# Climatic Perspectives

A.E.S. LIBRARY  
SEP 11 1992  
BIBLIOTHEQUE S.E.A.

June 22 to 28, 1992

A weekly review of Canadian climate and water

Vol. 14 No. 26

## Good prospects for Arctic marine shipping

The outlook for Arctic marine operations this year is optimistic, thus far; however, in some parts of the Hudson Bay region the ice breakup is expected to occur one to two weeks later than normal. A very stable position of the Arctic vortex, over northern Baffin Island during last winter and spring, has been responsible for more than 22 consecutive weeks of below normal temperatures. Over the Ungava and Hudson Bay regions this cold weather regime has meant an above normal number of the freezing degree days and a greater than normal sea-ice thickness. In the High Arctic, and over the western Arctic, the number of freezing degree days and the ice conditions were generally close to normal.

The development of the open water passage, for Arctic commercial ships, depends on both the initial ice conditions, as well as the meteorological parameters; like temperature, winds and cloudiness. In the Hudson Bay and Ungava regions,

where thicker than normal ice developed this year, and with the long range forecast of below-normal temperatures for mid-June to mid-July, the ice breakup and clearing could occur about one to two weeks later than normal. However, this situation is not considered serious enough to alter commercial shipping schedules.

The first Arctic supply ship will leave Montréal on the second week of July, and pass by the open channels near the frozen Labrador coast, en route toward the Hudson and Ungava bay communities. Although the Arctic supply ships are heavily reinforced to be able to deal with ice and stormy weather, it is very likely that, at the beginning of the season, they will require the assistance of ice breakers.

It is too early to assess the shipping situation in more northerly parts of the Arctic. In both Baffin Bay and Davis Strait, the present ice pack consists of closely concentrated thick and medium first year ice, with a trace of old ice; however, breakup is progressing ahead of schedule in northwestern Baffin Bay and

