	Halifax	16
Edmonton	16	Charlottetown	16
Regina	17	Goose Bay	14
Winnipeg	18	St. John's	13

Canada

In May 1988, the first official monthly temperature forecast was made public, and is now available at all A.E.S. weather centres and offices in a map version transmitted on the national facsimile network, and a text version on the national telecommunications network.

- **Welcome rain alleviates western Prairie drought**
- **Farmers worried by the dry weather in Ontario, Quebec and the Maritimes**

ACROSS THE COUNTRY ...

Yukon and Northwest Territories

A cool, moist air mass covered the Yukon at the beginning of the week, with some snow reported in the north. A ridge of high pressure produced sunny, warmer weather conditions by mid-week. In the Mackenzie Valley, pleasant weather gave way to cooler, cloudy conditions, but sunny weather returned by week's end. It was a windy week in the eastern Arctic, with a mixture of cloud and sun. On southern Baffin Island the snow on the ground has almost disappeared.

British Columbia

An off-shore atmospheric trough controlled the weather pattern, resulting in unsettled weather conditions and variable amounts of rain. The northern half of the province was mostly cloudy; elsewhere skies were changeable. Snow fell on the higher elevations of the Alaska Highway in northeastern B.C. Forage crops are lush, but warm, dry weather is needed for the hay harvest. The weather showed signs of improvement for the weekend.

Prairie Provinces

It was a cool unsettled week across Alberta, with substantial amounts of rain falling in the parched areas of the southeast. During the first four days of the period many areas received amounts approaching 30 to 60 millimetres. River levels have risen, and in fact in the Peace River district farmers are bemoaning the wet weather.

The week started out extremely hot in southern Saskatchewan and Manitoba, with maximum temperatures in the forties. On the 7th, numerous temperature records, in the mid- to high thirties, were broken. In contrast, northern regions had readings only in the single digits. This much cooler air mass spread southwards, covering the southern agricultural districts by the middle of the week, while temperatures in the north began to move upwards. Showers and thunderstorms accompanied the cooler weather, bringing much needed rain to the drought stricken areas of Saskatchewan. See page 3 for more details.

Weekly Temperature Extreme (°C)

	MAXIMUM	MINIMUM
BRITISH COLUMBIA	LYTTON 31	PUNTZI MOUNTAIN -2

NEWFOUNDLAND	GOOSE 25	CHURCHILL FALLS -2

ACROSS THE NATION

WARMEST MEAN TEMPERATURE	24	ESTEVAN	SASK
COOLEST MEAN TEMPERATURE	-4	MACKAR INLET	NWT

Ontario

Although daytime temperatures recovered markedly the last two days of the period, for the most part, the week was cool, breezy and not at all summer-like. The early part of the week saw daytime temperatures only climbing into the teens, with overnight frost reported in many rural areas. The prairie heat wave, which affected northwestern Ontario to some extent, finally spread eastwards, and reached southern and central Ontario over the weekend, pushing daytime temperature readings up into the thirties. It has been a dry week, with only isolated showers on June 8 and 9. Critically dry fields are evident in many agricultural districts. In northwestern Ontario, locally heavy showers produced from 10 to 20 millimetres of rain, but a serious forest fire hazard still continues to plague the region. Burning is restricted in many parts of the province.

