

Climatic Perspectives

March 5 to 11, 1990

A weekly review of Canadian climate

Vol.12 No.10

Another dry start for the Prairie growing season

Snowfalls are very important to the prairie agricultural community. The snow cover helps stop soil erosion and conserves soil moisture through the winter season. Snow melt in the spring replenishes the moisture necessary for crop germination.

Spring shaping up dry

It has been another relatively snow-free winter across the Prairies, and by the end of May there may be several drought-stricken areas if heavy precipitation does not materialize. The largest possible trouble spot is the stretch from Lacombe, Alta, east to North Battleford and Scott, Sask. Further to the south, another sector includes the area bounded by Medicine Hat, Alta, Shaunavon, West Poplar River and Yellow Grass, Sask. In Manitoba, Portage la Prairie, Pilot Mound and Brandon define a third area. *Forage Drought Early Warning System, Agriculture Canada.*

Water reserves in southern Manitoba critical

A surface water supply crisis exists in southern Manitoba. This is the third year of the current hydrologic drought. Less than 25% of normal run-off is expected in the extreme south this spring. At least 100 mm of precipitation is needed before the freshet in order for there to be a median run-off. Unfortunately, even median run-

off would not solve the problem. One municipal water supply reservoir may go dry by this fall and others could suffer the same fate in 1991 if dry conditions persist. *Winnipeg Climate Centre, AES.*

Snowstorm hits Alberta

After almost 3 weeks of spring-like temperatures heavy snow fell in a band from southern Alberta to west-central Saskatchewan on March 11. The 10 to 15 centimetres of snow was a welcome sight to ranchers whose spring crops will need this additional moisture.

Warming trend on the eastern Prairies

A new calculation of mean daily February temperatures averaged over the last thirty years (1961-90) indicates that the eastern prairies are becoming warmer. Thirty-year averages are re-calculated every ten years at the start of each new decade. The results determine the new normal temperatures at each location.

