June 7 to 13, 1993

A weekly review of Canadian climate and water

Vol: 15 No. 24

Severe weather hits central Canada

Most of central Canada had a taste of Western Canada turns wet warm, summer-like weather this week, with daytime highs reaching the mid to upper twenties.

Thunderstorms accompanied a cold front, as it moved across Manitoba on the evening of the 12th. Hail was reported in the southwest part of the province, with the first Prairie tornado of the season touching down at Brookdale. The twister destroyed a cattle shed and knocked down hydro poles, trees and other buildings. The storms dumped up to 50 mm of rain across parts of southern Manitoba and western Saskatchewan, bringing this week's totals to 96 mm at Morden, Man., and 71 mm at North Battleford, Sask. Southern Saskatchewan and southwestern Manitoba missed most of the moisture with these storms, resulting in crop conditions to be near the critical stage in these dry areas.

In Ontario, a cold frontal passage during the late afternoon of June 9 triggered a line of severe thunderstorms, which spawned a small tornado. Torrential downpours, hail and damaging winds were reported in many parts of southern and central Ontario, including the Toronto area, where power outages and local street flooding were reported. The most severe damage was related to a downdraft along the southeast shore of Lake Simcoe. Eight houses and many large trees were damaged in the blowdown. A funnel cloud was spotted in a heavily industrialized portion of Mississauga, just west of Toronto. A tornado touched down in Muskoka. Damage in the area revealed twisting of tree trunks and branches.

Across British Columbia, the weather became cool, wet and unsettled - quite a change from just a few weeks ago. Disturbances along the coast provided an endless stream of moisture which pushed inland. In the Okanagan Valley, this month's rainfall is already well-above the June average. Okanagan Lake is at its maximum level - a situation which will have to be watched carefully if the rainy weather continues. Farmers are attempting to cut and dry their first crop of hay, which is approximately two weeks early. On Vancouver Island, the fire hazard is low and growth is lush and green.

Much needed moisture drenched southeastern Alberta over the weekend. Rainfall amounts over 50 mm were common across the south this week. As much as 84 mm of rain fell in the foothills, with snow falling at higher elevations. On June 12, a number of new 24-hour precipitation records were set. Picture Butte, in southeastern Alberta, recorded 100 mm this week, of which 75 mm fell on the 11th and 12th. Since the beginning of June, Lethbridge and Medicine Hat received 82 and 67 millimetres of rain, respectively. This is nearly three times the normal for the whole month.

Elsewhere....

The southern Yukon saw a fair amount of afternoon convective cloud and scattered showers and thundershower activity. Further to the north, after a dismal start to the period, skies became sunny, allowing temperatures to climb into the high teens. The

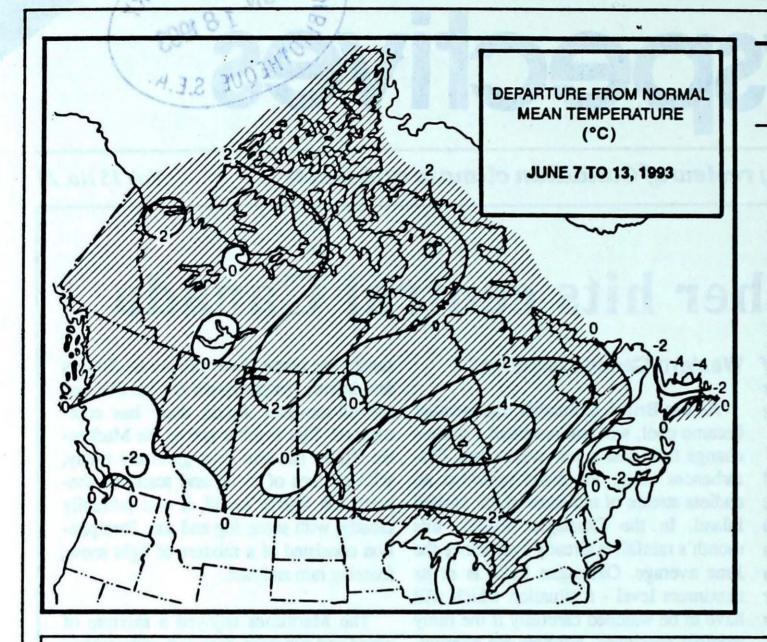

tundra has come alive with Arctic flowers and insects. Major rivers are ice-free and the all-too-brief Arctic thaw has commenced. The weather across the Mackenzie Valley has also been generally sunny, with patches of cloud and scattered showers. On Baffin Island, it was primarily cloudy, with some fog and sun. Precipitation consisted of a mixture of light snow, freezing rain and rain.

