

Climatic Perspectives

Snow follows completion of prairie harvest

Near ideal fall weather has advanced the western grain harvest to more than 95 percent complete by the end of September. This is well ahead of the five year average of just 66 percent complete in Alberta and 79 percent complete in Saskatchewan.

This week, the first significant snowfalls of the season blanketed parts of the country. In the Yukon, a number of locations reported fresh snowfalls, and record cold temperatures as low as -16°C. Higher elevations of central and northern B.C. had 15 to 20 centimetres of snow covering the ground, for the first time this season. In the south, highways above the 5,000 metre level were also covered with snow for a couple of days. Surprisingly, a good portion of the Northwest Territories missed out on the heavy snowfalls. The Great Slave Lake District recorded their first snowfall only this week.

On October 2, the first major snowstorm of the season dumped more than 28 cm of snow across parts of northern Saskatchewan, with the storm and accompanying snow moving eastwards into Manitoba the next day. It was much the same story in Alberta. This week Edmonton and Jasper received more than 10 and 30 centimetres of snow, respectively. Snowfalls of up to 20 centimetres blanketed the Edson and Peace River Districts, where luckily, harvesting is now essentially complete. By the end of the week, there was a solid cover of snow, 10 to 20 centimetres deep, from central Alberta, across central Saskatchewan into northern Manitoba.

Low water levels in Nova Scotia's reservoirs

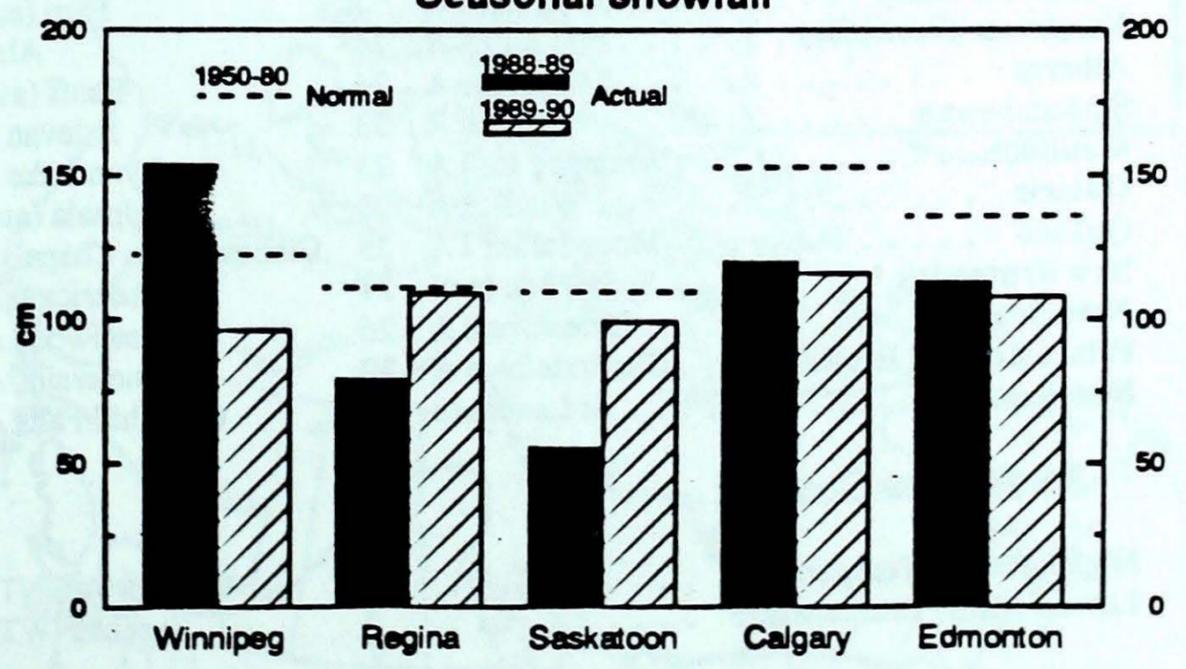

It has been a relatively dry summer in some parts of Nova Scotia. Truro for example, received 181.0 mm of rain during the June to August period, compared to a normal of 247.6 mm. This precipitation shortfall has not helped the water deficit situation in the province. Six water storage reservoirs in Nova Scotia are presently at only 48 percent of their full

rated capacity, while four other reservoirs in the province are at 54 percent capacity.

