- 67f. Return to an order of the House of Commons, dated 5th April, 1909, for a copy of all petitions and correspondence, whether by letter or telegrams, and all plans submitted either to the Railway Department or to the authorities of the Intercolonial Railway, and of all decisions arrived at, relating to the enlargement of the station of the Intercolonial Railway at Cap St. Ignace, or the construction of a new station. Presented 14th May, 1909.—*Mr. Roy (Montmagny)*... ..*Not printed.*
- 67g. Return to an order of the House of Commons, dated 5th April, 1909, for a copy of all correspondence, memorials, reports and decisions arrived at respecting the construction of a tank at the Intercolonial Railway station at Cap St. Ignace, and the increased cost to be paid to the Aqueduct Company supplying the water for the engines running on the said railway. Presented 14th April, 1909.—*Mr. Roy (Montmagny)*... ..*Not printed.*
- 67h. Return to an address of the Senate, dated 18th March, 1909, praying for all petitions presented to the Governor General in Council, asking that the Intercolonial Railway may be placed under the Railway Board, together with all correspondence in connection therewith. Presented 4th May, 1909.—*Hon. Sir Mackenzie Bowell*... ..*Not printed.*
- 67i. Certified copy of a Report of the Committee of the Privy Council, approved by His Excellency the Governor General on the 20th April, 1909, *re* Intercolonial Railway. Presented (Senate) 30th April, 1909, by Hon. Sir Richard Cartwright... ..*Not printed.*
68. Return to an order of the House of Commons, dated 1st February, 1909, for the production of all the original applications and tenders filed in the Department of the Interior in respect of Timber Berth No. 1122, and that the same be laid on the Table of the House, said papers not to be part of the archives of this House, but to be returned by the Clerk to the Department of the Interior after inspection. Presented 12th February, 1909.—*Mr. Campbell*... ..*Not printed.*
69. Return to an order of the House of Commons, dated 1st February, 1909, showing what lands, at what price, and to what persons or corporations have been sold along the route of the Grand Trunk Pacific for stations, terminal or town site purposes. Presented 12th February, 1909.—*Mr. Foster*... ..*Not printed.*
70. Return to an order of the House of Commons, dated 26th January, 1909, showing, year by year, since 1881, the expenditures charged annually to capital under the caption of Dominion lands, together with a similar statement of the total receipts from sale of lands, town sites, &c., where public domain has been permanently alienated. Presented 12th February, 1909.—*Mr. Ames*... ..*Not printed.*
71. Return to an order of the House of Commons, dated 1st February, 1909, showing the amount of gold, silver and copper coins manufactured by the branch of the Royal Mint in Canada, and the amount of said coin not disposed of since it commenced operation up to 1st January, 1909. 2. How much silver in its crude state has been offered for sale to the management of the Royal Mint from Canadian mines in the year 1908, and what quantity has been accepted. 3. What reason the government gives for not purchasing all the silver in its crude state that is offered. 4. The system used in deciding from whom to make purchases. 5. How many Canadian mines have sold silver to the government, the names of said mines, and the quantity purchased from each. Presented 12th February, 1909.—*Mr. Armstrong*... ..*Not printed.*

