

Climatic Perspectives

February 20 to 26, 1989

A weekly review of Canadian climate

Vol. 11 No. 9

Extensive ice cover off East Coast of Canada ... but offshore winds keep shipping lanes open

A continuation of colder than normal temperatures over northeastern Canada has produced favorable conditions for ice formation and expansion in coastal areas.

Off the Atlantic coast, the southern limit of the pack ice is about normal for this time of year (between 47 and 48°N). However the eastern ice edge is about 140 km further east than normal. In the Gulf of St. Lawrence, the amount of ice is greater than normal, especially along the Newfoundland coast. Prevailing westerly winds have continued to produce a general eastward ice drift.

The forecast for March from the Ice Centre in Ottawa calls for a continuation of the trend of the past several weeks with colder than normal winds from the northwest along the Labrador coast. Brief periods of northerly winds, combined with ice growth may advance the ice edge to near St. John's, especially during the first half of March.

H. McRuer,
Ice Centre, AES Ottawa

Stormy week in the Maritimes

The Maritimes finally got a taste of winter weather this past week. Prior to this period, the winter storm season had been particularly quiet. The absence of cold outbreaks, combined with light precipitation, and numerous days with above-normal temperatures helped diminish the usual rigors of winter. Last week saw a change in this pattern.

According to Frank Amirault (AES Halifax) "It seems that winter is playing catch-up". It was very mild early in the week with the mercury rising to 16°C at Greenwood on the 21st when rain arrived and continued through the 22nd, dumping 30 to 58 mm of water across the Maritimes. Several parts of Nova Scotia experienced flooding which forced the closure of some highways. Snow and freezing rain accompanied a cold outbreak on the 22nd and 23rd resulting in numerous automobile accidents. Following a brief respite, another 10-20 cm of snow fell over most regions on Saturday. Moncton

