

Climatic Perspectives

ARCH. C2.

July 16 to 22, 1990

A weekly review of Canadian climate and water

Vol. 12 No 29

Hot, Dry Weather Fuels Forest Fires in the Yukon and British Columbia

A continuation of the hot, dry weather touched off numerous forest fires in many areas of the Yukon and British Columbia, while in other areas, the risk of fire is now rated as high to extreme.

Across the Yukon, record-breaking heat and smoke characterized the third week of the month. By mid-week, a ridge of high pressure dominating the Yukon produced 39 tied or broken daily maximum temperatures between the 19th and 22nd. The hot spot for the week was Mayo with 32°C on the 21st, breaking the daily maximum of 28°C established in 1982. Smoke from 29 forest fires made for very uncomfortable conditions across the central and northern parts of the Yukon. The acrid smoke caused residents of Old Crow to be evacuated over the weekend. By the end of the week, 16 fires were under observation and 13 fires were being fought. There have been 90 fires so far this year (destroying 52,317 hectares of forest), compared to the 171 fires which raged across the Yukon in 1989.

Across B.C. the threat of forest fires was moderate to high with extreme conditions in a few areas as indicated on the map. There were 161 fires burning across the province by the end of the week, with only two out of control. So far this year, there have been 816 fires claiming 4,537 hectares of forest.