The Maritimes enjoyed a mixture of cloud and sunshine. Heavy thunderstorms were reported on the 10th. There were reports of small hail in parts of Nova Scotia. A lightning strike near a home in Hammonds Plains, N.S., cut a five-metre long trench in the ground, but luckily did little damage to the house. Cool temperatures and a lack of sunshine, so far this spring, have put many Nova Scotia farmers two weeks behind schedule.

In Newfoundland, the first day of the period was sunny - one of the few nice days this month. The remainder of the week was cold, cloudy and wet. Winds on the south coast gusted to more than 100 km/h. Later, cold northerly winds produced drizzle, fog and even some snow. Slightly better, sunnier weather prevailed across Labrador.

A Look Ahead...

For the week of June 21, above-normal temperatures are expected across southern Ontario. Below-normal temperatures are likely across the Prairies, the Northwest Territories, northern Quebec and the Atlantic region. Elsewhere, temperatures will be near normal.

Cartography ... T. Chivers

ISBN 0225-5707 UDC 551.506.1(71)

Climatic Perspectives is a weekly publication (disponible aussi en français) of the Canadian Climate Centre, Atmospheric Environment Service, 4905 Dufferin St., Downsview, Ontario, Canada M3H 5T4

(416) 739-4438/4330 InterNet (Email): CCCOPS@aestor.dots.doe.CA Fax: (416) 739-4446

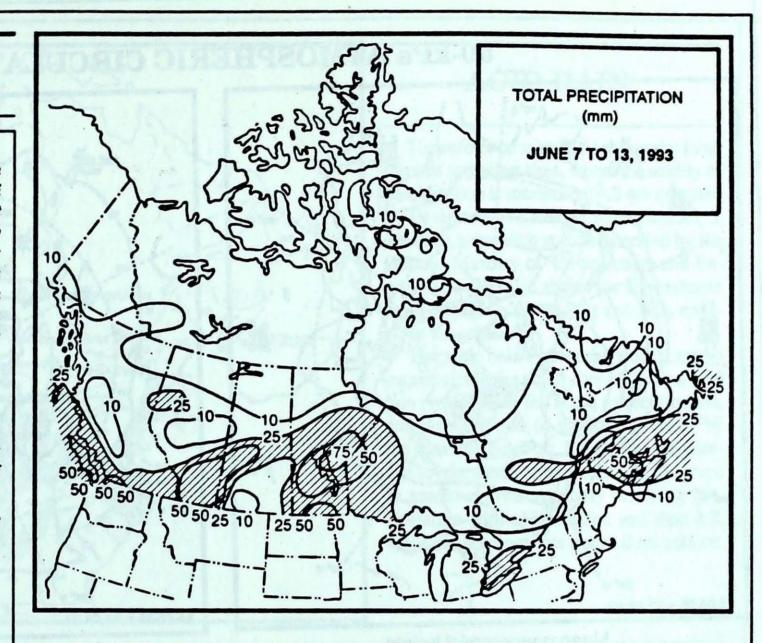

The purpose of the publication is to make topical information available to the public concerning the Canadian Climate and its socio-economic impact.