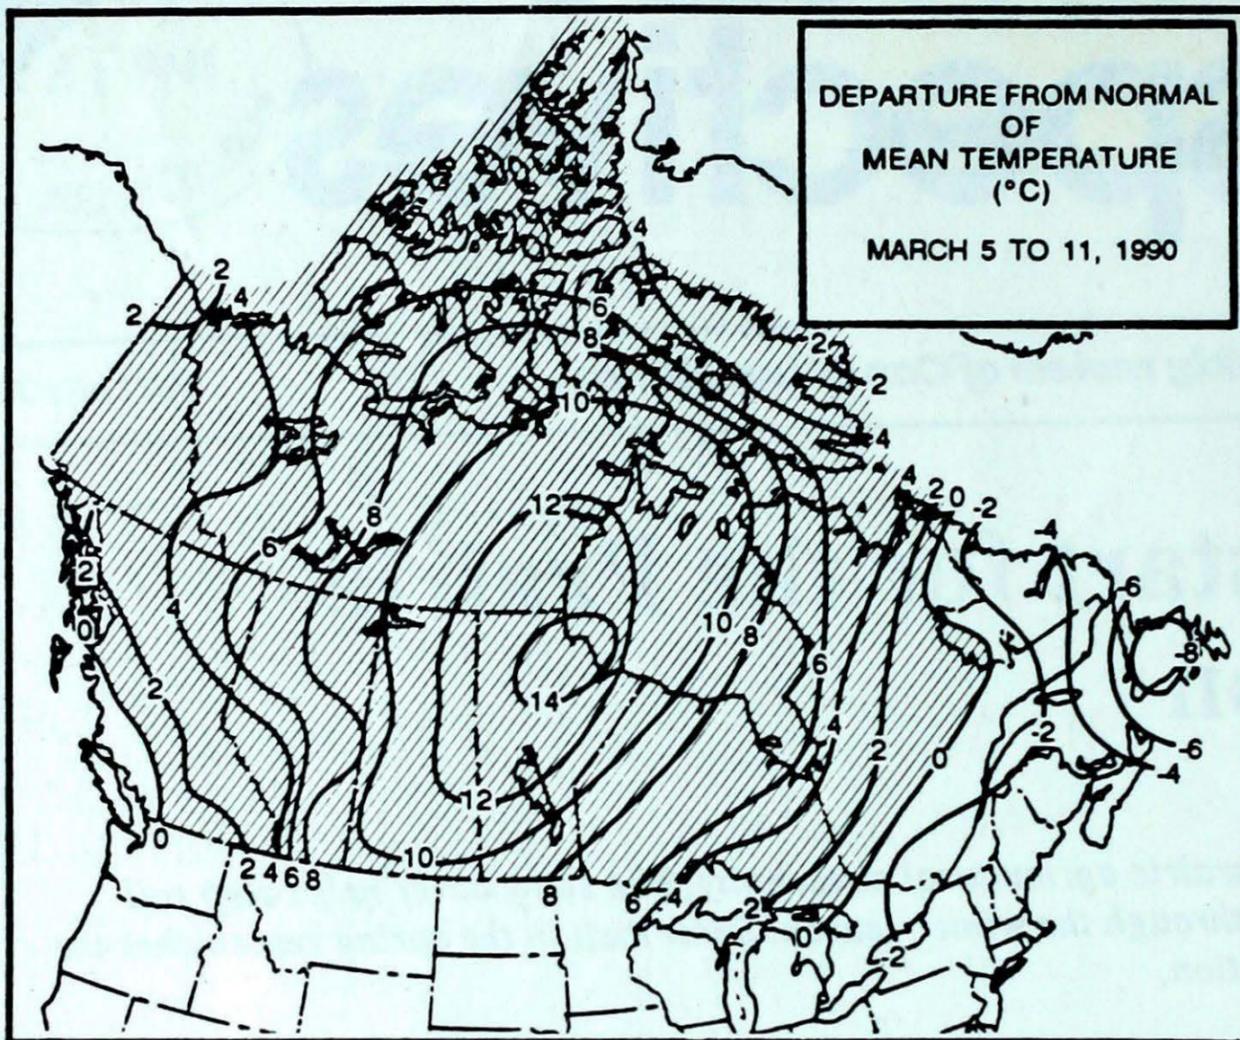

Spring arrives on time...

For the week of March 19, above-normal temperatures, are forecast for the entire country, except near-normal temperatures are expected for the southern parts of British Columbia and southwestern Alberta. Ontario, the southern half of Quebec and the Atlantic provinces will most likely experience temperatures 3 to 5 degrees above normal.

New normal February mean daily temperatures

| Station | 1961-90 | 1951-80 |
|-----------|---------|---------|
| Winnipeg | -15.1 | -15.6 |
| Brandon | -14.8 | -15.2 |
| Saskatoon | -14.0 | -14.6 |
| Regina | -13.0 | -13.6 |
| Estevan | -11.2 | -12.0 |

Cartography T. Chivers

ISBN 0225-5707 UDC 551.506.1(71)

Climatic Perspectives is a weekly publication (disponible aussi en français) of the Canadian Climate Centre, Atmospheric Environment Service, 4905 Dufferin St., Downsview, Ontario, Canada M3H 5T4

☎ (416) 739-4438/4436

The purpose of the publication is to make topical information available to the public concerning the Canadian Climate and its socio-economic impact.

