Presented March 1, 1916.—*Mr. Carroll* . . . . . *Not printed.*
144. Return to an Order of the House of 16th February, 1916, for a copy of all letters, telegrams and correspondence between the Department of Marine and Fisheries, or any official thereof, and any person or persons in reference to the proposed retirement from office of the present keeper of the lighthouse at Cape Jourmain, in the county of Westmorland. Presented March 1, 1916.—*Mr. Copp* . . . . . *Not printed.*
145. Return to an Order of the House of 7th February, 1916, for a copy of all correspondence between the Department of Militia and Defence or any of its branches, and the Department of Agriculture, in reference to the using of the immigration or quarantine buildings at McNab's Island and Lawlor's Island, Halifax, N.S., for military purposes, and particularly for their use by the 63rd Regiment, Overseas Contingent. Presented March 1, 1916.—*Mr. Maclean (Halifax)* . . . . . *Not printed.*
146. Return to an Order of the House of 7th February, 1916, for a return showing the names of all medical officers appointed and employed for immigration or quarantine purposes at Halifax, St. John, Quebec, Montreal, Toronto, Winnipeg, Regina, Calgary, Edmonton, Vancouver and Victoria, together with the date of appointment of each, their salary, and in each case designating whether they or any of them are still in the service of the Government, and when not, the date when the service ceased. Presented March 1, 1916.—*Mr. Maclean (Halifax)* . . . . . *Not printed.*
147. Return to an Order of the House of the 3rd February, 1916, for a return showing:—1. The names of the different tenderers for the carrying of the mails from the rural boxes established in the counties of l'Assomption and Montcalm down to the present day. 2. The figure of each of such contracts, and the name of the tenderer to whom each of such contracts has been awarded, and for what sum. 3. If any contracts were given without tender. If so, to whom, and for what amount. Presented March 2, 1916.—*Mr. Seguin* . . . . . *Not printed.*
148. Return to an Order of the House of the 21st February, 1916, for a copy of all correspondence and telegrams exchanged between the Labour Department and the workingmen at Thetford Mines prior, during, or after the last strike in that vicinity, and of all other papers relating thereto. Presented March 2, 1916.—*Mr. Verville* . . . . . *Not printed.*
149. Fenian Raid Bounties—to whom paid in Queens County, N.S.—(*Senate*) . . . . . *Not printed.*
150. Return to an Address to His Royal Highness the Governor General, of the 3rd February, 1916, for a copy of all Orders in Council passed since 4th August, 1914, dealing with members of the Canadian Expeditionary Forces in the following particulars: Pensions to partially or totally disabled soldiers or their dependents; money allowances or other provision made for the support or care of partially or totally disabled returned soldiers; and pay allowances or other consideration to dependents of soldiers while on active service, and after their return from active service, because of disablement from any cause. Presented March 3, 1916.—*Mr. Oliver* . . . . . *Printed for sessional papers only.*
151. Return to an Order of the House of the 3rd February, 1916, for a return showing the names of all medical officers employed and designated in the years 1914 and 1915, in the examination of recruits in the county of Pictou, and of any changes in the list of said officers in said period. Presented March 3, 1916.—*Mr. Macdonald* . . . . . *Not printed.*
152. Return to an Order of the House of the 4th March, 1915, for a return showing the names and addresses of all persons in Annapolis and Digby Counties, Nova Scotia, to whom the bounty under the Fenian Raid Volunteer Bounty Act has been paid; the names and addresses of all persons from said counties whose applications have been rejected; and the names and addresses of all applicants from said counties whose applications have not been disposed of. Presented March 3, 1916.—*Mr. Law* . . . . . *Not printed.*
153. Return to an Order of the House of the 19th February, 1915, for a return showing the names and addresses of all persons in South Cape Breton, Nova Scotia, who have been paid Fenian Raid Bounty; the names and addresses of all persons in South Cape Breton, N.S., who have made application for said bounty and who have not yet received it. Presented March 3, 1916.—*Mr. Carroll* . . . . . *Not printed.*

---

**CONTENTS OF VOLUME 28—Continued.**

---

- 154.** Return to an Order of the House of the 1st March, 1915, for a return showing the names and addresses of all persons who received bounty. Raid Bounty was paid in the county of Halifax, N.S., to date. Presented March 3, 1916.—*Mr. Maclean (Halifax)*.

The names, dates of appointment, post office addresses at time of appointment, and former occupations of the censors employed by the Militia Department at Louisburg and North Sydney, Nova Scotia. 2. The names of all the said censors who are also decoders, and the names and addresses of all who are employed in the censorship service at the above points. 3. The amount paid to each censor or decoder since the 4th of August, 1914, up to the 1st February, 1916, or to any party or person in connection with the censorship or decoding services at the above places. Presented March 20, 1916.—*Mr. McKenie.*  
*Not printed.*
196. Return to an Order of the House of the 3rd February, 1916, for a copy of all letters, telegrams, agreements and all other papers relative to the creation of a Board of Conciliation, during the year 1915, under the Industrial Disputes Investigation Act in regard to the employees of the Nova Scotia Steel Company, in the county of Pictou. Presented March 20, 1916.—*Mr. Macdonald* . . . . . *Not printed.*
197. Return to an Order of the House of the 6th March, 1916, for a list of the employees in the Dominion Police Force, with the salary of each of them. Presented March 20, 1916.—*Mr. Boulay* . . . . . *Not printed.*
198. Return showing:—1. Whether the Government have taken cognizance of the following article published in the Montreal "Gazette" on November 1, 1915:—"Canadian Help Comes from Sale of Gift Flour. Foodstuffs not Needed by the English Poor were Bought for Belgian Relief.—Funds to Aid East Coast.—Hon. Walter Long Suggested to Canadian Government that \$750,000 be Allotted, and Latter Agreed.—(Special cable from the "Gazette's" resident staff correspondent.)
- "London, October 31,—'Canada's aid to the east coast towns of England, which are suffering through the war, is the subject of some misconception,' said Sir George Perley to-day. In a statement in the Commons, Hon. Walter Long said that the necessary funds for a Government scheme of help for hotel and lodging house keepers had been generously provided by the Canadian Government. This gave rise to the idea that the Dominion was taking a new step, but the fact is that no money is coming from Canada. Of the flour sent by Canada a year ago to relieve distress in England, very little was distributed, as poverty was in no way abnormal. Some 400,000 bags of this flour were transferred to the American committee for Belgian relief, which purchased them. The money paid for this flour being in the hands of the Local Government Board, Hon. Walter Long, as President of the Board, suggested to Sir George Perley that this might be utilized for the relief of the east coast towns where the season had been ruined owing to the lack of railway facilities and the disinclination of the public to visit the east coast because of the possibility of German naval or aerial raids. The Dominion Government acquiesced in this proposal, and the sum of \$750,000, part of the proceeds of the sale of the flour, has now been allotted for this purpose. Canada's generosity will therefore go to alleviate the distress of a large number of better-class people, who are direct sufferers from the war, instead of the destitute poor, for whom it was intended, but who, it develops, were not in need of it." 2. Whether the said article is accurate. If not, in what respect it is inaccurate. Presented March 20, 1916.—*Mr. Papineau.*  
*Not printed.*
- 198a. Return showing:—1. Whether the Government is aware that the following extract from an article was published on the 12th January, 1915, in the Montreal "Gazette":—
- "Distress Caused in England by War is Negligible.—Comparatively Small Portion of Colonial Gifts Used for National Relief.—Much Went to Belgians.—War Office also took Large Share.—Salvation Army has Scheme Requiring Canadian Co-operation.—(Special cable from the "Gazette's" resident staff correspondent.)
- "London, January 11.—Very satisfactory evidence of the comparative absence in England of any distress caused by the war is furnished by a report on the special work of the Local Government Board arising out of the war, which was issued to-day as a White Paper. The action by Noel Kershaw, dealing with the disposition of the gifts from the Colonies, shows that only a small part of the goods allocated has been required for relieving the distress of civilians.
- "The following is the disposition of the 940,530 bags of flour received from Canada: To the local committees for the relief of distress, 90,474; to the Belgian Refugees Committees, 1,691; transferred to the War Office, 99,760; further offer to the War Office, 300,000; to the Belgian Relief Commission, 443,886; sold, owing to damage, 4,719." 2. Who had charge of accepting delivery and the shipping of this flour. 3. Whether the Government have any information of the shortage of 59,430 bags of flour, alleged in said article. If not, what became of the flour that was short. Presented March 20, 1916.—*Mr. Papineau* . . . . . *Not printed.*

**CONTENTS OF VOLUME 28—Continued.**

199. Return to an Order of the House of the 6th March, 1916, for a return showing the amounts contributed from the constituency of Medicine Hat for machine guns, and by whom contributed or forwarded. Presented March 21, 1916.—*Mr. Buchanan*... *Not printed.*
200. Return to an Order of the House of the 13th March, 1916, for a copy of all letters, petitions, recommendations and other documents in the possession of the Post Office Department relating to the appointment of the postmaster at West Roachdale, Guysborough County, Nova Scotia, to take the place of J. H. McGuire, deceased. Presented March 21, 1916.—*Mr. Sinclair*... *Not printed.*
201. Return to an Order of the House of the 28th February, 1916, for a return showing in detail the payment or payments amounting to \$647.50, paid to P. A. Stoddart, fishery guardian, Shelburne County, N.S., during the year ending March 31, 1915. Presented March 21, 1916.—*Mr. Kyte*... *Not printed.*
202. Return to an Order of the House of the 28th February, 1916, for a copy of all correspondence, letters, telegrams and documents of all kinds relating to the chartering of the vessel *Starling*, by the Department of Marine and Fisheries. Presented March 21, 1916. *Mr. Kyte*... *Not printed.*
203. Return to an Order of the House of the 7th February, 1916, for a copy of all documents, letters, messages, correspondence and reports concerning a conference between the Minister of Agriculture and certain representatives of the Mennonite Church in or about July, 1873, and referred to in a certain letter dated 23rd July, 1873, signed by P. M. Lowe, Secretary of the Department of Agriculture, and addressed to Messrs. David Klassen, Jacob Peters, Heinrich Wiebe and Cornelius Toews, delegates from Southern Russia. Presented March 21, 1916.—*Mr. McCraney*... *Not printed.*
204. Return to an Order of the House of the 13th March, 1916, for a copy of all letters, telegrams, petitions, memorials and other documents relating to the subsidizing by the Government of the construction of ships in British Columbia, or of ships when built; or as to the laying down or constructing or assisting in the construction in British Columbia of twenty-five ships by the Government, or as to assisting by subsidies or otherwise in the construction of ships in the Dominion. Presented March 23, 1916.—*Mr. Macdonald*.  
*Not printed.*
205. Return to an Order of the House of the 13th March, 1916, for a copy of the affidavit of David W. McLean, Windsor, N.S., to whom Warrant No. 25737 was issued for Fenian Raid Bounty, and also a copy of all correspondence and other documents relating to the payment of the same. Presented March 23, 1916.—*Mr. Macdonald*... *Not printed.*
206. Return to an Order of the House of the 9th March, 1916, for a return showing:—1. The amount collected in wharfage on goods landed on Government wharves in the county of Victoria, at Neils Harbour, Ingonish, Englishtown, South Gut, Baddeck, Little Narrows, Nyaiga, and Big Bras d'Or. 2. The amount collected at each of the above places, by whom collected, and how much returned to the Government in each case. Presented March 27, 1916.—*Mr. McKenzie*... *Not printed.*
207. Return to an Order of the House of the 20th March, 1916, for a return showing:—The names of the 54 Canadian officers employed in the Canadian Pay and Record Office, London, and amounts per month paid to each of them. Presented March 27, 1916.—*Mr. Macdonald*... *Not printed.*
208. Return to an Order of the House of the 3rd February, 1916, for a copy of all letters, telegrams, petitions, directions and other documents relative to the surveys for a railway under the Railway Department, which have been carried on during the past summer, at points east and west from Sunnybrae, in the county of Pictou. Presented March 27, 1916.—*Mr. Macdonald*... *Not printed.*
209. Return to an Order of the House of the 21st February, 1916, for a copy of all papers, agreements, letters, telegrams and other documents relating to the proposal to purchase, lease, or use of, the railway known as the Vale Railway, county of Pictou, and to the operation of the same by the Railway Department. Presented March 27, 1916.—*Mr. Macdonald*... *Not printed.*
210. Return to an Order of the House of the 7th February, 1916, for a return showing the number and purpose of all commissions appointed by the Government since 1911, and the cost of each, together with names of the various members of such commissions. Presented March 27, 1916.—*Mr. Pardoe*... *Not printed.*
211. Return to an Order of the House of the 6th March, 1916, for a copy of all correspondence, letters, telegrams and documents relating to the dismissal or resignation of Dr. W. T. Patton from the service of the Veterinary Inspection Branch of the Department of the Interior, and his re-appointment and his later dismissal or resignation. Presented March 27, 1916.—*Mr. Buchanan*... *Not printed.*

### CONTENTS OF VOLUME 28—*Continued.*

- 211a.** Return to an Order of the House of the 3rd April, 1916, for a copy of all correspondence, letters, telegrams and documents relating to the dismissal or resignation of Dr. W. T. Patton, from the service of the Veterinary Inspection Branch of the Department of Agriculture at Coutts, Alberta, and his re-appointment and later dismissal or resignation. Presented May 10, 1916.—*Mr. Buchanan*, . . . . . *Not printed.*
- 212.** Return to an Order of the House of the 28th February, 1916, for a copy of all accounts, telegrams, letters, bills of costs and other documents relating to the case of J. P. Dionne against the King, before the Exchequer Court, in which case Mr. Leo Bérube was attorney and Mr. E. H. Cimon was counsel, both being lawyers of Fraserville. Presented March 27, 1916.—*Mr. Gauvreau*, . . . . . *Not printed.*
- 212a.** Return to an Order of the House of the 5th April, 1916, for a copy of all telegrams and letters from Leo Bérube, lawyer, M.P.P., to the Minister of Justice, relating to the production of the official and public documents asked for by C. A. Gauvreau, M.P., in the case of J. P. Dionne vs. The King, and of any answers of the Minister of Justice to such telegrams and letters. Presented April 10, 1916.—*Mr. Gauvreau*, . . . . . *Not printed.*
- 213.** Return to an Address to His Royal Highness the Governor General, of the 7th February, 1916, for a copy of all correspondence with the Imperial authorities in connection with the purchase of horses, and the prohibiting of the export of horses. Presented March 27, 1916.—*Sir Wilfrid Laurier*, . . . . . *Not printed.*
- 214.** Return to an Order of the House of the 1st March, 1916, for a copy of all correspondence, telegrams, reports and documents of all kinds relating to the visits of a fair wage officer to New Glasgow, N.S., in connection with the schedule of wages of men employed in works making shells at that place. Presented March 28, 1916.—*Mr. Macdonald*, . . . . . *Not printed.*
- 215.** Copy of Order in Council P.C. No. 634, dated 24th March, 1916, *re* the prohibition of the exportation of certain goods including nickel, nickel ore and nickel matte, to certain foreign ports. Presented by Sir Robert Borden, March 28, 1916.  
*Printed for sessional papers only.*
- 216.** Return to an Order of the House of the 6th March, 1916, for a copy of all correspondence, accounts, vouchers, memoranda, etc., relating to the construction of a launch way and boat house at Bear Cove Beach, Halifax County, N.S., and completed in 1914. Presented March 29, 1916.—*Mr. Maclean (Halifax)*, . . . . . *Not printed.*
- 217.** Return to an Order of the House of the 6th March, 1916, for a detailed statement of the expenditure last year at McNair's Cove, Nova Scotia, giving the names of the workmen, the number thus employed, the amount paid to each; also the amount paid for supplies and material, and the names of the persons to whom the same was paid. Presented March 29, 1916.—*Mr. Chisholm (Antigonish)*, . . . . . *Not printed.*
- 218.** Return to an Order of the House of the 6th March, 1916, for a copy of all correspondence, accounts, vouchers, receipts, etc., in connection with the construction of a wharf at Shad Bay, Halifax County, N.S., in 1914 and 1915. Presented March 29, 1916.—*Mr. Maclean (Halifax)*, . . . . . *Not printed.*
- 219.** Return to an Order of the House of the 16th March, 1916, for a return showing:—1. Whether the Government has received any complaints as to the manner of supplying clothing to the Royal Military College, or as to its fit, workmanship or materials employed, or as to any delay in furnishing the cadets with clothing. 2. If so, from whom such complaints have been received. 3. On what grounds. 4. What form the complaint was in. 5. The nature of the complaint. 6. If the Government is aware as to whether or not there has been dissatisfaction as to the fit, workmanship and materials employed, or as to any delay in furnishing the cadets with clothing. 7. If it is true, as alleged, that the late Commandant of the Royal Military College, Colonel Crowe, before he left, recommended a change of system for the supply of clothing, and outlined the features of such a system. 8. If so, the details of the plan suggested. 9. To what extent the plan suggested by Colonel Crowe was adopted. If not adopted, why not. 10. Whether the present Commandant of the Royal Military College made any suggestions as to a change in the system of supplying clothing to the cadets. 11. If so, the changes which he suggested. Presented March 30, 1916.—*Mr. Carvell*, . . . . . *Not printed.*
- 220.** Escape of alien enemies from detention camps at Amherst, N.S.—(*Senate*) . . . . . *Not printed.*
- 221.** Return to an Order of the House of the 21st February, 1916, for a copy of all letters, petitions, papers, telegrams, tenders and other documents relating to the establishment of a rural mail route from Alma, through Sylvester and Loch Broom, and as to the closing of the post offices at Sylvester and Loch Broom. Presented March 31, 1916.—*Mr. Macdonald*, . . . . . *Not printed.*

---

### CONTENTS OF VOLUME 28—Continued.

- 222.** Return to an Order of the House of the 3rd February, 1916, for a copy of all petitions, letters, papers, telegrams, tenders and other documents relating to the establishment of rural mail route from Scotsburn to North Scotsburn, Rogers Hill and Hardwood Hill, and as to the closing of any post offices on said route. Presented March 31, 1916.—*Mr. Macdonald*. . . . . *Not printed.*
- 223.** Return to an Order of the House of the 9th February, 1916, for a copy of all documents, letters, messages, correspondence, reports, etc., regarding the cancellation of the subsidy contract to the Compagnie de Navigation Trans-St. Laurent, and the granting of a like contract to another company, for service between Rivière du Loup, Tadoussac and other ports on the north shore, including all correspondence exchanged between the Department of Trade and Commerce, the Post Office Department, or the ministers of such departments and the two above-named companies. Presented April 3, 1916.—*Mr. Gauvreau*. . . . . *Not printed.*
- 224.** Return to an Order of the House of the 7th February, 1916, for a return showing the amounts expended by the Post Office Department for that part of the present fiscal year ending 31st December, 1915, under the following subheads: Conveyance of mails by land; conveyance of mails by railways; conveyance of mails by steamboats; making and repairing mail bags, locks, etc.; rural mail boxes, salaries, travelling expenses, manufacturing postage stamps and postage notes, tradesmen's bills, stationery, printing and advertising, miscellaneous disbursements, and maintenance of the service in the Yukon. Also showing the revenue for the same period under the various sub-heads of revenue mentioned in Appendix "A" of the report of the Postmaster General for the year ending March 31, 1915. Presented April 3, 1916.—*Mr. Maclean (Halifax)*. . . . . *Not printed.*
- 225.** Return to an Order of the House of the 21st February, 1916, for a copy of a petition from the citizens of Louisville, requesting that L. F. Sanfaçon be not dismissed from his position of postmaster of that town; also of all letters sent by A. Bellemare, M.P., in connection with the dismissal of said L. F. Sanfaçon and asking for such dismissal; and of all letters from the same A. Bellemare, M.P., recommending Chas. Ed. Lasage as postmaster in the place of the said L. F. Sanfaçon. Presented April 3, 1916.—*Mr. Gauvreau*. . . . . *Not printed.*
- 226.** Return to an Order of the House of the 23rd February, 1916, for a copy of all documents, reports, correspondence, etc., relating to the changing of St. Eleuthère Station on the National Transcontinental Railway. Presented April 3, 1916.—*Mr. Lapointe (Kamouraska)*. . . . . *Not printed.*
- 227.** Return to an Order of the House of the 13th March, 1916, for a copy of all instructions, letters, telegrams, and of other documents relating to any action taken, or to be taken, against the firm of Jas. W. Cumming, by the Department of Railways on account of the disclosures made in regard to irregularities in the weighing of freight, as appears in Return No. 25, dated February 29, 1916. Presented April 3, 1916.—*Mr. Macdonald*. . . . . *Not printed.*
- 228.** Certified copy of a Report of the Committee of the Privy Council, approved by His Royal Highness the Governor General on the 3rd April, 1916, respecting the appointment of a Royal Commission to inquire into certain contracts made by a committee (known as the Shell Committee) of which General Sir Alexander Bertram was chairman. Presented by Sir Robert Borden, April 3, 1916. . . . . *Not printed.*
- 228a.** Certified copy of a Report of the Committee of the Privy Council, approved by His Royal Highness the Governor General on the 15th April, 1916, concerning the transmission of the Hansard report containing the debate on the motion of Sir Wilfrid Laurier re expenditure made by the Shell Committee (so-called), to the Right Honourable the Secretary of State for the Colonies, together with a copy of the Order in Council approved on the 3rd instant authorizing the issue of a Royal Commission to inquire into certain contracts made by the said Shell Committee (so-called). Presented by Sir Robert Borden, April 17, 1916. . . . . *Not printed.*
- 229.** Return to an Order of the House of the 20th March, 1916, for a copy of all letters, recommendations, telegrams, reports of officials and other documents relating to the appointment of A. Kastella as Mechanical Superintendent of Dredges, and as to his resignation from said office, and also as to causes and reasons of his resignation or removal. Presented April 4, 1916.—*Mr. Macdonald*. . . . . *Not printed.*
- 230.** Return to an Address to His Royal Highness the Governor General, of the 21st February, 1916, for a copy of all letters, telegrams, memos, Orders in Council, reports, and of all and every document concerning the construction of the dam at Grand'Mère, county of Champlain, province of Quebec, by the Laurentide Co., Limited. Presented April 4, 1916.—*Mr. Lemieux*. . . . . *Not printed.*
- 231.** Memorandum No. 2, respecting work of the Department of Militia and Defence—European War 1914-15, from 1st February, 1915 to 31st January, 1916. Presented by Hon. Mr. Kemp, April 5, 1916. . . . . *Printed for sessional papers only.*

---

### CONTENTS OF VOLUME 28—*Continued.*

- 232.** Return to an Order of the House of the 15th March, 1916, for a copy of all letters, telegrams and petitions in the possession or under the control of the Post Office Department having reference to the dismissal of Postmaster McRitchie at North River Centre, Victoria County, Nova Scotia, and to the appointment of Neil McLeod in his place. Presented April 5, 1914.—*Mr. McKenzie*... ..*Not printed.*
- 233.** Return to an Order of the House of the 27th March, 1916, for a copy of all petitions, correspondence, telegrams, recommendations and other papers or documents in the possession of the Postmaster General or his department, relating to the dismissal of James Hall, Postmaster at Milford Haven Bridge, Guysborough County, Nova Scotia, and the appointment of Guy O'Connor, as his successor. Presented April 5, 1916.—*Mr. Sinclair.*  
*Not printed.*
- 234.** Return to an Order of the House of the 7th February, 1916, for a report showing the apportioning of electoral polling divisions in Manitoba, made by judges under authority of the Dominion Elections Act, 7-8 Edward VII, Chapter 26. Presented April 5, 1916.—*Sir Wilfrid Laurier*... ..*Not printed.*
- 235.** Return to an Order of the House of the 23rd February, 1916, for a copy of all profiles, reports, correspondence and all documents concerning the construction of a viaduct at Amqui, on the Intercolonial Railway, at the place called Traverse Dubé, Dubé Crossing; also of the plans of properties belonging to the Intercolonial Railway at Amqui, and of the land leased to the Municipality of Amqui, with a copy of the lease affecting such land. Presented April 5, 1916.—*Mr. Lapointe (Kamouraska)*... ..*Not printed.*
- 236.** Return to an Order of the House of the 20th March, 1916, for a return showing the number of horses bought for remounts in Alberta, the persons from whom they were purchased, and the amount paid for each horse. Presented April 6, 1916.—*Mr. Buchanan.*  
*Not printed.*
- 237.** Return to an Order of the House of the 15th March, 1916, for a return showing:—1. Who has been furnishing food, clothing and other necessary supplies to the soldiers at North Sydney and Sydney Mines, since the 4th August, 1914, to the 1st February, 1916. 2. The names and amounts paid to each, and amounts due to each on 1st February, 1916, over and above what has already been paid. 3. Whether the said supplies of all kinds were obtained or called for by public tender. If so, how the tenders were called, and who the tenderers were. 4. If the contracts for such supplies were always given to the lowest tenderer. 5. The names of those who tendered, and the figures of the tenders in each case. 6. The different methods by which tenders were invited, and for what classes of merchandise or supplies. Presented April 6, 1916.—*Mr. McKenzie*... ..*Not printed.*
- 238.** Order in Council No. P.C. 680, dated 23rd March, 1916, respecting the application of the Industrial Disputes Investigation Act, 1907, in the case of disputes between employers and employees affecting the delivery of war supplies. Presented by Hon. Mr. Roche, April 6, 1916... ..*Not printed.*
- 239.** Return to an Order of the House of the 13th March, 1916, for a copy of all the evidence taken by the Commission appointed to inquire into claims for damages made against the Militia Department in the town of Sydney Mines, Nova Scotia, and of the report made upon each claim or case, said claims being for damages to lands and other property. Presented April 7, 1916.—*Mr. McKenzie*... ..*Not printed.*
- 240** Return to an Order of the House of the 1st March, 1916, for a copy of all letters, correspondence and telegrams between the Speaker, the Clerk of the House of Commons, the Civil Service Commission and the Minister of Finance in regard to the proposed appointment of Mr. H. Crossley Sherwood, as Assistant Clerk of Routine and Records, from 1st October, 1914, down to the present date. Presented April 7, 1916.—*Mr. Turriff.*  
*Not printed.*
- 240a.** Supplementary Return to an Order of the House of the 1st March, 1916, for a copy of all letters, correspondence and telegrams between the Speaker, the Clerk of the House of Commons, the Civil Service Commission and the Minister of Finance in regard to the proposed appointment of Mr. H. Crossley Sherwood, as Assistant Clerk of Routine and Records, from 1st October, 1914, down to the present date. Presented April 10, 1916.—*Mr. Turriff*... ..*Not printed.*
- 241.** Return to an Order of the House of the 20th March, 1916, for a copy of all recommendations, letters, telegrams and correspondence relating to the recent appointment of a lightkeeper at Arisaig, N.S. Presented April 7, 1916.—*Mr. Chisholm (Antigonish).*  
*Not printed.*

### CONTENTS OF VOLUME 28—*Continued.*

243. Return to an Order of the House of the 3rd February, 1916, for a copy of all letters, telegrams, or other communications sent to the Government or any member or department thereof before 15th August, 1914, pointing out the necessity of granting relief to the settlers in the drouth-stricken area of Alberta. Presented April 10, 1916.—*Mr. Buchanan*... ..*Not printed.*
244. Return to an Address to His Royal Highness the Governor General, for a copy of all correspondence with the Imperial authorities respecting legislation by the Parliament of the United Kingdom, in answer to the petition of the Canadian Parliament asking for amendment of the *British North America Act* with reference to the Senate. Presented April 10, 1916.—*Sir Wilfrid Laurier*... ..*Printed for sessional papers only.*
245. Return to an Address to His Royal Highness the Governor General of the 7th February, 1916, for a copy of all letters, correspondence, memoranda, Orders in Council, etc., relative to the Transatlantic Mail Service for the winter season 1915-16, and passing between the contractor company and any Department of Government or Minister of the Crown. Presented April 10, 1916.—*Mr. Maclean (Halifax)*... ..*Not printed.*
246. Return to an Order of the House of the 21st February, 1916, for a return showing the amounts of money paid by all Departments of the Government to the Regina "Province" and "Standard," the Moosejaw "News," and the "Saskatchewan Star," respectively, in each of the years 1914 and 1915. Presented April 10, 1916.—*Mr. Martin (Regina)*... ..*Not printed.*
247. Return to an Order of the House of the 5th April, 1916, for a copy of all questions asked of candidates for examination in the Inside Civil Service since the 1st May, 1912. Presented April 10, 1916.—*Mr. Boulay*... ..*Not printed.*
248. Return to an Order of the House of the 3rd February, 1916, for a return showing:—1. Who recruiting officers were for the counties of Lunenburg, Queens, Shelburne and Yarmouth, Nova Scotia, during the months of July, August, September, October, November and December, 1915. 2. What remuneration each received during each month, for salary, disbursements and expenses. 3. If they are still employed as recruiting officers. 4. If so, what salary is being paid each recruiting officer per day or per month. Presented March 10, 1916.—*Mr. Kyte*... ..*Not printed.*
249. Return to an Order of the House of the 16th February, 1916, for a return showing:—1. Whether the Government, or the Department of Militia and Defence has employed any parties other than the officers of the permanent force to obtain recruits for the overseas forces. 2. If so, the number of persons so employed in each province. Presented April 11, 1916.—*Mr. Hughes (P.E.I.)*... ..*Not printed.*
250. Return to an Order of the House of the 3rd February, 1916, for a return showing the names and addresses of members of the House of Commons and of the various Provincial Legislatures in Canada who are in the service of the Department of Militia and Defence, either in Canada or overseas; the official rank and rate of pay of each; the names of those who are now in Canada; the names of those who are in England; and the names of those who are or have been in active service at any of the battle fronts. Presented April 11, 1916.—*Mr. Kyte*... ..*Not printed.*
251. Return to an Order of the House of the 16th February, 1916, for a return showing:—1. The amounts expended in railway subsidies in Canada during the years 1912, 1913, 1914 and 1915. 2. The amounts by provinces, and the names of the lines to which granted. 3. Amounts expended on the construction of Government-owned railways in Canada during the above years. 4. The amount expended in each province, and the name of the line of railway on which such expenditure was made. 5. Amounts expended on harbour and river improvements in Canada during the above years. 6. The amounts by provinces and the particular places where expended. 7. Amounts expended on the building of public wharves, public breakwaters, and public dredging in North Cape Breton and Victoria during the years 1905 to 1911, inclusive, including the expenditure on Government railways. 8. Amounts expended for like purposes in the said county, during the years 1912, 1913, 1914 and 1915. Presented April 11, 1916.—*Mr. McKenzie*... ..*Not printed.*
252. Return to an Order of the House of the 29th March, 1916, for a copy of all letters, telegrams, etc., exchanged between the Department of Public Works and the Department of Justice and the Council of the Town of Rigaud, Archibald Macdonald, Elzear Montpetit, and the Rigaud Granite Company, Limited, in connection with the military building. Presented April 11, 1916.—*Mr. Boyer*... ..*Not printed.*
253. Return to an Order of the House of the 3rd April, 1916, for a copy of all letters, telegrams and correspondence of all kinds in any way referring to a subsidy granted to the ss. *Amethyst*, plying between Montreal and Newfoundland ports during the years 1910-11 and 1911-12. Presented April 11, 1916.—*Mr. Maclean (Halifax)*... ..*Not printed.*

## CONTENTS OF VOLUME 28—*Continued.*

- 254.** Return to an Order of the House of the 21st February, 1916, for a copy of all letters, papers, telegrams and other documents relating to the survey in the harbour of Pictou, for a proposed new bridge, by the Railway Department; and also a statement showing the amounts paid in connection with said survey, the names of the persons to whom paid, and the purposes for which they were paid. Presented April 11, 1916.—*Mr. Macdonald*... ..*Not printed.*
- 255.** Return to an Address of the Senate, dated 21st day of March, 1916, for:—A statement giving the following information as regards each of the following countries: Great Britain, France, Russia, Italy, Belgium, Servia, the Dominion of Canada, Australia, New Zealand, and the Confederation of South Africa, for each of the last three years for which the information may be at hand, namely:—  
     (a) The quantity and value of spirituous liquors produced or manufactured;  
     (b) The quantity and value imported;  
     (c) The quantity and value exported; and  
     (d) The quantity and value consumed, giving in each case, the information for each kind of spirituous liquors separately. Ordered, That the same do lie on the Table.—(*Senate*)... ..*Not printed.*
- 256.** Return to an Order of the House of the 16th March, 1916, for a return showing:—1. The number of medical doctors employed by the Militia Department at Halifax, N.S. 2. The name of each, and their rank and pay, respectively. 3. If the entire time of all or any is devoted to the militia service. 4. When not constantly employed in the militia service, the usual daily period of service. Presented April 12, 1916.—*Mr. Maclean (Halifax)*... ..*Not printed.*
- 257.** Return to an Order of the House of the 3rd April, 1916, for a copy of the correspondence between Mr. J. Antime Roy, of l'Isle Verts, and the Federal Government, on the subject of a farm that might be sold or leased to the Government for the purposes of an experimental farm. Presented April 12, 1916.—*Mr. Paquet*... ..*Not printed.*
- 258.** Return to an Order of the House of the 28th February, 1916, for a copy of the contract with the Amalgamated Dry Dock and Engineering Company for the construction of a dry dock at North Vancouver, B.C., together with the application for subsidy therefor, and also a copy of all reports of engineers' correspondence, and all other documents relating thereto. Presented April 12, 1916.—*Mr. Pugsley*... ..*Not printed.*
- 259.** List of those in the Canadian Expeditionary Forces who had received decorations, medals and mentions in despatches, to 17th March, 1916. Presented by Hon. Mr. Kemp, April 12, 1916... ..*Printed for sessional papers only.*
- 259a.** List of decorations and medals awarded to members of the Canadian Expeditionary Force and officers of the Canadian Militia to 17th March, 1915, checked with the London "Gazette" to the above date. Presented by Sir Robert Borden, May 2, 1916.*Not printed.*
- 260.** Return to an Order of the House of the 13th March, 1916, for a return showing the names of all the medical examiners of recruits appointed since the war started to date. Presented April 13, 1916.—*Mr. Nesbitt*... ..*Not printed.*
- 261.** Return showing:—1. How much overtime was paid to men in the Printing Bureau from 1st January, 1916, to 1st April, 1916. 2. The names of the men who were paid overtime. 3. Which were day men, and which night men. 4. What rate of overtime each man received, how much at 1½ day rate, and how much at double rate. Presented April 17, 1916.—*Mr. Turriff*... ..*Not printed.*
- 262.** Return to an Address to His Royal Highness the Governor General of the 3rd February, 1916, for a copy of all Orders in Council, letters, telegrams, recommendations and other documents in connection with the Government's decision in September, 1915, to exact payment of one-half of the seed grain liens. Presented April 18, 1916.—*Mr. Knowles*... ..*Not printed.*
- 263.** Return to an Order of the House of the 9th February, 1916, for a return showing the name, port of registry, tonnage and name of the master of all steam trawlers that cleared outwards from the port of Canso, Nova Scotia, in the year 1915. Also a copy of all reports and declarations under the hand of the master or chief officer of each of the said trawlers so clearing outward from said port since 16th April, 1915, required to be signed by such masters under the provisions of an Order in Council passed on the 16th April, 1915. Presented April 25, 1916.—*Mr. Sinclair*... ..*Not printed.*
- 264.** Return to an Order of the House of the 7th February, 1916, for a statement showing the quantity of wheat shipped month by month, during the calendar years 1914 and 1915, from Winnipeg to Fort William and Port Arthur, and by what railways; to Duluth by the Canadian Northern Railway or allied system; to Minneapolis and St. Paul by the Canadian Pacific Railway, to the seaboard by rail over Canadian territory and to American ports over American railways. Presented April 25, 1916.—*Sir Wilfrid Laurier*... ..*Not printed.*

### CONTENTS OF VOLUME 28—*Continued.*

265. Return to an Order of the House of the 12th April, 1916, for a return showing:—1. How many clerks there are in the Finance Department who belong to and are paid from the outside service vote and who work in the inside service. 2. The names of said clerks. 3. Salary paid to each. 4. How long each has been in the service of the Department. 5. If all or any of these clerks have passed any examination. If so, what examination and on what date or dates. Presented April 26, 1916.—*Mr. Turriff*... ..*Not printed.*
266. Return to an Order of the House of the 23rd February, 1916, for a return showing:—1. The number of permanent employees in the Department of Inland Revenue in 1915-16. 2. How many there will be in 1916-17. 3. How much money was paid in salaries for temporary employees in each of the following years: 1912-13, 1913-14, 1914-15 and 1915-16. 4. The names of the temporary employees and the dates of their appointment, respectively. Presented April 26, 1916.—*Mr. Lanctot*... ..*Not printed.*
267. Return to an Order of the Senate dated the 14th instant, showing the number of men recruited up to the first day of April, 1916.—(*Senate*)... ..*Not printed.*
268. Return to an Order of the Senate, dated the 23rd day of March, 1916, of all papers and documents dealing with the escapes and the liberation of alien enemy prisoners from the detention camp situated at Banff, in the province of Alberta. Ordered, That the same do lie on the table.—(*Senate*)... ..*Not printed.*
269. Return to an Order of the House of the 19th April, 1916, for a return showing:—1. Whether there is a Director of Recruiting and Organizations in England for the Canadian Service. 2. If so, his name and duties. 3. The number employed upon his staff. 4. The total expenses of his staff. Presented April 28, 1916... ..*Not printed.*
270. Return to an Order of the Senate, dated 11th instant:—For a copy of an application made by Rev. Isaac Hunter Macdonald, of Kintore, Ontario, to the Militia Department for a position of chaplain or major; also, of all copies of letters, papers or telegrams either recommending or opposing said application.—(*Senate*)... ..*Not printed.*
271. Return to an Address to His Royal Highness the Governor General of the 29th March, 1916, for a copy of all petitions received by the Governor General in Council requesting the disavowal of the Act of the Legislature of the Province of Ontario, Chapter 45, 5 George V, 1915, concerning the School Commission of the Roman Catholic Schools of the City of Ottawa, and of all documents, memoranda, reports, letters and correspondence concerning the said petitions for disavowal, or concerning the said Act of the Legislature of the Province of Ontario, 5 George V, Chapter 45. Presented May 1, 1916.—*Mr. Lapointe (Kamouraska)*... ..*Not printed.*
- 271a. Order in Council and Report of Minister of Justice transmitting to Lieutenant Governor of Ontario copy of petition from Samuel Genest and others, praying for the disallowance of an Act of the Legislature of Ontario, Chapter 45 of 5 George V (1915). Order in Council and Report of Minister of Justice on the Statutes of the Legislature of Ontario, passed in the 5th year of His Majesty's reign (1915). Report of Prime Minister of Ontario on petition relating to the disallowance of an Act of the Legislature of Ontario, Chapter 45 of 5 George V (1915). Presented May 3, 1916.—*Mr. Lapointe (Kamouraska)*... ..*Printed for sessional papers only.*
272. Return to an Order of the House of the 20th March, 1916, for a copy of all telegrams, letters, correspondence and contracts between the Quebec Harbour Commission and Benjamin Demers, of the parish of St. Nicolas, county of Lévis, concerning the purchase of the St. Nicolas quarry. Presented May 1, 1916.—*Mr. Bourassa*... ..*Not printed.*
273. Return to an Order of the House of the 13th March, 1916, for a return showing a list of vessels belonging to the Canadian Government which are on service under the provision of the Canadian Naval Act, and of all vessels not now in service and their present condition and suitability for service, and also for a copy of all letters, petitions or communications had by or with the Government in regard to the establishment of a Canadian Naval Brigade. Presented May 1, 1916.—*Mr. Macdonald*... ..*Not printed.*
274. Return to an Order of the House of the 29th March, 1916, for a copy of all correspondence, petitions and papers, including the report of Charles Bruce, engineer, in the possession of the Department of Marine and Fisheries relating to the construction of a bait freezer at White Head, Nova Scotia. Presented May 1, 1916.—*Mr. Sinclair*  
*Not printed.*
275. Duplicate Return to an Order of the House of the 17th March, 1915, for a copy of all correspondence and reports relating to the purchase of 25,000 shovels of special pattern, mentioned in Order in Council P.C. 2302, dated 4th September, 1914, on page 38 of memoranda respecting work of the Department of Militia and Defence, and also relating to any further purchases of such shovels. Presented May 1, 1916.—*Mr. Hughes (P.E.I.)*... ..*Not printed.*

### CONTENTS OF VOLUME 28—*Continued.*

- 276.** Return to an Order of the House of the 5th April, 1916, for a copy of all letters, telegrams, offers, tenders, reports, contracts and documents relating to the sale or other disposal of small arms ammunition since 4th August, 1914. Presented May 1, 1916.—*Mr. Macdonald*... *Not printed.*
- 276a.** Supplementary Return to an Order of the House of the 5th April, 1916, for a copy of all letters, telegrams, offers, tenders, reports, contracts and documents relating to the sale or other disposal of small arms ammunition since 4th August, 1914. Presented May 2, 1916.—*Mr. Macdonald*... *Not printed.*
- 277.** Return to an Order of the House of the 23rd February, 1916, for a copy of all documents, correspondence, reports, etc., concerning the dismissal of J. B. Levesque, of Rivière Ouelle, as steward on the steamer *Champlain*. Presented May 2, 1916.—*Mr. Lapointe (Kamouraska)*... *Not printed.*
- 278.** Return to an Order of the House of the 13th March, 1916, for a copy of all correspondence, memoranda, reports, telegrams, recommendations, orders, etc., between the Department of Railways and Canals and the officers of the St. Maurice Fire Protective Association with reference to fire protection on the Transcontinental Railway line between Hervey Junction and the western boundary of the Province of Quebec. Presented May 2, 1916.—*Mr. Bureau*... *Not printed.*
- 279.** Return to an Order of the House of the 20th March, 1916, for a copy of all letters, telegrams, correspondence and contracts between the Department of Railways and Canals or any official thereof, including the officials of the Intercolonial Railway, and any member of the Government of New Brunswick, the St. John and Quebec Railway Company or any official thereof, regarding the operation of the Valley Railway, so-called, in the Province of New Brunswick, from the first day of October, 1914, down to the present date. Presented May 2, 1916.—*Mr. Curvell*... *Not printed.*
- 280.** Return to an Order of the House of the 10th April, 1916, for a copy of a certain lease made by the Government of Canada to one J. A. Culverwell, of a certain water-power on the Trent waterway, known as the Burleigh Falls power; and of all assignments of said lease and of the consents of the Government of Canada thereto; and also a copy of all correspondence, telegrams, tenders, reports, contracts and other papers, relating to the said original lease. Presented May 2, 1916.—*Mr. Burnham*... *Not printed.*
- 281.** Return to an Order of the Senate, dated the 12th April, 1916, showing copies of all petitions, correspondence, etc., relating to the purchase, by the Government, of the Quebec and Saguenay Railway.—(*Senate*)... *Not printed.*
- 282.** 1. Copy of letter from the Chairman of the Grand Trunk Railway Company of Canada to the Prime Minister *re* proposals made in respect to the Grand Trunk Pacific Railway Company.  
 2. Schedule of outstanding bonds, debentures, loans and notes, 1st January, 1916, and interest payments of the Grand Trunk Pacific Railway Company and Grand Trunk Pacific Branch Lines Company.  
 3. Memorandum *re* Grand Trunk Pacific Act, 1914, and proceeds of securities issued thereunder.  
 4. Statement showing bonds, etc., authorized, issued and outstanding and net proceeds therefrom, also interest payable for the years 1916 and 1917 (as from 29th February, 1916), Grand Trunk Pacific Railway and Grand Trunk Pacific Branch Lines.  
 5. Advances by Grand Trunk Railway Company at 29th February, 1916.  
 6. Financial statements of the Canadian Northern Railway System, 15th April, 1916.  
 7. Memorandum *re* Canadian Northern Railway Company Guarantee Act, 1914, and proceeds of securities issued thereunder.  
 8. Letter from G. A. Bell, financial comptroller of the Department of Railways and Canals to the Prime Minister, in respect to issue of his certificate for the purpose of releasing the proceeds of the forty-five million dollar, 4 per cent debenture stock, guaranteed by the Dominion Government. Presented by Sir Robert Borden, May 3, 1916.  
*Printed for distribution and sessional papers.*
- 282a.** Copies of mortgage deed of trust securing an issue of \$16,000,000 of Grand Trunk Pacific Railway bonds, guaranteed by the Dominion Government. Presented by Sir T. White, May 5, 1916... *Printed for distribution and sessional papers.*
- 282b.** Copies of mortgage deed of trust securing an issue of \$45,000,000 of Canadian Northern Railway securities, guaranteed by the Dominion Government, issued under the legislation of 1914. Presented by Sir Thos. White, May 5, 1916.
- 283.** Return to an Order of the House of the 23rd February, 1916, for a return showing:—1. The amount which has been paid out for new buildings and repairs at the Royal Military College and at Fort Henry, in each of the years 1912, 1913, 1914 and 1915. 2. To whom the money was paid, and the amount in each case. 3. What portion of the work was tendered for, and the amount of each tender submitted. Presented May 3, 1916.—*Mr. Edwards*... *Not printed.*

# CONTENTS OF VOLUME 28—Continued.

284. Return to an Order of the House of the 27th March, 1916, for a return showing the names and addresses of all persons in the Public Service of any and every Department of the Government of Canada, in the counties of Cape Breton, Victoria, Inverness, Richmond, Guysborough, Antigonish and Pictou, Province of Nova Scotia. Presented May 4, 1916.—*Mr. Carroll*... ..*Not printed.*
285. Return to an Order of the House of the 17th February, 1916, for a return showing the amount which has been paid out for printing outside of the Printing Bureau in each province, in each of the years 1912, 1913, 1914 and 1915, and to whom paid. Presented May 5, 1916.—*Mr. Best*... ..*Not printed.*
- 285a. Supplementary Return to an Order of the House of the 17th February, 1916, for a return showing the amount which has been paid out for printing outside of the Printing Bureau in each province, in each of the years 1912, 1913, 1914 and 1915, and to whom paid. Presented May 17, 1916.—*Mr. Best*... ..*Not printed.*
286. Report of the Commission on the Waterworks and Sewerage Systems of Canada. Presented by Hon. Mr. Hazen, May 8, 1916... ..*Not printed.*
287. Return to an Order of the House of the 12th April, 1916, for a return showing:—1. How many clerks there are in the Customs Department who belong to and are paid from the outside service vote and who work in the inside service. 2. The names of said clerks. 3. Salary paid to each. 4. How long each has been in the service of the Department. 5. If all or any of these clerks have passed any examination. If so, what examination and on what date or dates. Presented May 10, 1916.—*Mr. Turriff*... ..*Not printed.*
288. Return to an Order of the House of the 6th March, 1916, for a return showing the amounts paid under retroactive clause of the Act providing for an impost of 50 cents per proof gallon on all spirits taken from bond between the date of the outbreak of war and the date of the passage of such Act; and also by whom paid, and the date of payment. Presented May 10, 1916.—*Mr. Graham*... ..*Not printed.*
289. Return to an Order of the House of the 3rd February, 1916, for a return showing the names of all employees of the Government of Canada in the inside and outside service who have enlisted since the 4th day of August, 1914, for overseas service; and the names of all employees of the Government of Canada in the inside and outside service who have enlisted since the 4th day of August, 1914, for home defence; also the salary received by each previous to enlisting; and the rate of pay received by each since enlisting; specifying those, if any, who continue to enjoy the salaries paid them before their enlistment and the amount of same. Presented May 10, 1916.—*Mr. Kyte*... ..*Not printed.*
290. Return to an Order of the Senate, dated 26th April, 1916, for:—A copy of the agreement between the Government of Canada, acting for the Transcontinental Railway, the Canadian Pacific Railway Company and the Canadian Northern Railway Company for the construction, operation and maintenance of the Union Station at Quebec, which the Honourable the Acting Minister of Railways says (*Hansard*, page 2690) is to be used by these three railways.—(*Senate*)... ..*Not printed.*
291. Return to an humble Address of the Senate, dated 29th March, 1916, to His Royal Highness the Governor General; praying His Royal Highness to have laid on the Table of the Senate:—A statement of all expenses to date in connection with the expenditures of public moneys at Port Nelson; also an estimate of the further expenditure to complete the works at Port Nelson on Hudson Bay.—(*Senate*)... ..*Not printed.*
292. Return to an Order of the House of the 3rd April, 1916, for a copy of all investigations, letters and correspondence whatsoever, regarding the dismissal of J. B. Deschênes and Thomas Bernier, employees on the Intercolonial Railway at Rivière du Loup. Presented May 12, 1916.—*Mr. Boulay*... ..*Not printed.*
293. Return to an Order of the House of the 19th April, 1916, for a return showing a list of the decoders and censors employed at Halifax since the war broke out, together with the names, dates of employment, total amount paid, by whom recommended, and former employment of each. Presented May 12, 1916.—*Mr. Sinclair*... ..*Not printed.*
294. Return to an Order of the House of the 22nd March, 1916, for a return showing:—1. Whether there is a list of companies, firms, or persons resident in Halifax, N.S., at present in the Department of Militia and Defence from whom are asked tenders for war supplies on behalf of the said Department or War Purchasing Commission. If so, the names of such companies, firms or persons. 2. During the calendar year 1915, whether public tenders were asked for any war supplies at Halifax, N.S. 3. If so, the nature of the supplies for which tenders were asked, to whom tenders were awarded, and the prices, for the said respective articles or supplies. Presented May 12, 1916.—*Mr. Maclean (Halifax)*... ..*Not printed.*
295. Reports of engineers relating to the Lotbinière and Megantic Railway; the Quebec, Montmorency and Charlevoix Railway between Quebec and Cape Tourmente; and the Quebec and Saguenay Railway from Cape Tourmente to Nairn Falls, near Murray Bay. Presented by Hon. Mr. Reid, May 15, 1916... ..*Not printed.*

- 297.** Return to an Order of the House of the 1st May, 1916, for a copy of all papers, telegrams, letters and other documents in connection with the decision to locate an interior storage elevator at Calgary, Alberta. Presented May 17, 1916... ..*Not printed.*
- 298.** Return to an Order of the House of the 12th April, 1916, for a return showing the plan and description of the proposed permanent harbour quay line in the harbour at Pictou, and for a copy of all papers, letters, telegrams and other documents relating to the establishment of the same. Presented May 17, 1916.—*Mr. Macdonald* ... ..*Not printed.*
- 299.** Return to an Order of the House of the 21st February, 1916, for a copy of all tenders, offers, letters, telegrams and other documents relating to the arrangements for the handling of freight and coal at Pictou, in connection with the boats engaged in the winter service between Pictou and Prince Edward Island during the year 1914-1915, and during the present season. Presented May 18, 1916.—*Mr. Macdonald* ... ..*Not printed.*

CANADA

REPORT

OF THE

MINISTER OF PUBLIC WORKS

ON THE

OTTAWA RIVER STORAGE

1915

*Submitted in accordance with the Provisions of Chapter 39, Section 34,  
of the Revised Statutes of Canada.*

PRINTED BY ORDER OF PARLIAMENT

OTTAWA

PRINTED BY J. DE L. TACHÉ,  
PRINTER TO THE KING'S MOST EXCELLENT MAJESTY

1916

*To Field Marshal, His Royal Highness Prince Arthur William Patrick, Albert, Duke of Connaught and of Strathearn, K.G., K.T., K.P., etc., etc., Governor General and Commander in Chief of the Dominion of Canada.*

I have the honour to lay before your Royal Highness the Report of the Department of Public Works of Canada, on the Ottawa River Storage scheme, for fiscal years ending March 31, 1913, 1914, and 1915.

I have the honour to be, sir,

Your Highness's most obedient servant,

ROBERT ROGERS,  
*Minister of Public Works.*

OTTAWA, 30th December, 1915.

## C O N T E N T S.

---

Report on construction and maintenance of Ottawa River Storage Reservoirs.

Surveys in Watershed area.

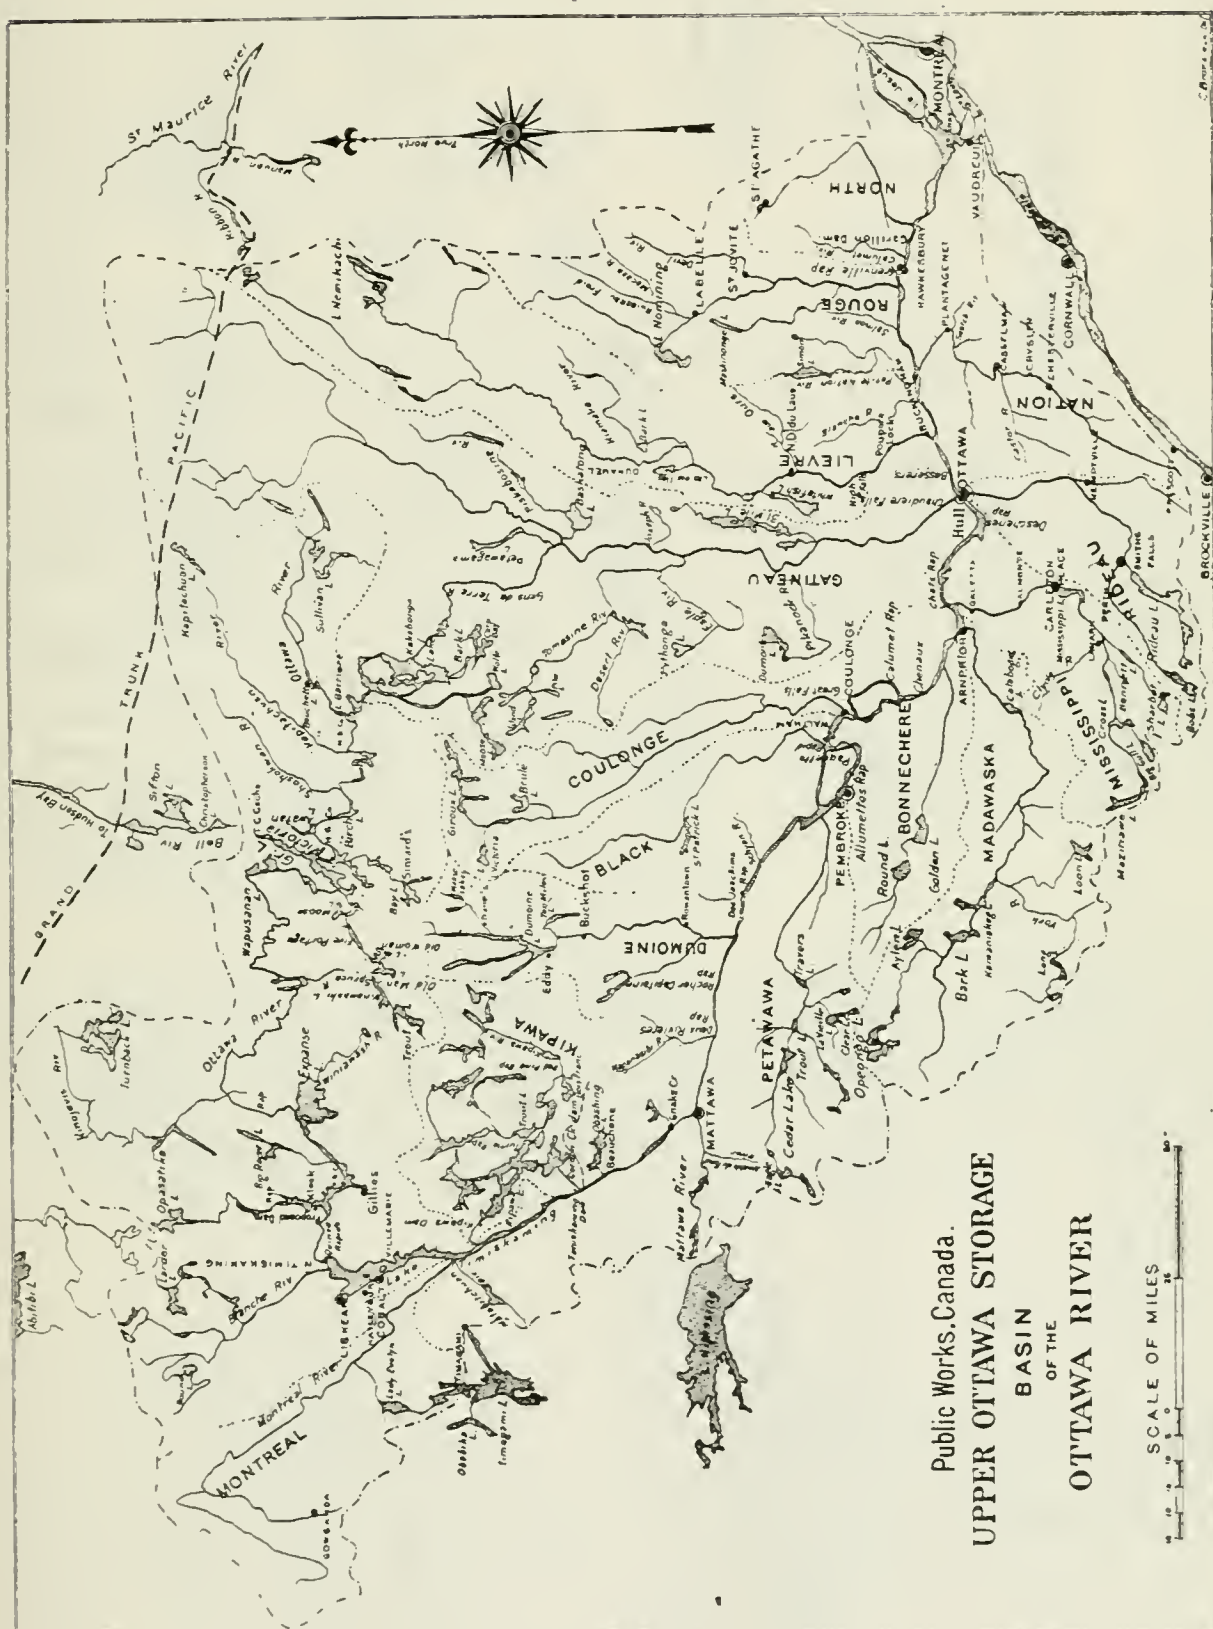

Notes on Keokuk dam, Mississippi river.

Measurements of flow of Ottawa river and tributaries.

Records of water stages Ottawa and St. Lawrence.

## OTTAWA RIVER STORAGE.

DEPARTMENT OF PUBLIC WORKS, CANADA,

Ottawa, Ont., June 23, 1915.

E. D. LAFLEUR, Esq.,  
Chief Engineer,  
Public Works Dept., Ottawa.

SIR,—I have the honour to submit a report on the Ottawa River Storage work covering generally the period from 1st April to 31st March, 1915.

The storage scheme had its inception some years ago in connection with a maintained flow of water for the Chaudière powers at Ottawa. It was actively pushed between 1904 and 1908, when construction was decided upon.

The first idea was to build eight or ten dams of comparatively low height at the outlets of various lakes; they were to be of wooden cribwork, similar to those built throughout the country by lumbermen, with weirs closed by stoplogs. Extended investigation however showed that better results would be obtained by confining the work to the three large lakes, Quinze-Expanse, Timiskaming and Kipawa, each over 100 square miles in area and into which large watersheds drained.

It was therefore decided to build concrete structures of considerable height and secure as deep storage as possible upon each of these three lakes. The raised surface for these reservoirs was sharply limited by damage to property which was rapidly increasing in value owing to the exploitation of Cobalt and other mining areas.

## TIMISKAMING DAM.

The dam was begun in May, 1909, the contractors were relieved of the work, August, 1911, and it was completed by the department, August, 1912. The cost, including damages, will be nearly \$500,000. The total length of dam is 1,600 feet, the height 25 feet, and the flood flow through sluice-ways 100,000 cubic feet per second, several times more than through the Assuan dam, Egypt. To avoid excessive inundation, arrangements were made to deepen and widen the outlet of the lake, and thus tap lower layers of the reservoir.

