# Canadian Manuscript Report of Fisheries and Aquatic Sciences 3110 

## Canadian Manuscript Report of Fisheries and Aquatic Sciences

Manuscript reports contain scientific and technical information that contributes to existing knowledge but which deals with national or regional problems. Distribution is restricted to institutions or individuals located in particular regions of Canada. However, no restriction is placed on subject matter, and the series reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Manuscript reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report is abstracted in Aquatic Sciences and Fisheries Abstracts and indexed in the Department's annual index to scientific and technical publications.

Numbers $1-900$ in this series were issued as Manuscript Reports (Biological Series) of the Biological Board of Canada, and subsequent to 1937 when the name of the Board was changed by Act of Parliament, as Manuscript Reports (Biological Series) of the Fisheries Research Board of Canada. Numbers 1426-1550 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Manuscript Reports. The current series name was changed with report number 1551.

Manuscript reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

## Rapport manuscrit canadien des sciences halieutiques et aquatiques

Les rapports manuscrits contiennent des renseignements scientifiques et techniques ques qui constituent une contribution aux connaissances actuelles, mais qui traitent de problèmes nationaux ou régionaux. La distribution en est limitée aux organismes et aux personnes de régions particulières du Canada. Il n'y a aucune restriction quant au sujet; de fait, la série reflète la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports manuscrits peuvent être cités comme des publications complètes. Le titre exact parâ̂t au-dessus du résumé de chaque rapport. Les rapports manuscrits sont résumés dans la revue Résumés des sciences aquatiques et halieutiques, et ils sont classés dans l'index annual des publications scientifiques et techniques du Ministère.

Les numéros 1 à 900 de cette série ont été publiés à titre de manuscrits (série biologique) de l'Office de biologie du Canada, et après le changement de la désignation de cet organisme par décret du Parlement, en 1937, ont été classés comme manuscrits (série biologique) de l'Office des recherches sur les pêcheries du Canada. Les numéros 901 à 1425 ont été publiés à titre de rapports manuscrits de l'Office des recherches sur les pêcheries du Canada. Les numéros 1426 à 1550 sont parus à titre de rapports manuscrits du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 1551.

Les rapports manuscrits sont produits a l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

#### Abstract

Zetterberg, P.R., Watson, N.M., and O’Brien, D.S. 2017. Strait of Georgia recreational fishery statistics for salmon and groundfish, 2011. Can. Manuscr. Rep. Fish. Aquat. Sci. 3110: x + 101 p.

Recreational fisheries in the Strait of Georgia have been monitored since the 1960's and since 1980 the subject of an intensive creel survey. Annual reports of the results of this monitoring program are produced. This report documents recreational catch and effort estimates from the Strait of Georgia creel survey in 2011 and compares these to data from 2006 to 2010 to determine recent trends in catch and effort.

The 2011 Strait of Georgia creel survey estimates were derived from 5,829 fishing interviews and 85 aerial surveys. In addition to the creel survey, data were also collected through a recreational fishery logbook program and the resulting data are also presented in this report. The logbook data are treated as a census of catch obtained during logged trips, and are analysed with creel data to ensure that logged trips are not double counted in the creel survey estimates.

For the entire survey year (February through December) anglers conducted an estimated 118,261 boat trips and kept 35,210 chinook, 8,302 coho, 15,539 sockeye, 94,468 pink, 786 chum salmon, as well as 2,325 halibut, 5,053 lingcod, and 9,640 rockfish. The comparative (May to September) effort increased by $26.2 \%$ from 87,443 boat trips in 2010 to 110,371 in 2011 and was $19.3 \%$ above the five-year average of 92,515 trips. Comparative total salmon retained catch increased by $81.6 \%$ from 80,963 in 2010 to 146,992 in 2011 mainly due to an increase in abundance of Fraser River pinks. Salmon retention in 2011 was $82.7 \%$ higher than the 2006-2010 average of 80,440 . Based on these estimates, the kept catch per boat trip (CPUE) across all salmon species during the entire survey period in 2011 was 1.31.

A total of 1,517 chinook and 534 coho salmon were examined for adipose fin clips by creel survey staff. Of these, $29.0 \%$ of chinook and $47.2 \%$ of coho had adipose fin clips. Scale samples were also collected from retained chinook and the results consisted of $3.5 \%$ age 2 fish, $28.6 \%$ age 3 fish, $57.5 \%$ age $4,10.4 \%$ age 5 fish, and $0.0 \%$ age 6 fish.

## RÉSUMÉ

Zetterberg, P.R., Watson, N.M., and O’Brien, D.S. 2017. Strait of Georgia recreational fishery statistics for salmon and groundfish, 2011. Can. Manuscr. Rep. Fish. Aquat. Sci. 3110: x + 101 p.

La pêche récréative dans le détroit de Géorgie a fait l'objet d'une surveillance depuis les années 1960 et, depuis 1980, elle a fait l'objet d'un sondage intensif. Des rapports annuels sur les résultats de ce programme de surveillance sont produits. Ce rapport documente les estimations des captures et des activités récréatives de l'enquête sur le creusage du détroit de Géorgie en 2011 et les compare aux données de 2006 à 2010 afin de déterminer les tendances récentes en matière de captures et d'effort.

Les estimations du sondage de creux de 2011 du détroit de Géorgie ont été tirées de 5829 entrevues de pêche et de 85 levés aériens. En plus de l'enquête sur le canot, les données ont également été recueillies dans le cadre d'un programme de journal de pêche récréatif et les données qui en résultent sont également présentées dans le présent rapport. Les données du carnet de bord sont traitées comme un recensement de la capture obtenue au cours de trajets enregistrés et sont analysées avec des données de cartographie afin de s'assurer que les trajets enregistrés ne sont pas comptés deux fois dans les estimations de l'enquête de pêche.

Pour la totalité de l'année d'enquête (de février à décembre), les pêcheurs ont effectué environ 118261 excursions en bateau et ont conservé 35210 saumon quinnat, 8 302 saumons coho, 15539 saumons rouges, 94468 saumons roses, 786 chum, ainsi que 2 325 flétans, 5053 lingacodes et 9640 sébastes. L'effort comparatif (de mai à septembre) a augmenté de $26,2 \%$, passant de 87443 en 2010 à 110371 en 2011 et de $19,3 \%$ par rapport à la moyenne quinquennale de 92515 voyages. Les prises totales comparatives de saumon ont augmenté de $81,6 \%$, passant de 80963 en 2010 à 146992 en 2011, principalement en raison de l'augmentation de l'abondance des roses roses du Fraser. La rétention du saumon en 2011 était 82,7\% plus élevée que la moyenne 2006-2010 de 80 440. Sur la base de ces estimations, la capture gardée par excursion en bateau (CPUE) pour toutes les espèces de saumons durant toute la période de l'enquête en 2011 était de 1,31.

Un total de 1517 saumons quinnats et 534 saumons coho ont été examinés pour les attaches de nageoires adipeuses par le personnel de l'arpentage. Parmi ceux-ci, 29,0\% de saumon quinnat et $47,2 \%$ de coho avaient des pinces adipeuses. Des échantillons d'écailles ont également été recueillis à partir de chinook conservé et les résultats ont été constitués de $3,5 \%$ d'âge 2 poissons, $28,6 \%$ d'âge 3 poissons, $57,5 \% 4$ ans, $10,4 \% 5$ ans et $0,0 \% 6$ ans.

## INTRODUCTION

This report documents the 2011 Strait of Georgia (SG) creel survey catch and effort statistics from the tidal recreational finfish fishery, with comparisons to the 2006 to 2010 survey results (previous 5 year averages) and presents the methodology for collecting these data. Data are presented in tables and figures with catch and effort dating back to 1987. Catch and effort tables are displayed by month, Pacific Fishery Management Area (PFMA) and species. For comparison purposes and unless otherwise specified, the annual data presented are from the period May through September only. The SG creel survey collects information on all species but only finfish data is presented.