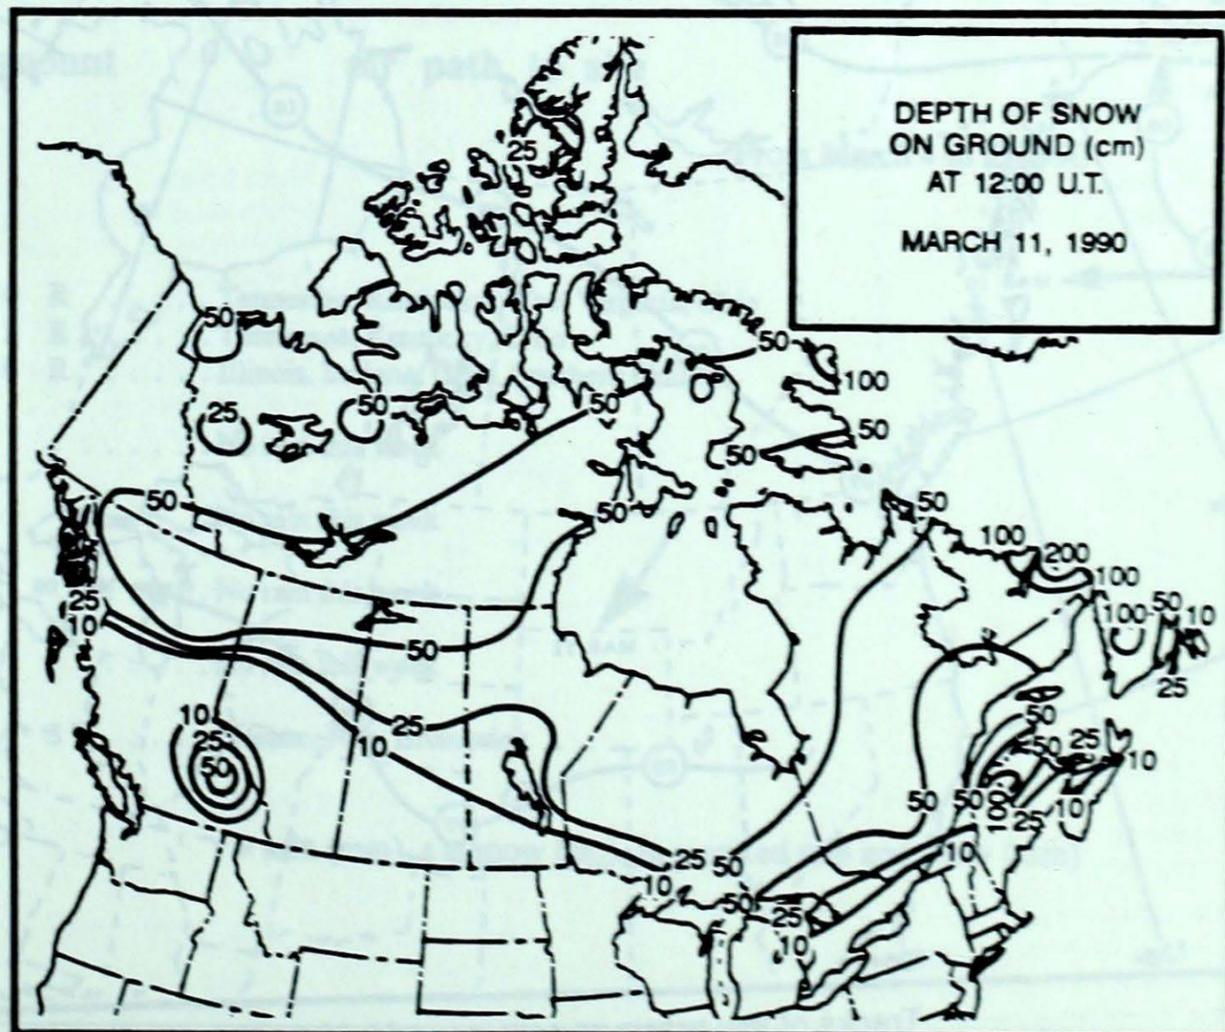

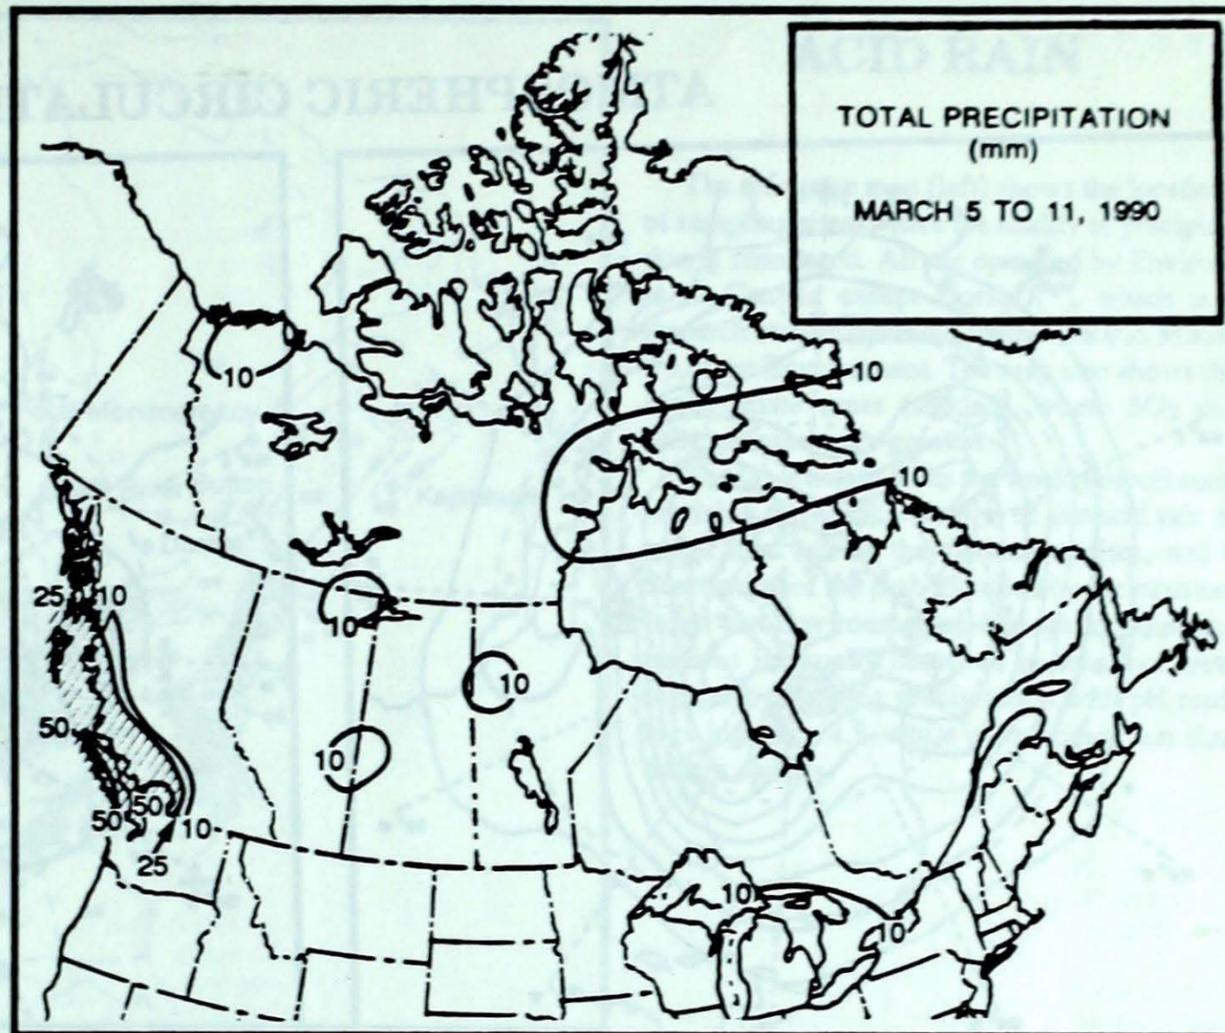

The data in this publication are based on unverified reports from approximately 225 Canadian synoptic weather stations. Information concerning climatic impacts is gathered from AES contacts with the public and from the media. Articles do not necessarily reflect the views of the Atmospheric Environment Service.

ATMOSPHERIC CIRCULATION

Mean geopotential height
50-kPa level (10-decametre intervals)

Mean geopotential height anomaly
50-kPa level (10-decametre intervals)

