April 12 to 18, 1993

A weekly review of Canadian climate and water

Vol. 15 No. 16

Spring's fickle weather

Just when it seemed safe to put away the winter clothes and snow shovels, winter came back to some parts of the country, as a cold Arctic air mass pushed southwards once again.

In Alberta, thunder was heard in a number of places during the first two days of the period. The thundershowers developed as daytime highs climbed into the mid-teens. The weather over the weekend was a much different story. A developing storm over the northwestern States spread moisture northwards over the Prairies. The interaction of cold air pushing southwards from the Territories produced bands of snow across central Alberta, northern Saskatchewan and central Manitoba. By Sunday morning Drayton Valley, Alta., reported 25 cm of snow, while Edmonton received 10 cm of the wet stuff.

A vigorous low pressure system tracked northeastwards out of the American mid-west on April 16, dumping between 5 and 20 centimetres of snow across northern Ontario. Almost 30 cm of the white stuff fell in northeastern Ontario, while the southern portions of the province escaped with only snow flurries. A flood alert was issued for the Sault Ste. Marie, Sudbury and Ottawa Valley regions, where as much as 30 mm of rain was forecast. In contrast, prior to this cold outbreak, thunderstorms rolled across the southern portions of the province on April 15, accompanying a warm front, which saw the temperature at St. Catharines rise from 7°C at 9 pm to 22°C by 10 pm Thursday evening.

Flood alert continues In New Brunswick

Although floodwater subsided somewhat, from last week, rain and rapid snowmelt due to this week's warmer temperatures have caused water levels in the Saint John River Basin to start climbing once again. Large volumes of water, flowing downstream, filled low lying areas of the lower Saint John River Basin. As such, water levels for the next few days will be sensitive to any precipitation, and will react quickly to additional rainfalls. Regions of concern are Fredericton, Maugerville, Jemseg, Oak Point and the Indiantown areas.

Elsewhere...

In the Yukon, mainly cloudy skies, light showers and flurries gave way to clearing skies for the weekend. Maximum temperatures climbed to the mid-teens in the southern and central portions of the Territory. In the Mackenzie Valley, it was a mostly sunny and mild week. Most winter ice roads north of Yellowknife, and the ice bridge at Fort Providence have closed. Baffin Island saw a fair amount of sunshine during the first half of the week, but cloudy skies and snow moved in thereafter.

Passing disturbances resulted in an unsettled, but mild week across British Columbia. Sunny breaks were interspersed by frequent showers as a moist, unstable air mass dominated. Strong southeast winds

off the coast kept commercial halibut fishermen close to shore, after one boat sank off Cape Scott in 5-metre swells last week. Some fruit tree varieties such as apricots are blooming in the Okanagan.

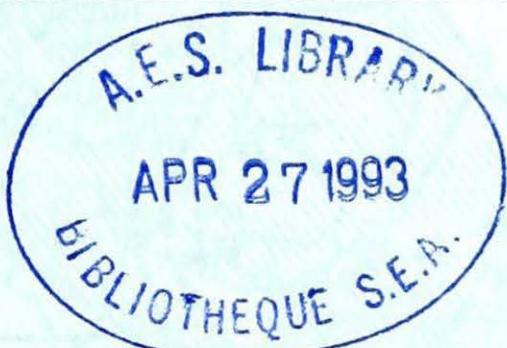

The Maritimes remained mild, although skies were mainly cloudy, producing a mixture of light rain and snow. Accumulations of up to 10 cm were reported in New Brunswick and the Gaspé.

In Newfoundland, last week's sunny and mild weather came to an end. A series of disturbances tracking southeast of the Avalon Peninsula gave unseasonable weather conditions and as much as 25 cm of snow. A cool, northeasterly flow brought freezing precipitation to the eastern portion of the Island.

A cold front swept across Labrador. However, some communities in the southeast still managed to set new record high daytime temperatures, in the double digits, early in the period. Some snow was reported.

