Canadian Technical Report of Fisheries and Aquatic Sciences

Technical reports contain scientific and technical information that contributes to existing knowledge but which is not normally appropriate for primary literature. Technical reports are directed primarily toward a worldwide audience and have an international distribution. No restriction is placed on subject matter and the series reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Technical reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report is abstracted in Aquatic Sciences and Fisheries Abstracts and indexed in the Department's annual index to scientific and technical publications.

Numbers 1 - 456 in this series were issued as Technical Reports of the Fisheries Research Board of Canada. Numbers 457 - 714 were issued as Department of the Environment, Fisheries and Marine Service Technical Reports. The current series name was changed with report number 925.

Technical reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

Rapport technique canadien des sciences halieutiques et aquatiques

Les rapports techniques contiennent des renseignements scientifiques et techniques qui constituent une contribution aux connaissances actuelles, mais que ne sont pas normalement appropriés pour la publication dans un journal scientifique. Les rapports techniques sont destinés essentiellement à un public international et ils sont distribués à cet échelon. Il n'y a aucune restriction quant au sujet; de fait, la série reflète la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports techniques peuvent être cités comme des publications complètes. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports techniques sont résumés dans la revue Résumés des sciences aquatiques et halieutiques, et ils sont classés dans l'index annual des publications scientifiques et techniques du Ministère.

Les numéros 1 à 456 de cette série ont été publiés à titre de rapports techniques de l'Office des recherches sur les pêcheries du Canada. Les numéros 457 à 714 sont parus à titre de rapports techniques de la Direction générale de la recherche et du développement, Service des pêches et de la mer, ministère de l'Environnement. Les numéros 715 à 924 ont été publiés à titre de rapports techniques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 925.

Les rapports techniques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

ABSTRACT

Drozdowski, A., E. Horne and F. Page. 2018. Seasonal Current Statistics and Tidal Constituents from Canso Strait and Eastern Nova Scotia. Can. Tech. Rep. Fish. Aquat. Sci. 3280: viii + 122p

Current statistics and tidal constituents are presented graphically and in table form for the Canso Strait and Eastern Scotian Shelf area. Twenty six current meters were deployed and recovered with usable data for this analysis. The report describes the deployment, data processing, analysis and presentation methods used.

RÉSUMÉ

Drozdowski, A., E. Horne and F. Page. 2018. Les statistiques des courants saisonniers et les composantes de marée du détroit de Canso et de la zone de l'est du plateau néo-écossais. Can. Tech. Rep. Fish. Aquat. Sci. 3280: viii + 122p.

Les statistiques des courants et les composantes de marée du détroit de Canso et de la zone de l'est du plateau néo-écossais sont présentées sous forme de graphique et de tableau. Vingt-six courantomètres ont été déployés et récupérés afin d'obtenir des données utilisables aux fins de la présente analyse. Le rapport décrit le déploiement, le traitement des données, l'analyse et la présentation des méthodes utilisées.

INTRODUCTION

This report presents current meter data collected during 2015-17 in support of the World Class Tanker Safety Systems (WCTSS) project for Port Hawkesbury. The port sits on the Canso Strait (Eastern Nova Scotia) and is currently one of the busiest ports in Canada in terms of tonnage, hosting large international transport ships and oil tankers, which navigate to the area through Chedabucto Bay (Figure 1 and 2).

The aim of the data collection was to improve hydrographic knowledge of the area and aid the development and validation of a hydrodynamic model concurrently being developed for the area. During the data collection period, vertical profile current time series were collected through 26 deployments at 11 stations. As the deployments were generally longer than a month and up to 7 months, the results are summarized as general seasonal statistics and tidal constituents at standard vertical depths. Tidal constituents are also present graphically at bi-weekly time spacing and full vertical resolution. Profile time series of currents along the depth averaged principal axis are included in the Appendix. The report is aimed to serve as reference material for hydrographic queries of the region.