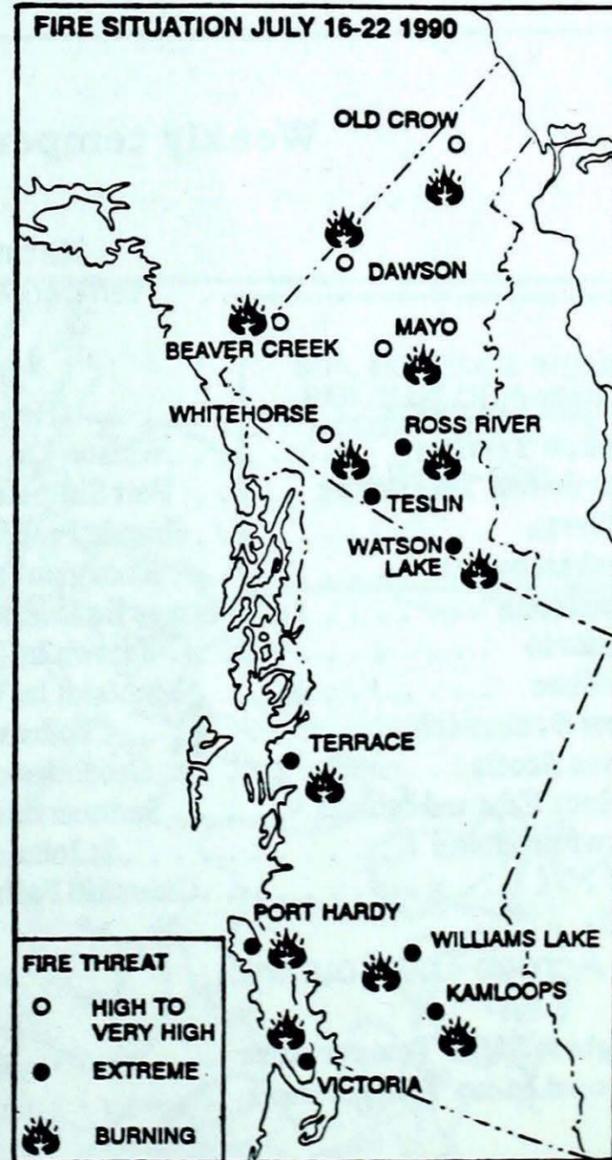

Prairie Agriculture Generally Good

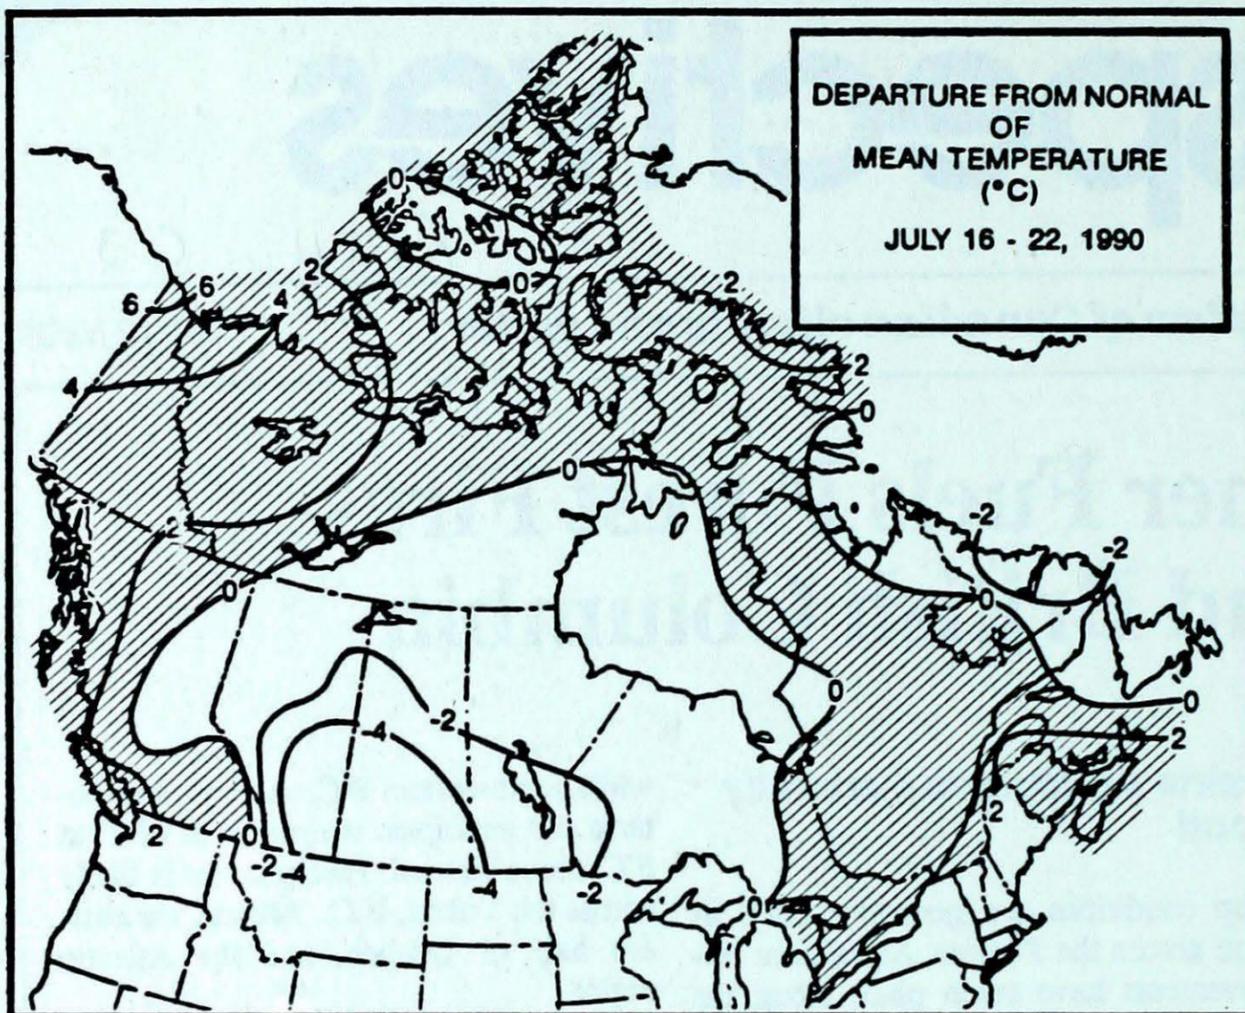

Crop conditions are generally rated as good across the Prairies. Significant improvements have taken place along the northern border between Alberta and Saskatchewan from Cold Lake to Vegreville, Alta., to Biggar, Sask. Parts of southeastern Alberta, the southern border region of Alberta and Saskatchewan and southwestern Saskatchewan have reported crop stress due to a lack of moisture in the soil. Soil moisture reserves are well below normal in the Lethbridge and Brooks areas of Alberta and the Saskatoon, Wynyard and Kindersley areas of Saskatchewan. Isolated thunderstorms caused severe hail and wind damage in parts of southern Saskatchewan on the 16th.

Hot weather shifts into the Prairies...

For the week of July 30, above-normal temperatures are expected for all of Canada except near to slightly below-normal temperatures are expected for the Arctic Islands. Manitoba and Saskatchewan may soar to temperatures of 5° to 7°C above normal,

while southwestern B.C., Alberta, and Ontario can anticipate temperatures of 2° to 5°C above normal. Precipitation is likely across the Yukon, B.C., Alberta, the eastern half of Quebec, and the Atlantic region.