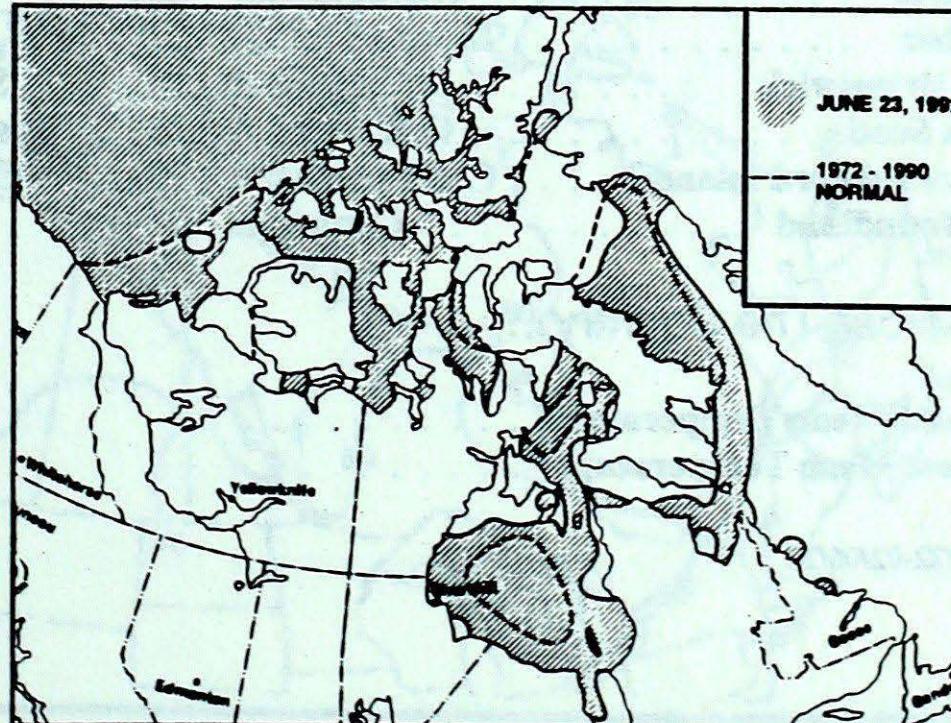

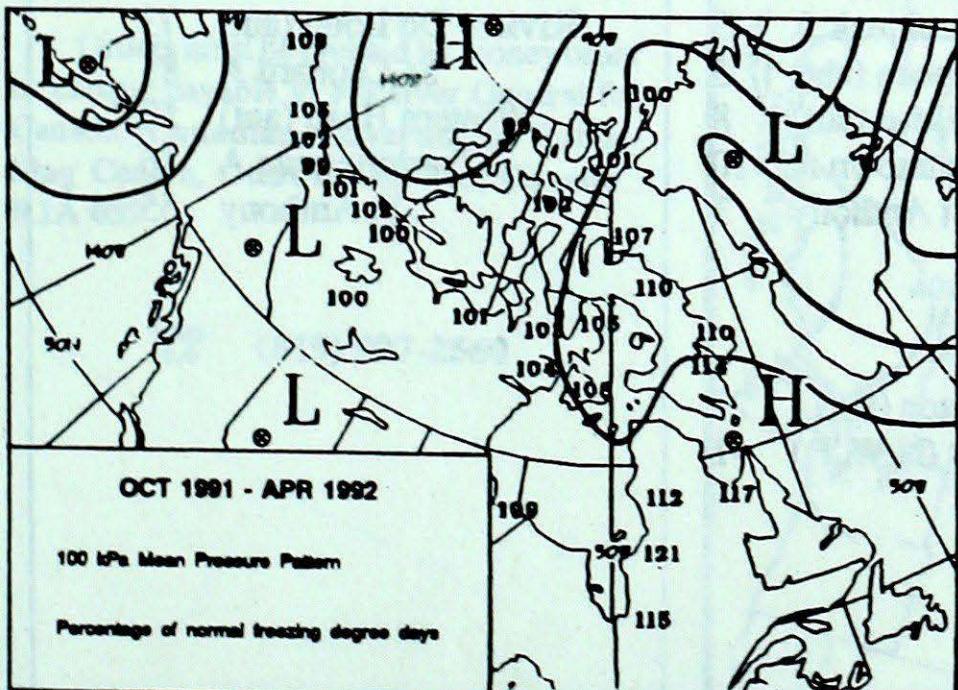

in Lancaster Sound, improving prospects for resupplying settlements and mining communities. Even though southern Beaufort Sea remains covered with close pack, thick, first year ice, the breakup is forecasted to occur in near-normal time.

The ships going along the western Alaska coast, at the beginning of the marine season, could require the assistance of ice-breakers, but in general, the outlook for the Arctic marine operations looks normal. As the season progresses, the temperature, cloud and wind conditions will determine the extent to which the sea-ice will affect the marine traffic.