## KIPAWA DAM.

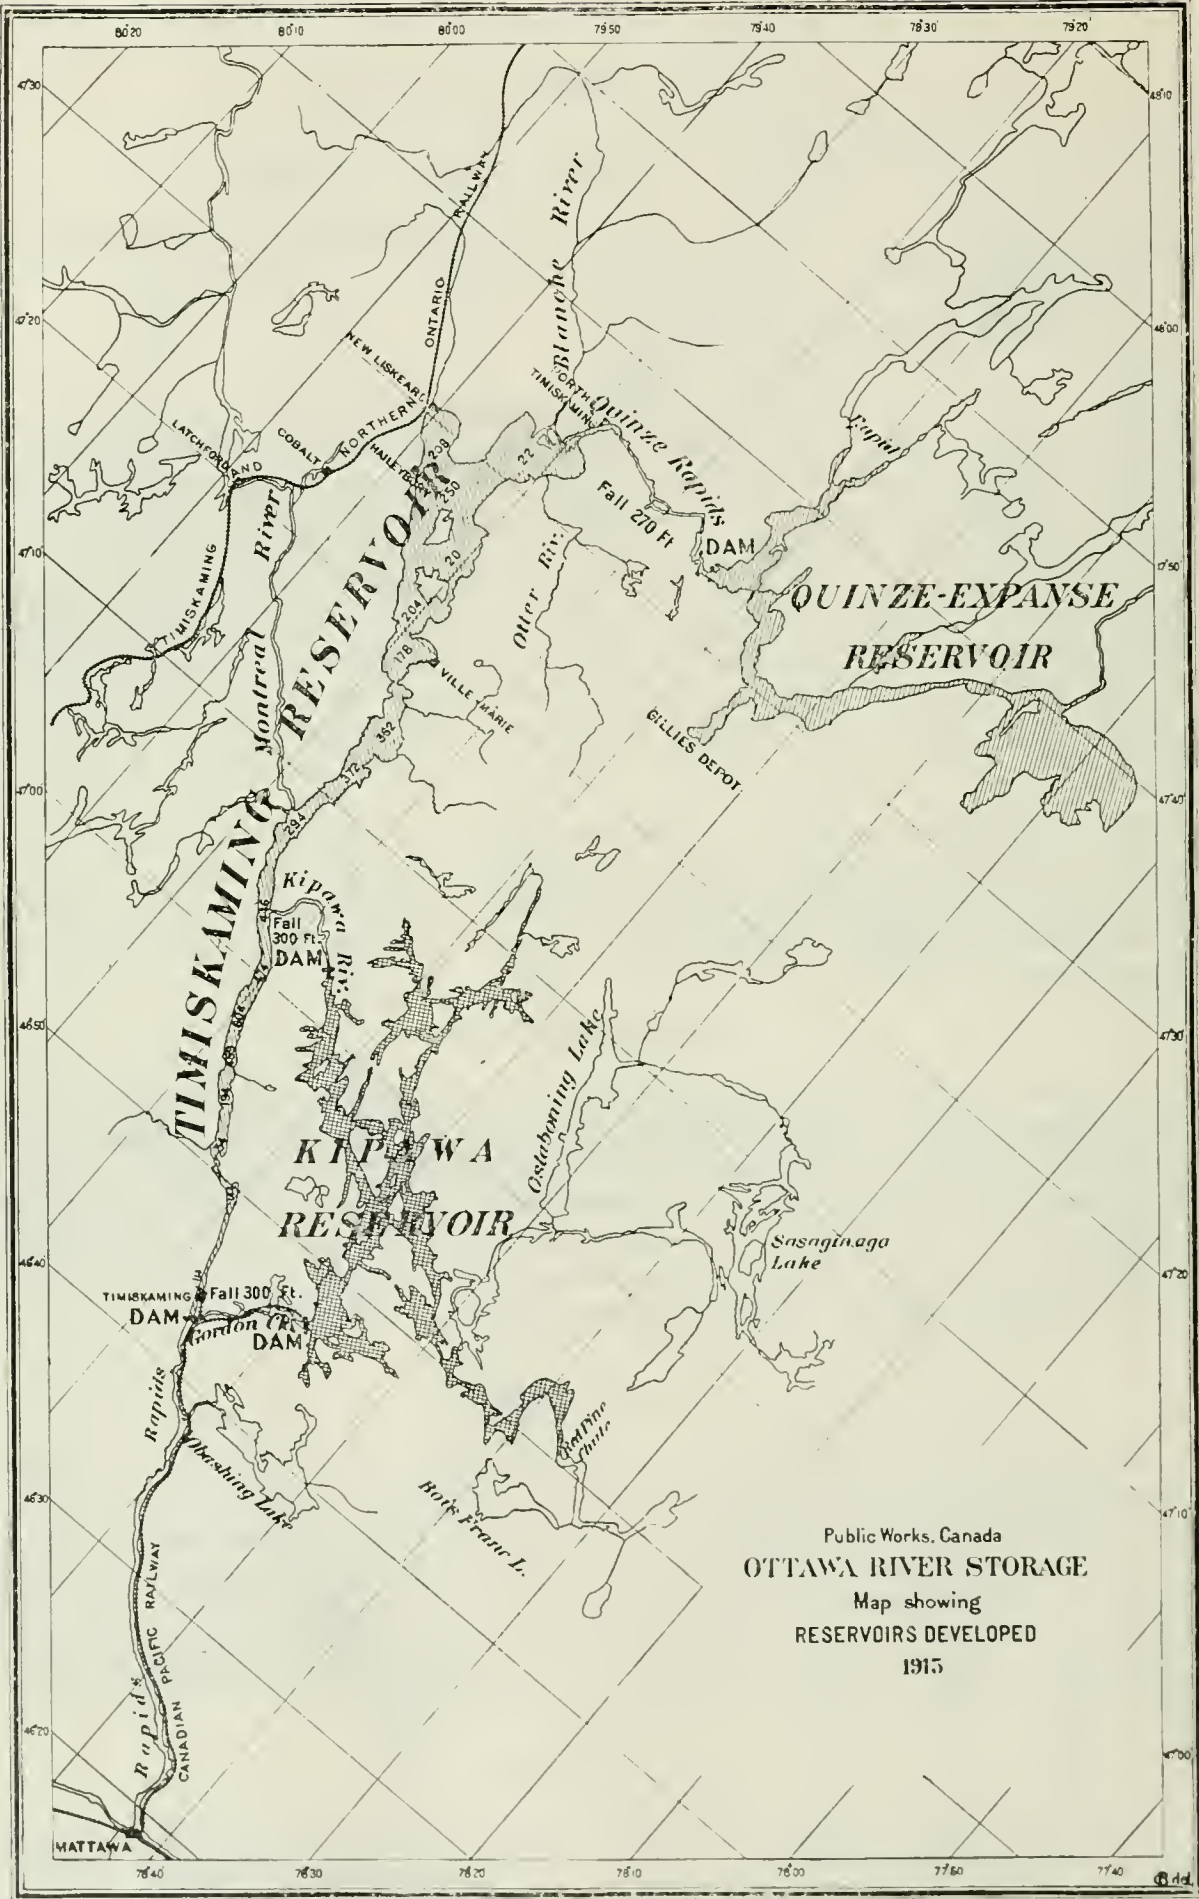

The Kipawa river dam at the north end of the lake was begun November, 1910, and completed May, 1911, at a cost of \$62,000.

The Gordon Creek dam at the south end of the lake was begun October, 1911, and completed May, 1912, at a cost of \$42,000. Land damages are roughly estimated at \$6,000, and the total expenditure will be \$110,000. In 1911, the partial storage given off from Kipawa reservoir helped to avoid the recurrence of extreme low water and consequent trouble with the domestic supply at Ottawa city.

## QUINZE DAM.

Work was begun August, 1911, by daywork, and a contract was let May, 1912, to be completed September, 1914. It was finished in October, 1914, but no storage was available for that autumn. Damages to timber limits by flooding are difficult to estimate, but the 23,000 acres affected may be placed at \$70,000,

## SESSIONAL PAPER No. 19a

the total cost would then be about \$500,000 for this reserve. The dam is a rock-fill, over a mile long, with sixteen regulating sluices capable of passing flood flow.

Total cost of all dams is estimated at \$1,110,000, not including Kakabonga, which is estimated at \$250,000 more.

Although the results are still very incomplete, the efficiency of the storage reservoir has already indicated itself. In April, 1913, the spring break-up was very early with the result that the Madawaska and other south tributaries of the Ottawa discharged rapidly, leaving but little ground water in their watersheds for the summer's supply.

The ensuing rainfall was very scant, in fact the period from April to September, inclusive, showed only 14 inches precipitation, the lowest since 1906. Timiskaming reservoir filled quickly and remained full with surplus water running out until the end of June, from which time it was necessary to draw steadily on the storage till the middle of October, when 7 feet had been taken off, and navigation interests began to complain.

Kipawa reservoir was also drawn down about 7 feet when navigation was affected in a peculiar manner, as the raised level had allowed of going into bays formerly never approached, but to which access now became a vested right. There was also difficulty in loading steamboats from the wharfs when the surface lowered 7 feet.

The benefits of storage were shown by an increased navigation depth on both Kipawa and Timiskaming. There was also about 1 foot better water than in 1906 through Allumettes lake, Chats lake, and Deschênes lake, while at the foot of the Rideau locks, Ottawa, there was 2 feet better depth than during former dry years. The surface was also a foot higher at Grenville and a foot higher over lake of two mountains than during the low periods of 1906 and other years. If, of course, these reaches were penned up with dams and weirs, at least 5 feet better depth could have been maintained throughout the season. In the natural state it takes almost spring freshet flow to raise the various lakes 5 feet above low-water regimen.

The second series of benefits consisted of the increased amounts of water passing over the various falls along the Ottawa river. At present only the Chaudière fall at Ottawa is developed and when the flow is less than 20,000 c.f.s., the various powers experience shortage, but at 30,000 c.f.s., all have sufficient water, labour is constantly employed, and the municipal requirements for light and transportation are easily met.

In 1913, the flow at Ottawa diminished to 20,000 c.f.s. about the middle of August, but instead of falling below this it was maintained at about that figure till autumn. This, too, although the autumn rains were delayed till the end of October, after which there was an abundant supply during January, February, and March, 1914.

## TIMISKAMING RESERVOIR.

The detailed description of Timiskaming reservoir will be taken up first. It consists of the lake of that name, which has an area of over 100 square miles and is navigable for steamboats for 70 miles from Timiskaming station, Canadian Pacific Railway, to North Timiskaming. This lake is a rift in the granite plateau filled by the Ottawa river through the Quinze rapids and emptying through another rapid portion of the Ottawa extending 38 miles from Timiskaming to Mattawa.

Upon this reservoir area 15 feet in depth of an available storage is held by the Timiskaming dam consisting of 20 odd weirs with concrete piers between, each weir being closed as desired with stoplogs. The storage can easily be accu-

6 GEORGE V, A. 1916

culated from the 8,000 square miles of drainage area above and the 11,000 square miles of local basin.

The concrete weirs at the outlet were begun in May, 1909, the contractors being Messrs Kirby & Stewart, who were relieved of the work in August, 1911. The department then completed the dam, and it was put into operation August, 1912. The total length of the dam is 1,600 feet with 20-odd regulating weirs capable of discharging a flood flow of 100,000 c.f.s.

The construction of the Quebec channel dam, during the winter of 1912, was hampered by an unremitting fight against water during very cold weather. Anchor ice formed in quantity at the mouth of Gordon creek, 300 feet down stream from the dam, and the penned-up water threatened to overtop the lower coffer-dam. The coal supply for steam machines was constantly running low owing to an extensive strike in the Pennsylvannia fields and the pumps and other machinery became frozen despite constant care.

By the middle of April, the foundation slab was completed, also the filling of the cut-off trench with concrete. This trench was a very serious undertaking, especially in its western half, where the water-saturated sand caved in to an alarming extent. By the end of the month, the sluices had been completed and as much riprap as possible was laid along each shore as a protection against the current. The coffer-dam was then blown out both above and below the work as far as the rapidly rising water admitted.

To avoid excessive inundation of property and still obtain a great volume of storage water, the design contemplated the widening and deepening of Timiskaming outlet.

In May, the steam shovel was moved into the Ontario channel, and after an enforced idleness due to high water, worked from the middle of June to 7th September. This work was necessary in order to complete the enlargement of the Ontario channel, which in the natural state passed only a high-water flow. It is now 20 feet deep at full reservoir and 400 feet wide.

About 4,000,000 pieces of timber, mostly sawlogs and pulp wood float past Timiskaming every year, so a timber pass with heavy booms forming a funnel approach was constructed and has given satisfaction.

No. A.—General view Timiskaming dam, Ontario sluices in foreground.

## SESSIONAL PAPER No. 19a

For removing and placing the stoplogs in the sluiceways a lifting machine consisting of two 40-foot spuds with rack attachments was set up in May, 1912. It is driven by a 10-h.p. Dake steam engine connected by gearing to pinions that mesh into the spud racks.

The log-lifting machine has given fair satisfaction, but an accident twisted one spud, a 9 by 9 I-beam, during the rise of May, 1913, and the dam was without lifting machine for several days. Hand winches, which are held in reserve, sufficed to take out enough stoplogs to pass the flood, but the surface stood nearly a foot above regulated level for some days. The engagement of the lifting spud with the lower stoplogs when a heavy current is passing through the sluiceway presents constant dangers and difficulties.

A new lifting apparatus capable of raising all the logs fastened together as one gate has been designed, and detail structural plans prepared. The cost would approach \$50,000, so its construction has been deferred for the present.

Several attempts have been made to remove parts of the cofferdam with explosives, but although the wooden cribwork is easily blown apart, there is little effect upon the stone filling. The dredge was brought down but was unable to remove the material, owing to the strong current.

A very serious wash-out below the Ontario sluiceways of Timiskaming was discovered in July, 1913, after the spring freshet had subsided. On the 25th April, a critical examination was made below the dam, but no scour of any consequence had then taken place. Between April and July, however, the lower apron, a concrete slab 1 foot thick, extending 400 feet across the channel and 50 feet downstream, was broken up and carried away for a length of 200 feet. The river bottom was scoured out 20 feet below grade for a distance of about 100 feet, and at 200 feet the erosion was fully 5 feet deep.

Why the river bottom was not scoured out during the two previous summers, that this part of the dam had been in operation is impossible to say. No excavation was done during the past two years downstream, but the channel upstream was enlarged during the last summer and many larger boulders were loosened by the steam shovel. Possibly the strong current of the spring freshet may have carried boulders bouncing through the sluices, which cracked the lower apron. On the other hand, the vertical back swirl, due to the heavy sheet of water, may have broken through the hard-pan layer and washed out the sand and gravel beneath.

To make repairs, it was necessary to first place all the stoplogs in the Ontario sluiceways and then to staunch them tight with plank sheeting and canvas curtains. A quarry was then opened near the Ontario end of the dam, and the broken rock was deposited in the scoured-out portion of the river bed.

The scour also extended underneath the concrete floors of the sluiceways, and this had to be filled with concrete deposited through water 10 to 20 feet in depth. Every precaution was taken against leakage to prevent currents that might wash away the cement. The concrete was deposited through a trimmie, and the mixture was made very wet, so it would flow as far as possible into the cavity.

On 14th June, 1914, a wash-out occurred beneath the island end of the Quebec sluices at Timiskaming dam, and a hole 15 feet deep was scoured in the river bottom. Three of the concrete piers dropped down, completely wrecking four sluiceways, or about 100 feet in all of the dam.

It was decided to sacrifice the four sluice openings and fill the break with a loose-rock embankment to the full height and width of the roadway. It is allowable to close these openings because the provision has always been found very ample, and the completion of Quinze dam now admits of controlling and lessening the peak of the spring floods.

The cause of this wash-out will always remain uncertain, but a leak or piping as it is called must have occurred through the treacherous soil either beneath the piers or in rear of island abutment.

No. 1.—Timiskaming Reservoir, Ontario sluices; lifting machine with spuds up ready to lower and grapple a stoplog. Beneath the white water twenty feet in depth of rock has been deposited to fill in the scouring of the river bed.

No. 2.—Timiskaming Reservoir, Quebec sluices; crib-work being placed along downstream side to protect against scouring.

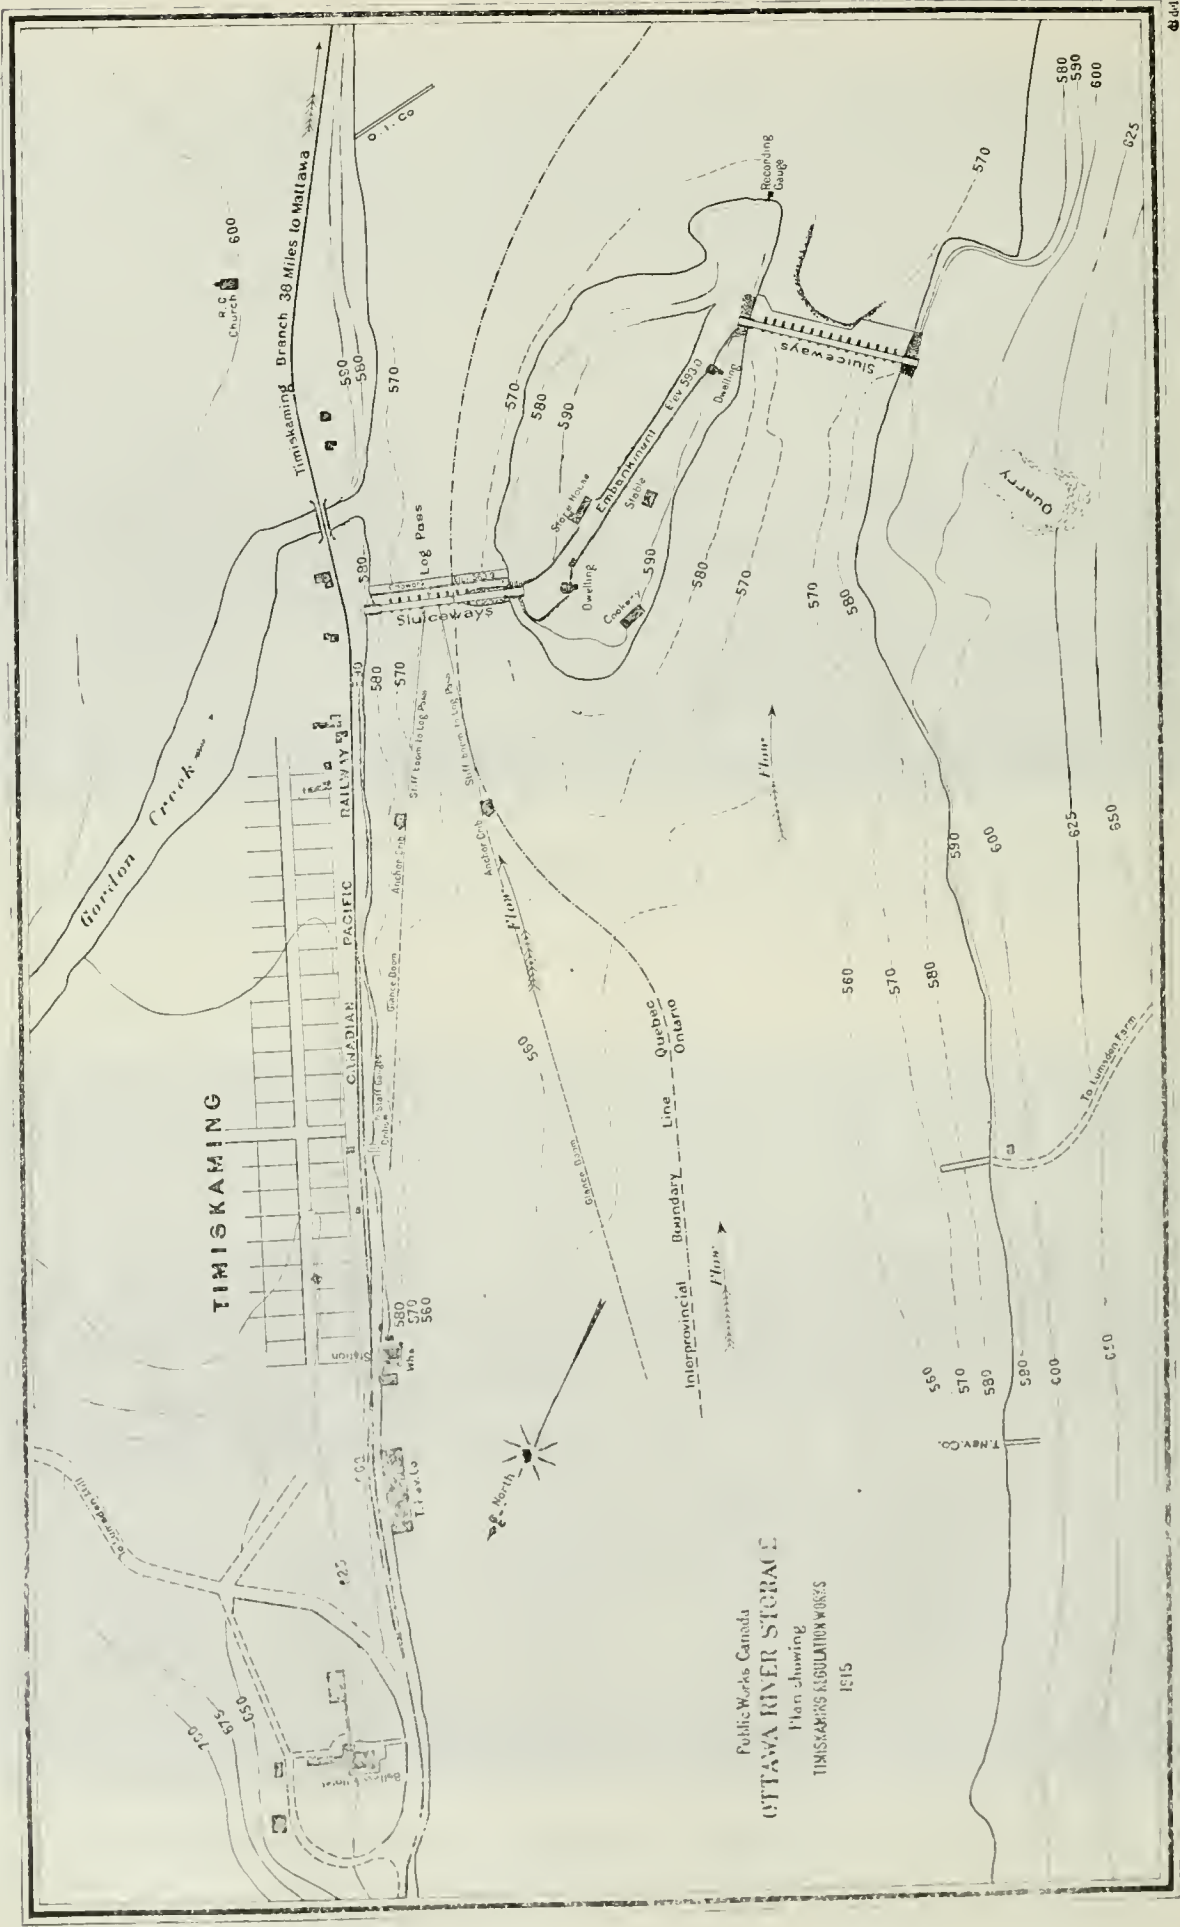

No. 3.—Timiskaming Reservoir, Quebec sluices; washout, June, 1914, fifteen deep when four sluiceways were destroyed.  
Temporary suspension bridge 100 feet long, also locomotive crane depositing rock in gap, are shown.

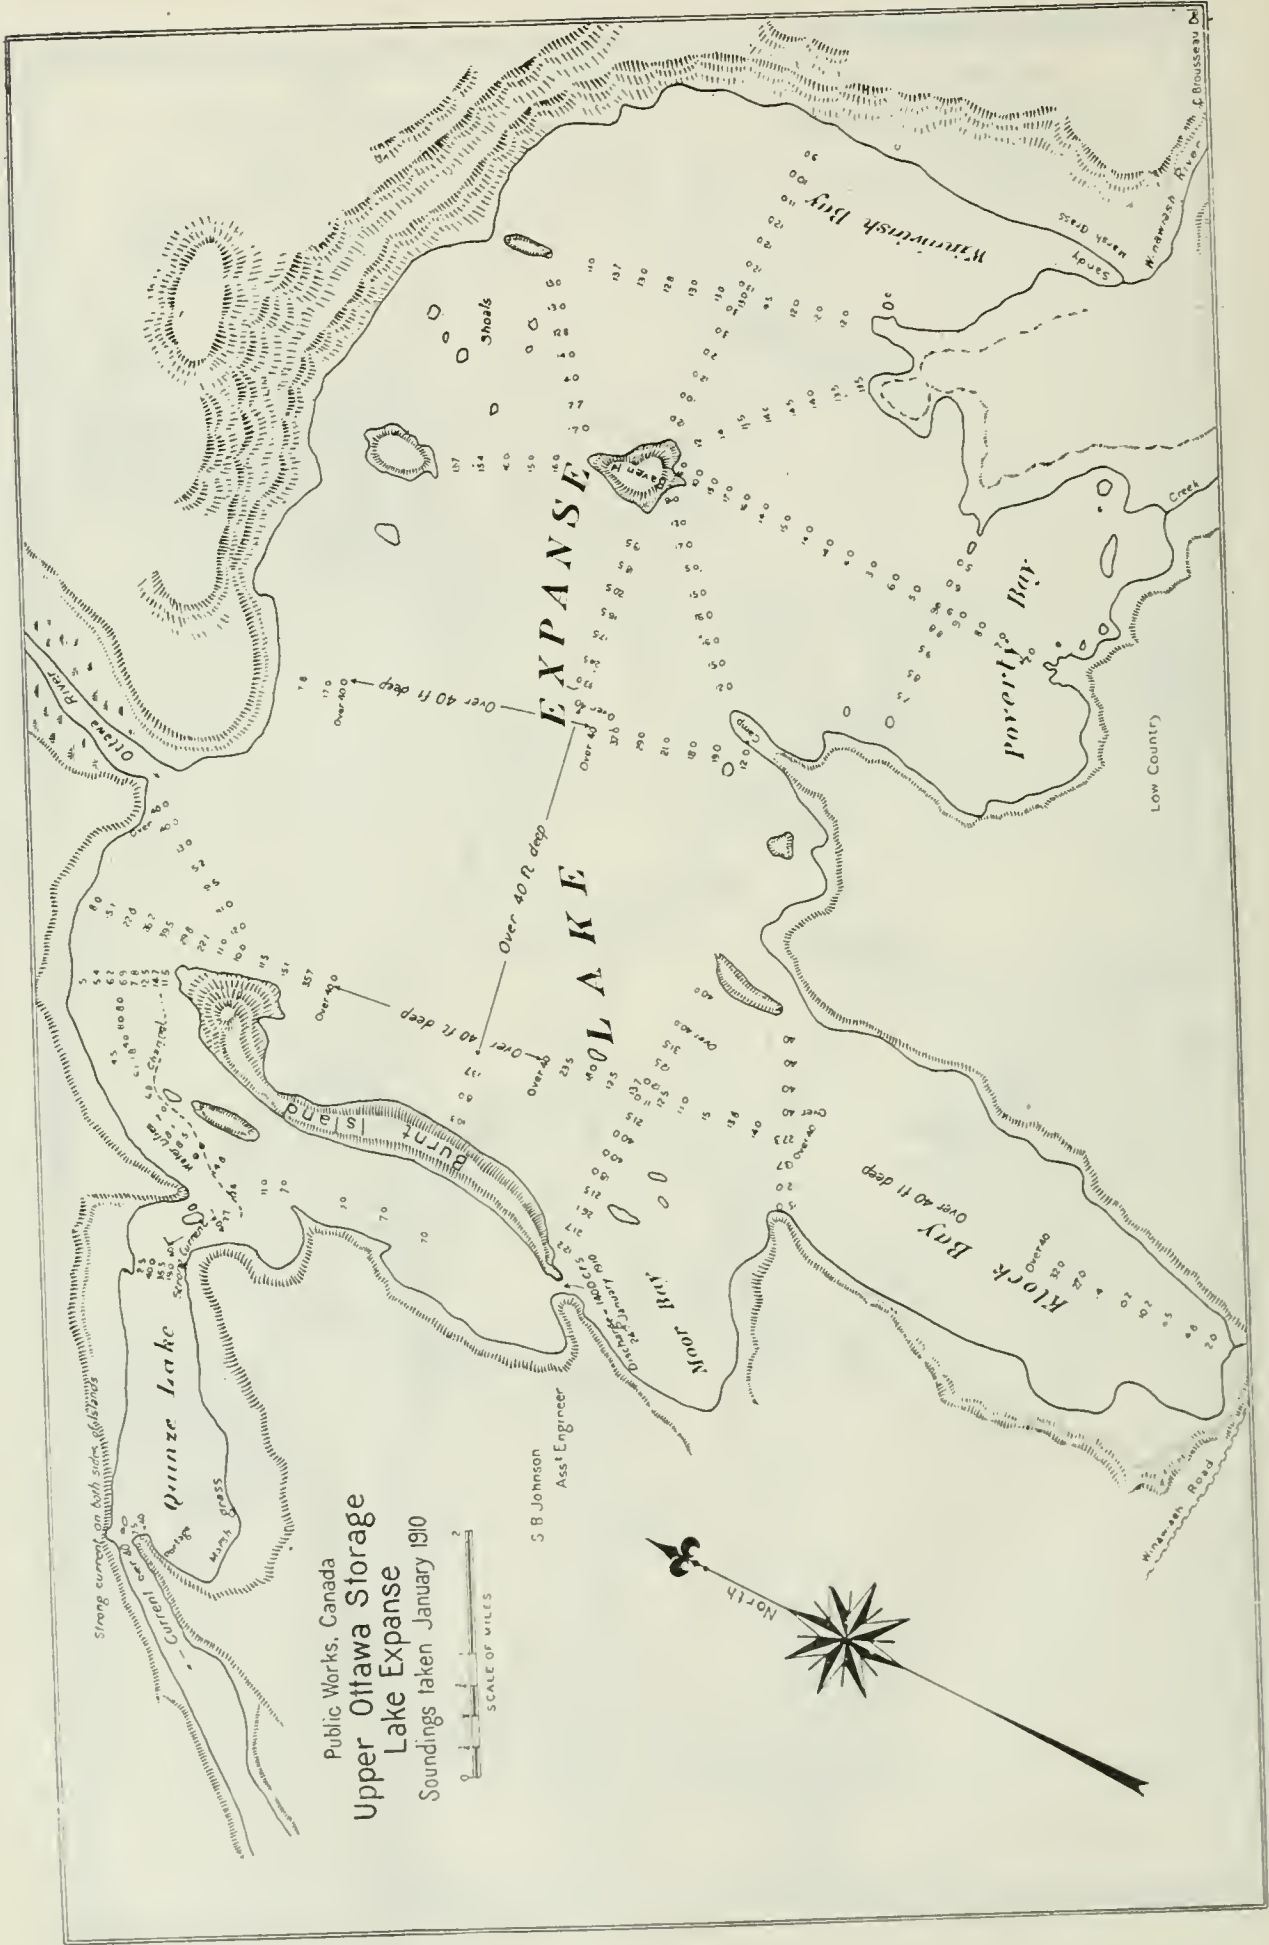

No. 4.—Timiskaming Reservoir, Quebec sluices; washout repaired by rock-fill embankment. Slight leakage through rock is seen along toe.

## QUINZE RESERVOIR.

Quinze reservoir consists of lakes Expanse and Quinze, navigable for 60 miles, and totaling 120 square miles in area, upon which a depth of 20 feet can eventually be stored. The watershed area tributary to this reservoir is about 8,000 square miles.

The dam is a rock-fill, over a mile long, with sixteen regulating sluices, situated about the central part, closed with stoplogs, and capable of passing the flood flow. It was located and designed in 1910, and the foundation of the sluice-ways was built directly by the department, work closing in March, 1912. A contract was let to Messrs. Morrow and Beatty, 29th April, 1912, for the completion of the concrete sluiceways and the rock work. Owing to the condition of the summer roads, little could be done on the work, but a firm of sub-contractors, Messrs. Dibona and Orlando, commenced operations in September, 1912. Some clearing and grubbing was done and the excavation of a bank seat trench commenced on the north side of the river.

During the winter of 1913, British Columbia fir stoplogs were hauled into the work; also sufficient cement to build the concrete sluiceways.

Concrete work began on 1st April, 1913, gravel being used from the pit previously opened for the foundation concrete. The cement was much fresher than that used the year previously in foundations, but it was found that the concrete was again very slow in setting. In consequence, the gravel was washed with improved, but not altogether satisfactory results, as to rapidity of set. Pipes were then arranged to spray water continuously upon the piers, and after a time a thoroughly good monolith was obtained.

It has since been found that this slow setting was due to some brown gravel distributed in layers through the pit, which contains chlorates of magnesium and potassium, that tend to retard the set. The only method of overcoming this unusual difficulty is selection in the gravel pit, if possible, accompanied by very thorough washing. The concrete piers were completed by the end of June, after which the steel girders and concrete deck were placed on top. Extra cement had to be secured for this work, as a richer mixture than contemplated was used, owing to the slow setting. The cartage of this cement over the summer roads caused considerable delay, and the deck was not finally finished until the beginning of September.

When a rock-fill is built upon the natural surface of the river shore, the seepage issuing along the toe, with the reservoir full might undermine the foundation. After consideration it was decided to excavate a trench to good material along the downstream toe, which will be filled with the loose rock of the dam. The seepage is thus carried away through this large stone drain without scouring the earth beneath the fill.

The work was largely rock excavation from borrow pits, which has been deposited in the rock-fill dam, but some further excavation was done to obtain foundations for sluice-way piers.

The south end of the embankment across swampy ground was completed in July, 1913, and has settled somewhat since. During construction there was considerable settlement into the soft swamp which, of course, has increased the quantity of rock used. Staunching material of earth and gravel has been deposited upon the upstream slope all along the embankment.

The rock-fill dam was extended into the river from both the north and south sides, the central portion averaged nearly 40 feet in height. A junction was made 26th February, 1914, before high water rendered the head excessive.

The original estimate, made in 1911, was \$237,000, and the final cost \$297,000, the increase of \$60,000 being due principally to greater quantities of rock excavation than expected. It was thought that 70,000 cubic yards of

1912

6 GEORGE V, A. 1916

rock in solid would make 105,000 yards in the embankment, or that 1 cubic yard solid would yield  $1\frac{1}{2}$  yards in bank. As previously reported, however, there was considerable settlement in the fill, though very little rock was lost in the current. Altogether 113,600 cubic yards of rock were excavated from the borrow pits and the sluice foundations, all of which was deposited in the fill except 4,500 cubic yards used for concrete. The rock excavation was done by coyote blasts, that is a small tunnel was driven in 20 or 30 feet, a T chamber made at the end and loaded with powder and dynamite. Much of the rock, in pieces up to a cubic yard and over, was hauled a quarter of a mile on stone boats sliding on wooden poles. The central portion was hauled from the north side borrow pits by narrow-gauge cars into which the rock was lifted by Forest loaders. These are small horse-power derricks that have proved very useful, both at Quinze and at Timiskaming.

From April, 1914, the work consisted chiefly of widening and trimming the rock fill and depositing gravel on the upstream slope. The work was completed 20th October, 1914, in a very satisfactory manner, and the final estimate has been paid.

#### SURVEYS.

An examination was made of Kakabonga lake, the source of the western part of the Gatineau river, by Mr. A. Gray, in September, 1912.

The scheme was to build steel frame sluice-ways controlled with stoplogs at Barrière post, Hudson's Bay Company, near the north outlet and across the Gens de Terre river near the south outlet. Detail surveys were made and the estimated cost was \$172,000, without damages to timber that would be flooded along the borders of the reservoir.

During February and March, 1913, Mr. W. E. Blue ran a general flood contour around the main shore of the lake, but numerous low islands yet remain to be examined.

If dams were built across both outlets of Kakabonga, a storage reservoir of 15 feet depth and 100 square miles surface would be formed. Unfortunately the catchment basin for this would only be 2,500 square miles, so Kakabonga, like Kipawa, might not fill during dry years.

With a raised surface there was also a possibility that the water might be passed westwards to the Coulonge and fed into the Ottawa above the Calumet and other large falls, increasing the flow. This by-pass, however, was found to be impracticable owing to the heavy excavation, although the distance to canal would only be 1,000 feet.

Both the reports are included, together with the estimate, plans, and photographs.

Surveys have been carried forward in the Kipawa watershed to fix the size and elevation of Lakes Ostaboning and Sasaginaga. This party is at present continuing a survey begun some time ago between Timiskaming and Mattawa.

The Madawaska river and lakes have also been under survey and very good progress has been made. This watershed contains 3,200 square miles and there are several large lakes regarding which information is frequently asked.

The various surveys made throughout the watershed cannot be assembled for mapping purposes without latitude and longitude determinations. It is only since the introduction of wireless telegraphy that longitude can be taken accurately and economically where no telegraph lines exist. During 1914, a party equipped with wireless apparatus established points at Quinze, Kinégivis, Grand Lake Victoria, and Kakabonga lakes. Their work was much hampered by low water in the streams and by cloudy weather and bush fires, but the

No. 8.—Quinze Dam: view of upstream face across river, showing sluiceways and rock slope staunched with fine material. Full reservoir surface will be five feet below the top of dam.

6 GEORGE V, A. 1916

points have been fixed to about a quarter second, or 25 feet on the earth's surface. We are indebted to Dr. King of the Observatory for furnishing Mr. Dier, telegrapher, and Mr. Nechion, observer, and to the Navy Department for the use of a wireless outfit.

No. 9.—Kipawa Reservoir, log pass in dam across the head of Gordon Creek.

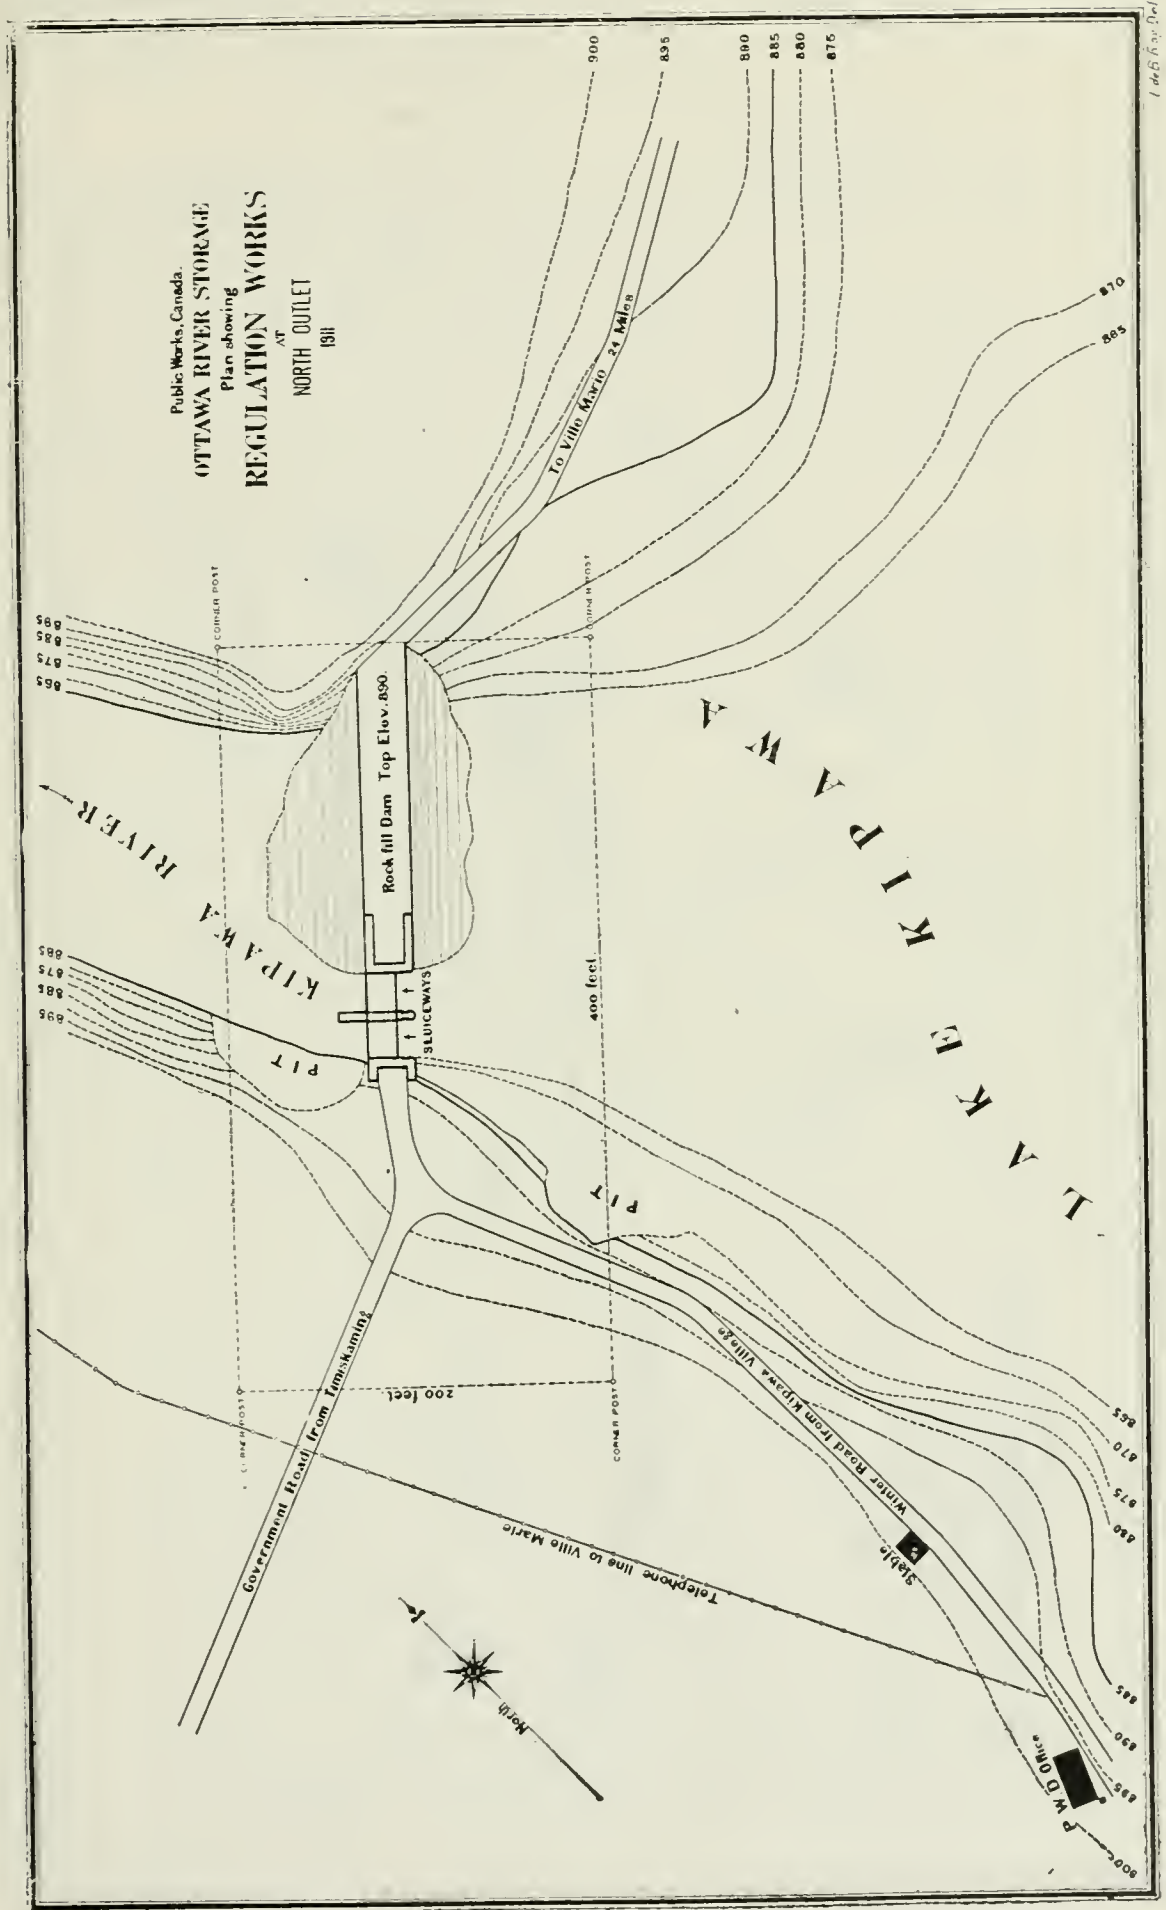

Office work has consisted in reducing notes and plotting discharge curves for metering and in keeping the returns from the fifty-odd gauge stations. Mr. DesRosiers has also attended to a mass of work connected with geodetic levelling and plans required in connection with various dry docks and other works of the department.

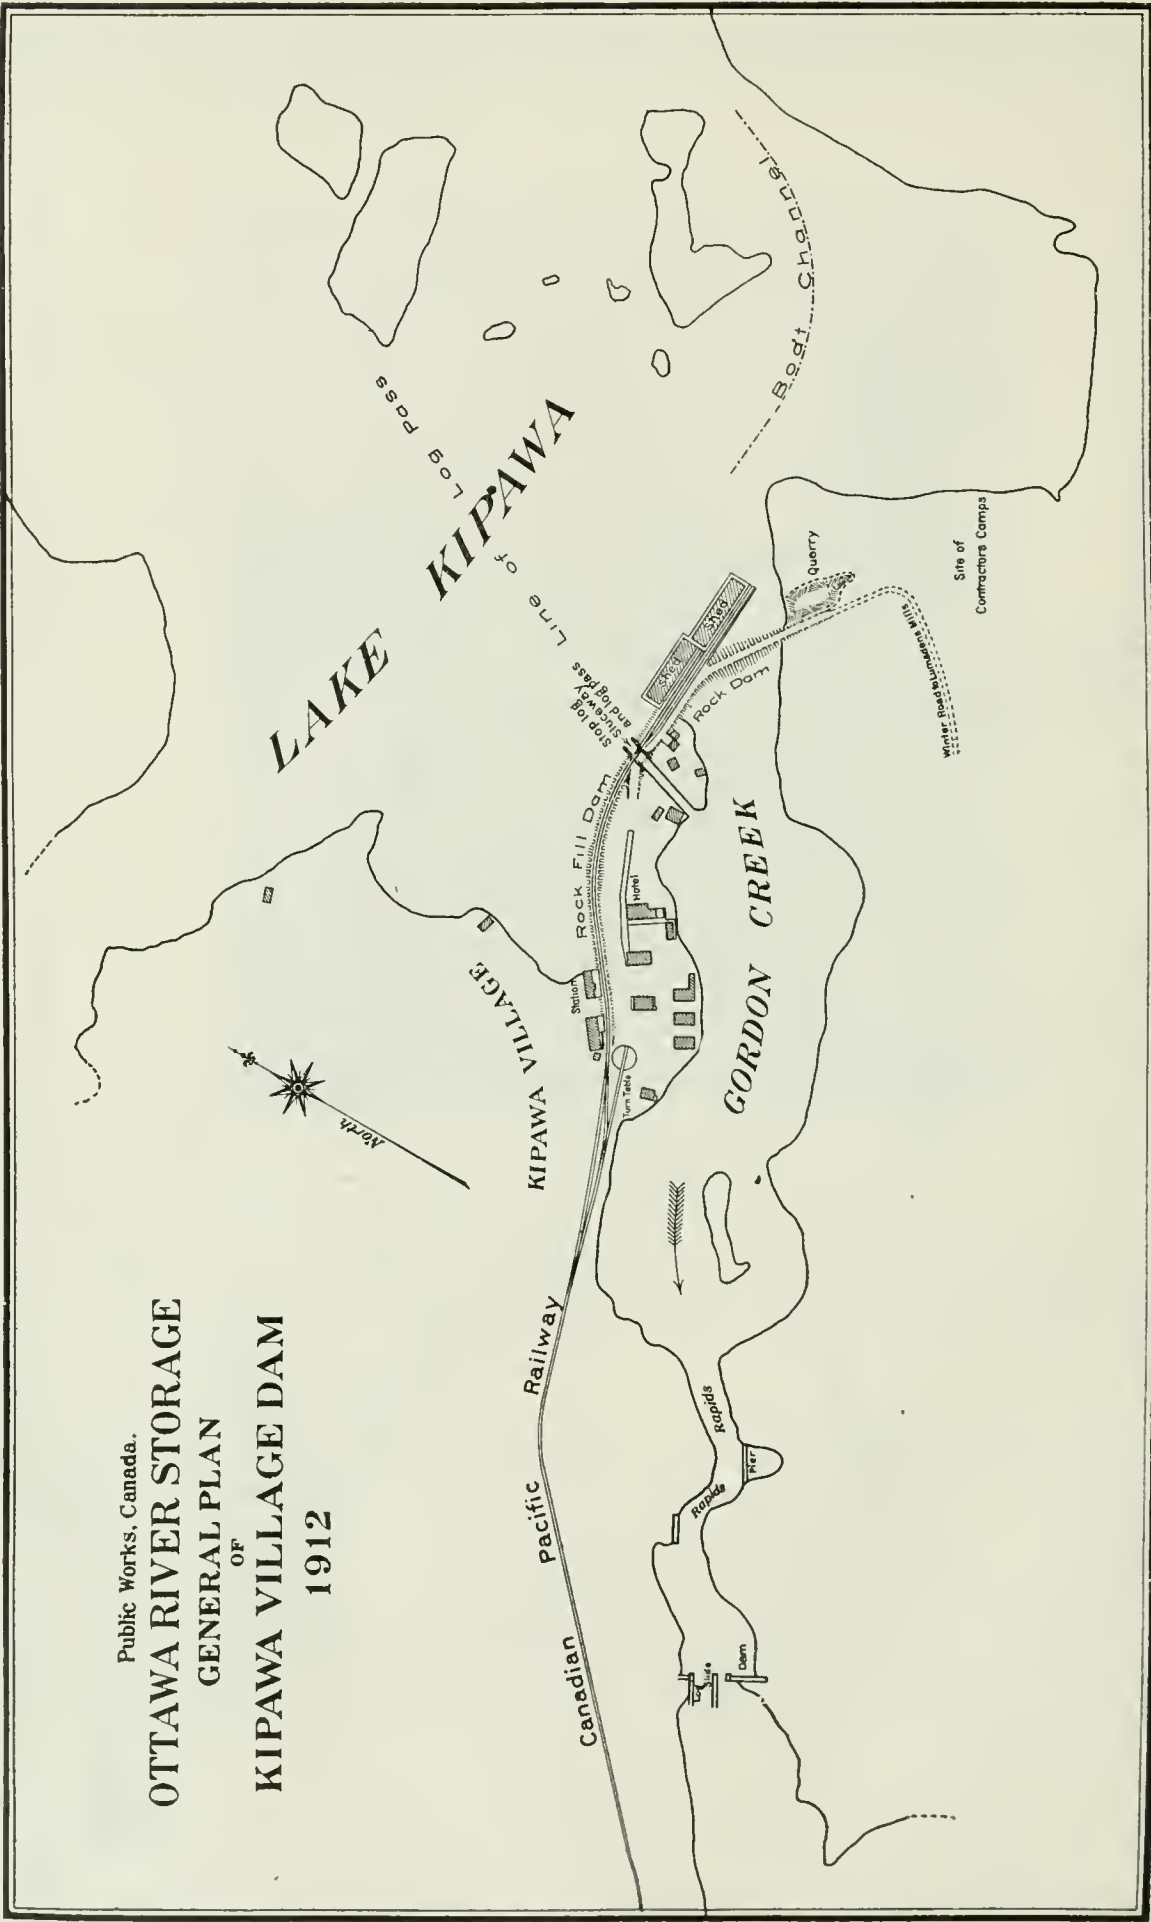

The watershed map of the Ottawa river is constantly being corrected, and further information is being added as survey notes come in. The longitude and latitude determinations make it now possible to advance the work on the mile-to-an-inch plans of the river and its tributaries.

In connection with Kakabonga, a detailed report from Mr. Gray is submitted, together with the report of the survey made by Mr. Blue. Plans are also submitted showing the various lakes connected with the scheme and the excavation necessary to pass the stored water via the Coulonge river.

SESSIONAL PAPER No. 19a

SESSIONAL PAPER No. 19a

26th February, 1913.

C. R. COUTLEE, Esq.,

Engineer in charge, Ottawa River Storage,

Public Works Department, Ottawa.

SIR,—In connection with my investigation last September of the proposed dams at the head of Gens-de-Terre river and foot of Barrière lake for the Kakabonga reservoir, I beg to submit the following:—

In order to create artificial storage on Kakabonga lake, it is necessary to include in the storage basin, Bark lake, Rapid lake, Kakabonga and Barrière lakes. For the control of this storage, two dams are necessary, on Kakabonga lake at the head of Gens-de-Terre river, about 500 feet below the present timber dam operated by the lumber firm of Messrs. Gilmour and Hughson; the second dam required will be located about  $6\frac{1}{2}$  miles west of Hudson Bay, Barrière lake Post, where the Ottawa river flows out of the lake.

The proposed Kakabonga dam site is situated at the head of the Gens-de-Terre river, about 500 feet below the present lumber dam, built about forty years ago by Gouin. It is about 100 miles north of Maniwaki, the terminus of the Canadian Pacific Railway, Gatineau branch. There is a good winter road from Maniwaki to Bark Lake depot (sixty-five miles), the base camp for the Gilmour and Hughson Lumber Company, and which is situated on the south shore of Kakabonga lake.

The maximum load by team on the winter road is 2,200 pounds and the time occupied in the return trip is five days.

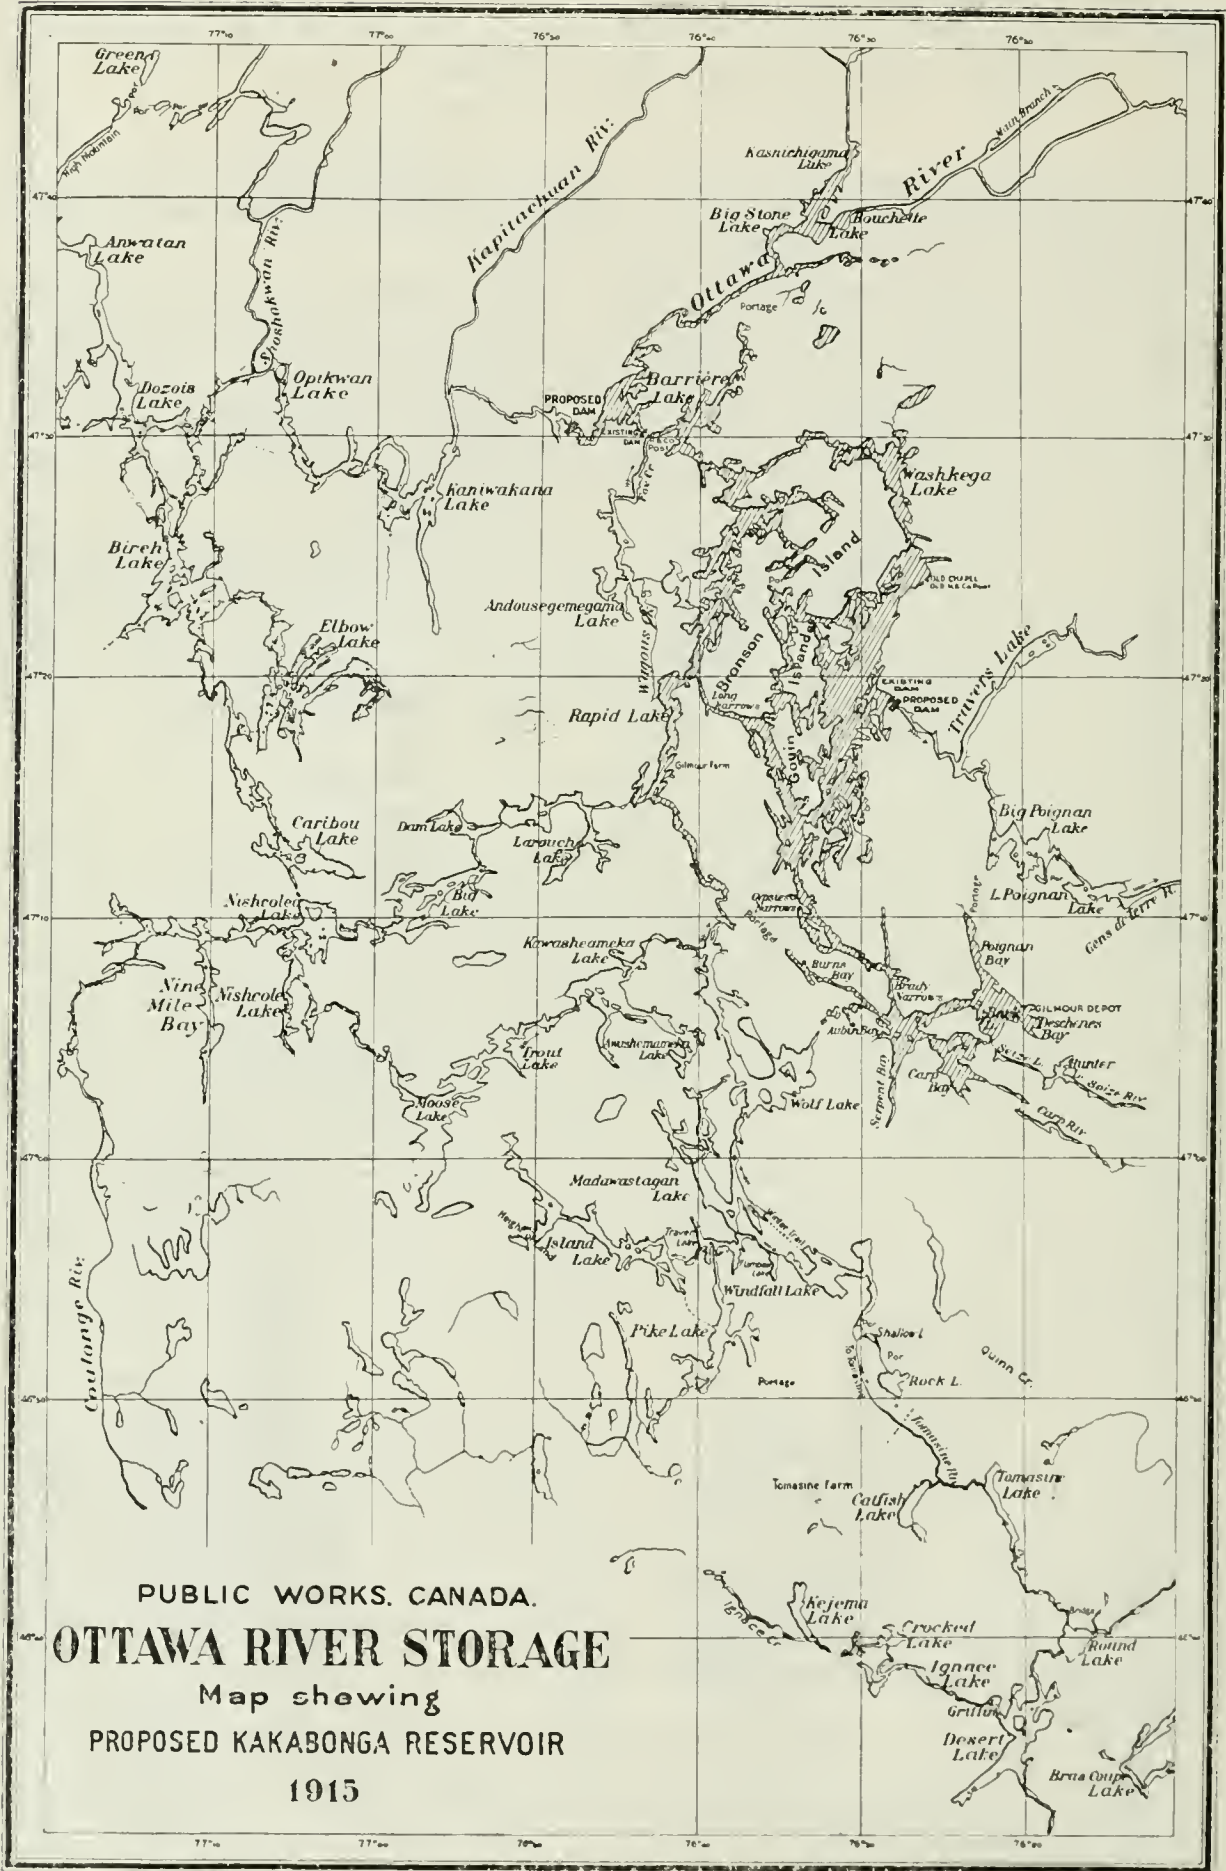

There is a good summer road from Maniwaki to Carp Lake depot (50 miles), one of the W. C. Edwards Company's stopping camps, and from Carp Lake depot to Bark Lake depot, the road is very difficult, even for pedestrian travel. From Bark Lake depot to the present lumber dam at the head of Gens-de-Terre river (35 miles), the lake is navigable and it is possible to bring material, etc., by the steam *alligator* owned by the Gilmour and Hughson Lumber Company.

The proposed Barrière Lake dam site is situated on the Ottawa river, 115 miles north of Maniwaki, and about  $6\frac{1}{2}$  miles east of the Hudson Bay post, Barrière lake, which is also reached from Maniwaki to Bark Lake depot, thence by steam *alligator* through Rapid lake to a small timber dam built by Gouin about forty years ago, and situated about  $1\frac{1}{2}$  mile east of the Barrière lake, Hudson Bay post. At this dam, material, etc., will require to be transported about 300 feet over the dam and brought by boats or scow to the proposed site (5 miles), which is at the foot of the lake and at the head of a 31.7-foot fall in the Ottawa river.