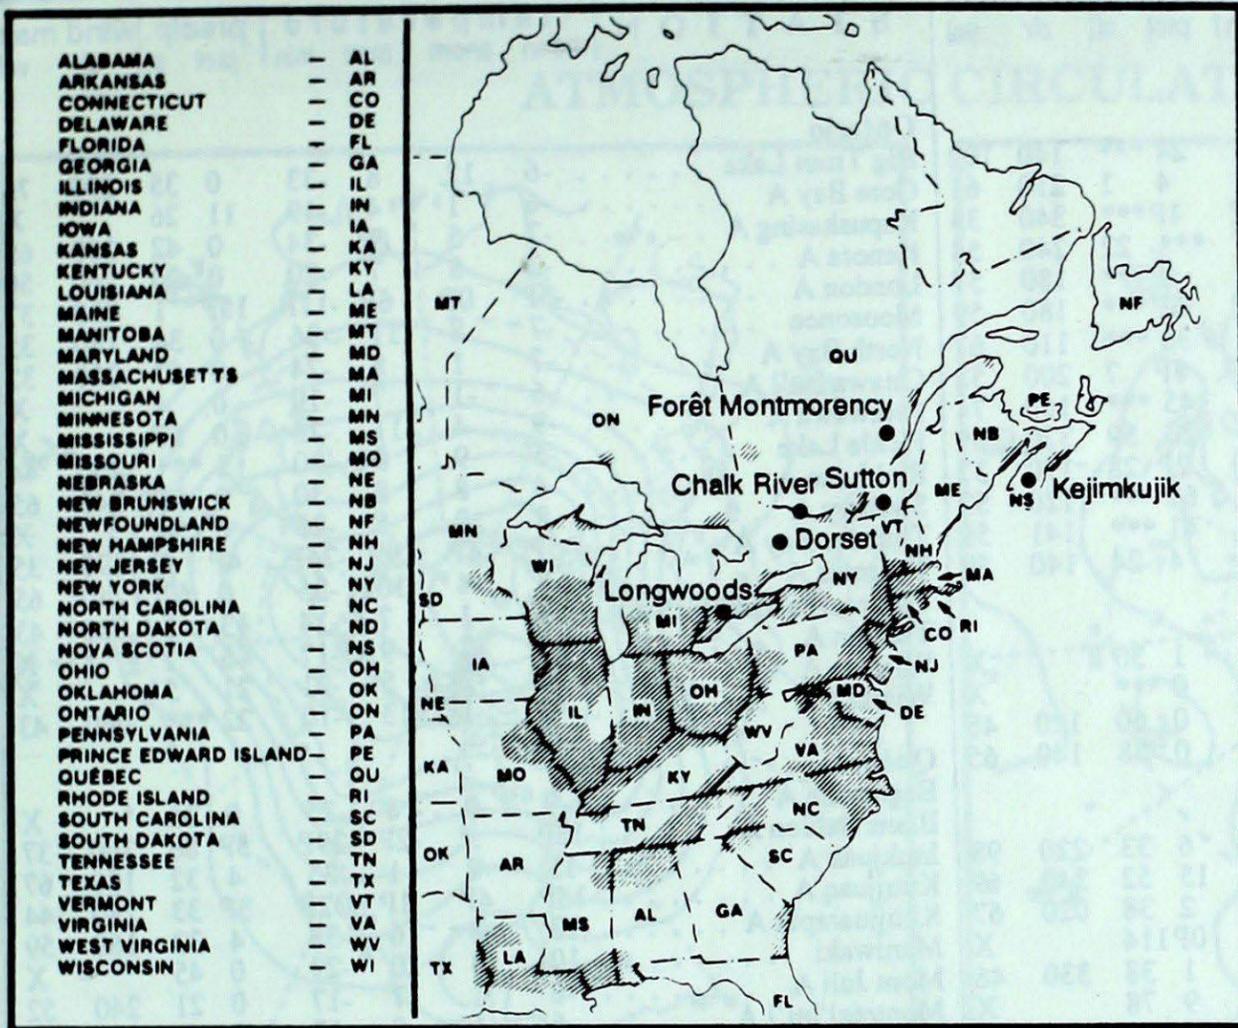

Tracks of low pressure centres at 12:00 U.T. each day during the period.

ACID RAIN

The reference map (left) shows the locations of sampling sites, where the acidity of precipitation is monitored. All are operated by Environment Canada except Dorset (*), which is a research station operated by the Ontario Ministry of the Environment. The map also shows the approximate areas (shaded), where SO₂ and NO_x emissions are greatest.

The table below gives the weekly report summarizing the acidity (or pH) of the acid rain or snow that fell at the collection sites, and a description of the path travelled by the moisture laden air. Environmental damage to lakes and streams is usually observed in sensitive areas regularly receiving precipitation with pH readings less than 4.7, while pH readings less than 4.0 are serious.

Site day pH amount air path to site

ATMOSPHERIC CIRCULATION

Mean geopotential height
50-kPa level (10-decametre intervals)

Mean geopotential height anomaly
50-kPa level (10-decametre intervals)

also brings a combination of warm weather, rainstorms, quickly melting snow cover and ice-jams caused flooding conditions. In central Ontario flooding occurred especially where the swollen rivers empty into ice-covered lakes which restrict the rivers' flows. The area of most flood damage was along Beaverton and Pufferlaw Creeks where they empty into Lake Simcoe. Preliminary estimates indicate damage to homes, businesses, farms and businesses is about \$1 million. Flooding occurred along the Humber River near Angus, the Pelee River and along rivers and creeks in the Chubbuck and Colborne regions. Other rivers in central Ontario came close to but did not flood their banks. In eastern Ontario there are currently high flows on the Rideau, Mississippi and Madawaska Rivers. Northwestern Ontario's snowpack is approximately 20% of normal and there is the potential for flooding.

In Saint-Maximilien, southern Quebec, the bridge spanning the Nicolet River was carried away by the ice, and the bridge at Kingsley Falls was damaged and closed to

traffic. The railway cable dropped in Saint-Christophe. Most of the still routes in the Eastern Townships have closed due to lack of snow. The warm weather has had an adverse effect on some of the maple sugar operations: in areas where the maximum temperatures reached 20°C, buds began to burst which caused the syrup to take on the unpleasant taste of the buds, and will render the syrup unsalable.

Mountain snowpack in British Columbia

The British Columbia Ministry of Environment, Water Management Search, in-

mount snow pack, run-off and flooding
 part as of March 1st. But in all probability, this year's melting of the mountain snowpack will produce above-normal peak flows on the Fraser, Thompson, Columbia, Peace and Liard Rivers, while a below-normal water supply is expected in the Clearwater, Kettle and Nicola basins.

Wintry weather to rekindle...

A low from the High Arctic will bring well below-normal temperatures from the Prairies to Atlantic Canada for the week starting March 26. British Columbia and the Yukon, however, will have above-normal readings.