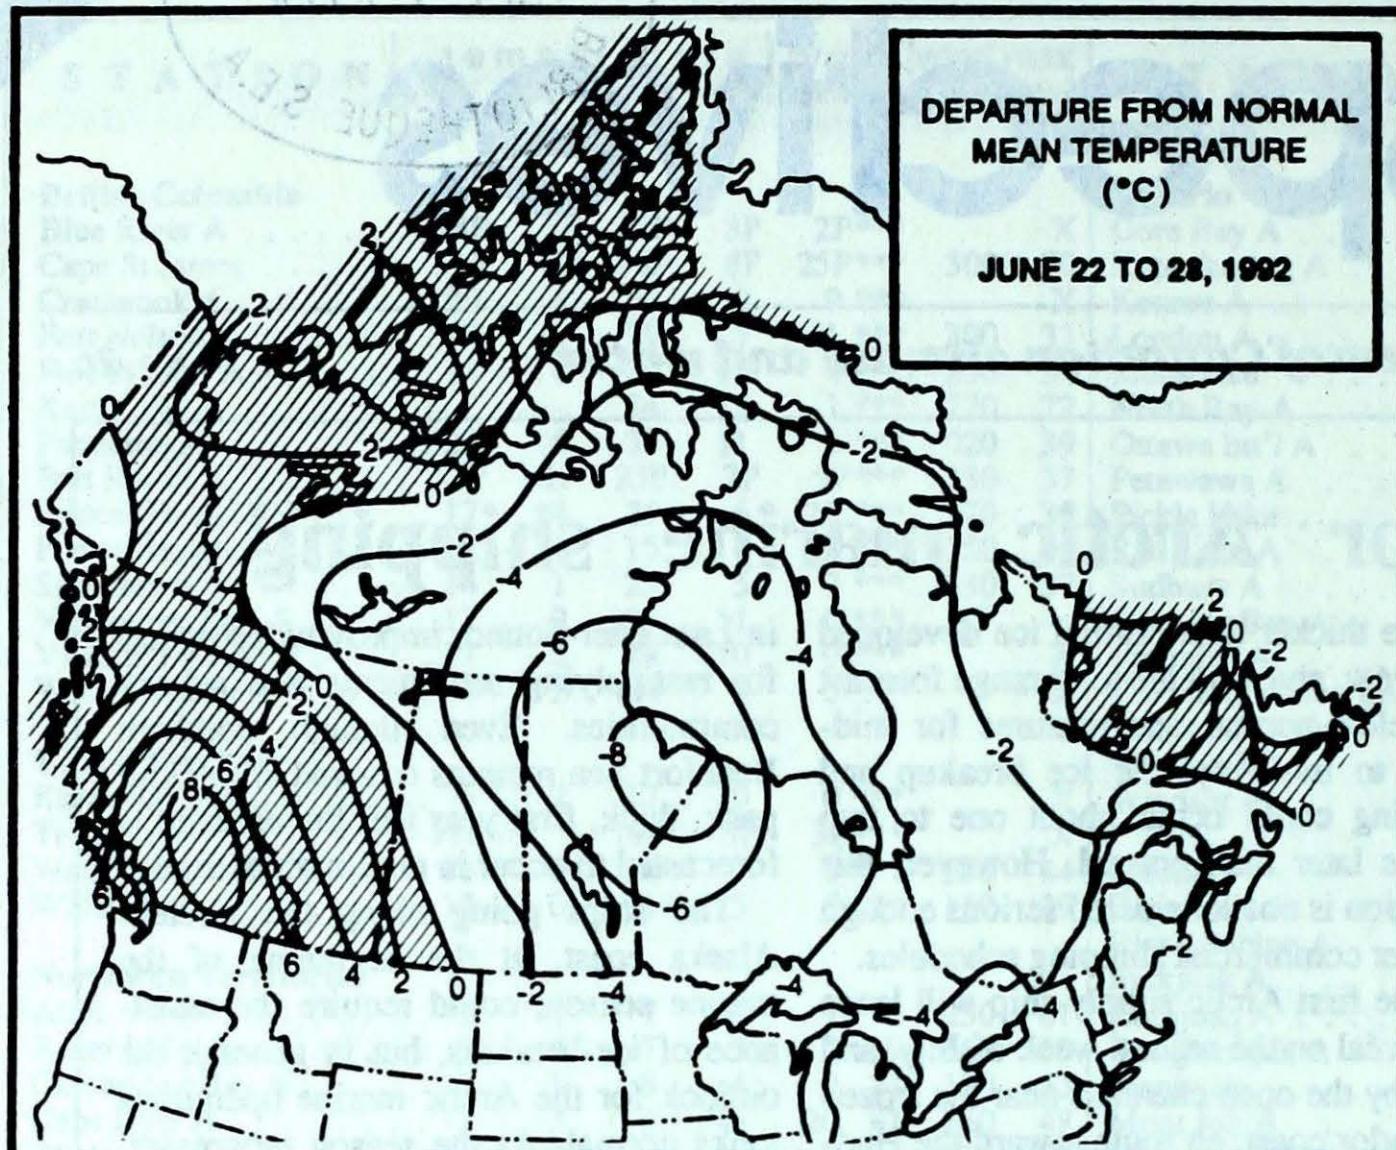

### A look ahead...

For the week of July 6, a broad ridge of high pressure over western Canada will combine with a centre of low pressure over the Great Lakes to give, generally, above normal temperatures to the provinces west of Saskatchewan and below normal readings to Saskatchewan and all regions eastward.

**Climatic Perspectives** is a weekly publication (disponible aussi en français) of the Canadian Climate Centre, Atmospheric Environment Service, 4905 Dufferin St., Downsview, Ontario, Canada M3H 5T4

**Telephone** (416) 739-4438/4436

The purpose of the publication is to make topical information available to the public concerning the Canadian Climate and its socio-economic impact.