In addition to creel survey data, in 2011 we included log data from the voluntary logbook program. Logbooks were distributed by the Sport Fishing Institute of British Columbia (SFI) and Fisheries \& Oceans Canada (DFO) for completion by selected fishers, including guides, and $\log$ data have been included in this year's report providing a more complete picture of the recreational fishery.

The 2011 report is one of a series documenting the activities of the creel survey and provides official SG tidal recreational fishery catch statistics. All official recreational fishery catch estimates are stored in the Catch and Release Estimation Survey Tool (CREST), a database maintained by DFO South Coast regional staff. Please contact the lead author for more details. A list of previous reports in this series may be found in Appendix A.

## BACKGROUND

Historically, the SG fishery supported what was one of the most valuable recreational fisheries in British Columbia. Recent coded-wire tag (CWT) recoveries indicate chinook catches consist primarily of Puget Sound, Fraser River, and East Coast Vancouver Island salmon stocks. There has been evidence of declining stocks since the 1970's (Argue et al 1983) and the mid-1990's saw a decrease in recreational fishery success due to lower abundance of chinook (Oncorhynchus tshawytscha) and coho (O. kisutch).

An assessment of approximately 60 years of escapement and catch data for all five Pacific salmon species from the north and central coasts indicate that pink salmon ( $O$. gorbuscha) are doing relatively well but coho and chinook are doing relatively poorly (DFO 2011). Salmon survivals appear to be strongly influenced by conditions in their early marine life and ocean survival and growth tends to be best when La Niña conditions and cool ocean waters are present in the first months that juveniles enter the ocean (DFO 2011). Various First Nation, commercial, and recreational groups on both sides of the Canada/U.S. border depend on these stocks, economically and for sustenance.

The SG creel survey study area comprises over $5,900 \mathrm{~km}^{2}$ of ocean and has in excess of $2,400 \mathrm{~km}$ of shoreline. From its southern end near Victoria, the strait extends about 290
km northwest past Campbell River and at its greatest width is about 32 km wide. Two major population centres, Vancouver and Victoria, and many smaller centres such as Nanaimo and Campbell River are located within the study area. Over 500 boat launch ramps, marinas and public wharves as well as thousands of private boat launching facilities provide ocean access (Figure 1).

The recreational fishery is active throughout the year but over $85 \%$ of the effort occurs in the summer months of May to September (Collicutt and Shardlow 1993). The most sought after species in the SG recreational fishery are chinook and coho salmon, but in recent years significant fisheries directed at pink, sockeye (O. nerka), rockfish (Sebastes spp.) and particularly halibut (Hippoglossus stenolepis) have developed in certain areas.

The recreational fishery remains the primary harvester of chinook and coho in the SG. Effort in this fishery has fluctuated with an estimated 189,150 boat trips in 1960 to peaks of 562,113 in 1984 and 561,495 in 1988 (Table 3). The all-time low of 77,028 boat trips was estimated in 2008 and 2011 was 110,371.

Creel survey data are used for a variety of management and reporting purposes within DFO and to support international agreements. Catch estimates are used to support stock assessment analyses in the post season, as well as evaluation of catch relative to in-season catch limits for some species. In addition, effort and catch estimates from the creel survey are used to both predict the effects of regulation changes and to measure success of management actions. The adipose clip information for chinook and coho collected during the survey are provided to the Mark Recovery Program and it is used in combination with other data to estimate exploitation rate, marine survival and conduct stock distribution analyses (Kuhn et al. 1988).

## OBJECTIVES

The specific objectives of the 2011 SG tidal creel survey were:

1. To estimate the recreational angler effort and catch (both releases and retention) of chinook, coho, chum ( $O$. keta), pink, and sockeye salmon, halibut, lingcod (Ophiodon elongatus), rockfish and other finfish by month for PFMA 13 through 20(SG), 28, and 29.
2. To estimate the catch rate of adipose-clipped chinook and coho in the recreational fishery.
3. To estimate the age composition and mean length-at-age for chinook, and length frequency for chinook and coho retained in the recreational fishery.
4. To collect halibut and lingcod biological samples.

## METHODS

## STUDY DESIGN

The design of the SG tidal creel survey conducted in 2011 was similar to that used in the survey since its inception (DPA Consulting Ltd. 1982) with modifications to data analyses, sampling intensity, flight routes and data processing. It is comprised of two independent surveys: angler interviews and aerial surveys. Angler interviews provide data on recreational fishing catch per unit effort (CPUE) and daily activity patterns. Aerial surveys provide estimates of total recreational fishing effort in the study area at the time of the aerial survey. These data are combined to provide monthly estimates of total recreational fishing effort and total catch of salmon, groundfish and other finfish in the recreational fishery using the analytical methods described by English et al. (2002).

The fishery is stratified by the following characteristics for analysis:

1. Month. The survey operated from 01 May to 30 September for the entire SG and PFMA 19 and 20(SG) were surveyed from 01 February to 31 December in 2011.
2. Geographic area. Catch and effort estimates were produced at the creel sub-area (which differ from PFMA sub-areas) level and summarized by PFMA. These creel sub-areas are defined by Shardlow (1985) and plotted in Figures 3a and 3b. In reports prior to 2006, these were simply called 'Statistical Areas' which was changed to PFMAs starting with the 2002-2006 data report, Zetterberg et al. (2009). PFMA boundaries are legally defined and in some cases differed from the creel areas. After a review in 2010 , changes were made to some creel area boundaries to align them to PFMA boundaries in 2011 (Ganton 2011). In this report, similar to Zetterberg et al. $(2006,2008)$ and Carter et al. $(2007)$, we report catch at the PFMA level and compare these estimates with the appropriate creel area for historical comparisons. A detailed description of the survey area is provided in Appendix B.
3. Day type. Weekend and mid-week days were considered independently because recreational fishing effort is known to differ strongly between these day-types. Statutory Holidays were treated as weekend day-type.
4. Time of day. Sampling shifts were conducted during set time periods. A sampling shift is defined as a consecutive time period of interviewing anglers by one creel surveyor. The timing of sampling shifts varied during the year to account for varying fishing effort due to changes in sunrise and sunset timing. From April to August sampling shifts occur during one of two time periods within a day: AM shift ( 0800 to 1500 hours) or PM shift (1400 to 2100 hours). The timing of these shifts change in both September and October (September: AM 0800 to 1500 hours; PM 1300 to 2000 hours - October: AM 0900 to 1600 hours; PM 1200 to

1900 hours). Due to shorter daylight hours during winter, only single mid-day sampling shifts occur from November to March (November and February: 1000 to 1700 hours; December and January: 0900 to 1600 hours; March: 1100 to 1800 hours).

Specific landing sites were chosen as locations for sampling shifts. Site selection was based on four criteria: representativeness, traffic volume, site accessibility and adequate observation points. Discussions with local fishers, marina operators, Fishery Officers, and long term creel survey staff, along with data from previous surveys were used to choose sites that were representative of local recreational fishing activity with enough expected traffic volume. Sites with traffic volume of more than 15 boats per day in the summer were considered as possible sampling locations. Site accessibility refers to whether an interviewer can easily reach a site by car during the defined shift hours. Only sites with good accessibility were selected. As a result, landing sites on any of the islands in the SG were excluded from the survey. The final criterion of adequate observation points was essential for interviewers to obtain an accurate count of all boats returning to a landing site.

Selected access sites were grouped into one of five survey zones (1-Victoria, 2 Cowichan/Nanaimo, 3 - Campbell River/Comox, 4 - Sunshine Coast and 5 - Vancouver). These zones delineated areas within which local survey staff was hired. To reduce travel costs, survey staff conducted shifts only at sites within their survey zone.