Weekly normal temperatures (°C)

ISBN 0225-5707 UDC 551.506.1(71)

Climatic Perspectives is a weekly publication (disponible aussi en français) of the Canadian Climate Centre, Atmospheric Environment Service, 4905 Dufferin St., Downsview, Ontario, Canada M3H 5T4

☎ (416) 739-4438/4436

The purpose of the publication is to make topical information available to the public concerning the Canadian Climate and its socio-economic impact.

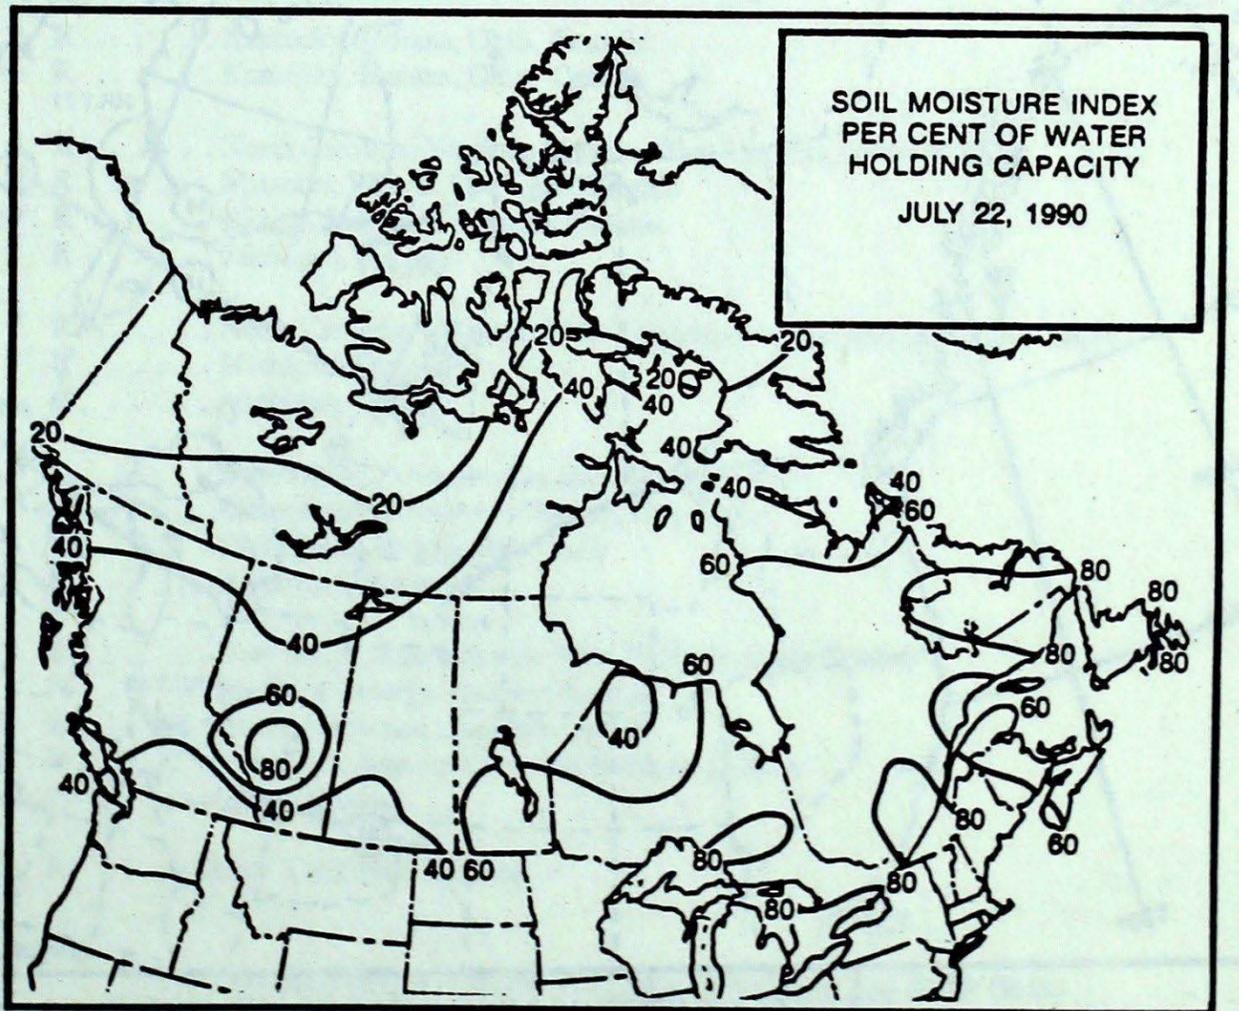

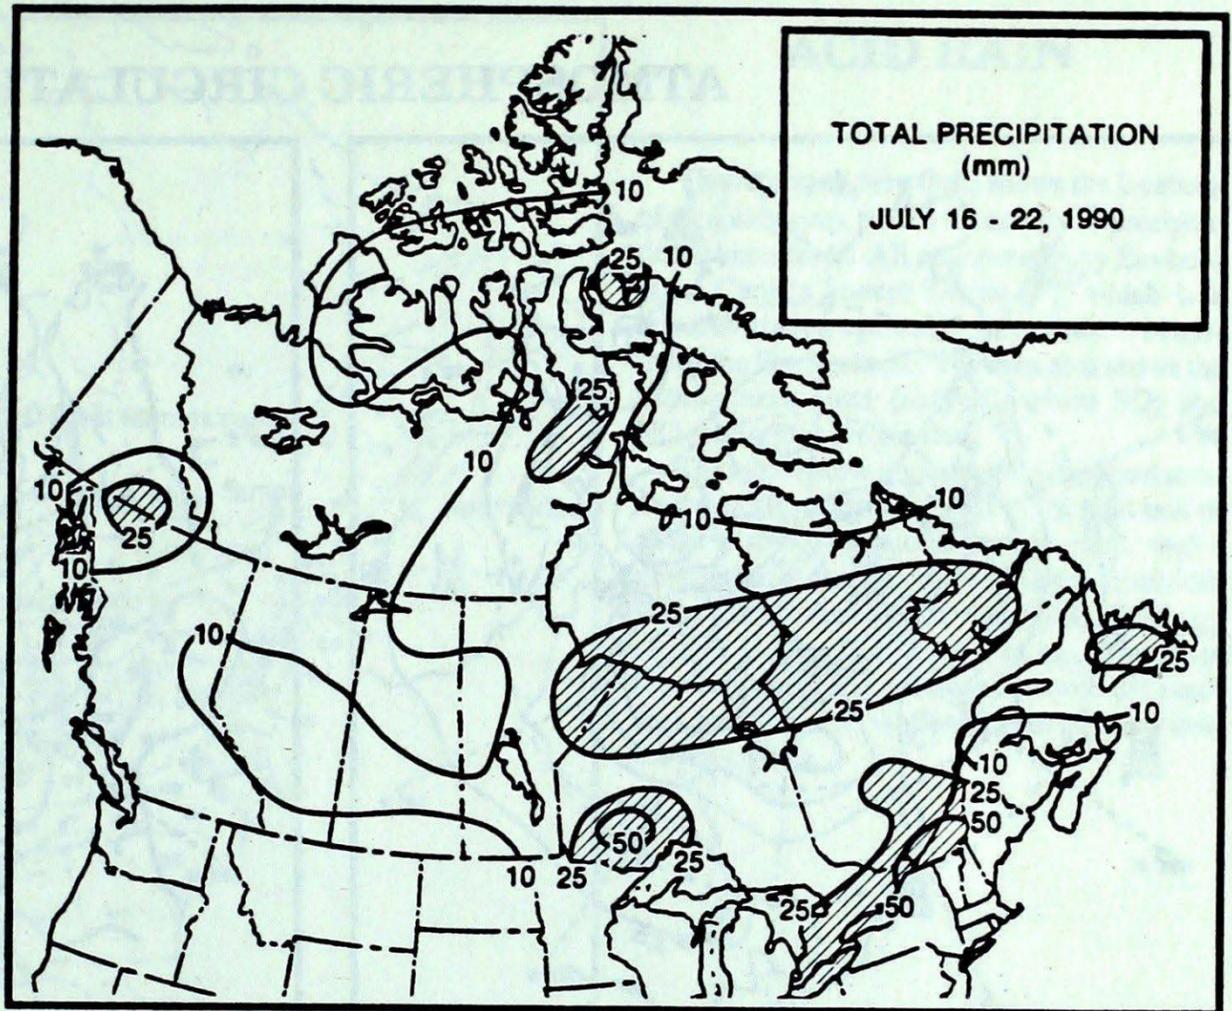

The data in this publication are based on unverified reports from approximately 225 Canadian synoptic weather stations. Information concerning climatic impacts is gathered from AES contacts with the public and from the media. Articles do not necessarily reflect the views of the Atmospheric Environment Service.