CONTENTS OF VOLUME 17—*Continued.*

- 71a.** Return to an order of the House of Commons, dated 1st February, 1909, showing the total cost of the Royal Mint to 31st December, 1908; the total expenses of Royal Mint for the calendar year 1908, (a) for additions and improvements, (b) for maintenance, (c) for salaries, (d) for bullion copper, silver and gold, respectively; the amount of copper, silver and gold coinage that was struck during that time; and the net profit on each kind of coinage. Presented 31st March, 1909.—*Mr. Foster*.. . . .*Not printed.*
- 72.** Return to an order of the House of Commons, dated 25th January, 1909, showing, in detail, the items comprised in the amount \$699,235.52, given as miscellaneous revenue for the month of December, 1908. Presented 12th February, 1909.—*Mr. Ames.*
Not printed.
- 73.** Return to an order of the House of Commons, dated 25th January, 1909, showing all free mail deliveries established or authorized since the 30th of June, 1908, in towns or villages; all free rural mail deliveries established or authorized since said date, the number of persons served by each such free mail delivery in the community or route for which it has been so established and the cost in each instance. Presented 12th February, 1909.—*Mr. Borden (Halifax)*.. . . .*Not printed.*
- 73a.** Return to an order of the House of Commons, dated 22nd March, 1909, for a copy of all correspondence and memoranda relating to rural mail delivery in the province of Alberta. Presented 17th May, 1909.—*Mr. McCarthy*.. . . .*Not printed.*
- 74.** General orders issued to the Militia between 28th November, 1907, to 31st January, 1909. Presented 15th February, 1909, by Sir Frederick Borden.. . . .*Not printed.*
- 75.** Return to an order of the House of Commons, dated 8th February, 1909, in detail showing what disposition has been made of the vote of \$35,000 to cover the cost of boring for oil, gas, coal, &c., passed on 15th July, 1908, with a copy of all correspondence, reports, telegrams, memoranda, &c., connected with the matter, giving the district in which the wells were drilled, the cost and present condition of each well, and a copy of all contracts and tenders. Presented 15th February, 1909.—*Mr. Armstrong*..*Not printed.*
- 76.** Return to an order of the House of Commons, dated 25th January, 1909, showing: 1. The number of accidents which occurred at level railway crossings in Canada during the period of five years prior to the 31st of March, 1908. 2. The time where and the places at which these accidents occurred. 3. The alleged cause of the accident in each case. 4. The number of persons killed in each case. 5. The number of persons injured and the nature of the injury in each case. 6. A statement in each case as to whether the crossing was protected or not, and if protected, by what means. Presented 16th February, 1909.—*Mr. Lennox*.. . . .*Not printed.*
- 76a.** Return to an order of the House of Commons, dated 10th February, 1909, showing since the constitution of the Railway Board, in how many cases they have ordered protection of highway-railway crossings, (a) by separation of the highway and railway, (b) by gates, (c) by other means, and the method adopted in each case; how the proceedings were initiated in each case; what order was made as to the expense of the work or service in each; at what points separation of highway and railway was ordered, and the actual or estimated cost in each case; in how many, and what cases applications were refused. Presented 4th March, 1909.—*Mr. Lennox*.. . . .*Not printed.*
- 76b.** Return to an address of the Senate, dated 25th February, 1909, for copies of all requests to the Board of Railway Commissioners by the Minister of Railways, under section 28 of the Railway Act, and also copies of all orders in council made within the last twelve months respecting level crossings by railways over public highways, the dates of making such requests or orders in council to be given. Presented 19th March, 1909.—*Hon. Mr. Ferguson*.. . . .*Not printed.*