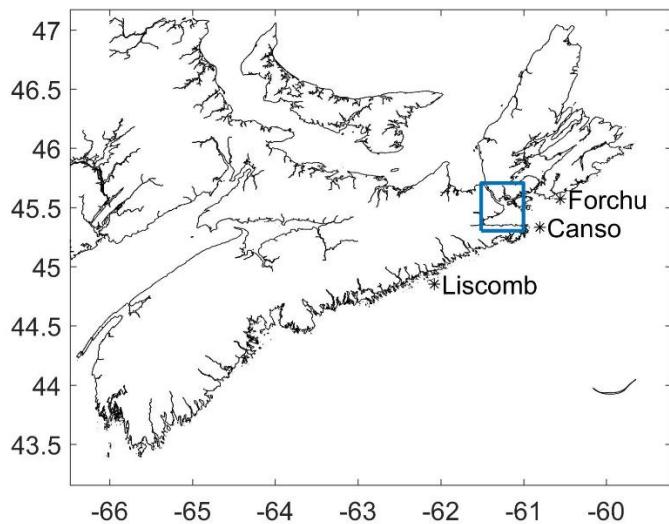

Figure 1 Map showing locations(*) of outer stations. Box shows placement of inset below.

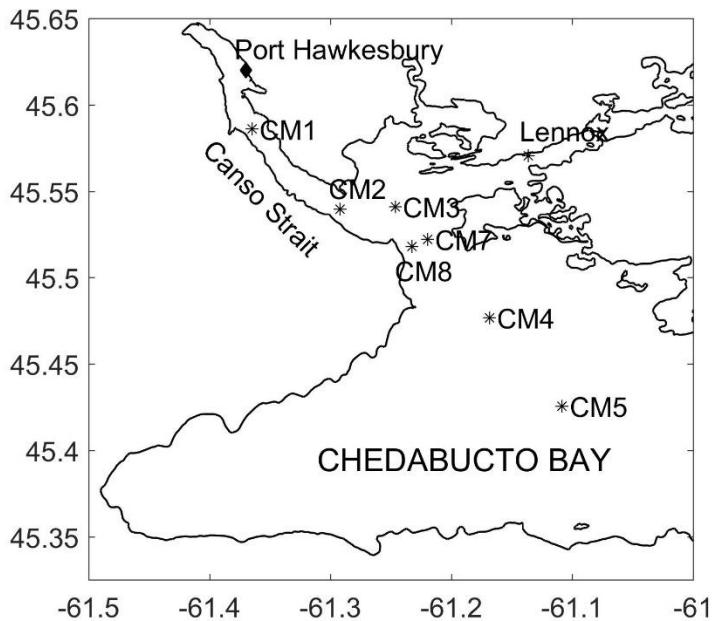

Figure 2 Map showing locations (*) of inner stations (see inset Fig. 1).

2: INSTRUMENT DEPLOYMENT DETAILS

Acoustic Doppler Current Profilers (ADCP's) were used for all 26 deployments described here. The majority of these were done with RDI Sentinel V 300 kHz instruments, and a few with the RDI Workhorse 300 kHz. All instruments were deployed in the upward looking configuration moored near the bottom. The majority of deployments measured currents only and these were deployed in streamlined buoyancy floats anchored 2.5 meters above bottom. A few of the deployments used instruments equipped with a wave package (wave data not included in this report). These were moored in tripod frames resting on the bottom. Figure 1 and 2 show the locations of the stations while Table 1 the occupation period at each station. Station occupation varied from 21 days (Forchu) to nearly 2 years (CM1). More detailed meta-data is presented in Table 2.

3: DATA PROCESSING

Approximately top 10% of ADCP data is contaminated due to surface side-lobe reflection interference (RD Instruments, 1996) and should be removed before analysis. In practice, this cut off can vary from deployment to deployment. The top cut off bin for each of the present deployments, was determined by inspecting bin correlation and error velocity, as well as data itself. Data quality within the vertical bins used for analysis was high with mean correlations above 100 where 100 is the expected correlation in quality data between adjacent vertical bins (see RD Instruments, 1996). Error velocity was typically in the 1-2 cm/s range. Vertical sampling

resolution was high, generally 1m. For further instrument deployment and sampling details refer to Table 2.