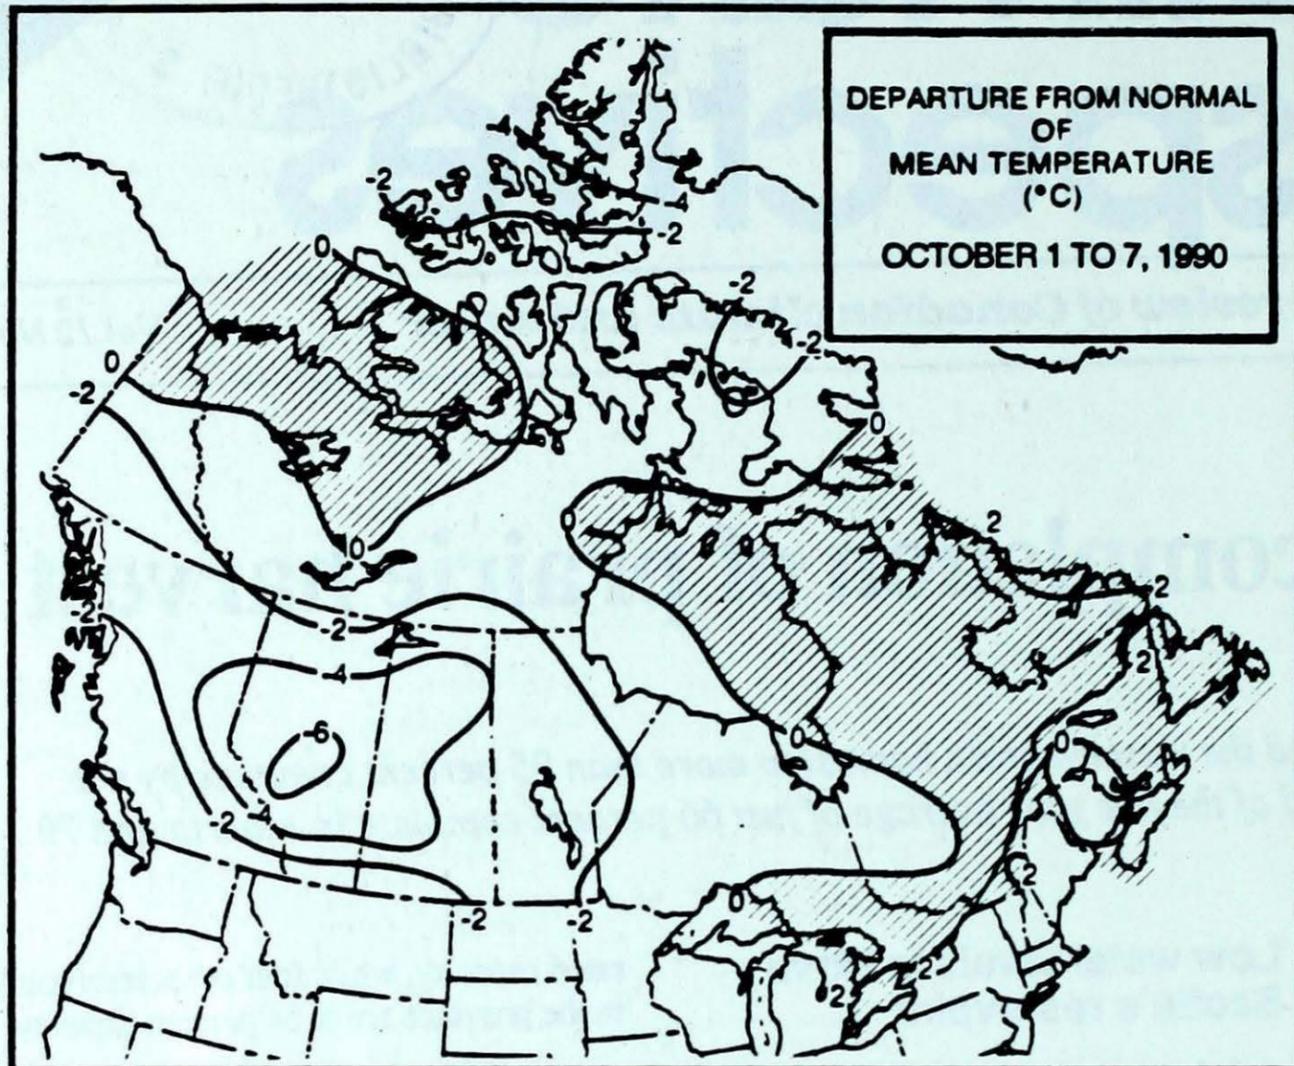

Unseasonably cold weather ahead...

A series of low pressure systems covering the country from the Yukon through the Prairies to Atlantic Canada will bring below normal temperatures throughout most of Canada for the week of October 15. Only extreme southern Ontario will experience near normal temperatures.

Seasonal snowfall

In the last two years, snowfalls on the Canadian Prairies have been, for the most part, below normal.

Climatic Perspectives is a weekly publication (disponible aussi en français) of the Canadian Climate Centre, Atmospheric Environment Service, 4905 Dufferin St., Downsview, Ontario, Canada M3H 5T4

☎ (416) 739-4438/4436

The purpose of the publication is to make topical information available to the public concerning the Canadian Climate and its socio-economic impact.