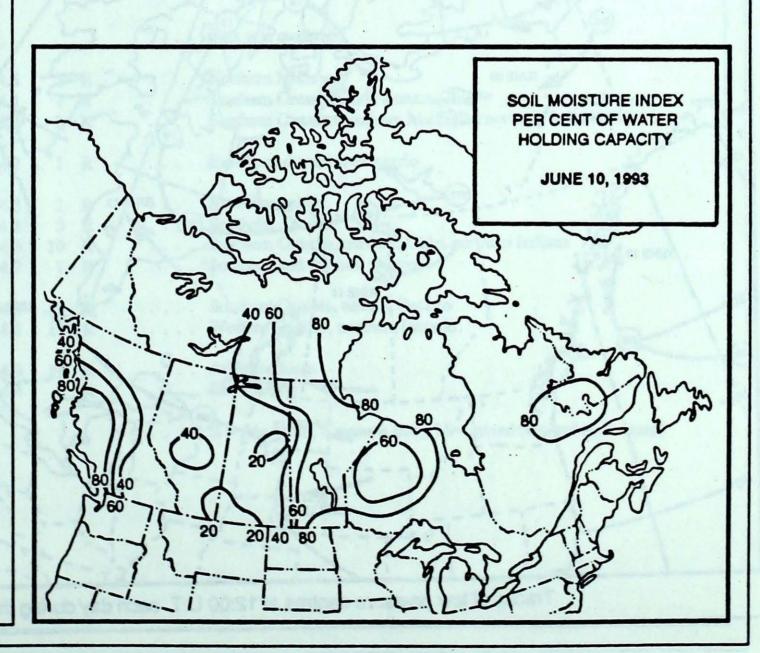

The data in this publication are based on unverified reports from approximately 225 Canadian synoptic weather stations. Information concerning climatic impacts is gathered from AES contacts with the public and from the media. Articles do not necessarily reflect the views of the Atmospheric Environment Service.

Annual Subscriptions and changes:

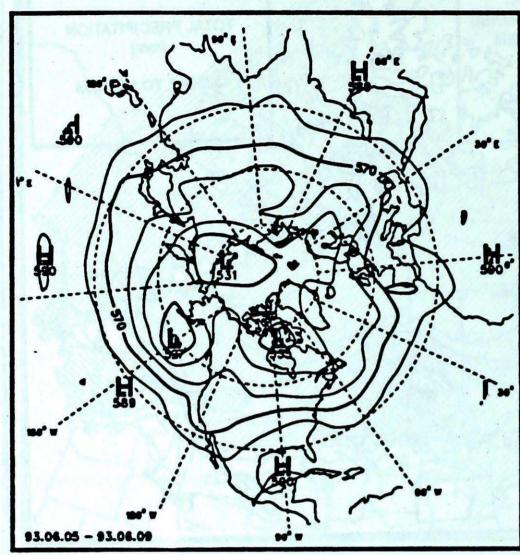

Albert Wright (416) 739-4156 Fax: (416) 739-4264

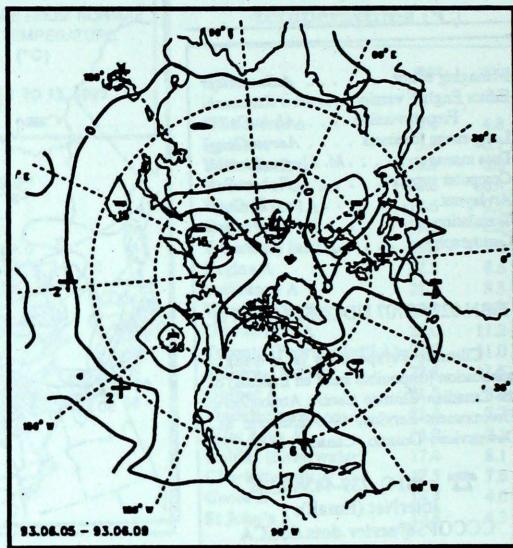

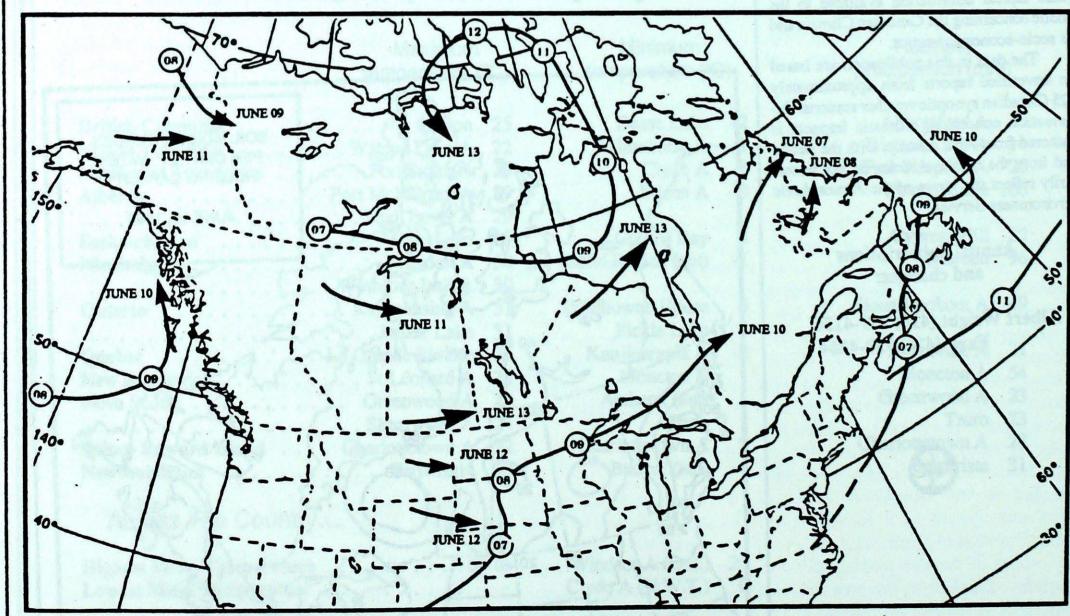

50-kPa ATMOSPHERIC CIRCULATION

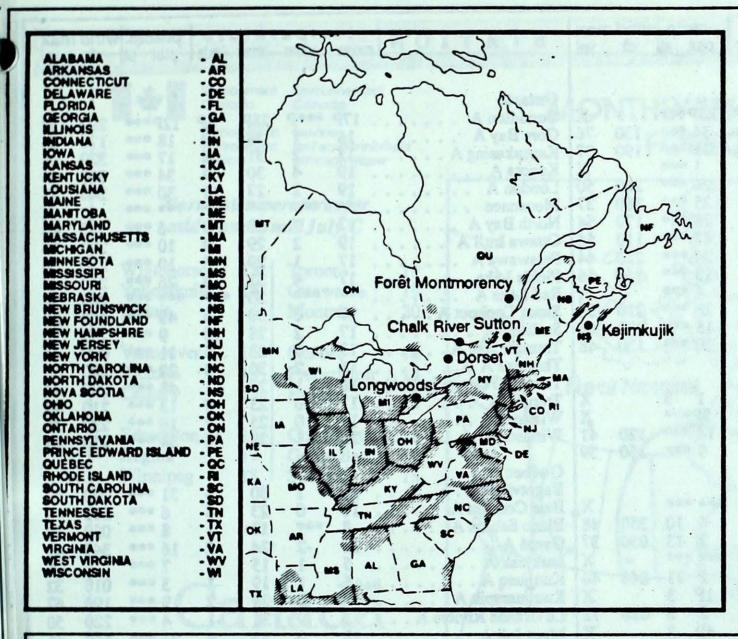

Mean geopotential height 50-kPa level (10 decametre intervals)

Mean geopotential height anomaly 50-kPa level (10 decametre intervals)

Tracks of low pressure centres at 12:00 U.T. each day during the period.

ACID RAIN

The reference map (left) shows the locations of sampling sites, where the acidity of precipitation is monitored. All are operated by Environment Canada except Dorset (*), which is a research station operated by the Ontario Ministry of Environment and Energy. The map also shows the approximate areas (shaded), where SO₂ and NO_x emissions are greatest.

The table below gives the weekly report summarizing the acidity (or pH) of the acid rain or snow that fell at the collection sites, and a description of the path travelled by the moisture laden air. Environmental damage to lakes and streams is usually observed in sensitive areas regularly receiving precipitation with pH readings less than 4.7, while pH readings less than 4.0 are serious.

Canadä

MONTHLY TEMPERATURE FORECAST

One quarter of Canadians still put hazardous materials in with their regular garbage. Many common household products are poisonous, flammable, explosive or corrosive. Check product labels for warning symbols and always dispose of hazardous materials properly.

An environmental citizenship message from Environment Canada.