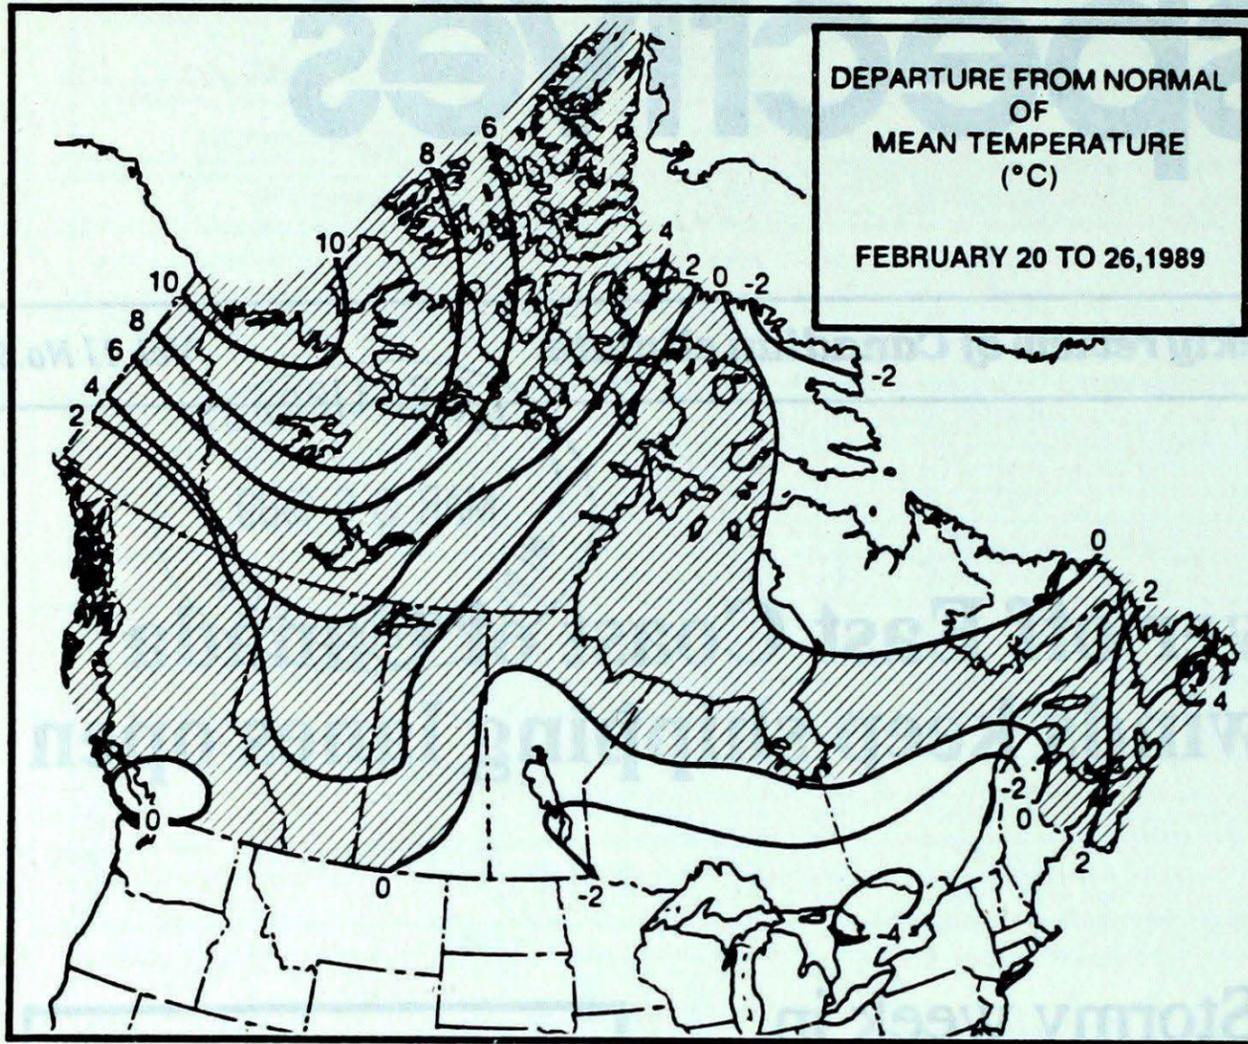

**Cool March
predicted for
most of Canada**

The 30-day forecast issued by the Canadian Climate Centre for the month of March predicts generally cool weather for most of Canada. Southern and central Ontario as well as the north-western corner of the N.W.T. are expected to be above normal.

However, some warmer temperatures are expected over most of the Prairies and Ontario during the second week of the month.

Aaron Gerye,
Canadian Climate Centre

recorded nearly 38 cm. In many locations, this snowfall raised total accumulations for February above the combined total over the three previous months!

Normal Snowfall for the Month of March.

Climatic Perspectives is a weekly bilingual publication of the Canadian Climate Centre, Atmospheric Environment Service, 4905 Dufferin St., Downsview, Ontario, Canada M3H 5T4

(416) 739-4438/4436

The purpose of the publication is to make topical information available to the public concerning the Canadian Climate and its socio-economic impact.