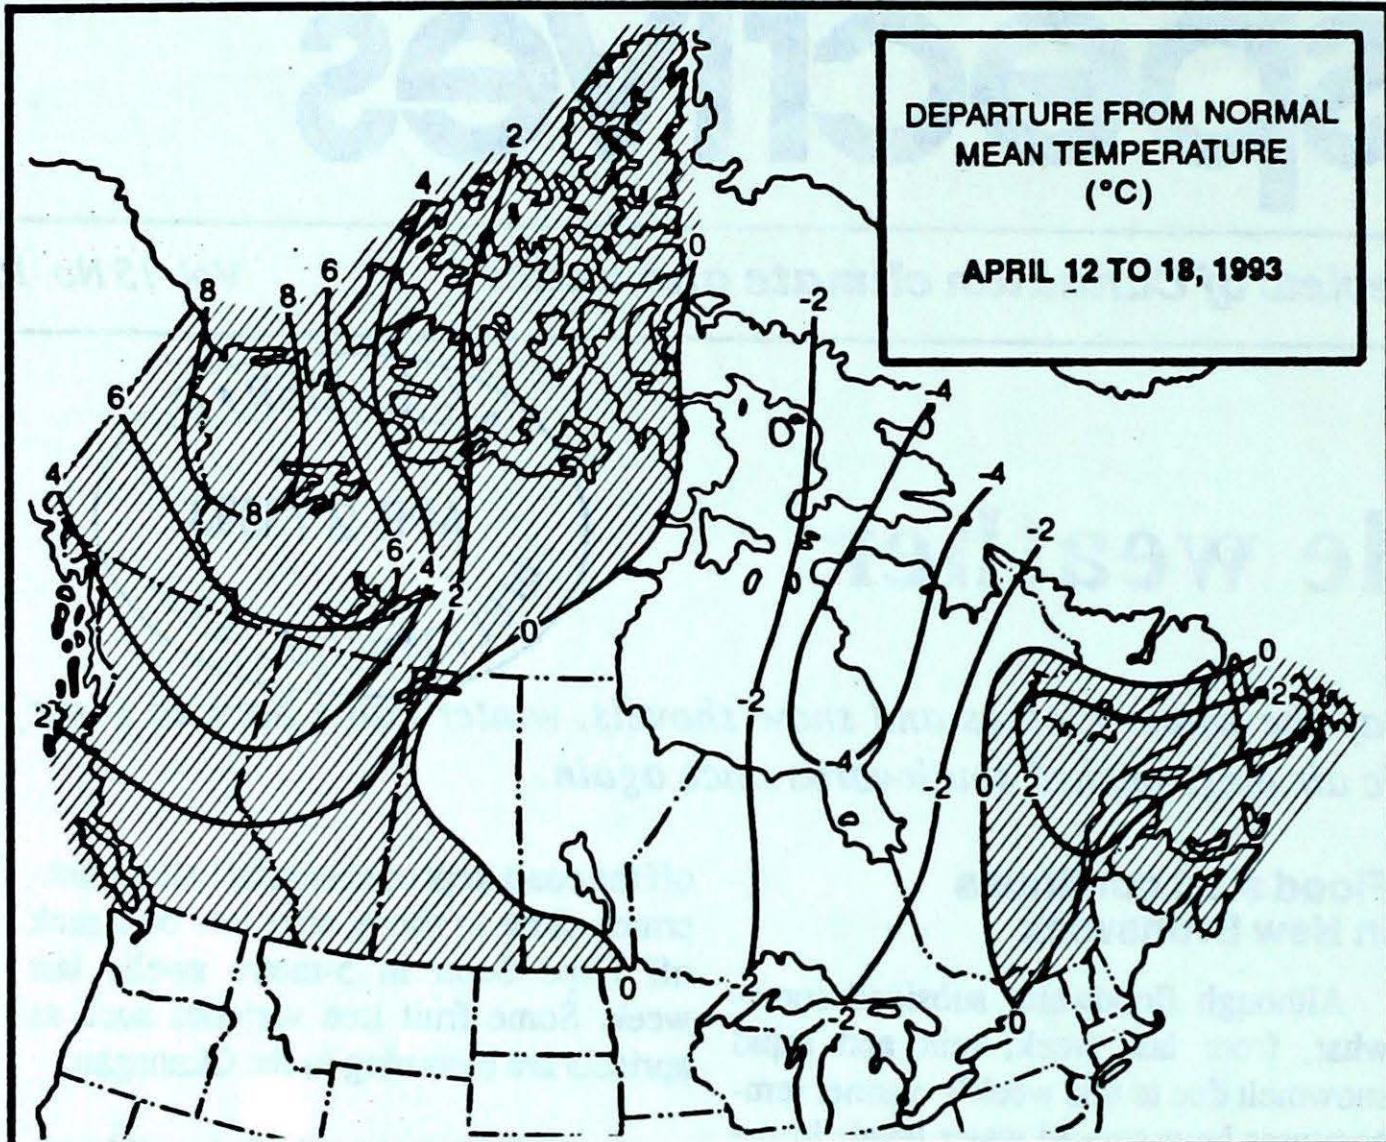

A Look Ahead...

For the week of April 26, below-normal temperatures are expected for most of the country, except near to above-normal temperatures are possible west of Manitoba. Precipitation is possible for coastal British Columbia, while unsettled weather will occur over the Atlantic provinces.

Climatic Perspectives is a weekly publication (disponible aussi en français) of the Canadian Climate Centre, Atmospheric Environment Service, 4905 Dufferin St., Downsview, Ontario, Canada M3H 5T4

Telephone: (416) 739-4438/4330

InterNet (Email):