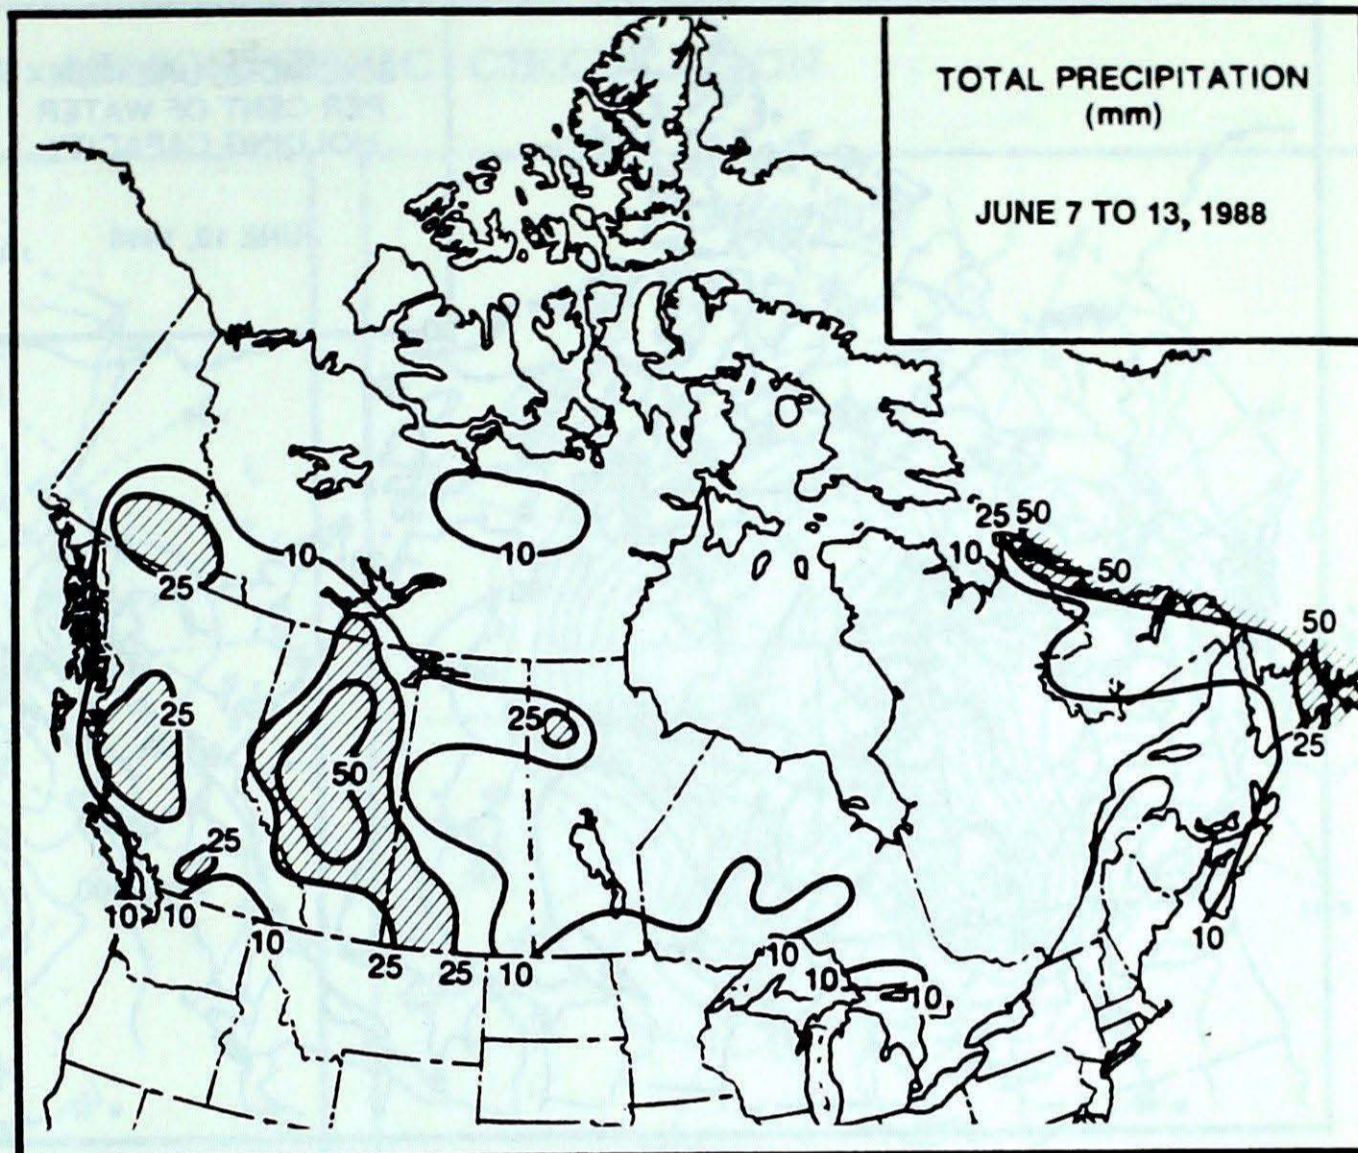

Quebec

It was a cool, dry week, with significant warming by the weekend. A ban on outdoor open fires is in effect in a number of districts due to the high forest fire hazard. Forty one forest fires are burning in the province, a number of them the result of lightning strikes. Thunderstorms associated with a frontal passage on the 12th produced hail in the Trois-Rivières region. Hay is being harvested in the Eastern Townships.

Atlantic Provinces

In the Maritimes it was a variable week. Temperatures were particularly cool the first four days, with some minimums dropping below freezing in New Brunswick. Rainfall was light, with heaviest amounts falling in Nova Scotia, while parts of New Brunswick did not receive any. An out-of-control forest fire was burning southeast of Bathurst.

Newfoundland was cool and unsettled with showers most days. Record rainfalls of 20 to 35 millimetres were recorded on the 10th. In Labrador, periods of snow and rain fell early in the week. Temperatures rebounded to the mid-twenties over the weekend, but not before Churchill received 7 cm of snow. On Sunday, an approaching cold front produced wind gusts to 122 km/h near Goose Bay.

NEWFOUNDLAND	BONAVISTA	52

Rain in the Prairies a godsend

By Wednesday, the heat wave in the prairies abated, bringing relief to many from the 40°C temperatures. The cooler weather brought timely rain to many agricultural districts just in time for germination, but will provide only enough moisture for crops to thrive on for only approximately three weeks. Parched southwestern Saskatchewan received between 25 and 40 millimetres of rain. The drought effects might be temporarily over, but much more moisture is still needed over the next month or so, because water supplies are so depleted. Severe storms also accompanied the rain, with a number of funnel clouds and unconfirmed tornadoes reported near the Alberta - Saskatchewan border Friday evening.

Meanwhile, claims are still coming in to cover damage suffered from the tornadic activity that occurred June 5 in the Camrose area, with damage claims totaling so far \$3.3 million.