The two timber dams, at present existing, were originally built about forty years ago by Gouin; they create an artificial storage of about 4 feet on these lakes, and are used and maintained by the Gilmour and Hughson Lumber Company, the dam at the head of the Gens-de-Terre river being used for passing logs down the Gens-de-Terre river to the Gatineau river to Hull. The dam on Barrière lake is situated about  $1\frac{1}{2}$  mile west of Barrière lake, Hudson Bay post, it divides Barrière lake in two, the water of the west portion of the lake follows its natural course down the Ottawa river, and the waters of the eastern portion are diverted and passed through the Gatineau by the Gens-de-Terre dam.

The drainage area of the proposed basin is 2,500 square miles, the Ottawa river above Barrière lake contributing 1,345 square miles and the Kakabonga and other lakes 1,155 miles. The total area of the reservoir is 100 square miles, made up as follows:—

## SESSIONAL PAPER No. 19a

	Square miles.
Bark lake to Burns narrows .....	14.4
Kakabonga lake.....	46.8
Part of Barrière lakes east of present dam, including Rapid lake.....	29.4
Barrière lake, Bouchette lake, and 40 miles of Ottawa river above Barrière lake.....	10.0
Total.....	<u>100.6</u>

The type of dams proposed is the same as those already built at Kipawa and under construction at Quinze, viz., rock-fill with 20-foot sluices and wooden stoplogs. On account of the high cost of transportation of cement and the limited life of wood for the sluice-ways, it is proposed to use steel bents instead of concrete for the abutments and piers. The steel work, will be connected to the rock-fill embankment with timber cribs. At both locations a good rock foundation has been found for the sluice-ways, and all the work in connection with preparing the foundations and building the piers can be done in the dry, thus getting away from costly unwatering work.

From previous investigations by Goodspeed (1906 G.B.S.C. 1906) and Dansereau (Report 1910), it has been fairly well established that by the construction of two dams, a storage of 15 feet can be maintained on the present Kakabonga basin and, for this purpose, a careful survey has been made and plans prepared for two dams at the locations above described.

At the head of the Gens-de-Terre river, the proposed dam will be 25 feet above the sill, and 1,000 feet long. The type of dam proposed is similar to the Kipawa and Quinze dam, viz., rock-fill with steel piers and wooden stoplogs. The proposed dam at Barrière lake will be 25 feet high above the sill, and 2,000 feet long.

## FOUNDATIONS OF SLUICE-WAYS.

The sites of the sluice-ways have been located on rock. The Gens-de-Terre site appears from the examination made to be solid, but at the Barrière site the rock at the surface appears shattered and full of seams. Some work was done to trace the depth of these seams, and they only appear to extend down a few feet, but in view of the foundation trouble which developed at the Quinze site, I would recommend that further investigation be made of both sites.

## MATERIALS FOR CONSTRUCTION.

At Gens-de-Terre site the nearest available sand, suitable for concrete, is at the mouth of the Kakabonga river, about 8 miles north of the dam site.

For the rock embankments, good suitable quarries can be opened up at the dam site. At Gens-de-Terre there is about 2 feet cover on the solid rock, and at Barrière there is a cover of about 6 feet of fine sand over the solid rock.

Timber for stoplogs and cribwork can be obtained from the limits bordering the reservoir. It will, however, be necessary to go a considerable distance back from the lake to obtain the large dimension timber for the stoplogs.

## COST OF RESERVOIR.

Detailed estimate of both dams is attached, but no estimate is made of the land damages until the survey now being made of the flooded land is received.

Gens-de-Terre dam.....	\$ 70,000 00
Barrière lake dam .....	102,000 00
Total .....	<u>\$172,000 00</u>

TIME FOR COMPLETION.

Both dams can be completed in eighteen months. The contract for steel work will require to be let about July 1, in order that it may be ready for shipment by January 1. The contract for the other work will require to be let by December 1 so that supplies, etc., may be transported to the dam sites during winter months.

Yours obediently,  
A. GRAY,  
Asst. Engineer in charge.

Engineer in charge,  
Ottawa River Storage, Ottawa.

## . CONTOUR SURVEY KAKABONGA LAKE.

SIR,—In connection with the contour survey of the Kakabonga reservoir, I beg to submit the following report:—

The object of the trip was to ascertain the amount of land that would be flooded by raising the water level of the lakes to the proposed full regulated level of 1,198, with special reference to those places mentioned on page 180 of the Ottawa River Storage Report, of 1911. The land required would be to elevation 1,203, thus giving a 5-foot reserve.

The present water level varies from 1,182 to 1,187.

The height of land between the reservoir and Dam lake, the head water of the Coulonge river, was also investigated with a view to create an artificial outlet of stored water by way of the Coulonge river.

The party, consisting of fourteen, left Ottawa on January 19, for Maniwaki. Here provisions and teams were obtained and on January 22, a start was made. Bark Lake depot was reached on January 24, after a 65-mile drive over good winter roads.

Another day and a half's driving down the lake brought the party to a shanty, near Long Narrows. The party was split up here, one-half going to the Kakabonga river, while I took the other half and went to the height of land between Rapid lake and the Coulonge river.

Camp was made on Mountain creek which flows into Rapid lake. This creek varies from 80 to 20 feet in width, and in the spring would probably be 5 or 6 feet deep.

Some 4,000 feet up the creek is a small lake, 1,000 feet wide. Its elevation on January 30 was 1,213.91, and its depth in the centre, some 27 feet.

Between this lake and Larouche lake is a black spruce muskeg at elevation 1,217, and 2,300 feet wide. The elevation of Larouche lake on February 4 was 1,213.54.

This lake is about 5 miles long, and in it are two narrows: one is three-quarter mile long, 15 feet wide, and the other is 600 feet long and 60 wide. Both are very shallow.

The outlet of Larouche lake is near its west end, and flows north, emptying eventually into the Ottawa River, near Birch lake.

The divide between Larouche and Dam lake, the headwater of the Coulonge river, is about 1,100 feet across. At 400 feet from Larouche, the elevation of the ground is 1,218, and at 1,000 feet it is 1,240. From here the ground falls steeply to Dam lake, whose elevation on February 4 was 1,189.04.

Under present conditions, Kakabonga reservoir is some 3 feet lower than Dam lake.

At the proposed full reservoir level it would be 10 feet higher than Dam lake, thus only giving a 10-foot head on any canal that would be built to throw the water down the Coulonge.

To do this would entail a great expense, and the benefits derived would not warrant this.

6 GEORGE V, A. 1916

Returning by way of Long Narrows, the party travelled south around the end of Gouin's island, then north to the Kakabonga dam with the intention of working along the east shore to join on with the other party.

From Kakabonga dam to the Kakabonga river, the shore is high, with a high range of hills in the back ground. Very little valuable timber will be destroyed. A few spruce will be flooded, and many birch, balsam, and poplar.

It was necessary to go up the Kakabonga river about 6 or 7 miles in order to obtain elevation 1,203.

At its mouth is a large flat of jack pine and spruce, which will be flooded. There is hardly any rise in the river for 4 miles, but when the rapids are struck they are practically continuous. The shores are steep. Four miles from the mouth, the right and left branches of the river join the main stream. They are both very rapid, so the required rise was soon attained.

In this section, from the Kakabonga dam to Rock lake, including the Kakabonga river, the amount of land that will be flooded to elevation 1,198 is 2,438.5 acres, or 3.8 square miles. The area between elevation 1,198 and elevation 1,203 is 450.75 acres, giving a total of land required on this section equal to 2,889.25 acres, or 4.5 square miles.

While at the Kakabonga dam it was found that to bring the grade of the fill of the proposed dam up to 1,203, it would increase its length by 100 feet. The Gens-de-Terre river was open below the rapids.

The two parties met on February 19. The next day camp was moved to Hebert's shanty on Bronson island. From here a team was taken to Lacroix's camp on Long Narrows and thence up the lake to Brady's Narrows, where camp was made on February 22.

From Brady's Narrows, the party worked south, taking in part of Burns bay, Serpent bay, and Carp bay.

In the end of Burns bay there is no danger of the water escaping to the west, although it may flood eastward over to Crooked Narrows on Kakabonga lake, thus making an island. Several small lakes were investigated on the south shore of Burns bay, and the required elevation was obtained.

There are quite a few good white pine in the bay, the average diameter being from 8 to 16 inches. One clump of fifty-one white pine, 24 to 26 inches diameter was found on a line 500 feet long. The red pine averages from 7 to 18 inches, and are not so numerous as the white. A few spruce will be flooded. The remainder of the trees are birch, balsam, and cedar, with a few tamarack.

In Serpent bay are a good number of white and red pine, averaging about 12 inches diameter. In the bottom of the bay, the timber is all burnt, except a swamp in a creek gully, which is covered with black spruce, 2 to 12 inches in diameter.

The shores of Carp bay are high, only one large flat being found on the south shore of the bay. On the west shore, very few pine are found, but on the east and north shores are quite a few good red and white pine.

Owing to signs of an early break up it was decided to investigate the height of land between Bark lake and Seize lake, the headwater of Seize creek, which flows south to the Gens-de-Terre river.

A check line of levels was run over the lowest part of the height of land, which showed the elevation of Seize lake on March 19, to be 1,193.10. The highest point on the gully was 1,201.

A fill to bring this up to 1,203 would be 115 feet long and with a width of 10 feet at the top and side slopes 1 to 1 would contain some 130 cubic yards.

The survey of Carp bay was completed on March 19. The party moved to Poigan bay on March 20, over very bad ice. That night, a heavy rainstorm rotted the ice considerably, so it was decided to move to the depot and discontinue work.

## SESSIONAL PAPER No. 19a

Bark lake depot was reached about 9 a.m. on the 21st. In the p.m. a survey was made of the depot buildings, and the divide in the end of Desehenes bay was investigated. The lowest elevation found on the ridge between this lake and Hunter lake was 1,206.

Permanent hubs were left at the ends of the survey, so that future work may be tied on that already done.

The area flooded from Brady's Narrows, south, including most of Burns bay, Serpent bay, and Carp bay is as follows: Area to 1,198 is 1,083.5 acres, and between 1,198 and 1,203 is 463.2 acres, making a total of land required of 1,546.76 acres, or 2.4 square miles.

The party reached Ottawa on March 24, being sixty-three days away. Of this time, twenty-three days were spent in travelling (getting to and from the lake and moving camp), two days were lost by rain, and there were seven Sundays leaving thirty-one days' work on the survey line. During this time, 81.9 miles of traverse were run, and 17.6 miles of line cut in the bush to the contours. This makes an average of 2.6 miles per day for traverse and 2,950 feet of line cut per day.

The total area of land required in the places surveyed amounts to 6.9 square miles. The area of the lake would be increased by 5.5 square miles.

The total length of shore line around the reservoir, including the Ottawa river, past Bouchette lake, is approximately 475 miles. The length of the shore line of Bronson island and Gouin's island, which divides Kakabonga lake, is 160 miles. These islands have to be contoured, owing to the timber on them. This makes a total of 665 miles, of which 80 miles have been done in the past season, leaving 585 miles to do.

During summer months, probably 50 miles a month would be a good average. The main shores could probably be finished in eight months.

The cost of the survey is divided up as follows:—

Transport .....	\$ 370 00
Provisions .....	707 00
Equipment at 200, say 10% .....	20 00
Wages .....	2,120 00
<b>Total .....</b>	<b>\$3,217 00</b>
Cost per mile 3,217	
$\frac{\quad}{80} = \$40\ 03.$	

I have the honour to be, Sir,

Your obedient servant,

W. E. BLUE,

Assistant Engineer.

## LONGITUDE AND LATITUDE DETERMINATIONS.

In connection with the longitude and latitude determinations, a detail report from Mr. T. C. Dennis of the Astronomical Observatory staff, follows. This includes all the work done during 1914 and 1915, so that a complete description of all the points determined in the field is now on record.

6 GEORGE V, A. 1916

OTTAWA, December 1, 1915.

C. R. COUTLEE, Esq.,

Engineer in charge.

Ottawa River Storage, Ottawa.

SIR,—During the summers of 1914 and 1915, several stations were observed in the watershed for latitude and longitude. Dr. King, C.M.G., Dominion Chief Astronomer, kindly lent observers. It was decided to use the novel method of wireless telegraphy for the comparison of time signals with the Dominion Observatory; and a portable wireless receiving instrument was secured for this purpose.

The party consisted of seven, an observer and six men for the canoe transport. During the ten months the party was in the field, about one thousand miles were covered with the canoes, and thirteen stations were observed. Many portages had to be made through unsettled country, so that it was necessary to reduce weight as much as possible.

The astronomical transit used was smaller than desirable, and it was found impracticable to carry the cement generally used for its foundation, so that the standard of accuracy was slightly below that obtained with the larger instrument with the concrete base. The time comparison was made with the observatory by means of the time signal sent out from Washington at ten o'clock, p.m. The observers at the observatory and in the field each comparing his clock with Washington, by means of the coincidence method.

Aerials consisting of two wires 300 to 600 feet long were erected at the different stations, using the highest trees in the vicinity for masts.

At stations where cement was not available, piers for the instrument were on several occasions constructed by using three logs about 7 feet long which were placed on end in the ground leaving about  $2\frac{1}{2}$  feet above. These logs were firmly nailed together at the top and in some cases a cribwork, was erected around them to protect the pier. At three of the stations a large stump was used as a pier, and these were found to be nearly as solid as the cement. The pier at one of the stations was built of large flat stones, which gave very satisfactory results.

Although the instruments carried were of a delicate nature and required careful handling, they made the whole distance without accident of any kind. The wireless outfit proved very satisfactory, and at every point where it was erected signals were received on the first night. The party was always in touch with the large wireless stations on the Atlantic coast.

The determination of the positions of those stations has a probable error of  $\cdot 035$  S. or about 35 feet in longitude and  $\cdot 10''$  or about 10 feet in latitude.

The following are descriptions of the stations observed:—

*Quinze Dam*.—Observing pier 1,160·9 feet N.  $47^{\circ} 22'$  W. from Challoner's Canadian B.M. No. MDCX (elevation 842·90 feet).

*Kinojevis River*.—Observing pier 577·9 feet S.  $54^{\circ} 46'$  W. from B.M. No. 3 (elevation 879·44 feet), established by G. B. Hull of Department of Public Works.

*Barrière*.—The pier is situated on the north side of the arm of Rapid lake, about 600 feet from its shore. It is 1,690·8 feet from a copper plug cemented into the rock, close to the Hudson's Bay flag pole. This plug is 68·5 feet from the southwest corner of Hudson's Bay Company's store, and 157·5 feet from northwest corner of residence of manager of Hudson's Bay stores.

*Grand Lake Victoria*.—The pier is situated on the south side of the Ottawa river, distant therefrom about 1000 feet. It is also 2078·4 feet with bearing N.  $79^{\circ} 20' 48''$  E. from a copper plug cemented into the rock and surmounted

## SESSIONAL PAPER No. 19a

by a cairn of stones. This copper plug is near the residence of the manager of the Hudson's Bay Company stores.

*Hunter's Point, Kipawa district, Quebec.*—The station is a screw head in the top of a concrete pier built on a flat-topped boulder at Hunter's point. The station is 30 feet from the north shore of the North river, and about 1,300 feet west of Mr. Pierre's house on the opposite side of the river. Station 64 of the Public works Department survey is N.  $62^{\circ} 25'$  E. of the astronomical station, and distant 1,474.2 feet. A line has been cut to a copper bolt placed in the solid rock, 433.2 feet due north of the astronomical station. The bolt is at the south side of a stone cairn. The line from stations 64 and 63 of the Public Works Department survey has a bearing of N.  $63^{\circ} 35' 30''$  E. with this north-and-south line.

*Stubbs Bay, Des Moines Lake, Quebec.*—The astronomical station is a screw head in the top of a concrete pier situated on a narrow hog's back, about 50 feet wide, extending south-easterly into Lake Du Moine at Stubbs bay. A copper bolt has been placed in a boulder, 2124.6 feet due south of the station. The station is 1454.5 feet from the southeast corner of the store at Eddy's depot on a bearing S.  $6^{\circ} 34' 30''$  W.

*Ward Lake Station, Coulonge River, Quebec.*—The astronomical station is a copper bolt in a large flat rock surface, on the east side of Wards lake. It has been tied to the lake, which is about one mile long and quarter of a mile wide by a triangulation survey. The station is 15 feet from the shore of the lake, and about 100 feet south of a tall pine tree from which the limbs have been cut. There is a cairn of large flat stones 2 feet north of the bolt. A squared cedar post with a nail on top has been placed 2,360.9 feet due south of the station on the opposite side of the lake. The station is 4,580.2 feet from the north side of the entrance of Victoria creek on a bearing S.  $60^{\circ} 09'$  E.

*Crow-Coulonge Station, Coulonge River, Quebec.*—The station is a copper bolt in the top of a large pine stump (21 inches in diameter) 100 feet from the south shore of the Coulonge river about 200 feet up stream from the mouth of the Crow river on the opposite side of the Coulonge. The stump is well blazed on the north and south side. It is distant 470.9 feet from a copper bolt placed in the solid rock on the north side of the Coulonge and east side of the Crow rivers at their intersection. A squared post has been placed 356.5 feet due south of the station, and the line cut out.

*Gens de Terre Station, Gatineau River, Quebec.*—The astronomical station is a copper bolt in the top of a concrete pier on the north side of the Gens-de-Terre river, 25 feet from the shore and 700 feet from the Gatineau river. A squared cedar post with nail on top is placed 415.1 feet due south of the station on the opposite side of the Gens-de-Terre river. A line has been cut from the astronomical station to the Gatineau river near the forks.

*Lièvre forks station, Lièvre River Forks, Quebec.*—The station is a screw head in the top of a blazed birch stump 15 feet east of the west branch of the Lièvre river, and 380 feet above the forks of the east and west branches. A squared post with nail on top has been placed 653.8 feet true south of the station on the east side of the east branch of the river. A copper bolt is placed in the solid rock on the west side of the east branch 730.2 feet from the station on a bearing N.  $33^{\circ} 30'$  W.

*Gatineau forks station, Gatineau River, Quebec.*—The station is a screw head in the top of a large forked pine stump, between the east and west forks of the Gatineau river. About 300 feet from the forks on the hog's back, between the two branches. A copper bolt is placed 292.3 feet from the station on top of a large rock face at the point between the forks, and about 20 feet above the water. A squared spruce post is placed due south of the station 818.6 feet

6 GEORGE V, A. 1916

on the east side of the east fork, about 30 feet from the shore and about 20 feet above the water. The lines are cut from the station to the copper bolt and the south mark.

*Chaudière Dam Station, French River, Ontario.*—The station is a screw head in the top of a concrete pier on the height of land west of the government offices. A copper bolt is placed in the solid rock due south of the station. The station and bolt have been connected by survey to the Georgian Bay Canal survey.

*French River Village Station, Ontario.*—The station is a screw head in the top of a concrete pier placed on the top of a low rock hill about 100 feet north of Mrs. Tessier's house at French River village. It is also about 100 feet from the shore of a small bay on the south side of the French river. A copper bolt is placed due north of the station. The bolt and the station have been connected by survey with the Georgian Bay Canal survey.

T. C. DENNIS.

No. 13.—Portable Wireless receiving instrument and comparison clock, which is electrically connected with headphones and sidereal observing clock in another tent that protects the astronomical transit. The time signal from Washington is heard in the phone connected with the comparison clock, which registers on a chronograph ribbon.

SESSIONAL PAPER No. 19a

No. 14.—Aerial masts at Ward Lake, Coulonge river. Two wires are . . stretched between trees to receive the pulsations sent from the powerful sending station.

No. 15.—Astronomical Transit set on large stump near forks of Lièvre river.

No. 16.—Astronomical transit with sidereal observing clock upon bench to left.

NOTES ON A VISIT TO KEOKUK DAM, MISSISSIPPI RIVER,  
IOWA, U.S.A.

DEPARTMENT OF PUBLIC WORKS,

OTTAWA, January 27, 1913.

EUGENE D. LAFLEUR,  
Chief Engineer, P.W.D.,  
Ottawa.

SIR,—According to your instructions of the 10th of December last, we, the undersigned, have the honour to report that we have visited the water-power in course of development at Keokuk, Iowa, U.S., at the foot of the Des Moines rapids on the Mississippi river, with the object of obtaining useful information in view of probable similar developments being undertaken in Canada.

The works under construction at Keokuk by the “Mississippi River Power Company” are the largest ever undertaken by any private company in America. The capital required, about \$25,000,000, has been subscribed in several European countries, Canada, and the United States. The amount of power to be developed is 300,000 horse-power, or about one-half of the total now utilized by five companies at Niagara Falls. Although the present installation will consist of only fifteen turbines and electric generators of 10,000 horse-power each or one-half of the ultimate installation, however, the foundations for the additional units are all built and will require but a comparatively small outlay to complete any part of or the whole installation as it becomes necessary. The city of St. Louis, Missouri, 140 miles distant, has already contracted for 60,000 horse-power for ninety-nine years. The transmission line is nearly completed, and will carry the electric current at 110,000 volts. The works are to be completed by the 1st of July next.

## HISTORY.

The project of utilizing the Des Moines rapids for an electric water-power has been under consideration for a great number of years, dating back to 1848,

6 GEORGE V, A. 1916

when it was proposed to develop 10,000 horse-power by means of wing dams. In 1890, a company was organized and engaged the services of Mr. Lyman E. Cooley who made several propositions for water-powers of different capacities at Nashville, 8 miles above Keokuk, but this company was unable to finance its scheme.

A few years later, the matter was taken up by Mr. Hugh L. Cooper, Consulting Engineer of New York, who proposed the works now being carried out. He undertook to raise the funds and he organized the new company which took over the rights of the old company. In 1905, Congress passed a Bill authorizing the company to proceed with the works.

#### SITE.

The site of the power plant is at Keokuk, Iowa, on the west side and Hamilton, Illinois, on the east side of the Mississippi river, at the foot of the Des Moines rapids, which extend for a distance of nearly 12 miles. It is 220 miles west of Chicago; 140 miles north of St. Louis, Missouri, and 180 miles east of Kansas City. It is the centre of a population of nearly 5,000,000 within a radius of 220 miles. The city of Keokuk has a population of 15,000. The river at this place has a depth of 7 feet, the rapids have a fall of 23 feet, and are overcome by a canal, 9 miles long and three locks with 6 feet of water on the upper sill, built by the United States Government in 1877, on the west side of the river, but navigation is not practicable at low stages of the river.

#### CONDITIONS IMPOSED.

Several conditions were imposed by the Government before granting authority to build the water-power development by the company; such as the construction of a lock 110 feet wide, 400 feet long, with a lift of 40 feet and a depth of 8 feet on the upper sill to take the place of the old canal; the construction of a dry dock 110 feet wide at entrance, 463 feet long. These are to become the property of the Government after completion, and the power for their operation is to be furnished free in perpetuity by the company; the water level is not to be raised more than 35 feet above its present level at the site of the dam and the depth of 8 feet is to be maintained on the new lock sill. The company has to pay all damages on account of flooded lands and to raise the level of the highways and railroads on both sides of the river.

#### ADVANTAGES DERIVED.

The company estimates that the advantages derived by the Government from the construction of the dam and water-power are equal to a capitalization of over \$5,000,000, as the old canal and locks, built in 1877, were in need of constant repairs which, together with the cost of operating, amounted to \$40,000 a year; besides, 2 feet additional depth of water on the sill of the new lock are obtained and deep water navigation is provided for a distance of 60 miles above the dam. It is also contended that a saving of two hours will be effected by boats running in open slack water instead of through the canal.

#### WORKS UNDER CONSTRUCTION.

All the works are built of concrete on a solid rock foundation and consist of:—

*First.*—A dam 4,278 feet long plus the east abutment 290 feet and west abutment 81 feet. The dam is 42 feet wide at the bottom and 29 feet wide at the top, of

## SESSIONAL PAPER No. 19a

a total height of 53 feet. The dam is composed of 119 arched spans, with piers 6 feet thick and 30 feet of clear span. The spillways between the piers are 32 feet high from bottom, with vertical upstream face; the downstream face is an ogee curve. The dam is keyed into the lime-stone bottom of the river about 5 feet in depth. Steel sluice gates, 11 feet high on top of each spillway, with their ends fitted into grooves in each pier, are to be raised by electric travelling derrick as required, to regulate the level of the river. The piers support a reinforced concrete floor intended to carry the derrick and a railway track. The piers and dam consist of solid mass concrete of 1-3-5 mixture.

*Second.*—A power-house, 1,718 feet long, 133 feet wide, with sub-structure built of mass concrete and 70 feet high to generator floor. The substructure contains the turbine chambers, stairs, and passage ways; it is provided with two ice chutes, 30 feet wide, for sluicing out ice floating in the fore bay: the superstructure is 107 feet high, the walls are built of reinforced concrete, and there are four floors, the first containing the generators and the others contain the oil switches, the transformers, and other accessories.

*Third.*—Thirty generators and turbine units, each mounted on the same vertical shaft, which is 25 inches diameter, running fifty-eight revolutions per minute. The generators are 31 feet in diameter, the turbines 16 feet 2 inches in diameter, of a capacity of 10,000 horse-power each, rated on a 32-foot head of water; this head will vary from 22 to 35 feet. A thrust bearing on rollers carries the generator, turbine, and shaft, a total weight of 550,000 pounds. The first installation will consist of only fifteen power units. The turbine chambers are 39 feet in diameter, and the water is guided so as to have the best effect on the turbines.

*Fourth.*—A lock 110 feet wide, 400 feet long, with 8 feet of water on the sill, and walls 52 feet high, from 8 to 33 feet thick, with main filling culverts under the concrete side walls and branch culverts with outlets through the floor; four branch culverts on each side. The culverts are cast in concrete around steel lining as a protection against erosion. The lower lock gates are 50 feet high and consist of a steel truss sheeted with steel plates on the compression side only; part of the outer side of the frame is sheeted so as to form an air chamber which will support a part of the weight of the gate by its power of floatation. The gates are pivoted on hardened steel and bronze. The upper lock gate is of an entirely new design, it consists of a single steel caisson and is intended to carry a railway track to be used when the lock entrance is closed; the bottom part is an air chamber that may be filled with water the weight of which sinks the gate into a chamber until its top is somewhat below the lock sill and allows the boats to pass over it. As soon as the boat is in the lock, compressed air is introduced into the air chamber which forces the water out, allowing the gate to float back in place. Proper appliances are provided at each end to lock the gate in its proper position. Three gates of this design will be built, one for the dry dock and two for the lock, one of which is a guard gate, all interchangeable.

*Fifth.*—A dry dock, 110 feet of entrance, 463 feet long. It is to be closed with one of the gates above described. No pumps will be required for this dock as the water may be let out by gravity through a culvert having its outlet in the lower reach of the river below the power-house.

*Sixth.*—A sea-wall, 1,110 feet long, 45 to 70 feet high, to be built on the west side of the river to protect the railroad embankment which has been raised on account of the higher level of the river.

*Seventh.*—An ice-fender, 2,325 feet long, on the line of the upper limit of the forebay to exclude the ice therefrom. A 300-foot opening in the ice-fender is provided at its west end for navigation purposes. This opening will be closed during the winter season by a floating boom built of timber trusses, 5 feet deep.

The concrete structure is a series of arched spans 60 feet long with 10-foot piers between; the top of the structure will be 8 feet wide and the bottom 18 feet wide; the crown of the arches will be 4 feet below low water so as to prevent ice from entering through the spans.

All the concrete was deposited in the dry in cofferdams built of open face timber cribs, 24 feet long, 16 feet wide and about 15 feet high, placed 12 feet apart, allowing the water to run between the cribs, when all the cribs were placed and ballasted with stone, the openings were closed with horizontal square timbers. The cofferdams were built in lengths of about 400 feet. Vertical planks were driven along the outer face and earth was deposited against the sheathing. The cribs were built by two crews; rewards were given for fast work with the result that an average of one crib was built in a day, each crib containing 22,000 feet b.m. of timber. One section of cofferdam was ready before the concrete had been completed in the preceding section.

All the works are built by day labour under the direction of the chief engineer, Mr. Hugh L. Cooper. They are divided into two sections; the Illinois section consists of the dam from the east shore to the power-house, and the Iowa section includes the power-house, the lock, the dry-dock and the ice-fender; each section has its complete organization and plant. The bridge floor over the piers of the dam was completed as the work advanced so that it could be used for the transportation of the concrete on cars carrying 1½-yard buckets drawn by steam engines on a railway of standard gauge. Near the end of the finished part of the floor was mounted a travelling cantilever derrick, 240 feet long, which took the buckets from the cars and carried them ahead to the mould at the end of the cantilever arm of the derrick, which is 150 feet long; the derrick, fully equipped, weighs 175 tons, and runs on six wheels over 100-pound rails placed 25 feet apart.

The total amount of concrete employed in these works is about 650,000 cubic yards, the total length of the concrete works is about two miles.

All the materials used for concrete are delivered in the mixers by gravity from hoppers in which they have been deposited by cars running on an elevated railway. During the winter, the broken stone and sand are heated by steam pipes distributed in the hoppers, but no concrete is mixed when the temperature is below +20 degrees Fahrenheit.

The quantity of steel used in the works amounts to 7,000 tons, and the quantity of timber used for the cofferdam and forms was 10,000,000 feet b. m.

The amount expended on the plant alone was about \$1,000,000. The plant consists of: 15 miles of standard-gauge railway, 60-pound rails; 16 standard-gauge steam locomotives; 142 cars, of which 50 are dump cars; 1,700 tons of steel in derricks, steel forms, and bridges; five 10-ton derrick cars; 9 concrete mixers; 44 steam boilers; 50 miles of iron pipes, 1 to 5 inches diameter; stone crushers, capacity 3,500 cubic yards per day; centrifugal pumps; air compressors, etc.

The works were commenced in December, 1910, and are expected to be finished not later than the 30th June, 1913, or about thirty-one months, during which about \$25,000,000 will have been expended.

The raising of the water level by the construction of the dam will flood a large area of land on both sides of the river, in which 800 private parties and companies were concerned, to whom damages had to be paid. Out of the total number of cases, only eight were not amicably settled immediately; six of these have since made satisfactory arrangements, and only two will have to be decided by a court of justice, the company having been most liberal in the settlement for damages.

A large proportion of the flooded land paid by the company is to be reclaimed and laid out into parks for local attraction on each side of the lake to be formed.

## SESSIONAL PAPER No. 19a

We cannot speak too highly of the many kindnesses extended to us by the secretary of the company and the assistant engineers under Mr. H. L. Cooper, the chief engineer, whom we had not the pleasure of meeting on account of his absence from Keokuk.

The company is willing to give every facility to their numerous interested visitors to inspect the works and give all the information regarding the mode of construction; observation platforms are built on each side of the river overlooking the works, from which descriptions are given by one of the officials. We were, however, favoured by being accompanied by one of the junior engineers through all the different parts of the works for a detailed inspection.

We have the honour to be, sir,

Your obedient servants,

C. R. COUTLEE,  
M. Can. and Am. C.S.

V. C. VALIQUET,  
Supervising Engineer.

P.S.—The following details of the Keokuk work, gleaned from the company's publications, *Engineering News*, and other sources, is submitted as useful for reference in connection with hydraulic work.

## HYDROGRAPHY.

The Keokuk dam across the Mississippi pens up the greater part, but only a part of the northern or upper river draining 171,500 square miles. Extreme floods are not experienced in this upper portion. The Missouri draining 527,000 square miles—the area of the whole St. Lawrence basin—enters below Keokuk at St. Louis, and the Ohio draining 204,000 square miles joins at Cairo. These two great rivers sometimes form a conjunction flood creating rises of 40 feet in the river surface.

The upper river is not so extreme. At the dam site, the general surface of the natural rock bottom of the river is elevation 480. Low-water elevation is 484 and high-water elevation 505, showing an extreme fluctuation of 21 feet.

The Mississippi reservoir system amounts to 3,300 square mile feet, about half the Ottawa storage. The reserves are from 500 miles to 300 miles above St. Paul, Minn., which is 400 miles above the dam. These reservoirs being 700 to 900 miles distant seem to have no appreciable effect on the flow at Keokuk.

The drainage area of the Mississippi river above the dam amounts to 110,000 square miles, or double the area of the Ottawa basin. The basin consists principally of the states of Iowa, Wisconsin, and Minnesota, reaching northward to within 30 miles of the south shore of lake Superior.

The average annual precipitation in the south part of the basin is 35 inches, but decreases northward to 30 inches at St. Paul and 25 inches at the extreme northern boundary. This is not much different to the annual rainfall over the Ottawa basin, but the annual run-off is apparently less, being only 0.4 c.f.s. per square mile in the northern part, and about 1 c.f.s. per square mile in the southern part of the basin.

The Keokuk power plant consists of thirty wheels, rated at 10,000 horse-power, and 200,000 horse-power electrical, is to be developed on 32-foot head. The average annual flow is about 62,000 c.f.s., or nearly 0.5 c.f.s. per square mile for the whole area.

6 GEORGE V, A. 1916

The sluice-ways in the dam are 30 feet by 11 feet high, and 113 in number. This would seem to be arranged for passing a maximum flow of 410,000 c.f.s., the highest recorded is 372,500, or about 3.4 c.f.s. per square mile. The Ottawa area yields, during the May flood, 6 c.f.s. per square mile, and in parts 8 c.f.s. per square mile.

#### CLIMATE.

The climate is milder than that over the Ottawa basin, but ice takes to a thickness of 20 inches. During the extraordinarily severe winter of 1912, the ice was 30 inches thick in places, but broke up at the end of March. At the time of our visit, 9th January, there was good sleighing in Keokuk and frazil ice was forming in the rapids. The year before, the ice attack upon the Keokuk offer dam (24th March, 1912) seems to have been very heavy.

#### TOPOGRAPHY.

Between Montrose and Keokuk, Ia., a distance of about 12 miles, the river-bed has a fall of 23 feet, forming what is known as the Des Moines rapids. The surface fall is about 23 feet at low water, and 16 feet at high water, the greater part of this fall being in the lower 8 miles. The river is in solid limestone formation, and its bed is practically smooth, so that there is no broken water or surface disturbance except during very low water and at the lower end of the rapids, where ridges of harder rock cross the bed. The river channel itself is only navigable at high water, however, and navigation past the rapids is provided for by a canal. The river here is nearly a mile wide and has a depth of about 7 feet at mean water. In a 20-year range of observations, its volume of flow ranged from 20,000 cubic feet per second at low water to 372,500 at flood stage, the mean as deduced from gauge curves being 62,000 c.f.s.

The dam will raise the water level about 35 feet at the dam, submerging a considerable area of flat land along the banks and forming a pool about 60 miles in length. About 35 per cent of the submerged land is on the Illinois side, where the bluffs are nearer to the river than on the Iowa side. On the latter side, however, the tracks of the Chicago, Burlington, and Quincy Railway will have to be raised for a distance of about 9 miles. The normal working-head on the hydraulic machinery at the power-house will be 32 feet, but the head may vary from 21 feet at high water to 39 feet at low water, the upper level being kept constant.

The Mississippi, except for low water, is, with the exception of a 12-foot fall at Rock island, free of obstruction from St. Paul to New Orleans.

#### NAVIGATION REQUIREMENTS.

Raising the river surface involved among other damages the abandonment of the United States canal along the west side of the river. Consequently a new lock concentrating all the rise, about 40 feet, had to be constructed.

A proposition that the Government should pay the actual cost of building the new lock and appurtenances was disapproved by the chief of engineers on the grounds that: (1) such an arrangement between the Government and a private corporation in the construction and maintenance of a public improvement was not desirable; and (2) that the existing works are amply sufficient for navigation requirements, the new lock being necessary only because the construction of the dam will render these existing works useless.

The upper Mississippi River Improvement Association was very active in the matter, finally the company agreed to build even a larger lock than demanded by the United States corps. The idea is that a navigation similar to that down the Ohio will eventually obtain.

SESSIONAL PAPER No. 19a

## MARKET FOR POWER.

The locality of the dam will eventually be a great manufacturing district. The five million people in the power radius will require current for lighting, domestic purposes, and for street railways. The raw products would seem to be chiefly agricultural, but steamboats and barges may of course transport bulky materials from distant points, eventually.

The Ottawa valley has great agricultural productions, but in addition has much mineral and forest products. It is a superior power district to Keokuk in all respects, except population.

## COFFERDAM AROUND POWER-HOUSE.

A great deal of timber was used for cribwork and concrete forms. It came from Louisiana and Mississippi, sawn ready for use. With us, it would generally be economy to have a saw-mill at the site.

Standard gauge tracks connect up to all parts of the work, so that car loads of timber and stone filling for cribs were run out to the very spot at which they were used.

The half mile of cofferdam for the power-house, which lay in the direction of the river current, was, of course, subject to scour. This would have carried away the clay seal deposited along the outside toe, but shoulders were built out from the general line of cribwork to baffle the current. The upper shoulder was extended out 100 feet into the river in March, 1912, as additional protection against ice attack.

The cribwork cofferdam around the power-house was 25.5 feet high to withstand maximum floods, and that of April 6, 1912, rose to within 3 inches of the top. The cofferdams pocketing the various sections across the river did not attempt to keep out anything but ordinary floods, as it was found cheaper to allow them to flood, under the circumstances.

Cribs were scribed to the bottom and were 24 feet long by 16 feet wide, built with full open joints and without dovetails; rough vertical planks inside retained the stone filling. They were built ashore, launched and finished floating and set by guy lines with a space of 12 feet between. After the cribs were loaded with stone, the gap was filled with stoplogs, the upstream face was sheeted with 3-inch plank set vertically, and then earth was dumped along the toe from cars. Stone was deposited on top of the earthfill, if it needed protection from the current. Timber and some of the filling was handled by standard-gauge derrick cars, and the boring and spike driving was done with pneumatic tools.

The power-house site required 150 cribs to inclose the space 700 feet wide by 2,000 feet long round three sides, the old canal bank forming the shore side of the rectangle. Work was begun January, 1911, but was only rapidly under way by middle of March. The upper half of the area was inclosed 20th April, and unwatered by the 11th May, so that dust was flying. All these cribs were braced to give additional strength; they were built in about 8 feet of water. A bonus was given if one crib per day was built and set for a period of twenty-five days by each crew. The crib filling was from a quarry near by that was stripped and excavated by steam shovel, then hauled in 12 cubic yard air dump cars. This cofferdam proved to be very tight and has given no trouble. A 6-inch centrifugal pump easily handles all the leakage.

## COFFERDAM ACROSS MISSISSIPPI.

On 1st March, 1912, all piers up to and including No. 82 had been built from Hamilton, across to Keokuk, and cofferdam No. 3 was pumped dry, leaving

6 GEORGE V, A. 1916

450 feet to close. The final gap between the river cofferdam and the power-house was closed July 22, 1912. The method of building this last part was similar to that followed before. Cribs were placed and loaded with stone, the water finding a flow-way in the spaces between. No difficulties arose until in the last 200 feet when, in addition to the greater current and depth, the rock bottom for the first time was found covered with gravel.

The cribs were made larger, more heavily loaded, and placed touching each other. A strong fender boom was moored along the upstream face of the cribs already built and extended out to baffle the current.

The new crib bottom was built on a ear, run out to the end and swung to place under the lee of the boom, to which it was made fast. It was then gradually sunk to place and filled with stone.

The building of the oggee part of the dam was done in lifts to avoid excessive depths due to raise of surface. No concrete was placed during February, 1912, owing to continued cold, and in March, an ice jam, below the site, flooded the works; this emergency, however, was expected, and all the plant was taken out. The ice gorge below gave way 24th March, and the increased current brought down a heavy ice attack. The piers, which were only four months old, were subjected to swiftly moving cakes of ice,  $2\frac{1}{2}$  feet thick and 30 feet by 100 feet in size, with no resulting damage. The cofferdam across the river remained flooded till 1st May, but the previous good progress prevented this delay from seriously affecting the general advance, the last section of the cofferdam connecting with the power-house.

#### CONSTRUCTION PLANT.

For construction, compressed air was largely used, except for locomotives and steam shovels. The power plant on the Keokuk shore consisted of five boilers of 1,000 horse-power total capacity, and one 350-horse-power and one 150-horse-power air compressors at 125 pounds pressure. On most works it is desirable that the power be centralized, and compressed air is simple, safe, and effective. It can be used in ordinary engines for derricks, mixers, and pumps; also for drilling, cleaning hobs and surfaces, and for painting and white-washing machines. About \$1,000,000 has been spent on plant, which is much less than 10 per cent of the cost of the work.

A water supply was obtained from 1,000-gallon tank; there was also an electric lighting plant which allowed of working full time, even during short winter days.

The sand supplied for both sides of the river was obtained 2 miles below the dam at the mouth of the Des Moines. It amounted to 300,000 cubic yards, and was pumped by a dredge to a shore pile, whence it was handled by two cubic yard clam derricks on to 12 cubic yard cars, which had running rights over the C. B. & Q. railway.

#### TYPE OF DAM.

It was decided to install a plant and build from the Illinois side on account of securing greater space for machines and material, better railway service, and because there was a good quarry obtainable nearby.

The gravity type of dam was chosen, as the large quantities of concrete could be placed more cheaply in mass, and there was no bother with the setting of reinforcing rods in the field. A very weighty and solid job was the ideal aimed at. The concrete was one cement, three sand, and five stone, but displacers do not seem to have been used extensively.

SESSIONAL PAPER No. 19a

## EAST SIDE PLANT AND MATERIALS.

The east side plant, including the quarry, are comprised in a circle of 600 feet radius, the centre being the end of the dam. The quarry was 300 feet from the end of dam. Its face was 35 feet high, and there was about 8 feet stripping. Well drills, making  $5\frac{1}{2}$  inches holes, were used, the average depth being 38 feet, with holes spaced 15 feet apart and 20 feet from the face. The explosive was 60 per cent dynamite, with two fuses in each hole, fired by dynamo current. There was considerable trouble with freezing.

One row of holes shot, gave employment for six weeks to a 100-ton steam shovel, loading into 12 cubic yard air dump cars. The force was fifteen men, and about 1,000 cubic yards per day was the output. This was hauled to and dumped into a large crusher, which took 1-ton pieces without hand breaking.

The dust and fine stone was carried away from the crusher by a conveyor to be used in road-making, and the rest passed through a rotary screen throwing out  $4\frac{1}{2}$  inch stone to be recrushed in small crusher. All the stone passed down a chute into a bin holding 500 cubic yards. Beneath this bin were tracks leading up an incline and two 5 cubic yard bottom dump cars carried the stone by air winch up to the 700 cubic yard bin above the mixing machines.

Sand from the Des Moines river is brought to another bin above the incline and hauled up on a third track to a bin above the mixers in a similar way to the stone.

Cement is stored in a 10,000-barrel shed, which abuts the mixing machine. There are four  $1\frac{1}{2}$  cubic yard air-run Smith concrete mixers set in concrete arches, which support the stone and sand bins. Steel chutes with valves, opened by air cylinders, convey and measure the charges of stone and sand. Cement is lead to the mixers by a hand-operated chute, and a measured quantity of water comes from a tank above, while the mixers are revolving.

The concrete is hauled away by light locos and flat cars, upon each of which are two  $1\frac{1}{2}$  cubic yard bottom dump steel skips. Each skip is spotted at the mixer and, when all are filled, the train is run out under the large traveller which lifts the skip to the forms. The east-side plant placed some 200,000 cubic yards in the dam.

## CONCRETE PLANT EAST SIDE.

The concrete structure for the mixing plant has four arched openings, in each of which is a mixer of the drum type, of  $1\frac{1}{2}$  yards batch capacity. Just above the mixer is a floor on which are the cement hopper and the measuring chutes from the stone and sand bins above. The gates of these chutes are operated by compressed-air cylinders, but the gate of the cement hopper is operated by hand. The proportion of stone is a fixed quantity, but the proportion of sand can be varied slightly (to suit the size of the stone) by means of turnbuckle and screw attachments on the operating levers. Water is supplied from a barrel fitted with a measuring gauge. One man operates the gates of the measuring hoppers, handles the water valve and starts and stops the mixer. The cement is emptied from the sacks directly into the hopper, where it required to be stirred with a paddle to make it run quickly into the mixer. The men handling the cement wear respirators, covering nose and mouth, as a protection against the dust. Each mixer is driven by a vertical engine which is operated by compressed air in summer and steam in winter, the exhaust steam being then required to heat the sand and water.

The concrete plant on the west or Keokuk, Ia., side is very similar to that on the Hamilton, Ia., side, but the crusher is close to the mixers and elevates directly to bins above them. This is the more compact plant of the two, but on each case the excavated stone is hauled to the mixing place and then crushed.

6 GEORGE V, A. 1916

## WINTER WORK.

Winter work was not carried on when the temperature was below 20 Fahrenheit, still all pipes, both for air and water, had to be protected, and the sand and mixing machines were heated. Exposed concrete was covered with tarpaulins, and steam radiators kept the air warm beneath. These precautions were quite sufficient to have admitted of continuous work, as the results at Timiskaming dam have amply proved.

## CONCRETE MATERIAL.

All cement is given a seven-day test at the mill, and is shipped in sealed cars to the plant, where it is again tested at the laboratory. More importance is attached, however, to the tests of the mortar, in order that it may be seen whether this is being made properly and economically. At the concrete mixing plant, samples of the mortar are taken every morning and afternoon, and tested at once as to proportions. Briquettes are made for future tests at 7 days, and at 3, 6, 9, 12, and 24 months.

The stone for concrete for the main dam is obtained from a quarry adjacent to the construction plant of the Illinois division.

The concrete plant capacity is 1,200 cubic yards per 10-hour day, which required 100 cars (12 cubic yards) of broken stone, fifty cars of sand, and six cars of cement. Eight hundred  $1\frac{1}{2}$  cubic yard batches are mixed and a like number of skips are filled, hauled to place and deposited. Besides machinery, force employed was 250 men, say 5 cubic yards of concrete per man, per day. There are about 300,000 cubic yards of concrete in the power-house, lock and retaining walls on the Keokuk side.

## STEEL FORMS FOR THE DAM.

The use of steel forms on a large scale is one of the many special features of the work and these forms are of a novel design, originated by Mr. B. H. Parsons, the mechanical engineer. They are built of structural steel shapes and faced on the inner side with steel plates. For the pier form, each end consists of a vertical panel or leg the full width of the pier, and to the sides of these are bolted horizontal girders, 5 feet high, forming the side panels. Each panel is slightly shorter than the one below, to provide for the batter of the end of the piers, but they are made interchangeable, so that a panel for any given height can be used at any pier. In the upper panels, diagonal members are used so that the structural framing forms a truss. This is done in order that when the lower panels are removed the upper ones will be strong enough to carry the load of green concrete in the arches.

Each arch centre is composed of three-hinged trusses, and made in two sections, with a transverse joint at crown; it consists of a series of shallow trusses carrying the curved plate which forms the lagging. At the springing they are seated on the pier forms; at the crown are horizontal lugs which come into line and admit of driving longitudinal pins. This insures accuracy and rigidity. To release the center, the pins are driven out, allowing the two half forms to fall away.

A special feature of the work is the manner in which accurate position of the pier forms is secured. In advance of the work a small concrete pedestal is built on the rock bottom at the location of each end form; this extends the full width of the pier and has upon it a cast-iron shoe which is set and anchored at lines and levels given by the engineer. The shoe has two pins or dowels on the top face, to engage with holes in the bottom member of the end form.

## SESSIONAL PAPER No. 19a

Thus each pier form is given exact position, and is held in position by the dowel pins at the base and the connections to the longitudinal trusses and struts at the top.

Ten complete sets of pier and arch forms were used, the pieces weighing  $4\frac{1}{2}$  to  $6\frac{1}{2}$  tons.

For the dam sections between the piers, a pair of steel trusses will be fitted to recesses in the latter; one of these (near the upper side of the dam) is a little above the crest level, and the other (at the lower side) is a little above the toe. Beneath these will be fitted the forms carrying the lagging shaped to the contour of the downstream face of the dam. For the vertical upstream face, steel panels will be braced between the piers.

All forms are left in place for about a week, with five days as a minimum. As to speed of erection, the record is the erection of a complete pier and arch form in 5 hours, 20 minutes.

## TRAVELLERS.

One of the most interesting features of the work is the use of a steel traveller for handling and placing the concrete, this machine closely resembling the travellers used in steel-bridge erection. The cars carrying the concrete buckets are run under the rear end of the traveller; a trolley then picks up a bucket, runs it out on the forward cantilever end and lowers it to the cofferdam or form. As the work advances, a track is laid along the roadway over the arches, and the machine is moved forward.

The traveller consists of steel trusses 25 feet apart, the rear portion having a length of 90 feet, and the cantilever portion 150 feet. The rear portion is mounted on six wheels running on a track of 100-pound rails carried by steel I-beams embedded in the concrete surface of the bridge which surmounts the dam. These I-beams are to carry the rails of the permanent traveller for handling the gates. The top of the I-beams is flush with the surface of the concrete, and pockets beneath its upper flange (to receive the bolts for the rail fastenings) are formed by cast-iron blocks which are made in two pieces, so that they can be removed when the concrete has set. Three railway tracks are laid through the rear or supporting portion of the traveller, there being a clearance of 24 feet in width and 16 feet in height. On these tracks are run the concrete trains, a semaphore over each track (on the back of the elevated engine-house) being used to signal the enginemen when to run in their trains.

The total height of the traveller is 65 feet, and its deck is 25 feet above the rails. This deck carries three runways, 210 feet long, one over the centre of each supply track. On each of these runways is a travelling trolley hoist, with its hoisting and travelling cables operated by two compressed-air engines, a large receiver being mounted on the machine. The engines for each hoist are operated by a man stationed in an engine-room below the deck, where he has a good view of the cars below and the runways above. At the end of each runway is a boy who has full view of the work below and signals the engineman by telephone as to the movements to be made. This avoids the confusion of hand signals or shouted orders. The concrete is delivered in  $1\frac{1}{2}$  yard drop-bottom buckets placed on flat cars; the trolley picks up a bucket, runs it out, lowers, raises, and returns it.

The machine weighs, with all its machinery, about 175 tons; this weight is carried by six wheels on the two rails. The equipment includes three 10-horse-power engines for traversing the trolleys, at 500 feet per minute; and three 40-horse-power engines for hoisting, at 150 feet per minute.

For the complete work on the dam there are four travellers in use. The first is a steel frame, with booms for erecting the forms; this is carried by rails on stringers supported by long ties resting on the side trusses of the last completed

6 GEORGE V, A. 1916

steel forms, which thus serve as falsework. Following this is the cantilever traveller above described, which is used solely for handling and placing concrete. Behind this is a steel frame with booms for taking down the forms on the completed work behind the concreting traveller. The fourth traveller is also a steel frame with booms, and is used for depositing the concrete of the dam sections between the piers; the buckets are lowered over the side and dumped into chutes which deliver it to the required position.

For the work at the power-house section on the Iowa side, there are four cantilever gantry cranes; these have bridges 195 feet long over all; the main part spans the excavation and is supported by two bents 120 feet apart. Beyond one bent the bridge extends 60 feet as a cantilever, spanning tracks laid along the side of the excavation. Behind the other bent is a cabin containing the machinery for driving the hoisting and travelling cables of the trolley; this machinery is operated by compressed air. The trolley has a travel of 170 feet and a hoisting capacity of  $4\frac{1}{2}$  tons. The four cranes travel on two lines of rails, one at each side of the excavation. For the excavation, these cranes will handle the skip loads of broken rock, dumping them into cars on the upper level, these cars being run on tracks spanned by the cantilever. For the concreting, they will take the dump-buckets from cars on the same tracks and convey them to the required point. To the left and beyond the travellers is the cofferdam. Each crane has two 40-horse-power engines for hoisting at a speed of 150 feet per minute, and two 10-horse-power engines for traversing the trolley, at 500 feet per minute. As on all the other travellers, the engines are operated by compressed air. The total weight of the crane, with all its machinery is about 75 tons, which is carried by two wheels under each bent.

#### EXCAVATION.

The power-house excavation began 5th May, 1911, and 27,000 cubic yards were taken out by August, the material going to raise the C. B. & Q. railway tracks. It was all rock and, after blasting, was removed by steam shovel, which was loaded into skips handled by large travelling cranes.

The lock pit was begun 28th July, with a force of men and two stiff-leg derricks, this was the only place where channelling machines were used, and they seemed to have been confined to the trenches for filling culverts. The excavation for foundations of the retaining wall, 11,000 feet long, which will protect the raised railway track, was also carried on at the same time as the lock pit.

The excavation for the foundation of the dam proper was always several hundred feet ahead of the concrete. Over a quarter of a mile, or 40 per cent of the whole length on the east side of the river was through dry fields, and done without cofferdam. After the over-burden of earth was removed, the shale and soft rock was blasted out. A depth of 4 feet was always excavated in the rock to provide a good footing for the dam.

To test the rock, however, for seams, 6-inch holes were drilled every 36 feet to a depth of 30 feet. A time record was kept, and if the rock seemed soft, it was tested with compressed air, observations being made to find if the pressure was reduced by leakage.

The first cofferdam for the river section extended from pier 49 to pier 76, about 1,000 feet. The upstream side was formed of cribs loaded with stone, with spaces between each crib filled with stoplogs. The downstream side consisted merely of earth dumped from trestle work. When the piers and arches were completed in any section, the cofferdam was torn out, allowing the water to pass through between the newly erected piers. About four piers and arches were erected each week, and there was no trouble from the arch tending to kick over the pier.

## SESSIONAL PAPER No. 19a

During the fall floods of 1911, when 69 piers had been built, 20 of which were in the first section of cofferdam, the whole work was flooded. Through the weather bureau, ample warning was given, and all machinery had been removed when the water poured in, 17th October, 1911.

Each section of cofferdam was pumped out by a battery of two centrifugal pumps, 6-inch discharge, run by three vertical steam boilers. There was no mud on top of the rock, so drilling was at once begun. The holes were 4 feet deep generally and spaced 4 feet apart, and three or four lines were blasted together.

The broken rock was loaded into skips by men, and swung out over the dam into the river by two derricks, which moved along on skids and rollers. The width of the foundation trench was 48 feet, and the sides were carefully blasted. It seems remarkable that channelling machines were not used to secure a sharp edge as a cut-off against water seepage. One would have expected a small steam shovel to have excavated this foundation rock with a gantry crane to hoist out the loaded skips.

At the time of our visit, the dam had been pushed across the river, and the only excavation was in the tail-race along the power-house. This was in rock 22 feet deep, 2,000 feet long and 50 feet wide at the north end, increasing to 250 feet at the south end. The rock was loaded onto cars by steam shovel and taken to the crusher for concrete.

## SLUICE GATES.

The gates or stoplogs (which act as flash-boards) for closing the openings above the spillway crest, are steel panels, 11 feet high and 32 feet long over all; these slide in grooves in the piers, and the downstream sides of their ends rest against cast-iron seats set into the face of each groove. Each gate consists of a framework of 18 inch I beams covered with  $\frac{3}{8}$  inch steel plate on the upstream face. These gates will be handled by a traveller or derrick car running along the bridge which forms the top of the dam. When raised they are held in position by a locking device.

## LOCK.

As already stated, the rise in surface, due to the dam, has necessitated the building of a lock by the power company. The final arrangement with the United States Corps and the navigation interests, led to a change of length of 400 feet with a width of 110 feet and depth on sill of 8 feet. This is to accommodate a possible navigation similar to that of the Ohio river.

The absence of an entrance wall at the upper end of the lock is noticeable. We were told that a heavy boom would eventually be placed to guide in boats.

The lower sill is elevation 477.65, and the lock floor is finished to the same level. The upper sills are elevation 511.00 and the coping elevation 530, or 5 feet above high water.

The lower end of the lock has arched mitre gates attached to a frame with two diagonals that takes up all the dead weight, the arch carrying all the water pressure. These gates are 49 feet high, and each leaf is 66 feet 4 inches long, curved to a radius equal to its length, the weight is about 300 tons. The specification follows in case it may be required for reference:—

## SPECIFICATION FOR MITRE GATES.

The work to be done under these specifications is the construction of a pair of mitering lock gates and appurtenances finished complete and ready and consisting of the following:—

6 GEORGE V, A. 1916

Two (2) sets of foundation castings, complete, with pintles and fittings.

Two (2) anchorages, complete, with upper pintles, cast-iron curb, floor plates and other fittings.

Two (2) sets of reaction castings and fittings for quoins.

Two (2) leaves forming one mitering lock gate, complete, with buoyancy chambers and tubes with air locks for access thereto, foot walk and cast-steel and other fittings as shown.

Each gate leaf will consist of the following: Thirteen arched ribs curved to the arc of a circle of radius  $66' 4\frac{3}{4}"$ . These ribs will be framed together from top to bottom of leaf by heavy girders forming the quoin and mitreposts and by nine (9) lines of intermediate framing. The quoin and mitre posts are further reinforced and pressure from arch rib distributed by cast-steel castings in a continuous line from top to bottom, with fittings as shown. The frame thus formed will be covered on its convex side by steel plate stiffened as shown and caulked water tight over its entire surface.

The curved shell of leaf described above will be reinforced by heavy steel framing on its concave side, designed to sustain the entire dead weight of leaf and to prevent warping of leaf under any circumstances, with particular reference to power applied at top to open gate against maximum head of water allowed.

Except as otherwise indicated, all parts of work will be of structural steel of a class known as railway bridge steel, except for rivets which shall be of a class known as rivet steel. The quality of this material and workmanship on same shall be in accordance with standard specifications of American Steel Manufacturers, revised February 6, 1903.

*Steel castings.*—The process of manufacturing may be selected by the builder but material must not contain more than 0.06 per cent phosphorus or sulphur. Finished castings must be sound and free from sponginess, pittings, cracks or blow holes and must be thoroughly annealed before finishing. Standard test pieces shall develop an ultimate strength of from 65,000 to 70,000 pounds per square inch, an elastic limit of not less than one half the ultimate strength, on elongation of from 18 to 20 per cent in 2 inches, and shall bend cold through  $180^\circ$  to a radius equal to thickness of test piece without fracture on an outside of bent portion.

*Nickel steel.*—This material to be used for pintles. They shall be forged from ingots or blooms of sufficient size to ensure sound metal and shall be thoroughly annealed before machining. The material shall contain not more than 0.04 per cent phosphorus, nor more than 0.05 per cent sulphur and not less than  $3\frac{1}{4}$  per cent of nickel. Standard test pieces shall show ultimate strength of 90,000 to 100,000 pounds per square inch, an elastic limit of not less than one half ultimate strength, and elongation of 18 per cent in 2 inches.

Workmanship must be of highest quality and precision to ensure accurate alinement of each leaf and proper performance of whole gate when subjected to the stress incident to its functions as lock gate. Castings must be accurately machine finished as indicated, with bolt holes drilled or reamed to match and provided with fitted bolts. Quoin and mitre post castings must have finished bosses opposite junction of arch ribs. Finished parts and members must be true to line and dimensions and the whole work must be assembled in the shops during manufacture and each part fitted and marked with a steel stencil for identification on erection, drawings to be furnished by builder. Arched ribs must be milled accurately to line at ends to ensure efficient butt joints. Rivets will be  $\frac{3}{4}$  inch and  $\frac{7}{8}$  inch diameter, and holes for same will be reamed to match when parts are assembled during erection. Rivet holes will therefore be punched proper size for reaming in the shop. Edges of plates forming watertight skin of gate and buoyancy chamber with its partitions will be sheared, leaving clearance between adjoining plates, and all joints between these plates will be

## SESSIONAL PAPER No. 19a

provided with fitted outside butt straps bevel sheared for caulking. Pitch line of rivets must not be more than 2 diameter from edge where caulking is required, and such rivets shall be spaced about  $3\frac{1}{2}$  diameter. Pintles must be finished and polished to dimensions, and bushings for same finished smoothly to fit. Bushings for upper pintles to be bored and grooved for lubrication, and castings containing same to be bored and fitted with compression grease cups of suitable capacity. The hole to receive the bushing in these casting to be rough board 2 inches smaller in diameter than shown, so that final boring may be done after anchorages are bedded in the masonry.

Machine finished surfaces must be coated with white lead and tallow and be otherwise fully protected against injury before shipment. Inaccessible surfaces shall be coated with red lead before assembling and riveting up in the shops, and all other parts of the work shall be thoroughly coated with pure linseed oil before shipment.

The manufacturer shall furnish each and every part, piece, and member requisite to the entire completion of the work as shown or specified herewith including fitting-up bolts and field rivets (with 10 per cent excess for waste), and each such part or member shall be finished, complete, ready for assembling and erection in place. Erection and all field work will be done by this company.