CONTENTS OF VOLUME 17—*Continued.*

- 77.** Return to an order of the House of Commons, dated 1st February, 1909, showing all importations of steel bars, steel ingot, rolled iron and steel, steel rails and structural steel, into the Dominion of Canada, by months, since the 31st day of March, 1908, and up to the 31st January, 1909, showing: (a) the quantity imported, (b) the country from which imported. (c) port of entry, (d) the value of the imports, and (e) the amount of duty paid thereupon. Presented 18th February, 1909.—*Mr. Boyce.*
Not printed.
- 78.** Return to an order of the House of Commons, dated 8th February, 1909, showing the number of seizures made by the Department of Inland Revenue during the years 1904, 1905, 1906, 1907 and 1908; the date of seizures; by whom seized; what the seizures consisted of; amount realized by the sale of such material seized; and how the seized material was disposed of. Presented 18th February, 1909.—*Mr. Barr.* . . . *Not printed.*
- 78a.** Return to an order of the House of Commons, dated 10th February, 1909, showing the number of seizures made by the Department of Customs during the years 1904, 1905, 1906, 1907 and 1908; the date of seizures; by whom seized; what the seizures consisted of; the party from whom seized; amount realized by the sale of such material seized; and how the seized material was disposed of. Presented 11th March, 1909.—*Mr. Barr.*
Not printed.
- 79.** Return showing remissions of interest made under subsection 2 of section 88 of the Indian Act, chapter 81, Revised Statutes of Canada, for the year ended 31st March, 1908. Presented 18th February, 1909, by Hon. F. Oliver. *Not printed.*
- 80.** Return to an order of the House of Commons, dated 3rd February, 1909, showing how many sessional clerks and messengers have been appointed to the House of Commons since 1880; their names and the date of their appointments; if appointed by the Internal Economy Commission or otherwise; how many sessional clerks and messengers have been removed from the House of Commons since 1880; their names and the dates of their removal; if removed by the Internal Economy Commission or otherwise. Presented 19th February, 1909.—*Mr. Paquet.* *Not printed.*
- 81.** Copy of an order in council of the 15th February, 1909, relative to the Second Joint Report of the Commission for the demarcation of the meridian of the 141st degree of west longitude (Alaska Boundary), appointed in virtue of the First Article of the Convention between Great Britain and the United States, signed at Washington on the 21st April, 1906; and also a copy of the said Report. Presented 22nd February, 1909, by Hon. F. Oliver. *Not printed.*
- 82.** Return to an order of the House of Commons, dated 3rd February, 1909, showing what precautionary measures were taken by the government to combat the introduction of the foot and mouth disease into Canada from United States; what officials were appointed especially for the work, the dates of appointment, length of service, remuneration paid to each as salary or expenses; the present danger, and when the embargo on live stock from the United States was raised. Presented 22nd February, 1909.—*Mr. Sharpe (Ontario).* *Not printed.*
- 82a.** Return to an order of the House of Commons, dated 8th February, 1909, showing what States of the United States have been quarantined by order in council by reason of the prevalence of foot and mouth disease in such States; how many inspectors were appointed by the government to prevent the importation of live stock into Canada from quarantine States; at what points such inspectors were stationed; and what salaries these inspectors were paid. Presented 22nd February, 1909.—*Mr. Chisholm (Huron).* *Not printed.*

CONTENTS OF VOLUME 17—*Continued.*

83. Return to an order of the House of Commons, dated 10th February, 1909, showing the quantity of summer-caught white fish, and the value, the pickerel, quantity and value, the sturgeon, quantity and value, exported to the United States for each year, respectively, during the years from November 1893 to November, 1908, from the Manitoba ports. Presented 23rd February, 1909.—*Mr. Bradbury*.*Not printed.*
84. Return to an order of the House of Commons, dated 8th February, 1909, showing, in detail, all moneys received by this government from the sale of land, forest, mines, fisheries and other natural resources of the province of Alberta for the last fiscal year. Presented 23rd February, 1909.—*Mr. McCarthy*.*Not printed.*

Return to an order of the House of Commons, dated 22nd February, 1909, showing how many heads of stock there are on the respective experimental farms and what they consist of; the estimated value of the different kinds, and for what purposes they are utilized; how many acres there are in each experimental farm; how many acres there are under cultivation on each farm. Presented 26th February, 1909.—*Mr. Staples*.*Not printed.*
90. Declaration of Principles, North American Conservation Conference. Presented 26th February, 1909, by Hon. S. A. Fisher..*Printed for both distribution and sessional papers.*
91. Statement of insurance paid on the St. Lawrence route on merchandise, provisions and grain, from 1900 to 1907, both years inclusive. Presented (Senate) 28th January, 1909, by Hon. Sir Richard Cartwright.*Not printed.*