In 2011, interviews were conducted at 35 designated landing sites (boat ramps, marinas, or resorts; Figure 1) representative of the recreational fishing activity in the survey area at a particular time. Within each month and survey zone, each site was randomly allocated between one and 17 sampling shifts. The survey effort at specific access sites was optimized prior to the 2011 season based on an analysis of reported fishing activity from various landing sites and observed fishing activity during overflights (O'Brien and Carter 2009). Sampling shifts were also divided equally among weekend and mid-week days and AM and PM daily time periods. The higher sampling effort on weekend days allows for a higher proportion of angling trips to be sampled (interviewed).

In 2011 marine recreational logbooks were distributed for completion by selected anglers. The purpose of these volunteer logbooks was to collect fishing activity and catch data in areas with less accessible landing sites where creel data are more difficult to acquire. Fishers frequenting these areas were asked to participate in this program.

Fisheries and Oceans staff coordinated data collection, data entry, and generated all catch and effort estimates.

## DATA COLLECTION

## Angler interviews

Surveyors were stationed at boat ramps or marinas for sampling shifts to interview anglers as they returned from fishing. The numbers of boats returning to a site during a sampling shift as well as number of interviews attempted, completed, refused and missed were recorded on a tally sheet. For each boating party landing after recreational fishing, the following information was recorded on an interview form (Figure 2):

1. Total number of licensed anglers in the boat.
2. Time of landing.
3. Whether the trip included services of an angling guide.
4. Time of departure and length of trip.
5. Total time during which fishing lines were in the water.
6. Average number of fishing lines or shellfish traps in the water.
7. Catch Summary: -Species and total number of kept and released fish for each creel sub-area fished (data sheets include the possibility of three sub-areas being fished during a single trip).
-Number of hours directed at each species, type of fishing conducted (gear) and primary fishing location in each creel sub-area.
8. Adipose fin-clip status for kept and/or released chinook and coho.
9. Seal or sea lion encounter information.

Interviewers, who are trained in fish identification, inspected retained catch of each boating party willing to participate in the survey. Landed chinook and coho were checked for a missing adipose fin, which indicates that fish may be of hatchery origin and possibly the presence of a CWT (Kuhn et al. 1988). The interviewer informed anglers about the head recovery program and submission of heads when retaining an adipose clipped chinook or coho but did not facilitate head recoveries in any other way at the direction of the volunteer Mark Recovery Program. In addition, chinook and coho were measured (fork length) and DNA sampled and chinook scale samples were also collected for age determination.

Additionally, groundfish species were also biologically sampled. Retained lingcod (Ophiodon elongates) were measured (fork length), sex was determined and a portion of the dorsal fin was removed and placed in a labelled envelope for use in age determination (McFarlane and King 2001; MacLellan 2004). Other species including rockfish and halibut were identified to species and measured (fork length).

In 2011, SG creel surveyors continued electronically entering their data into the CREST system, a South Coast database and analysis tool for recreational data. This electronic entry system has been operational since 2008 and greatly facilitates rapid estimate generation. DFO provided laptop computers to each surveyor to facilitate field data entry.

## Logbooks

In 2011, logbooks were distributed by representatives of the SFI in the Campbell River area and in the Victoria/Sooke area, and by DFO in the Nanaimo and lower Sunshine Coast areas. A portion of these logbooks were returned to DFO at the end of the fishing season and data were entered into CREST and verified, and these data are presented in Tables 5 to 14, alongside the creel data, by month and PFMA.

## Effort counts

Effort, defined as individual boats actively fishing, is counted via aerial surveys of the study area. The study area is divided into approximately equal northern and southern sections for purposes of aerial effort counts (Figure 3a and b). Seaplane charter companies in Victoria and Courtenay (Pat Bay Air and Island Air, respectively) provided aircraft for this purpose. Aerial surveys travelled along the pre-defined routes and a single on-board observer counted all boats actively engaged in recreational fishing activity, using standard methods (Nagtegaal et al. 2009). Effort estimates, therefore, are the number of estimated finfishing boat trips by month and PFMA (Table 5 to 14).

Flight paths and times of departure were designed to cover major concentrations of recreational fishing activity at peak periods and the number of aerial surveys each month was governed by budget. There were between six and ten flights per month depending on the time of year, with the highest number of flights occurring during the peak period in July and August (Table 1). Planes flew at an altitude of 150-300 m (500-1000 feet) to facilitate a broad range of vision and still allow easy identification of vessel type. Aerial surveys conducted between May and September range between 3 to 4.5 hours covering a flight path of 600 to 670 km at speeds of 145 to 220 km per hour. During the March to April period in PFMA 19 and 20(SG), flights were 1.5 hours covering a 200 km route (Figure 3c). Days for aerial surveys during a month were randomly selected for each day type (weekday and weekend). Flight paths are reviewed annually and adjustments are made based on interview results indicating fishing activity outside of the current path.

## DATA ANALYSIS

Data analysis of the results from the tidal creel survey program in 2011 included calculation of catch and effort statistics, calculation of variance of total fishing effort and catch $($ Standard Error $=$ SE), estimating the proportion of marked $(C W T)$ chinook and coho salmon, and estimation of age and length composition of retained chinook. Established analysis methods are detailed by English et al. (2002). The estimates in this report are a summary of those maintained in the CREST database.

Along with data from the 2011 creel survey program, recreational log information from guided and un-guided participants within the SG area was also collected. Logbook data are entered into CREST, and logged catch for areas and times consistent with the 2011

SG creel survey program are presented here. The logbook data are treated as a census of catch obtained during logged trips, and are analysed with creel data to ensure that logged trips are not double counted in the overall catch estimates.

## RESULTS AND DISCUSSION

## 2011 FINFISH REGULATIONS

Catch is affected by fishery regulations; therefore to understand catch, details of the key finfish regulations are essential. Regulations are an important tool to conserve stocks by controlling angler impacts on various fish populations.

Chinook, pink, and chum salmon retention was open all year in the SG survey area in 2011. Due to early timed Fraser River chinook concerns, restrictions were initiated at the beginning of March until late July in the southern portion of the SG survey area. Coho retention was allowed from June to the end of December with two (2) hatchery fish per day being the most common retention regulation. Retention of sockeye in the SG survey area was allowed from early August till mid-September. Most groundfish species were open all year in the SG survey area in 2011. Halibut retention was open from March to the beginning of September. Lingcod and rockfish were open concurrently from May to the end of September. For further details on the regulations which affected the 2011 SG recreational fishery (for major finfish species) see Appendix G.

The retention of sub-legal chinook, defined as chinook smaller in length than the legal size limits stated in the regulations ( $<45 \mathrm{~cm}$ in PFMA's 19 (south of Cadboro Point) and 20(SG) and also < 62 cm in PFMA's 13-18, 19 (north of Cadboro Point), 28, and 29), continues to be a minor issue in the SG survey area. Retention of sub-legal chinook by recreational fishers has been tracked since 1989 in the SG survey area, when the size limits were increased from 45 to 62 cm . Percentages are separated in Table 24 as Victoria versus the rest of the SG and are calculated based on the number of sub-legal chinook measured by the surveyors divided by the total number of chinook measured. According to the surveyors, most sub-legal chinook retentions are misidentified pink salmon.

## DISTRIBUTION OF SAMPLING EFFORT

A total of 5,829 interviews with finfishing anglers at 35 landing sites, and 85 aerial surveys were conducted in 2011 (Table 1). Monthly distribution of interviews generally reflected monthly distribution of fishing effort (number of boat trips; Figure 4). While the
survey goal is to attain interviews from $10 \%$ of fishing effort, total interviews in 2011 represent $4.9 \%$ of estimated total fishing effort for the entire study area (118,261 full year boat trips; Table 5). Interview coverage for the SG survey from May to September in 2011 ranged from a low of $1.3 \%$ in PFMA 29 to a high of $8.4 \%$ in PFMA 19 (Table 1) based on the total estimated effort.

All 2011 SG recreational catch and effort statistics are summarised for key species by month and PFMA. Fishing effort and catch statistics by key species are presented for each combination of month and PFMA (Appendices C-1 to C-4, and C-9 to C-21).