The manufacturer will submit complete shop drawings to the company for approval before work is commenced in the shop.

Each leaf of this gate will be operated by a machine similar to that used in the Panama Canal locks.

The lock has a main gate and safety gate of the floating or disappearing type, and the gate of the dry dock is similar. They are designed to serve as a railway bridge also. This type applies particularly well to this situation as the upper sills are 20 odd feet above the river bottom.

## SPECIFICATION FOR FLOATING GATES.

The work to be done under these specifications is the construction of three (3) floating gates and appurtenances, all exactly alike and interchangeable, finished complete, ready for erection, all as shown on the drawings enumerated on this sheet and consisting of the following: Three gates with guide runners, gears, shafts, buoyancy chambers, etc., and all fittings for same, except air piping, valves, and gauges, railroad track material and woodwork.

Three sets of reaction castings with bronze anchor bolts and all fittings.

Three sets of bed plates with bronze anchor bolts, to receive gates when open.

Three sets of guide castings with bronze anchor bolts and all fittings.

Three sets of gate latches or supports complete with bed plates, anchorages, connecting rods, air cylinders, etc.

Each gate consists of two vertical trusses 112' 0" long c. to c., spaced 15' 0", apart c. to c., and connected together in plane of top chords by a horizontal truss and in plane of bottom chords by lateral bracing; all in the form of a deck railroad bridge. The downstream truss is, in fact, a plate girder, and its web is heavily reinforced to sustain hydrostatic pressure, thus forming the waterproof barrier of the gate. The resulting pressure along top chord of this truss is sustained and carried to the lock walls by the horizontal truss at top of gate. The bottom chord and end frames of this girder are fitted with oak contacts which take bearing upon and transmit pressure to cast-iron sills bedded in the masonry sill and walls of the lock. These gates will also act as railroad bridges, for which purpose floor beams and stringers are provided as shown.

The floatation of each gate is by means of two displacement chambers of fixed volume, and one open bottom buoyancy chamber as shown. The volume

of displacement in buoyancy chamber will be under control of the operator's house, whereby each gate may be opened or closed (*i.e.*, lowered or raised) at will—compressed air will be conducted from the lock power-house through pipe galleries to proper points under each gate. The oak bearing along the bottom and ends of gate will not be in contact with masonry or reaction castings at any time, except when gate is in closed position. Each gate will be confined to position and transverse alignment by guide runners sliding in vertical cast-iron guides bedded in the lock walls at each end of the gate. These guides also form toothed racks which engage a spur wheel at each end of gate and as each spur wheel is keyed fast to a shaft which extends from end to end, the simultaneous movement of every part of the gate and its longitudinal alignment are assured. Each gate will be locked in closed position by the mechanism shown and each gate may be raised and floated out of its recess (to dry dock or to replace either of the other gates) without removing any part and without assistance other than tow lines and barges lashed alongside to prevent turning turtle.

Except as otherwise indicated all parts of the work will be of structural steel of a class known as railway bridge steel, except for rivets which will be of a class known as rivet steel. The quality of this material and workmanship on same shall be in accordance with standard specifications of American Steel Manufacturers, revised February 6, 1903.

*Steel Castings.*—The process of manufacturing may be selected by the builder, but material must not contain more than 0.06 per cent phosphorus or sulphur. Finished castings must be secured sound and free from sponginess, pittings, cracks and blow holes, and must be thoroughly annealed before finishing. Standard test pieces shall develop an ultimate strength of from 65,000 to 70,000 pounds per square inch, an elastic limit of not less than one-half the ultimate strength, an elongation of 18 to 20 per cent in 2 inches, and shall bend cold through 180° to a radius equal to thickness of test piece without fracture on outside of bent portion.

Workmanship must be of highest quality and precision to ensure accuracy of fit, alignment and dimension of the gate as a whole and its several parts and members. The whole work must be assembled in the shops during manufacture and each part fitted and marked with a steel stencil for identification on an erection drawing to be supplied by the builder. When so assembled (all field holes previously sub-punched) must be reamed parallel to a diameter  $1/16$  inch greater than the rivet to be used. Rivets will be  $3/4$  inch and  $7/8$  inch diameter. Abutting edges of plates forming water tight skin of gate and buoyancy chamber must be planed to fit and all joints between these plates will be provided with fitted buffstraps, bevel sheared for caulking throughout. All other joints in this water tight work must be fitted in a manner providing for caulking. Pitch line of rivets must not be more than 2 dias. from edge where caulking is required and such rivets shall be spaced about  $7\ 1/2$  inches diameter. Castings must be accurately machine finished as indicated with bolt holes reamed to match and provided with fitted bolts.

Machine finished surfaces must be coated with white lead and tallow and be otherwise fully protected against injury before shipment. Inaccessible surfaces shall be coated with red lead before assembling and riveting up in the shops. and all other parts of the work shall be thoroughly coated with pure linseed oil before shipment.

The manufacturer shall furnish each and every part, piece, and member requisite to the entire completion of the work as shown or specified herewith, including fitting-up bolts and field rivets (with 10 per cent excess for waste) and each such part or member shall be finished complete, ready for assembling and erection in place. Erection and all field work will be done by this company.

## SESSIONAL PAPER No. 19a

The manufacturer will submit complete shop drawings to this company for approval before work is commenced in the shop.

## VALVES.

Besides the sluice gates of the main dam and the gates to close off the water from the intake to the turbines, there are several smaller openings to be closed. These are the filling and emptying valves of the lock and dry dock. There are four inlets and four outlets for the lock, each of which is a cylindrical valve 6.5 feet diameter. The inlet valves close the tops of vertical shafts leading to the large conduit in the eastern lock wall. This inlet is elevation 507, or 12 feet lower than the low water of the upper reach.

There is no curtain wall to seal the entry and create a draft tube action which would utilize the total head of 20 feet between the upper and lower reaches. Possibly one valve could have been made sufficient with this head, instead of four valves under only 12 feet head.

The outlet valves close vertical adjutages leading up from the main conduit, when opened the water spouts up and runs away from the back of the wall into the lower level. These valves are raised and lowered by a screw stem, but it is not clear how compressed air is applied to this work.

The other valves used are 6.5 feet diameter butterflies for filling and emptying the dry dock. These are of cast-iron covered with light steel plates to present a smooth surface to the passing water. They close vertical conduits, but do not come quite to the horizontal position, so that they close on a bevelled joint which forms a tight seal. They are operated by a vertical connecting rod which is pressed up or down by compressed air.

## COMPRESSED AIR POWER.

Notwithstanding the immense amount of electric energy generated in the power-house close by, the lock is operated by compressed air obtained by two turbines belted to two compressors. The turbo-compressor sets are placed in the heavy wall joining the head of the lock with the power-house.

Presumably the air will be led into reciprocating engines, which will operate the cylinder valves and the lower gate opening machines. For the butterfly valves in the dry dock a single stroke of a cylinder secures direct operation. Air is particularly well adapted to the operation of the head gates by displacing the water in the buoyancy chamber.

It is interesting to compare the hydraulic cylinder method of operation at the Soo, Mich., with the electric operation at our Canadian Soo, and these again with the compressed air system at Keokuk.

## OPERATION OF LOCK.

As stated, the valves are operated by compressed air, and the lower gates will be operated by the same power through a large horizontal wheel, to the rim of which the gate strut is attached.

To fill the lock the cylinder valves situated at the upper end of the river wall will be opened. The water will flow down a vertical shaft into the longitudinal wall culvert, the centre of which is about floor level. From this conduit eight 6-foot diameter pipe culverts extend out underneath the lock floor. The wall conduit is 13 feet diameter down to the first pipe, 12.5 feet to the second pipe, and diminished down to 6 feet at the last pipe. Each pipe under the floor has seven vertical adjutages up through the lock floor, the total number being fifty-six, and through these the water spouts to fill the lock.

6 GEORGE V, A. 1916

To empty the lock, the cylindrical valves at the rear of the river wall are opened and the water flows down through the wall into the conduit and out through the valves to the lower reach.

#### DRY DOCK.

This is located alongside the lock and is 400 feet long by 110 feet wide at entry and a draught of at least 8 feet. The west wall of the lock forms one side of the dry dock, while a paved slope forms the other, the lower end is closed by a concrete wall reaching from the foot of the lock across to the shore. The upper end is closed by a single floating gate similar to that of the lock. The floor of the dry dock is elevation 511, but is not concreted, the rock filling from nearby excavation being considered quite sufficient.

The dry dock is emptied by gravity through butterfly valves and a dive culvert to the lower reach. Adjacent to the dry dock are the lock grounds with storehouses, saw-mill, and carpenter and machine shop, through which standard-gauge track connections are run to the nearby railway. There are nine tracks in all, three passing through the shops, two through the warehouses, and two leading close to the edge of dry dock. This track system is very desirable and worthy of close study.

#### ICE SKIMMERS.

Stretching from the upper end of the power-house to the shore across the head bay for 2,300 feet are a series of submerged arches to keep floating ice from entering. There are twenty-five piers in all, spaced 70 feet centre to centre, each opening spanned by concrete beams, 60 feet long, 8 feet wide and 15 feet deep, the bottom being under water. There is, however, a 300-foot gap to pass navigation, and this will be closed by a boom in winter-time. Across these piers and over the main dam, standard railway tracks will be laid, and a revenue obtained as a bridge across the Mississippi.

Owing to the great cost of a large cofferdam shutting off the river when the ice fender was to be built, it was decided to construct small caissons within which the concrete for each pier would be placed.

Each caisson consists of four oblong boxes which are water tight, and they are designed in such a manner as to permit their being locked together, when in place, and unlocked, when they are ready to be taken down and moved. The space between the oblong boxes of each caisson is the exact size of the pier, so that when the caisson is sunk into place by means of filling the boxes with water there is no additional form work necessary for placing the concrete. The caisson thus stills the water and the concrete is then mixed dry without any water being added to it, and placed by means of a sealed steel box with a bottom dump.

#### LABOUR.

The Americans are left to find their own quarters in Keokuk or Hamilton. The foreigners (mainly Italians and Austrians) are housed in bunk-houses, which are built by the company and let to the men for a small rental. The men provide their own food and cooking. Each bunk-house accommodates sixteen men, and is provided with running water and electric light. Watchmen are provided to keep order, and a doctor in Keokuk acts as the company's medical officer; he visits the work and the two camps, inspects the men and sees that proper sanitary conditions are maintained. He has an office on the work, with a man in charge who is kept advised of the doctor's movements, so that the latter can be called by telephone at any time. At each camp there is a room, with necessary instruments and appliances, for dressing wounds and attending to any emergencies. Swamp lands and waterholes near the work are sprinkled with oil to prevent trouble from flies and mosquitoes.

## SESSIONAL PAPER No. 19a

It is most desirable that inspectors holding St. Johns Ambulance certificate should be employed by the Provincial Governments to travel through camp districts, giving first aid and enforcing sanitary regulations.

One reason for the rapid and systematic progress of the work is the organization of the labour. One lot of men does nothing but place concrete, and consequently become very expert at this. On the form erection, certain men do the bolting and unbolting, others the placing of panels, etc. The working day is of ten hours; 7 a.m. to noon, and 1 to 6 p.m.

## HYDROLOGY OF OTTAWA RIVER, TRIBUTARIES, &amp;c.

The hydrology of the river is constantly under study; Mr. S. B. Johnson, who is in charge of this work, submits a report which contains all results up to date.

The fundamental requirement in water flow investigation is the surface fluctuation of the river and tributaries under consideration. This is usually obtained by staff gauges securely set at selected points, and read daily by some one residing nearby. These results are very much dependent on the care and accuracy of the gauge readers, but to the credit of the district it must be said that negligence is comparatively rare. Natural conditions, however, affect all our gauges, for instance, the flood flow of the Gatineau ploughing squarely into the current of the Ottawa acts as a partial dam. This causes the gauge at the foot of the Rideau locks to show higher water than the actual flow of the river represents. However, constant measurements at all stages of the surface tend to reduce such local errors by actual weight of numbers in calculating the means of many meterings.

In summer-time, sawlogs float down the river in great numbers, indiscriminately, and form partial dams at shoals and rapids. For instance, a jam forms over night in the Deschenes rapids and the surface height of the lake above at Britannia rises, indicating an increased flow of water. The amount of water passing, however, has not altered, and if the log jam floats away during the following day conditions become normal again. The only safeguard against this condition is a great number of meterings.

In winter-time ice conditions also affect gauges; firstly, by freezing about them; and, secondly, masses of frazil ice block parts of the channel so that a higher surface is recorded while there is no increase in the flow.

Measurements of the flow are being carried on continually both during the summer and winter, but causes similar to those affecting the gauges give trouble. It is therefore necessary to change the metering sections from time to time, and also to examine the results carefully and check a great mass of figures.

When the river surface is covered with ice, the water encounters increased friction, and therefore winter meterings show a different relation to the surface heights.

The metering instruments are of delicate construction and, after a few days' use, each one is sent to Ottawa for rating. A fairly good rating station is now established at Dows lake on the Rideau canal, where the revolutions of the meter are tested while it is moved through still water at known speeds.

Precipitation records and temperatures are kept wherever men are employed throughout the watershed. In addition, the Meteorological Survey send us all their records, from which various tables are compiled, giving the relation of rainfall and temperature to run-off.

A series of temperature records of air and water has been kept for several years, which tends to show that the northern lakes keep well above freezing. This is probably due to the ground water of the swamps retaining its heat for considerable lengths of time. Notwithstanding this, however, the ice on these lakes always attains a fair thickness.

The most important records of the report are the surface elevations for as many years back as possible at various points along the river. These elevations have been corrected to correspond to the lines of precise levelling that the department has established. They are therefore a permanent record for purposes of navigation, for power projects, and for use in connection with claims. Some six hundred tables are embodied in the report, giving in most cases daily elevations which have been checked and re-checked.

SESSIONAL PAPER No. 19a

In a few cases, such as Timiskaming reservoir, for instance, the gauge at the outlet shows a higher surface than the gauge at the head. These cases have been closely examined and seem due to wind pile, and perhaps to waves of flow caused by opening and closing of sluice-ways.

---

DEPARTMENT OF PUBLIC WORKS, CANADA.

## OTTAWA RIVER STORAGE,

C. R. COUTLEE, Esq.,  
Engineer in Charge,  
Ottawa River Storage.

OTTAWA, ONT., July 31, 1915.

SIR,—In the following report dealing with the flow of the Ottawa and St. Lawrence rivers and their tributaries for the three years ending the 1st of April, 1915, a résumé is given of all the observations thus far collected by this branch of the service. In addition, some of the records published in previous reports have been revised and are included in their new form. These revisions were made possible by the results derived from more extended surveys and in some cases by improved field equipment and methods. It may therefore be expected that each succeeding year will throw still more light on data gathered in the past, and thus make further revisions necessary.

Commencing from Quinze lake and working downwards, an outline of the observations made and resultant tables are submitted as follows:—

## QUINZE LAKE AND RIVER.

*Location of gauges.*—Gauge No. 1, at Klock's depot, about 3 miles north of the outlet of the lake. Gauge No. 2, at the head of Quinze river on the north shore of the lake, and consisting of two staff gauges, one for high water and one for low water, on separate piers. Gauge No. 3, immediately above the dam on a pier on the south shore. Gauge No. 4, at the foot of Maple rapids, on a pier on the north side of the river.

*Records available.*—Gauge No. 1, 3rd June, 1909, to 31st December, 1914; discontinued and replaced by gauge No. 2. Gauge No. 2, 1st November, 1914, to date. Gauge No. 3, 22nd April, 1914, to date. Gauge No. 4, 1st May, 1911, to date.

*Drainage area.*—9,700 square miles.

*Discharge measurements.*—Meterings are now made at a section about one-half mile above Devil's chute and 5 miles from North Timiskaming. Previous to the construction of the dam at Timiskaming, meterings were taken just above the village of North Timiskaming at the island. This station had, however, to be abandoned owing to the slack water caused by the dam at the foot of the lake. The new section above Devil's chute has proved itself to be far superior to the two channels at North Timiskaming. The mean velocity varies between 1.2 feet per second for low water and 3.5 feet per second for a flow of 40,000 c.f.s.

*Discharge curve.*—Well defined between elevation 816 and 825 on gauge No. 4, or between flows of 1,800 and 25,000 second-feet. The records are excellent between these stages, but further meterings are necessary before the curve can be extended upward.

*Winter flow.*—The relation between gauge heights below the Maples, and discharge, has not been found to be affected by ice.

*Precipitation and temperature records.*—Temperature observations (both atmospheric and water) started on the 14th January, 1911. Precipitation measurements started 1st April, 1911. These observations have been continued to date.

Chas. R. Dal.

SESSIONAL PAPER No. 19a

**BLANCHE RIVER, ONT.**

(Drainage Area, 1,720 square miles.)

**DISCHARGE MEASUREMENTS of the Blanche River.**

Date.	Made by.	Discharge.
1909.		
June 17 .....	S. B. Johnson .....	2,070
1914.		
Jan. 16 .....	J. A. Beauchemin.....	668

**HAILEYBURY, ONT.**

*Location of gauges.*—Gauge readings are received through the Ottawa District Engineer's office, the observations being taken from a staff gauge on the steamboat wharf at Haileybury.

*Records available.*—1st July to 8th December, 1906; 19th April, 1907, to 2nd July, 1908; 1st January, 1909, to date.

*Precipitation and Temperature records.*—Precipitation and atmospheric temperature observations started in 1893, and have been continued to date by Mr. Paul A. Cobbold, for the Dominion Meteorological Service.

**MONTREAL RIVER.**

*Location of gauges.*—Mr. R. de B. Corriveau, Ottawa District Engineer, has three staff gauges at Latchford. No. 1 is on a pier on Bay lake just above the dam; No. 2 is directly below the sluices; and No. 3 is on a pier in front of Empire mill. A gauge was placed at Gillies depot by this office in December, 1913, but owing to the power dam at Hound chute on this reach of the river, it did not prove satisfactory, and readings have been discontinued.

*Records available.*—Gauge No. 1, 1st March, 1912, to date; gauge No. 2, 20th December, 1913, to date; gauge No. 3, 19th July, 1909, to date; Gillies depot gauge, 13th December, 1914, to date.

*Drainage area.*—2,800 square miles.

*Discharge measurements.*—Current-meter measurements have been made at frequent intervals since June, 1909. Meterings are made from a rowboat about 1 mile downstream from Latchford during high water and about 3 miles downstream during low water.

SESSIONAL PAPER No. 19a

6 GEORGE V, A. 1916

## KIPAWA LAKE AND RIVER, GORDON CREEK.

*Location of Gauges.*—At Kipawa River dam there are three staff gauges—No. 1 on the upstream face of the dam, giving the lake levels; No. 2 about 1,500 feet below the dam; and No. 3, 2 miles down the river. At the head of Gordon creek there is a staff gauge giving Kipawa lake elevations. Near the mouth of Gordon creek, a staff gauge is located on the north abutment of the highway bridge below Lumsden's mills.

*Records available.*—Gauges Nos. 1 and 2 were installed on the 1st October, 1912, and have been read to date. Gauge No. 3 was installed on the 13th May, 1914, and was read for a short period only. Readings, have however, now been resumed. The gauge at the head of Gordon creek was installed on the 1st June, 1909, and Lumsden's mill gauge on the 1st April, 1910. Observations on both these gauges have been continued to date.

*Drainage area of Kipawa lake.*—2,133 square miles.

*Discharge measurements.*—In 1909, three meterings were made of the Kipawa river above the old dam. During the construction of the new dam the section was changed to one about three-quarters of a mile downstream, and has since been used for all later meterings. These measurements are made at a narrow channel about 300 feet wide with a mean velocity at high water of about 3 feet per second. A row-boat is used to meter from and is held in position by a rope and cable stretched across the stream. Gordon creek meterings are made from the highway bridge above Lumsden's mill. The flow at this section is even, and does not exceed 3.5 feet per second at high water, and goes down to 0.4 foot per second at low water.

*Discharge Curves.*—The Kipawa river curve is well defined for flows between 300 and 700 c.f.s., and between 3,000 and 4,000 c.f.s. More meterings are required in order to properly determine the intermediate part of the curve. The Gordon creek curve is fairly well defined for flows from 300 c.f.s. up to 2,000 c.f.s.

*Winter flow.*—Apparently unaffected by ice in either Kipawa river or Gordon creek.

SESSIONAL PAPER No. 19a

NOTE.—Discharge from November 24, 1912, to December 15, 1912, estimated. Discharge from October, 1913, to January 10, 1914, estimated.

Daily Discharge  
of the  
GORDON CREEK  
1st of April 1912 to 31st March 1913

NOTE:- Current meter measurements are made from the highway bridge above the mills, at this stretch the water surface levels are affected by the opening and closing of the mill gates.

It was therefore found necessary to refer the meterings to a gauge placed below the mills, where there is no back water effect. At this point the river is so swift that a rise of one foot on the gauge represents a corresponding increase of nearly 600 cubic feet per second in the flow.

The hydrograph shows the influence of the weekly and sometimes more frequent closing of the power plants.

TIMISKAMING, QUE.

*Location of Gauges.*—Staff gauges are placed as follows: No. 1 on the steamboat wharf at the railway station; No. 2 at the foot of the island; and No. 3 at the metering section 4 miles below the dam. A recording gauge is also placed at the foot of the island, and gives an accurate record of the hourly water surface fluctuation below the dam.

*Records Available.*—Readings were started on the gauge at Timiskaming wharf on the 1st January, 1909, and have been continued to date. On the gauge below the island readings were started on the 1st April, 1911, and have been continued to date. The gauge at the metering section 4 miles below the dam is read only when meterings are being made.

*Drainage Area.*—18,100 square miles, including Gordon creek.

*Discharge Measurements.*—Meterings were first made at the narrows above Timiskaming, but when the dam was started the station had to be abandoned, owing to the backwater caused by the dam greatly decreasing the velocity at the section. A new metering section was located 3 miles below Timiskaming at a narrow in the river about 400 feet wide, with a mean velocity at high water of nearly 6 feet per second, and about 1 foot per second at low water. For metering purposes, a  $\frac{3}{4}$ -inch steel rope was stretched across the channel, firmly supported on the shores by posts and trees. On this cable an ironbound wooden cage is made to travel from shore to shore carrying two men and the metering outfit. The cage is moved from one metering observation point to another by means of a crank and winch with a three-sixteenth inch wire cable stretched across the stream, and having three turns around the drum of the winch.

*Discharge Curve.*—Fairly satisfactory meterings have been secured, and a curve constructed by relating the results of these meterings to the gauge elevations below Timiskaming dam. Many meterings are still required before the curve can be considered well defined.

*Winter Flow.*—The gauge elevations below the dam to which the discharge curve is referred are not affected by ice conditions, the water being swift and deep enough to carry away both ice and logs without causing a jam.

*Precipitation and Temperature Returns.*—Temperature observations (both atmospheric and water) started in February, 1910, and precipitation in March, 1910. These have been continued to date.

\*\*Mean monthly precipitation computed from observations at Quinze-Dam and Timiskaming, (Ottawa-Storage), and Haileybury (Dom. Met. Service).

SESSIONAL PAPER No. 19a

PUBLIC WORKS, CANADA.  
OTTAWA RIVER STORAGE  
DAILY TEMPERATURES,  
OF  
AIR AND WATER  
AT  
TIMISKAMING,  
P.Q.

## MATTAWA RIVER AND ITS TRIBUTARIES.

*Location of Gauges*.—Staff gauges, placed in 1905–6, are still in operation at the foot of Turtle and Talon lakes and below Pimisi bay. Those placed during the same period at Whitefish bay, Nasbonsing lake, and Kai-bus-kong river are no longer in existence. Three miles up the river from its confluence with the Ottawa, the Mattawa water surface elevations are secured daily above and below the power-house. The upper level is obtained by measuring down to the water surface from the top of the south abutment. The lower reach has a staff gauge attached to a small pier about 600 feet below the power-house. On the Amable du Fond river watershed, the gauges placed on the larger lakes and at Booth's farm, on the river, have not been visited since the completion of the Georgian Bay Canal survey.

*Records available*.—At the foot of Turtle lake, staff gauge readings from the 19th March, 1905, to 29th December, 1906; White Fish bay, 21st March, 1905, to 31st December, 1906; Nasbonsing lake at Bonfield, Ont., 27th March, 1905, to 31st December, 1906; Kai-bus-kong river at Menard's bridge, 4th March, 1905, to the 29th December, 1906; Talon lake 26th January, 1905, to 31st December, 1906; below Talon chute, 25th April to 31st December, 1906; below Pimisi bay, 25th February, 1905, to 31st December, 1906.

Amable du Fond watershed—Three-mile lake, 12th September, 1905, to 29th December, 1906; Tea lake, 13th September, 1905, to 29th December, 1906; Kioshkoqui lake, 3rd September, 1905, to 31st December, 1906.

Amable du Fond watershed.—Gauges were placed in September, 1905, and observations taken up to the end of 1906 on Three-mile, Tea, Manitou, and Kioshkoqui lakes, and from July, 1905, to the end of 1906 at Booth's farm on the river.

Mattawa river at Plain Chant chute.—Upper and lower gauges were read from the 3rd of June to 2nd December, 1906, 9th May to 2nd July, 1908, and from the 29th September, 1914, to date.

*Drainage areas*.—Foot of Turtle lake, 78 square miles; North river, 92 square miles; Foot of Nasbonsing lake, 71 square miles; Foot of Talon lake, 342 square miles; Amable du Fond river, 433 square miles; Mattawa river at Mattawa, 880 square miles.

*Discharge Measurements*.—Turtle lake outflow is metered below Whitefish pond  $2\frac{1}{2}$  miles from the lake. Nasbonsing lake outflow is metered at Menard's bridge, about 5 miles from Bonfield. The outflow from Talon lake is metered at Talon narrows above the dam.

The flow from the Amable du Fond watershed is metered near Booth's farm above Eau Claire.

For the total flow of the Mattawa river, meterings are made a short distance above the bridge at Mattawa.

*Discharge Curves*.—Fairly well-defined for Turtle and Nasbonsing lakes, and well defined for Talon lake and the Amable du Fond river.

*Precipitation and Temperature records*.—Lake Talon precipitation and temperature observations by the Dominion Meteorological Service, from 1891 to date. Precipitation and temperature observations at other points on the watershed were taken during the Georgian Bay Canal survey. These are all published by the Dominion Meteorological Service, Toronto, and are not here re-published.

## OTTAWA RIVER AT MATTAWA.

*Location of Gauge.*—Staff gauge on the outer end downstream corner of the old wharf opposite the Rosemont hotel, Mattawa.

*Records available.*—Gauge readings from 1st of May to the 10th of August, 1906; 9th May to the 26th June, 1908; and from the 11th April, 1909, to date.

*Drainage area.*—19,660 square miles, including the Mattawa river.

## OTTAWA RIVER AT KLOCK STATION.

*Location of Gauge.*—Standard weight and chain gauge on south shore of the river at the village.

*Records available.*—Gauge readings from 23rd October to 10th December, 1904; 1st April to 22nd October, 1905; 19th February to 31st December, 1906; 1st May to 1st July, 1908; and from the 7th April, 1909, to date.

*Drainage area.*—19,880 square miles total drainage area to the metering section, 6 miles below Klock station.

*Discharge measurements.*—These were first made at a point about 5 miles above Deux Rivières. This section never proved satisfactory owing to the swiftness of the current, the unevenness of the shores above and below the section and a very rough bottom. A new section was located about one-half mile above the La Vielle rapids, the mean velocity of which at high water was found to be 2 feet per second, being less than the upper section. The river bed is smooth and the banks fairly straight and even.

*Discharge Curve.*—Although only a limited number of meterings have been made, the curve may be considered as fairly accurate. During the winter months, however, gauge readings are entirely unreliable as a criterion of the flow. Ice at times chokes the channel below the gauge to such an extent that the water will rise over a foot while the flow past the section is considerably reduced. Log jams, during the summer months, also have the same effect on the flow.

DISCHARGE MEASUREMENTS of Ottawa River at Deux Rivières from the 15th May, 1905, to the 31st March, 1915.

MAGANASIBI RIVER.

*Location of Gauge.*—Staff gauge on downstream side of west pier of highway bridge, 1 mile from the mouth.

*Records Available.*—Gauge is read only at such times when the Maganasibi and Ottawa rivers are being metered.

*Drainage Area.*—234 square miles.

*Discharge Measurements.*—These are made from the highway bridge, 1 mile upstream.

*Discharge Curve.*—Apparently accurate within 2 per cent of the actual flow.

SESSIONAL PAPER No. 19a

DISCHARGE MEASUREMENTS of Maganasibi River, from the 1st June, 1905, to the 29th May, 1908.

Date.	Made by	Water Elevation assumed Datum.	Discharge in Sec.-ft.

DUMOINE RIVER.

*Location of Gauge.*—Standard weight and chain gauge, 1 mile upstream from the mouth of the river.

*Records Available.*—Gauge readings from 21st April, 1913, to date.

*Drainage Area.*—1,517 square miles.

*Discharge Measurements.*—These are made about 1½ mile upstream, from a row-boat held in position by a rope and cable.

*Discharge Curve.*—The number of meterings made are not sufficient to make a well-defined curve.

DISCHARGE MEASUREMENTS of the Dumoine River, from the 2nd June, 1905, to the 26th February, 1914.

Date.	Made by	Water elevation.	Discharge in Sec.-ft.

PETAWAWA RIVER.

*Location of Gauge.*—A staff gauge is placed on a pier near the east shore of the river and a short distance below the highway bridge leading to the military camp. This gauge takes the place of the one previously used above the Canadian Pacific railway bridge. The latter was placed directly at the head of the Third chute, and was frequently interfered with by logs during the summer months, as well as by ice in the winter.

*Records Available.*—Old gauge above Third chute, 5th April to 15th November, 1905; 4th May to 27th June, 1908; 20th April to 18th December, 1909; 4th January, 1910, to 31st August, 1913. New gauge below highway bridge 2nd April, 1913, to date.

*Drainage Area.*—1,586 square miles.

*Discharge Measurements.*—The majority of the meterings have been made from the highway bridge leading to the military camps. Winter measurements and some of the later summer ones were made about three-quarters of a mile above Third chute, from a row-boat. The upper section proved more satisfactory than the one at the bridge, the current being more even and not so swift.

*Discharge Curve.*—This is not accurate. The lower reach of the river is composed of a series of falls and rapids, with intervening stretches of swift water. At the head of these chutes, logs frequently jam, causing a variation in the relation between the water surface levels and the flow.

*Winter Flow.*—The discharge relation is affected by ice.

DISCHARGE MEASUREMENTS of the Petawawa River.

NOTE.—Precipitation figures taken from Stonecliffe.

NOTE.—Precipitation and temperature taken from Stonecliff, Ont.

Log jams occurred during the spring of 1912 and remained during the greater part of the summer.

6 GEORGE V, A. 1916

PEMBROKE, ONT.. (OTTAWA RIVER).

*Location of Gauge.*—Staff guage on steamboat wharf.  
*Records Available.*—Gauge readings from 14th February, 1905 to 3rd February, 1906; from 10th May to 31st December, 1906; and from 1st April, 1912, to date.

CULBUTE CHANNEL (OTTAWA RIVER).

*Discharge Measurements.*—Meterings were made from the bridge at Chapeau and from a row-boat held in position by the ferryman's cable near Waltham.  
*Discharge Curve.*—Not well defined.

DISCHARGE MEASUREMENTS of the Culbute Channel, Ottawa River.

BLACK RIVER AT WALTHAM.

*Location of Gauge.*—Staff gauge on downstream side of bridge pier dividing the power-house head-race from the main river channel.  
*Records Available.*—Gauge readings from 26th April to 15th November, 1905; 17th May, 1909, to date.  
*Drainage Area.*—950 square miles.  
*Discharge Measurements.*—Made from a row-boat a short distance above the bridge. A cable and rope are stretched across the stream during the meterings from which to obtain the distances and hold the boat in position.  
*Discharge Curve.*—Fairly well defined. At low-water periods the water surface elevation is partially controlled by the manipulation of the head-gates at the power-house.  
*Winter Flow.*—Evidently affected by ice.

NOTE.—Figures for the month of April, 1909, were estimated by taking the mean of 4 years records at the same station and for the same month.

COULONGE RIVER.

*Location of Gauge.*—Staff gauge attached to a pier at the head of Coulonge chute.

*Records Available.*—Gauge readings 26th April to 15th November, 1905; 14th May to 27th June, 1908; 1st January, 1910, to date.

*Drainage Area.*—1,820 square miles.

*Discharge Measurements.*—Made from boat at a section about one-quarter of a mile above Coulonge chute.

*Discharge Curve.*—For discharges from 300 up to 1,000 c.f.s. the curve is well defined, but beyond that flow further meterings are required in order to arrive at a more definite curve.

*Winter Flow.*—Evidently affected by ice during short periods.

May 12	.....	.....	45,000
Aug. 16	.....	344.76	20,014
Nov. 14	.....	344.31	16,100
1907.			
June 15	.....	352.32	90,310

OTTAWA RIVER AT HEAD OF COULONGE LAKE AND AT LA PASSE.

*Location of Gauge.*—Staff gauge on pier just above ferry landing at La Passe, Ont.

*Records available.*—Gauge readings at head of Coulonge lake, 9th June, 1894, to 6th November, 1904; La Passe (foot of Coulonge lake), 17th February, 1905, to 27th January, 1906; 28th September, 1911, to date.

*Drainage area.*—At La Passe, 27,900 square miles.

*Discharge measurements.*—Made from catamaran opposite the village of La Passe.

*Discharge curve.*—The controlling sections are a long distance below La Passe, and frequently logs either fill the channels or stick at the head of the chutes, thus raising the level of the reach without increasing the flow. The curve is therefore useless during the time these logs remain at the head of the falls.

*Winter flow.*—The discharge relation is affected by ice.

## BRYSON, QUE.

*Location of Gauge.*—A staff gauge was attached to the steamboat wharf at Bryson in February, 1905, but has since been destroyed by ice.

*Records available.*—Gauge heights from 14th February, 1905, to 31st December, 1906.

*Discharge measurements.*—These are made from row-boats at various sections from Calumet up to the head of Calumet island. The greater part of the reach is fairly even and is well adapted to metering purposes.

*Discharge curve.*—Not well defined.

*Winter flow.*—The flow at Bryson is affected by ice to about the same degree as that at La Passe.

## DISCHARGE MEASUREMENTS of the Calumet Channel of the Ottawa River.

Date.	Made by	Water Elevation.	Discharge in Sec.-ft.

6 GEORGE V, A. 1916

DISCHARGE MEASUREMENTS of Bernard Creek:  
(Drainage area, 80 square miles).

Date.	Made by	Discharge in Sec.-ft.
1914. Nov. 14	G. B. Anderson.....	27

BONNECHERE RIVER AT RENFREW.

*Location of Gauges.*—Staff gauge above the intake of the lower power-house. Observations were discontinued owing to the level of the reach being regulated by the power people during low water period. A weight and chain gauge was placed in December, 1914, around the first bend below the town at a point which is not affected by back water.

*Records available.*—Gauge heights from 3rd April to 15th November, 1905; 15th April, 1909, to 31st December, 1914. Chain gauge, 19th December to date.

*Drainage area.*—910 square miles.

*Discharge measurements.*—Made from the Canadian Pacific Railway bridge above the town.

*Discharge curve.*—The water levels at the new gauge below the power-houses require calibrating. The old discharge curve cannot be used during periods of low water owing to the artificial regulation of the reach, and is very uncertain at higher stages.

*Winter flow.*—Possibly to a small extent affected by ice.

*Precipitation and Temperature records.*—Kept by Dr. Wm. Forrest at Renfrew, Ont., for the Dominion Meteorological Service since 1890.

Public Works, Canada.

UPPER OTTAWA STORAGE

DAILY DISCHARGE  
OF THE  
MADAWASKA RIVER  
1909

TOTAL DRAINAGE AREA = 3210 SQUARE MILES

四 歌

MISSISSIPPI RIVER.

*Location of Gauge*.—On upstream side of highway bridge below the power plant at Galetta. The gauge is under the supervision of the Eastern Ontario district engineer for the Hydro-electric Commission of Ontario; data are exchanged where ever possible.

*Drainage area*.—1,400 square miles.

*Discharge measurements*.—These are made above the lower highway bridge at Galetta, Ont., from a row-boat.

DISCHARGE MEASUREMENTS of the Mississippi River.

Date.	Made by	W. S. Elevation.	Discharge in Sec.-ft.
1905			
April 8	J. Gillespie.....	91.99	7,755
June 14	O. M. Stitt.....	89.48	2,605
Aug. 5	A. L. MacLennan.....	88.74	1,376
Oct. 3	J. J. Collins.....	88.06	695
1905.			
Mar. 30	J. Gillespie.....		700
1908.			
May 20	D. H. Philp.....		2,862
1913.			
Dec. 2	J. Beauchemin.....		1776

<sup>1</sup>East channel.

OTTAWA RIVER AT FITZROY HARBOUR, ONT.

*Gauge readings*.—3rd February, 1905, to 29th December, 1906.

OTTAWA RIVER AT QUYON, QUE.

*Location of Gauge*.—Staff gauge on boat-house at Quyon landing.

*Records available*.—Gauge readings from 27th May to 12th June, 1914: 5th January, 1915, to date.

*Drainage area*.—34,270 square miles, below Quyon and Carp rivers.

*Discharge measurements*.—Made at the first narrows below Quyon from two boats attached together. Distances secured by triangulation.

*Discharge curve*.—Fairly well defined for medium and low-water flows.

*Winter flow*.—Discharge relation not affected by ice to any perceptible degree.

DISCHARGE MEASUREMENTS of Ottawa River at Quyon, Que.

## RIDEAU RIVER.

*Location of Gauge.*—Water surface elevations are secured by measuring down from the base of rail on the Grand Trunk bridge near Hurdman's Bridge P.O.

*Records available.*—Gauge readings from the 24th March, 1914, to date.

*Drainage area.*—1,516 square miles.

*Discharge measurements.*—Made from the Grand Trunk bridge in the summer, and about one-half a mile above in winter.

*Discharge curve.*—Not yet well defined.

## DISCHARGE MEASUREMENTS of the Rideau River.

Date.	Made by	W. S. Elevation.	Discharge in Sec.-ft.
1901. April 1	Andrew Bell.....	187.99	14,300
1905. April 20-21	S. B. Johnson.....		2,365
June 6	O. Stitt.....		399
Aug. 14	J. E. Walsh.....		705
1908. May 13	D. H. Philp.....		9,410
1911. Dec. 15	S. B. Johnson.....	182.22	590
1912. Jan. 16	".....	182.37	430
Mar. 7	".....	182.42	390

## GATINEAU RIVER.

*Location of Gauges.*—Staff gauge No. 1 at head of falls at Chelsea. Staff gauge No. 2 on pier at foot of island at Chelsea. Bristol recording gauge on pier at foot of island at Chelsea.

*Records Available.*—Gauge No. 1 from 24th October, 1911, to date. Gauge No. 2 from 12th December, 1899, to date.

*Drainage Area.*—9,130 square miles.

*Discharge Measurements.*—Made from a launch at Ironsides during the summer, and opposite Gatineau Point village. During the winter, they are made at the head of Pagan Falls, Kirk's Ferry.

*Discharge Curve.*—Fairly well defined.

*Winter Flow.*—Discharge relation is affected by ice usually from late in November to early in April.

DISCHARGE MEASUREMENTS of the Gatineau River and Tributaries.

NOTE.—Mean of Bark Lake and Ottawa, taken from 1st Nov., 1912, for temperature and rainfall.

Public Works, Canada.  
**OTTAWA RIVER STORAGE**  
DAILY DISCHARGE  
OF THE  
**GATINEAU RIVER**  
FOR THE FOLLOWING YEARS

## SESSIONAL PAPER No. 19a

## OTTAWA RIVER, BELOW OTTAWA.

*Location of Gauge.*—Staff gauge at foot of the Rideau locks.

*Records Available.*—Readings have been taken from this gauge by the Department of Railways and Canals since the year 1844. These are all available with the exception of the years 1847, 1848, and 1849, records for these years having been destroyed by fire.

*Drainage Area.*—45,470 square miles, including Gatineau and Rideau rivers.

*Discharge Measurements.*—These have been made since the year 1905, at Besserer's Grove, 9 miles below Ottawa. During extreme high water, the country on the Quebec side of the river is flooded for about a quarter of a mile back. The movement of this mass of water is so slow that it cannot be metered, thus rendering the high-water measurements, to a small degree, unreliable. New sections were chosen, in the spring of 1915, at Kettle island, opposite the rifle range. These are apparently quite suitable at high water, but during low water the section on the north side of the island will probably be useless owing to slack water.

*Discharge Curve.*—During certain periods of the year, the north shore tributaries of the Ottawa river yield a greater rate of flow per square mile of their drainage area than does the Ottawa river itself. This is inclined to retard the flow of the Ottawa while the basin, Ottawa-Grenville, is filling up, causing the relation between the gauge readings at the Rideau locks and the flow to vary. The discharge curve is fairly reliable during the greater part of the year.

*Winter Flow.*—Discharge relation affected by ice.

DISCHARGE MEASUREMENTS of the Ottawa River at Besserer's Grove.

March.....	23,000	13,400	16,510	0.363	0.419	123	26.1	0.34
The year.....	95,520	13,000	28,940	0.635	8.642	35	42.4	24.91

NOTE—Mean monthly precipitation taken from Quinze Timiskaming, Bark Lake, (Ottawa River Storage); Renfrew, Haileybury, Rutherglen, Stonecliff (Dom. Met. Service); and Ottawa (By Mr. Ellis of Experimental Farm.) Discharge estimate by adding flows of Rideau and Gatineau Rivers into Chaudiere.

## OTTAWA RIVER AT EAST TEMPLETON, QUE.

*Records Available.*—Staff gauge readings from the 8th May, 1905, to 31st December, 1906.

## LIEVRE RIVER.

*Location of Gauge.*—The staff gauge read during 1905 and 1906 was attached to a pier above Dufferin falls at Buckingham, Que. This pier and gauge have since been torn out by ice. The gauges now used are at the head and foot of Poupore locks.

*Records Available.*—Readings from Dufferin falls gauge, 17th April to 11th November, 1905, and from 14th May to 1st December, 1906. Poupore locks (head and foot) 1st April, 1910, to date.

*Drainage Area.*—4,040 square miles.

*Discharge Measurements.*—Made from a launch 3 miles above Buckingham Que.

*Discharge Curve.*—Fairly well defined.

*Winter Flow*—Discharge relation is affected by ice.

DISCHARGE MEASUREMENTS of the Lievre River.

## ROUGE RIVER ABOVE CALUMET, QUE.

*Location of Gauges.*—Gauge No. 1 is at the head of Table falls, attached to the forebay wall near the racks of the power-house. Gauge No. 2 is about 200 feet below the power-house fastened to a small stone-filled crib. Both these gauges are the standard staff gauge used by this survey.

*Records Available.*—Gauge No. 1, 14th April to 15th November, 1905; 14th May to 31st December, 1906; and from the 15th May, 1909, to date. Gauge No. 2 was only placed this year.

*Drainage Area.*—1,780 square miles.

*Discharge Measurements.*—Made from a row-boat about 2 miles above Table falls.

*Discharge Curve.*—Not very well defined owing to backwater from the dam and power-house at Table falls. A new curve will be related to the lower gauge as soon as a sufficient number of meterings have been secured.

*Winter Flow.*—The reach above the falls is considerably affected by ice.

SESSIONAL PAPER No. 19a

SESSIONAL PAPER No. 19a

OTTAWA RIVER AT GRENVILLE, QUE.

*Records Available.*—Staff gauge readings for the head and foot of the Grenville canal from 1st January, 1871, to date.

*Drainage Area.*—54,330 square miles, to head of Grenville canal.

OTTAWA RIVER AT CARILLON, QUE.

*Records Available.*—Staff gauge readings for the head and foot of the Carillon canal from 1st January, 1870, to date.

*Drainage Area.*—54,500 square miles to Carillon.

*Discharge Measurements.*—Made from a launch about 2 miles below Carillon, Que.

*Discharge Curve.*—The curve related to the lower Carillon gauge is not well defined owing to considerable variation in levels caused by winds on Oka lake, and to a certain extent by the opening and closing of the lock gates. The levels at the upper Carillon and lower and upper Grenville gauges are affected to a small extent by the opening and closing of the lock gates.

*Winter Flow.*—Discharge relation affected by ice.

OTTAWA RIVER AT ITS OUTLETS.

*Location of Gauges.*—Staff gauges at head and foot of St. Anne’s canal.  
*Records Available.*—Readings from upper gauge from 1870 to date. Lower gauge from 1871 to date.  
*Drainage Area.*—55,600 square miles.  
*Discharge Measurements.*—For the total outflow of the river from the Lake of the Two Mountains meterings are made at Carillon (described under Carillon heading), and at the four outlets to the lake. In order to arrive at the total flow of the river from the Carillon meterings the run-off from the 1,100 square miles of drainage area between Carillon and Montreal has to be taken into account. Of this drainage area, 875 square miles are taken up by the watersheds of the North and Rigaud rivers. These rivers have been metered a sufficient number of times—as is shown by the lists—to give a fair knowledge of this extra run-off.  
*Discharge Curve.*—The curves for the four outlets are all referred to the Upper St. Anne’s gauge and may be considered fairly accurate.

\* Bark Lake figures not available for precipitation means of fiscal year 1912-1913.

†Mean monthly precipitation computed from observations at Quinze dam, Timiskaming, and Bark lake (Ottawa Storage); Haileybury, Stonecliff, and Renfrew (Dom. Meteorological Service); Ottawa (Central Experimental Farm), and Montreal (McGill University). Discharges obtained from Upper Carillon for 1912-13 from April to June 15 and Dec. 13, 1912, to March 31, 1913, from plotted discharge at Upper Carillon. Discharges obtained from Upper Grenville for 1913-14 and from Dec. 18, 1913, to March 26, 1914, from plotted discharge at upper Grenville.

ANNUAL RUN-OFF of the Ottawa River at North Timiskaming, below Timiskaming dam, at the Chaudière falls, at Besserer's Grove, and at Montreal.

SESSIONAL PAPER No. 19a

## DRAINAGE AREAS of the Ottawa River and its tributaries.

	Square miles.	Square miles.
Quinze river, from N. Timiskaming .....		9,700
Blanche river .....	1,897	
Wabis river .....	226	
Ottawa valley to Montreal and Kipawa rivers .....	669	
Montreal river .....	2,800	
Kipawa river and Gordon creek .....	2,133	
Ottawa valley to Timiskaming dam .....	655	
Total to foot of Timiskaming lake .....		18,100
Ottawa valley between Timiskaming and Mattawa .....	683	
Mattawa river .....	880	
Total to Mattawa .....		19,663
Ottawa valley between Mattawa and Deux Rivieres .....	225	
Total to metering section above Deux Rivieres .....		19,888
Maganasibi river .....	234	
Total to Deux Rivieres .....		20,120
Ottawa valley between Deux Rivieres and Rocher Capt. ....	115	
Total to Rocher Capitaine .....		20,235
Dumoine river .....	1,517	
Ottawa valley between Rocher Capitaine and Joachims .....	394	
Total to Des Joachims .....		22,146
Schyan river .....	296	
Petawawa river .....	1,586	
Indian river .....	440	
Ottawa valley between Des Joachims and Black river .....	652	
Black river .....	950	
Total to foot of Allumette island .....		26,070
Coulange river .....	1,820	
Ottawa valley to La Passe .....	32	
Total to La Passe .....		27,922
Ottawa valley to foot of Calumet island .....	300	
Total to foot of Calumet island .....		28,222
Ottawa valley between Calumet island and Cheneux .....	64	
Total to Cheneux .....		28,286
Bonnechere river .....	910	
Madawaska river .....	3,210	
Total to Arnprior .....		32,406
Mississippi river .....	1,400	
Ottawa valley between the Cheneux and Chats .....	167	
Total to Chats falls .....		33,973
Carp river .....	133	
Quyon river .....	164	
Total to Quyon metering section .....		34,270
Ottawa valley between Chats and Chaudiere falls .....	351	
Total to Chaudiere falls .....		34,621
Rideau river .....	1,516	
Gatineau river .....	9,130	
Ottawa valley between Chaudiere and Besserer's .....	67	
Total to Besserer's Grove .....		45,334
Little Blanche river (East Templeton) .....	137	
Lievre river .....	4,043	
Blanche river (Thurso) .....	236	
South Nation river .....	1,436	
North Nation river .....	710	
Salmon river .....	78	
Rouge river .....	1,780	
Calumet river .....	163	
Ottawa valley between Besserer's and Grenville .....	408	
Total to Grenville .....		51,325
Ottawa valley between Grenville and Carillon .....	180	
Total to Carillon .....		54,505
North river .....	700	
Rigaud river .....	175	
Ottawa valley between Carillon and head of Montreal Island .....	311	
Total to head of Montreal island .....		55,691
Total to mouth of river .....		56,041

## LIST OF GAUGES on the Ottawa River and tributaries and on the St. Lawrence River.

River or Lake.	Locality.	Zero.	Gauge Reader and Address.
Quinze L.....	Douglas Farm.....	849.50	
".....	Near outlet.....	851.30	A. E. Leacy, N. Timiskaming, Que.
Quinze R.....	Above dam.....	846.55	" " "
".....	Below dam.....	818.02	" " "
Timiskaming L.....	Haileybury.....	575.96	F. J. Fitzgerald, Haileybury, Ont.
Bay L.....	Latchford.....	896.96	G. H. Schneider, Latchford, Ont.
Montreal R.....	Below dam.....	892.45	" " "
".....	Empir eMill.....	890.35	" " "
Kipawa L.....	Kipawa dam.....	869.50	Maurice Denis, Fabre, Que.
Kipawa R.....	Below dam.....	859.98	" " "
".....	2 miles below dam.....	822.04	" " "
Timiskaming L.....	Timiskaming Station.....	572.66	J. B. Belanger, Timiskaming Sta., Que.
Kipawa L.....	Head Gordon Creek.....	868.00	Shannon & Fraser, Kipawa P. O., Que.
Gordon Creek.....	Lumsden's Mills.....	770.02	James Kerr, Lumsden's Mills, Que.
Ottawa R.....	Below Timiskaming dam.....	566.22	J. B. Belanger, Timiskaming, Que.
".....	I. C. O. camp.....	542.71	C. W. Thomson, Timiskaming, Que.
".....	Mattawa.....	488.46	Charles Morel, Mattawa, Ont.
Mattawa R.....	Foot Turtle L.....	660.72	
Talon L.....	At dam.....	631.82	
Mattawa R.....	Below Pimisi Bay.....	582.20	
".....	Above power house.....	522.09	Edmond Belanger, Mattawa, Ont.
".....	Below power house.....	495.70	" " "
Ottawa R.....	Klock Sta., H. W.....	478.00	A. Guilbault, Klock Sta., Ont.
".....	Klock Sta., L. W.....	468.00	" " "
Dumoine R.....	1 mile up.....	439.79	Paul DuFoe, Mackey's Sta., Ont.
Petawawa R.....	Highway bridge.....	411.00	James McLaughlin, Petawawa, Ont.
Ottawa R.....	Pembroke.....	361.63	Capt. W. Murphy, Pembroke, Ont.
Black R.....	Above power house.....	476.95	J. H. Maxwell, Waltham Sta., Que.
Coulonge R.....	Above Coulonge Ch.....	498.55	Camille Germain, Leclair P. O., Que.
Coulonge L.....	La Passe, Ont.....	339.68	Gilbert Gervais, La Passe, Ont...
Bonnechere R.....	Below Renfrew.....	280.60	W. Stewart, Renfrew, Ont.....
Calabogie L.....	Calabogie village.....	497.30	Mrs. J. Dyrsdale, Calabogie, Ont.
Madawaska R.....	Claybank, Ont.....		Narcisse Jaundraw, Arnprior, Ont., R. F. D. No. 3.
Arnprior L.....	Arnprior, Ont.....	237.00	H. E. Barnes, Arnprior, Ont.
Mississippi R.....	Below Galetta.....	242.32	Hydro-Electric Power Comm.
Ottawa R.....	Quyon, Que.....	187.32	Geo. Gallinger, Quyon, Que..
Deschenes L.....	Britannia Bay.....	187.47	J. Sparks, Britannia Bay, Ont.
Ottawa R.....	Rideau Locks.....	122.37	W. H. Bishop, Ottawa, Ont.
Rideau R.....	Black Rapids.....		G. E. Armstrong, Black Rapids, Ont.
".....	Hurdman's Bridge.....	199.06	H. McCurry, Hurdman's Bridge P. O.
Bark L.....	G. & H. depot.....	1. 181.03	John T. White, River Desert P. O.
Gatineau R.....	Above Chelsea.....	238.21	Lilian Hyde, Chelsea P. O., Que.
".....	Below Chelsea.....	206.14	" " "
".....	" (Bris. G.).....	204.87	" " "
Lievre R.....	Above Poupore.....	433.40	O. Laframboise, Poupore P. O., Que.
".....	Below Poupore.....	423.40	" " "
S. Nation R.....	Plantagenet Springs.....	170.20	N. J. Sibley, Plantagenet Spr., Ont.

RIVER ST. LAWRENCE METERING

TWO AND A QUARTER MILES ABOVE CEDAR RAPIDS

CEDARS. P.Q.

August 30<sup>th</sup> to September 2<sup>nd</sup> 1910

Gauge = 126.40 Area = 938512 Sq. Ft. Flow = 257404 C.F.S. Mean Velocity = 2.74 Ft. per Sec.  
Average depth of Mean Velocity below Surface = 60.4 %

RIVER ST. LAWRENCE METERING  
ONE QUARTER OF A MILE BELOW  
LANORRAIE, P.Q.

September 26<sup>th</sup> and 27<sup>th</sup> 1910  
GAUGE READING, LANORRAIE WHARF.  
Area - 118582 Sq. Ft. Flow - 273000 C.F.S. Mean Velocity - 2.30 Ft. per Sec.  
Average depth of Mean Velocity below Surface - 61.5 %  
Mean depth - 34 Ft., Width at Water Surface - 3492 Ft.

6 GEORGE V, A. 1916

## ST. LAWRENCE RIVER.

Metering the St. Lawrence river was first started in 1910 and 1911, when the writer made a few measurements above Montreal at the Cedars, and below Montreal at Lanoraie. Since then, two parties have been kept constantly at the work during the summer months. The sections chosen at the Cedars and at Lanoraie could not very well be improved upon. The bed of the river at both places is smooth and free from shoals and the shores are even. The current at the Cedars section averages about  $3\frac{1}{2}$  feet per second, and at Lanoraie about  $2\frac{1}{2}$  feet per second.

In April, 1912, new sections were laid out opposite Pointe aux Trembles. These were later abandoned owing to the shoaly condition of the river bed and to dredging operations interfering with the accuracy of the measurements. However, on investigation, the channels just above Bout de l'Ile were found to be superior to those previously located.

Vertical staff gauges are maintained at Pointe aux Trembles, Bout de l'Ile, Varennes, and at Lanoraie. Daily readings are also received at this office from the gauges at the head and foot of most of the St. Lawrence river canals. The work of determining the zero elevations of these various gauges and of reducing the daily readings to mean sea datum is not far enough advanced to warrant a more complete description being made for this report.

Before closing, I wish to express my appreciation for the very valuable information and assistance that has been given me by the Washington office of the United States Geological Survey, and from the United States corps of engineers.

I have the honour to be, sir,

Your obedient servant,

SYDNEY B. JOHNSON,

*Hydraulic Engineer.*

---

NOTES ON ANNUAL CONFERENCE, WATER RESOURCES BRANCH  
HELD AT WASHINGTON, D.C.

C. R. COUTLEE, Esq.,  
Engineer in Charge,  
Ottawa River Storage,  
Dept. Public Works,  
Ottawa.

21st December, 1914.

SIR,—The Annual Conference of the Water Resources Branch of the United States Geological Survey, which I had the honour to attend, was held in Washington, D.C., from the 7th to the 12th of December of this year. A great many interesting points were taken up, having to do with all the waterways of the United States and of its possessions. The meetings were well attended, as all of the district engineers belonging to this branch of the survey were present, together with some of their assistants, and, in addition, a few prominent engineers from other branches of government work. Among these last were Secretary Lane, of the Interior Department; George Otis Smith, Director of the Geological Survey; F. H. Newell, a past chief engineer of the department, and one of the first engineers in the States to use a current-meter for obtaining stream flow data; and Mr. Davis, Chief Engineer of the United States Reclamation Service.

In opening the conference, Mr. Nathan C. Grover, Chief Hydraulic Engineer said "the Water Resources Branch exists as a result of annual appropriations by Congress."

## SESSIONAL PAPER No. 19a

"For gauging the streams and determining the water supply of the United States, and for the investigation of underground currents and artesian wells, and for the preparation of reports upon the best methods of utilizing the water resources."

He spoke with emphasis on the importance of keeping the data in an up-to-date condition, not only to thus have a continual check on the records and measurements, but also that the information might at all times be available at the central office, in order that the many requests from outside sources might be complied with. Mr. Grover also spoke of the extent to which work is simplified by the adoption of uniform standards that have been carefully worked out and proved by long experience. The systematic training of men both for the field and office, he considered of great importance. In this connection he thought that every field engineer should spend a certain amount of time in the central office, and office men in the field. Only in this way could they understand and sympathize with their respective reports and problems.

An office engineer, among other things, spoke of the importance of the field keeping the central office well informed when new ideas or methods were being tested. He also spoke at considerable length on the allowable percentage that discharge measurements might vary from the rating curve. In general practice he thought that about 15 per cent was the greatest difference permissible for maximum and minimum discharges, and 5 per cent for the intermediate measurements. "The curve shall be considered reasonably well defined over that portion covered by measurements whose average error is not greater than 5 per cent."

One of the district engineers considered it a better plan to utilize available funds by getting as much information as possible, even though of an approximate nature, rather than go to great details on a few rivers. This point was questioned by several engineers, and instances were cited where trouble was caused by lack of accurate data. The consensus of opinion seemed to be in favour of thoroughness rather than scattered and approximate information.

An interesting paper on standardization of equipment brought out the importance of varying the standard of computations where it seemed necessary. A tolerable degree of accuracy might in some cases be all that was required, while in other instances more accurate data are essential. The paper described fully the standard metering car now being used by the survey, emphasizing the importance of having all the parts of the car and attachments galvanized, including the turnbuckles and the carrying cable; the cost of one of these cars is now only \$8.50, laid down in any district. Where good anchorage for the cable supports are not available, concrete bases are always used. The adoption by the survey of the small Price (Gurley) as their standard meter was strongly endorsed. In the discussion that followed, the advisability of using only one style of meter was questioned. Currents in a river or stream affect the screw type of meter in an entirely different way from the cup-shape form of instrument. Hence, unless a meter can be rated in moving water with approximately the same style of cross currents as found in the rivers to be metered, the only safe method is to use two or more distinct classes of instruments.

A paper dealing with weight and chain gauges showed clearly the advantages this type of gauge held over the ordinary vertical staff gauge. The average length of chain used for gauges of this type was 21 feet, and the average stretch for the various gauges in thirty-one months amounted to only thirty-one one-hundredth of a foot. When steel bridges have been used, they have been found to rise as much as three-tenths of an inch, due to change of temperature. Growing trees should never be utilized for gauge supports or for bench-marks.

In a paper on equipment and methods, the white enamel gauge was mentioned as being the most satisfactory staff gauge yet used. It also dwelt on the import-

ance of having good reference marks to all gauges. A bench-mark should also be placed on the top of the box covering the chain gauge. The length of current-meter observations at a single point was also discussed in the paper. In results from one meter an average difference of  $2\frac{1}{2}$  per cent at the same stage in the river was found, due to different periods of time being given the current-meter observations. By experiment, it was found that the percentage of error for 70-second periods is about one-half the error for 10-second periods. The point was emphasized that between 25 and 30 vertical observations should be taken across a single stream at each metering. The determination of the mean velocity in the verticals was a very important factor. The most accurate method yet found being the 2-, 6-, and 8-tenths method, duplicating the 6-tenths observation in taking the mean. The paper brought out the point that probably the greatest source of error in stream gauging is in the determining of velocity.

Before closing for the day, there was some discussion on the use of concrete bases for sloping staff gauges. Where solid rock was not available, the concrete should be sunk at least 4 feet below the surface to ensure its stability not being interfered with by the frost.

The following day, the discussion was continued relating to the time intervals of velocity observations, as well as on the distances between the verticals. If a stream is less than 10 feet wide, vertical velocities should be obtained at every one-half foot across the stream. From 15 to 20 feet wide, they should be taken at every foot. When it is found that, owing to a change of river stage or oscillations in the current, a lengthy metering would give faulty results, fewer velocity observations should be taken.