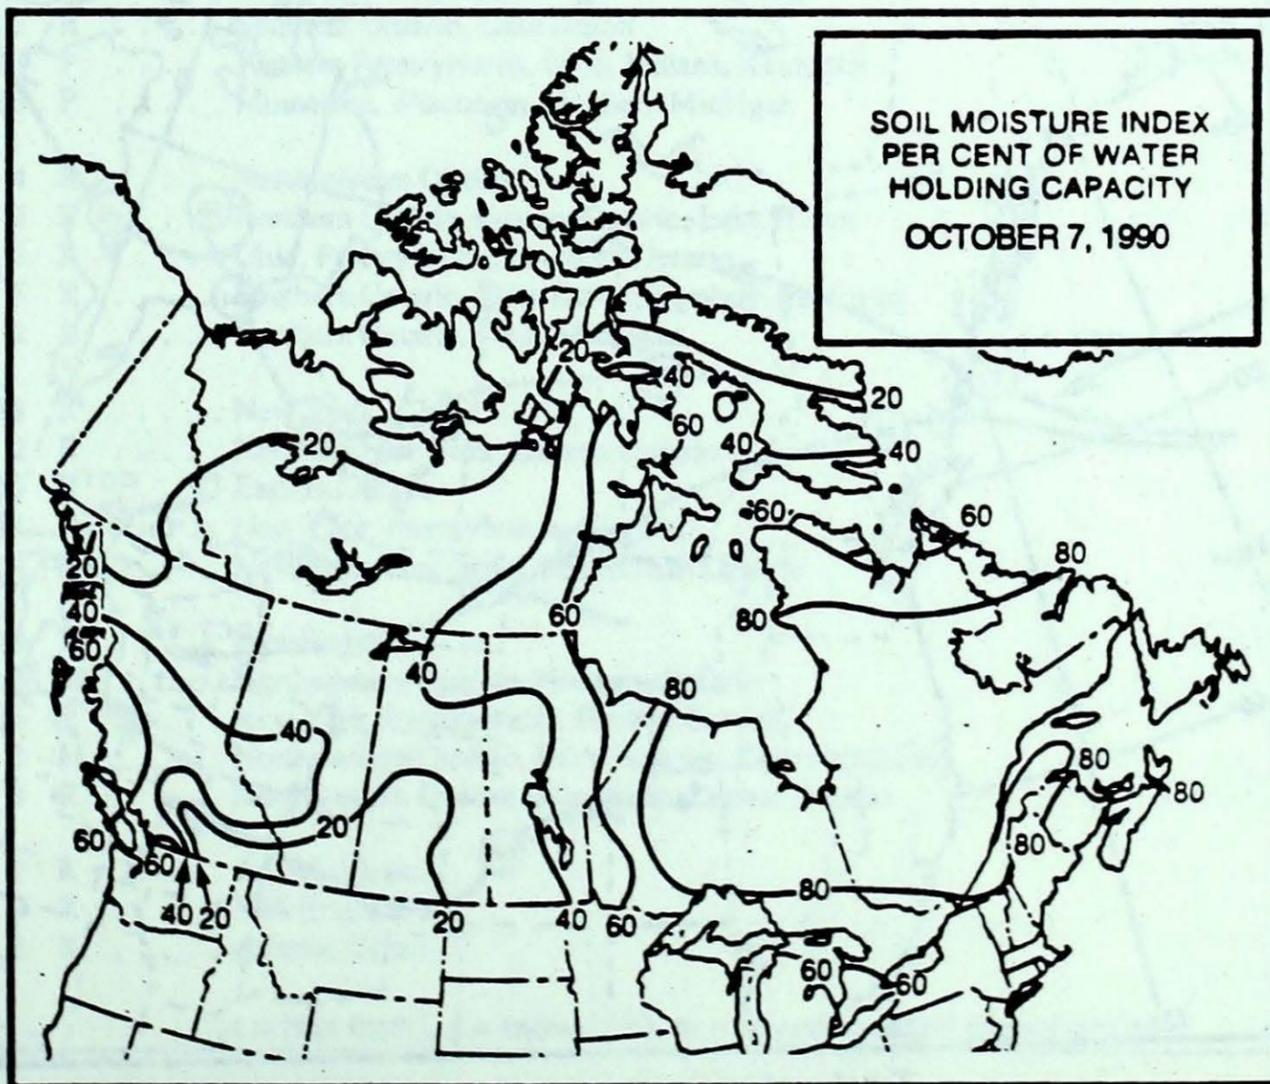

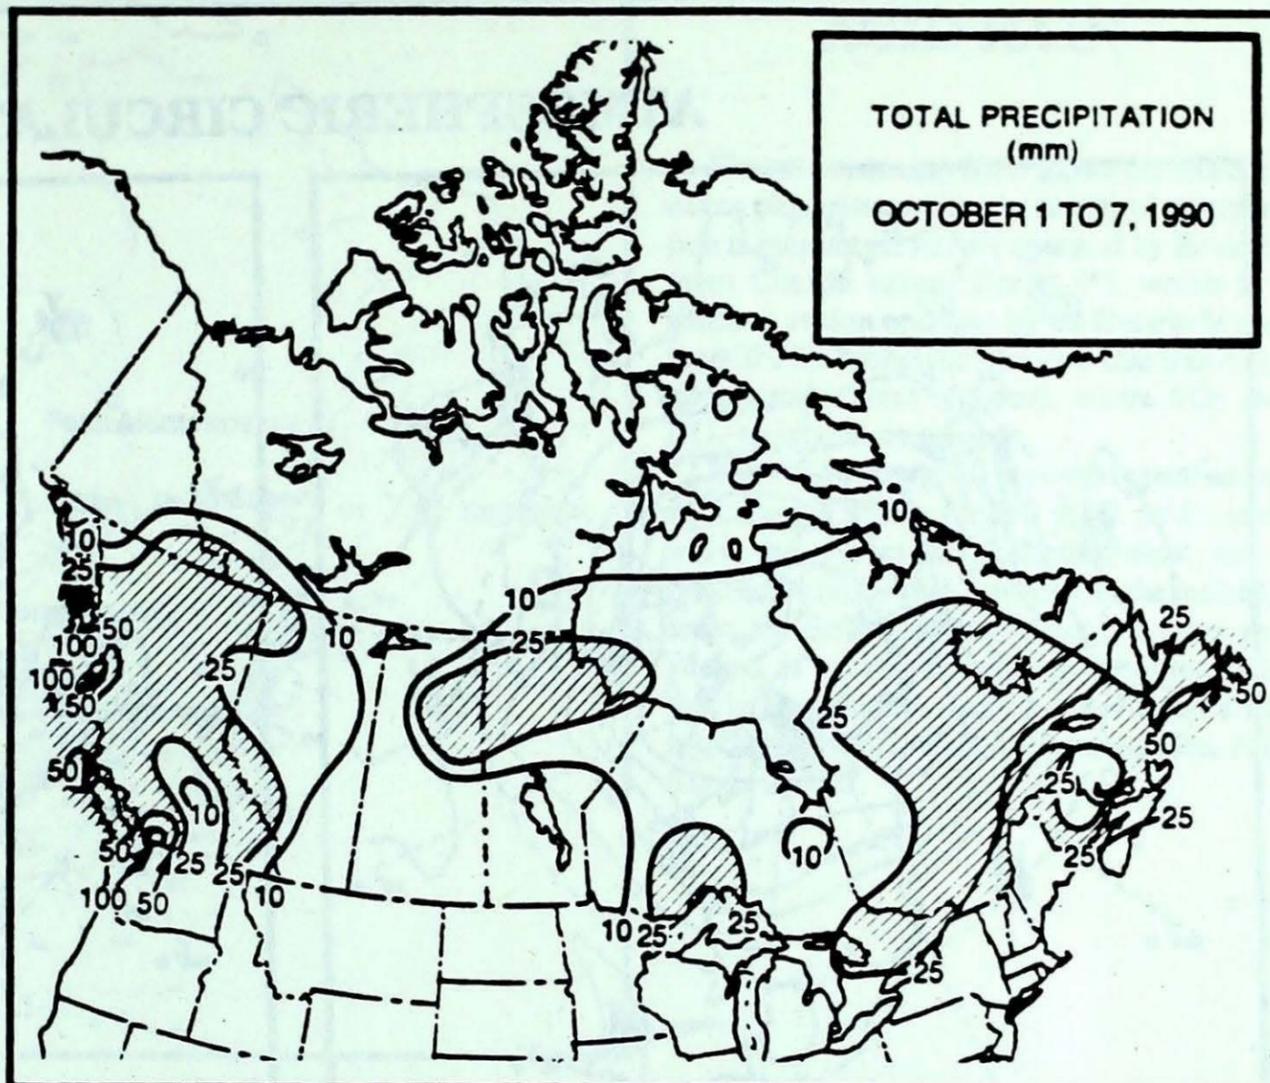

The data in this publication are based on unverified reports from approximately 225 Canadian synoptic weather stations. Information concerning climatic impacts is gathered from AES contacts with the public and from the media. Articles do not necessarily reflect the views of the Atmospheric Environment Service.

ATMOSPHERIC CIRCULATION

Mean geopotential height
50-kPa level (10-decametre intervals)

Mean geopotential height anomaly
50-kPa level (10-decametre intervals)