Anglers made 110,371 boat trips during 2011 (May to September); this is a $26.2 \%$ increase in effort from 87,443 trips completed in 2010 and $19.3 \%$ above the five-year average of 92,515 trips (Table 3). Angler effort has varied over the previous five years from a high of 106,435 boat trips in 2009 to a low of 77,028 in 2008 (Figure 5). Fishing effort followed the same general seasonal pattern as seen in previous years where effort levels climbed steadily from April, peaked in August and declined in September and October (Figure 6). The highest effort expended in 2011, during the May to September period, was in PFMA 20(SG) (25.5\%), 13 (21.5\%), 17 (9.6\%), and 14 (8.7\%) respectively (Appendix C-1).

Ninety-six logbooks were distributed to 90 fishers in the Campbell River, Nanaimo, Victoria, and the lower Sunshine Coast areas and 60 ( $62.5 \%$ ) of these were returned with data. Table 2 lists the number of logged boat trips received by DFO in 2011. The average number of logged trips per returned logbook was 36.2.

## RECREATIONAL CATCH

Finfish retained in the SG recreational fishery for the May to September period in 2011 were estimated at 178,889 pieces and consisted of $82.2 \%(146,992)$ salmon (Table 5 and $6), 12.5 \%(22,286)$ groundfish, and $5.4 \%(9,612)$ rockfish (Table 11 and 13). Anglers also released an estimated 182,580 finfish pieces which consisted of $56.8 \%(103,768)$ salmon (Table 7 and 8 ), $29.8 \%(54,482)$ groundfish, and $13.3 \%(24,330)$ rockfish (Table 12 and 14) for this same period. Comparisons of CPUE between salmon and groundfish are summarized by month and PFMA in Appendices D-3 and D-7 for the creel survey and Appendices D-4 and D-8 for log data.

## Salmon

Recreational salmon retention for the SG in 2011 totalled 146,992 pieces for May to September (Table 4) and 154,382 for the entire survey year (Tables 5 and 6). For the May to September period, retained catch consisted of $22.3 \%$ chinook, $2.5 \%$ coho, $10.6 \%$ sockeye, $64.2 \%$ pink, $0.4 \%$ chum, and $0.04 \%$ unidentified salmon. Salmon retention in

2011 was $82.7 \%$ higher than the 2006-2010 average of 80,440 . Comparative salmon released and total salmon intercepted for 2011 is listed in Table 4.

In 2011, the highest effort expended was observed in PFMA 20(SG) (27.6\%), 13 $(20.1 \%)$, and $19(10.5 \%)$ with a total salmon kept CPUE of 2.11, 2.06, and 0.54 , respectively (Figure 15, Appendix D-7). The CPUE for all salmon kept by PFMA for log data are presented in Appendix D-8. Readers should note that sample sizes associated with these estimates are in Table 2. Fishing effort was highest during the May to September period in 2011 with the peak salmon kept CPUE observed during August at 1.74 (Appendix D-3). Although effort decreased substantially in October, CPUE was highest overall during this time (for both creel survey at 1.83 and logged trips at 5.83) due to coho catch. CPUE in 2011 for salmon in general is listed by month in Appendices D-3 for the creel survey, D-4 for log data, and by PFMA in D-7 for the creel survey and D-8 for log data.

## Chinook

In 2011, chinook salmon retention was 32,742 pieces (five-year average $=26,652$ ) during the May to September period (Table 3, Figure 5). Within the previous five years, retention ranged from 17,936 in 2008 to 37,460 in 2009. Monthly chinook retained increased steadily through May and June and peaked in August at 10,517 pieces (Table 5, Figure 7). For the entire survey period, PFMA 13 recorded $33.9 \%$ of the total estimated catch, followed by PFMA 20(SG) (29.8\%), 19 (8.8\%), and 14 (7.4 \%) (Table 6, Figure 9, Appendix C-2).

Chinook salmon releases in 2011 was estimated at 28,466 pieces (five-year average $=$ 24,101 ) during the May to September period (Table 3). Monthly chinook released increased from June to July and peaked in September (Table 7). Retained legal, and released legal and sub-legal sized chinook (smaller than the legal size limit - $<45 \mathrm{~cm}$ in PFMA 19 (north of Cadboro Point) and 20(SG) and <62 cm in PFMA 13-18, 19 (south of Cadboro Point), 28, and 29) are summarized in Table 9 by month and Table 10 by PFMA for 2011. Appendix F summarizes the number of retained chinook annually from 1960 to 1986. Table 3 summarizes the number of released chinook annually from 1987 to 2011.

Seasonal (May to September) average creel survey CPUE for chinook has remained fairly constant over the past five years with 2008 having the lowest ( 0.23 ) and 2009 having the highest (0.35). In 2011, chinook CPUE for retained catches had an average of 0.30 compared to the 2006 to 2010 average CPUE of 0.29 (Table 3, Figure 8). For the entire survey period, PFMA 13 recorded the highest CPUE at 0.40 followed by PFMA 20 (0.32), 14 (0.27), and 29 ( 0.26 ). Chinook CPUE is separated out for the creel survey in Appendix D-1 by month and D-5 by PFMA, and for logged records in D-2 by month and D-6 by PFMA.

Chinook retention improved in the early 2000's from the lows in the late 1990's, but declined again from 2003 to 2006. Retention increased slightly in 2007 and was at its
lowest level in 2008, since records began in 1960 (Table 3, Figure 5 and Appendix F respectively). Chinook CPUE increased in 2011 relative to 2010 (0.30/boat trip vs $0.26 /$ boat trip, respectively), likely resulting from an increase in abundance of chinook. Chinook retention increased $45.7 \%$ from 22,471 in 2010 to 32,742 in 2011. An addition to this report is Appendix $\mathrm{C}-22$ that documents the spatial distribution of retained chinook in the northern (PFMA 13-16) vs southern (PFMA 17-20(SG), 28 \& 29) SG. Two patterns of retained catch dominate the time-series since 2000: 1.) Relatively low retained catch apparent from 2003 to 2009 in the north vs the south ( $\sim 65 \%$ of the retained chinook catch coming from the south); and 2.) approximately equal catches north to south apparent in 2001, 2010 and 2011. Northern SG retained catches were only higher than in the southern portion in 2000 and 2002. The change in pattern from 20032009 to 2010 and 2011 is striking; and it's relation to abundance, stock distribution or fishing activity have yet to be evaluated. Spatial distribution of catches is an area for continued research.

## Coho

Coho salmon retention in 2011 (May to September period) was 3,640 pieces (five-year average $=3,810$ ) which was $5.5 \%$ higher than $2010(3,452$; Table 3, Figure 10). Retained catch peaked in August at 1,497 pieces for the May to September period, but then drastically increased to 4,649 ( $56 \%$ of the total coho retention) for the month of October (Table 5). For the entire survey period, PFMA 20(SG) recorded $76.6 \%$ of the total estimated catch, followed by PFMA 19 (6.5\%) and 13 (6.2\%; Table 6, Figure 9).

Coho retention has fluctuated widely and Table 3 shows the variation in retained coho catches since 1987 and releases since 1998. From a comparative high of 947,481 pieces in 1988, retention continued to decline over time. The 1999 estimate of coho retained was an all-time low of 310 pieces due to a majority of areas being closed to their retention. Coho catch numbers began to improve in the early 2000's as stocks showed some recovery as well as the advent of mark selective (adipose-clipped only) fisheries in selected areas on hatchery stocks. Appendix F summarizes retention of coho from 1960 to 1986.

Coho salmon releases for 2011 were 21,497 pieces (five-year average $=14,956$ ) during the May to September period. Releases in 2011 were $103.4 \%$ higher than $2010(10,570)$. Table 3 summarizes the number of released coho annually from 1998 to 2011.