A most interesting paper was read on some long and unusual flow records. In a section of Arizona there were nine consecutive years of low water. During this period, seven years followed one another without the occurrence of a single flood. The value of long and continuous river flow records was emphasized. Thousands of dollars had been thrown away on power developments, due to insufficient or inaccurate data. In some instances, developments were completed when only scattered precipitation records were available. This has frequently led to costly errors, due to wrong estimates of the minimum stream flow. Cases were cited where power propositions had been carried through, ranging from two to ten times in excess of the available low-water flow.

A short paper dealing with the accuracy in final computations, described fully where errors might occur in the working up of discharge rating curves, and differences in computation due to various methods employed in taking off the daily mean from recording gauge returns.

In a paper dealing with the responsibilities and limitations of the survey, with special reference to distribution and operation, the subject was brought up of control by the Federal Government of all waterways in the country. In this paper, the necessity was brought out of the commercial value of waterways and power sites being known before even the question of government control could be taken up. The centralization of power was fast becoming an established fact, and must necessarily be followed by some kind of control by the people.

Another paper followed on the same subject. It also explained the usefulness of daily flow hydrographs, how they assist materially in following the fluctuations of flow down the course of the stream, also indicating readily the effect on the lower reaches of heavy rains or the manipulation of artificial controls higher up the stream.

An interesting discussion followed as to just how far government engineers should assist private companies who are using the whole or part of the stream being studied, the consensus of opinion being that it was possibly not wise to go into operation of stream gauging unless the State co-operated. In any

## SESSIONAL PAPER No. 19a

case, government engineers were absolutely prohibited from making surveys for private individuals.

State co-operation with the Geological Survey engineers was found in some cases to cause undue expense in installing or maintaining gauge stations. One case was cited where the cost of installing a recording gauge and cable station was 50 per cent greater than it would have been had it been under one control. It was found, however, that in the majority of the states, co-operation was found to greatly facilitate the gathering of stream flow data.

A paper on some conditions requiring the use of recording gauges was read. Fifty per cent of the recording gauges had to be placed owing to the unreliability of observers. The significance of this point could not be over-emphasized. Staff gauge observers have been caught absent from their posts for two or three weeks at a time; upon returning they had filled in fictitious readings, in some cases causing errors of over 30 per cent to creep into the final flow computations.

A paper brought out the necessity of using recording gauges when a stream has artificial control. Particularly is this necessary when two or more power-houses under different control are situated at the same fall. Some interesting anecdotes were told relating to the inefficiency of some gauge observers. In speaking of the various types of recording gauges, a Stevens gauge was described that ran for three months without being visited at a station where it was impossible to secure an observer. This type of gauge is run by a weight-driven clock, the weight dropping at the rate of 7 feet per month, and the clock therefore running as long as there is enough chain and space to permit of the movement of the power weight. A very convenient style of portable recording gauge was set up at a cost of 59 cents, this being for expressage. This type of instrument is used principally where only a short period of readings is required. It is very cheap and can be set up in half a day. The Gurley Simplex gauge which runs for two days is another style used where only a short period of records is required. A properly attended recording gauge station will not exceed in cost the ordinary staff or chain gauge station.

Recording gauges should be placed at power plants, storage reservoirs and at outlying stations where the gauge reader could not be visited frequently.

One spoke of doubting whether a certain observer made regular visits to the recording gauge or not, although the man stated that he never missed a day. A Veeder counter was placed just inside the gauge house and connected to the door. The observer was told that it was a new kind of barometer. When the station was visited three weeks later, the counter showed the door to have been opened twice.

A representative of the Gurley Company described the different types of gauges manufactured by them. The weight-driven printing gauge was described as being the only one of its kind and is now being used extensively throughout the United States and Canada. The weight drops  $1\frac{1}{4}$  inches per day.

Various types of gauges and their connections, including a transmission gauge, were thoroughly discussed. Probably the simplest and strongest instruments are those turned out by the Gurley people. The Stevens gauges have a unique invention whereby they will continue to record water levels that may exceed the limits for which the gauge is installed. This is accomplished by a device which causes the pencil to reverse its motion automatically when it reaches the limit of the record sheet. A good practice to follow in installing gauges is to make a  $\frac{1}{4}$ -inch hole in the float pipe for each square foot of water surface. Ventilation is necessary, either directly from the gauge well or through the house, preferably the latter.

In several districts it had been found from practical experience that it was advisable to have an observer make frequent visits to the recording gauges.

The Freize and Gurley graph gauges were both described as being unlimited in their range, the Gurley gauges having the advantage of simplicity in construction, and possibly better clock movements. An instrument by which mean daily discharges could be quickly taken off recording gauges was described. The instrument is not yet perfected, but the results so far obtained have shown it to be practical.

A paper dealing with installations gave some instances where recording gauges had been installed at a cost of less than \$50, and others where the cost had exceeded \$400. Pictures were shown of a house built of boulders, no other material being available. This cost \$320 without the gauge.

Costs in Honolulu, Hawaii, for installing recording gauges varied between \$50 and \$100. Corrugated iron pipe is used extensively wherever it can be procured at a reasonable price.

Eighty-five recording gauges are in use in Arizona, and staff gauges are being replaced with the former type as soon as is permissible.

Bristol pressure gauges came up for discussion, but were soon disposed of. Experiments had been carried on with this style of gauge at Spier Falls, N.Y. The gauge was placed alongside of a Gurley Simplex recording gauge at a station well equipped for such a purpose. Differences were found of more than a tenth of a foot between the Bristol records and the actual water levels. This inaccuracy in the Bristol gauge was not in any degree caused by temperature changes. At the present time no Bristol gauges are being used by the survey.

Mr. G. C. Stevens, the inventor of the Stevens gauge, stated that he could supply floats that would work in inclined pipes.

A paper on artificial controls dealt mainly with small streams where the water was in such demand that accurate and permanent records were of immense value. Experience had shown that weirs do not often give a true relation to the weir formulæ, but in the end form an ideal permanent control which can readily be rated by current-meter measurements taken at various depths of water over the crest.

A paper on the computations of records and methods of filing the sheets containing them was read. It was thought possible to reduce errors to a minimum by the use of recording gauges. If proper care were devoted to the selection of a site and to the installation of the gauge, errors should not exceed two per cent for ordinary stations, and where exceptional accuracy is required, 1 per cent. If the graphs show much irregularity, the daily means should be taken off with a planimeter, but if they are fairly regular, the daily mean arrived at from hourly readings will be sufficiently close.

Another writer on the same subject considered that one of the big problems of the day in connection with the use of recording gauges was to find an accurate method of computing the mean daily discharge. By using hourly gauge heights, the results will almost invariably be negative. He referred to an article in the *Engineering News* for the 27th August, 1914, which describes a quick method for taking off discharges directly from the original graphs.

An illustrated talk described conditions on the island of Hawaii. The streams on this island seldom have a greater drainage area than 10 square miles. The annual rainfall sometimes amounts to 600 inches in certain parts of the island, the known maximum for twenty-four hours being over 27 inches. This is slightly less than the highest rainfall on record, which occurred in the Philippines at Bagnio (elevation, 5,000 feet), Northern Luzon island being 38.5 inches in twenty-four hours, and 60 inches in fifty-two hours. The speaker said that he found corrugated iron to be the most economical material for the wells and houses; it could also hold its own in strength and durability. It was necessary to use the lightest material obtainable owing to the long distances supplies had to be transported by packmen. The Japanese made the best workmen,

## SESSIONAL PAPER No. 19a

and were always employed in preference to the natives. As the latter were also failures as gauge attendants, the engineers preferred to do their own "guessing." The average cost of recording gauges and their installations came to \$300 each.

The question of drainage areas was taken up in a paper which dealt principally with scales at present used by the various branches of the survey, and with methods of measurement. For drainage areas over 1,000 square miles, maps to a scale of 1-500000 gave sufficiently accurate results. Within a short period the whole of the United States will be covered by surveys, and contour maps will be published to the above scale.

Secretary Lane of the Interior Department visited the conference and gave a short address. He spoke of the country's water-courses as being one of its greatest assets, even more important than its coal, and equally important with its lands. Speaking of the method employed by Great Britain in India, he quoted Sir William Wilcox as saying, "It makes no difference who owns the land, as long as the Government owns the water." He thought that in all probability the United States would soon come to the same opinion.

A paper explained the usefulness of the ground-water division of the service, and cited some of the instances where it was particularly valuable. A plea was put in for the co-operation of the engineers throughout the United States. Lack of funds rendered it impossible to make more than a cursory survey of a few widely scattered sections. It was found very difficult to ascertain the relation between evaporation from land and that from water surface.

The relations between the Washington office and the field was the subject of a paper read by one of the Washington engineers. The use of adding and computing machines was considered in detail, the former being particularly useful for all offices where gauge records were received. A new attachment for the Dalton adding machine was also described. This makes it possible for the adding and tabulation of the gauge and discharge records to be done in one operation on the standard size gauge sheets.

Mrs. D. B. Wood, editress in the Washington office, read a paper on the preparation of manuscripts for publication. The paper dealt partly with the lax methods of a good many of the district engineers in not paying proper attention to the very careful set of rules drawn up by the central office. The paper, although goodnatured throughout, was a severe rebuke to delinquents. Directions were given regarding the proper use of titles and sub-titles in reports, and attention was drawn to other necessary points that the author should thoroughly work out before submitting his manuscript to the editorial office.

Mr. J. C. Hoyt, in his paper on the preparation of illustrations for reports, showed some excellent reproductions from what were very poor photographs, retouched before being sent to the engraver's.

A paper on the limitations in the analysis of base data brought out the necessity of devoting careful attention to all meterings that have been discarded for any reason, or that do not apparently agree with a series of other meterings made at the same point.

In the ensuing discussion, an engineer told of some meterings that had been discarded but were, upon being carefully compared with the stream slope, found to be only slightly in error.

The use of the automobiles in stream gauging work was described, showing how a large saving in the cost of transportation was effected since the adoption of these machines. A much greater territory was also covered than would otherwise have been possible with the same appropriation.

Two of the authors of Water Supply Paper No. 345-E, which sets forth a method of determining the daily discharge of rivers of variable slope, described some further experiments that he had made along the same lines. This latter

6 GEORGE V, A. 1916

work verified in every way the correctness of the principle set forth in the above paper.

A paper describing general conditions in New York state, referred particularly to the installation of recording gauges. Although temperatures have dropped as low as 35 degrees below zero, they have not experienced any trouble from water freezing in the wells. It was found, however, that electric gauges gave out in extremely cold weather. Throughout the greater part of the state, low water occurs during August and September, the water going higher in January and February.

Two papers on stream gauging and its relation to hydraulics were the last to be read at the conference. Some fine slides were shown with these papers, illustrating some of the uses to which stream gauging data can be put, and the ultimate results.

The conference closed on Saturday evening, the 12th inst., with short addresses by Messrs. Grover and J. C. Hoyt.

Monday, the 14th inst., was spent in examining recording gauges and other instruments, and going through the various branches of the service.

Summing up the principal features of the papers and discussions, the practicability of the following suggestions might be emphasized, viz.—

(1) A type or recording gauge capable of running for eight days without re-winding, to be adopted.

(2) Recording gauges to be used for all important rivers, more especially where there is a varying daily fluctuation, caused by the operation of power or storage dam.

(3) Results of meterings to be made available as promptly as possible after the actual field work is done.

(4) Gauge readings to be examined and entered directly the cards arrive in the office, all questionable records investigated without delay, and missing cards written for.

(5) Complete cost data to be kept of all work, year by year, efforts constantly made to improve the efficiency of the work, while at the same time cutting out unnecessary expenses.

(6) A system of filing to be adopted, which will be readily understood by any one of the office staff, and kept in the charge of one person.

A great many interesting and important points were brought out which cannot be included here. The papers, however are to be mimeographed and copies sent to those attending the conference.

Respectfully submitted,

Your obedient servant,

SYDNEY B. JOHNSON,  
*Hydraulic Engineer.*

## SESSIONAL PAPER No. 19a

ELEVATIONS above M.S.L. of Quinze Lake at Douglas Farm, for 1909-10.

## COMMISSION

Appointing commissioners to inquire into and report upon the commercial feasibility and national advantages to be derived from the proposed construction of a deep inland waterway from the Georgian bay, Ontario, to the port of Montreal in the province of Quebec.

Dated 18th March, 1914.

Recorded 1st April, 1914.

Lib. 212, Fol. 67.

THOMAS MULVEY,

*Deputy Registrar General of Canada.*

## CANADA.

GEORGE THE FIFTH, by the Grace of God, of the United Kingdom of Great Britain and Ireland, and of the British Dominions beyond the Seas, KING, Defender of the Faith, Emperor of India.

To all to whom these presents shall come, or whom the same may in anywise concern,

GREETING,—

WHEREAS in and by an order of His Royal Highness our Governor General in Council, bearing date the eighteenth day of March, in the year of Our Lord One Thousand Nine Hundred and Fourteen, provision has been made for a careful and thorough inquiry by our commissioners therein and hereinafter named in respect of the proposed construction of a deep inland waterway, providing for accommodation for the large lake carriers from the Georgian bay, in the province of Ontario, to the port of Montreal, in the province of Quebec, from the point of view of the commercial feasibility and national advantages to be derived from such a waterway, and in that connection to inquire into and consider the following questions, namely:—

1. A study of the transportation problem in relation to the proposed waterway; to what extent can it help in developing the resources of the country.

2. The advantages of a large waterway from the lakes to the seaboard, open to the largest type of lake carriers; the feasibility of these carriers navigating such waterway and the influence on the rate regulation of transport, especially upon cheaper commodities which the country produces.

3. The competition of the waterway with the railways; effect on railways, by creating new industries, on account of cheap transportation of low grade freight that cannot be handled by rail, causing an expansion in industries, an increase to the population and a demand for a higher class of freight seeking transportation by rail.

4. The probable volume of traffic available on account of the natural advantages of such waterway, which would be the shortest and deepest water route from the head of the Great Lakes to the seaboard for the largest lake vessels and the probable length of the open navigation season through this waterway.

5. Traffic of the Great Lakes; how it reaches the seaboard. The percentage of Canadian traffic handled through United States ports, and causes for this diversion.

6. Lake transportation; rates that obtain; lake and rail rates as against all rail rates; also a comparison with an all water route rate; also a comparison between the proposed Georgian Bay Ship Canal route and all the competing routes in existence and in course of construction and their capacity; comparative cost of transportation per ton mile, rail, lake and rail, and all water.

7. A comparison of the volume of traffic that may be handled by water as against the rail routes within the same period. Possible economic advantages of such a waterway.

8. The position of the Northwest; Fort William and Port Arthur being the objective point of all lines running through the wheat belt. How the situation at the head of the lakes would be ameliorated; would an all water route from Fort William to the seaboard, for largest lake vessels, be the natural complement of the present water and rail routes?

9. The position of the existing and projected Gulf Lines via Galveston, what their influence would be regarding diversion of traffic from the lakes and St. Lawrence route. The effect upon the movement of the traffic by the opening of the Hudson Bay, and Pacific and Panama routes.

10. The conditions that exist at the Atlantic seaboard, Canadian and United States, as to handling traffic, and as to ocean and insurance rates.

11. Interprovincial trade. The facilitating of trade between the provinces. The Northwest to supply Ontario, Quebec, and the Maritime Provinces with wheat at a cheaper transportation rate; Ontario and Quebec to supply in return the product of their manufactures, whilst it will perhaps be possible for Nova Scotia to supply coal to some Ontario points at a cheaper freight rate than it now costs to bring it from the United States, effecting a great saving to the country.

12. The iron industry and other mineral resources; the deep waterway as a factor in their development.

13. Pulp industry and the possibility of development.

14. The tendency to manufacture at the base of supply; the possibilities along the route of the waterway where raw material that cannot be transported by rail at a low rate is available. The easy development of large water powers at dams, for manufacturing purposes.

15. New territory opened in the Northwest and the requirements to move the grain crop in the future to open market; the cost of transporting wheat from important centres in the Northwest to head of lakes.

16. Storage at the head of the lakes and the seaboard; extent of terminals required.

17. Markets, general statistics, synopsis of history of deep canals; their trade development.

18. Generally speaking, the commercial feasibility of the proposed waterway.

Now Know Ye that by and with the advice of our Privy Council for Canada, we do by these presents nominate, constitute and appoint William Sanford Evans, of the city of Winnipeg, in the province of Manitoba, financial agent; Frank Stephen Meighen, gentleman, and Edouard Gohier, merchant, both of the city of Montreal, in the province of Quebec, to be our commissioners to conduct such inquiry; to have, hold, exercise and enjoy the said office, place and trust unto the said William Sanford Evans, Frank Stephen Meighen and Edouard Gohier, together with the rights, powers, privileges and emoluments unto the said office, place and trust of right and by law appertaining during pleasure,—And we do further nominate, constitute and appoint the said William Sanford Evans to be the Chairman of the said Commission.

## SESSIONAL PAPER No. 19b

And we do hereby under the authority of the revised Statute respecting inquiries concerning public matters confer upon our said Commissioners the power of summoning before them any witnesses and of requiring them to give evidence on oath or on solemn affirmation if they are persons entitled to affirm in civil matters, and orally or in writing, and to produce such documents and things as our said Commissioners shall deem requisite to the full investigation of the matters into which they are hereby appointed to examine. And we do hereby further authorize the said Commissioners to employ such technical and professional assistants as they may deem necessary in connection with the inquiry. And we do hereby require and direct our said Commissioners to report to His Royal Highness the Governor General in Council the result of their investigation together with the evidence, if any, taken before them and any opinion they may see fit to express thereon.

In testimony whereof, we have caused these our letters to be made patent and the great seal of Canada to be hereunto affixed. Witness: Our Most Dear and Entirely Beloved Uncle and Most Faithful Counsellor, Field Marshal His Royal Highness Prince Arthur William Patrick Albert, Duke of Connaught and of Strathearn; Earl of Sussex (in the Peerage of the United Kingdom); Prince of the United Kingdom of Great Britain and Ireland; Duke of Saxony, Prince of Saxe-Cobourg and Gotha; Knight of Our Most Noble Order of the Garter; Knight of our Most Ancient and Most Noble Order of the Thistle; Knight of Our Most Illustrious Order of St. Patrick; One of our Most Honourable Privy Council; Great Master of Our Most Honourable Order of the Bath; Knight Grand Commander of Our Most Exalted Order of the Star of India; Knight Grand Cross of Our Most Distinguished Order of St. Michael and St. George; Knight Grand Commander of Our Most Eminent Order of the Indian Empire; Knight Grand Cross of Our Royal Victorian Order; Our Personal Aide-de-Camp; Governor General and Commander-in-Chief of our Dominion of Canada.

At our Government House, in Our City of Ottawa, this eighteenth day of March, in the year of Our Lord One thousand nine hundred and fourteen and in the fourth year of Our reign.

By Command,

THOMAS MULVEY,

*Under-Secretary of State.*

Honourable ROBERT ROGERS,  
Minister of Public Works,  
Ottawa, Canada.

SIR,—Pending the completion of the statistical survey of the principal facts and conditions entering into the transportation problems referred to the Georgian Bay Canal Commission, which it was arranged should be undertaken as preparatory to the work of the Commission, I beg to submit the following Interim Report covering such matters as have already been submitted to examination.

Yours respectfully,

W. SANFORD EVANS.

OTTAWA, 1916.

# INTERIM REPORT, GEORGIAN BAY CANAL COMMISSION.

---

By W. SANFORD EVANS, *Chairman, Georgian Bay Canal Commission, 1916.*

## INTRODUCTORY STATEMENT.

Under the authority of Parliament, a survey and investigation of the practicability and probable cost of the long-mooted proposition to construct a deep waterway from Georgian bay to the harbour of Montreal, by way of the French and Ottawa rivers, was initiated in 1904 under a board of engineers. In 1909 this board submitted a report (Georgian Bay Ship Canal Report upon Survey, with Plans and Estimates of Cost, 1908), the plans providing for a waterway 22 feet deep, with a length of 440 miles, in which there would be 28 miles of canal excavation, 66 miles of channel dredging, and 346 miles of river and lake; with 27 locks of a minimum length of 650 feet, with 65 feet clear width and 22 feet clear depth, the lift ranging from 5 feet to 50 feet; and with a minimum water supply in the summit basin, capable of being increased, which would permit of 20 lockages per day throughout a season of about 210 days. The cost, originally placed at \$100,000,000, was, in view of increases in the cost of materials, subsequently estimated at \$125,000,000.

In 1914 a Royal Commission was issued, in the terms already set forth, for a report upon the "commercial feasibility" of such a canal, and in general upon many elements of the transportation problem in Canada. The engineers had reported that the canal was practicable, but the report of the Georgian Bay Canal Commission was to be upon the question whether or not it would pay Canada to spend \$125,000,000 upon this public work.

A reasonable judgment upon the economic feasibility of any proposition must be based upon a careful study of facts and upon an equally careful estimate of tendencies and possibilities of development. As many of the conditions which constitute the economic factors of a problem such as this have not previously been statistically studied in Canada, and are not adequately set forth in any existing compilations, it was considered desirable to collect and arrange certain important classes of facts as preliminary to the consideration of any conclusions by the commission, and even as preliminary to the holding of public hearings. An arrangement was accordingly made by which the chairman of the commission undertook this preparatory statistical survey, and this interim report, sets forth some of the facts so far examined. It is not a report on conclusions, but rather a general introductory statement of part of the case to be argued, and takes the form of a summary statement, illustrated by diagrams, and an appendix containing tables of figures. It is submitted at this stage for constructive criticism and for suggestions as to other essential matters to be taken into consideration so that the case may be made complete. As soon as the most important fundamental facts are available and within the knowledge of those interested, argument can profitably be heard, and in due time, and after full public hearings, the Georgian Bay Canal Commission will present its report.

*Scope of this report.*—Great public works, such as railways and canals, may be undertaken for political, military, or economic reasons. The terms of Confederation imposed on the Dominion Government a political obligation for certain works of this kind. Military purposes have led to very large expenditures on transportation

facilities in many countries, and perhaps neither military nor the higher political reasons should be overlooked in connection with any public work. The present question, however, is whether there is an economic reason for a Georgian Bay canal.

A canal is constructed to carry traffic and from the national standpoint might have economic justification:—

(1) If existing traffic facilities are congested, or in danger of congestion within a period of time for which provision should now be considered, and if the proposed canal offers adequate and satisfactory additional facilities.

(2) Even if actual congestion is not threatened, then if a sufficiently great volume of traffic is likely to be affected by the building of the canal so that the decreased cost or the increased convenience will bear a remunerative relation to the capital invested. Under this heading there would be two inquiries:—

(a) As to the volume of traffic that would probably use the canal itself;

(b) As to the volume of traffic likely to be affected by the competitive influence of the canal, through the effect of the new route on the rates and conveniences of other routes.

(3) If its construction would probably promote the development of traffic to a greater extent or at a more rapid rate than an alternative improvement in facilities, and to a degree commensurate with the cost.

(4) If in connection with its construction collateral assets or benefits might be created, of which water-powers may be taken as one example, which, properly appraised, might so supplement the traffic advantages as to make the total national return appear profitable.

This interim report does not deal with possible collateral values created by the building of the proposed Georgian Bay canal, which must later be inquired into, but solely with the problem of traffic.

Again, this report does not deal with the important question of local traffic, but only with the problem of through traffic. A canal might enable the population along its banks to receive and ship goods on better terms than at present and might lead to a marked increase of population in that district and to the establishment of new industries; and it might also further the development of such natural resources as that district may contain. To the extent to which it is a net addition to the sum of national well-being, and is not accompanied by a corresponding loss elsewhere or is not only a transfer from one point to another, an economic advantage to a section of the population or to a limited district may be counted a national advantage. But it must not cost too much and the burden of the cost must be properly placed. The natural resources of the territory tributary to the proposed canal should be carefully investigated, and an estimate made of all probable local gains. In this report, however, only facts and conditions bearing on the general traffic problem of Canada are under examination.

The proposed Georgian Bay canal would form a new channel in the St. Lawrence and Great Lakes water-route from the Atlantic ocean to the heart of the North American continent. Over certain of the existing channels of this greatest of inland waterways there now passes an enormous volume of traffic. Some of this is Canadian traffic and some United States traffic. Some of the vessels are of Canadian or British registry, and some of United States registry. These vessels freely use all canals and improvements in the waterways, without distinction because of the nationality of the vessel or the national ownership of the canals or deepened channels, and, within the restrictions of the coasting laws, some traffic of Canadian origin is carried in United States vessels, and some traffic of United States origin is carried in Canadian vessels. This great waterway is paralleled to the north and to the south throughout its whole course by many railway lines, which also carry an enormous traffic of mixed national origin and destination.

## SESSIONAL PAPER No. 19b

Among the materials necessary as a basis for a reasonable judgment on the economic feasibility of the canal in its relation to general traffic, there should be facts covering the following points:—

(1) The magnitude of the total traffic of both countries that now so moves and that may in the future so move as to fall within the sphere of influence of such a canal. Traffic of Canadian origin or destination, that is, traffic that enters into Canadian trade, should be differentiated from United States traffic in order that it may be considered separately, for the national advantage to Canada of benefits conferred on Canadian traffic would be much more direct and would be calculated on broader grounds than would the advantage to Canada that might be incidental to benefits conferred on United States traffic.

(2) The routes now followed by traffic and the causes of the present distribution. If necessary in order to discover these causes, the goods must be traced from their point of origin right through to their ultimate destination, even if this involves a study of transportation conditions on the ocean and of the methods and demands of foreign markets.

(3) The classes of goods now constituting the traffic, and the possibilities of increase in each of these classes and of the addition to the traffic of new classes of goods.

(4) The present nature and probable tendencies of railway competition against the water routes.

The traffic that would probably feel first and most directly the influence of a new canal is the traffic that now passes by water between the East and the West in North America. This report represents the results of an investigation of this waterborne traffic along the above general lines. No detailed study of the rail-borne traffic and of railway competition has yet been made.

In the summary statement no attempt is made at exhaustive treatment, but rather the facts of a single year or with respect to a single article are selected to illustrate the general conditions found to exist, and diagrams are freely used. Indeed, much of the report is but an explanation of the diagrams. In the appendix are given tables of statistics, some compiled direct from original material and some taken from various authoritative publications, which will in most cases provide material for a much more extended study. The year 1913 has been chosen for special attention, first because the traffic movement was greater in that year than in any other, and second, because 1913 was the latest complete year before the disturbances created by the war, and witnessed the fullest manifestation of the tendencies of what may be called normal times. Normal conditions must be understood before the abnormal can be rightly judged.

There is included in the appendix also a precis index of Hansard Debates of the House of Commons and the Senate on the Georgian Bay Ship Canal, 1902-13.

As many other problems, beside that of the Georgian Bay canal, depend upon the same fundamental facts, it is possible that the material herein presented may prove of interest in more than the one practical direction.

In this report, the quantities, and not the values, of freight traffic are taken into consideration, whenever these can be obtained, and less attention is paid to freight rates than to the general conditions that underlie freight rates.

It is the weight, or the bulk, of freight traffic that chiefly creates a transportation problem, and not its value. Cargoes and carloads are measured by tons and not by dollars. To illustrate: In the fiscal year 1912-13, Canada imported unset diamonds to the value of \$3,846,350.<sup>1</sup> If put into one package, these diamonds would probably weigh about 44 pounds, and the whole package could be thrown into the corner of the

<sup>1</sup> Report of the Department of Customs, Trade and Navigation, year ending March 31, 1913, p. 354.

small safe in one express car. In the same fiscal year, Canada imported large quantities of soft coal, aggregating over five times the value of the diamonds. Taking for comparison the quantity of soft coal which at the entered price would give a value equal to the diamonds, we have a freight tonnage of 1,923,175 tons. According to the report of the Department of Railways and Canals,<sup>1</sup> there were in that year on all the railways in Canada a total of 14,746 coal cars, with an average capacity of 38½ tons. If all these cars were assembled to carry the above amount of coal, each car would have a little over 3½ loads. Put in another way, if these cars were made up into trains of forty cars each, and twelve such trains were despatched per day, it would take 104 days to move the load. Here we have a big transportation problem, whereas the same value in diamonds offers no transportation problem at all, but only an insurance or police problem. It may be much more profitable for a country to produce or trade in goods that must be weighed by ounces or pounds, but it is only tons, no matter what their value, that can fill vessels or cars and that require new canals, deeper channels, more railway lines and heavier rails and bridges.

Freight rates do not always explain traffic movements, and are sometimes symptoms rather than causes. A relative cheapness of rates will not always divert traffic from other routes; for traffic often seems to move upstream against higher rates. There are many conditions which determine the routing of traffic, and it is impossible to reach sound practical conclusions by studying freight tariffs alone. What has been sought in the present investigation is the causes of traffic movements, whether these causes have manifested themselves in freight rates or not. There may be artificial interferences with the operation of these fundamental causes, such as may arise from the exercise of governmental regulation on the one side, or from conferences, affiliations, pools, or combinations on the other, but it has not been possible in the time to trace the influence on the courses of traffic that may have been exerted by these means.

---

<sup>1</sup> Railway Statistics, year ending June 30, 1913, p. 139.

**FREIGHT TRAFFIC TO AND FROM LAKE SUPERIOR.<sup>1</sup>**

The principal volume of waterborne traffic between the East and the West in North America passes back and forth through the Sault Ste. Marie canals, and it can there be conveniently measured and analysed owing to the admirable statistical reports<sup>2</sup> prepared under the direction of Lt.-Col. Mason M. Patrick, Corps of Engineers, U.S. Army, covering the traffic of both countries through all the canals, and of the Canadian Department of Railways and Canals<sup>3</sup> dealing specially with the traffic through the Canadian canal.

In diagram 1 is represented in graphic form the total freight traffic of Canada and of the United States combined, passing through the canals at Sault Ste. Marie, Ontario and Michigan, during the season of navigation of the year 1913.<sup>4</sup>

Fig. 1 shows the total freight traffic divided into eastbound and westbound traffic. Of a total freight traffic of 79,718,344 short tons, there passed eastbound 59,205,853 tons, and westbound 20,512,491 tons. Among the points to be noted are:—

(1) The magnitude of this traffic. In tons of cargo and in net registered tonnage of vessels, the traffic through the Sault Ste. Marie canals during somewhat less than eight months of open navigation greatly exceeded the twelve months' total of any other canal or of any single port in the world. Its figures, so far as narrow waterways are concerned, are apparently surpassed only by those of the Detroit river,<sup>2</sup> which, in addition to carrying over 87 per cent of the traffic which also passes through the Sault Ste. Marie canals, carries traffic to and from lake Michigan, lake Huron, and Georgian bay and local traffic for Detroit river ports. A direct comparison in freight tons with the traffic through the Suez canal is not practicable, but the net registered tonnage of vessels passing through the Suez canal in the year 1913 was 20,032,884 tons, while the net registered tonnage of vessels passing through the Sault Ste. Marie canals in the navigation season of the same year was 57,989,715 tons.

(2) The distribution of traffic as between eastbound and westbound, the ratio being 2.88 to 1.

(3) The growth of the traffic. In the appendix<sup>4</sup> are given detailed figures for 1911 to 1915. In 1890 the total freight traffic was 9,041,213 tons; in 1900, 25,643,073 tons, and in 1913, 79,718,344 tons.

Fig. 2 shows the origin of the traffic.<sup>5</sup> No matter what the original national source or the ownership of the goods may be, the traffic originating at Canadian ports is, in accordance with the commonly accepted definition, called Canadian traffic, and is represented in solid black; while the traffic originating at United States ports is called United States traffic, and is represented by the hatched portions of the figures. Out of a total eastbound traffic of 59,205,853 short tons there originated at Canadian ports 6,103,847 tons, or 10.30 per cent. Out of a total westbound traffic of 20,512,491 tons there originated at Canadian ports 771,410 tons, or 3.27 per cent. Of the total eastbound and westbound traffic combined, 6,875,257 tons, or 8.62 per cent, was of Canadian origin.

<sup>1</sup> Appendix Tables 1-17, pp. 87-102, Statistics, 1911-15.

<sup>2</sup> Annual Statistical Reports of Lake Commerce, passing through canals at Sault Ste. Marie, Ontario and Michigan, with a Supplementary Report of commerce passing through the Detroit River.

<sup>3</sup> Canal Statistics.

<sup>4</sup> Appendix, Table 1, p. 87, Statistics, 1911-15.

<sup>5</sup> Appendix, Table 2, p. 87, Statistics, 1911-15.

Fig. 3 shows the destination of the traffic,<sup>1</sup> that is the freight shipped to Canadian ports as compared with the freight shipped to United States ports. Of the total eastbound freight, 6.11 per cent, or 3,619,636 tons, was destined to Canadian ports in the east; while of the total westbound freight, no less than 29.02 per cent, or 5,954,388 tons, was destined to Canadian ports in the west.

It will be noted that there are marked differences in the relative proportions of traffic in figures 2 and 3. It is evident, for example, that a much smaller amount of freight arrived at Canadian ports in the east than was shipped from Canadian ports in the west, the difference being 2,484,211 tons. This means that a large amount of Canadian freight, eastbound, was shipped to United States ports, and that there was not a corresponding amount of United States freight shipped to Canadian ports. The heavy shipments of Canadian grain and flour to United States ports are not offset by any correspondingly large movement of United States traffic, at least from the Lake Superior district, to Canadian ports. On the other hand, nearly 7½ times as much freight arrived at Canadian ports in the west as was shipped from Canadian ports in the east, the difference in this case being accounted for chiefly by the large shipments of United States coal to Canadian ports in the west.

*Distribution of traffic by lake districts.*—Leaving the St. Marys river the traffic eastbound divides, one portion diverging to ports on lake Michigan, one to ports on lake Huron and Georgian bay, a very large portion to lake Erie ports, while the balance goes to ports on lake Ontario and the St. Lawrence river. Westbound, streams of traffic converge from all these districts. It has not so far been found practicable to work out the traffic belonging to each individual port, but the material is available for estimating the traffic of ports grouped according to lake districts.

It is clearly important to understand how existing traffic by water is routed. Traffic between lake Michigan and lake Superior will probably, for example, prove to have little bearing on the problem of a Georgian Bay canal; and again, the traffic now received at and shipped from lake Erie ports must be examined with a view to determining to what extent this routing is due to the fact that the commodities constituting the westbound traffic originate in districts directly tributary to lake Erie, and to what extent the eastbound traffic now received at those ports is influenced by fundamental causes, such as consumption demand or the existence of through export facilities. With regard to the traffic with lake Huron and Georgian bay and with lake Ontario, it will be important also to inquire what proportion belongs to local districts that could not be served by an alternative route through a Georgian Bay canal. At this stage, however, only the general facts of distribution will be presented.

*Total traffic by the lake districts.*<sup>2</sup>—In diagram 2 is shown the total eastbound traffic through the Sault Ste. Marie canals during the season of navigation of 1913, divided according to the lake districts to which the freight was shipped, and the total westbound traffic divided according to the lake districts from which the freight was shipped. Comparing the quantity shipped to lake Erie in the eastbound figure with the quantity shipped from lake Erie in the westbound figure, the relation of outward to return cargoes with respect to that lake district is indicated; and so with each of the other lake districts. The preponderance of the traffic with lake Erie ports is strikingly apparent.

Of a total eastbound freight traffic of 59,205,853 tons, there was shipped to ports on lake Erie, 49,427,101 tons, or 83.48 per cent; while of a total westbound traffic of 20,512,491 tons, there was shipped from ports on lake Erie, 19,297,105 tons, or 94.07 per cent. Of the combined total of eastbound and westbound traffic of 79,718,344 tons, the traffic between lake Erie and lake Superior amounted to 68,724,206 tons, or 86.2 per cent.

Traffic with lake Michigan ports comes second in total amount, although it is only about one-twelfth as great as the traffic between lake Superior and lake Erie, the figures

<sup>1</sup> Appendix, Table 3, p. 88, Statistics, 1911-15.

<sup>2</sup> Appendix Table 4, pp. 88-90, Statistics, 1911-15.

# EAST- AND WESTBOUND DISTRIBUTION OF TOTAL TRAFFIC THROUGH CANADIAN AND AMERICAN CANALS AT SAULT STE MARIE. NAVIGATION SEASON 1913

FIG. 1 BY TOTALS

FIG. 2 BY PORTS OF ORIGIN

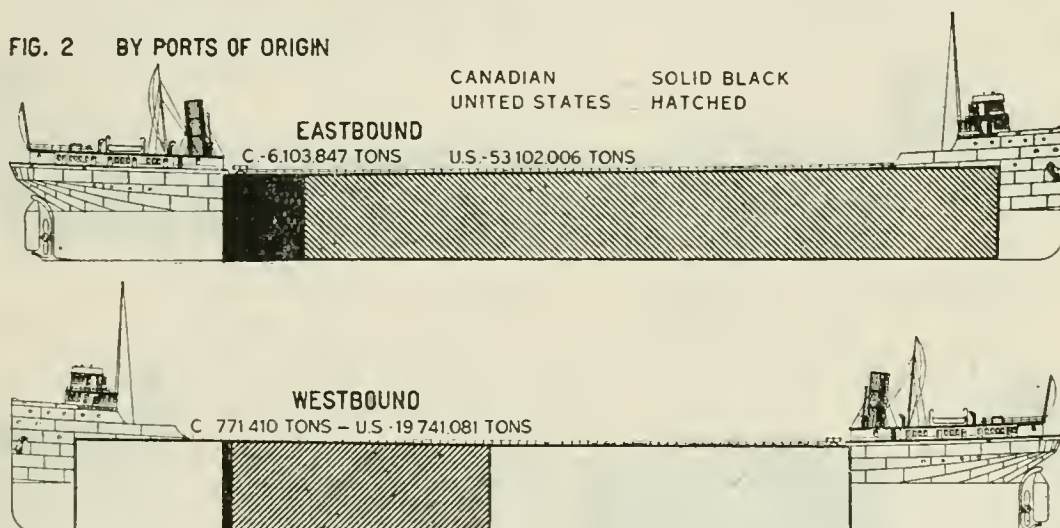

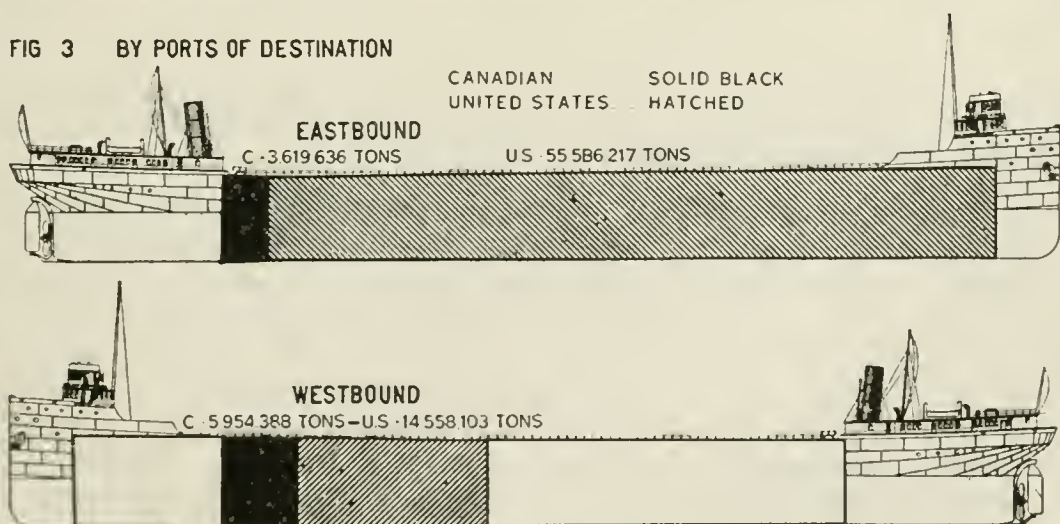

FIG. 3 BY PORTS OF DESTINATION

6 GEORGE V, A. 1916

being 6,704,080 tons, or 8.40 per cent. Eastbound there was shipped to lake Michigan, 6,376,535 tons, or 10.77 per cent of the total, and from lake Michigan ports westbound there was shipped 327,545 tons, or 1.59 per cent of the total westbound freight.

Of the combined total eastbound and westbound, the traffic between lake Huron and Georgian bay and lake Superior amounted to 2,885,890 tons, or 3.62 per cent. To lake Huron and Georgian bay ports there was shipped eastbound, 2,445,945 tons, or 4.14 per cent; and westbound from lake Huron and Georgian bay ports, 439,945 tons, or 2.14 per cent.

Of the combined total eastbound and westbound, the traffic between lake Ontario and St. Lawrence river and lake Superior amounted to 1,404,168 tons, or 1.76 per cent. To lake Ontario and St. Lawrence river ports there was shipped 956,272 tons, or 1.61

DIAGRAM No. 2.

### DISTRIBUTION BY LAKE DISTRICTS OF TOTAL TRAFFIC THROUGH CANADIAN AND AMERICAN CANALS AT SAULT STE. MARIE, NAVIGATION SEASON 1913

per cent, and from lake Ontario and St. Lawrence river ports there was shipped westbound 447,896 tons, or 2.18 per cent.

*Canadian traffic by lake districts.*<sup>1</sup>—Of a total traffic of Canadian origin amounting to 6,875,257 tons, 48.33 per cent, or 3,322,534 tons was traffic to and from lake Erie ports. Traffic with lake Huron and Georgian bay ports came second, with 2,361,375 tons, or 34.34 per cent. Traffic with lake Ontario and river St. Lawrence ports amounted to 1,107,317 tons, or 16.10 per cent. From Canadian ports on lake Superior to ports on lake Michigan there was shipped 34,031 tons or 1.22 per cent of the total.

In this traffic with lake Erie nearly all the freight was eastbound, very little freight westbound having originated at the Canadian ports on that lake. Lake Ontario and river St. Lawrence ports supplied a little over one-half of the westbound traffic, namely, 394,148 tons, or 51.09 per cent of the total Canadian westbound traffic. Lake Huron and Georgian bay ports supplied 353,395 tons, or 45.81 per cent.

<sup>1</sup> Appendix, Table 5, p. 91. Statistics, 1911-15.

SESSIONAL PAPER No. 19b

The particulars are as follows:—

TOTAL Canadian traffic by lake districts—Navigation season, 1913.

Direction.	Lake Ontario and River St. Lawrence.		Lake Erie.		Lake Huron and Georgian Bay.		Lake Michigan.		Total Tons.
	Total Tons.	Per Cent.	Total Tons.	Per Cent.	Total Tons.	Per Cent.	Total Tons.	Per Cent.	
From lake Superior eastbound to.....	713,169	11·68	3,298,667	54·04	2,007,980	32·89	84,031	1·38	6,103,847
To lake Superior westbound from... ..	394,148	51·09	23,867	3·09	353,395	45·81	.....	....	771,410
Combined total. . . .	1,107,317	16·10	3,322,534	48·33	2,361,375	34·34	84,031	1·22	6,875,257

Of the total traffic originating at Canadian ports which was shipped to Canadian ports<sup>1</sup>, lake Huron and Georgian bay had 52·10 per cent, lake Ontario and the St. Lawrence river, 29·02 per cent, and lake Erie, 18·87 per cent. When the westbound shipments are examined separately, lake Ontario and the St. Lawrence river stand first with 52·93 per cent, and then follow lake Huron and Georgian bay with 44·08 per cent, and lake Erie with 2·97 per cent. The particulars are as follows:—

CANADIAN traffic to Canadian ports by lake districts—Navigation season 1913.

Direction.	Lake Ontario and River St. Lawrence.		Lake Erie.		Lake Huron and Georgian Bay.		Lake Michigan.		Total Tons.
	Total Tons.	Per Cent.	Total Tons.	Per Cent.	Total Tons.	Per Cent.	Total Tons.	Per Cent.

Of the traffic originating at Canadian ports which was shipped to United States ports,<sup>2</sup> no less than 84·63 per cent was traffic with lake Erie, nearly all being eastbound grain shipments from Fort William and Port Arthur to United States ports on that lake. The eastbound shipments to United States ports on lake Huron are also chiefly grain to Port Huron.

<sup>1</sup> Appendix, Table 6, p. 92, Statistics, 1911-15.

<sup>2</sup> Appendix, Table 7, p. 93, Statistics, 1911-15.

The particulars are as follows:—

CANADIAN traffic to United States ports by lake districts—Navigation season 1913.

Direction.	Lake Ontario and River St. Lawrence.		Lake Erie.		Lake Huron and Georgian Bay.		Lake Michigan.		Total Tons.
	Total Tons.	Per Cent.	Total Tons.	Per Cent.	Total Tons.	Per Cent.	Total Tons.	Per Cent.	
From lake Superior east-bound to. ....	.....	....	2,604,875	85·60	353,882	11·63	84,631	2·76	3,041,988
To lake Superior west- bound from.....	5,482	14·74	2,000	5·38	29,695	79·87	.....	.....	37,177
Combined total. ....	5,482	·17	2,606,875	84·63	383,577	12·46	84,331	2·73	3,079,165

*United States Traffic by Lake Districts.*<sup>1</sup>—Practically 90 per cent of all traffic originating at United States ports moves between lake Erie and lake Superior. Some large shipments of iron ore go to lake Michigan, and there are grain shipments to lake Michigan, to lake Huron and Georgian bay and to lake Ontario and the St. Lawrence river. Principally because of its coal shipments, lake Erie supplies 97·63 per cent of all United States traffic carried westward.

The particulars are as follows:—

TOTAL United States traffic by lake districts—Navigation season 1913.

Direction.	Lake Ontario and River St. Lawrence.		Lake Erie.		Lake Huron and Georgian Bay.		Lake Michigan.		Total Tons.
	Total Tons.	Per Cent.	Total Tons.	Per Cent.	Total Tons.	Per Cent.	Total Tons.	Per Cent.	
From lake Superior eastbound to.....	243,103	·46	46,128,434	86·86	437,965	·82	6,292,504	11·85	53,102,006
To lake Superior west- bound from.....	53,748	·27	19,273,238	97·63	86,550	·43	327,545	1·66	19,741,081
Combined total.....	296,851	·41	65,401,672	89·78	524,515	·72	6,620,049	9·08	72,843,087

The chief features of United States traffic shipped to Canadian ports<sup>2</sup> are the large shipments from lake Erie, principally coal, the shipments of grain to lake Huron and Georgian bay and to lake Ontario and the St. Lawrence river. Part of this grain is Canadian grain shipped via Duluth and Superior, but as the shipment is from a port in the United States it is from the transportation standpoint United States traffic.

<sup>1</sup> Appendix, Table 8, p. 94, Statistics, 1911-15.

<sup>2</sup> Appendix, Table 9, p. 95, Statistics, 1911-15.

SESSIONAL PAPER No. 19b

The particulars are as follows:—

<sup>1</sup> Appendix, Table 10, p. 96, Statistics, 1911-15.

## NUMBER, CAPACITY AND NATIONALITY OF VESSELS.

How many vessels were engaged in 1913 in the carrying of the enormous freight tonnage which passed through the Sault Ste. Marie canals? Of what types and sizes were these vessels, and how does the classification of 1913 compare with the classifications of earlier years? How many were Canadian vessels and how many United States vessels, and how did they compare as to capacity and what proportions of the traffic were carried by each? These and many other points must prove of practical interest and perhaps of great importance.

The development in type of vessels employed in the lake Superior trade will indicate the results of experience in economy and efficiency of transportation. The division of the total traffic, or of the traffic on certain routes, between Canadian and United States vessels will throw light on the nature and limits of national competition in the carrying trade under the present coasting laws and the existing conditions of trade. What is the present "load factor" of vessels in this trade, that is, how well filled are they on the average, how does the load in one direction compare with the load in the other, and on one route with another, and how is the load distributed in each direction throughout the season? How does the "load factor" of Canadian vessels compare with that of United States vessels? Such matters must be understood before the relative development possible to the Canadian carrying trade can be estimated and before the probable advantages or limitations of a new water route can be judged.

*Development of Canadian carriers.*—While by comparison with that of the United States the Canadian mercantile fleet on the inland waters is small, it is yet of considerable size and its capacity has been steadily growing.<sup>1</sup> In diagram 3 (fig. 1) is presented the comparative increase in gross tonnage of vessels of Canadian and British register engaged in the carriage of passengers and freight on the Great Lakes and connecting waters, the river St. Lawrence between Kingston and Montreal, the Rideau canal, and the Ottawa river between Ottawa and Montreal; that is, on the inland waters west of Montreal to the head of lake Superior.

In actual number of vessels there has been no great change in recent years, but the type and size have improved. In the fiscal year 1899-1900 there were 242 vessels so engaged; in 1905-06 the number was 270; and in 1913-14 the number was 265.

The size of the vessels thus registered for service on the above inland waters, as measured by the aggregate gross tonnage, was, in 1899-1900, 90,924 gross tons; in 1905-6, 157,625 gross tons; and in 1913-14, 310,176 gross tons. In 1913-14 there were five fewer vessels engaged than in 1905-6, but the aggregate size of the vessels had practically doubled. Larger vessels had been substituted for smaller vessels. The changes that have occurred in the aggregate size of vessels in the different classes, according to gross tonnage, are set forth in fig. 2 of diagram 3.

The great increase in capacity has been in the class of vessels of over 2,000 tons gross register (say, over 1,250 tons net register) and since 1908-9 the capacity of this class of vessels has been greater than that of any other class. A marked increase has also taken place in the aggregate capacity of vessels between 1,000 and 2,000 tons gross register. There has been an actual falling-off in the class of vessels between 500 and 1,000 tons gross register, while the capacity of vessels under 500 tons gross register has remained fairly constant, but in this smallest class the number of vessels has greatly decreased, showing that many of the very smallest vessels have been discarded and somewhat larger vessels substituted.

<sup>1</sup> Appendix, Table 18, p. 103, Statistics, 1899-1914.

DEVELOPMENT OF CANADIAN VESSELS ON INLAND WATERS.

GROSS TONNAGE OF VESSELS REGISTERED IN CANADA & GREAT BRITAIN  
ENGAGED ON THE GREAT LAKES AND CONNECTING WATERS. WEST OF MONTREAL.

1899 - 1900

FIG. I. COMPARISONS OF AGGREGATE TONNAGE.

FISCAL YEAR	NO. OF VESSELS	GROSS TONNAGE
1899-1900	242	90,924
1905-1906	270	157,625
1913-1914	265	310,176

1905 - 1906

1913 - 1914

Of the above Canadian mercantile fleet, consisting in 1913-14 of 265 vessels of 310,176 tons gross register, or 214,580 tons net register, there passed through the Sault Ste. Marie canals in the navigation season of 1913,<sup>1</sup> 144 vessels of 170,558 tons net register; that is, 54.34 per cent of the number and 79.48 per cent of the capacity, showing that the larger vessels in the Canadian fleet were engaged in the Lake Superior trade to a greater extent than in the shorter trades.

In 1913,<sup>1</sup> 708 vessels of United States register, having a capacity of 1,807,412 net registered tons, passed through the Sault Ste. Marie canals. Compared with the Canadian, they were 4.91 times as numerous; their value was 8.31 times as great; and they had 10.59 times the capacity. On the average the United States vessels were thus very much larger than the Canadian, and had a relatively greater carrying capacity in proportion to capital invested. The United States vessels carried 15.17 times as much freight as Canadian vessels, and were thus more heavily loaded or made a greater number of trips. It should be noted, however, that Canadian vessels carried 47,825 passengers, while the United States vessels carried only 29,369 passengers. Relatively there were more passenger boats in the Canadian fleet. The particulars are as follows:—

CANADIAN VESSELS.

Class.	No.	Valuation.	Tonnage.		Passengers.

*Total Traffic by Nationality of Vessels.*<sup>2</sup>—Of the total eastbound freight traffic through the Sault Ste. Marie canals in 1913, 3,389,860 tons, or 5.72 per cent, was carried in Canadian vessels, and 55,815,993 tons, or 94.28 per cent, was carried in United States vessels; while of the total westbound freight traffic, 1,539,739 tons, or 7.50 per cent, was carried in Canadian vessels, and 18,972,752 tons, or 92.50 per cent, was carried in United States vessels. Of the combined eastbound and westbound total, 6.18 per cent was carried by Canadian vessels and 93.82 per cent by United States vessels.

Of the traffic originating at Canadian ports and amounting to 6,103,847 tons eastbound and 771,410 tons westbound, Canadian vessels carried of the former 3,165,610 tons, or 51.86 per cent, and of the latter, 761,535 tons, or 98.71 per cent; or of the

<sup>1</sup> Appendix, Table 11, pp. 97-98, Statistics, 1911-1915.

<sup>2</sup> Appendix, Table 4, pp. 88-90, Statistics, 1911-1915.

## SESSIONAL PAPER No. 19b

total eastbound and westbound combined, amounting to 6,875,257 tons, Canadian vessels carried 3,927,145 tons, or 57.11 per cent.

With regard to traffic destined to Canadian ports, of the total of 3,619,636 tons eastbound, Canadian vessels carried 3,286,109 tons, or 90.71 per cent; while of the total westbound, amounting to 5,954,388 tons, Canadian vessels carried 1,515,437 tons, or 25.40 per cent. Out of the total eastbound and westbound combined, Canadian vessels carried 4,798,546 tons, or 50.12 per cent.

Because of the coasting laws, Canadian vessels of course carried all the Canadian traffic destined to Canadian ports, but of the eastbound traffic originating at Canadian ports which was shipped to United States ports, amounting to 3,041,988 tons, Canadian vessels carried only 103,751 tons, or 3.41 per cent. Of the westbound traffic of Canadian origin destined to United States ports, amounting to 37,177 tons, Canadian vessels carried 27,302 tons, or 73.43 per cent.

Of the traffic originating at United States ports and shipped eastbound to Canadian ports, amounting to 557,777 tons, Canadian vessels carried 224,250 tons, or 40.2 per cent. Of the large westbound traffic of United States origin destined to Canadian ports, amounting to 5,220,155 tons, Canadian vessels carried 778,204 tons, or 14.90 per cent.

*Distribution by Nationality of Vessels According to Lake Districts.*<sup>1</sup>—Traffic between Lake Superior and Lake Ontario and River St. Lawrence ports is largely controlled by Canadian carriers. Out of a total eastbound of 956,272 tons, Canadian vessels carried 749,364 tons, or 78.36 per cent; and out of a westbound total of 447,896 tons, Canadian vessels carried 424,705 tons, or 94.03 per cent; or out of a combined total of 1,404,168 tons, Canadian vessels carried 1,174,069 tons, or 83.61 per cent.

The traffic with Lake Huron and Georgian Bay ports is also largely controlled by Canadian vessels. Of the eastbound total of 2,445,945 tons, Canadian vessels carried 1,820,349 tons, or 74.42 per cent; of the westbound total of 439,945 tons, Canadian vessels carried 345,854 tons, or 78.61 per cent; or of a combined total of 2,885,890 tons, Canadian vessels carried 2,166,203 tons, or 75.07 per cent.

Of the enormous traffic with lake Erie ports, Canadian vessels carried a very small portion; of the total eastbound business, 1.62 per cent, and of the total westbound business, 3.81 per cent, and of the combined total only 2.24 per cent. Nevertheless, Canadian vessels carried more tons of freight to and from lake Erie ports than to and from ports on lake Ontario and the St. Lawrence river.

With lake Michigan ports the traffic of Canadian vessels was relatively insignificant.

---

<sup>1</sup> Appendix, Table 4, pp. 88-90, Statistics, 1911-1915.

The particulars of distribution by nationality of vessels by lake districts are as follows:—<sup>1</sup>

<sup>1</sup> Appendix, Table 4, pp. 88-90, Statistics, 1911-1915.

### LOAD FACTOR.

Cost of transportation per unit of cargo, and therefore the economic basis of freight rates, must depend largely on the load factor obtaining for the carriers. If a vessel has a full load each way on every trip it will operate at the maximum of efficiency and at the lowest cost per unit of cargo. The load factor may fall short of this ideal in two general ways; there may be enough freight in one direction to furnish full loads, but not enough in the opposite direction to furnish more than partial loads, or the freight may be offered so irregularly in either direction or in both directions that the loads vary throughout the season. To meet the requirements of any particular "trade" there must be vessels enough to carry the maximum amount of freight offering for shipment at any particular time. If, then, the freight does not continue to be regularly offered throughout the season, but if, for example, the amount in one period of the year is very much less than the amount in some other period, then the shipping either will be uneconomically employed in the slack months, or vessels must be diverted to other trades; and in either case average costs per unit of cargo will tend to be increased. In the same way, if outward and return freights are unequal, the number of vessels must be proportionate to the greater of these quantities, and the voyage in the opposite direction will not be fully efficient, which likewise will increase average costs per unit of cargo. Transportation costs per unit of cargo are therefore, other things being equal, lowest in that trade offering the most favourable load factor. Among the other general conditions determining costs are distance, or the comparative length of the voyage, and time, which is not necessarily in exact proportion to the number of miles to be travelled. We have thus three general factors affecting the economic basis of freight rates and therefore the relative advantages of competitive routes:—

(1) Distance, or the length of one route as compared with another. Certain costs are almost directly proportionate to distance travelled. In long-voyage trades the vessel can make fewer round trips in a season than in short-voyage trades, and must distribute its season's costs over a smaller number of cargoes. Put in another way, it takes a larger number of vessels to move the same amount of freight in a season over long routes than over short routes, and therefore the freight on the long route must meet the costs of the larger number of vessels.

(2) Time, or the period necessary for a round trip. If navigation on one route is rendered slower than on another because of obstructions, such as canals, or narrow or shallow waterways, requiring slower speeds, the costs on that route as compared with the more open route will be relatively higher. On the other hand, the length of time a vessel must spend in port in a season in loading and unloading must be taken into account. In short-voyage trades a vessel is in port more frequently than in long-voyage trades, and a greater proportion of its time is spent in loading and unloading. This will tend to modify the factor of distance in favour of the long-voyage trade. On one route half as long as another route a vessel will not be able to make quite twice as many voyages in a season because it will have to spend almost twice as much time in loading and unloading.

(3) Load factor, as discussed above.

*General load factor in the Lake Superior Trade.*<sup>1</sup>—Eastbound. in 1913, there passed through the Sault Ste. Marie canals, 29,067,251 net registered tons of shipping, carrying 59,205,853 short tons of freight. There were thus 2.03 short tons of cargo for every net registered ton of vessel capacity. A net registered ton equals 100 cubic feet of space, and the average long ton of freight is assumed to occupy 40 cubic feet. According to these accepted standards of measurement it may be assumed that a vessel can carry approximately  $2\frac{1}{2}$  long tons of average freight per registered ton.<sup>2</sup> There are many passenger and package freight vessels in the Lake Superior trade in which the freight capacity would fall much below the theoretical standard, and on many occasions vessels of all classes must have sailed with comparatively light loads. In view of these conditions, and even allowing for the difference between the short ton and the long ton, an average record for a total season of 2.03 short tons of cargo for every net registered ton that passed through the canals is remarkable. Such results could occur probably only in a trade in which a large proportion of the freight consisted of heavy bulk commodities such as iron ore, of which, upon occasion, more than  $2\frac{1}{2}$  long tons could be loaded into each registered ton of space. In view of the above figures it may fairly be said, therefore, that the freight boats in the Lake Superior trade went east with full loads, and to this extent approached the ideal of economic loading in that direction.

On the return trips westbound, however, only 20,512,491 short tons of freight were carried, or only a little over one-third of the freight carried on eastbound trips. The exact ratio was 2.88 eastbound to 1 westbound. In 1912 the ratio was 3.23 to 1, and in 1911, 2.13 to 1. This disparity between eastbound and westbound traffic is a departure from ideal conditions; but there are few trades in the world in which freight is even approximately equal in both directions, and a ratio of 2 or 3 to 1 cannot be regarded as exceptionally unfavourable.

The second important condition of satisfactory traffic is the regularity with which freight is offered throughout the season. A vessel might sail full on every trip it made, but might not be able to make regular trips because freight was not available at all times; or a greater quantity of freight might be offered in one month, necessitating the employment of a large number of vessels, while in some other month, or months, comparatively little freight might be offered, causing the laying-up of certain vessels or their diversion to other trades. The vessels remaining in the trade might continue to carry good loads, but the general load factor of that trade would become unfavourable.

*Monthly Distribution of Eastbound and Westbound Traffic.*<sup>1</sup>—In diagram 4 the quantities of freight carried in each month of the navigation season are shown for the years 1913, 1912, and 1911. The solid black columns represent the quantities of eastbound freight, and the hatched columns the quantities of westbound freight. The full months of open navigation on the Great Lakes are May to November, inclusive. Ordinarily navigation is open for a week or two at the end of April, and, at increased insurance, the season is extended at least until the 10th of December. April and December are thus short months. Comparing the heights of the solid black columns it is seen that the eastbound freight is offered with great regularity, November showing the smallest quantity, due to the falling-off in iron ore shipments after the first heavy frosts. Still more remarkable under the conditions, however, is the evenness of the westbound shipments. With only about one-third of a load for the mercantile fleet in that direction, the westbound freight is distributed throughout every month of the navigation season. The fleet could carry all the westbound freight in less than three

<sup>1</sup> Appendix, Table 16, p. 101, Statistics, 1911-1915.