Annual Subscriptions

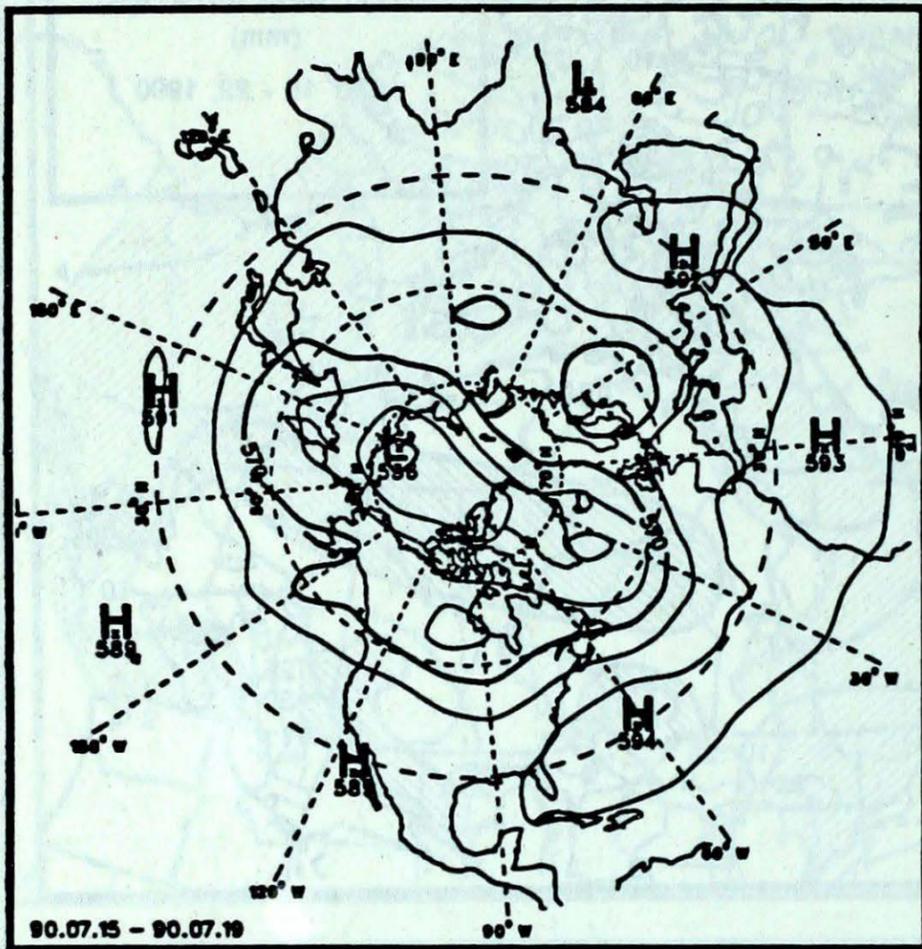

weekly and monthly : \$35.00
foreign: \$42.00
monthly issue: \$10.00
foreign: \$12.00

Orders must be prepaid by money order or cheque payable to Receiver General for Canada. Canadian Government Publishing Centre, Ottawa, Ontario, Canada K1A 0S9