In 2011, coho retained CPUE averaged 0.02 for the May to September period (five-year average $=0.03$; Appendix D-1, Figure 11). For the entire survey period, PFMA 20(SG) recorded the highest retained CPUE at 0.19 followed by PFMA 18 (0.05). Coho kept and released CPUE is separated out for the creel survey in Appendix D-1 by month and D-5 by PFMA, and for logged records in D-2 by month and D-6 by PFMA.

## Sockeye, pink, and chum

The recreational fishery for sockeye in the SG in 2011 occurred from 10 August till closing on 16 September with some restrictions in PFMA 16 and 29 intended to conserve Fraser River and Sakinaw Lake stocks. The final diversion rate estimated for Fraser River sockeye was estimated at $62 \%$ through Johnstone Strait (Pacific Salmon Commission 2016). There were 15,539 pieces retained for the May to September period (five-year average $=16,375$; Table 3). For the entire survey period, PFMA 29 recorded $41.3 \%$ of the total estimated catch of sockeye followed by 13 (29.4\%), and 28 ( $16.9 \%$; Table 6). Retained catch peaked in August with 9,291 pieces (Table 5).

Estimated sockeye releases during 2011 were 4,115 pieces (five-year average $=1,838$ ) for the May to September period (Table 3). Releases are listed by month and by PFMA in Tables 7 and 8 respectively. Detailed retained and released estimates by month and PFMA are listed in Appendices C-9 and C-10. A comparison of retained sockeye in 2011 is displayed with the five year average in Figure 12.

Pink salmon retention was 94,440 pieces (five-year odd cycle average $=89,676$ ) for the May to September period in 2011 (Table 3). The final diversion rate estimated for Fraser River pink through Johnstone Strait was $44 \%$ (Pacific Salmon Commission 2016). A comparison between the 2011 and the five-year average of odd-year pink are presented in Figure 13. Retained catch peaked in August with 52,554 pieces (Table 5). For the entire survey period, PFMA 20 (SG) recorded $52.8 \%$ of the total estimated catch of pink salmon followed by PFMA 13 (33.4\%), and 18 (4.5\%; Table 6, Appendix C-11). A comparison of retained pink in 2011 is displayed with the five-cycle average in Figure 13.

Estimated pink salmon releases for 2011 were 30,414 pieces for the May to September period (five-year even cycle average $=28,175$ ) (Table 3). Pink releases for the entire survey period were highest in PFMA 20(SG) (39.3\%) followed by 13 (29.5\%) and 29 ( $10.0 \%$; Table 8). Releases by month and PFMA are presented in Table 7 and Appendix C-12.

Chum salmon retention was 569 pieces (five-year average $=770$ ) during the May to September period (Tables 3). Retained catch peaked during September at 526 pieces and for the entire survey period, $62.6 \%$ were taken in PFMA 13 and $35.9 \%$ in PFMA 20(SG) (Tables 5 and 6). A comparison of retained chum in 2011 is displayed with the five year average in Figure 14. Releases are presented in Table 7 by month and Table 8 by PFMA and detailed in Appendix C-1 and C-14.

CPUE for sockeye, pink, and chum is listed in Appendix D-1 by month for the creel survey, D-2 for log data, and by PFMA in D-5 for the creel survey and D-6 for $\log$ data.

## Groundfish

Recreational groundfish retention for the SG in 2011 totalled 31,898 pieces for May to September and 33,584 for the entire survey period (Tables 11 and 13). For the May to September period, retained catch consisted of $6.9 \%$ halibut, $15.0 \%$ lingcod, 28.7\% rockfish, and $49.3 \%$ other groundfish.

More accurate species identification has allowed catch estimates for most groundfish species, including rockfish. Previous reports (Hardie et al. 2003) have identified only three species of groundfish and nine species of rockfish; however, beginning in 2007 an additional nine species of groundfish were identified by creel surveyors. Lingcod, rockfish, and spiny dogfish (Squalus acanthias) catches have been recorded the longest (since 1981) and halibut recording began in 1998. Since 2000, all species of groundfish intercepted in the survey (i.e. retained catch that is observed by a creel surveyor) have had an estimate generated. A taxonomic reference of all species reported in 2011 is presented in Appendix E.

Groundfish retained for the May to September period in $2011(31,898)$ increased $17.5 \%$ from $2010(27,156)$. Rockfish comprised the largest proportion of this catch in 2011 at 9,612 (30.1\%) pieces along with rock sole (Lepidopsetta bilineata) at 6,158 (19.3\%) pieces, lingcod at 5,047 ( $15.8 \%$ ) pieces, greenling (Hexagrammidae spp.) at 3,193 ( $10.0 \%$ ), Starry Flounder (Platichthys stellatus) at 1,998 (6.3\%) pieces, and halibut at 1,821 (5.7\%) pieces. From May to September, halibut retentions have decreased relative to the five-year average by $24.5 \%$ (five-year average $=2,411$ ) and lingcod has increased by $46.3 \%$ (five-year average $=3,449$ ). Rockfish retention increased by $15.6 \%$ from the five-year average of 8,315 (Figure 16).

The 2011 catch of groundfish species was not evenly distributed across the study area. Retained rockfish was highest in PFMA's 20(SG), 17, 18, and 13 with $24.7 \%, 15.3 \%$, $13.9 \%$, and $11.8 \%$ of the total catch, respectively (Table 13). Lingcod retention was highest in PFMA 17 (29.9\%), followed by PFMA's 14 (13.4\%), 18 (12.5\%), 13 ( $10.9 \%$ ) and 20(SG) (10.6\%; Table 13). Halibut retained was highest in PFMA's 19 (83.3\%), 20 (SG) ( $10.9 \%$ ), and 13 ( $2.4 \%$; Table 13). Table 15 provides a summary of groundfish kept for the entire survey period by major catch areas. Tables 12 and 14 provide summaries of groundfish releases by month and PFMA respectively. A breakdown of lingcod releases, by legal versus sub-legal size categories, is provided in Appendices C20 and C-21 respectively.

Since 2001, nine species of rockfish have been identified throughout the survey. In 2009, kept and release estimates were grouped into two categories; group 1 and group 2. Rockfish group 1 consists of any catch for china (Sebastes nebulosus), copper ( $S$. caurinus), quillback ( $S$. maliger), tiger ( $S$. nigrocinctus), and yelloweye ( $S$. ruberrimus) and group 2 consists of any other rockfish species, including those that were unidentified. Of the identified species, only three species, copper and quillback, and yelloweye showed considerable retention in the SG for 2011 (Table 16). Tables 11 and 12 provide rockfish
catch summaries by month and Tables 13 and 14 by PFMA. Figure 16 displays monthly estimated catches along with the five year average.

The estimated retained CPUE for groundfish varied through the creel survey period across species, with a high of 0.37 in October and lows of 0.00 in December and February and averaged 0.20 for the year (Figure 17; Appendix D-3). Retained CPUE for rockfish ranged from a high of 0.13 in July to 0.00 in October and February to March and averaged 0.08 for the entire year. Kept and released CPUE for the creel survey is summarized by PFMA (Appendix D-7) and by month (Appendix D-3) for rockfish and groundfish. The CPUE for both groundfish and rockfish for $\log$ data are presented in Appendices D-4 and D-8 by month and PFMA respectively.

Kept CPUE for halibut during the creel survey ranged from 0.21 in April to 0.01 in July to September (and 0.00 from October to February) and averaged 0.02 for the year (Appendix D-1). Lingcod retention occurred from May to September and CPUE ranged from 0.08 in May to 0.03 in June, August, and September and averaged 0.04 for the year (Appendix D-1). Released CPUE for the creel survey is presented by month and PFMA in Appendix D-1 and D-5, respectively. The CPUE for the log data used with the estimates in 2011 are displayed in Appendix D-2 by month and Appendix D-6 by PFMA.