<sup>2</sup> Buoyancy differs with types of construction and this theoretical standard could not often be reached under actual loading conditions.

MONTHLY DISTRIBUTION OF  
TOTAL EAST AND WEST BOUND TRAFFIC THROUGH  
CANADIAN AND AMERICAN CANALS AT  
SAULT STE. MARIE

months, but, instead, it receives about one-third of a load for each trip. The monthly distribution of traffic in this trade therefore approximates the ideal, assuming that the ratio of eastbound to westbound must be 2 or 3 to 1.

The detailed figures showing the tons of freight carried each month in relation to the total net registered tonnage passing through the canals are as follows:—

FREIGHT tons per registered ton by months—season of 1913.

EASTBOUND.

Month.	Net Registered Tonnage.	Freight Carried.	Freight Tons per Ton Registered.
April .....	568,591	1,098,123	1.93
May.....	4,116,487	8,332,178	2.02
June.....	4,301,178	8,855,821	2.05
July.....	4,379,149	9,107,569	2.07
August.....	4,036,966	8,263,273	2.04
September.....	4,073,226	8,348,801	2.04
October.....	4,233,721	8,675,590	2.04
November.....	2,868,919	5,574,135	1.94
December.....	489,014	950,363	1.94

WESTBOUND.

April .....	948,742	807,432	.85
May .....	4,069,577	3,044,017	.74
June.....	4,339,264	3,257,792	.75
July.....	4,317,853	3,170,555	.73
August .....	3,996,387	3,226,169	.80
September. .	4,051,030	2,561,564	.63
October .....	4,300,612	2,243,684	.52
November.....	2,641,354	1,871,042	.70
December.....	257,645	330,236	1.28

The highly favourable general load factor in the lake Superior trade, due to the satisfactory loading and to evenness of distribution throughout the season, must determine the economic basis of freight rates in this trade, and must to a large extent dominate the whole problem of transportation on the Upper Lakes. If the routing of any large proportion of the traffic in either direction were changed in such a way as to alter the average load factor, then the economic basis of freight rates could not remain what it was in 1913. The route with the more favourable load factor could at a certain point successfully compete against the route with the less favourable load factor, even against some decreased cost of navigation on the latter route. Again, if the load factor presented by traffic of Canadian origin happened to be less favourable than the load factor presented by traffic of United States origin, then Canadian traffic would tend to be subject to somewhat higher costs if handled exclusively by itself. If Canadian vessels attempt to operate on a less favourable load factor than United States vessels then they must be content to earn less profits, or at times perhaps even no profits at all.

*Load Factor of Canadian Traffic.*—Taking by itself the traffic originating at Canadian ports in 1913, we have 6,103,847 tons eastbound and 771,410 tons westbound, or a ratio of 7.91 to 1. This may be compared with the general ratio for all traffic of both Canadian and United States origin combined of 2.88 to 1. If the Canadian traffic had been handled separately, the vessels which carried the eastbound load would on the return trips have had only 12.64 per cent of their cargo space filled, instead of the

## SESSIONAL PAPER No: 19b

actual 34.75 per cent which, on the average, fell to all vessels engaged in the combined lake Superior trade that season.

With traffic of United States origin, the ratio of eastbound to westbound in 1913 was 2.69 to 1. If this traffic had been handled entirely by itself, the vessels which carried the eastbound loads would on the return trip have had 37.17 per cent of their space filled. Traffic of United States origin therefore presented from the transportation standpoint a much more favourable ratio than traffic of Canadian origin.

In 1911 the ratio with respect to traffic of Canadian origin was 4.09 eastbound to 1 westbound; in 1912, 4.70 to 1; and in 1913, as we have seen, 7.91 to 1. During these three years the ratio grew less favourable, due to the fact that the eastbound shipments of Canadian grain increased to a much greater extent than the westbound shipments of Canadian goods. With respect to United States traffic, the ratio in 1911 was 2.05 to 1; in 1912, 3.15 to 1; and in 1913, 2.69 to 1. In each of these years, therefore, the ratio for United States traffic was more favourable than that for Canadian traffic.

The second condition for a satisfactory load factor is evenness of distribution throughout the season. It is not practicable with the material now available to present separate diagrams of the monthly distribution of Canadian traffic and of United States traffic along the same lines as diagram 4, which represents the monthly distribution of the total combined traffic, but it is possible to give in tons the monthly shipments of grain from Fort William and Port Arthur, which in 1913 were as follows:—

	Tons.
April.. . . . .	305,260
May.. . . . .	703,704
June.. . . . .	316,718
July.. . . . .	415,110
August.. . . . .	191,160
September.. . . . .	209,927
October.. . . . .	1,353,071
November.. . . . .	1,172,559
December.. . . . .	845,942
Total.. . . . .	5,513,451

As grain forms the greatest part of the Canadian eastbound traffic, the above distribution may be accepted as approximately representing the distribution of eastbound Canadian traffic as a whole. Diagram 5 presents, in the solid black line, this monthly distribution worked out according to percentages, that is, the quantity shipped in each month is reduced to a percentage of the total amount of Canadian grain shipped in a season; and comparison is made with the distribution in percentages, similarly worked out, of the total combined eastbound traffic, as shown in the dotted line. Taking the months of May to October, for example, it will be seen that only about 3.47 per cent of the total season's Canadian grain load was carried in August, while 24.54 per cent was carried in October, and that wide variations existed also in the other months. But with the total combined traffic the monthly percentages remained within remarkably narrow limits, varying only between 13.96 per cent and 15.38 per cent. If we deduct Canadian grain from the total eastbound traffic the range of the balance would be only between 13.64 per cent and 16.19 per cent in the same months.

It is evident, therefore, that the load factor presented by Canadian traffic is much less favourable than that presented by United States traffic.

In this examination of traffic movement in the lake Superior trade, only general totals are taken into consideration. Any general conclusions indicated by the statistics here presented must be re-examined in the light of further analysis of details. In the matter of load factor, for example, the nature of the freight shipped must be taken into account. Bulk commodities and package freight present somewhat different

problems. United States traffic offers large quantities of bulk freight in both directions, while the bulk freight of Canadian origin is practically all in one direction, and consists of eastbound grain. This fact probably increases the unfavourable position of the load factor in Canadian traffic.

*Load Factor of Canadian Vessels.*<sup>1</sup>—Under the conditions prevailing in the lake Superior trade, actual and potential competition must exist between the mercantile fleets of Canada and the United States. Operating side by side in the same waters, there would be a tendency towards the same standards of service and of profits even if, by legislation, the spheres in which the respective fleets could operate were kept entirely separate. As it is, however, the coasting laws of the two countries leave

DIAGRAM No. 5.

### GRAIN SHIPMENTS FROM FT. WILLIAM AND PORT ARTHUR COMPARED BY MONTHLY PERCENTAGES WITH EASTBOUND MOVEMENT OF TOTAL LAKE SUPERIOR TRAFFIC

open to competition all that portion of the traffic of the two countries which passes, or can be made to pass, from a port in one country directly to a port in the other country, either because the goods so shipped are destined to the latter country for consumption or can pass in transit through that country on favourable terms. There was thus open to competition in 1913, theoretically at least, all the traffic that was not carried directly from one Canadian port to another Canadian port and from one United States port to another United States port. Subtracting this coasting traffic from the totals, there remained 3,599,765 tons eastbound and 5,257,332 tons westbound open to competition. Canadian vessels were free, so far as legislative restrictions are concerned, to carry all of this traffic, and so were United States vessels. As a matter of fact this traffic was divided, the Canadian fleet securing 328,001 tons,

<sup>1</sup> Appendix, Table 4-12 to 15, pp. 88-98 to 100, Statistics, 1911-15.

## SESSIONAL PAPER No. 19b

or 9.11 per cent of the eastbound, and 805,506 tons, or 15.32 per cent of the westbound, or 12.79 per cent of the combined total. In proportion to the relative carrying capacities of the two fleets, the Canadian fleet secured somewhat the larger share. By adding competitive traffic in the above amounts to the traffic that exclusively belonged to it as being billed from one Canadian port to another Canadian port, the Canadian fleet changed an unfavourable load factor into one that was much more favourable.

More important, perhaps, than the mere statistical examination of the facts of the competitive division of traffic in the Great Lakes is the question of the extent to which competition does or may determine the diversion of traffic. Canadian grain from Fort William and Port Arthur for Europe can, for example, follow Canadian routes to a Canadian ocean port, it can go to certain United States lake ports and pass back from them to Canadian routes and ocean ports, or it can move through Canadian lake ports to United States ocean ports, or can directly take United States routes to United States ocean ports. The same is true of United States export grain from Duluth and Superior. Goods destined for lake Superior from the Eastern States have under certain conditions the choice between a Canadian lake port and a United States lake port. These are but examples of the alternatives that enlarge the possibilities of competition. How far do competitive conditions in lake shipping determine the routing of such traffic?

Goods are routed by the shipper, and either at his own discretion or on instructions of the consignee. In the routing, for example, of so much Canadian export grain to United States lake and ocean ports, is the decision of the shipper determined by such conditions as lower freight rates by United States vessels or to United States lake ports, or by a shortage of suitable Canadian vessels, necessitating the engaging of United States vessels which must sail to a United States lake port; or are the causes found, not in the lake shipping conditions at all, but in facilities beyond the lakes, such as the supply of ocean tonnage at the different ports of export?

In the general facts now under consideration, certain points may be noted having a bearing on these questions. The Canadian fleet, as it existed in 1913, carried all the Canadian grain and other goods actually routed from one Canadian port to another Canadian port, and in addition was able to carry eastbound 103,751 tons from Canadian to United States ports and 224,250 tons from United States ports to Canadian ports, and westbound picked up more than half its total load at United States ports. Again, the Canadian fleet eastbound carried on the average only 19.87 freight tons per registered ton of capacity, while the United States fleet carried 30.88 freight tons per registered ton. Even making allowance for the proportion of passenger and package freight boats, it would appear that the Canadian fleet could have carried a larger amount of freight than it did carry, at least if the freight had been regularly offered. That on the average for the season the Canadian fleet could have carried more Canadian traffic to Canadian ports, if it had been so billed, does not, of course, mean that at times of exceptionally heavy offerings of freight the Canadian fleet may not have been found inadequate.

That the Canadian fleet shares in the competitive traffic shows that it is able to meet competitive freight rates, and indeed it is obvious from all the facts that freight rates in the lake Superior trade must tend to be the same for like services with all vessels. If Canadian vessels could not, on the whole, give as favourable rates as United States vessels, they could not, with the various alternative routings possible, hold even the proportion of the traffic they carried in 1913. Two questions arise here: How are Canadian vessels able to meet the rates of United States vessels, and why is the Canadian fleet the size it is, that is, why is it not bigger or smaller? The load factor the Canadian fleet can establish must largely determine these matters.

If the Canadian fleet had carried all the traffic originating at Canadian ports, the ratio of its eastbound to its westbound load would have been 7.91 to 1. If it had been

confined to the Canadian traffic routed to Canadian ports, the ratio would have been 4.17 to 1. Both these ratios would have been unfavourable as compared with the general ratio in the lake Superior trade of 2.88 to 1. The Canadian fleet actually secured a ratio of 2.20 to 1. This result was due to its carrying eastbound only 3,165,610 tons, or 51.86 per cent, of the traffic originating at Canadian ports, and in addition, 224,250 tons originating at United States ports, and carrying westbound practically all the traffic originating at Canadian ports in the east, or 761,535 tons, which was 98.71 per cent of the total westbound Canadian traffic, and then adding 778,204 tons loaded at United States ports. The Canadian fleet carried eastbound a little more than one-half the Canadian eastbound traffic, and carried westbound a little more than double the amount of the Canadian westbound traffic.

The amount of Canadian traffic carried by United States vessels, although a large percentage of all Canadian traffic, was relatively less important to the United States fleet than was the United States traffic to the Canadian fleet. Eastbound the United States fleet carried 2,938,237 tons, or 48.14 per cent of all the traffic originating at Canadian ports, but this amounted to only 5.26 per cent of the total eastbound load of the United States fleet. Westbound the United States fleet carried only 9,875 tons of Canadian traffic, or 0.05 per cent of its total westbound load. Its participation in Canadian traffic did not improve the general load factor of the United States fleet, for the ratio between the eastbound and westbound Canadian traffic carried by it was 297.54 to 1, but the Canadian traffic was relatively so small that it could be carried on occasional trips when other equally satisfactory cargoes did not happen to be offering.

In comparing the ratio for the Canadian fleet of 2.20 to 1 with the ratio of the United States fleet of 2.94 to 1, loading must be taken into account. Eastbound, as we have seen, the Canadian fleet carried relatively lighter loads, and even westbound it carried 9.03 freight tons per registered ton to 10.49 freight tons carried by the United States fleet. On the other hand, it carried a bigger proportion than the United States fleet of package freight, which is perhaps more profitable, and more passengers. If the Canadian fleet had on the average a longer route than the United States fleet, because more of its vessels made the long water trip to Montreal, this would modify the appearance of the figures of loading, since the vessels on longer routes cannot make so many trips in the season, and therefore cannot carry so many tons of freight. But it is doubtful if the route of the Canadian fleet is quite as long as that of the United States fleet, for the Canadian fleet carried 53.69 per cent of its load on the short route to lake Huron and Georgian bay, and only 22.10 per cent to lake Ontario and the St. Lawrence River ports, while the United States fleet carried 87.11 per cent of its load to lake Erie.

In their trade with lake Huron and Georgian bay ports, the Canadian vessels carried 1,820,349 tons eastbound and 345,854 tons westbound, an unfavourable ratio of 5.26 to 1. In their trade with lake Erie ports, however, the Canadian vessels carried 804,353 tons eastbound and 735,200 tons westbound, which gives the remarkably favourable ratio 1.09 to 1. In the trade with lake Ontario and River St. Lawrence ports, Canadian vessels carried 749,364 tons eastbound and 424,705 tons westbound, a ratio of 1.76 to 1. In the small trade with lake Michigan the Canadian vessels carried eastbound 15,794 tons, and westbound 33,980 tons, or a reversed ratio of 1 to 2.15. Lake Erie therefore offered the best load factor for Canadian vessels, at least for the bulk freighters. The second best load factor was found in the trade with lake Ontario and St. Lawrence ports, the westbound freight including 36,195 tons picked up at United States ports, and probably chiefly hard coal. The lake Ontario boats westbound could, of course, pick up soft coal at United States ports on lake Erie, but the carriage of soft coal is largely left to the bulk freighters, which cannot at present engage in the lake Ontario and St. Lawrence river trade. Grain freight rates on the shorter Georgian bay route are generally the same as to lake Erie ports, but the longer route presents a more favourable load factor.

SESSIONAL PAPER No. 19b

On account of its containing a larger proportion of small and medium-sized vessels the Canadian fleet might appear to be at a competitive disadvantage so far as economy of handling is concerned. Vessels up to about 2,000 tons net register are, however, able to compete in the open lake trade, because they are better adapted to the package freight business, and they besides have the trade through the Welland and St. Lawrence canals entirely to themselves.

*Vessels Carrying Canadian Grain.*—Two special statements were prepared from the official records at Fort William and Port Arthur covering the seasons of 1911-12-13, the one containing the name, nationality, and registered tonnage of each vessel carrying grain from those ports with the details of its cargo, the date of clearance and the port to which it sailed, and the other containing the name, nationality, capacity, and amount of cargo of each vessel delivering coal to those ports, with the date on which each cargo was entered for unloading. Compilations of details in these two statements are interesting in connection with a study of the real nature of the traffic in the lake Superior trade and of the competition between Canadian and United States vessels.<sup>1</sup>

The following table shows the tons of grain carried from Fort William and Port Arthur in the season of 1913 by Canadian vessels and by United States vessels, in each case classified according to net registered tonnage:—

VESSELS Carrying Grain from Fort William-Port Arthur—Season of Navigation, 1913 (Classified).

Total.....	187	2,565,880	.....

It will be noted that there were practically twice as many United States vessels engaged as Canadian vessels, and that the United States vessels were on the average very much larger in capacity, yet the United States vessels did not carry as much grain as the Canadian vessels, the explanation being found in the fact that a majority of the United States vessels made only one trip with Canadian grain in the season,

<sup>1</sup> Specially compiled from statistics at the port of Fort William-Port Arthur, courtesy Board of Grain Commissioners.  
19b—3

6 GEORGE V, A. 1916

while many of the Canadian vessels were steadily employed in carrying grain throughout the season, one Canadian vessel having taken as many as twenty-eight loads.

The number of loads per month taken by Canadian and United States vessels is as follows:—

LOADS of Grain per Month from Fort William and Port Arthur.

Month.	Canadian Vessels.	United States Vessels.
April.....	43	7
May.....	122	32
June.....	96	19
July.....	107	11
August.....	74	7
September.....	83	22
October.....	149	89
November.....	145	110
December.....	30	55
Totals.....	849	352

These figures illustrate the irregularity of grain shipments. Canadian vessels, on the average, carried 8.57 loads for each vessel engaged, while the United States vessels carried but 1.88 loads per vessel. The Canadian grain fleet was apparently engaged to something approaching full capacity only in the months of May, October, and November. In October, and particularly in November, shipments direct all-water to Montreal tend to fall off and the boats double up on the shorter routes and can thus make more trips.

The large proportion of Canadian vessels under 2,000 tons net register, 67 out of 99, or more than two-thirds, is notable. These vessels carried 62.55 per cent of the grain carried by Canadian vessels, or 32.12 per cent of the total grain carried by all vessels. Vessels of this size can use the Welland and St. Lawrence canals, but these vessels actually carried from Fort William and Port Arthur more than four times the grain that travelled direct to Montreal by water, and they therefore successfully engaged in the open lake competitive traffic, and, as pointed out, are probably able to do this because of the return package freight business.

By comparing the list of vessels carrying grain from Fort William and Port Arthur with the list of vessels carrying coal to those ports, it is possible to determine the direct relationship between the coal and grain traffic in so far as those ports are concerned. It might be supposed that if Fort William and Port Arthur received 4,217,248 tons of coal and shipped out 5,273,595 tons of grain, the vessels that unloaded coal would simply move from the coal dock to the grain elevator and fill up with grain for the return trip. The load factor offered by these two bulk commodities in that year at those ports was extraordinarily favourable. As a matter of fact, however, there was only a slight relationship between these two traffics in so far as United States vessels were concerned. United States vessels carried 3,609,496 tons of coal to Port Arthur and Fort William, and United States vessels carried 2,565,880 tons of grain from those ports, but only occasionally did the vessel that brought coal load grain, or the vessel that went east with grain return with coal. Only 397,413 tons of the total coal load of United States vessels to those ports, or 11.10 per cent, can thus be traced into a direct relationship with the grain-carrying traffic of United States vessels from Port Arthur and Fort William. Most of the United States vessels, after unloading coal, sailed light to load iron ore or some other freight at other ports. Other vessels, mostly light, came in to load grain. In November and December, after

## SESSIONAL PAPER No. 19b

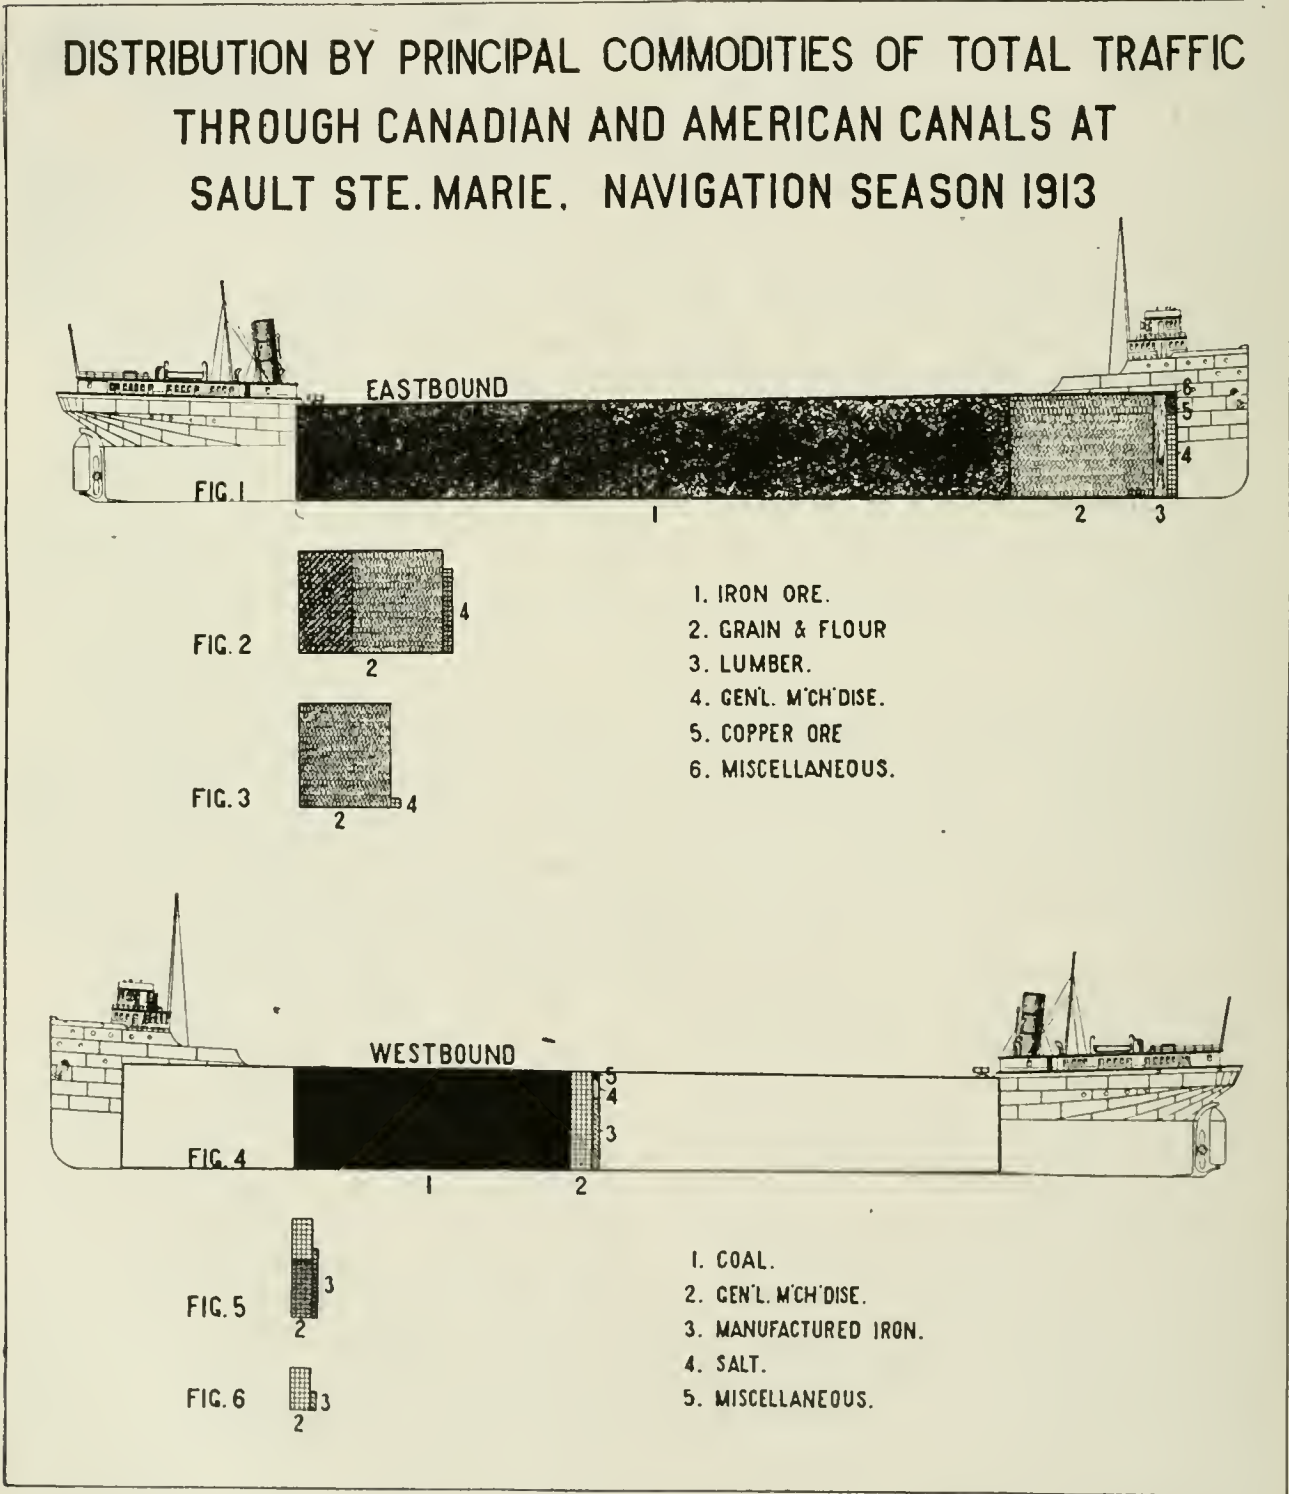

the ore trade falls off, there is a much more direct relationship between the two traffics. Of the 637,640 tons of coal carried to Fort William and Port Arthur by Canadian vessels, no less than 389,873 tons, or 64.11 per cent, was carried by vessels that immediately loaded grain, or had returned with coal after carrying down a cargo of grain. This means that the portion of the Canadian grain fleet, consisting of bulk freighters, or at least such bulk freighters as were on the route to lake Erie ports, pretty regularly loaded coal back. The facts, particularly with regard to the United States vessels, tend to show that the movements of lake vessels are determined by general conditions rather than by the traffic conditions peculiar to individual ports. Iron ore and coal probably dominate the whole position, the remaining traffic being more or less incidental, except with the smaller vessels. The participation of United States bulk freighters in Canadian traffic, and their actual or potential competition in this traffic, must largely be determined by conditions in the iron ore and coal traffic.

As nearly all the iron ore traffic falls to United States vessels under the coasting laws, Canadian bulk freighters must so adjust their loads of grain and coal as to be able to meet the competition of United States vessels on the basis of the standards set in the iron ore and coal trades. In November about one-third of the United States fleet is laid up or diverted to other trades, and so during that month and in December plenty of United States tonnage has been available for the Canadian grain traffic when rates have been made sufficiently attractive.

TOTAL TRAFFIC BY PRINCIPAL COMMODITIES.

In diagram 6, figures 1 and 4, there is presented graphically an analysis of the total eastbound and the total westbound traffic through the Sault Ste. Marie canals,

DIAGRAM NO. 6.

according to the commodities carried. The figures for the season of navigation of 1913 are as follows:—<sup>1</sup>

<sup>1</sup> Appendix, Table 17, p. 102, Statistics, 1911-14.

Eastbound—

Export bound—	Tons.	Per cent.
Iron ore.. . . . .	48,076,977	81·20
Grains, including flour.. . . . .	9,632,792	16·26
Lumber.. . . . .	978,697	1·65
General merchandise.. . . . .	403,068	·69
Copper.. . . . .	85,378	·14
Building stone, sand, pig-iron, etc.. . . . .	28,941	·04

Total, . . . . .	59,205,853
------------------	------------

Westbound—

General merchandise.....	1,367,792	6'66
Manufactured iron.....	380,152	1'85
Salt.....	108,997	'53
Miscellaneous.....	32,612	'15

Total.. . . . .	20,512,491
-----------------	------------

If nearly all the iron ore shipped in 1913 (fig. 1, No. 1) was destined to industrial plants within the distributing areas controlled by Chicago, Gary, and the lake Erie ports, then that portion of the traffic could not have been diverted to a Georgian Bay canal. Most of the lumber (fig. 1, No. 3) was United States coasting traffic, and in any case would not likely have moved down the Ottawa valley in competition with the lumber of that district. The copper ore (fig. 1, No. 5), like the iron ore, was destined to industrial plants out of the competitive range of the proposed canal; and the miscellaneous traffic (fig. 1, No. 6) was largely building stone and sand, and, therefore, strictly local in character. If, after careful investigation, it should be decided that the traffic that existed in 1913 in the above classes of goods could not have been diverted, then there would be left for further consideration the classes consisting of grain and flour and general merchandise (fig. 1, Nos. 2 and 4). The quantities represented by these two classes would compare with the **total** traffic as fig. 2 with fig. 1. The shaded portions of fig. 2 (grain and flour, 3,543,134 tons; general merchandise, 359,283 tons) represent the United States coasting traffic ~~in~~ these two classes, with this exception that grain grown in Canada but shipped from Duluth-Superior is in this case not included as United States traffic. The spring wheat grown

in the United States and shipped from Duluth-Superior is, unless with crops of more than average size, nearly all milled in the United States, little being exported to Europe in the form of wheat. The surplus of winter wheat shipped from Chicago is thus rather more open to the competition of Canadian routes than is the wheat shipped from Duluth-Superior. If, now, it be desired to compare the balance of the traffic not subject to these doubts or limitations with the total traffic, fig. 3 (grain and flour 6,039,658 tons; general merchandise, 44,785 tons), in which the shaded portions of fig. 2 are left out, may be compared with fig. 1.

Treating westbound traffic in the same way, it is clear that the coal shipped in 1913 (fig. 4, No. 1), being Pennsylvania coal, would not have used a Georgian Bay canal. The salt (fig. 4, No. 4), in so far at least as it was Canadian traffic, was probably shipped from the Windsor district; and the miscellaneous (fig. 4, No. 5) was in any case unimportant. The balance of the traffic consisted of general merchandise and manufactured iron as in fig. 5, of which the shaded portions (general merchandise, 834,932 tons; manufactured iron, 263,343 tons) were United States coasting traffic. With the shaded portions left out, the comparative quantities (general merchandise, 532,860 tons; manufactured iron, 116,809 tons) would appear as in fig. 6.

This treatment is, of course, merely suggestive, and the relative quantities in the shaded and unshaded portions of figs. 2 and 5 are, with the details now available, only very rough approximations. By the careful application of some such method it should, however, be possible to arrive at reasonably accurate quantities of each class of commodities that should appear in figs. 3 and 6; that is, it should be possible, in respect to the traffic of any particular year, to segregate the quantities and classes of freight for which a Georgian Bay canal, if in existence, might have been able to compete. After excluding traffic necessarily controlled by United States routes, there should, in the second place, be excluded such traffic as would necessarily be controlled by the present Canadian lake-and-rail routes, and the water route by lake Erie and lake Ontario, because such traffic originated at or was destined to points which could not be conveniently reached by the Georgian Bay Canal route. What would be left after this second exclusion would be the traffic that could be competed for by the Georgian Bay Canal route as against the existing Canadian routes, and in the case of export or import traffic, as against the competition also of certain United States routes and of the route through the west coast around by the Panama canal, and of that by way of Hudson bay. A consensus of opinion might even be reached as to the proportion of this competitive balance which might fall to the Georgian Bay canal, and as to the extent to which such canal might affect the freight rates and facilities on the other routes.

## TRAFFIC TO AND FROM LAKE MICHIGAN.

Lake Michigan carries a large traffic that does not in its course pass through the Sault Ste. Marie canals, and has not therefore entered into the statistics just examined. A few general facts may here be presented to indicate broadly the character of this traffic and the routes by which it moves. The traffic of the port of Chicago forms the greater part of the traffic of lake Michigan, and may be taken as representative.<sup>1</sup>

In the season of 1913 the total traffic of the port of Chicago, in and out, amounted to 12,605,201 freight tons. For comparison with lake Superior ports it may be stated that in that year the port of Duluth-Superior had a freight tonnage of 46,875,416 tons, and Fort William-Port Arthur a little over 12,000,000 tons. The principal commodities received at and shipped from Chicago were:—

Received—	Short Tons.
Iron ore.. . . . .	5,582,881
Coal.. . . . .	2,018,610
Merchandise, unclassified.. . . . .	1,526,000
Shipped—	
Grain, flour and mill stuffs... . . . .	1,906,407
Total.. . . . .	11,034,898

The balance of 1,570,303 tons consisted of receipts of grain, lumber, salt, sugar, manufactured iron, etc., and shipments of merchandise, manufactured iron, and other classified articles. The ratio of total freight tons received to total freight tons shipped was about 4 to 1. The iron ore was from lake Superior and from Escanaba or other lake Michigan ports. In the trade between lake Michigan and eastern lake districts the bulk commodities were grain eastbound and coal westbound, with some general cargo in both directions. In this trade more tons moved westbound to Chicago than eastbound from Chicago, but if an accurate analysis could be made the difference in the total might be found comparatively small. Traffic, however, was less evenly distributed throughout the season than in the lake Superior trade, the arrivals and departures of vessels curving upward to a peak in July and August, and then following the same curve downward.

Chicago has traffic with Canadian ports in grain eastbound and package freight in both directions. In 1913, Chicago shipped grain and flour to Canadian ports as follows:—<sup>2</sup>

## LAKE Shipments to Canadian Ports, 1913.

From Chicago to	Flour.	Wheat.	Corn.	Oats.
	Bbls.	Bush.	Bush.	Bush.
Depot Harbour .....	78,000	32,000	1,537,000	2,315,000
Midland .....		58,000	1,520,000	332,000
Tiffin.....		266,000	2,351,000	189,000
Collingwood.....			3,432,000	
Port Colbourne.....		656,000		
Kingston.....			184,000	
Prescott .....			695,000	
Montreal .....		1,009,000	45,000	
Other Canadian ports.....			55,000	
Total.....	78,000	2,621,000	9,819,000	2,836,000

<sup>1</sup> Annual Report of Chicago Board of Trade.

<sup>2</sup> Appendix, Table 21, p. 106, Statistics, 1911-14.

The greater part of these shipments merely passed through Canada in transit to the Eastern States; a part was exported from Canadian ocean ports; and a small balance, particularly of corn, was retained in Canada for consumption. It is an interesting fact that Canadian lake-and-rail lines compete directly with United States lake-and-rail lines for traffic between the Eastern States and the North Central and Western States. Canadian ports on Georgian bay thus under certain conditions compete with Buffalo, even although some of the traffic may be carried by rail across the border at Niagara Falls. Other portions of this in transit traffic cross the border at such points at Prescott and points on the railway lines south of Montreal. Of the above totals of grain the following amounts are reported as in transit shipments which passed back again into the United States:—<sup>1</sup>

In Transit Shipments, 1913—

Flour . . . . .	brl.	15,367
Wheat . . . . .	bush.	89,500
Corn . . . . .	"	8,573,538
Oats . . . . .	"	3,076,636

Of the shipments from Chicago to Canadian lake ports which were destined for export through Canadian ocean ports the principal item was wheat, 2,375,724 bushels, an amount corresponding with the shipments to Port Colborne and to Montreal. In certain years the shipments of grain from Chicago for export through Canadian ocean ports are very much larger than they were in 1913. Reduced to tons the total grain and flour shipped from Chicago to Canadian ports amounted in 1913 to 409,218 tons.

Package freight moves in both directions through Canadian lake ports in transit between Chicago and the eastern states and between Chicago and Europe, but the total is not large in tons.

From the statistics of the arrivals and departures of vessels engaged in foreign trade, it is evident that Chicago ships much more to Canadian ports than it receives from Canadian ports; and further that these shipments are heavier in certain months than in others.

VESSELS in Foreign Trade—Chicago District.\*

Month.	Arrivals.		Clearances.	
	No.	Tonnage.	No.	Tonnage.
April . . . . .	2	4,397	13	23,619
May . . . . .	13	22,072	13	22,314
June . . . . .	20	31,064	23	38,842
July . . . . .	22	27,693	34	49,137
August . . . . .	23	36,388	44	66,655
September . . . . .	15	25,542	44	85,635
October . . . . .	21	31,889	38	77,089
November . . . . .	24	36,157	44	161,496
December . . . . .	8	20,508	4	18,737
Total . . . . .	148	235,710	257	543,524

\* Chicago District comprises Chicago, Michigan City, Waukegan, Gary and Indiana Harbour.

The clearances for Canadian ports were about 1¾ times the arrivals from Canadian ports, and the aggregate registered tonnage clearing was almost 2½ times

<sup>1</sup> Appendix, Table 22, p. 107, Statistics, 1909-14.

GRAIN SHIPMENTS FROM CHICAGO BY RAIL AND BY LAKE.

FIG.1 YEARLY TOTALS OF ALL GRAINS 1900 TO 1913 .

FIG. 2 WEEKLY SHIPMENTS OF WHEAT ALONE 1912 AND 1913.

the tonnage arriving. The vessels arriving averaged about 1,500 tons net register, and if we assume that these same vessels cleared again for Canada, then the additional vessels loaded for Canadian ports averaged about 3,000 tons net register. Bulk freighters were added to carry the grain, while the regular package freight business was done by the smaller boats. The bulk-freighters did not load back from Canadian ports to Chicago.

While the Canadian lake-and-rail lines are competitors with the United States lake-and-rail lines for Chicago business, the all-rail lines are the strongest competitors of all. As compared with the quantities of grain shipped by rail from Chicago, the shipments by lake have shown a marked relative decline in the past ten years. It would appear that the railways now do the regular grain traffic business and the lake carries the peak of the load.

In diagram 7, two figures are presented in illustration of this development. Fig. 1 shows the total movement from Chicago of all grains for fourteen years, divided into rail shipments and lake shipments, the former with a marked tendency to increase, and the latter with a tendency to decline, until in 1913 about  $3\frac{1}{2}$  times as much was shipped in all directions by rail as was shipped by lake. In figure 2 the shipments of wheat by the eastbound rail lines, alone, are compared for the years 1912 and 1913 with the shipments of wheat by lake. Most of the wheat shipped eastbound by rail was destined to points that could be reached also by the lake-and-rail lines, and the traffic in this figure is therefore largely competitive traffic. It will be noted that the eastbound rail lines do a fairly steady business every week in the year, while the lake shipments are crowded into a few weeks from the end of July to the middle of September. The lake in those years was extensively used for only about one-third of the navigation season. It may not be without significance that the peak of the lake wheat load from Chicago corresponds with the slack period in grain shipments from Fort William and Port Arthur. In 1913 the eastbound rail lines from Chicago carried 27,933,000 bushels of wheat, while the lake carried only 16,173,690 bushels; in 1912, shipments by lake were a little larger than shipments by rail, the quantities being: rail, 16,680,800 bushels; and lake, 17,523,384 bushels.

In every class of goods received and shipped by Chicago, even coal, and with the one apparent exception of salt, the rail lines have succeeded in securing the larger share of the traffic. By lake Chicago received 1,212,687 barrels of salt in 1913, and by rail, 950,058 barrels.

What proportion of the traffic now passing between Chicago and Canadian ports might be diverted to a new route such as the proposed Georgian Bay canal? What are the possibilities of increasing the trade between lake Michigan and Canadian ports? On what basis should the value to Canada of the diversion of the merely in transit traffic be measured? Canada at present supplies no return bulk traffic for lake Michigan, coal westbound now dominating the lake Michigan trade. How could the proposed new route establish a competitive load factor?

Freight traffic in the lake Superior and the lake Michigan trades constitutes nearly all the present waterborne traffic which might be affected by the building of a Georgian Bay canal. There is, in addition, a certain amount of traffic to and from ports on Georgian bay and lake Huron and the town of Sault Ste. Marie which might be competed for by the proposed new canal, but in the total this traffic is not large. The immediate purpose of this section of the present report is met by the setting forth of the main features of the existing traffic by water.

Other interesting and important aspects of the problem remain for future examination. From the traffic returns of the Welland and St. Lawrence canals a great deal of information can be gathered as to the nature and distribution of the traffic now using the eastern section of the existing water route. There is local traffic on this part of the route as well as through traffic. To what extent has the local traffic developed? Railways across southern Ontario compete directly with this water route

## SESSIONAL PAPER No. 19b

as they would with a Georgian Bay canal. What do the facts indicate as to the ability of the railways to secure traffic under such competitive conditions? What changes may reasonably be expected from the completion of the new Welland canal? What is the theoretical traffic capacity of the present St. Lawrence canals? How should costs by the Welland and St. Lawrence canals compare with costs from Buffalo to New York by the new Erie canal and costs by the St. Lawrence canals with costs, by canal, from Oswego to New York?

Before attempting a study of these matters of detail, relating particularly to the mechanical ability of the railways and of other canals to compete with the proposed Georgian Bay canal, the general treatment of the subject will be continued,—first, by raising the question of the probable development of traffic in the future; and second, by following the present export traffic after it leaves the Great Lakes waterway to see under what general conditions it becomes part of the great traffic of the ocean.

## FUTURE DEVELOPMENT OF TRAFFIC.

It is not possible to rest the case for the Georgian Bay canal after arguing alone on the traffic conditions of the present. In the year 1913 was found the greatest volume of traffic between the East and the West in North America which has yet been recorded. If it should seem that Canada, had the Georgian Bay been then completed, might have derived from the traffic of that year an additional benefit commensurate with the cost of the canal, then an effective argument for immediate construction could be offered. Nevertheless, it would still be wise to consider the general causes and tendencies that affect the development of traffic. If, on the other hand, Canada's probable share of the traffic of 1913 might not seem to warrant a further large national investment, it would be necessary to inquire whether there might not be reasonable expectation that traffic would so increase year by year that the investment would soon become profitable, and would accordingly be a sound business proposition.

With respect to each class of goods transported in 1913, there should, therefore, be an inquiry with a view to determining the possibilities; first of the maintenance of the present volume of traffic, and second, of the increase of this volume and particularly of such increase as might come within the competitive influence of a Georgian Bay canal. Taking, for example, iron ore and copper ore eastbound, the probabilities of the continued shipment of the present immense tonnage should be considered, because if this traffic were greatly reduced, either by failure of the supplies of raw material or by the opening up of more favourable sources of supply for eastern industrial plants, or were diverted by the establishment of a centre for the iron industry at some point further west, then the whole economic structure of lake traffic would be altered. If, again, new markets for this iron and copper ore could be opened up, because of the construction of a new deep waterway to the sea or, at least, in such districts as would render a Georgian Bay canal a competitive route, then this ore traffic would become a factor in deciding the economic feasibility of the proposed canal, and it would remain only to set a value in national advantage on the passage of such traffic through Canadian channels.

The problem of coal traffic is perhaps even more important. If any large section west of lake Superior is likely to continue dependent upon supplies of eastern coal, and if the Pennsylvania coal fields can control that market, then lake Erie must retain a strong attraction for shipping. If, on the other hand, it should appear possible to develop a new source of coal supply for the west, such as the Nova Scotia fields, for example, then Canadian routes might supply bulk traffic westbound and greatly improve their competitive position. The traffic in general merchandise and manufactured articles may be expected to increase in some relation to the increase in population. It should also be inquired whether certain classes of goods not now shipped by the lakes, such as meats, provisions, and packing-house products, of which Chicago alone ships eastbound by rail over one million tons per year and some of it to Montreal for export, might not under practicable conditions be made to contribute tonnage to the new water route.

*Wheat and Flour.*—Because the movement of grain and flour is to-day Canada's greatest traffic problem, and because these products form so large a part of the total freight now apparently open to the competitive influence of a Georgian Bay canal, it may be well first to study the possibilities of this traffic in some detail. For the sake of simplicity of treatment, the present study will be confined to wheat, or wheat and flour alone. Any principles discovered or methods evolved can then be applied to other grains.

## SESSIONAL PAPER No. 19b

How much wheat will western Canada be prepared to offer for shipment five, ten, or twenty years hence? What general conditions will set the limits to the production and shipment of wheat? What proportion of the total wheat traffic will be destined to districts or countries that could be reached on favourable terms by a route through a Georgian Bay canal?

To give an estimate of the quantity of wheat there might be for shipment from western Canada in any future year is to make a guess. Will it be 500,000,000 bushels? Will it be 1,000,000,000 bushels? Or will it not be any greater in ten or twenty years than it was in 1913? It will depend upon conditions. Some of these conditions may already be recognizable. If a large wheat traffic should be deemed necessary in order to make a new canal economically feasible, it is clearly desirable to select such determining conditions as can be agreed upon and apply them as tests to the guesses that may be made.

One general determining condition will be the number of acres of land in western Canada capable of growing wheat; but as there is more of such land than can, by any stretch of probability, be turned to account within a generation or two, this condition will not impose any practical limitations. Good wheat land need not grow wheat; it may be used for other crops, or it may continue to grow prairie grasses.

A second general condition will be the extent of the world's demand for wheat, and the price it is prepared to pay for it. Assuming an abundance of good land and labour enough to cultivate it, the limitation upon the quantity of wheat actually raised will probably be found in market conditions. What markets could be reached by way of a Georgian Bay canal? What will be the demand of these markets, and what will be the tendencies affecting price?

From the standpoint of a Georgian Bay canal, the Orient may be excluded from the markets to be considered, because what wheat and flour western Canada may ship to the Orient will undoubtedly go out by the west coast. If the United States should cease to produce enough wheat for its own needs, only a portion of such western Canadian wheat as might be purchased by the New England states would take the long eastern route to Montreal before crossing the border. On this continent a Georgian Bay canal could compete for shipments to the markets of eastern Ontario, Quebec, the Maritime Provinces, and the New England states, but these markets, while valuable, would not call for the creation of new transportation facilities. The important market, obviously, is Europe. In the past, out of every 7 bushels of wheat and flour shipped by all exporting countries, Europe has absorbed a little over 6 bushels. It is the only great market for breadstuffs, and in shipments to this market from western Canada a Georgian Bay canal might prove a competitive factor.

If the European market for wheat and flour is thus likely to prove one of the conditions mainly determining such future shipments of wheat as are of concern to the problem of a Georgian Bay canal, then the probable capacity and the probable methods and prices of this market should be applied as tests to the estimates of such shipments. Before attempting to forecast future conditions in the European market, it will be desirable to understand the present conditions. For this purpose the answers to four questions, at least, should be clearly worked out:—

- (1) How much imported wheat and flour does Europe now buy?
- (2) How does Europe now buy this wheat and flour, that is, how are its purchases distributed throughout the year?
- (3) Where does Europe now buy this wheat and flour?
- (4) What price tendencies are now observable in connection with the European market?

*Shipments to Europe.*—Diagram 8 graphically presents the answers to questions 1 and 2, and illustrates certain other interesting points as well. The answer to question

3 is presented in diagram 9. For the purpose of these diagrams, Broomhall's statistics of the weekly shipments of wheat and flour (included at its equivalent in bushels of wheat) have been taken for the years 1905 to 1913, inclusive. The actual shipments in the first week in each of the above nine years have been added together and divided by nine to arrive at the average first week's shipments during that period, and so with each of the other weeks of the year. The drawings thus contain fifty-two columns, and represent the average movement of wheat and flour in each week of the year for nine years.<sup>1</sup>

The quantities of wheat and flour shipped by exporting countries are the quantities which are received by importing countries. These diagrams may, therefore, be looked at from the point of view either of exports or of imports. The definite dates given are the dates of shipment from the countries possessing surpluses, but the quantities represent the needs and the purchases of importing countries more truly than they do the surpluses of exporting countries.

In diagram 8, fig. 1, taken as a whole, can be seen the average quantities of wheat and flour shipped from all exporting countries in the world to all importing countries in the world, while from the base to the superimposed white line can be found the quantities shipped weekly to Europe from all exporting countries. The importing world purchased on the average in the above period 562,184,000 bushels of wheat and flour per year, of which the importing countries of Europe took 484,104,000 bushels, or 86.11 per cent.

These latter figures, therefore, represent the capacity, before the war, of the European market for imported wheat and flour. It is interesting to note that during the first year of the war, or from August 1, 1914, to July 31, 1915, there was shipped to European countries, 477,344,000 bushels of wheat and flour, or a little less than the average of the previous decade, the increased purchases of some countries being offset by the partial embargo on imports by Germany and Austria.

The wheat grown in the world between 1905 and 1913 averaged about 3,400,000,000 bushels per year, so that only about 16 per cent entered into international commerce. Europe, as a whole, grew four times as much as it imported, and even the countries of Europe showing net imports grew twice as much as they imported. The following table gives the production of wheat and the net imports of wheat and flour of the principal importing countries of Europe for a representative year, 1912:—

Country.	Year.	Wheat Crop.	Wheat and Flour net imports during subsequent 12 months.
		Bushels.	Bushels.
Austria-Hungary .....	1912	254,240,000	56,000
Belgium .....	1912	15,280,000	50,184,000
Denmark .....	1912	3,760,000	19,520,000
France .....	1912	333,600,000	44,952,000
Germany .....	1912	160,240,000	68,608,000
Holland .....	1912	4,600,000	17,520,000
Italy .....	1912	165,600,000	72,512,000
Norway .....	1912	312,000	3,600,000
Portugal .....	1912	5,600,000	4,000,000
Spain .....	1912	112,000,000	2,936,000
Sweden .....	1912	7,808,000	9,602,000
Switzerland .....	1912	3,176,000	21,904,000
United Kingdom .....	1912	57,400,000	238,096,000
Totals .....		1,123,616,000	543,896,000

<sup>1</sup> Appendix, Table 23, p. 108, Statistics.

# WEEKLY SHIPMENTS OF WHEAT AND FLOUR AVERAGED FOR 9 YEARS, 1905 TO 1913.

Figs. 2 and 3 in diagram 8 show the division of European imports into quantities imported by the United Kingdom and quantities imported by the continental countries of Europe. The United Kingdom is the largest single importing market in the world, and during the period under review it imported 217,424,000 bushels of wheat and flour per year, or 44.91 per cent of the total imports of Europe.

Coming now to the question of the distribution throughout the year of European importations of wheat and flour, it is manifest from the diagram that there is a tendency towards evenness of distribution. Breadstuffs are consumed day by day throughout the year in approximately the same quantities, and the fundamental demand, therefore, tends to be steady. For some reasons the importing world has not considered it practicable or profitable to import in one or two brief periods a total year's requirements of wheat and flour, perhaps partly because to unnecessarily store imported grain in Europe would be to unnecessarily pay interest on a sum equal to all costs, charges and intermediate profits involved in the transfer of the grain to Europe, whereas grain can be stored at the point of production for the interest on farm costs alone; partly because the consequent congestion of traffic would throw an ill-balanced load on the world's transportation systems, and make freight costs too high; and partly because such a load would be as difficult to finance as to transport.

If the world's shipments had been absolutely even, the weekly quantity would have been 10,811,000 bushels. The smallest week's average shipments, 8,040,000 bushels in the week of July 16, was only 21.5 per cent below this general average; and the greatest week's shipments, 13,136,000 bushels in the week of October 2, was only 25.63 per cent above the general average. As the contingencies are innumerable, this is not, after all, a very great divergence from the straight line. When longer periods than a week are considered, the relative differences become smaller. The following are the totals when the year is divided into quarters and halves:—

Average World's Shipments, 1905-13, Total 562,184,000 bushels—

1st quarter year. . . . .	135,224,000	(bush.)	
2nd " . . . . .	142,048,000		1st half year. . . . . 277,272,000
3rd " . . . . .	131,752,000		
4th " . . . . .	153,160,000		2nd " . . . . . 284,912,000

Average Shipments to ex-European Countries, 1905-13, Total 73,080,000 bushels—

1st quarter year. . . . .	19,368,000	(bush.)	
2nd " . . . . .	19,224,000		1st half year. . . . . 38,592,000
3rd " . . . . .	18,528,000		
4th " . . . . .	20,960,000		2nd " . . . . . 39,488,000

Average Shipments to Europe, 1905-13, Total 484,104,000 bushels—

1st quarter year. . . . .	115,856,000	(bush.)	
2nd " . . . . .	122,824,000		1st half year. . . . . 238,680,000
3rd " . . . . .	113,224,000		
4th " . . . . .	132,200,000		2nd " . . . . . 245,424,000

Average Shipments to Great Britain, 1905-13, Total 217,424,000 bushels—

1st quarter year. . . . .	59,040,000	(bush.)	
2nd " . . . . .	54,392,000		1st half year. . . . . 113,432,000
3rd " . . . . .	49,672,000		
4th " . . . . .	54,320,000		2nd " . . . . . 103,992,000

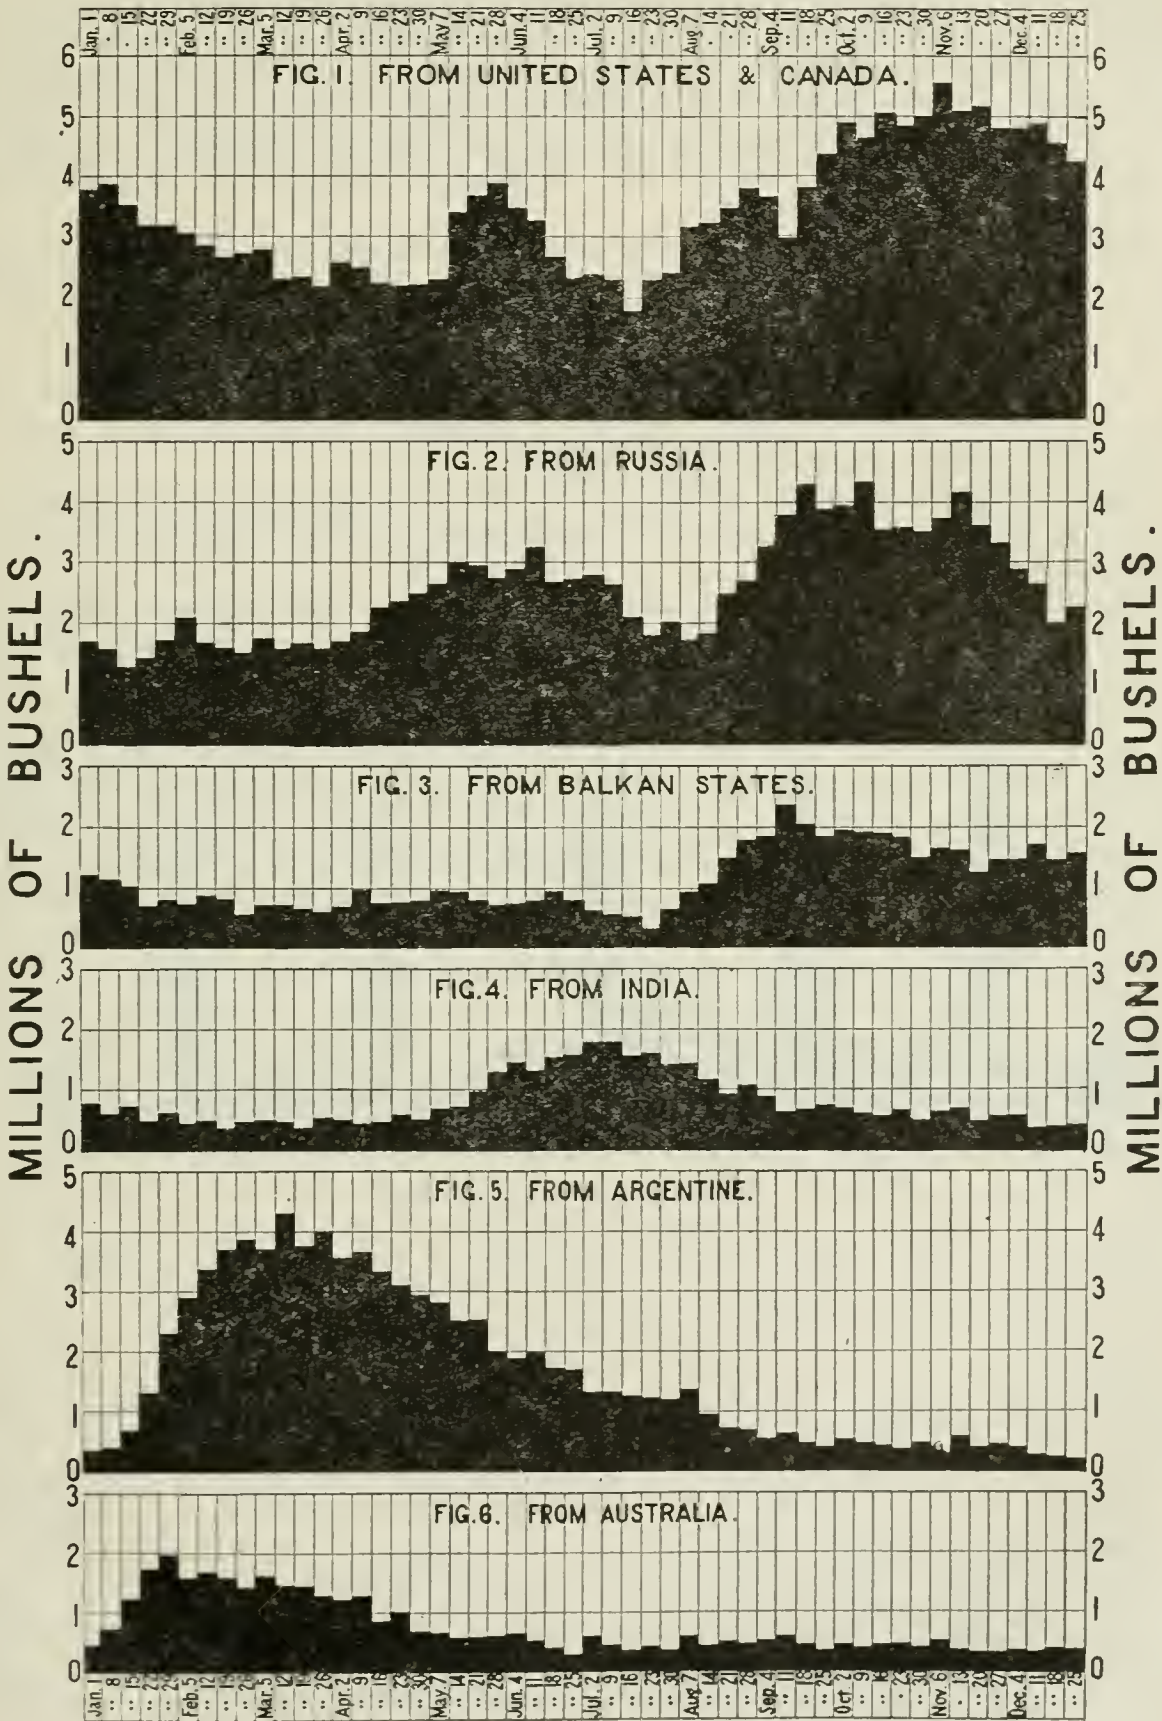

Average Shipments to Continent of Europe, 1905-13, Total 269,616,000 bushels—

1st quarter year. . . . .	57,328,000	(bush.)	
2nd " . . . . .	63,568,000		1st half year. . . . . 125,896,000
3rd " . . . . .	65,152,000		
4th " . . . . .	78,568,000		2nd " . . . . . 143,720,000

These figures confirm the substantial evenness of distribution visible to the eye in the diagram. Shipments to ex-European countries were remarkably regular. Shipments to the continental countries of Europe temporarily declined about the time the new European crop was ready for the market, and the average was adjusted a little later by exceptionally heavy purchases from the new crop of the exporting coun-

WEEKLY SHIPMENTS OF WHEAT AND FLOUR  
SHOWING QUANTITIES FROM CHIEF EXPORTING COUNTRIES  
AVERAGED FOR 9 YEARS. 1905 TO 1913.

tries of the northern hemisphere. This causes the irregularity in the diagram that is most noticeable. The United Kingdom purchases most heavily in the first quarter of the year, and the continent in the last quarter.

*Sources of Supply.*—Diagram 9 sets forth the average weekly contributions of wheat and flour from the chief exporting countries to the totals which have just been considered.<sup>1</sup> In most cases the statistics used in this diagram represents shipments to all countries, but the shipments from India and from the Argentine are shipments to Europe alone. As the shipments to ex-European countries are so even week by week, it may for all practical purposes be said that this diagram shows how each of the principal grain exporting countries sends supplies to Europe, that is, how Europe buys from each of these countries.

Beginning at the bottom of the diagram with Australia (fig. 6), it will be noted that shipments are heaviest in the first three months of the year, immediately following the Australian harvest, but that a steady export of a moderate quantity is maintained throughout the year.

The Argentine (fig. 5), where the harvest is a little later than in Australia, ships a very large proportion of its whole surplus in February, March, and April, the shipments dwindling off towards the end of the year.

India (fig. 4) ships more heavily in the middle of the year, also just after its harvest, but holds over a fair proportion of its surplus for regular export during the balance of the year.

The Balkan States (fig. 3) ship heavily, but on the whole regularly, during the last four months of the year, but hold over a substantial quantity for shipment during the next spring and summer.