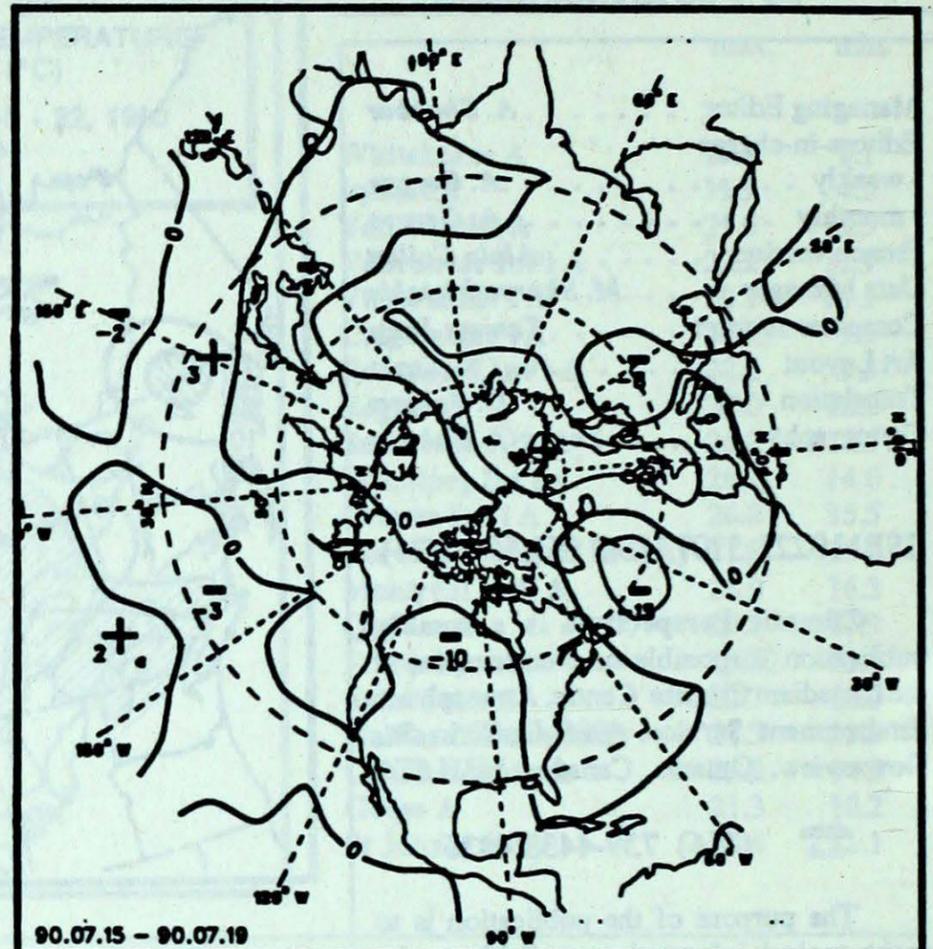

☎ (819) 997-2560

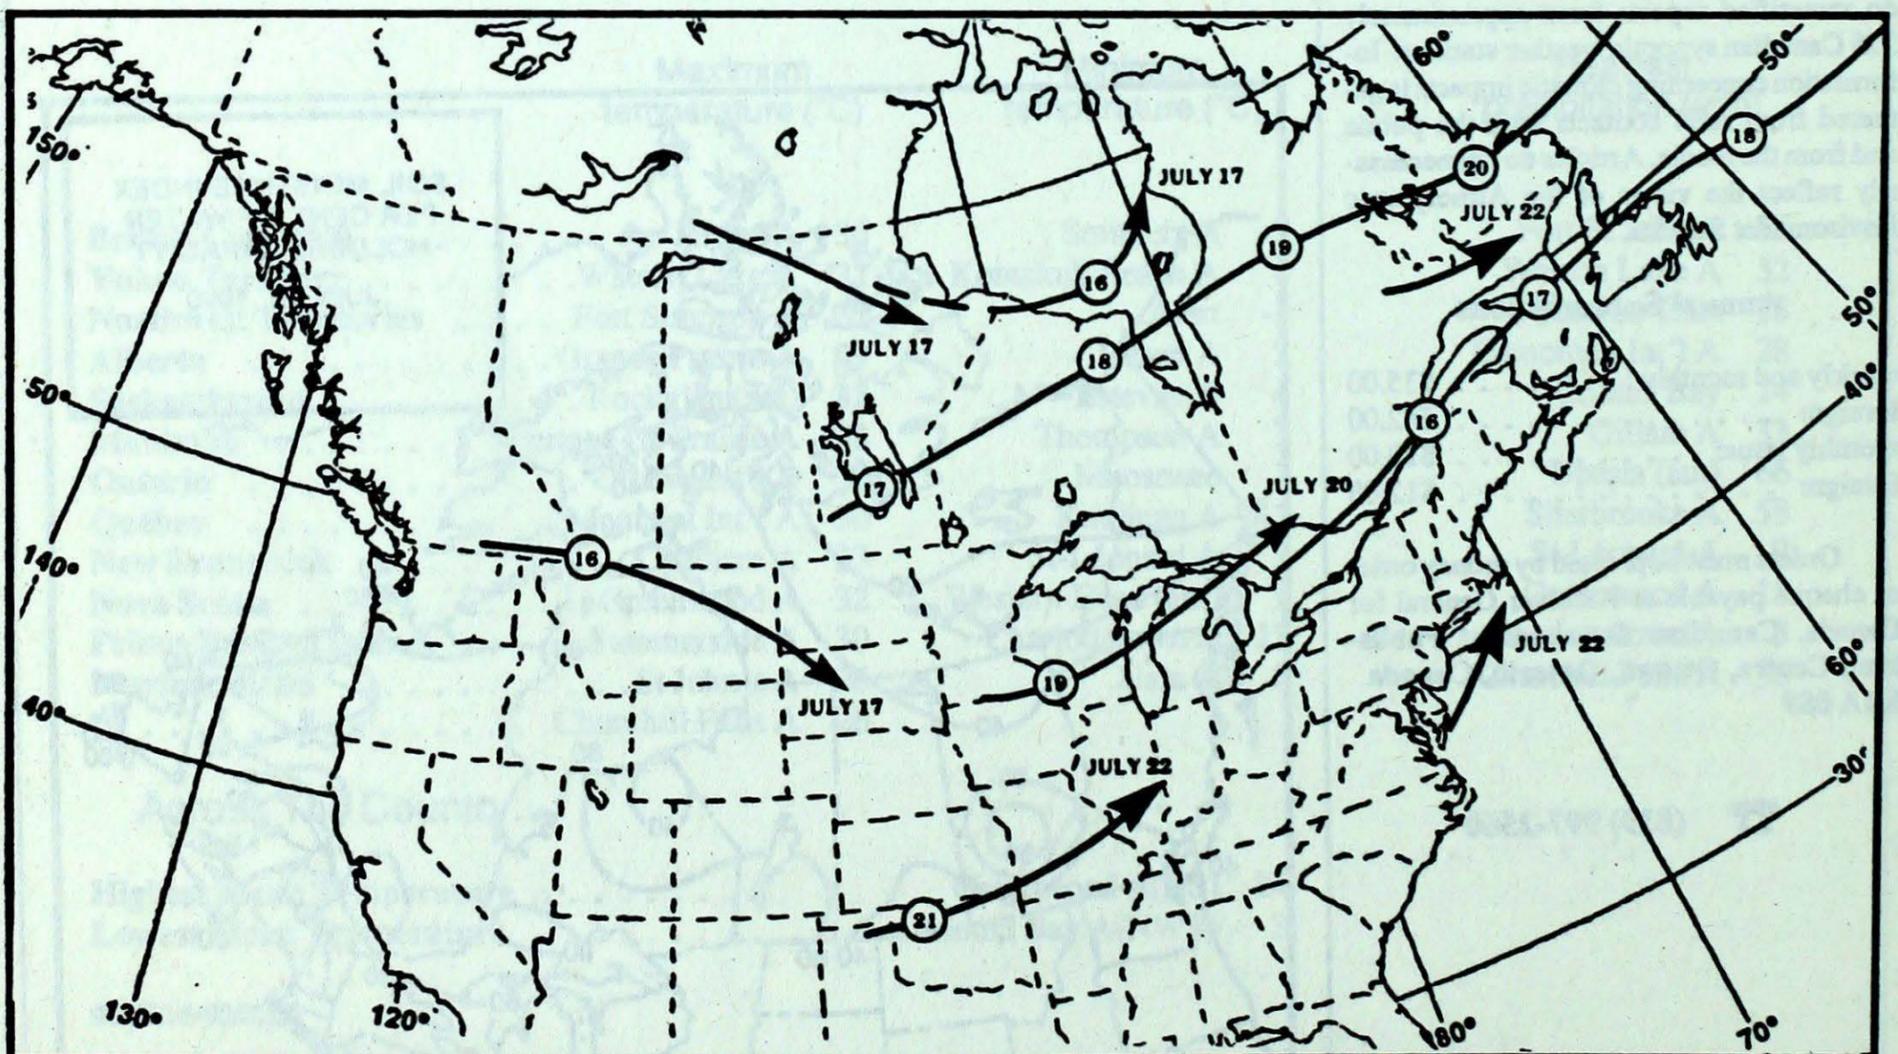

ATMOSPHERIC CIRCULATION

Mean geopotential height
50-kPa level (10 decametre intervals)