 CONTENTS OF VOLUME 17—*Continued.*

- 92.** Statement of the affairs of the British Canadian Loan and Investment Company (Limited), for the year ended the 31st of December, 1908, also a list of the shareholders for the same year, in compliance with the Loan Corporation Act. Presented (Senate) 25th February, 1909, by the Hon. the Speaker. *Not printed.*
- 93.** Copy of the Progress Report, Hudson Bay Railway Surveys, 1st February, 1909. Presented 4th March, 1909.—*Hon. G. P. Graham.* *Not printed.*
- 93a.** Return to an order of the House of Commons, dated 8th February, 1909, showing all surveys made to date in the prosecution of the proposed Hudson Bay Railway. Presented 8th March, 1909.—*Mr. Meighen.* *Not printed.*
- 94.** Return to an order of the House of Commons, dated 26th January, 1909, of all correspondence, papers and reports of engineers or others, relating to the authorization and construction of a canal from Lake Simcoe to Newmarket, including all contracts entered into, the amount of money so far paid, and the estimated cost of the completed work, with plans showing the capacity of the canal, and for all statements and estimates of the commercial reasons for the work. Presented 4th March, 1909.—*Mr. Foster.* *Not printed.*
- 94a.** Return to an order of the House of Commons, dated 22nd March, 1909, showing: 1. Who were employed to value the land of the right of way of the canal from Holland River to Newmarket, and what other duties than valuation of lands these parties were entrusted with. 2. The remuneration of each of these valuers. 3. How long they were employed, and upon what terms. 4. (a) What properties they valued, (b) at what amount or rate in each case, (c) the acreage of each property, (d) in how many cases, by names, the valuations were accepted by the owners, (e) in how many cases, by names, the valuations were finally rejected by the owners, (f) in what cases expropriation proceedings were resorted to, and (g) the result as compared with valuers' figures. 5. What titles to all properties have been required. Presented 31st March, 1909.—*Mr. Lennox.* *Not printed.*
- 95.** Return to an order of the House of Commons, dated 8th February, 1909, for a copy of all lists of voters as prepared by the enumerators and completed by the deputy returning officers for the several polling subdivisions in the electoral riding of Calgary, in the province of Alberta, and used in the recent general election for the House of Commons. Presented 4th March, 1909.—*Mr. McCarthy.* *Not printed.*
- 95a.** Return to an order of the House of Commons, dated 8th February, 1909, showing the names of the deputy returning officer, poll clerk, scrutineer or agent, or any other officer who acted, respectively, as such in the several polling subdivisions in the electoral district of Calgary in the recent general election for the House of Commons. Presented 4th March, 1909.—*Mr. McCarthy.* *Not printed.*
- 95b.** Return to an order of the House of Commons, dated 15th March, 1909, showing, in respect of the election for the House of Commons, held in the county of Montcalm, on the 26th of October, 1908, and in respect of each polling subdivision (a) the number of votes polled for each candidate; (b) the total number of valid votes polled; (c) the number of rejected ballots; (d) the number of spoiled ballots; (e) the number of voters on the revised voters' list; (f) the number of ballot papers in possession of the deputy returning officer at the hour of the opening of the poll; (g) the number of ballot papers remaining unused in the hands of the deputy returning officer at close of the poll; (h) the name and the address of the returning officer and names and addresses of each of his deputies and poll clerks; (i) all correspondence between the government, or any officer thereof, and the returning officer, or any deputy returning officer or poll clerk or, any candidate in respect of said election. Presented 22nd March, 1909.—*Mr. Ames.* *Not printed.*