## BIOLOGICAL DATA

## Adipose-clipped chinook and coho

In 2011, for the entire survey period, 1,491 chinook ( $4.2 \%$ of total estimated catch; $88.6 \%$ of catch passing by creel observers) were examined for adipose fin clips. Of the chinook examined during the May to September period, $16.8 \%$ had clips ( $22.7 \%$ for Victoria region, $11.5 \%$ for South Gulf, and $4.8 \%$ for the North Gulf; Table 17). Chinook kept catch from May to September was 3,816 adipose-clipped, 28,419 unclipped, and 507 unknown for a total of 32,742 pieces (Appendix C-7). Of retained chinook with known mark status (for the entire survey period) $52.6 \%$ of adipose-clipped occurred in PFMA 20 (SG), $31.6 \%$ in $19,5.8 \%$ in 17 , and $3.3 \%$ in 13 (Appendix C-8). Unclipped chinook retention was $40.2 \%$ in PFMA 13, $24.4 \%$ in 20 (SG), $8.7 \%$ in 14 , and $7.6 \%$ in 29 (Appendix C-8). Releases by marked, unmarked, and unknown status are also presented in Appendix C-7 by month and in Appendix C-8 by PFMA.

For the entire survey period, 535 coho ( $6.4 \%$ of total catch; $95.9 \%$ of catch passing by creel observers) were examined for adipose fin clips. Among coho examined for the May to September period, $83.8 \%$ had adipose clips. Regionally (for the same period), percentages of adipose clips were $85.8 \%, 71.4 \%$, and $84.6 \%$ for Victoria, South Gulf, and North Gulf, respectively (Table 18). Coho kept catch from May to September was 2,764 adipose-clipped, 865 unclipped, and 11 unknown for a total of 3,640 pieces (Appendix C5). Coho with known mark status (for the entire survey period) were $75.5 \%$ adipose-
clipped in PFMA 20(SG), $8.5 \%$ in 13, $5.9 \%$ in 28, and $3.3 \%$ in 19 (Appendix C-6). Unclipped coho retention was $77.6 \%$ in PFMA 20(SG), $10.1 \%$ in $19,5.0 \%$ in 18, and $3.8 \%$ in 13 (Appendix C-6). Releases by marked, unmarked, and unknown status are also presented in Appendix C-5 by month and in Appendix C-6 by PFMA.

In 2011, 788 heads were returned to the Sport Head Recovery Program (SHRP) from the SG survey area, but 264 chinook heads were excluded from PFMA 20(SG) as they were listed as caught in PFMA 20 in general and potentially from catch areas outside our survey area. Of the remaining 329 adipose-clipped Chinook, $41.8 \%$ contained a CWT. The number of CWT's recovered by stock are summarized in Table 19. Further information on the SHRP can be obtained from the web at <http:// http://www.pac.dfo-mpo.gc.ca/fm-gp/rec/points/shrp-prts-eng.html > (accessed 2016 Nov 18) or by calling 1-866-483-9994.

## Catch-at-age for chinook

During 2011, 593 chinook were sampled for scales. All scale samples were sent to the aging lab at the Pacific Biological Station (PBS) to be aged resulting in 461 readable samples; 132 could not be aged due to regenerated scales or incorrect mounting. Table 20 lists the monthly number and age composition of readable chinook samples. All ages represent total age at year of life caught (including both freshwater and marine life stages - i.e. Gilbert-Rich age (Groot and Margolis 1991)). Age data are summarized graphically in Figure 18.

Monthly age proportions were applied to estimated monthly chinook catches kept to provide a breakdown by age group (Table 21). The 2011 chinook recreational kept catch in the SG consisted of $3.5 \%$ 2-year olds ( 5 -year average $=4.7 \%$ ), 28.6\% 3-year olds (5year average $=46.3 \%$ ), $57.5 \% 4$-year olds ( 5 -year average $=41.6 \%$ ), and $10.5 \% 5$-year olds or greater ( 5 -year average $=7.4 \%$; Table 23).

## Mean length-at-age for chinook and length for coho

In 2011, the average fork length (FL) of measured chinook was $73.6 \mathrm{~cm}(\mathrm{n}=738$; Figure 19). Length at age by month is presented in Table 22. The overall mean length of age 3 and 4 fish were $660(\mathrm{n}=132)$ and $779(\mathrm{n}=265) \mathrm{mm}$, respectively. The longest salmon sampled was a 1040 mm FL unclipped adipose chinook landed at Sunny Shores Marina on 26 July caught in PFMA 20(SG), and the scale age of this fish was determined to be $5_{1}$ (Gilbert-Rich age, Age 5).

Of all chinook measured for length by SG creel survey staff in 2011, 11 (1.5\%) were smaller than the legal size limit ( $<45 \mathrm{~cm}$ in PFMA 19 (south of Cadboro Point) and 20 (SG) and $<62 \mathrm{~cm}$ in PFMA 13-18, 19 (north of Cadboro Point), 28, and 29). Of the 547 retained chinook that were measured from May to September in all areas, 10 ( $1.8 \%$ ) were sub-legal. Sub-legal chinook retention has been tracked since 1989 when the size
limit changed; this was also the highest retention year ( $\sim 22 \%$ ). Since 2000, retention rates have varied between $\sim 1$ to $6 \%$ for the entire SG study area, and was $3 \%$ in 2011. Historical rates of sub-legal sized retained chinook observed in the creel survey are presented in Table 24.

The average fork length of measured coho salmon was 604 mm in 2011 ( $\mathrm{n}=164$; Figure 20). In total, $29.4 \%$ of coho observed during interviews ( $\mathrm{n}=558$ ) were measured. The longest coho sampled was a 790 mm FL unclipped adipose fish landed at Pedder Bay Marina on 22 October, caught in PFMA 20(SG).

## SUMMARY

A tidal recreational fishery creel survey was conducted in the Strait of Georgia (SG) in 2011 to estimate the catch of all reported recreational finfish species and the total recreational fishing boat trips. Logbook data were also collected. In this report, data are presented by month and PFMA.

For the entire creel survey period (May to September for the entire SG, PFMA 19 and 20(SG) were surveyed from February to December) recreational fishers made an estimated 118,261 boat trips. A total of 5,829 finfish boat trips (4.9\%) were interviewed at 35 landing sites in the SG creel survey area. A total of 85 aerial surveys were used to count fishing effort.

Based on these data, recreational anglers retained an estimated 187,966 finfish pieces of which $82.1 \%$ were salmon and $17.9 \%$ were groundfish. The 154,382 landed salmon consisted of 35,210 ( $22.8 \%$ ) chinook, 8,302 ( $5.4 \%$ ) coho, 15,539 ( $10.1 \%$ ) sockeye, $94,468(61.2 \%)$ pink, 786 ( $0.5 \%$ ) chum, and 78 unidentified salmon. The 33,584 landed groundfish consisted of 2,325 ( $6.9 \%$ ) halibut, 5,053 ( $15.0 \%$ ) lingcod, 9,639 ( $28.7 \%$ ) rockfish, and 16,566 (49.3\%) other groundfish. Anglers also released 200,801 finfish during the same period which consisted of $58.8 \%$ salmon and $41.2 \%$ groundfish. The 118,081 released salmon consisted of 31,235 ( $26.5 \%$ ) chinook, 25,661 ( $21.7 \%$ ) coho, 4,115 ( $3.5 \%$ ) sockeye, 30,422 ( $25.8 \%$ ) pink, 218 ( $0.2 \%$ ) chum, and 26,429 ( $22.4 \%$ ) unidentified salmon. The 82,720 released groundfish consisted of $195(0.2 \%)$ halibut, 26,534 ( $32.1 \%$ ) lingcod, 25,622 ( $31.0 \%$ ) rockfish, and 30,369 (36.7\%) other groundfish.

Comparisons of the 2011 estimates are made to the previous five years of catch estimates to determine trends in catch, effort, and catch per unit effort. Effort and chinook kept catch followed the same general pattern as the 2006 to 2010 five-year averages. Chinook kept CPUE was higher than average for April to July and dropped below in October. Coho kept CPUE was similar to the average until October when it increased over 13 times. Sockeye and pink kept catches were similar to the average while chum was well below. Based on biological samples from the creel survey, we estimate that $29.0 \%$ of
kept chinook and $47.2 \%$ of kept coho were adipose fin-clipped. In addition, age results from chinook scales indicate retained catch was $3.5 \%$ age 2 fish, $28.6 \%$ age 3 fish, $57.5 \%$ age $4,10.4 \%$ age 5 fish, and $0.0 \%$ age 6 fish.