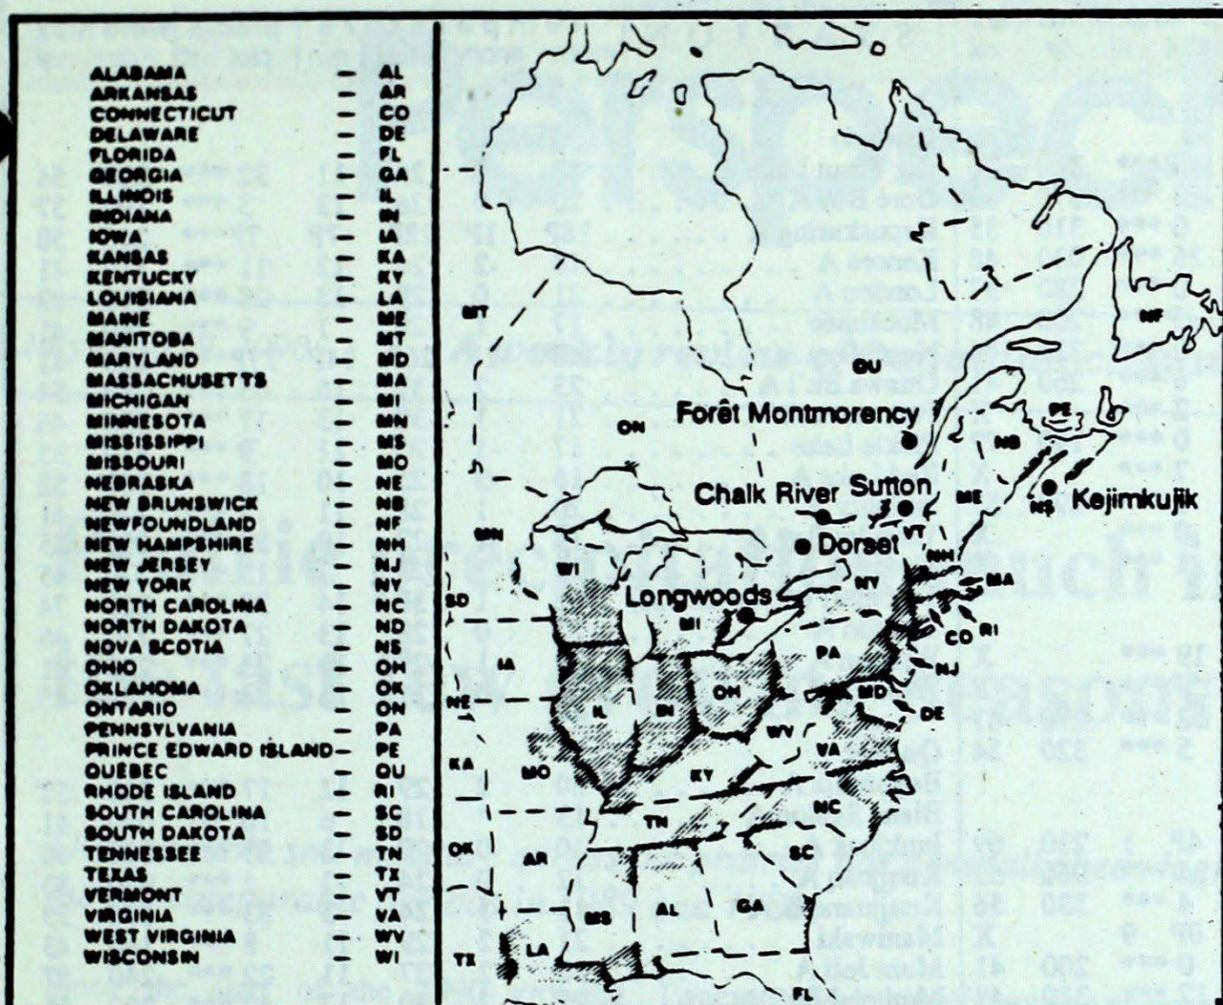

Mean geopotential height anomaly
50-kPa level (10 decametre intervals)

Tracks of low pressure centres at 12:00 U.T. each day during the period.

ACID RAIN

The reference map (left) shows the locations of sampling sites, where the acidity of precipitation is monitored. All are operated by Environment Canada except Dorset (*), which is a research station operated by the Ontario Ministry of the Environment. The map also shows the approximate areas (shaded), where SO₂ and NO_x emissions are greatest.

The table below gives the weekly report summarizing the acidity (or pH) of the acid rain or snow that fell at the collection sites, and a description of the path travelled by the moisture laden air. Environmental damage to lakes and streams is usually observed in sensitive areas regularly receiving precipitation with pH readings less than 4.7, while pH readings less than 4.0 are serious.

Site	day	pH	amount	air path to site	July 15 to 21, 1990