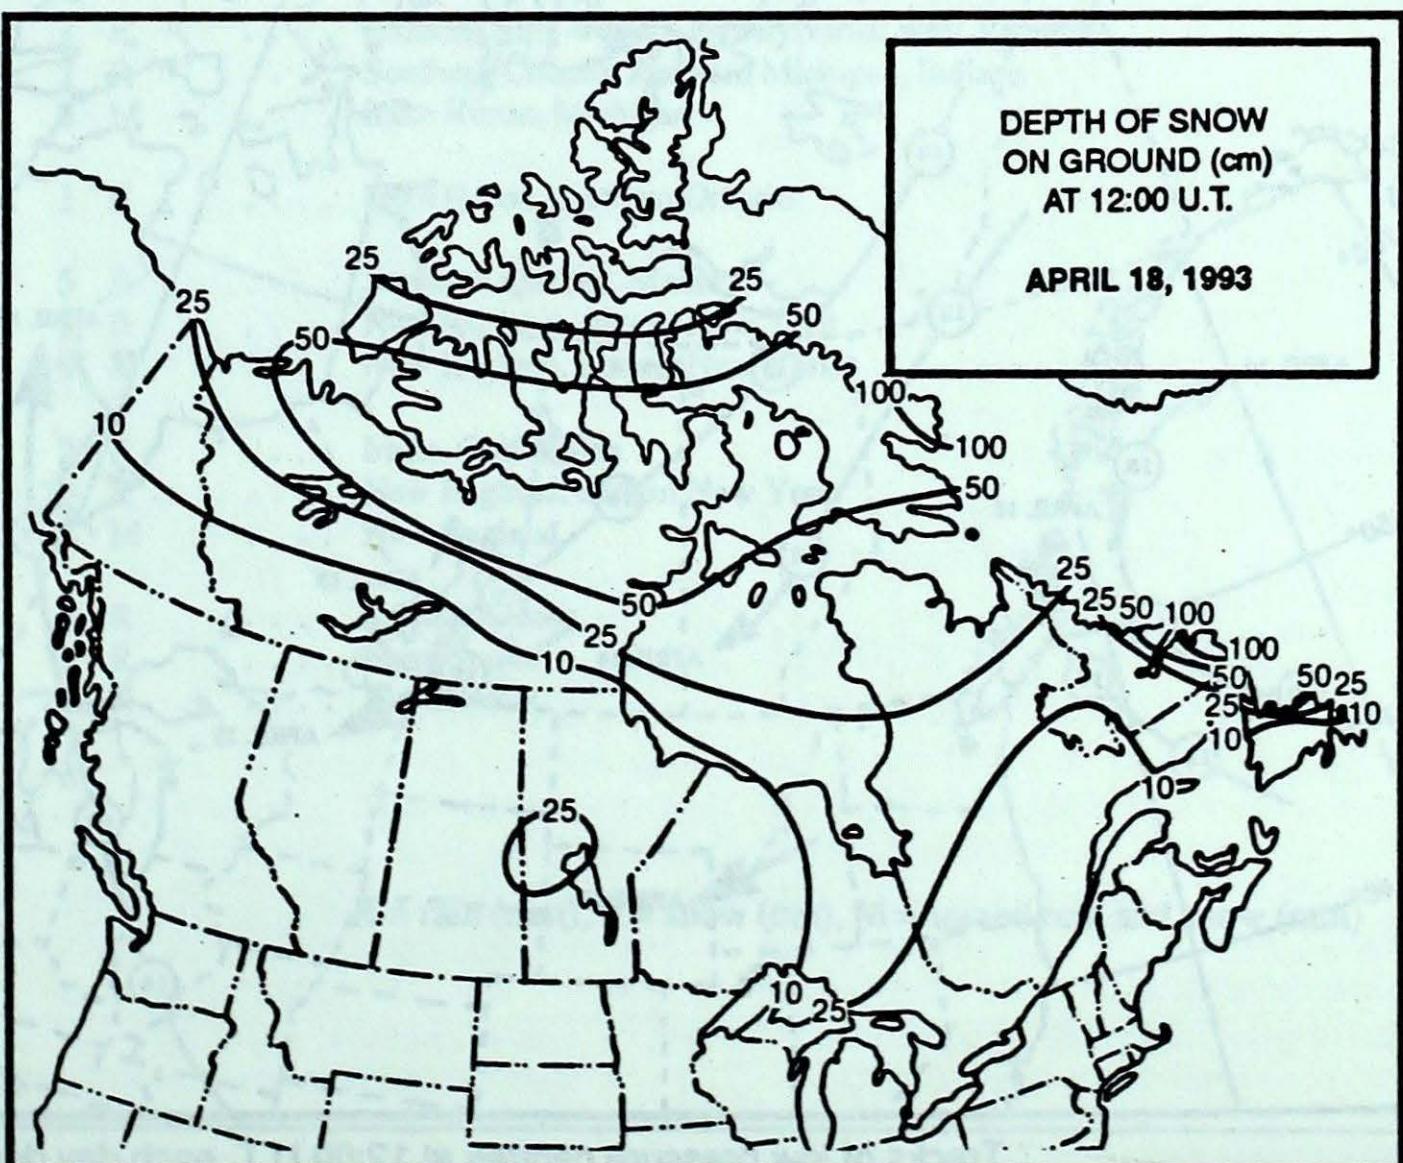

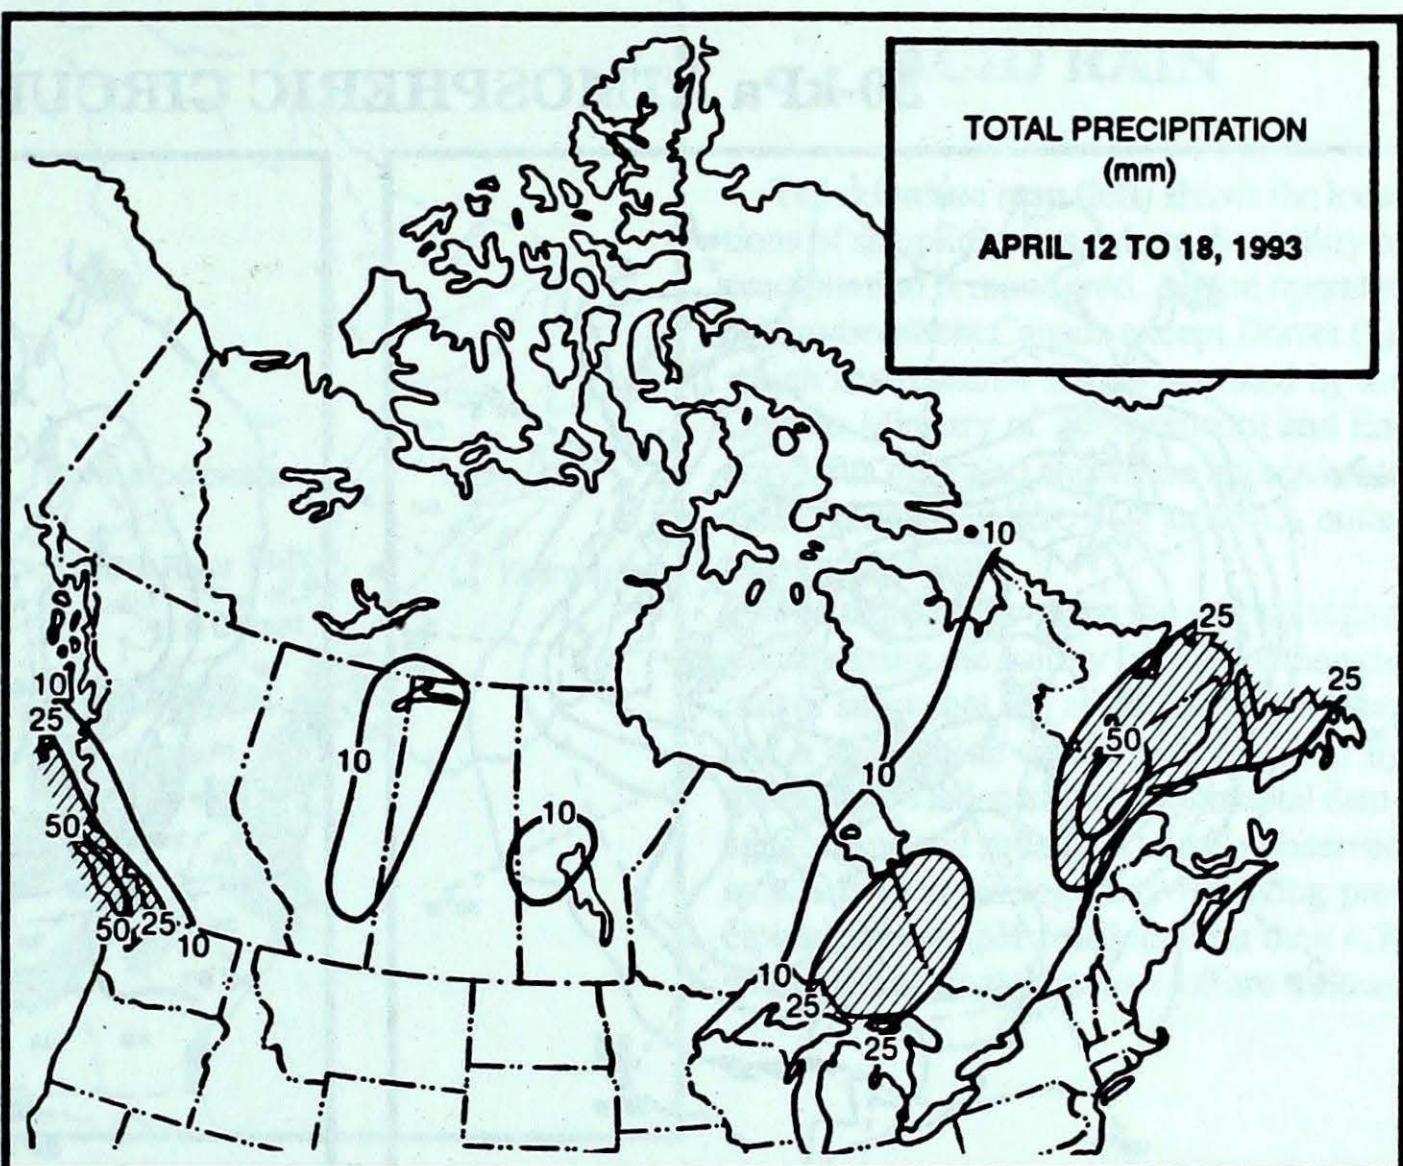

CCCOPS@aestor.dots.doe.CA

The purpose of the publication is to make topical information available to the public concerning the Canadian Climate and its socio-economic impact.