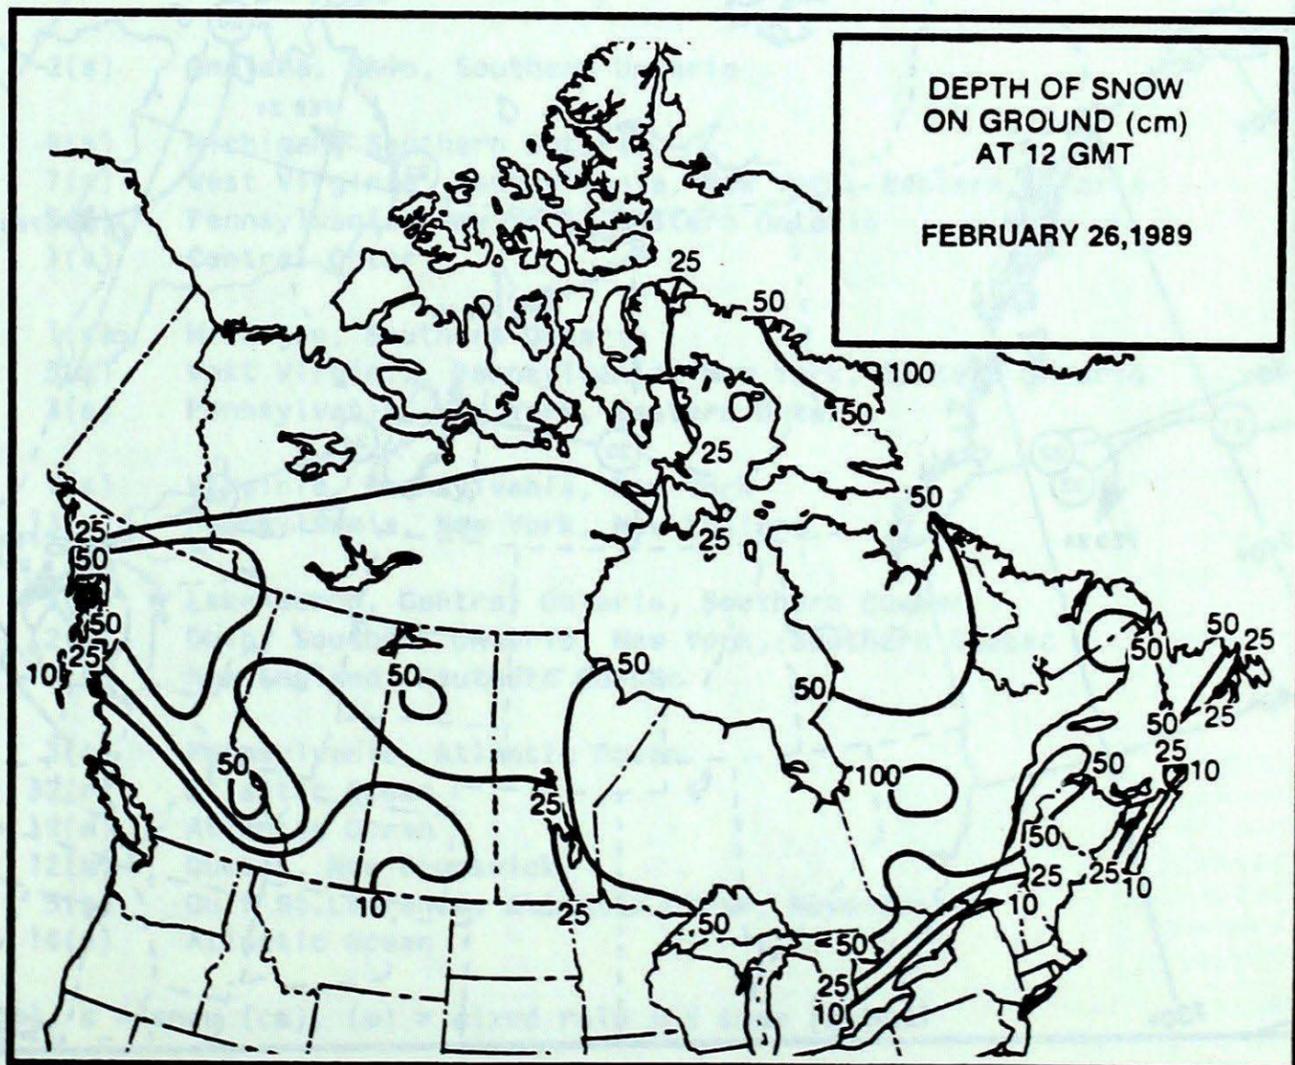

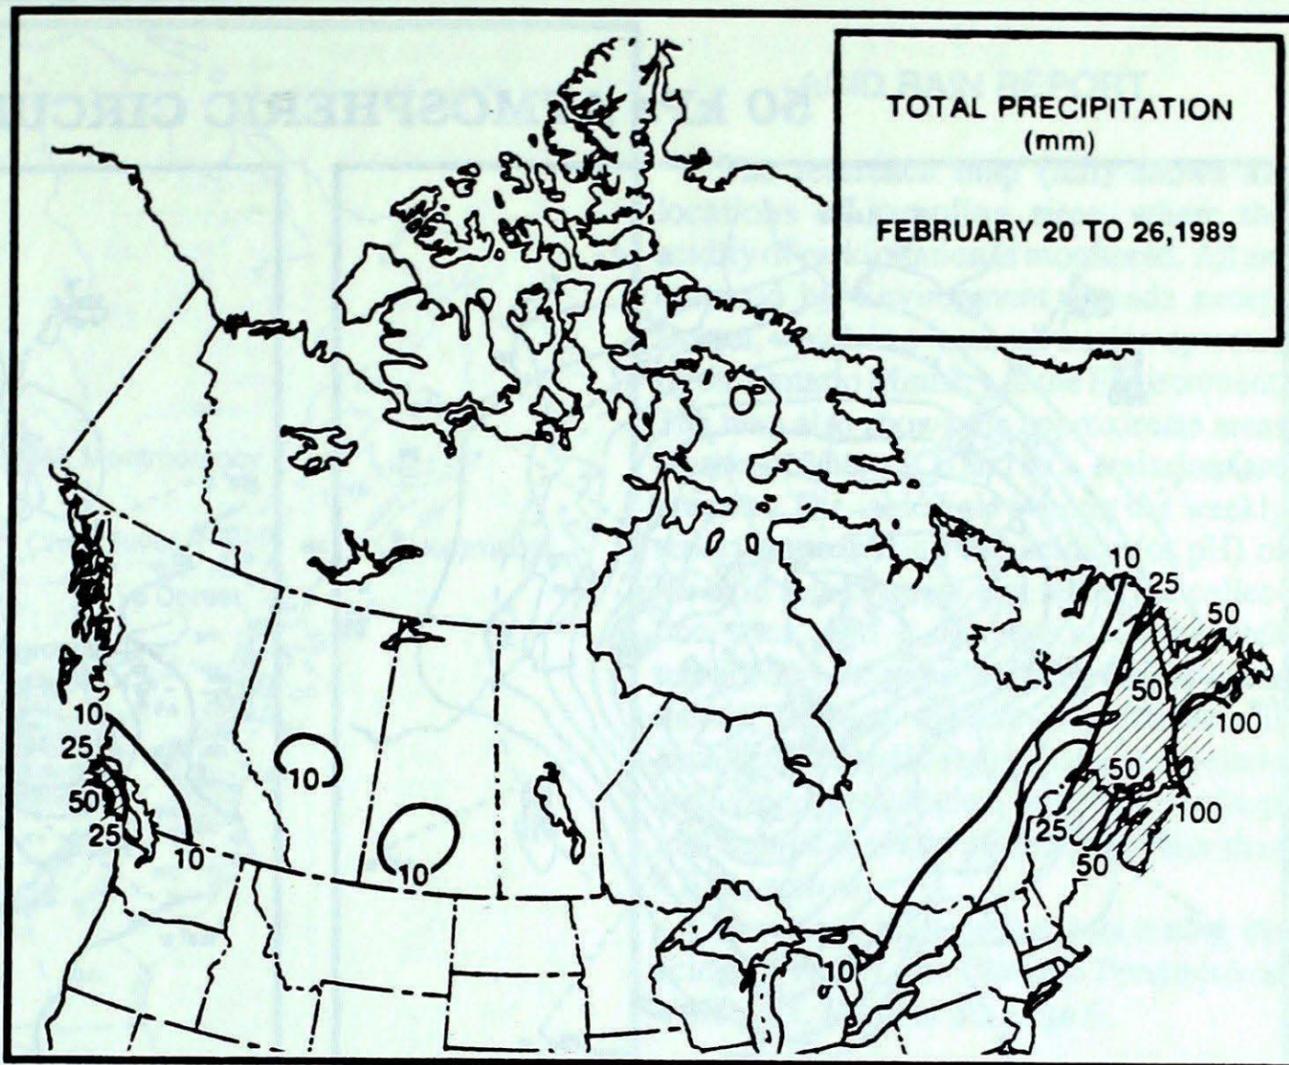

The data in this publication are based on unverified reports from approximately 225 Canadian synoptic weather stations. Information concerning climatic impacts is gathered from AES contacts with the public and from the media. Articles do not necessarily reflect the views of the Atmospheric Environment Service.

ACID RAIN REPORT

The reference map (left) shows the locations of sampling sites, where the acidity of precipitation is monitored. All are operated by Environment Canada except Dorset, which is a research station operated by the Ontario Ministry of the Environment. The map also shows the approximate areas (shaded), where SO₂ and NO_x emissions are greatest. The table below gives the weekly report summarizing the acidity (or pH) of the acid rain or snow that fell at the collection sites, and a description of the path travelled by the moisture laden air. Environmental damage to lakes and streams is usually observed in sensitive areas regularly receiving precipitation with pH readings less than 4.7, while pH readings less than 4.0 are serious.

For more information concerning the acid rain report, see Climatic Perspectives, Volume 5, Number 50, page 6.

FEBRUARY 19 TO FEBRUARY 25, 1989