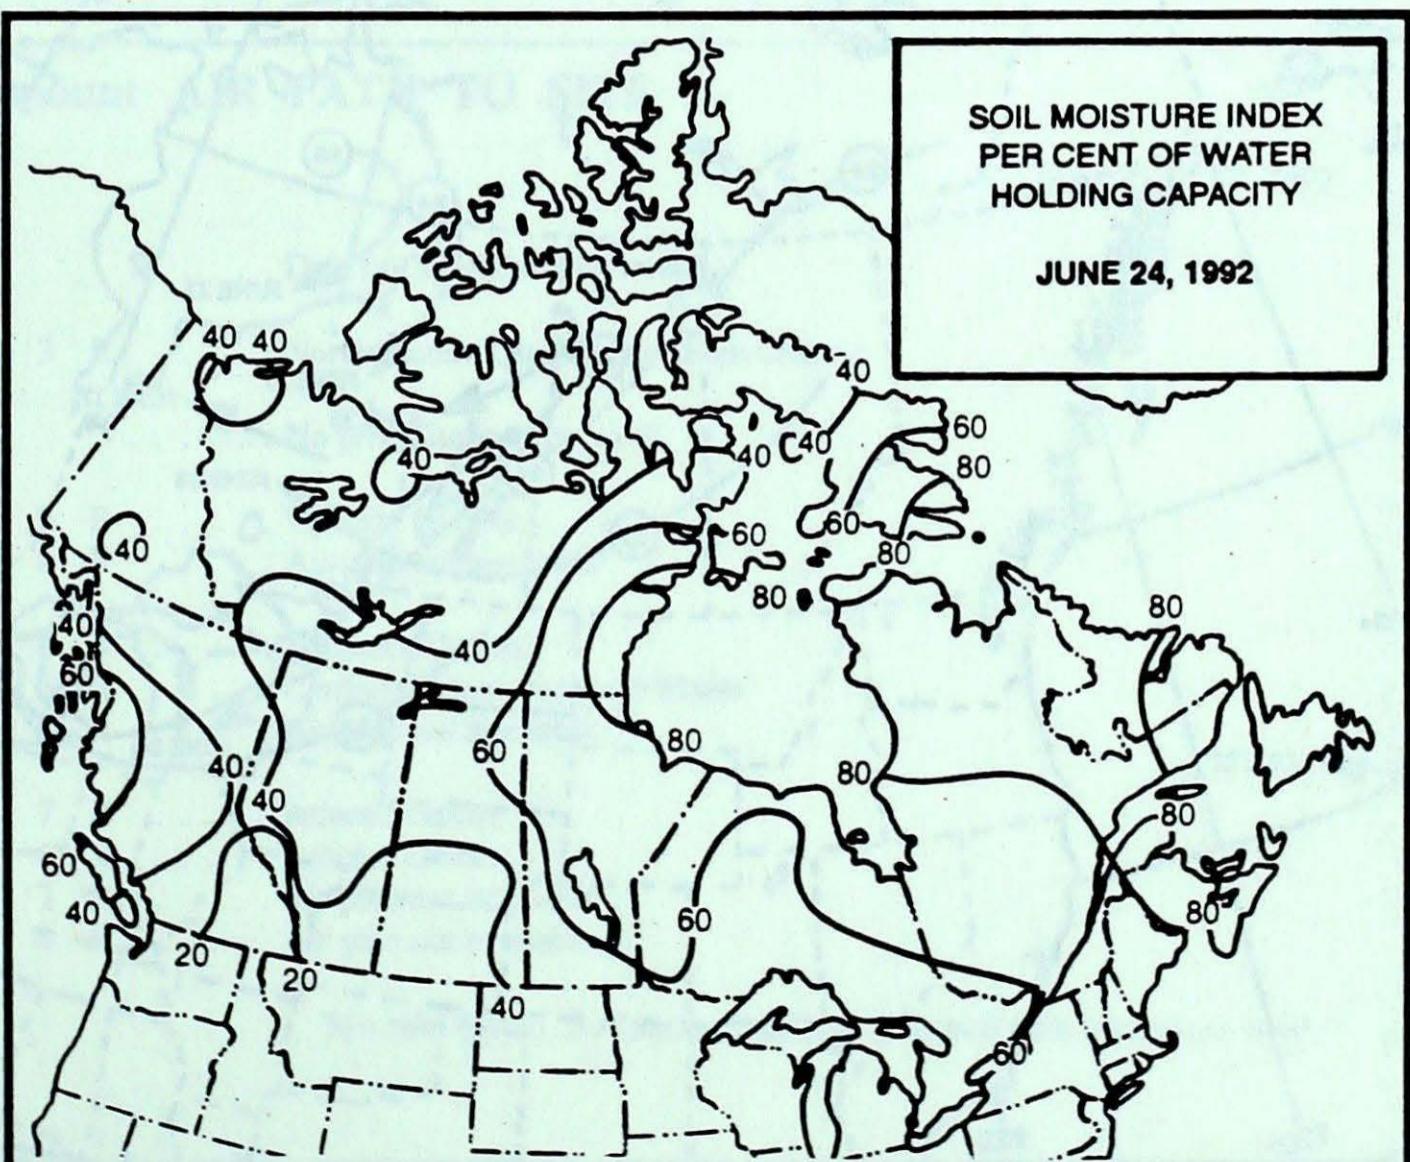

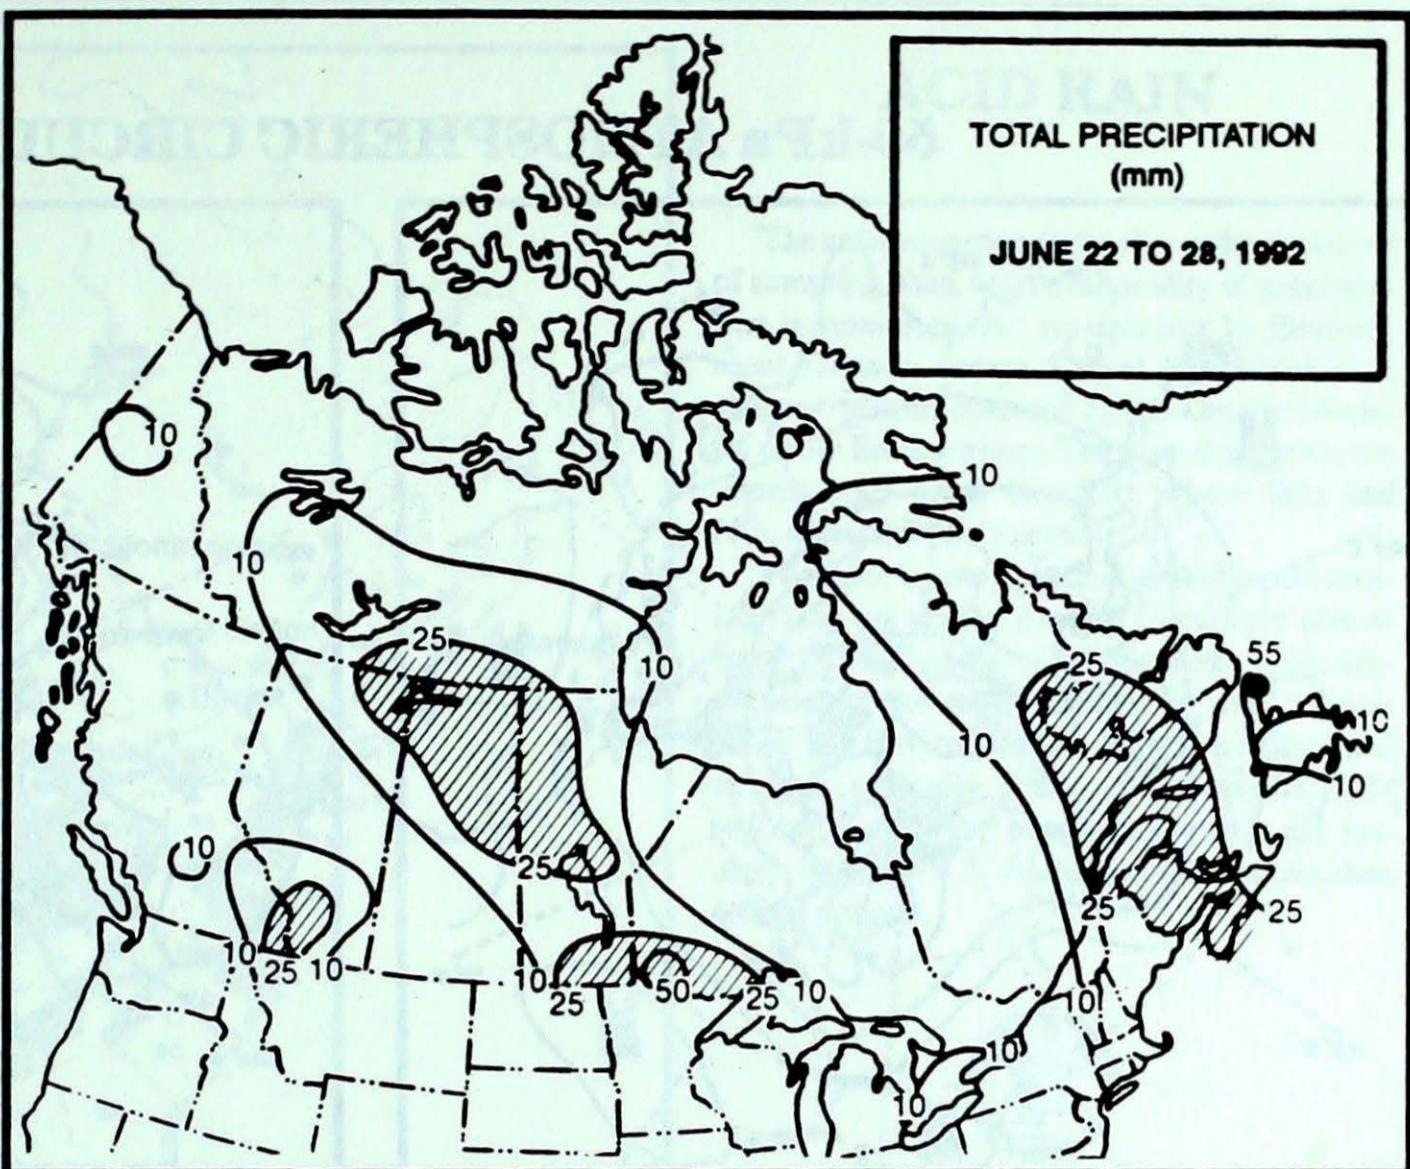

The data in this publication are based on unverified reports from approximately 225 Canadian synoptic weather stations. Information concerning climatic impacts is gathered from AES contacts with the public and from the media. Articles do not necessarily reflect the views of the Atmospheric Environment Service.