CONTENTS OF VOLUME 17—*Continued.*

- 95c.** Return to an order of the House of Commons, dated 17th February, 1909, for a copy of all lists of voters as prepared by the enumerators and completed by the deputy returning officers for the several polling subdivisions in the electoral riding of Qu'Appelle, and used in the recent general election for the House of Commons; also for a return showing the boundaries of the said polling subdivisions, and the names of the enumerators, deputy returning officers, poll clerks, candidates' agents or scrutineers who acted for each poll. Presented 22nd March, 1909.—*Mr. Lake..Not printed.*
- 96.** Return to an order of the House of Commons, dated 11th February, 1909, for a copy of a report made by Charles Olin to the Department of the Interior, of his visit to Sweden for that department in 1907-8, and of all correspondence leading up to his appointment to make such trip, and in any way relating thereto. Presented 4th March, 1909.—*Mr. Goodeve.. . . .Not printed.*
- 97.** Return to an order of the House of Commons, dated 8th February, 1909, for a copy of all applications that have been received for the transfer of villa lots in section 14, township 24, range 1, west of the fifth meridian, and all correspondence in connection therewith since the 10th day of June, 1908. Presented 4th March, 1909.—*Mr. McCarthy. Not printed.*
- 98.** Return to an order of the House of Commons, dated 1st March, 1909, showing the average number of men employed in every capacity in the working, maintenance and repairs of the Carillon and Grenville Canals during each of the following months: July and August, 1906 and 1908, September and October, 1907 and 1908; and the total outlay for wages and salaries; also, the total expenditure of every kind in connection with the said canal during each of these months. Presented 4th March, 1909.—*Mr. Perley.. . . .Not printed.*
- 99.** Return to an address of the House of Commons, dated 22nd February, 1909, for a copy of orders in council, correspondence, letters, despatches, memoranda and communications, between the Imperial and Canadian governments relating to the organization of a Imperial General Staff. Presented 5th March, 1909.—*Mr. Talbot.*
Printed for both distribution and sessional papers.
- 100.** Return to an order of the House of Commons, dated 1st February, 1909, for a copy of all correspondence between the Surveyor General's Department or Department of Indian Affairs and the late Mr. Vaughan, D.L.S., covering his instructions to survey the parish of St. Peters, St. Clements and St. Peters Indian Reserve; together with Mr. Vaughan's correspondence, &c.; of all correspondence between the Department of the Interior and Mr. H. M. Howell, Commissioner to investigate Indian claims on said reserve; of the report of Mr. Rothwell, Law Clerk of the Department of the Interior, on the said St. Peters land claim; of the itemized account of Frederick Heap, of the services rendered during the investigation, and instruction to him from the Department of the Interior and Indian Affairs. Presented 5th March, 1909.—*Mr. Bradbury. Not printed.*
- 100a.** Return to an order of the House of Commons, dated 22nd February, 1909, for a copy of the treaty arranged between St. Peters Indians and the government; and of all correspondence, papers, instructions, and documents relating to the aforesaid treaty. Presented 11th March, 1909.—*Mr. Bradbury.. . . .Not printed.*
- 100b.** Return to an order of the House of Commons, dated 17th February, 1909, showing the number and names of all parties who were entitled to receive patents, and did receive patents, under the treaty made by Mr. H. M. Howell for the surrender of St. Peters Reserve, Manitoba. Presented 12th March, 1909.—*Mr. Bradbury.. . . .Not printed.*

CONTENTS OF VOLUME 17—Continued.

- 100c.** Supplementary Return to No. 100. Presented 5th April, 1909.. . . . *Not printed.*
- 100d.** Return to an order of the House of Commons, dated 5th April, 1909, for a copy of all papers, letters and correspondence relating to, and an itemized statement of, the account of Mr. H. M. Howell in regard to the surrender of St. Peters Reserve. Presented 27th April, 1909.—*Mr. Smyth*.. . . . *Not printed.*

Presented 6th April, 1909.—*Mr. Sharpe (Ontario)*.. . . . *Not printed.*

105d. Return to an order of the House of Commons, dated 26th January, 1909, showing, in respect of the sinking fund in connection with each outstanding loan forming on 31st March, 1908, part of the funded public debt: (a) term of loan, (b) the sinking fund rate, (c) the amount that has been each year set aside, including earnings of interest reinvested, (d) the aggregate amount to credit of sinking fund of that particular loan on 31st March, 1908, (e) the aggregate amount which may be reasonably expected to stand to credit of sinking fund on date when loan shall fall due, and if extended at the end of final period, (f) percentage which accrued sinking fund and its earnings will bear to the nominal amount of loan on date of expiry. Presented 6th April, 1909.—*Mr. Ames*.. . . . *Not printed.*

105e. Supplementary Return No. 105c. Presented 19th April, 1909.. . . . *Not printed.*

105f. Return to an address of the House of Commons, dated 8th February, 1909, for a copy of all orders in council, correspondence and papers, including prospectuses, in relation to the loans negotiated by the Minister of Finance from the 1st January, 1907, to date. Presented 19th April 1909.—*Mr. Foster*.. . . . *Not printed.*