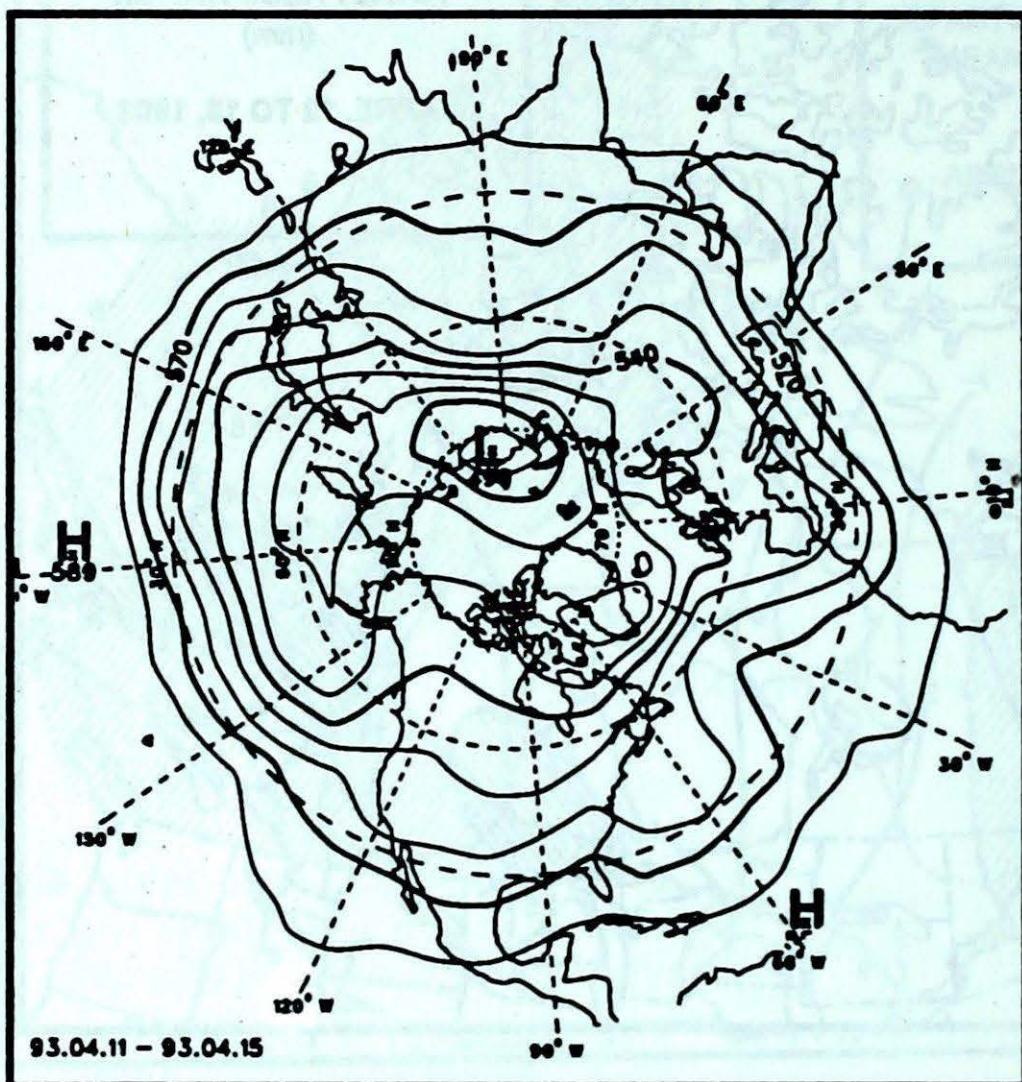

The data in this publication are based on unverified reports from approximately 225 Canadian synoptic weather stations. Information concerning climatic impacts is gathered from AES contacts with the public and from the media. Articles do not necessarily reflect the views of the Atmospheric Environment Service.

ACID RAIN

The reference map (left) shows the locations of sampling sites, where the acidity of precipitation is monitored. All are operated by Environment Canada except Dorset (*), which is a research station operated by the Ontario Ministry of Environment and Energy. The map also shows the approximate areas (shaded), where SO₂ and NO_x emissions are greatest.

The table below gives the weekly report summarizing the acidity (or pH) of the acid rain or snow that fell at the collection sites, and a description of the path travelled by the moisture laden air. Environmental damage to lakes and streams is usually observed in sensitive areas regularly receiving precipitation with pH readings less than 4.7, while pH readings less than 4.0 are serious.