**Annual Subscriptions**

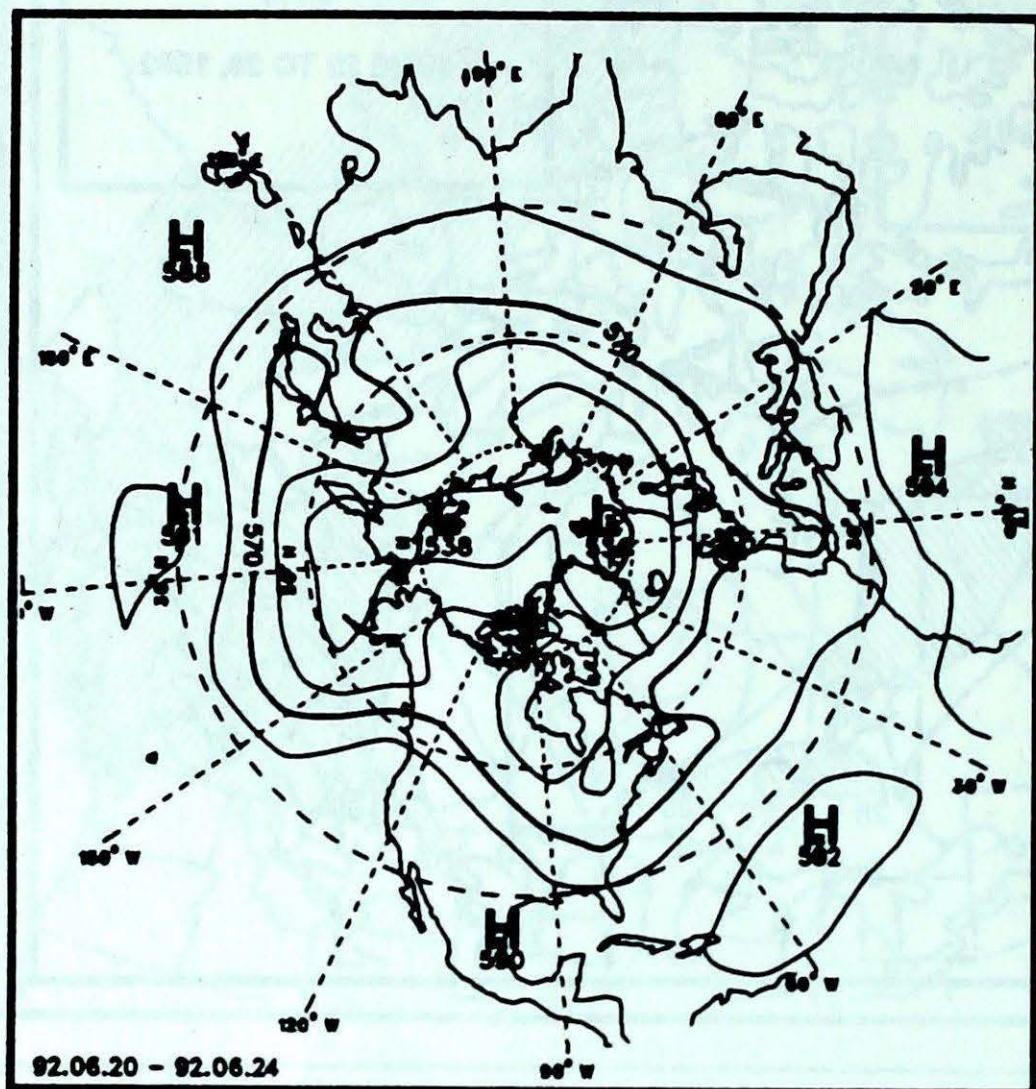

weekly and monthly:	..... \$35.00
foreign:	..... \$42.00
monthly issue:	..... \$10.00
foreign:	..... \$12.00

Orders must be prepaid by money order or cheque payable to Receiver General for Canada. **Canadian Government Publishing Centre, Ottawa, Ontario, Canada K1A 0S9**