## ACKNOWLEDGEMENTS

The authors would like to thank our field surveyors and the logbook participants who collected data to make this report and the catch estimates possible. We thank staff at the Pacific Biological Station Fish Ageing Lab for providing scale ages from the samples, and staff at J.O. Thomas and Associates for analysing code-wire tags obtained from chinook and coho. Finally, we thank the private marina and boat ramp operators for their cooperation and assistance as well as the thousands of recreational fishers who voluntarily participated in this survey.

${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
${ }^{2}$ Other Groundfish includes all other groundfish except halibut, lingcod, and any rockfish.
${ }^{3}$ Rockfish Group 1 includes china, copper, quillback, tiger, and yelloweye.
${ }^{4}$ Rockfish Group 2 includes all other rockfish not included in Rockfish Group 1.
${ }^{5} \mathrm{Log}=$ logbook reported data incorporated into final estimate

## Appendix B. Strait of Georgia creel (SG) survey study area.

The creel 'Areas' delineated within the SG creel survey prior to 2011 were statistical salmon purse-seine fishing areas used previous to the current PFMAs (Shardlow 1985). In 2010 a review was done which resulted in certain creel sub-areas being realigned (Ganton 2011) so that each creel 'Area' matched each PFMA as legally described in schedule 2 (Management Area boundary descriptions) of the Pacific Management Areas Regulations, 2007, SOR/2007-77. Catch and effort estimates were produced for PFMA 13 through 19, 20(SG), 28, and 29 and these areas are further divided for the purpose of the creel survey into creel sub-areas (Figure $3 \mathrm{a}, \mathrm{b}$ and c ). Sub-areas being delineated by observed sport fishing patterns and concentrations.

The SG creel survey study area and landing site locations used in 2011 are shown in Figure 1. The study area for which these statistics apply includes those waters of JDF Strait and the SG bounded in the south by a line from Sheringham Pt. on Vancouver Island due south to an intersection with the International Boundary and along the International Boundary to the B.C, Mainland coast at Blaine (Boundary Bay) and in the northern by the following boundary lines:

1. A line in Johnstone Strait from Rock Point just west of Rock Bay to a point approximately 1 km west of the western-most point of Turn Island.
2. Includes the waters of Nodales Channel south of East Thurlow Island bound by a line from Johns Point on East Thurlow Island to Owen Point on the mainland coast.
3. Bute Inlet below a line from Lawrence Point across the inlet. This coincides with the intersection of PFMA sub-areas 13-21 and 13-22.
4. A line from Raza Point on Raza Island northwest to the mainland coast off Calm Channel.
5. A line from the southern-most point of Raza Island to the western-most point of West Redonda Island.
6. A line from the eastern-most point of West Redonda Island from Marylebone Point to Horace Head on East Redonda Island.
7. Desolation Sound bound by a line from the southern-most point of East Redonda Island to Price Point on the mainland coast.
8. A line from Zephine Head on Gifford Peninsula south of Desolation Sound to Sarah Point on the Malaspina Peninsula.
9. A line from Elephant Point on the mainland coast northeast of Saint Vincent Bay to intersect with the peak of Mount Foley approximately 1.5 km south southwest of Lapan Creek.
10. A line starting at a point approximately 2.5 km north of Dacres Point on the mainland coast to a point approximately 1 km north of Treat Creek.
11. A line that coincides with the intersection of PFMA sub-areas 16-9 and 16-11 from Egmont Point on the mainland coast to the Sechelt Peninsula.
12. A line that coincides with the intersection of the boundaries of PFMA sub-areas 28-1 and 28-3 in Howe Sound.
13. A line from the southern-most point of Halkett Point on Gambier Island due east till it intersects with the mainland coast at Lions Bay.
14. A line directly under the Lions Gate Bridge from Prospect Point northeast to the West Vancouver shoreline.

${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
${ }^{2} 78$ unidentified salmon were kept in the SG in 2011 and were not included.

## Appendix E. Taxonomic reference of species reported in 2011.

*Listed alphabetically by common name.

Black rockfish
Brown Irish lord
Cabezon
Canary rockfish
China rockfish
Chinook salmon
Chum salmon
Coho salmon
Copper rockfish
Dogfish (spiny dogfish)
Flatfishes
Flounder
Greenling
Hake (Pacific)
Halibut (Pacific)
Herring (Pacific)
Kelp greenling
Lingcod
Mackerel (chub)
Not identified salmonids
Other groundfish
Other rockfish
Other sole
Pacific cod
Pacific sandab
Pink salmon
Quillback rockfish
Ratfish
Red Irish lord
Rock sole
Sculpins
Skates
Sockeye salmon
Starry flounder
Tiger rockfish
Vermillion rockfish
Yelloweye rockfish
Yellowtail rockfish

Sebastes melanops
Hemilepidotus spinosus
Scorpaenichthys marmoratus
Sebastes pinniger
Sebastes nebulosus
Oncorhynchus tshawytscha
Oncorhynchus keta
Oncorhynchus kisutch
Sebastes caurinus
Squalus acanthias
Heterosomata, Plueronectiforme spp.
Bothidae, Pleuronectidae spp.
Hexagrammidae spp.
Merluccius productus
Hippoglossus stenolepis
Clupea harengus pallasi
Hexagrammos decagrammus
Ophiodon elongatus
Scomber japonicus
Salmonidae spp.
Other species in class Chondricthyes and Osteichthyes
Sebastes, Sebastodes, Sebastolobus spp.
Bothidae, Pleuronectidae spp.
Gadus macrocephalus
Citharichthys sordidus
Oncorhynchus gorbuscha
Sebastes maliger
Hydrolagus colliei
Hemilepidotus hemilepidotus
Lepidopsetta bilineata
Cottidae spp.
Rajidae spp.
Oncorhynchus nerka
Platichthys stellatus, Inopsetta ischyra
Sebastes nigrocinctus
Sebastes miniatus
Sebastes rubberimus
Sebastes flavidus

Appendix F. Tidal effort statistics and recreational estimates of chinook and coho kept for the SG, 1960 to 1985.

| Year | Effort ${ }^{1}$ (boat trips) | Chinook | Coho |
| :---: | :---: | :---: | :---: |
| 1960 | 189,150 | 83,000 | 238,000 |
| 1961 | 199,935 | 63,000 | 152,000 |
| 1962 | 205,547 | 86,000 | 167,000 |
| 1963 | 247,590 | 65,000 | 199,000 |
| 1964 | 198,120 | 51,000 | 182,000 |
| 1965 | 250,020 | 53,000 | 175,000 |
| 1966 | 259,100 | 80,000 | 249,000 |
| 1967 | 254,500 | 115,000 | 200,000 |
| 1968 | 265,030 | 150,000 | 250,000 |
| 1969 | 281,475 | 185,000 | 200,000 |
| 1970 | 306,255 | 220,000 | 500,000 |
| 1971 | 341,123 | 255,000 | 800,000 |
| 1972 | 300,349 | 287,000 | 335,000 |
| 1973 | 293,141 | 272,000 | 373,000 |
| 1974 | 443,441 | 269,000 | 772,000 |
| 1975 | 334,490 | 398,000 | 454,000 |
| 1976 | 340,729 | 490,000 | 415,000 |
| 1977 | 363,350 | 372,000 | 682,000 |
| 1978 | 369,035 | 500,000 | 1,103,000 |
| 1979 | 404,710 | 350,000 | 708,735 |
| 1980 | 510,400 | 204,100 | 393,500 |
| 1981 | 494,604 | 197,239 | 317,091 |
| 1982 | 559,395 | 124,390 | 411,686 |
| 1983 | 435,335 | 139,982 | 344,664 |
| 1984 | 562,113 | 315,913 | 401,628 |
| 1985 | 549,986 | 196,888 | 670,753 |
| 1986 | 502,334 | 146,781 | 530,345 |

${ }^{1}$ Effort prior to 1980 (the start of the creel survey) may not represent boat trips.