With the exception of the Lennox station deployment, only small number of short gaps occurred in the data. These were less than a few hours in duration and were filled with linear interpolation in time of the same bin. For reasons unknown, the Lennox time series had episodic gaps of up a few days (though generally a few hours). These were considered to severe for interpolation. The Lennox data was still used for general statistics but was excluded from tidal analysis which recommends atleast 28 days of gap free data. The sampling period of the instruments was 1 hour or under (generally 10 min.). All sub-hourly data time series were hourly-averaged before analysis.

4: DATA ANALYSIS

4.1 General Statistics

General statistics (abbreviations defined in Table 3) are presented seasonally and at standard levels in Tables 5-13. All compass directions are degrees true (clockwise from true north). Principal ellipse directions is taken as the northern hemisphere direction of the ellipse major axis (i.e. between -90 and 90 degrees).

The statistics were calculated was as follows. For simplicity, seasons were defined as the 3 full calendar months after the commencement of the astronomical seasons (e.g. winter: Jan-Mar). Seasonal coverage was high. Stations CM1 through 8 had at least a year of data while Canso, Liscomb and Lennox a partial spring and complete summer and fall. Forchu was the only poorly sampled station with only 21 days (hence no tidal analysis performed).

Due to the high data volume of this project, some vertical averaging was required to condense the data to reasonable size for presentation while still retaining the information on vertical variation of the currents. The following standard levels were chosen in meters: 5-15, 15-25, 25-35, 35-45 and >45. Data inside each level and season (and over multiple deployments where available), were weighted equally in the analysis. In addition, the same general statistics are presented for the full water column (labeled ALL) and where coverage was adequate, annually. As the Lennox sation was shallow (~12m), and had resolved currents to a depth of 2 m, only statistics for full water column are presented. Tidal analysis for principal tidal axis was done with the t_tide MATLAB package (Pawlowicz et al., 2006). The principal axis (total and tidal) as well mean velocity are also displayed graphically for available seasons and standard levels (Figure 3-12)

4.2 Tidal Constituents Tables

Resolved tidal current constituents are reported in elliptical form in Tables 14-57, for available seasons and standard levels. Ellipse orientations is defined as the angle between major ellipse axis and true north (in the northern hemisphere; i.e. between -90 and 90 degrees). All phases are in degrees GMT.

To perform the tidal analysis, time series were computed by averaging data in available standard levels for each season and station (as above). The tidal analysis was then performed with t_tide on segments longer than 28 day ensuring adequate resolution between semi-diurnal constituents (Foreman, 1977). The t_tide package returns the 95 % percent confidence interval (CI) based on a boot strap estimate. These were also included in the tables. Constituents for stations with more than one available particular season (e.g. CM1), were averaged. To ensure correct vector averaging, the constituents were converted to complex east and north amplitude, averaged, and then converted back to elliptical form. Resolvability was determined by the signal-to-noise ratio

$$SNL = \frac{A_{maj}^2 + A_{min}^2}{A_{majCI}^2 + A_{minCI}^2}$$

Where A denotes major (maj) and minor (min) amplitudes and corresponding confidence intervals (CI). SNL values below 2 were deemed unresolvable and noted as NR in the tables. To exclude poorly resolved constituents which made sporadic appearance within a station, only constituents which were resolvable for more than one season and vertical level were reported. Initially, the tidal analysis was performed allowing all constituents. However, only the following constituents were found to be resolvable in at least one station: M2, S2, N2, M4, MN4, S2K5, K1 and O1 (See Table 4).

4.2 Bi-weekly Tidal Constituent Profile Time series

Tidal constituents are also presented graphically in Figures 13-21. Tidal analysis here was done for all available 28 day periods with 14 day overlaps. No vertical averaging was performed. The goal here is to show the full temporal and vertical variability of the constituents (most clearly seen in CM3, Figure 15 or Canso, Figure 20). Only the dominant constituent from each station is plotted, which, with exception of Canso and Liscomb, was M2.

ACKNOWLEDGMENTS

We would like to thank Shawn Roach and Gary Bugden for excellent field support, and Roger Pettipas and Ryan Stanley for their informative reviews of this document. Gratitud is extended to the captain and crew of the CCGS Perley and Sigma-T are for providing a great working platform and their help with instrument deployment. Funding was supplied by WCTSS.