Temperature Anomaly Forecast

This forecast is prepared by searching historical weather maps to find cases similar to the present. The historical outcome during the 15 days subsequent to the chosen analogues is assumed to be a forecast for the next 15 days from now.

Climatic Perspectives is a weekly bilingual publication of the Canadian Climate Centre, Atmospheric Environment Service, 4905 Dufferin St., Downsview, Ontario, Canada M3H 5T4
 ☎ (416) 739-4438/4436

The purpose of the publication is to make topical information available to the public concerning the Canadian Climate and its socio-economic impact.

Unsolicited articles are welcome but should be at maximum about 1500 words in length. They will be subject to editorial change without notice due to publishing time constraints. The contents may be reprinted freely with proper credit.

The data in this publication are based on unverified reports from approximately 225 Canadian synoptic weather stations. Information concerning climatic impacts is gathered from AES contacts with the public and from the media. Articles do not necessarily reflect the views of the Atmospheric Environment Service.

ACID RAIN REPORT

The reference map (left) shows the locations of sampling sites, where the acidity of precipitation is monitored. All are operated by Environment Canada except Dorset, which is a research station operated by the Ontario Ministry of the Environment. The map also shows the approximate areas (shaded), where SO₂ and NO_x emissions are greatest. The table below gives the weekly report summarizing the acidity (or pH) of the acid rain or snow that fell at the collection sites, and a description of the path travelled by the moisture laden air. Environmental damage to lakes and streams is usually observed in sensitive areas regularly receiving precipitation with pH readings less than 4.7, while pH readings less than 4.0 are serious.

For more information concerning the acid rain report, see Climatic Perspectives, Volume 5, Number 50, page 6.