## Appendix G. Species and area specific tidal regulations for major finfish in the SG, 2011.

General regulations which affected the 2011 SG recreational fishery for major finfish species are summarized below (these regulations do not include tidal and non-tidal portions of the Fraser River):

- All coho, sockeye, pink and chum must measure 30 cm or more (tip of nose to fork of tail) and the daily limit was four (4), possession eight (8) except for coho which was two (2) per day and possession four (4). There were no annual limits on these species.
- The minimum size limit for chinook was 62 cm . Daily limit of chinook was two (2), possession of four (4). In a portion of PFMA 19/20 (Cadboro Bay to Sheringham Pt.), the minimum size limit for chinook was 45 cm .
- The annual limit for chinook coast wide was 30. The annual limit for PFMA 13 to 19 (north of Cadboro Point) is 15 chinook. The annual limit for PFMA 19 and 20 (south of Cadboro Point to Sheringham Point) was 20 chinook.
- Conservation measures were implemented again in specific PFMAs to protect certain chinook stocks including early timed Fraser River and lower SG. Please see the website at the bottom of the page for specific details.
- Two (2) adipose marked coho per day could be retained from 01 June to 31 December.
- The recreational fishery for Fraser River sockeye in South Coast marine waters was open to sockeye retention from 10 August until 16 September.
- The recreational rockfish and lingcod fisheries in the $S G$ were operated concurrently and were open from 01 May to 30 September.
- The recreational halibut fishery was open from 01 March to 05 September. The daily limit was one (1) per day with a possession limit of two (2).
- Program details for the halibut experimental recreational fishery for the 2011 fishing season are now available at: http://www.pac.dfo-mpo.gc.ca/indexeng.htm. Included on this website is an expression of interest form as well as a presentation that describes program details.
- Anglers are reminded that there are 164 Rockfish Conservation Areas (RCA's) coast wide and that fin fishing is prohibited in these areas. Maps and descriptions of RCA's are available on the DFO website and at local DFO offices.

For a comprehensive list of area and species specific regulations in the SG for 2011, please refer to the 2011-2013 British Columbia Tidal Waters Sport Fishing Guide and the following website: [http://www-ops2.pac.dfo-mpo.gc.ca/fns-sap/index-eng.cfm](http://www-ops2.pac.dfo-mpo.gc.ca/fns-sap/index-eng.cfm) (Accessed Nov 21, 2016).

[^0]:    ${ }^{1}$ This table uses values from May to September inclusively for historical comparisons
    ${ }^{2}$ Change in estimation methods (see English et al. 2002)

[^1]:    ${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
    ${ }^{2}$ Chin = chinook, Sock=sockeye and NO ID = unidentified salmon
    ${ }^{3}$ Log = logbook reported data incorporated into final estimate

[^2]:    ${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
    ${ }^{2}$ Chin = chinook, Sock=sockeye and NO ID = unidentified salmon
    ${ }^{3}$ Log $=$ logbook reported data incorporated into final estimate

[^3]:    178 unidentified salmon were kept and 26,429 unidentified salmon were released in the SG in 2011and were not included.
    ${ }^{2}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
    ${ }^{3} \mathrm{Log}=$ logbook reported data incorporated into final estimate
    No sub-legal chinook were reported released in the useable logbook data.

[^4]:    178 unidentified salmon were kept and 26,429 unidentified salmon were released in the SG in 2011 and were not included.
    ${ }^{2}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
    ${ }^{3}$ Log $=$ logbook reported data incorporated into final estimate
    No sub-legal chinook were reported released in the useable logbook data.

[^5]:    ${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
    ${ }^{2}$ Other Groundfish includes all other groundfish except halibut, lingcod, and any rockfish.
    ${ }^{3}$ Rockfish Group 1 includes china, copper, quillback, tiger, and yelloweye.
    ${ }^{4}$ Rockfish Group 2 includes all other rockfish not included in Rockfish Group 1.
    ${ }^{5}$ Log $=$ logbook reported data incorporated into final estimate

[^6]:    ${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
    ${ }^{2}$ Other Groundfish includes all other groundfish except halibut, lingcod, and any rockfish.
    ${ }^{3}$ Rockfish Group 1 includes china, copper, quillback, tiger, and yelloweye.
    ${ }^{4}$ Rockfish Group 2 includes all other rockfish not included in Rockfish Group 1.
    ${ }^{5}$ Log $=$ logbook reported data incorporated into final estimate

[^7]:    ${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
    ${ }^{2}$ Other Groundfish includes all other groundfish except halibut, lingcod, and any rockfish.
    ${ }^{3}$ Rockfish Group 1 includes china, copper, quillback, tiger, and yelloweye.
    ${ }^{4}$ Rockfish Group 2 includes all other rockfish not included in Rockfish Group 1.
    ${ }^{5} \mathrm{Log}=$ logbook reported data incorporated into final estimate

[^8]:    ${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.

[^9]:    ${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
    ${ }^{2} 26,429$ unidentified salmon were released in the SG in 2011 and were not included.

[^10]:    ${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
    ${ }^{2}$ 26,429 unidentified salmon were released in the SG in 2011 and were not included.

[^11]:    ${ }^{1} 78$ unidentified salmon were kept and 26,429 unidentified salmon were released in the SG in 2011 and were not included.
    ${ }^{2}$ Rel $=$ released.
    ${ }^{3}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.

[^12]:    178 unidentified salmon were kept and 26,429 unidentified salmon were released in the SG in 2011 and were not included.
    ${ }^{2}$ Rel $=$ released.
    ${ }^{3}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.

[^13]:    178 unidentified salmon were kept and 26,429 unidentified salmon were released in the SG in 2011 and were not included.
    ${ }^{2}$ Rel $=$ released.
    ${ }^{3}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.

[^14]:    ${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
    ${ }^{2} 78$ unidentified salmon were kept in the SG in 2011 and were not included.

[^15]:    ${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
    ${ }^{2} 26,429$ unidentified salmon were released in the SG in 2011 and were not included.

[^16]:    ${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
    ${ }^{2} 78$ unidentified salmon were kept in the SG in 2011 and were not included.

[^17]:    ${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
    ${ }^{2} 26,429$ unidentified salmon were released in the SG in 2011 and were not included.

[^18]:    ${ }^{\prime}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
    ${ }^{2} 78$ unidentified salmon were kept in the SG in 2011 and were not included.

[^19]:    ${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.
    ${ }^{2} 26,429$ unidentified salmon were released in the SG in 2011 and were not included.

[^20]:    ${ }^{1}$ In 2011 PFMA 19 and 20 (SG) were surveyed February to December. All other PFMAs were surveyed between May and September.

[^21]:    ${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.

[^22]:    ${ }^{1}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.

[^23]:    ${ }^{1}$ In 2011 PFMA 19 and 20 (SG) were surveyed February to December. All other PFMAs were surveyed between May and September.

[^24]:    ${ }^{1}$ Total includes species listed in table only.
    ${ }^{2}$ Rel. $=$ released.
    ${ }^{3}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.

[^25]:    ${ }^{1}$ Total includes species listed in table only.
    ${ }^{2}$ Rel. $=$ released.

[^26]:    ${ }^{1}$ Total includes species listed in table only.
    ${ }^{2}$ Rel. $=$ released.
    ${ }^{3}$ In 2011 PFMA 19 and 20(SG) were surveyed February to December. All other PFMAs were surveyed between May and September.

[^27]:    ${ }^{1}$ Total includes species listed in table only.
    ${ }^{2}$ Rel. $=$ released.