105g. Return to an order of the House of Commons, dated 26th January, 1909, showing, in detail, the contingent or nominal liabilities of the Dominion government on the 1st of January, 1909; that is to say, a statement of all amounts which might under existing legislation become exigible, such as earnable railway subsidies, government guaranteed loans, deficiencies which might require to be made good, &c. (See also 109a.) Presented 19th April, 1909.—*Mr. Ames*.. . . . *Not printed.*

106. Return to an order of the House of Commons, dated 22nd February, 1909: 1. Showing the approximate area of coal and timber lands, respectively, in each of the provinces of Saskatchewan and Alberta (a) owned by private individuals or companies, (b) leased by the government to private individuals or companies; and the approximate area in each province on which mining or lumbering operations are actually being carried on. 2. The approximate amount of revenue collected by the government between 1st January, 1906, and the 31st December, 1908, on account of (a) payments for coal lands; (b) coal royalties; (c) bonuses and rentals on timber lands; (d) timber dues; (e) hay lands; (f) grazing lands, and (g) irrigation areas within each of the above provinces. Presented 11th March, 1909.—*Mr. Lake*.. . . . *Not printed.*

CONTENTS OF VOLUME 17—*Continued.*

- 106a.** Return to an order of the House of Commons, dated 22nd February, 1906, showing how many acres have already been taken up in Manitoba, Saskatchewan and Alberta, respectively, by homestead and pre-emption, by railway lands, by Hudson Bay lands; by other corporations or persons; by waste, swamps or mountainous land unfit for tilling; by lake areas, including Winnipeg, Winnipegosis, Manitoba, Big Quill, Birch and Beaver; and the area in square miles of each province above named. Presented 11th March, 1909.—*Mr. Hughes*.*Not printed.*
- 106b.** Return to an order of the House of Commons, dated 8th March, 1909, for a copy of all applications, advertisements, tenders, leases, correspondence and papers of every description, with respect to timber berths Nos. 1316, 1317, 1318, 1330, 1331, 1332, 1333, 1334, 1335, 1336, 1360, 1361, 1362, 1363, 1364 and 1365. Presented 30th March, 1909.—*Mr. Bradbury*.*Not printed.*
- 106c.** Return to an order of the House of Commons, dated 22nd March, 1909, for a copy of all correspondence, communications in writing and documents, to the Minister of the Interior, or any official of the department, and the replies or communications from the minister or any official of the department, since 11th January, 1905, relating to the transfer of certain swamp lands in the Big Grass Marsh, in the province of Manitoba, to His Majesty King Edward VII., for the purposes of the province of Manitoba. Presented 30th March, 1909.—*Mr. Molloy*.*Not printed.*
- 106d.** Supplementary Return to an order of the House of Commons, dated 3rd March, 1909, showing with respect to leases granted since 30th June, 1896, for timber on Dominion lands in British Columbia, the names and addresses of lessees, the date, term and acreage of each lease, and the bonus received for the same. Presented 5th April, 1909.—*Mr. Taylor (New Westminster)*.*Not printed.*
- 106e.** Return to an order of the House of Commons, dated 5th April, 1909, for a copy of all correspondence, reports, papers, and communications in the possession of the Dominion Lands Office at Prince Albert and the Department of the Interior at Ottawa, in connection with the application for patent for the N.E. $\frac{1}{4}$ section 10, township 47, range 1, west 3rd meridian of A. A. Strachan, and the performance of his homestead duties. Presented 16th April, 1909.—*Mr. Lake*.*Not printed.*
- 107.** Return to an order of the House of Commons, dated 1st February, 1909, showing the total amount received by the *Winnipeg Free Press* from all the departments of the government from 1st July, 1896, to 1st January, 1909, specifying amount each year. Presented 11th March, 1909.—*Mr. Herron*.*Not printed.*
- 107a.** Supplementary Return to No. 107. Presented 26th March, 1909.*Not printed.*
- 108.** Return to an order to the House of Commons, dated 26th January, 1909, showing approximately the total amount of available cash on deposit to the credit of the government on the last day of each month during the period between the 1st of April, 1907, and the 31st December, 1908. Presented 11th March, 1909.—*Mr. Ames*.*Not printed.*
- 109.** Return to an order of the House of Commons, dated 26th January, 1909, showing to date the statement found on page 15 of the Budget Speech of 1893. Presented 11th March, 1909.—*Mr. Ames*.*Not printed.*
- 109a.** Return to an order of the House of Commons, dated 26th January, 1909, showing, in detail, the contingent or nominal liabilities of the Dominion government on the 1st January, 1909; that is to say, a statement of all amounts which might under existing legislation become exigible, such as earnable railway subsidies, government guaranteed loans, deficiencies, which might require to be made good, &c. (Supplementary to No. 105g.) Presented 11th March, 1909.—*Mr. Ames*.*Not printed.*