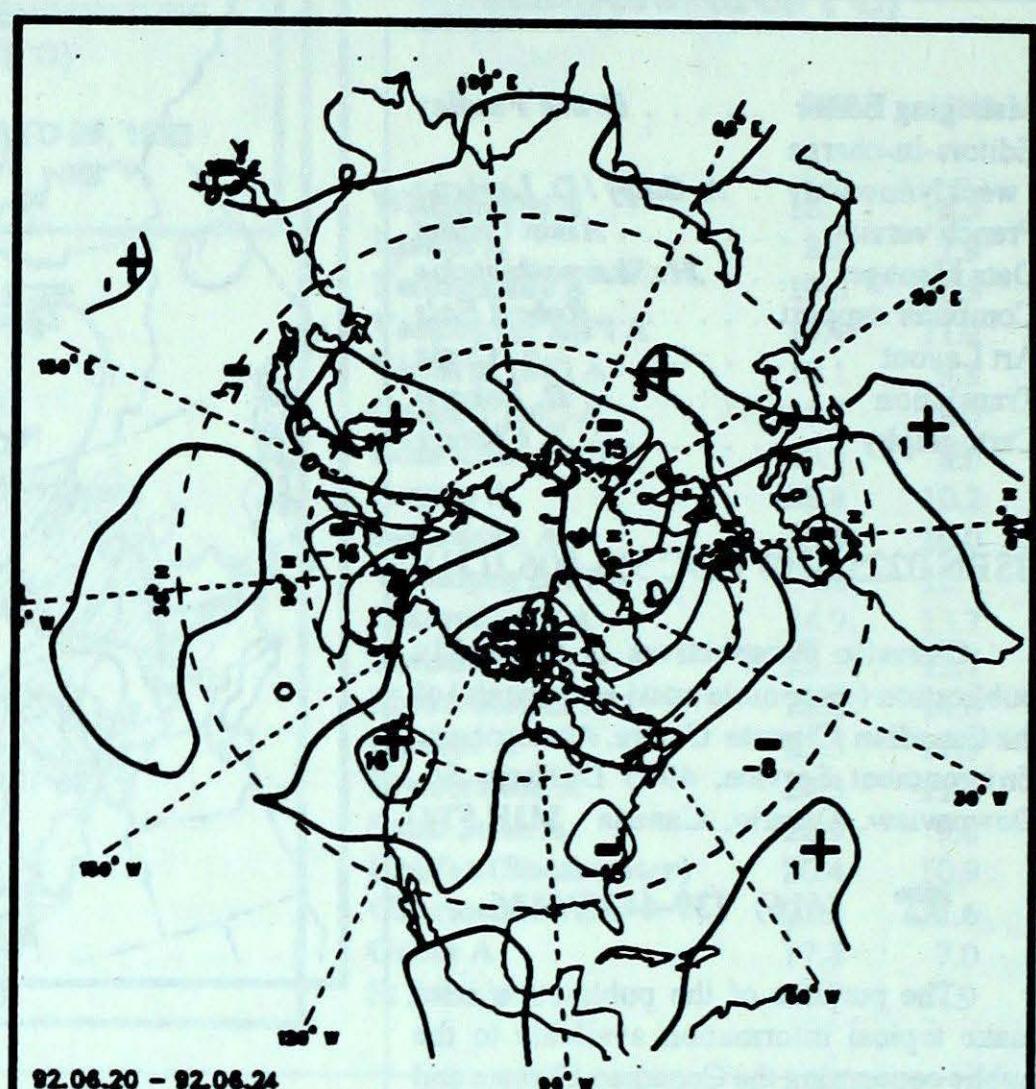

**Telephone** (819) 997-2560

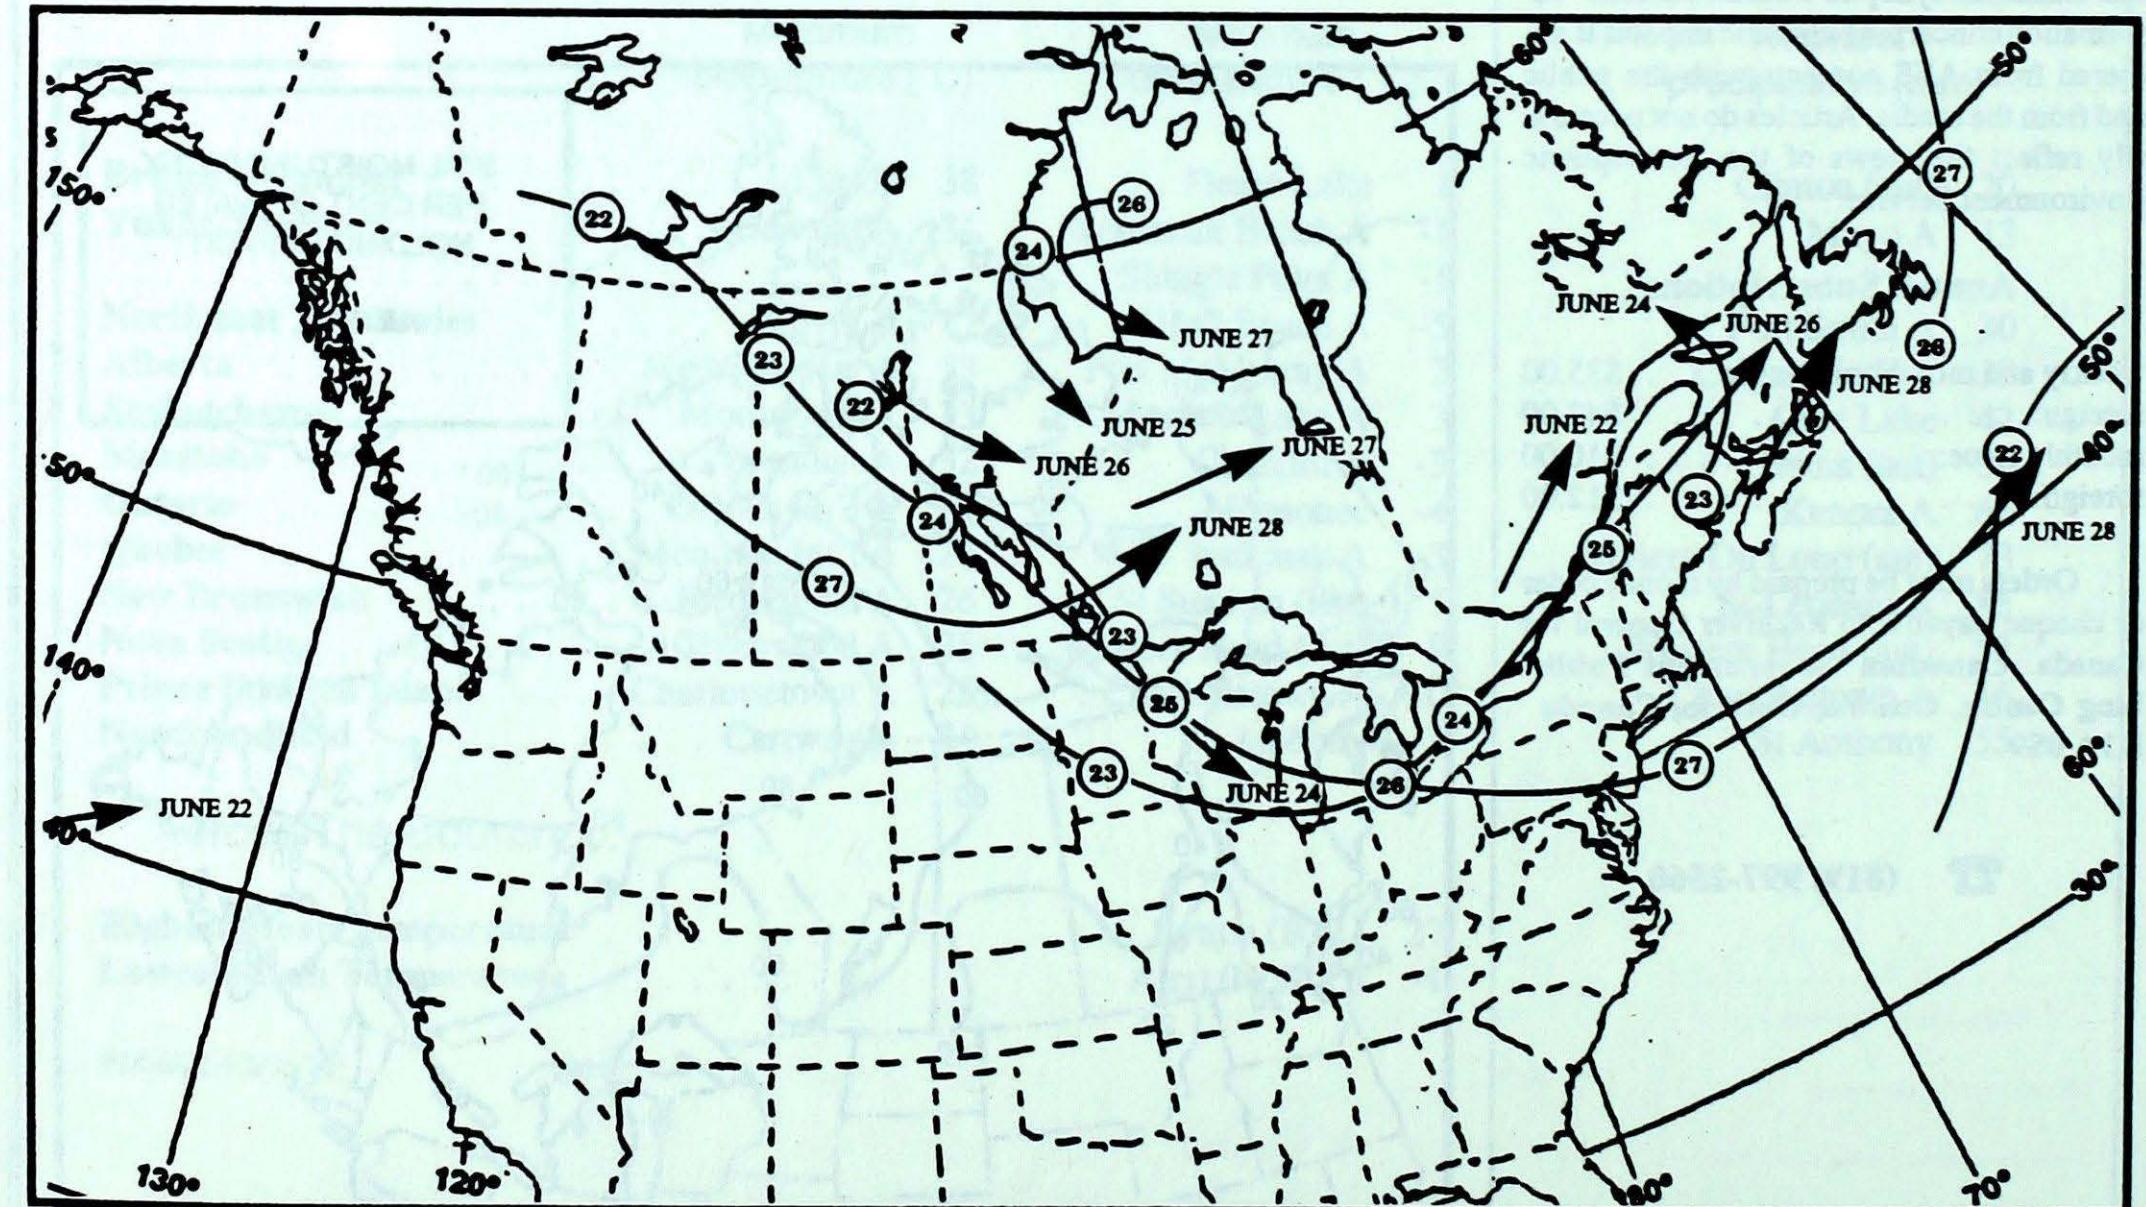

## 50-kPa ATMOSPHERIC CIRCULATION

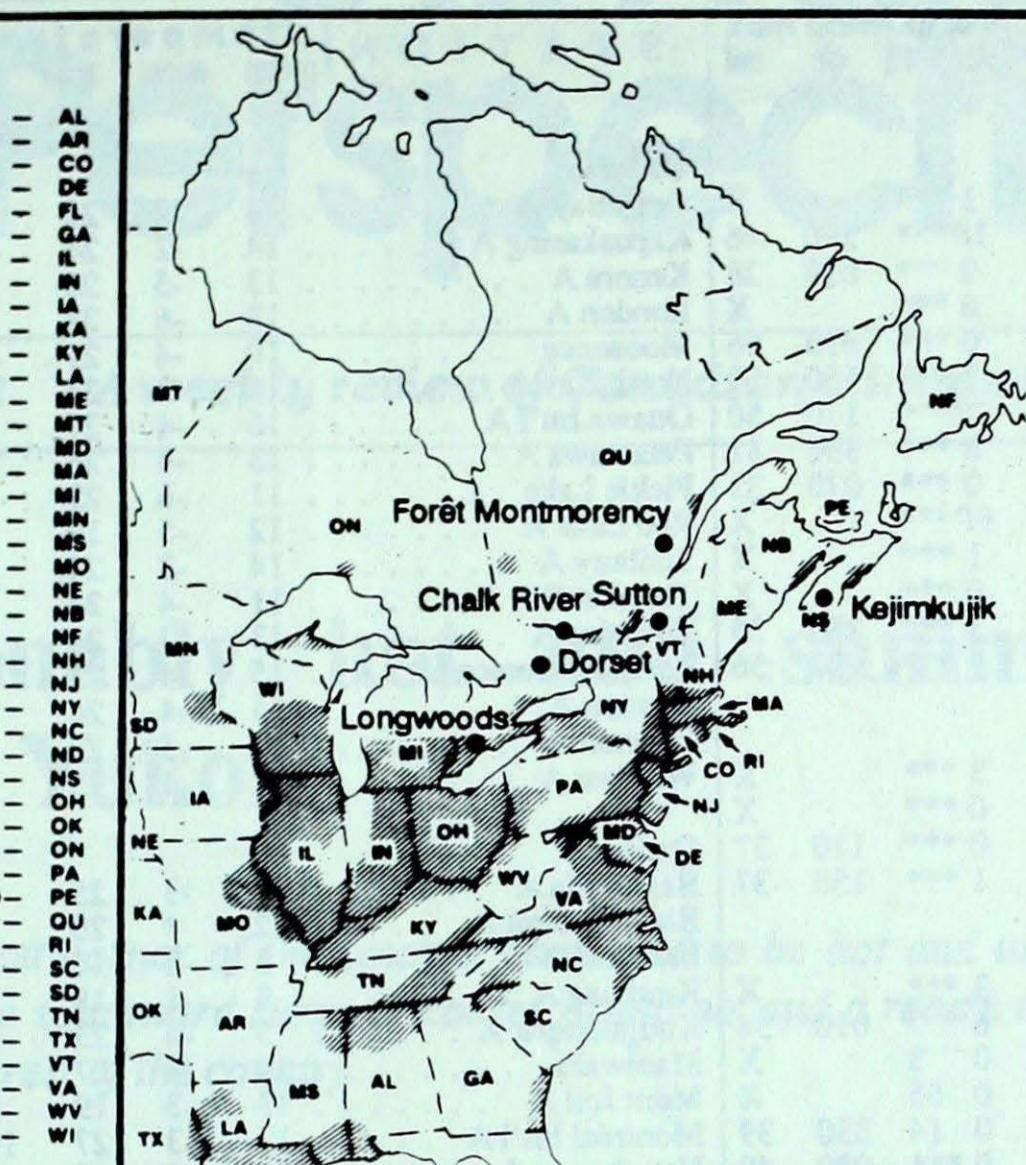

Mean geopotential height  
50-kPa level (10 decametre intervals)

Mean geopotential height anomaly  
50-kPa level (10 decametre intervals)

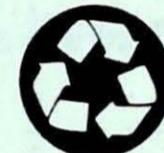

Tracks of low pressure centres at 12:00 U.T. each day during the period.

## ACID RAIN

The reference map (left) shows the locations of sampling sites, where the acidity of precipitation is monitored. All are operated by Environment Canada except Dorset (\*), which is a research station operated by the Ontario Ministry of the Environment. The map also shows the approximate areas (shaded), where SO<sub>2</sub> and NO<sub>x</sub> emissions are greatest.

The table below gives the weekly report summarizing the acidity (or pH) of the acid rain or snow that fell at the collection sites, and a description of the path travelled by the moisture laden air. Environmental damage to lakes and streams is usually observed in sensitive areas regularly receiving precipitation with pH readings less than 4.7, while pH readings less than 4.0 are serious.