Russia (fig. 2) also ships heavily after its harvest, but holds over a large proportion until the new year. During January, February, and March, certain Russian ports are closed by ice, but nevertheless a substantial and regular export takes place. When navigation is re-opened the volume of export increases, but regularity tends to be preserved. Considering climatic conditions, the export of the Russian surplus would appear to have an exceptionally well-regulated distribution throughout the year.

The United States and Canada (fig. 1) are treated together in commercial statistics. From the two countries combined the heavy shipments begin in August and extend on into the following January. In May a sharp peak is found following the opening of navigation on the Great Lakes and the marketing of "May" wheat. The sharpness of this May peak is in contrast with the broader movement which follows the opening of navigation in Russia. A considerable proportion of this May peak consists of Canadian wheat, which also is largely represented in the shipments during October, November, and December. The exports from the United States, during certain years before the Canadian exportable surplus became large, have been examined, and it would appear that in some years at least there was a greater regularity of shipment than was found on the average between 1905 and 1913.

If diagram 9 be now examined in relation to diagram 8 it will be seen that the importing world buys relatively heavily as soon as new crops are threshed, when wheat is intrinsically cheapest or there is the greatest pressure to sell. Taking the shipments to the United Kingdom for special examination, it will be noted that the first bulge in these shipments corresponds with the new crop marketings of Australia and the Argentine; that the second bulge corresponds with the marketing of May wheat in Canada and the United States and with the re-opening of navigation in Russia; that there is a small bulge corresponding with the marketing of the early winter wheat in the United States and in the Balkan states; and that the final bulge corresponds with the spring wheat marketing of the United States, Canada, and Russia. It is at these periods the United Kingdom buys a little more than its average consumption

<sup>1</sup> Appendix, Table 24, p. 109, Statistics.

SESSIONAL PAPER No. 19b

requirements, probably because it has been found profitable to do so, but it buys in any period only a little more than it requires for consumption, the only storage necessary being such as would carry over the surplus for a few weeks.

If the law of the consuming market be evenness of distribution throughout the year, then it is clear that this law must be recognized by producing countries and must determine to a large extent the volume of production, the methods of marketing and of transportation, and the system of finance of the country which aims to supply any large proportion of the European demand. Any estimate of Canada's probable shipments of wheat and flour to Europe in the future should be tested by the general conditions in Europe and in other producing countries which are suggested by the facts illustrated in these two diagrams.

DIAGRAM No. 10.

*Tendencies Affecting Price.*—Presumably wheat will not be grown, and, therefore, will not be shipped, unless the price is reasonably satisfactory to the producers. The existence of adequate transportation facilities at moderate cost may tend to improve the net return to the producers, but will not necessarily make this net price sufficient, under all conditions, to justify the production of wheat rather than some other product. No estimate of the volume of future traffic in any article should be accepted until present price tendencies are examined and the probable effects on price of the new assumed volume and of the new conditions proposed to be created have been studied.

What has been the relationship between Canadian wheat quantities and prices, and what tendencies, if any, have developed in connection with Canadian methods of marketing? As it is only in recent years that the Canadian surplus has been large enough to be an appreciable factor in international trade, this inquiry may be confined to the period from the beginning of 1909 to the end of the crop year 1913-14.

The primary markets of the world are those most directly in touch with, and therefore of most immediate importance to, the world's producers; and it is by the selling

6 GEORGE V, A. 1916

pressure in primary markets exerted against the buying pressure from ultimate consumers that the course of prices is chiefly determined, although this course may be modified by many intermediate agencies.

Canada's great primary market-place for wheat is the terminal elevators at Fort William and Port Arthur. It is there Western Canadian wheat is offered to exporters and to the Eastern Canadian trade. Prices quoted on the Winnipeg Grain Exchange are prices "in store Fort William-Port Arthur." The official records<sup>1</sup> of the receipts from the interior at these terminal elevators, month by month, show the manner in which Western Canada places its wheat on this market.

In diagram 10 these monthly receipts are shown from January, 1909, to August, 1914.<sup>2</sup> The outstanding feature of these receipts is the extreme peak developed in the last quarter of the year. A smaller peak in the month of May has also become clearly

DIAGRAM No. 11.

defined. It is obvious that Western Canada's method of marketing is to sharply thrust forward, immediately after the harvest, the greater part of its surplus, reserving something for a second thrust about the following May. This marketing in extreme peaks is not the accident of one or two years, but evidently the settled practice, becoming more definite year by year as the surplus has increased in volume.

Purchasers take wheat from the elevators every month in the year for shipment eastward by lake or by rail, although rail shipments are small by comparison. As shipments month by month do not strictly correspond with receipts, there is a varying amount always in store in the elevators. Diagram 11 represents the maximum amount of wheat in store in the Fort William and Port Arthur elevators in each month, according to the official weekly reports.<sup>3</sup> The outstanding feature of this diagram is the accumulation of wheat in the elevators during the period in which navigation is closed, that is, between December and April, in which latter month the peak of the year's storage load tends to be found.

The difficulties, or higher costs, of transportation in the winter time may influence some on thus holding over wheat; others may wait in the general hope of higher prices; while the very large private and country elevator interests buy wheat for the purpose

<sup>1</sup> Annual Reports of Winnipeg Grain Exchange.

<sup>2</sup> Appendix, Table 25, p. 110, Statistics, 1909-15.

<sup>3</sup> Appendix, Table 26, p. 112, Statistics, 1909-15.

## SESSIONAL PAPER No. 19b

of carrying it over the winter to ensure earnings on their investments in elevators. What the elevator companies buy they immediately sell again for delivery in some future month, because they desire only a safe investment showing a margin equal to carrying charges for their elevators; and all other owners of wheat who have wished to borrow against their holdings have "hedged," that is, entered into a definite contract for delivery in some future month. Most of these future contracts are for May delivery. The result, therefore, is that, partly because of the close of navigation on the lakes, but largely because of the trading, handling, and financing systems that have developed, a decided market peak accumulates for the month of May, which peak consists of the amount in store in the terminals in April plus the receipts from the interior in May. The second and greater peak of the year consists of the receipts during September, October, November, and December. It is therefore at these two periods of the year, Western Canada offers important volumes of wheat to the world's consumers.

What, now, is the relation between these Canadian market peaks and wheat prices? If diagram 8 be again referred to, it will be perfectly clear that we are here dealing with a method of marketing which is not at all in accordance with the general law of consumption demand. The wheat prices used for this inquiry will be the prices of contract grade wheat at Liverpool, and the prices of cash No. 1 Northern wheat on the Winnipeg Grain Exchange. These latter prices, as explained, are the prices of wheat in store in the terminal elevators at Fort William and Port Arthur, that is, the cash prices, on the spot, of the very quantities under consideration. Liverpool prices are selected because Liverpool is, more nearly than any other, a world market, and because in any case the United Kingdom was the purchaser, during the period under review, of over 91 per cent of all the Canadian wheat exported, and therefore the conditions at a representative market of the United Kingdom are the conditions to which the Canadian surplus actually stood in chief relationship. In the Liverpool market for contract grade wheat the importer can sell under the form of a "future delivery contract," the wheat he has just contracted by cable to buy from the Canadian exporter, and which wheat may at the moment still be in the terminal elevators at Fort William and Port Arthur, where its local market value is the Winnipeg cash price. The two sets of prices selected are therefore more nearly corresponding prices than any others that could be taken.

Before actually comparing quantities and prices, one or two points should be noted in connection with the demand in the United Kingdom for imported wheat. The United Kingdom is the leading importing market for higher grade wheat, and this not only because of the very large quantities of wheat required, but also because the merits of hard wheat are perhaps more generally recognized in the United Kingdom than in other importing European countries. The millers of the United Kingdom, however, do not make a flour of hard wheat alone. Hard wheats of various kinds are mixed with soft wheats of various kinds to make a blended flour. By this means the miller renders himself more independent than he otherwise would be of any one particular kind of wheat. If a special quality of wheat grown in only one country is relatively scarce, or very strongly held, the miller may, from other wheats upon the market, and by slightly altering his proportions, continue to produce a flour which preserves all the main characteristics with which his customers have become familiar. Imported flours can be blended as well as imported wheat. The advantages from the standpoint of the purchaser, of the use of a blended product are obvious, and, whether or not this system remains a permanent business policy, it is a fact that during the years under review the United Kingdom met only a part of its requirements by purchasing hard wheat and hard-wheat flours, and for the balance purchased soft wheat from many parts of the world to supplement its own domestic soft-wheat supplies.

The relationship of Canadian primary marketings to the purchases of the United Kingdom are shown in diagram 12. The solid black portion of this diagram is a repro-

duction of diagram 10 and represents the amount of wheat received each month at the terminal elevators at Fort William and Port Arthur. The hatched column in the month of April, which should be measured from the base of the figure, represents the maximum amount in store in those elevators in that month, being the peak of the accumulations there for May delivery as shown in diagram 11. The dotted line represents the total shipments to the United Kingdom month by month of wheat and flour from all the world, that is, roughly, the total monthly purchases of the United Kingdom from all countries.<sup>1</sup> Taking any one month, and measuring from the base of the figure to the dotted line, the total amount purchased for shipment to the United Kingdom in that month is shown.

DIAGRAM NO. 12.

Diagram 12 makes two almost startling revelations. First, that Western Canada sometimes puts upon the market in a month much more hard wheat than the United Kingdom, the only important consumer of its surplus, will purchase of all kinds of wheat and flour from all the world; and, second, that the United Kingdom purchases regularly and heavily during many months in which Western Canada has practically nothing to offer.

In October, 1913, Western Canada marketed 37,546,000 bushels, while the United Kingdom purchased of all kinds of wheat and flour only 19,075,000 bushels. In November, 1913, the Canadian marketings were 30,946,000 bushels, and the purchases of the United Kingdom, 16,918,000 bushels. In November, 1912, the figures were 27,563,000 bushels against 20,984,000 bushels; and in November, 1911, 19,941,000

<sup>1</sup> Appendix, Table 27, p. 112, Statistics, 1909-14.

SESSIONAL PAPER No. 19b

bushels against 19,587,000 bushels. In these months there was delivered at Fort William and Port Arthur an absolutely greater amount than the United Kingdom would purchase of hard and soft wheat combined, and of flour, for delivery from all countries. If we add together the figures for the two months of October and November in each of these years under review, the comparison is as follows:—

	Canadian Marketings Terminal Elevators.	Total Purchases United Kingdom.
	Bushels.	Bushels.
1909—October . . . . }	32,137,000	38,497,000
November . . . . }		
1910—October . . . . }	31,944,000	41,097,000
November . . . . }		
1911—October . . . . }	39,261,000	39,515,000
November . . . . }		
1912—October . . . . }	47,170,000	43,905,000
November . . . . }		
1913—October . . . . }	68,492,000	35,993,000
November . . . . }		

If it could be determined exactly how much of the purchases of the United Kingdom consisted of hard wheat, it would undoubtedly be found that the Canadian supply exceeded the demand of that market in the above two-month periods in every one of these years, and that in 1913 it was considerably more than twice the quantity required. The May peak also, which should be constructed by placing the April storage column on the top of the May receipts, was greater in three of the years than the total demand for all kinds of wheat and flour in any one month, and very much greater than the demand for hard wheat alone. And Canada is by no means the only source of supply of hard wheat, even in the autumn months.

As over 61 per cent of the surplus product of Canadian mills during these years was shipped to the United Kingdom as flour and was included in the above quantities of total imports of that country, it is evident that even the very large purchases of wheat by the Canadian millers, second only in importance to the purchases of the United Kingdom, would only partially diminish the pressure of the Canadian peaks, as shown, upon the market of the United Kingdom.

Bearing in mind this relationship of Canadian supply to the demand of the United Kingdom, it will now be interesting to bring into juxtaposition the quantities marketed at Fort William and Port Arthur and the prices of wheat at Liverpool and at Winnipeg. For this purpose, diagram 13 is presented. In fig. 1 are the Canadian quantities which have already appeared in diagram 12, although in this case turned upside down as overhanging the market, the dotted line again representing world shipments to the United Kingdom. In the centre of the diagram (fig. 2) are two price-lines.<sup>1</sup> The black line represents the price of contract grade wheat on the Liverpool Corn Exchange, and shows the highest and lowest quotation on that exchange during each month. The red line represents the high and low quotations during each month on cash No. 1 Northern wheat on the Winnipeg Grain Exchange. At the bottom of the diagram (fig. 3) are the monthly shipments, by lake and by rail combined, from the terminal elevators at Fort William and Port Arthur, showing how the wheat moves out into general consumption.<sup>2</sup>

Taking first the two price-lines with their fluctuations, it is evident that both Winnipeg and Liverpool markets are subject to the same general conditions. In its general trend it is obvious that the Winnipeg market either follows the Liverpool market or moves with it under the same influences. A spread in price between the two exchanges is necessary if business is to be done between them, the spread being at least sufficient to cover all costs of the transfer of wheat from the elevators at Fort William and Port Arthur to dockside Liverpool. The spread is actually slightly greater than appears in

<sup>1</sup> Appendix, Table 28, pp. 113-114, Statistics, 1909-14.

<sup>2</sup> Appendix, Table 25, pp. 110-111, Statistics, 1909-15.

this diagram because No. 1 Northern Manitoba wheat, quoted at Winnipeg, is above the standard on which the Liverpool quotations are based, and commands a small premium, about  $1\frac{1}{2}$  cents per bushel, when delivered on Liverpool contracts. Where the two price-lines overlap, or are very close together, after allowing for the premium as above, it is evident that no export business was being done by Canada or could be done. The spread between the prices becomes extreme toward the end of 1912 and toward the end of 1913.

Tracing the Liverpool price line alone, it will be noticed that there are three sharp upward movements, in 1909, 1912, and 1914, and one sharp decline in 1910. In the spring of 1909, Europe was in a nervous state following the annexation by Austria of Bosnia and Herzegovina. This was the period also of the Patten "corner" in Chicago. In 1912 occurred the Balkan war, which not only had its effect on European sentiment, but the closing of the Dardanelles by Turkey interfered with exports from the Black Sea and shut up a considerable number of ocean vessels. The sharp upturn in 1914 marked the beginning of the present great war. The extreme drop in 1910 apparently had no great significance. At midsummer, as we have seen, Europe imports less wheat than at any other period of the year; the world's crop of 1909 had been the largest for many years, and the prospects for the European crop of 1910 were for a still larger local supply. Under these conditions, it is explained, some cargoes of grain from Australia arrived at Liverpool on shipper's account, and the owners were finally forced to sell at a big sacrifice, which temporarily became manifest in all market quotations. These four extreme fluctuations occurred, therefore, under exceptional conditions, and more ordinary causes must be looked to for the explanations of all other price variations shown.

The quantities in fig. 1 should now be closely examined in their relation to the price-lines in fig. 2, attention being first confined to the Liverpool prices. Starting at the right hand of the diagram and letting the eye follow down the direction of the autumn peak of 1913, it will be seen that it fits into a marked depression in the Liverpool price, the line having apparently sagged many cents per bushel. The same thing is seen with the autumn peak of 1912, although not to so great an extent. There are clearly defined depressions also corresponding to the autumn peaks in 1911, 1910, and 1909. In each one of these five years the heavy Canadian marketings at the end of the year have coincided with a depression in price. If we leave out of consideration the sharp "squeeze" in 1910, it will be seen that, with the exception of one year (1911), the price that has met the Canadian peak is the lowest of the year. In the first half of 1911, other countries, Russia and Australia, dumped unusually heavy loads on a market that was weak because there had been two large world's crops in successive years. Canada dumped her crop, as usual, a few months later, but, although it was the largest Canadian crop in volume up to that time, it was probably the poorest in quality, only about 41 per cent being of contract grade. Its real weight could not, therefore, be great in a market for contract grade wheat. It found a depression in price, but not in this one case the lowest of the year.

If the eye now follows the smaller peaks in the month of May, which peaks consist of the total in store in April plus the deliveries in May, the combined volume hitting the market, in a slanting direction as it were, in May and June, it will be observed that these peaks also, in every case except 1909, find a declining market. In no case has any large volume of the Canadian crop met a relatively high price. Other countries selling when Canada does are, of course, subject to the same price basis, but a study of the peaks marketed by all other large exporting countries within the above period shows that no other country has marketed so large a proportion of its crop when prices are low as has Canada.

Is this correspondence between the Canadian peaks and price depressions a mere coincidence, and chargeable to temporary bad luck, or is it in the nature of direct cause and effect? Has Canada, on account of financial, or transportation, or other

## SESSIONAL PAPER No. 19b

local conditions, merely happened to market a large part of its crop when the world's basis of price must necessarily be low? It would not, perhaps, be surprising if prices in the consuming markets of Europe were regularly lowest in September, October, November, and December, because the greater part of the world's wheat is raised in the Northern Hemisphere and is intrinsically cheapest in those months, and, moreover, Europe's position as a purchaser should at that time be strategically strongest, since she is then secure of many months' supplies, if need be, in her own newly harvested domestic crop. But the records do not show any tendency to extreme weakness in prices at that period of the year, at least in the last three months, previous to 1909. An examination of Liverpool prices from 1909 back to 1898 fails to discover a single year in which the low point was reached in October, in November, or in December. The minimum price is found three times in September when the winter wheat supplies of the Northern Hemisphere are most abundant; twice in January, twice in March, twice in April, once in June, and once in July. On the other hand, the high points during the eleven years previous to 1909 occur once in October, twice in December, once in January, twice in May, twice in June, twice in August, and once in September.

Western Canada, since 1909, has marketed an important quantity of contract grade wheat in October, November, and December, and this is the only part of the world which marketed a large exportable surplus of that grade of wheat in those months, a quantity which was much greater than the current requirements of the United Kingdom, and at times perhaps than the current requirements of all Europe for wheat of that quality, unless at bargain prices, and Western Canada has, since 1909, found a tendency to an extreme weakness in prices where weakness apparently did not previously tend to show itself. These facts justify serious consideration of the hypothesis of direct cause and effect. In the commercial world even a temporary oversupply tends to break prices.

Returning to diagram 13, the eye should now follow the Winnipeg price-line. It will be noted that the Winnipeg prices are never relatively high except when the quantities on the market are small. As soon as volume appears at the terminals, prices tend to go on an export basis, that is, a spread from the Liverpool price appears sufficient to permit of export to Europe. Just this would be expected to be the case. The only points calling for special explanation in the Winnipeg line are the extreme spreads in the autumns of 1912 and 1913. These are the periods of the greatest excess of Canadian marketings when compared with the current requirements of the United Kingdom. Any excess must inevitably begin to feel strongly the competition of inferior wheats, and, if it is to be sold, must tend to approach the price level of these wheats until it becomes a bargain; or, if it is not to be sold, it must decline to a point at which it can safely bear all carrying charges to some future month. In Western Canada this future month is generally May, and the market estimates the carrying charges at  $4\frac{1}{4}$  cents to  $5\frac{3}{4}$  cents. Further, a surplus always tends to set the conditions for the total supply, and an excess at Fort William and Port Arthur must tend to bring down the price of the whole quantity marketed at the same time to the basis on which the excess can be negotiated.

If the figure at the base of the diagram (fig. 3) be now studied in connection with the Winnipeg price-line, it will be seen how large a proportion of each year's crop moves out of the elevators at the lowest price of the year. Take, for example, the crop grown in 1913, which was shipped east in the twelve months beginning with September, 1913, and ending with August, 1914. During the first four months of this crop year, 71.55 per cent of the whole year's surplus was shipped east at the lowest prices of the year. As a considerable part of the subsequent May shipment peak was "hedged" during these months on the basis of current prices plus carrying charges, this quantity should really be added to the autumn peak to represent the full proportion of the crop which Western Canada let go on the depression which

coincided with, or was caused by, its excessive deliveries on the primary market in the last quarter of the year.

*Conditions Affecting Cost.*—Whether or not the system of marketing in one or two extreme peaks causes lower prices for wheat, it is certain that it tends in some respects to create higher costs. These higher costs may fall upon the producers of wheat, or they may appear to be widely distributed, but any avoidable costs are unnecessary limitations.

Diagram 14 represents in freight cars the monthly quantities of wheat delivered from the interior to the terminal elevators at Fort William and Port Arthur for the crop year 1913-14. The very large equipment of rolling stock required to move the October shipments, and the small demand during most of the rest of the year, are strikingly evident. In October, 1913, there was delivered at the terminals, 37,546,215 bushels of wheat, and therefore rolling stock sufficient for that purpose was in existence, and a corresponding number of locomotives, and there were all the double tracks and sidings and sorting yards necessary to handle traffic of that magnitude. These things, being in existence, represent a capital investment that calls for twelve months' interest every year. The last string of cars, marked "average," if steadily employed, could have carried all of the wheat in the same twelve months. So far as wheat is concerned, there was really required, under theoretically perfect transportation conditions, a capital investment in railway facilities equal only to the "average" train, which is less than one-third the size of the actual October train. If all grains were taken instead of wheat alone, each of the trains would be longer, but the proportions would not greatly differ. In Canada there is no big load of other traffic with an opposite seasonal distribution, and the "average" train could carry back from the head of the lakes to Winnipeg and the west the maximum load of the present west-bound traffic. There is no intention of suggesting perfectly equal monthly shipments of grain as practicable, or even desirable, but there is no escaping the conclusion that present methods create an extra cost in fixed charges which must somehow be met.

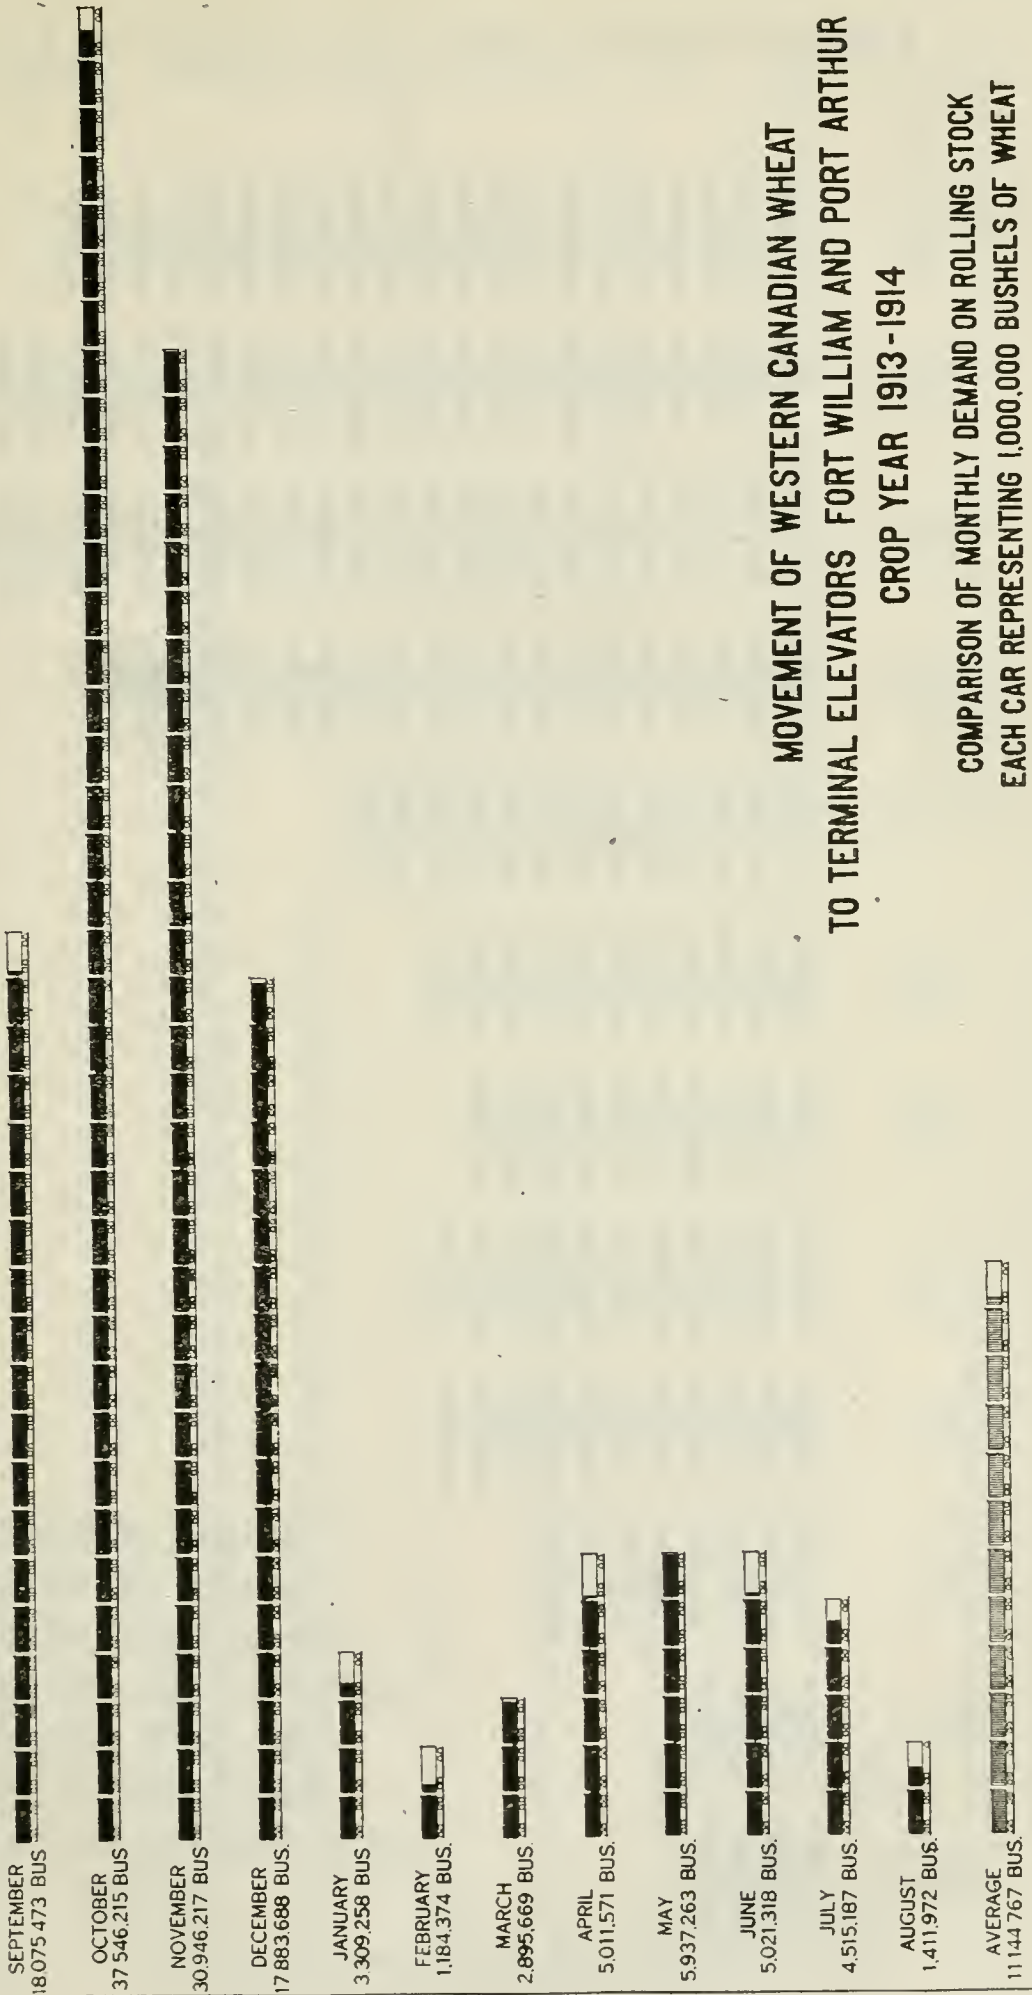

The irregularity of the employment of labour in connection with grain traffic is another aspect of this same matter. Diagram 15 shows the maximum number of men employed by the Canadian Pacific Railway Company each month of the above crop year on grain traffic on the Alberta, Saskatchewan, and Manitoba divisions, the last named embracing the lines to Fort William. The men counted were the engineers, firemen, brakemen, and conductors engaged on grain trains, and the yardmen employed because of grain traffic. Exactly the same conditions prevail on the other railways. In the operating departments of the railways there is no compensating demand for labour in the slack grain months. Employment of labour in this manner, apart from its serious sociological bearing, must tend to add to costs.

One further point may be emphasized, in diagram 16, and that is the nature of the demand under the present system for lake vessels to carry the wheat from Fort William and Port Arthur. This part of the subject has already been dealt with from a somewhat different point of view in discussing traffic conditions in the Lake Superior trade. Shippers of wheat in October, 1913, chartered almost three times the number of vessels that would have been required to move the whole year's load if it had been evenly distributed over the same navigation months. In the inserted figure in this diagram the inevitable consequence of such methods appears in freight rates. From September the rates moved upward to a high point in December, the two weeks of open navigation in which month generally witness the most active demand of the season, and fell again toward the low point as traffic declined. The greater part of the shipments bore the higher rates.

Tendencies toward excessive costs must be provided against as carefully as tendencies toward inequitable depressions in price, if the production of, and therefore the traffic in, wheat is to measure up to estimates based on the fertility of the soil and the capacity of the world's consuming markets.

## THE ROUTING OF EXPORT WHEAT.

From Fort William and Port Arthur wheat for export to Europe is distributed over many routes to the seaboard, and is shipped from some seven or eight different ocean ports. A part of the wheat follows Canadian routes to Canadian ocean ports, and part is diverted at some stage of its journey eastward to United States routes and to United States ocean ports. It is clearly necessary to examine the distribution of export shipments under normal conditions in order, if possible, to discover the determining causes. Unless the real causes, under present conditions, of the diversion of so much Canadian wheat to United States ports are recognized, it cannot be confidently asserted that any particular change in conditions will materially alter the situation.

What, in the first place, are the facts concerning the present diversion and distribution of export wheat shipments? In diagram 17 are presented the facts for the calendar year 1913. In this diagram the movement of Canadian wheat from the head of the Great Lakes to the seaboard is traced in solid black lines, drawn to a scale of width in accordance with the number of bushels passing over each part of the route. In the tables of figures inserted in the diagram will be found the principal quantities. Some Western Canadian wheat is forwarded each year by rail to Duluth-Superior for shipment from that point. Passing down the lakes this comparatively narrow stream joins the broad stream from Fort William and Port Arthur, and the combined total flows eastward through the St. Marys river. A tiny rivulet then diverges to Chicago and a little later a substantial stream moves toward Georgian bay and is divided up among many ports. The main stream, however, continues south through lake Huron, losing a little to Goderich, a little to Port Huron, and a trifling amount to Detroit. In its passage through lake Erie a very small quantity branches off to Toledo and another to Port Stanley, and quantities of some importance to Fairport and Erie. The chief body of the remaining stream flows straight to Buffalo, the balance swerving northward to be divided between the Port Colborne elevators, from which it is later transhipped; and the all water route to Kingston, Prescott, and Montreal. In the diagram all receipts at Canadian lake ports as well as those at Port Huron are carried through at full width to Montreal, and the export wheat which could be traced as having been shipped all rail in that year is also indicated as arriving at Montreal. It will be observed that the receipts thus shown for Montreal are greater than the wheat exports that passed on through that point. The difference would represent the amount of Western Canadian wheat which was retained in Ontario and in Quebec for milling purposes, or remained in various public elevators. Of the United States ports of export, Portland is represented as being supplied through Montreal, and Boston, New York, Philadelphia, and Baltimore through Buffalo, Erie, Fairport, and Toledo. Boston at times receives Canadian grain by way of Montreal. The width of the line of receipts at Buffalo is a little greater than the line of shipments passing on through Buffalo, for the reason that some Canadian wheat remained in winter storage in vessels lying in Buffalo harbour, and did not pass on within the calendar year.

To arrive at the total proportion which went out through United States ocean ports, the shipments to Portland must be added to the quantities which were diverted from the head of the lakes to United States routes, and which are brought together into one stream east of Buffalo in order that their comparative magnitude may be seen. I round figures two-thirds of the Canadian export wheat in the calendar year 1913 was

shipped through United States ocean ports, and one-third through the Canadian ocean ports. Quantities and proportions differ in different years, but a considerable diversion to United States routes appears to be the normal condition, although the normal proportion so diverted could be determined only after further examination of the facts.

Yearly total figures, such as represented in the above diagram, do not often supply sufficient material for a study of causes. To secure the necessary material there were taken, from the original records at Fort William, Port Arthur, and Duluth, particulars of every shipment of Canadian grain, and from the files of ships' manifests at Montreal, St. John, and Halifax the name of every vessel loading Canadian grain, distinguished as liner or tramp, with the date of loading, the quantity of each kind of grain carried and the port to which it cleared; and through the courtesy of the Department of Commerce, Bureau of Foreign and Domestic Commerce, at Washington, a competent statistician compiled, from the original records there, monthly details of the movement of Canadian products, in bond, through the United States ocean ports. This material covers the three calendar years 1911, 1912, and 1913.

*Causes of Diversion.*—Diversion may have been due to one or more of many causes: the physical inability of Canadian routes to handle more traffic; the superior speed or certainty of other routes; relative freight rates; financial, or other private business considerations, or personal preferences on the part of the shippers; conditions of ocean transportation. It will, therefore, be important to examine in more detail the movement of Canadian export wheat.

Diagram 13, which contains three figures, represents the manner in which Canadian export wheat leaves Canada month by month, by being shipped from Canadian ocean ports and being diverted to United States routes. The quantities shown as diverted to the United States do not always pass through United States ocean ports in the same months in which they are diverted from Canada; and this diagram, therefore, is not a direct comparison, by months, of ocean shipments, but only of shipments from Canada.

Fig. 1 shows the total shipments from Canada, the solid black portions of the monthly columns being the shipments from Canadian ocean ports, which are called "direct exports," and the balance of the columns the quantities diverted to United States routes, called "indirect exports." In figs. 2 and 3 these direct and indirect exports are shown separately.<sup>1</sup>

If fig. 2 is examined, it will be noted that it possesses some general regularity of form. In the months of December, January, February, March, and April the port of Montreal is closed, and the exports during these months are through the ports of St. John and Halifax, and are substantially equal in amount. In the month of May export from Montreal begins and continues until the end of November. During these months the exports are much greater in quantity; and if an imaginary line be drawn from the tops of the May columns to those of the November columns the idea is suggested that the almost rectangular figures thus formed represent in some way the capacity, or the usefulness, of the Montreal route, under the conditions that prevailed in each of the three years under review. Montreal does not export the same amount each month, the most marked departure from substantial evenness being found in the months of September and October in the years 1912 and 1913. That less wheat was shipped in these months was not due to there being no Canadian wheat for export, as appears from fig. 1. A study of Canada's total exports of all goods month by month discloses the tendency to crowd all exports upon the last third of the year. In September, October, and November the vessels arriving at Montreal are offered more cheese, apples and higher class goods than in the earlier months of the season, and the irregularity in the shipments of wheat may be due to the irregular offerings of

<sup>1</sup> Appendix, Table 29, p. 115, Statistics, 1909-13.

## SESSIONAL PAPER No. 19b

other freight, which carried somewhat higher rates and would be given the preference accordingly. The increased shipments in the month of November, when large quantities of other freight are still offering, may, perhaps, be explained by the higher freight rates obtainable for wheat in that month, which may have made it profitable for vessels to go to the expense of increasing their freight accommodation, which could be done in combination liners, for example, by fitting steerage quarters for package freight, thus leaving more space in the holds for wheat. It is not intended at this stage to assume any definite explanations, but only to point out the approach to regularity of form in the direct exports of Canadian wheat, in order that the entirely different character of the indirect shipments (fig. 3) may be observed.

The only regularity about the traffic diversion to United States routes is the fact that these routes carry the two peaks Western Canada thrusts forward. The first suggestion from this diagram, as a whole, is that the Canadian ports do a certain more or less regular business, and the United States routes carry the peaks of the loads. It is clear that the United States routes are not always competitors of the Canadian routes with the same effectiveness. From the relative quantities in the month of November, 1913, as shown in fig. 1, it cannot, for example, be inferred that the United States routes can always successfully compete with anything like the proportionate results there shown, for in the month of August, 1913, Montreal took nearly all the wheat offered, and in many other months it secured by far the larger quantities. Montreal exported more Canadian wheat than any other single port, New York coming second, Boston third, Philadelphia fourth, Baltimore fifth, Portland sixth, and St. John seventh.

The closing of navigation on the St. Lawrence in the winter months is a physical limitation on the Canadian routes, which may well have some effect on total yearly quantities shipped. During the period of open navigation, however, there is no climatic cause of diversion and shipments through Montreal may, therefore, be more particularly studied. That Montreal's proportion of the total export shipments of Canadian wheat in 1911, 1912, and 1913 was not larger cannot be satisfactorily accounted for, either by the physical shortcomings of the routes to Montreal from the interior, or by the inadequacy of the equipment on them. The St. Lawrence and Welland canals have never carried more than a moderate fraction of the traffic that could be passed through them; and, as we have seen, many Canadian vessels of "canal size" spend most of the season in the open lake trade, so that no continued shortage of vessels suitable for the all-water route could have been experienced. With regard to the lake-and-rail routes to Montreal, the capacity of the water section, could, of course, be limited only by the number of vessels available. Canadian vessels in those years carried all the Canadian coasting traffic in wheat, supplying Canadian millers as well as export requirements; they were not, on the average, fully loaded eastbound, as has been shown; and they were left free to carry some cargoes to United States ports, that is, to participate in the diversion. In October, 1913, there was loaded into Canadian vessels at Fort William and Port Arthur 14,020,901 bushels of wheat, and in the following month 13,126,533 bushels of wheat: the greatest month's export of wheat through Canadian ports was in the month of May, 1913, when the quantity was only 5,243,408 bushels; so that Canadian vessels on the lakes have loaded in each of two consecutive months over 2½ times the quantity of Canadian wheat that Canadian ocean ports have ever shipped in a month. Even if Canadian lake tonnage had been deficient, more Canadian wheat might have been shipped in United States vessels to such a point as Port Huron, from which Canadian rail lines could have carried it to Montreal; or to Buffalo, from which Canadian, or United States, vessels could have carried it by water to Montreal; and again more Canadian wheat might have been directed from the interior to Duluth-Superior where it could have taken United States vessels to Canadian ports. No ques-

## SESSIONAL PAPER No. 19b

tion can be raised about the ability of the rail lines across southern Ontario to handle in a season more ex-lake traffic than they have ever yet received.

Nor is any easy explanation found in freight rates. It would appear that the Canadian wheat that was diverted to United States ocean ports paid higher rates to the seaboard than did the wheat shipped to Montreal. An examination of regular and special tariffs for several years has failed to discover any period in which United States routes to the seaboard for Canadian wheat were allowed to have an advantage in freight rates over Canadian routes.

Montreal in 1914, with no corresponding increase in handling plant, exported 82 per cent more wheat than in 1913, or 38 per cent more of all grains, the greater part being United States products. Montreal's mechanical equipment could have handled more wheat than it did in 1911, 1912, and 1913, if more wheat had been offered.

Whatever may be the need of increased handling facilities at Montreal, of an enlarged fleet on the lakes and of better service on the railways, it would appear that present deficiencies in these respects do not completely explain why it was, for example, that only one-third of Canadian export wheat in 1913 passed through Canadian ocean ports.

Before attempting to estimate the diverting power of other possible causes, it may be well to inquire first into the conditions of transportation on the ocean. The exporter of wheat wishes to ship wheat to Europe. If he cannot ship right through to Europe in time to fulfil a contract offered him and at a total cost for the whole journey that will leave him a satisfactory net price, he will not ship at all. He may have preferences as to routes and ports, but he must at any given time choose the through route and the combined through rate that will enable him to do business. If the explanation of his routing of Canadian export wheat does not readily appear in local conditions between Fort William and Port Arthur and the seaboard, the final stage of the through route must be examined.

As in the case of traffic on the lakes, there should be some understanding of the types of vessels, of their distribution, of load factors, of freight rates, and perhaps of various incidental costs and charges.

*Liners and tramps.*—In 1912, the overseas commerce of the world was conducted by more than 25,000 steamers, of which 1,555 were "liners" and 23,500 "tramps." Vessels engaged in regular-line service, that is, vessels upon a fixed route and with a definite schedule of sailing dates, are known as "liners." The "tramps" are free to sail anywhere in search of a profitable cargo, and to be chartered by the highest bidders in the great shipping exchanges of the world. The 25,000 ocean carriers in 1912 were owned by approximately 4,200 different companies, firms, and individuals, and the 1,555 liners by 108 different companies.<sup>1</sup>

The functions performed by these two general classes of ocean carriers differ in many important respects. Tramps cannot perform as satisfactorily as liners many of the services required in modern commerce, but with respect to such traffic the two classes are directly competitive.

---

## SESSIONAL PAPER No. 19b

It will be noted that tramps carried no Canadian wheat from Montreal in the year 1911; that they carried a little in May and June, 1912; and that in 1913 they carried an appreciable quantity in several months of the season. Of the total wheat exports for the three years, tramps carried 5.66 per cent. In 1913 the percentage was 13.63, and in the month of June in that year they carried 28.23 per cent of the monthly total. It is evident that tramps proved in those years only a small and irregular factor in the wheat trade.

In the same diagram there is indicated the range, from lowest to highest, of ocean freight rates on wheat, month by month, from Montreal to Liverpool,<sup>1</sup> which may be taken as representative of freight rates to Europe. In 1911, freight rates were the lowest of the period. In that year there were no tramps. In May and June, 1912, the range had moved higher, and there were one or two tramps. In 1913 there was a distinct and sustained elevation of rates for the greater part of the season, and there were many tramps. In October and November, 1912, on the other hand, some rates were very high and yet no tramp cargoes are reported. All that can be said, therefore, from this examination of shipments in relation to freight rates, is that in 1911, 1912, and 1913 no tramp vessel took from Montreal a cargo of Canadian wheat except when freight rates were comparatively high, but that tramps were not attracted on every occasion on which the rates were high.

Merely incidentally, there are also introduced in diagram 19, lines indicating cargo insurance out of Montreal,<sup>2</sup> drawn to the same scale as the freight rates. Wheat is assumed to have been worth \$1 per bushel at the seaboard, and a rate of 25 cents per \$100, for example, to have been equivalent to a charge of one-quarter cent per bushel. Whatever may be the effect of relative insurance rates on the diversion of wheat traffic, it is perfectly clear that cargo insurance cannot be the immediate cause of this diversion. There are big forces of some kind swinging freight rates up and down, in comparison with which cargo insurance is a very small factor.

The next question that may naturally arise is as to the part played by tramp vessels in the grain traffic of those North Atlantic ports of the United States which attract so much Canadian wheat. The following are the figures for the four years, 1910-13, of the tramp cargoes of grain of all kinds loaded at Boston, New York, Philadelphia, and Baltimore:—

Year.	Boston.	New York.	Philadel- phia.	Balti- more.
1910.....			1	11
1911.....		4	14	17
1912.....		24	36	58
1913.....		20	34	129

It is obvious that it was not the large numbers of tramp vessels in the grain trade out of Boston and New York that can explain the diversion of Canadian wheat to those ports. In 1903, Boston loaded two tramp cargoes of grain, but apparently no more from that time to the end of 1913. In 1903, New York recorded eleven tramp grain cargoes, but from 1903 to 1911 not a single tramp cargo is recorded. According to records since 1878, Baltimore has loaded tramps every year, and Philadelphia every year but one, 1904; but on the average more tramps were loaded at Baltimore than at Philadelphia. In the appendix<sup>3</sup> will be found figures covering this whole period, which indicates that, since 1900 and up to the beginning of the war, tramp vessels were but

<sup>1</sup> Appendix, Table 30, p. 116, Statistics, 1909-14.

<sup>2</sup> Appendix, Table 31, p. 116, Statistics, 1911-14.

<sup>3</sup> Appendix, Table 36, p. 127, Statistics, 1878-1915.

a small factor in the North Atlantic grain trade. The liners evidently dominate the wheat exports.

*Ocean Freight Rates on Wheat.*—It will be desirable at this point to take a somewhat wider survey of the problem and inquire whether the changes in ocean freight rates just noted in the Montreal-Liverpool route, and which would seem to have been under the influence of powerful forces, are local in character, or peculiar to the Canadian port or even to the North Atlantic trade. Material for this survey has been obtained through the courtesy of Broomhall's Corn Trade News, at Liverpool, and Comtelburo's Daily Freight Register, at London. Mr. Broomhall was asked particularly for rates to Liverpool, which is the leading port of the United Kingdom for liners, the quotations to cover liner, or "berth," rates as well as tramp rates, and from his records furnished current rates, not necessarily confined to Liverpool rates, quoted on the first business day of each week, from January, 1909, until December, 1914, from the following ports: from New York, in the United States; from Odessa, the principal Black Sea port of Russia; from Karachi, the leading grain port of India; from the River Plate, down River, in the Argentine; and from Australia. The Baltic Exchange in London is the greatest charter market in the world for tramp vessels, and quotations from the Daily Freight Register are exclusively tramp rates and are in the form of high and low rates per month to the United Kingdom from the same ports, but including also tramp rates from Canadian Atlantic ports. The tramp rates from New York, Philadelphia, and Baltimore are generally the same, or rather tramps are generally chartered to load "Atlantic Range," that is, with the option to the shipper to select any one of several ports on the North Atlantic coast of the United States which have come by the custom of the trade to be placed upon the same basis, and this has some interesting consequences. Tramp rates from the Daily Freight Register are therefore "Atlantic Range" rates rather than New York rates.

These two sets of quotations have been charted in diagram 20.<sup>1</sup> Ocean freight rates are, of course, almost always quoted in shillings and pence and the unit of weight is sometimes the quarter (eight bushels), and sometimes the ton, and there are several different kinds of tons, according to the usage of each trade. For the purpose of this diagram the quotations received as above have been reduced to the common basis of cents per bushel of 60 pounds.

To fig. 1 have been added the freight rates from Montreal to Liverpool, which were used in diagram 19. These Montreal rates are represented in their range from high to low per month and therefore are in a different form from the other rate lines, which are based on a single quotation per week, but if the general trend of the Montreal rates be followed, comparisons can be made without difficulty.

Points to be noted in this diagram are:—

1. The remarkable parallelism of the main rate lines. By looking at the figures as a whole this fact can be clearly seen, and the point should be carefully noted. If the Argentine rate line be temporarily disregarded and attention fixed on the rate lines of Australia, Karachi, Odessa, and New York, the tendency is clearly apparent for these lines to maintain approximately the same proportionate distance from each other throughout the whole period. Marked temporary fluctuations occur in the individual lines, which may not instantly show themselves in the other lines, but there are few cases in which an important upward or downward movement in any one line does not stand in relation to a somewhat corresponding movement in the other lines within a period of two or three months.

2. That the spaces separating these main rate lines seem to bear some relation to the differences in distance from the United Kingdom. Odessa is 400 or 500 miles

<sup>1</sup> Appendix, Tables 32-33, pp. 117 to 124, Statistics, 1909-14.

## SESSIONAL PAPER No. 19b

more distant than New York; Karachi is almost twice as far from the United Kingdom as is New York; and the shortest route from any important Australian port is about three and a third times as long as the route from New York, though some routes from Australia by way of the Cape are about four and a third times the length of the route from New York.

3. That the New York and Montreal rates are, on the whole, the lowest rates to the United Kingdom enjoyed by any of the ports, and, except at one or two periods, the range of the rates from Montreal does not differ widely from the range of rates from New York. No exact comparison can be made between the Montreal line and the New York line because the former moves sharply between the highest and the lowest rates in each month while the latter flows between specific rates taken once a week. A study in detail of the relation between Montreal and New York rates would require more material than is supplied in this diagram.

4. That on two or three occasions Montreal rates appear relatively high or relatively low, but that Montreal rates are, on the whole, clearly subject to the same general forces as operate on other rates. It was in the first half of the navigation season of 1913 that Montreal rates were highest, relatively, being then higher than Odessa rates and as high as some Argentine rates. It was in this period Montreal had the greatest number of tramps shown in diagram 19. Montreal rates were not relatively high in October and November, 1912, although actually higher than in 1913, and there were no tramps. In the beginning of the season of 1912, when the range was much lower, Montreal rates were relatively high when compared with New York and Odessa and there were one or two tramps. It is possible, therefore, to amplify the inference from diagram 19 by stating that in the period examined tramps entered the Montreal wheat trade only when rates were relatively high.

5. That the tramp rates in fig. 2 tend to be higher than the rates in fig. 1. This is the case with every individual rate line. Some allowance must be made for the difference in the way the rates are quoted for these two figures, but as it is not understood that Liverpool regularly enjoys, under equal conditions, more favourable rates than other leading ports of the United Kingdom, it is probable that the liner rates included in figure 1 give to that figure a lower range than is found in the exclusively tramp rates in fig. 2. In other words, it is probable that tramps enter every wheat trade, as well as the Montreal trade, when rates are comparatively high. Among the details that may be noted under this heading is that New York and Montreal do not seem to have the lowest rates in fig. 2 as regularly as in fig. 1, the advantage often resting with Odessa. New York and Montreal seem to have paid relatively more for their tramps than for their liners. The merely occasional character of tramp business with Montreal is shown by the scattered quotations. The New York, or more correctly the "Atlantic Range" tramp rate line is also very much broken. It is suggested by fig. 2, therefore, that the tramp is a much more permanent factor in all the other trades than it is in the North Atlantic trade.

The Argentine rates cover a wider range in the period than any other rates. At the beginning of January, 1909, they held almost exactly their proper position in relation to distances, but for the following years they remained relatively low, while in 1912 and during parts of 1913 and 1914 they appear to have been unduly high. The somewhat erratic character of the Argentine rate line need not necessarily disturb such inferences as seem indicated by the general relationship between the other rate lines. One great trunk line of ocean travel from the United Kingdom and Northern Europe sweeps across the North Atlantic to the United States and Canada, while the other great trunk line sweeps through the Mediterranean, with branches to the innumerable ports there and on the Black Sea, and on through the Suez canal to the Indian ocean where it divides, one branch going to India and the Far East and the other to Australia. On account of the magnitude of the trade tributary to these two great trunk lines and to the variety of traffic and the number of ports, particularly on the

6 GEORGE V, A. 1916

Mediterranean and Far Eastern trunk line, it might be natural to expect that traffic conditions, and therefore freight rates, would tend to be somewhat more stable than in the case of the minor traffic route through the South Atlantic ocean. Moreover, Suez Canal tolls, which during this period averaged about \$1.25 per registered ton (Suez measurement), would prevent extreme reductions in rates from India and Australia, for this fixed charge, being on vessel capacity, would become relatively heavier as rates declined or vessels were less fully loaded. When traffic increased and vessels became relatively scarce, as they did in 1912, and when these world conditions coincided with some relative decrease in imports by the Argentine, it might be expected that rates in the South Atlantic trade would sharply rise. On the average for the whole period, however, the Argentine rates preserved about their relative place on the scale.

*Competition on the ocean.*—If it be assumed that the law of supply and demand has almost free, and even uncompromising, play upon the ocean, then it would be expected that there would be wide and sometimes rapid changes in rates; low rates in dull times such as preceded 1912; high rates when the pressure of traffic increases, and the supply of vessels becomes relatively or absolutely reduced, both of which conditions occurred in 1912. If, now, it be further assumed that there is effective competition among the 23,500 tramps, and, in certain classes of goods and under certain conditions, between the tramps and the 1,555 liners, and also more or less active competition among the liners themselves, then it would be expected that any tendency in rates would be quickly communicated to every ocean trade, and, whether rates were high or low, that in every trade, as soon as the machinery of competition could operate, rates would tend to be adjusted to a common basis of earning value to the vessels, that is, so adjusted that vessels in one trade could not earn much more than vessels in any of the other trades. This would mean an adjustment bearing some relation to distance, but modified by time, load factor, and incidental costs.

Whatever may be the correct conclusions upon the general theory of ocean rates, the facts regarding wheat rates for six years are as set forth in diagram 20. It has never been found practicable to effectively organize the 4,100 owners of tramp vessels for the fixing of rates. Competitive bidding is provided for in tramp markets at leading centers throughout the world and these centers are in constant cable communication with each other. Wheat is an entirely suitable cargo for tramps. It is also highly desired by liners to supplement other freight. Liners on the North Atlantic, before the days of freight conferences, occasionally carried parcels of wheat for nothing, and even purchased wheat when ballast was needed. Under conference conditions a minimum rate of 3 cents per bushel has been agreed upon, but even then a liner is free to carry up to 96,000 bushels at a lower rate on any trip when more ballast is required.

A combination liner, that is a vessel fitted to carry both passengers and freight, is probably, when on a good trade route, the most successful type of ocean carrier. Having some passengers, and some high-class freight, the combination liner, when it wants wheat, can afford to carry it at a rate the tramp cannot meet. A large proportion of the comparatively few combination liners in the world are in the North Atlantic trade, which is pre-eminently the liner trade. These liners take what wheat they want before the tramps can get a chance at it. To do this they must, as a general rule, keep their rates on wheat within the minimum fixed by the worldwide tramp competition, and within that limit they may be expected to demand on every shipment as high a rate as possible. Competition among the liners themselves must also be a factor of some importance.

*Effects on Canadian Wheat Exports.*—Returning, now, to the distribution of Canadian wheat exports as between Canadian and United States ocean ports, it may be

## SESSIONAL PAPER No. 19b

suggested that the facts clearly indicate that the liners in the Montreal trade first take what Canadian wheat they want; that the liners at Boston, New York, Philadelphia, and Baltimore have the second call on the business; and that when the liners are satisfied the tramps enter the trade and they enter it first at Baltimore and Philadelphia, and when the rates become relatively high they go to Montreal.

Fig. 2 of diagram 19, with its regularity of form, represents the capacity for wheat of the liners in the Montreal trade during the summer, and those in the St. John and Halifax trades in the winter. With liners, the capacity for wheat is, under ordinary conditions, the amount of cargo space not engaged for higher class goods. In the latter part of the season better-paying freight offers more freely and less space is left for wheat, but if the rates on wheat go up sufficiently the liners may enlarge their accommodation for freight. That the liners in the Montreal trade have the first call on the business is indicated, not merely by the comparative regularity of their takings, but by the fact that they sometimes take nearly all the wheat offering. So long as the Montreal liners will carry wheat across the Atlantic at rates not exceeding those of the liners from New York or other United States ports, the through Canadian route should be cheaper than the through routes by way of the United States, because the rates on Canadian wheat from the interior to Montreal are generally, if not always, lower than to the United States ports. Whether costs per unit of cargo on the Montreal route justify as favourable a rate as from New York may later be inquired into, as may also the practical effects on rates of the provision inserted in the contracts between certain liner companies and the Dominion Government in connection with the granting of subsidies, to the effect that rates from Montreal must not exceed rates from New York. At this point, however, it is sufficient to say that the Montreal liners seem to have the first choice of Canadian export wheat. Their immediate competitors are the liners at United States ports.

When the Canadian liners have no more space they care to devote to wheat at current rates, the competition for the balance is between the liners along the United States coast and the enormous fleet of tramps scattered throughout the world. If the United States liners desire more cargo they can secure what they want of the Canadian surplus wheat by making rates slightly below the basis fixed by general tramp competition. As Europe buys only so much wheat for delivery each month, there is not always serious conflict between seaboard shipments of Canadian and United States wheat, because if more Canadian wheat has been purchased for shipment in a certain month it is probable that less United States wheat will be pressing for export at that time. A glance back at the wheat lines running to Boston, New York, Philadelphia and Baltimore, in diagram 18, suggests that these lines are in proportion to the liner capacities at these various ports and do not represent any wild scramble for business.

After the liners along the North Atlantic have engaged to carry all the Canadian wheat they are prepared to take within the rates fixed by tramp competition, what remains over of the wheat must seek tramp vessels and offer rates to attract them. Charter rates from Atlantic range ports are regularly lower than from Montreal or from ports on the gulf of Mexico, and reasons could be advanced why they might be expected to be somewhat lower. Whenever tramp rates from Atlantic Range ports are lower than from other ports accessible to Canadian wheat, then the tramps will probably first enter the trade at Baltimore and Philadelphia, for the reason that these two ports, with the sanction of the Interstate Commerce Commission, enjoy a differential on ex-lake grain of three-tenths of a cent per bushel over New York and Boston, and, if a shipper can engage a tramp at Baltimore or Philadelphia for the same rates as from New York or Boston, he can save three-tenths of a cent per bushel by shipping from the former ports. On all rail shipments from or through Chicago, Baltimore enjoys a slightly higher differential than Philadelphia, and it may be for this reason Baltimore stands first in tramp shipments of grain. Tramp vessels may occasionally be in such positions that they are willing to report at Montreal on favourable terms

6 GEORGE V, A. 1916

as compared with any other North Atlantic port, but as a general rule rates offered for tramps from Montreal must be relatively high.

The above general interpretation of the facts adduced is offered only as a tentative working hypothesis. Very many more facts and conditions must be taken into consideration. Liners sail from United States ports to many ports not reached by liners from Canadian ports and some shipments may not be open to competition by Canadian liners. Again, wheat merchants in the United States buy Canadian wheat on the depressions in price accompanying extreme marketings and help to carry over the excess. The peaks shown in diagram 18 as diverted to the United States, appear in reduced form in the shipments from United States ocean ports, the balance being spread over several months to meet the conditions of European demand. In so far as individuals, whether merchants of the United States or of Canada, may choose to finance and to hold this excess in the United States, there is brought into play a diverting force of a different kind from those just considered. The whole appearance of the facts so far assembled suggests, however, that general transportation conditions on the ocean are among the fundamental causes of wheat diversion and that these other influences and motives may be only modifying factors.

But why are there not more liners in the Canadian trade? If the large surplus of Canadian wheat and other products which now seeks other ports of export could be carried to Montreal at least as cheaply, and generally more cheaply, why have not more vessels entered the regular trade between Canada and Europe? The distance on the Montreal route is rather shorter than on other routes and the time cannot be longer; what, then, of the load factor?

*Load factor on the North Atlantic.*—The importance of load factor in the transportation problem has already been discussed (p. 25). Liners are vessels committed to particular routes, and, in order that they may be able to command their share of competitive traffic, they must so arrange their load factor that they can afford to meet the rates of liners on alternative routes, and also the rates fixed by tramps on the basis of world-wide supply and demand.

To satisfy the conditions in any trade there must be vessels enough available to carry the peak of the load, but it may not be possible to keep regularly on any route liners enough for this purpose. With traffic irregularly offered the season's load factor might be so unfavourable and costs per unit of cargo so high, that competitive rates could not be met.

Canada's total exports to Europe of all classes of goods increased, with irregular monthly fluctuations, to a great peak in the autumn months, while the imports from Europe are pretty regularly distributed throughout the whole year. Measured by value, Canada, in the calendar year 1913, exported to Europe, in January, February, March, and April, goods to the value of \$43,146,701; in May, June, July, and August, goods to the value of \$69,838,920; and in September, October, November and December, goods to the value of \$124,894,678.<sup>1</sup>

On the other hand, Canada imported from the United Kingdom, from which the greater part of its European imports come, in the first four months of the same year goods to the value of \$46,646,995; in the second four months, goods to the value of \$51,840,477; and in the last four months, goods to the value of \$42,035,837.<sup>1</sup> The goods shipped to Europe are largely natural products of great bulk in proportion to value, while the goods imported from Europe, being chiefly finished products, occupy comparatively little cargo space. If the Canadian routes were to be supplied with liners capable of handling Canada's total trade with Europe, these liners must be numerous enough to carry the maximum shipments in any month, and in that case would have

---

<sup>1</sup> Compiled from records of the Customs Department.

## SESSIONAL PAPER No. 19b

extremely light cargoes eastbound during most of the rest of the year and westbound perhaps not enough cargo for ballast at any time. No account is here taken of the passenger business and of mail or other subsidies, which must affect the ability of liners to successfully handle somewhat irregular freight loads.

Under these conditions of Canadian trade with Europe, what load factor did the vessels on the Montreal route work out in the season of 1913? There was unloaded at Montreal in that season from all European countries 733,001 tons of freight, and there was loaded at Montreal for Europe, in liners and in tramps, 1,647,145 tons of cargo, giving a ratio of 2.23 eastbound to 1 westbound.<sup>1</sup>

Facts are not accessible to show the exact load factor on each of the competing United States routes. Although the quantity of freight to be moved inward, and the quantity to be moved outward, must primarily determine the distribution of shipping, statistics of tons in and tons out are obtainable for very few ocean ports in the world. National revenues are collected on values and port dues on registered tonnage, and there are records of the numbers and sizes of vessels and how much their cargoes would probably sell for, but little to show how full the vessels were, in or out. In the absence of published statistics for the United States one or two statements from authoritative sources may be cited. In his work on "The Ocean Carrier" (p. 41), Prof. J. Russell Smith, of the University of Pennsylvania, a recognized authority on transportation, says:—

North America sends across the North Atlantic more than twice as many tons of freight as Europe sends back.