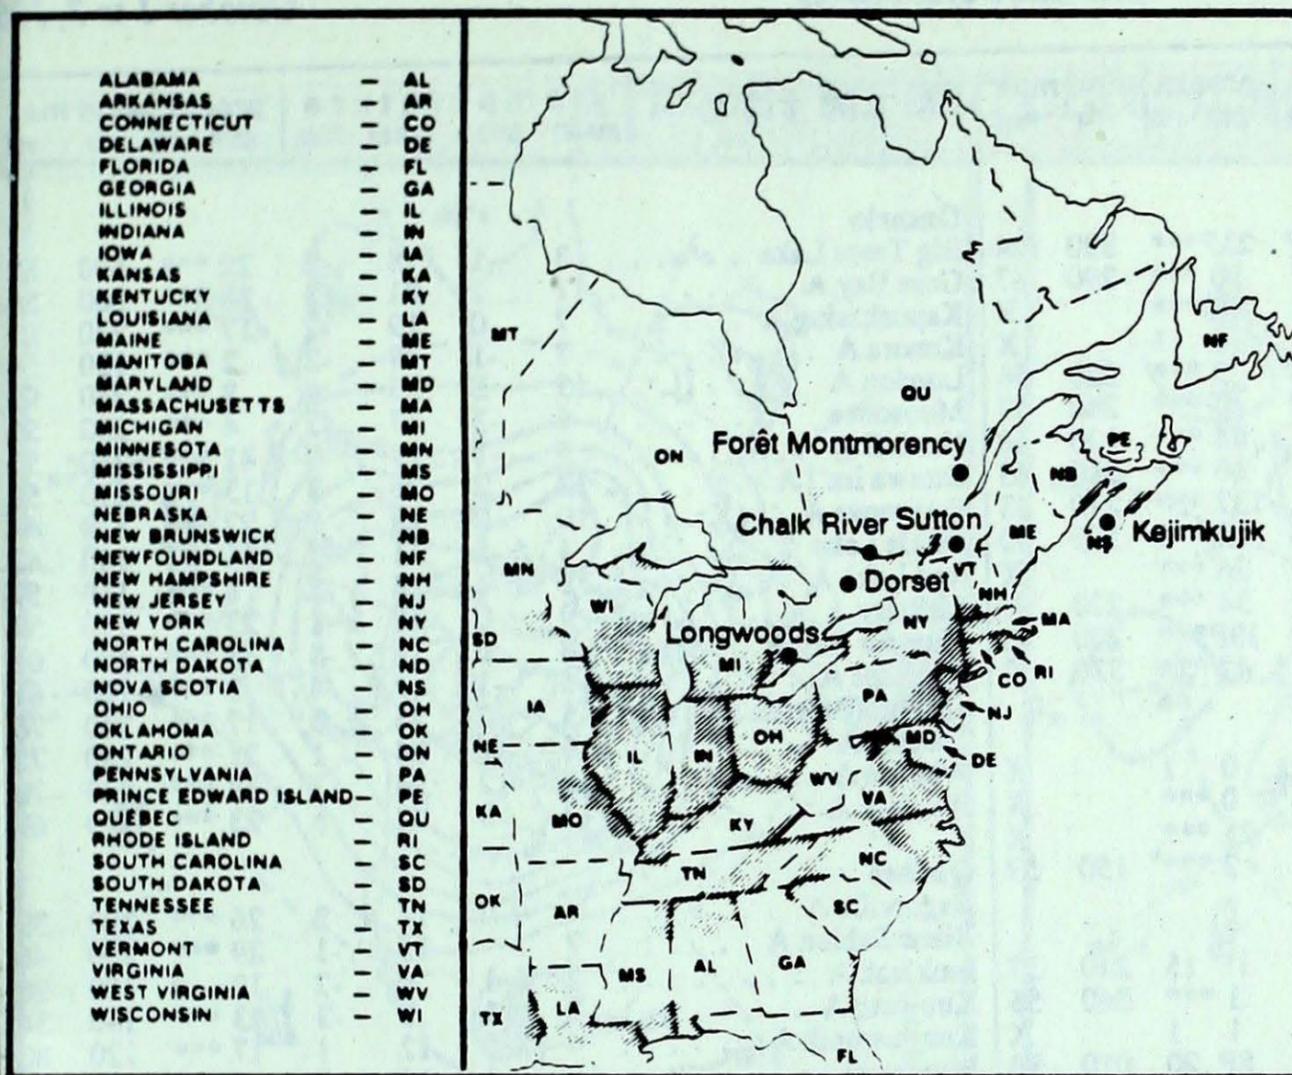

Tracks of low pressure centres at 12:00 U.T. each day during the period.

ACID RAIN

The reference map (left) shows the locations of sampling sites, where the acidity of precipitation is monitored. All are operated by Environment Canada except Dorset (*), which is a research station operated by the Ontario Ministry of the Environment. The map also shows the approximate areas (shaded), where SO₂ and NO_x emissions are greatest.

The table below gives the weekly report summarizing the acidity (or pH) of the acid rain or snow that fell at the collection sites, and a description of the path travelled by the moisture laden air. Environmental damage to lakes and streams is usually observed in sensitive areas regularly receiving precipitation with pH readings less than 4.7, while pH readings less than 4.0 are serious.

Site	day	pH	amount	air path to site	Sept. 30 to Oct. 6, 1990