In his evidence at Washington in January, 1913, before the Committee on the Merchant Marine and Fisheries. (Investigation of Shipping Combinations, Hearings, vol. 1, p. 610), Mr. Franklin, Vice-president of the International Mercantile Marine Company, quoted figures with respect to the Atlantic Transport Line, running between London and United States ports, showing cargo space not filled in the year 1912. These figures show that on the average the vessels of the Atlantic Transport Line brought to the United States on each trip 5,100 tons of cargo, and took back to London 10,784 tons, or a ratio of 2.11 to 1. The following direct question and answer are recorded:—

Mr. Hardy.—So that you export somewhere between two and three times what you import, is that the fact?

Mr. Franklin.—That is right.

These statements are in general accordance with the load factor existing in the Montreal trade, and theoretically it might be expected that substantially the same load factor would be found at all principal North Atlantic ports. Sailing eastbound, a vessel cannot carry more than a full load, or say a load of 100, and a large part of the bulk freight from North America can move as easily through one port as another and at only slight differences in cost. Large quantities of United States grain can without any difficulty be brought to Montreal and Canadian grain to the Atlantic Range ports of the United States. Under these conditions, why would a line company keep a vessel on the Montreal route, or the New York route, or any one route, if it could secure on that route an inward load of only a little less than 50, when an inward load of perhaps 75, or even 60, could be obtained upon another route? The vessel with the regular inward load of 75 could make sufficient concessions in rates to attract to any North Atlantic ports all the cargo it could carry eastbound. Under free competition vessels would at once be diverted from the less profitable to the more profitable route until an equilibrium was established; and no agreements or understandings could long prevent an adjustment in some manner. Conditions change every season, and the whole subject is complicated by passenger traffic, subsidies, port

<sup>1</sup> Compiled from records of the Customs Department.

differentials, general railway interests, and innumerable other matters. It is not improbable, however, that among the liners load factor tends to be equalized all along the North Atlantic coast.

What inward cargo was secured by the vessels on the Canadian routes? In the fiscal year ending March 31, 1914, Canada imported from Europe goods to the value of \$181,762,545. Of this total, goods to the value of \$169,527,341 arrived at Canadian ocean ports, and goods to the value of \$12,235,204 arrived in transit through the United States.<sup>1</sup> That is to say, 93.27 per cent of Canada's purchases in Europe came directly to Canadian ocean ports. In the same year, Montreal received from all countries goods to the value of \$6,331,989 in transit to the United States on through bills of lading, and Canada exported to the United States "goods not the produce of Canada," that is, goods imported from other countries but not on through bills of lading, to the value of \$13,575,474.<sup>2</sup> It is hardly practicable to determine how much of this freight, of a total value of \$19,907,463, handled en route to United States points, came from Europe, but making reasonable allowance it is evident that the freight carried inward from Europe by vessels sailing to Canadian ports must have been practically equal to all freight from Europe that was destined to Canada, and on the Montreal route this gave an inward load of a little less than 50 in comparison with the outward load of 100.

If Canadian ports receive practically all the freight belonging to Canada, and if Montreal receives its full share, what would happen if vessels enough were introduced into the Montreal trade to carry all the Canadian wheat exports? If in 1913 this has meant a doubling of the total number of vessels between that port and Europe, would each vessel have had an inward load of only 25 against its outward load of 100, or is there any way in which more intransit freight for other countries could have been secured? If this latter had not been found practicable, then presumably the vessels in the Boston, New York, Philadelphia, and Baltimore trades would have retained an inward load of approximately 50. Could such a condition have been maintained, and how would the cost have been distributed?

Canada has never yet been able to secure at Canadian ports enough vessels to carry all the Canadian exports; that is, no measures so far taken to that end have been sufficient to seriously disturb the simple economic balance of the load factor along the North Atlantic coast. In so far as the proposed Georgian Bay canal would be expected to very greatly increase the proportion of Canadian exports through Canadian ocean ports, it will clearly be necessary to arrive at some estimate of the permanent counteracting force of the general load factor, or at least of the cost involved in maintaining an ocean service on a less favourable economic basis than that prevailing on competing routes.

Canada's position in relation to the problem of ocean transportation is different from that of any other country at the present time, for no other country has access to so many ports in a foreign country that can be reached almost as conveniently and as cheaply as its own ports, and no other country, except the United States, is served by an ocean trade in which there are so many liners, which, therefore, dominate its export traffic.

OCEAN FREIGHT RATES ON WHEAT, SEPT. to DEC. 1915. to UNITED KINGDOM  
FROM CHIEF EXPORTING COUNTRIES

Fig. 1 As reported at Liverpool, one rate weekly

Fig. 2 Tramp Charter Rates as reported at London. High and Low per week.

## OCEAN FREIGHT RATES IN 1915.

It has not been found possible to complete for this report a comparative examination of the movements of traffic and the courses of prices and of freight rates under the abnormal conditions of 1914 and 1915. A few facts concerning ocean freight rates on wheat in the last four months of 1915 may, however, be briefly considered by way of supplement to the general survey of ocean rates for the six years immediately preceding the war.

In diagram 21 are shown the movements of wheat rates in the principal ocean trades between September 19 and December 31, 1915.<sup>1</sup> In fig. 1 rates on the first day of each week have been furnished, as in the case of diagram 20, by Broomhall's Corn Trade News, and for fig. 2 the high and low tramp rates per week by Comtelburo's Daily Freight Register. As Montreal rates seem to have kept within the limits of the New York rates during all this period, only the latter are quoted.

It will be noted that the whole range of rates is extremely high. For the greater part of the period liner rates in the New York trade were 40 cents, and at one time touched 42 cents per bushel. Such rates were never before reached under modern conditions. In 1910 the average wheat rate from New York was 3.18 cents per bushel, and for the five years 1909 to 1913 the average was 4.83 cents per bushel.

Rates in the North Atlantic trade had witnessed a spectacular rise which culminated in the week of September 26 in a final leap of 10 cents per bushel. In its course the New York rate line had crossed the Karachi line, although the Karachi route is twice as long, and about October 10 the New York rate was higher than the Argentine rate, while the Australia rate was comparatively very little higher. At this period North Atlantic rates were not only unprecedentedly high in themselves, but were relatively higher, when compared with other rates, than at any previous time. The diagram shows by what stages the rates, thus thrown into confusion by the upheaval in the North Atlantic trade, began to readjust themselves. It will be observed that this readjustment was by way of a rise in the other rates and not by a drop in the New York rate, and that the readjustment was not quite accomplished up to the end of December, chiefly because the Australia rate had not continued its rise. Were these developments in accordance with the laws and tendencies suggested as generalizations from the facts of normal times or to what extent had new forces been introduced?

During the progress of the war so many vessels had been requisitioned for military purposes, and so many interned and destroyed, that the world's mercantile fleet of ocean carriers had suffered a material reduction. Overseas trade had also at first been seriously affected, but the war soon created a large trade of its own and with an improvement in general commerce the demand for tonnage had become very insistent. There followed an uncompromising application of the law of supply and demand.

In the autumn of 1915, the United States and Canada were the only important sources of wheat supply for Europe. Southern Russia and Roumania were still blocked at the Dardanelles, and Northern Russia could send out only very small quantities through Archangel; the Government of India was in control of the supplies in that country and was conserving the surplus; Australia, owing to the partial crop failure in 1914 and pending the harvesting of the new crop, had nothing to export; and the Argentine had already disposed of the greater part of its 1914-15 surplus. Demand for cargo space for wheat thus became extraordinarily active in the North Atlantic trade.

<sup>1</sup> Appendix, Table 34, p. 125, Statistics.

6 GEORGE V, A. 1916

So much space had never before been needed in that trade, for North America was called upon to furnish nearly all the import requirements of Europe. The first effects on rates were therefore found in the North Atlantic trade. At the new high level of rates the North Atlantic trade attracted vessels enough to continue to ship each week ample supplies according to the estimated average weekly needs of importing countries, but as rates did not weaken there was apparently no large surplus of vessels available.

India shipped no wheat at all during this period but made small shipments of barley. The Argentine shipped some wheat and a good deal of corn, and Australia was waiting for the new crop. There was no pressure in these trades, at least for prompt shipment. India's harvest was some months distant, but it soon became necessary for Australia and the Argentine to engage tonnage for the movement of the new wheat crop, which would be ready for market in December and January. In Australia, in view of the alarming conditions in the freight market and in order to eliminate the element of local competition, the Government assumed the exclusive management of export shipments and it was reported that certain firms of ship brokers had been commissioned to engage up to 1,800,000 tons of freight room for wheat. In the Argentine the business was left in private hands.

In the regular line trade with the Argentine and with Australia were many vessels, and other vessels would from time to time sail for the South Atlantic or for the Far East with special outward cargoes, but the capacity of these vessels would not be adequate to move the quantities for which shipment was desired, and to obtain additional vessels meant offering rates equally profitable with those prevailing in the North Atlantic trade. The United States and Canada had enormous surpluses, and could continue to employ shipping. By the time its new crop was ready the Argentine had bid fully the equivalent of the New York rates, but the Australian Government had fixed an arbitrary limit of 95 shillings per ton (about 61 cents per bushel), beyond which it would not authorize a contract. Under these conditions, Australia could not expect to divert free tonnage from the other trades, but might secure such vessels as had other business in the Far East.

In 1910, when the average New York-Liverpool "berth" rate on wheat was 3.18 cents, the average River Plate-Liverpool rate was 5.78 cents, or a ratio of 1 to 1.82. If the New York rate of 40 cents per bushel be multiplied by 1.82, the result is 72.80 cents. Compared with the average New York rate for the whole five years, 1909-13, of 4.83 cents per bushel, the average Argentine rate was 8.60 cents, giving an average ratio of 1 to 1.78. The distance is about 1 to 2, but modified by time and load factor. The ratio between the average New York and Australia rates for the same five years was 1 to 3.46, the distance on the Australia route being  $3\frac{1}{2}$  to  $4\frac{1}{2}$  times as great as on the New York route, the shorter Australia routes being subject to Suez Canal tolls and delays. The Karachi route is about twice as long as the New York route, but its average rate for the five years was about 2.41 times the New York rate, perhaps influenced by the passage through the Suez canal. The Odessa route is only about 15 per cent longer than the New York route, and its average rate was about 1.23 times the New York rate. These calculations are based on the Liverpool quotations, and can be accepted only as a rough and ready measure of comparative rates. The tramp rates cannot be satisfactorily averaged because in some trades quotations are so scattered, but it would appear that on the whole the New York basis was relatively higher than with liner rates, while, compared with the other trades, Odessa and Karachi had relatively lower tramp rates than liner rates. Contrary to conditions before the war, tramp rates in the New York trade in September, October, and November, 1915, were rather lower than liner rates, but the ranks of the liners had been thinned by requisitioning and interment, and in the enlarged trade they had become a much smaller factor than formerly and, moreover, the great quantities of higher-class freight offering made it less necessary to underbid the tramps for wheat.

## SESSIONAL PAPER No. 19b

Estimating from the experience of the above five years, it would be necessary for Australia to offer a rate of approximately \$1.35 per bushel in order to attract vessels that could find employment in the New York trade at 40 cents per bushel, or in the Argentine trade at about 70 cents per bushel. Such a rate would, however, be absolutely prohibitive under competitive conditions; and yet it would be relatively not as high a rate as Australia paid in 1910, when the average rate was only 14.13 cents per bushel.

The conditions in 1915 thus bring out clearly one practical bearing of competitive ocean freight rates on international trade, which might not strike the attention in normal times. Rates tend to rise with the pressure of demand, and competition then tends to adjust rates in every trade to the same basis of earning value to the vessel, but as rates go up the spread widens in direct ratio, and it is the spread which makes the trading margin for one country as against another. When the New York rate is 4 cents per bushel, the Argentine rate 7 cents per bushel and the Australian rate 13 cents per bushel, North American wheat at the seaboard has a spread of 3 cents per bushel over Argentine wheat in the same position, and 9 cents per bushel over Australian wheat; but when the basis for New York has moved to 40 cents per bushel the spreads have become respectively 30 cents per bushel and 90 cents per bushel. Vessels earn no more in the long-voyage trades than in the short route across the North Atlantic, and there is no discrimination, but North America has been established in an almost impregnable trading position. If, under these conditions, Europe must have wheat from these three countries, North America can sell its surplus at a handsome profit before the Argentine can get cost and before Australia can export at all. The laws of supply and demand and of competition operate in commerce as well as in transportation. High ocean freight rates confer a temporary commercial advantage on countries served by short-voyage trades, but ultimately the injurious effects of excessive rates must, of course, tend to react even on the countries at first benefited.

Western Canadian wheat fields are further from the ocean than the Argentine wheat fields, and although interior transportation costs per mile in Canada are more favourable, the Argentine is in a good competitive position when the spread in ocean rates is only from 3 to 6 cents per bushel, but when the spread is 30 cents per bushel, Western Canada can obtain a good price for its wheat, can absorb the costs of all-rail transportation in the winter months and then can undersell Argentine wheat in Europe even in the very months in which Argentine wheat is intrinsically cheapest. Australian wheat fields are much more convenient to the ocean than those of Western Canada, and when ocean rates are only from 10 to 12 cents per bushel higher than the New York rates, Australian hard wheat can compete with Canadian hard wheat in the markets of the United Kingdom, but when very much greater spreads appear, this becomes impracticable. Even the arbitrary maximum rate of 61 cents per bushel fixed by the Australian Government in October, 1915, left a spread of about 20 cents per bushel, which is much greater than the difference in interior costs; and it will be instructive to learn how much wheat could be exported from Australia at a rate not half as profitable to the vessels as the rates prevailing in other trades, and whether compensation was obtained from rates on other goods inward or outward. Australia might, of course, be relieved from the dilemma thus created by war conditions through the extension of control by the governments of Europe over ocean traffic and shipping during the continuance of the war.

It is evident that not only do the general conditions of ocean transportation largely determine the distribution of international commerce, but that in the one particular of a change in the basis of freight rates, and even when there is no discrimination for or against any route, a factor exists of such varying power that it may seem to produce different kinds of effects according to the degree to which rates are raised or lowered.

## BANK RETURNS IN CANADA.

Trade and traffic must be financed, and therefore bank resources and methods, rates of interest, and rates and facilities in connection with international exchange, are fundamental conditions of production, commerce and transportation. Financial conditions may assist or check development and influence the direction it takes, and may be among the causes of the distribution and diversion of traffic. For these reasons, financial facts should be examined together with all other underlying facts, and with equal care. At this stage only a few of the main features of the resources and business of the chartered banks of Canada will be presented.

To what extent do the Canadian chartered banks assist in the financing of ordinary business in Canada? What proportion of their resources do they devote to this purpose? How is the load they carry in this respect distributed throughout the year? As safe and convenient depositories, banks give service to the public, but their great service to business is in the advances they make to facilitate the turn-over of business. Most of the advances for commercial business purposes appear in the accounts as "Current loans and discounts in Canada." This class of loans only will be considered, in its relation to other important banking facts; although it should be borne in mind that the banks also make other loans in Canada, such as loans to Governments, and "Call and short" loans on the security of stock, debentures and bonds, which are not all in connection with Stock Exchange business, but are often the form in which advances are made for commercial business. Call loans and loans to Governments are not relatively very large and the totals do not widely fluctuate.

In accordance with the Bank Act, the chartered banks submit to the Minister of Finance statements covering the condition of their principal accounts at the end of each month. These monthly returns contain all the main items of a balance sheet which are of direct concern to the public. The assets statement gives the measure of the total resources of the banks and sets forth what they have done with these resources, whether they have loaned them to clients, invested them in securities or buildings, or hold them in their vaults in the form of coin or Dominion notes. The liabilities statement shows where the banks have obtained these resources, whether from shareholders, from depositors, from their power to issue banks notes, or from miscellaneous sources. In diagram 22, fig. 1, the important items of these monthly returns bearing on the financing of general business in Canada are presented for the six years 1909 to 1914. This diagram gives amounts in dollars, while diagram 23 gives the relations in percentage of these amounts to the total resources of the banks in each month.<sup>1</sup>

Line, No. 1 in fig. 1, diagram 22, represents the total assets of the banks at the end of each month, that is, the total resources of the banks. The ability of the banks to give service must bear a direct relation to their total resources, varying as these resources vary. From the beginning of 1909 to the middle of 1913, the total resources of the Canadian chartered banks steadily increased, but in a slightly waving line, indicating small relative expansions in resources about the months of May and June and somewhat more marked expansions in October and November, the latter partly accounted for by the exercise of the power to issue excess currency at that time. Whether or not the increase in the resources of the banks kept pace with the increase in general trade and therefore with the need for banking accommodation will not here be inquired into; but it is clear that the resources actually in hand at any particular time will set the limits within which service can be performed.

---

<sup>1</sup> Appendix, Table 37-38, pp. 128-133, Statistics, 1909-15.

# MONTHLY RETURNS OF CANADIAN CHARTERED BANKS 1909 TO 1914

FIG. 1. CURRENT LOANS IN CANADA, AND OTHER PRINCIPAL BANKING ACCOUNTS.

FIG. 2. BANK CLEARINGS IN COMPARISON WITH DEPOSITS AND CURRENT LOANS.

## SESSIONAL PAPER No. 19b

Line No. 2 indicates total liabilities other than liabilities to shareholders. Line No. 2, therefore, divides the total resources of the banks into two parts. From the base of the figure to this line is the part of the total resources derived from depositors and other creditors, and created by the exercise of the power to issue bank notes. This is by far the greater part of the banks' resources. Between line No. 2 and line No. 1 is the part supplied by the shareholders in the form of paid-up capital, reserve accounts and profit and loss balances. It is the irregularities in line No. 2 that cause the irregularities in line No. 1; that is, it is the variations particularly in the deposits and bank note circulation that occasion the fluctuations in the line of total resources, the amounts belonging to shareholders remaining fairly constant but showing a steady increase.

Certain particulars are given separately in the remaining lines. Starting at the base of the figure, the red line, line No. 8, gives the greatest amount of bank notes in circulation at any time during each month. The power to issue bank notes is limited to the amount of paid-up capital, plus any amounts deposited in the Central Gold Reserves, but provision is made in the Bank Act for the issue of additional bank notes during the usual season of moving the crop to an amount not exceeding 15 per cent of the combined unimpaired paid-up capital and rest funds of the banks, and certain further extensions of this power were granted as temporary war measures. Bank notes are issued only as there is a demand for a circulating medium of this kind, and it will be noted that, except in the autumn months, the demand has not led to the continuous full exercise of the powers of the banks in this respect.

Line No. 7, representing paid-up capital, is practically a straight line with a slight steady rise. The paid-up capital forms only a small part of the total resources of the banks. The "rest or reserve" funds of the banks have grown more rapidly than the paid-up capital until they are almost equal to the latter in amount. The rest funds added to the paid-up capital give the total fixed contribution of the shareholders to the resources of the banks, and these combined rest funds and paid-up capital accounts are indicated in line No. 6. It is the amounts represented by line No. 6, plus profit and loss balances, that make up the spread between line No. 1 and line No. 2.

Canadian chartered banks do not confine their business to Canada, but participate in the international operations of Canadian trade and Canadian finance, and through their own branches or through agencies they receive deposits and make loans in other countries. Loans and deposits elsewhere than in Canada are included in the totals of the assets and liabilities, and will later be referred to, but in this diagram only deposits in Canada and current loans in Canada are given.

Deposits by the public are of two kinds, those payable after notice or on a fixed day, commonly called "savings department" deposits, and those payable on demand, which ordinarily earn no interest but form the funds against which bank cheques are issued. Banks must be prepared to meet instantly all demands upon them, and cannot, therefore, loan out or invest for fixed terms all the funds held by them, but must keep in cash and immediately realizable securities such amounts as may be necessary to meet any probable demands. As a basis for making current loans, savings deposits can be counted upon in a different way from demand deposits. For this reason savings deposits in Canada are shown separately in the broken yellow line, line No. 5. It will be noted that deposits of this kind increased throughout the period without any very marked variations. If demand deposits are added to savings deposits, the result is shown in line No. 3, which gives the total deposits by the public in Canada.

Coming now to line No. 4, we have the amounts advanced each month in the form of current loans and discounts in Canada. These amounts, as already pointed out, do not include call loans in Canada or loans to Canadian Governments, and, of course, do not include loans made elsewhere than in Canada. It will be noted:

1. That line No. 4 moves steadily upward from February, 1909, to September, 1913. The total of current loans increased year by year and almost month by month. Indeed, in the above fifty-five months there were only seven occasions on which the current loans in any month were not greater than those of the preceding month. So even an expansion of business is rather remarkable. It is clear that there is nothing erratic in this part of the banks' business. So far as totals are concerned, there was no withdrawing of resources from loans in one year or in one part of the year, and no sudden expansions at any time. Total loans were not reduced in the summer months to accumulate resources for the autumn, for summer loans were in each year greater than the spring loans had been, and the loans each autumn were greater than the loans in the summer, while the loans the following spring were greater than in the previous autumn. Loans expanded as total resources increased, but obviously at a slightly more rapid rate.

2. That current loans in Canada, which are made for fixed terms, were greater than the deposits in Canada placed in the banks for fixed terms, or subject to notice, and that the current loans increased faster than the savings deposits.

3. That after September, 1913, loans were actually reduced in amount, when the reaction in business had set in, and that the trend of the line became downward.

Business in Canada rapidly expanded from 1909 to midsummer, 1913, but varied in activity and volume at different periods of the year. Bank loans had no important seasonal variations. The service rendered by anything depends, however, upon how often it is used in a given time. If business in Canada were turned over only once a year, and if bank loans were all for twelve month periods, then only one service in a year would be performed by the resources devoted to bank loans; but if business were turned over twice a year and loans averaged six months, then the effectiveness of the loans would be double, and use every three months would quadruple the service. While no facts have been obtained to show the average time of turn-overs in general business in Canada, nor the average term of current loans, there can be found in the records of bank clearings evidence as to seasonal activity in the use of such banking resources as were at the disposal of individuals. Most business payments are made by cheques drawn on demand deposit accounts, which accounts are partly at least the product of bank loans. If a cheque passes from a client of one bank to another client of the same bank the exchange is adjusted within that bank without any public record; but if the exchange takes place between clients of different banks then the adjustment is made through the clearing house and the totals so adjusted at the various clearing house centres are regularly published. Clearing house returns are, therefore, the records of the amounts that change banks from time to time.

In fig. 2 of diagram 22 the monthly totals of bank clearings in Canada are shown,<sup>1</sup> the solid black line giving the total clearings in each month for all Canada, the dotted black line indicating the proportion of the clearings in eastern Canada and the broken line the proportion in western Canada, including Fort William after the organization of the clearing house there in 1911. The lines of total deposits, demand deposits and current loans in Canada are added to this figure so that comparisons of amounts involved can be made. It will be noted that bank clearings show a wide range of fluctuations, but that each year has the same characteristics, an increase in May and July and a much greater increase in October and November. There are some differences between eastern and western clearings. In the last quarter of the year, from 1909 to 1913, bank clearings were more than double the amount of the demand deposits. If it could be assumed that only cheques on demand deposit accounts, and bank notes withdrawn from such accounts, were cleared, then in the last three months of the year all the amounts in all demand deposit accounts in Canada changed banks

<sup>1</sup> Appendix, Table 39, p. 134, Statistics, 1909-15.

PRINCIPAL BANKING ACCOUNTS  
AS PERCENTAGES OF TOTAL RESOURCES  
1909 TO 1915

## SESSIONAL PAPER No. 19b

every two weeks. On several occasions an amount equal, or almost equal, to the total of current loans was exchanged between banks in a month. This is great activity; and it takes no account of the very large aggregate of adjustments made within individual banks which do not appear in the clearings. There is evidently business pressure twice a year which is met by the frequency of the turn-over of the banking resources at the disposal of individuals, but the total of the resources the banks afford to individuals does not greatly vary. Perhaps so rapid a turn-over in the autumn is undesirable and implies undue strain, or perhaps only at that time is the financial machinery working to full efficiency.

Further interesting light is thrown on current loans in Canada when percentages are examined. In diagram 22 the current loan line, line No. 4, is one of the most regular, but in diagram 23, where the various accounts are represented in percentages of the total resources, it becomes the most irregular of all the lines. Bank deposits and other funds fluctuated, but the loans were very steadily maintained and therefore the percentage relation showed marked changes. Then it is manifest that between 1909 and September, 1913, the banks put out in current loans an increasing percentage of their resources each year. Current loans in Canada expanded relatively faster than any other items in the accounts. The contraction, after September, 1913, is very striking in the percentage line. But perhaps the most interesting of all the points in connection with this line is that it plainly shows that the peak load is encountered by the banks, not in the autumn, but in the spring months. In every year this is true. With the aid of a little greater bank note circulation, then required, with slightly greater deposits and with greater activity in the turn-over, the banks can handle the rush of the autumn business and the moving of the crops with a smaller relative dead load than falls upon them when the activity of settlement declines after the turn of the year and it becomes necessary to carry over for several months what was not liquidated in the autumn. If, according to sound banking practice, there is only a certain percentage of resources which can safely be devoted to current loans, then it is clear that, as business is at present organized in Canada, a strain tends to fall upon the banks between January and May. This is a very important fact.

If it should be decided, for example, that it would be in the interests of the country that a larger proportion of the wheat should be held over so that excessive autumn marketings could be avoided, the question would arise whether with the present banking resources it would be practicable to carry a much heavier load from January to May, and this would lead to such other questions as to how banking resources could be increased, or how the business system could be altered to better distribute the load and to produce more frequent turn-overs and particularly in the spring months. How far does pressure from the necessity of securing liquidation at least once within the year account for the dumping in the autumn of many products, including wheat?

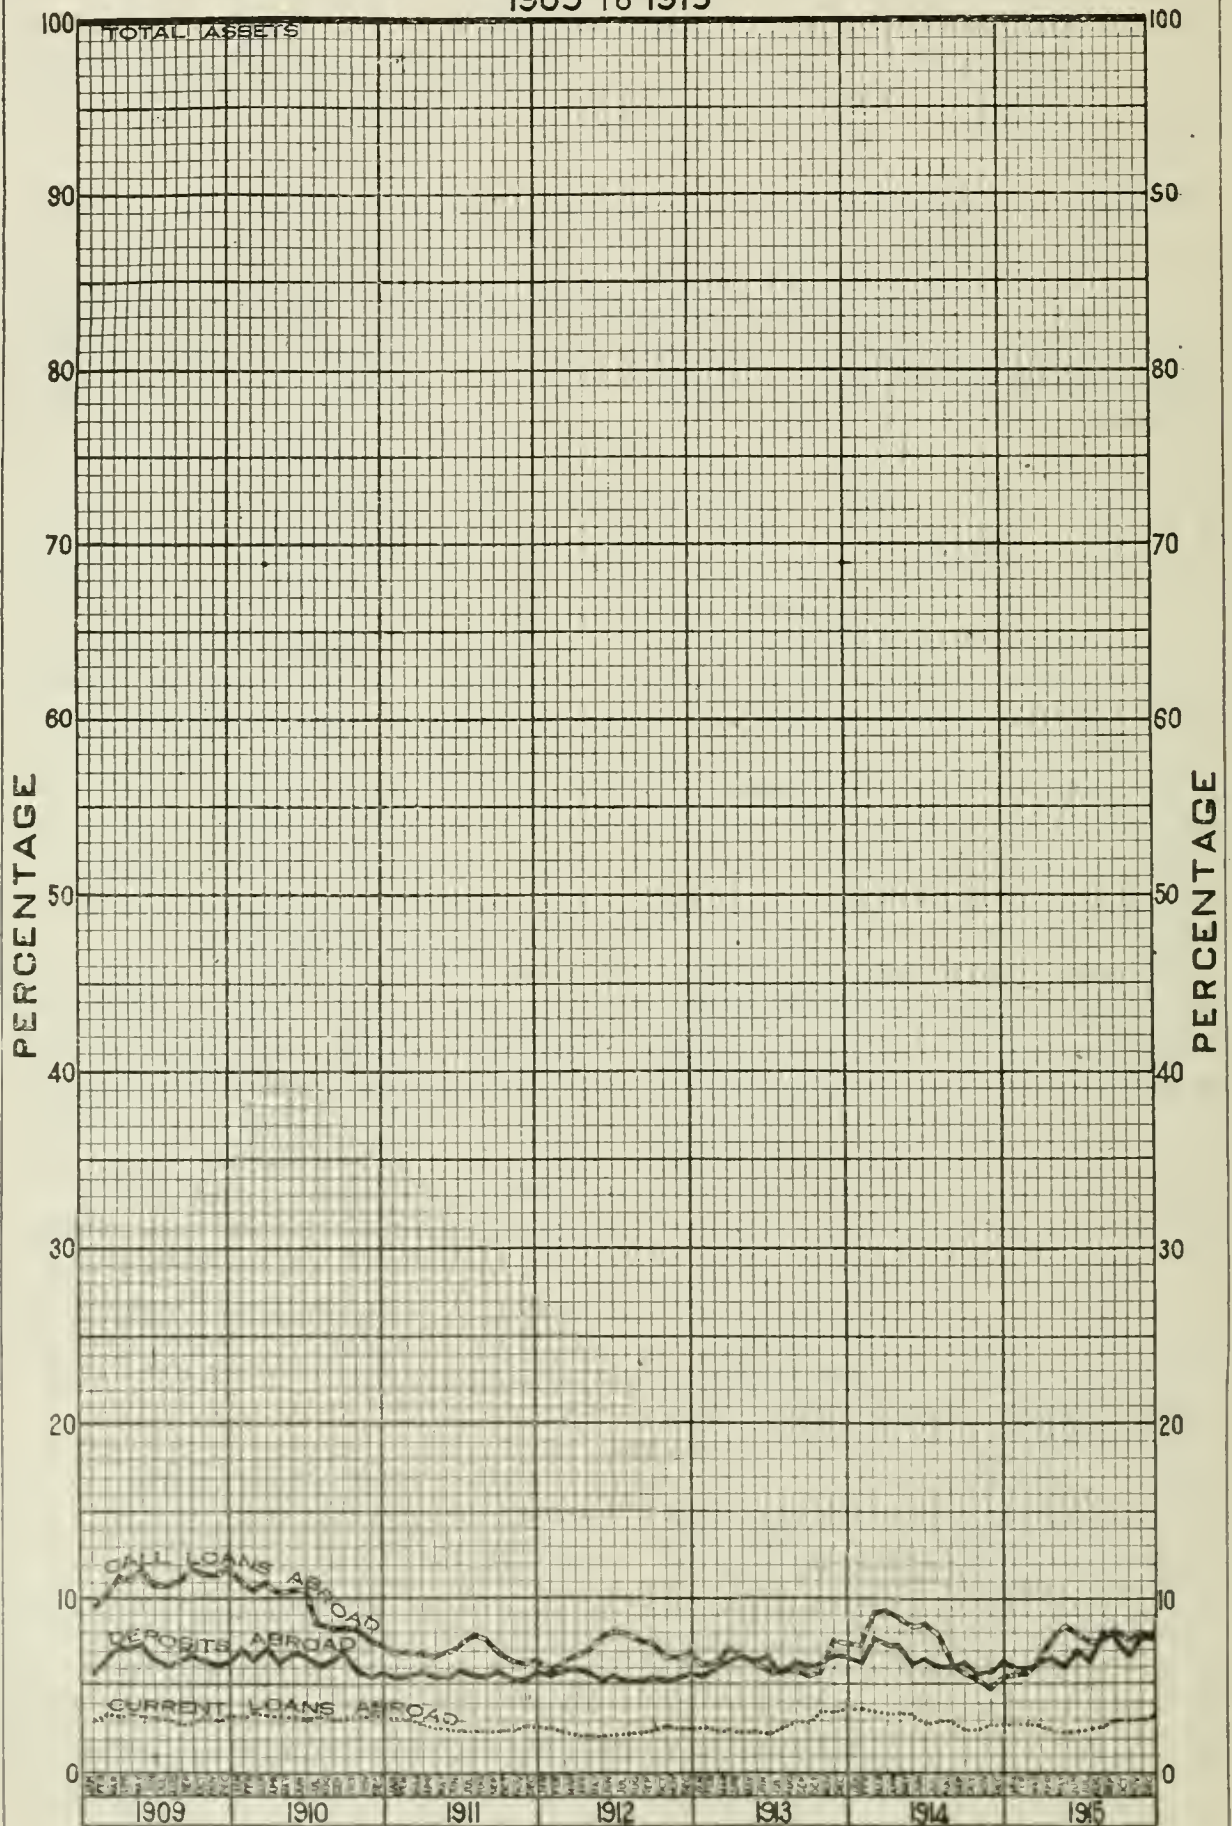

Do Canadian banks devote a proper proportion of their resources to current loans in Canada? Could still further assistance be rendered in this way, consistently with sound banking and the preservation of the absolute essentials of safety and of cash and liquid reserves against every probable demand?

Could banking resources be increased out of local financial supplies? Banks mobilize the financial resources of a country. Have Canadian chartered banks satisfactorily performed this function, that is, are the banking resources as large as the conditions in Canada make practicable? Individual banks can be judged only according to their efforts to increase their own resources, and according to the use they make of such resources as they have. If more resources are needed, a problem would exist which might not involve special responsibility on the part of any individual bank, nor would responsibility necessarily fall solely on the banks collectively. If present banking resources are not adequate to the needs of Canadian business, would it be wiser to seek temporary additional resources to meet the times of pressure, or to

# CALL LOANS, CURRENT LOANS AND DEPOSITS ELSEWHERE THAN IN CANADA, AS PERCENTAGES OF TOTAL RESOURCES OF CANADIAN BANKS

1909 TO 1915

## SESSIONAL PAPER No. 19b

increase the permanent resources which would then become a permanent annual charge upon the country? Or to what extent should both means be adopted?

Or should a complete, or a partial, solution of any difficulty that may exist be sought in changes in business methods and in the speeding up of the financial machinery? If the business system of the country is such that long terms of credit are granted and if, because of so much one-crop farming, many series of outstanding credits can be liquidated only once a year, then the same total of financial resources will accomplish much less than under a system of more frequent settlements. Again, if settlements are evenly distributed throughout the year instead of being crowded on midsummer and the autumn, the same amount of resources will do more work. These questions are merely mentioned here as among the more obvious points suggested for consideration by the facts submitted.

With regard to the other lines in diagram 23, a few observations may be made. Line No. 1, total assets, or total resources, is, of course, a straight line at 100 per cent. From the beginning of 1910 to the end of the first quarter of 1915, the total liabilities line adhered closely to the level of 84 per cent. Whether or not the contributions of shareholders are as large as they should be, it is evident that during this period they increased proportionately as fast as the deposits and other resources of the banks. In 1909, during the recovery from the depression of 1907-8, deposits increased faster than capital and rest accounts, and again in 1915 the growing accumulations of public money in the banks, gave to the line showing liabilities to the public an upward turn.

Total deposits in Canada, line No. 3, varied only a little in percentage during the whole period, but formed a bigger percentage of the banks' resources in 1911 and 1912 than in other years. Lines Nos. 5 and 6 show separately savings deposits and demand deposits. It will be noticed that these two lines tend to approach each other from 1909 to the end of 1913. Savings deposits did not hold the same rate of increase as other bank funds, while demand deposits improved their percentage. Relatively more funds were kept in the open active accounts during 1911, 1912, and 1913. With the contraction of business in the second half of 1913, savings deposits began to show a relative increase until the revival of business in the second half of 1915. It will be observed that the fluctuations in these lines occur at different times of the year, increases in demand deposits occurring at those periods which, as indicated by the bank clearings, are the periods of greatest activity in making settlements. Savings deposits stand relatively highest at the beginning of each year. Has this any connection with the fact that the banks are able, or are willing, at that time to place a somewhat larger proportion of their funds in current loans?

Line No. 7 gives the maximum bank note circulation in percentage of the total resources. Apparently from  $6\frac{1}{2}$  per cent to 8 per cent of the resources of the banks is required to be in the form of a circulating medium.

Diagram 24 is added to show in its relative proportions the ordinary banking business done abroad by Canadian chartered banks. Call loans and current loans are placed and deposits are accepted by Canadian banks "elsewhere than in Canada." In diagram 24 these accounts are represented in their percentage relation to the total resources of the banks. Obviously the business done abroad is comparatively small. Canadian banks derived about 6 per cent of their total resources from deposits, and placed about 3 per cent of their resources in current loans, elsewhere than in Canada. But the banks also placed call loans abroad varying from almost 12 per cent to less than 5 per cent of their total resources. The net amount of resources employed abroad, subtracting the deposits from the call and current loans, therefore varied from almost 9 per cent to less than 2 per cent. Different banks engage in this business in widely differing degrees, but only totals can here be considered. Call loans abroad show the highest percentages in 1909 and 1910, when business in Canada had not fully recovered from a general depression. The percentage increased again in

the early part of 1914 during another general depression. Larger percentages were carried abroad in the middle of the year than in either the spring or the autumn. Funds were evidently withdrawn from abroad in preparation for the moving of the crop, but it is interesting to note that the extreme withdrawals are in most years in the month of January, in preparation, apparently, for the peak load of current loans in Canada. After the outbreak of the war in 1914 these loans were sharply reduced. Banks explain call loans abroad as a desirable investment for funds that must be kept as immediately realizable reserves.

A study of the principles and the policy of banking cannot be undertaken as being within the scope of the special problems referred to the Georgian Bay Canal Commission, and this outline sketch of certain banking conditions has been introduced principally to suggest that, in connection with these special problems, discussion should recognize that there are elementary facts in finance, and that the problem of finance is inseparable from the problems of development and of distribution.

Furnished by Frank L. Neall, Manager Consolidated News, Statistics, and Transportation Bureau, Philadelphia, as shown by records of Peter Wright and Sons, etc.

NOTE.—April 3, 1915—For a number of years there were no oats shipped in full cargoes from United States, say until about 1890. During a considerable portion of the period, records were only kept of shipments of *Wheat and Corn* in full cargoes, and subsequently, oats were added. No records for many years were kept of shipments from Philadelphia of Rye, Barley and Flaxseed. The foregoing is probably as correct a statement of number of vessels loading full cargoes of grain at the respective ports as it is practicable to prepare, and they embrace substance of statements furnished at various Differential Hearings and also in connection with Advisory Board of 1881, and prior to that time, Statistics that were periodically submitted to Penna. R. R. and used by that company in their negotiations and current arrangements with the other Trunk Line Railroads, all of which were compiled by Peter Wright & Sons, Philadelphia.

Bank Returns in Canada.

STATEMENT Showing Total Assets, Current Loans in Canada, Current Loans Elsewhere than in Canada, Call and Short Loans Elsewhere than in Canada, With Percentage of Same as to Assets.

Compiled from the Clearing House returns.

**PRECIS INDEX OF HANSARD DEBATES OF THE HOUSE OF COMMONS AND  
THE SENATE ON THE GEORGIAN BAY SHIP CANAL, 1902-13.**

**HOUSE OF COMMONS, "HANSARD DEBATES."**

*(Compiled for the Georgian Bay Canal Commission, by Henri Roy, Librarian of the  
Department of the Secretary of State.)*

**1912-13.**

Question by Mr. MURPHY.—P. 1154, Dec. 16, 1912.

Bill 45, Mr. WHITE (Renfrew).—P. 1266, Dec. 17, 1912; 2nd reading, p. 1448, Jan. 14, 1913.

Bill 45, Debates on 3rd reading.—The amendment is to increase the bonding power from \$100,000,000 to \$175,000,000, p. 2591, February 3, 1913.

Resolution by E. B. DEVLIN.—P. 2622, Feb. 3, 1913; p. 3074, Feb. 11, 1913; Senate amendments.—P. 3741, Feb. 20, 1913.

**1911-12.**

Question by Mr. LEMIEUX.—P. 544, Nov. 29, 1911.

Bill 30, Mr. WHITE (Renfrew).—1st reading, p. 795, Dec. 5, 1911; 2nd reading, p. 1122, Jan. 12, 1912; 3rd reading, p. 4699, March 8, 1912.

Questions by Mr. DEVLIN on Government Policy.—P. 3060, Feb. 14, 1912; p. 1970, Jan. 26, 1912; p. 6785, April 1, 1912.

Question by Mr. MURPHY, French River, vote of \$100,000.—See p. 6657, March 29, 1912.

Question by Mr. DEVLIN.—P. 6729, March 30, 1912.

**1910-11.**

Mr. GERMAN (Welland).—Reads part of a *Globe* article, asks if \$3,000,000 is to be placed in the estimates, p. 2261.

Hon. G. P. GRAHAM.—Would not be disappointed to see both the Georgian Bay and Welland canals started, p. 2261.

Enquiry by G. V. WHITE.—Calls attention to an item in the *Montreal Star* and *Ottawa Citizen*; reads it, p. 2004-5.

Question by Hon. F. D. MONK.—If Americans will be entitled to its use, and answered by Hon. Aylesworth, p. 7804.

**1909-10.**

Bill 58, Mr. MCGIVERN.—1st reading, p. 1099; 2nd reading, p. 1333; 3rd readings and committee, p. 2258.

Mr. WHITE.—Debates *re* construction, and giving statistics of water development of waterways in Europe, etc., etc.

Mr. WHITE.—Inquiries, p. 6616, *re* Return.

Mr. PUGSLEY.—Laid on table Return to an order dated Feb. 14, 1910; moved by Mr. WHITE, p. 8734.

**1909.**

Final Report, with plans, estimates of cost, and fifty-six plates.

Statement of Mr. GRAHAM *re* Enlargements of Welland canal, p. 6415.

Inquiries as to government knowledge of a round-robin promulgated by lobbyists for a guarantee of the company's bonds, page 6415.

SESSIONAL PAPER No. 19b

1907-8.

- Bill 47, Mr. STEWART.—1st reading, p. 891; 2nd reading, p. 1059; committee, pp. 3622, 3794, 4230; 3rd reading, p. 4230.
- GRAHAM, Geo. P.—Reads clause in Bill safeguarding the rights of the Government, p. 3802.
- HAGGART, John.—Provisions for safeguarding the Government, pp. 3803-4. Personnel of the company promoting their charter, p. 3804. Canals built by companies, p. 3805.
- LANCASTER E. A.—Should have full information as to cost of work done by company before granting a renewal of charter, p. 3802. Not sure it would be the best thing in the interest of the country, p. 5239. Splendid system of canals in operation, except in depth and size of locks, p. 5240. Reads a memorandum from the St. Catharines Board of Trade, p. 5241. Not in favour of involving the country in such enormous expenditures, p. 5242.
- LENNOX, H.—Inquiries as to the amount expended by company up to the present time, p. 3794.
- MONK, F. D.—A gigantic work; should be no further delay, p. 3794. Sooner or later this work must be undertaken by the Government, p. 3798. Failure of the Government to declare their policy should not interfere with extension of a charter of a private company, p. 3799.
- REID, J. D.—For amount expended, Government should have all necessary information, p. 3798. Deepen Welland canal, p. 3801.
- SPROULE, T. S.—Only partial report presented to Parliament, p. 3794. Too important an undertaking to be in hands of a private corporation. Experience with the Chignecto Ship Canal Company, p. 3795. Not business-like for both the Government and the Company to be doing practically the same work, p. 3799.
- STEWART, R.—Has no further information, p. 3794.
- WRIGHT, A. A. (South Renfrew).—Company and Government schemes entirely different propositions, p. 3795. Canada first in regard to natural waterways. Great canals now under construction, p. 5228. The rapid increase in traffic through canals, p. 5229. Freight through the St. Lawrence, and our sources of freight, but only one grand system of through canals, p. 5231. Fort William 800 miles nearer Liverpool than by the Erie canal, p. 5232. Results of Dr. Haanel's experiments. Process in use at Welland, p. 5233. Quotes Mr. Butler on the Georgian Bay canal. Reads a letter from Mr. Reford, pp. 5234-5-6-7. Résumé of the advantages and benefits of the work, p. 5238. Hope the report will justify the Government in commencing operations at an early day, p. 5239.
- Motion by C. A. McCool.—For copy of all plans and reports in the possession of the Government in connection with the building of the Georgian Bay canal, p. 1941.
- BRABAZON, G. B.—The scheme has been mooted for fifty years, and never any great objection to it, p. 1997. We want the cheapest and shortest waterway, and this we have at our very door, p. 1998. Evidence before the British Chamber of Commerce. Quotes J. F. Hill, p. 1999. The Ottawa valley possesses under wealth. The Ottawa river pre-eminently one of the water-powers, p. 2000. The British Iron Mines, the Calumet Island Galena deposits and the Temiskaming district, p. 2001. Pulpwood alone should furnish an immense quantity of traffic, p. 2002. Nova Scotia coal vessels could ascend this waterway, p. 2003. Hopes to hear a declaration of policy from the Government, p. 2004. Hopes the Government will undertake it in its entirety, and not do it by piecemeal, p. 2005.

- CARON, J. B. T.—The effect of canal transportation on freight rates, p. 2005. When ever canals have come into competition with railroads they have proved better controllers of rates, p. 2006. The estimates cost a little under \$100,000,000, p. 2007. A comparison of distances. Hon. Mr. Stevens on the New York project, p. 2008. Has shown the Americans are averse to allowing the Canadian Government to build this canal, p. 2009. President Roosevelt's address to the Waterways Commission, p. 2010. Let us approach it as a work for the general advantage of Canada, p. 2011. Canada must have adequate waterways for harbours and commodious terminals, p. 2012.
- DEVLIN, E. B. (Wright).—More done in the last few hours to urge the construction of the canal than since he has been in the House, p. 2012. The Government has done, and will do, more to provide transportation facilities in Canada, p. 2013. It will benefit the whole Dominion because it will facilitate and cheapen the transport of grain, p. 2014. Quotes the report of the Royal Commission on Transportation, p. 2015. The movement of grain and flour in the season of 1906, p. 2016. The question of rail and water rates, p. 2017. Urges the immediate construction of the canal, p. 2018.
- LOGAN, H. J.—The question of transportation goes to the very root of our national life, p. 1992. Sir Wm. Van Horne, Walter Stanley, and Curtis Clarke quoted, p. 1993. A number of reasons why this great work should be undertaken, p. 1994. Would extend to Ontario the chance of using Nova Scotia coal, p. 1995. A comparison of rates, would not have to break bulk, p. 1996. Is in favour of the project if it can be completed for a reasonable amount, p. 1997.
- McCOOL, C. A.—Importance of proceeding with both the Ottawa and French River waters. Champlain route, p. 1941. History of canal works on the route, p. 1942. Recent surveys by Fraser, Wisner, and the Government. Opinions of eminent men, p. 1943. Quotes the *Globe* and the *Toronto News*, p. 1944. Quotes J. J. Hill. Nature goodness to Canada, p. 1945. Distances on the canal the question of time, p. 1946. Calculations based on a 22-foot waterway, p. 1947. The watershed entirely within Canadian territory, p. 1948. Address of the President of the Grain Produce Exchange of Winnipeg, p. 1949. Settlement of the country as facilities are provided, p. 1950. Quotes Mr. Bosworth before the Railway Commission, p. 1951. The history of the lake trade from Chicago shows a tendency to cheapen the rates, p. 1952. Quotes J. F. Hanrahan at the Memphis Deep Waterways Convention, p. 1953. Jas. E. Walsh on the transportation problem, p. 1954. A very strong argument in favour of this project, p. 1955. Shipments of wheat and receipts in 1906 at Montreal, p. 1956. Increase in railway mileage and equipment since 1903, p. 1957. The building up of the American Northwest very largely the result of water transportation, p. 1958. The immense water-power lying dormant along the route. What they could produce, p. 1959. Electrical smelting, "A Review of Cobalt Shipments," p. 1960. Impetus to mining industries by transportation justifying the development of cheap electrical power, p. 1961. Quotes "Industrial Canada," p. 1911-2-3-4-5. A despatch to the *Globe* from Montreal, p. 1966. This is an additional argument in favour of building this waterway, p. 1967. An appeal to the House to lose no more time in starting this great work, p. 1968. The entire scheme will be ready before the close of the session, p. 1969. Trusts that immediate action will be taken to start this great work, p. 1970.
- WATSON, R. J.—Politics should not be considered in the discussion of this great waterway, p. 1982. The question not one of local but of national import-

SESSIONAL PAPER No. 19b

ance, p. 1984. Quotes Alexander Mackenzie and Sir John A. Macdonald p. 1985. J. J. Hill called it the greatest boon from a commercial standpoint that could be conferred, p. 1986. The canal will cheapen the freight on wheat. Trade will see the shortest and cheapest route, p. 1987. The district rich in mineral and forest wealth. The construction an enormous benefit to Canada, p. 1988. If the whole work cannot be undertaken, make a start in the upper end, p. 1989. Description of the route and distance, p. 1990. Not very familiar with the lower end of the country, p. 1991. It is the necessary link to complete the cheapest and nearest possible highway, p. 1992.

WHITE, G. N.—Last year presented some reasons why the great work should be undertaken, p. 1970. Expenditure, revenue, and traffic to Canadian canals, p. 1971-2. Traffic through St. Mary's Falls canal and the Canadian Sault, p. 1973-4. One of the greatest national projects proposed for many years, p. 1975. Some advantages of this route shown by the engineers, p. 1976. The length of the season of navigation, p. 1977. Quotes a letter of Tarte to the Premier on the French River route, p. 1978-9-30. Quotes Laurier on the motion of Thomas Murray in 1903, p. 1980-1. Regrettable such delay has occurred in the preparation of the final report, p. 1982.

PUGSLEY, HON. WM.—Presents a report of estimated expenses prepared by A. St. Laurent, p. 12053.

BERGERON, J. G. H.—Asks that report be printed and copies distributed—large demand, p. 12836.

PUGSLEY, HON. WM.—Will take six weeks to print report, p. 12836-7.

HAGGART, HON. JOHN.—Asks when surveys will be brought down, that French River section come at once, p. 1740.

PUGSLEY, HON. WM.—French River practically complete, p. 1740.

1906-07.

## 1906.

## DEBATES ON "ROYAL COMMISSION ON TRANSPORTATION."

(*Commission appointed 19th May, 1903. Reported in 1906.*)

BENNETT, W. H. (East Simcoe).—Motion. Question has been before the country for past twenty years; is of great importance, p. 2038. Embraces movement of grain from west, quotes receipts of grain at Buffalo by decades from 1846 to 1896. American system of railroading has been successful in promoting trade from west to east, p. 2039. While progressing in matter of railways, the people of Canada have not failed to also emulate the United States in development of rail transportation, p. 2040. There is a great handicap upon Canadian vessels in competing with those owned by Americans, p. 2041. Government have not taken hold of problem in manner which they should; a purely Canadian policy would have been the best policy in interests of Dominion, p. 2042. Canadian Pacific Railway have to-day practically in course of construction a line from Victoria Harbour to Peterborough. Quotes evidence of Sir Thomas Shaughnessy before Railway Commission, p. 2043. Also C. M. Hays, pp. 2044-5. Also opinion expressed by commission as to making a national port of Midland, p. 2045. Canada Atlantic railway was never built as a first-class railway system. Grand Trunk Company propose concentrating business of Grand Trunk Pacific at Midland, p. 2046. If Government owned lake-front property, all railroads could come to Midland and have benefit of conditions prevailing, p. 2047. Means a great deal to Toronto to have national port at Midland, p. 2048. Export grain trade at Montreal has diminished nearly 10,000,000 bushels from years 1901 to 1904, despite expenditure of millions on port. Quotes report of *Ottawa Journal*, April 21 *re* "Wolvin

## SESSIONAL PAPER No. 19b

Line," p. 2049. Proper way to carry grain is by largest vessels on Great Lakes, and thus get advantage of water competition with railway system; question is: shall grain go by way of Buffalo or by way of Canada, p. 2050.—Distance from any point west of Great Lakes to Buffalo is a slower and longer running distance than distance to port of Midland; out of vast expenditure each year not a dollar is spent on work that will be available in future development of transportation system, p. 2051. Quotes report of Governor Simcoe made in year 1794 to Lords of Trade, p. 2052. Government should bring down a broad comprehensive plan at earliest possible moment, and concentrate efforts at some point on Georgian bay; Canada should make grasp for American trade on Great Lakes, p. 2053.

DEVLIN, E. B.—The transportation question is of such vital importance that it demands non-partisan treatment. Canada is today making greater progress than the United States. When the three great transcontinental railways are completed, Canadian trade will demand, as a necessity, additional channels of transportation, p. 3309. Mr. Schell (Glengarry) should have stated all the facts in connection with Georgian Bay canal. Quotes Mr. Sharley's report of the Ottawa and French River Navigation project. Canada has today a guarantee of immense and hitherto unthought of commercial prosperity, which justifies us in expending money on works which will prove a rich asset to the nation, p. 3310. Quotes rates on wheat via the Canadian Pacific railway during 1905 from principal wheat-shipping stations in the West to Fort William; rate by water is much less than that by rail, p. 3311. Quotes number of bushels that went forward from Fort William from 1899 to 1905. Quotes report made to Bureau of Statistics by Mr. Geo. G. Tunell, of Chicago, on Lake Commerce, dated February 3, 1898, p. 3312. Reads a report taken from *Engineering News* of New York, published March 5, 1903, pp. 3313-4. Will excel any country in matter of transportation, p. 3314.

HALL, R. R.—Quotes statement of Transportation Commission on pages 22 and 19 of report, p. 2053. Quotes Hon. R. L. Borden's speech at Peterborough, October 4, 1904, wishes to impress the importance of Trent Canal Waterway System, p. 2054. Quotes Deputy Minister of Railways and Canals, p. 2055. Whole Trent Canal Waterway system is very near completion, p. 2056. Many local advantages which could be derived from construction of canal, county of Peterborough would save, in coal alone, about \$90,000 a year, p. 2057. Midland is the point where grain might be economically brought with view to taking it to the ocean ports, and Trent waterway affords cheap barge transportation between Midland and Montreal, p. 2058. Quotes statement prepared by L. Richards, traffic manager of American Cereal Company, p. 2059. Rates made by Grand Trunk Railway and Canadian Pacific Railway from Midland to Montreal are made to compete as far as possible with carriage of grain from Buffalo to New York, p. 2060. Cost of Trent canal per mile when completed will be about \$47,169. Cost of keeping canal in repair is nothing compared with cost of maintaining and operating a railway line, p. 2061. Compares American freight rates with Canadian, p. 2062. If canal were built the milling industry along Trent canal would be stimulated, and water-powers will be developed, p. 2063. Of utmost importance to Canada that raw material which is produced should as far as possible be sent out to foreign markets in its manufactured state, pp. 2064-5. Rates charged by ocean vessels on flour do not handicap Canadian mills in favour of English mills as much as is supposed, p. 2066. In 1905 there was shipped from Canada only \$5,890,258 worth of flour to Great Britain, Africa, West Indies, Newfoundland, Australia, and different countries of Europe. The Government of the state of New York

are expending upwards \$100,000,000 in improving and deepening the Erie canal. p. 3279. Quotes Canadian freight information furnished by H. W. Richardson, of Kingston, grain dealer; also S. A. Thompson, of Duluth, Minn., furnished to Committee on Rivers and Harbours at Washington on April 11, 1898, pp. 3280-1. "A ship canal through Canadian territory would destroy American supremacy upon the Great Lakes." No canals can be built in the United States to compete with canals which may be constructed on Canadian territory. p. 3282. It is because the Germans have been so thoroughly alive to the importance of canal navigation and the improvement of their waterways that they have been able to make such an excellent showing in the financial and commercial world. There is no investment that this country could make better than to expend a large amount in improvement of waterways. p. 3282. If the United States could stand the enormous drains on her resources of forty-five years ago, we in Canada, who propose to make this century the century of Canada, could well afford to increase the national debt by upwards of \$100,000,000 or \$200,000,000, p. 3284.

HUGHES, S.—Compliments Mr. Hall for facts and figures on transportation. Explains Opposition leader's absence during discussion, p. 3285. Quotes citation from speech of leader of Opposition. Not one Liberal in that whole region was committed to Trent canal prior to 1896, and not one of them has been committed to it for some time. p. 3286. Mr. Hall who ought to know something about route, knew personally so little about construction of work that he had to quote from report of the Deputy Minister in order to place the facts before the House, p. 3287. Endorse the proposition of Mr. Clements (West Kent) for the construction of a waterway to connect lake St. Clair with lake Erie in order to facilitate transport of grain by that route; will endorse any reasonable proposition for development of other waterways, p. 3288.

HYMAN, Hon. CHAS.—Asks Mr. Bennett if he speaks by book when he says that Canadian Pacific Railway have in course of construction a line from Victoria Harbour to Peterborough, p. 2043.

PATERSON, Hon. WM.—Asks distance from Midland to Port Hope, p. 2046.

SHELL, J. T. (Glengarry).—The question most concerned in the method of transporting the produce of the western part of the country to the sea-board. The reason of the appointment of the Transportation Commission was to discover by which route our produce could reach tide-water the cheapest, and whether we can take it there cheaper than it can be taken through American ports, p. 3294. Traces development of railroads from 1873. It has taken over twenty years to wear out the old rolling stock, to relay the rails, to build new rolling stock and to put the roads in a position to handle freight so as to compete with the canal system. The St. Lawrence and Erie canals are practically put out of business by railroads, p. 3295. It is a question as to the amount of money we shall spend in developing our water routes as against railroad carriage, p. 3296. Quotes rates on wheat prevalent on certain railroads, p. 3297. Quotes rates on wheat prevalent on lakes. Shall it be the Trent Valley canal or the railways or the Georgian Bay canal that shall carry our produce from Georgian bay to tide-water, p. 3298. Are we going to build the Georgian Bay canal at a cost of from \$100,000,000 to \$120,000,000, p. 3299. If the Government propose to expend that large amount on the Georgian Bay canal, I say, halt! give it as a bonus to the railways until our system is a little better developed. Quotes statement from Trade and Commerce Department dealing with year 1904-5. Exports of wheat from the United States are growing less each year; quotes exports of domestic wheat from the United States through port of New York from

## SESSIONAL PAPER No. 19b

1902 to 1905. Quotes exports of wheat from all other ports of United States, p. 3300. Quotes amount of foreign wheat exported from the port of New York from 1902 to 1905. We must equip Port Colborne to make it equal to Buffalo. Whenever a small vessel going through the St. Lawrence canals takes its load from the Upper Lakes the freight is costing considerably more than it should if the grain were carried on a large vessel to Port Colborne and then transhipped into vessels of proper size on the Welland canal, p. 3301. Within recent years there have been as much as 10,000,000 bushels of American corn carried out through Canadian ports to Montreal. If the port of Port Colborne elevators are properly constructed and Montreal harbour properly equipped, that will be the largest corn-carrying route this continent has seen, p. 3302. We ought not to build the Georgian Bay canal; good railway rates more effective and more important p. 3303. Believes the Grand Trunk Pacific will carry grain all through the winter and deliver it at a profitable rate at the port of St. John. Hopes Halifax in the not distant future will be port for Northwest; has not a word to say against building of Trent Valley canal, p. 3304. Rail carriage has to-day entirely superseded any canal traffic that there is on the continent of America. Comparison of Canadian railways and canals with German railways and canals is absurd. In this country and in the United States, scientific minds have devoted themselves in lowering the freight rates on railways, p. 3305. With heavier equipment on railways, present rates will be cut nearly in two; railroad authorities state that difference between cost of hauling on a 1 per cent grade or three-ten or four-ten per cent grade is equal to forty per cent. This country would not be warranted in building Georgian Bay canal because of what lies in the future, p. 3306. Jim Hill wants canal because it will benefit Jim Hill, p. 3307. The more prosperous the West is, and the cheaper the western farmers can get their products to the markets of the world, the more prosperous and progressive will be the commercial life of Canada generally, p. 3308.

WATSON, R. J. (Parry Sound).—There should be no arguments at all on question of transportation, p. 3288. Depot Harbour is one of the best harbours on Georgian bay, and the railway line going out of Depot Harbour is not sufficient to afford accommodation necessary for a large grain traffic. Does not think House ought to adopt report of Transportation Commission in its entirety, p. 3289. Quotes twelve ports chosen by commission as national ports. Points out some details of programme recommended by Transportation Commission. Would accomplish purpose of House much better to consider question in a smaller committee, p. 3290. The relative failure of the St. Lawrence canal route is due to the fact that the ocean terminus of that route—Montreal harbour—has never been adapted to handle a large traffic coming to it from the Upper Lakes. Is it not a fact that during the summer a large quantity of freight destined for Europe passes through Montreal and reaches its destination by way of Boston and Portland, p. 3291. The Transportation Commission has virtually submitted for the consideration of the Government (4) four Canadian routes by which the products of the West can reach ocean navigation, p. 3292. The Government deserves great credit for the steps they have taken in having a complete and thorough survey made for the great project of the Georgian Bay canal; refers to the three great railways of Canada, p. 3293.