CONTENTS OF VOLUME 17—*Continued.*

- 110.** Return to an order of the House of Commons, dated 17th February, 1909, for a copy of all correspondence passing between the Department of Justice and the officers of New Westminster Penitentiary or other persons whatsoever, relating to the visit or proposed visit of detectives to Bill Miner during his incarceration in said penitentiary; also of the report of the Inspector of Penitentiaries after investigating the circumstances connected with Miner's escape, and of the evidence on which such report is based; also a copy of telegram sent from the said penitentiary to the department or its officers respecting Miner's escape, and of such telegrams as received and of telegrams sent and received in answer within two weeks from such escape. Presented 12th March, 1909.—*Mr. Taylor (New Westminster)*.. . . .*Not printed.*
- 111.** Return to an order of the House of Commons, dated 17th February, 1909, showing what amounts the government has paid property owners for damages caused by the holding up of water in the Otonabee River, between Hastings and Peterboro', and the names of the parties receiving settlements. Presented 15th March, 1909.—*Mr. Sexsmith.*
Not printed.
- 111a.** Return to an order of the House of Commons, dated 17th February, 1909, showing what amounts the government has paid property owners in or around Stony Lake for damages caused by the rising of water, and who they were. Presented 15th March, 1909.—*Mr. Sexsmith*.. . . .*Not printed.*
- 111b.** Return to an order of the House of Commons, dated 8th February, 1909, showing what measures, if any, have been taken by the government to lower the waters of Lakes Simcoe and Couchiching; what moneys, if any, have been expended for this purpose, the date of expenditure, and persons superintending the same; the future intention of the government in this direction, for the purpose of reclaiming thousands of acres of first-class arable land. Presented 25th March, 1909.—*Mr. Sharpe (Ontario).*
Not printed.
- 112.** Return to an order of the House of Commons, dated 3rd March, 1909, for the production of the original tenders received in reponse to advertisement calling for tenders for the erection of the building at Kingston R. M. C., intended for barracks accommodation, for stables; and also for a Return showing the advertisement and the papers in which inserted; said papers not to be part of the archives of this House, but to be returned by the Clerk to the Department of Public Works after inspection. Presented 15th March, 1909.—*Mr. Edwards*.. . . .*Not printed.*
- 112a.** Return to an order of the House of Commons, dated 3rd March, 1909, for the production of the original tenders received in response to advertisement calling for tenders for the erection of the Veterinary Hospital at Kingston, and also for a return showing the advertisement and the papers in which inserted, said papers not to be part of the archives of this House, but to be returned by the Clerk to the Department of Public Works after inspection. Presented 24th March, 1909.—*Mr. Edwards*.. . . .*Not printed.*
- 113.** Return to an order of the House of Commons, dated 22nd February, 1909, for a copy of all papers, letters, telegrams and communications, with reference to the complaint against and conviction and fine of F. Macdonald Jacobs, of Caughnawaga Reserve, for cutting cordwood upon territory occupied by him on the reserve, and to have refund of dues or fine. Presented 15th March, 1909.—*Mr. Boyce*.. . . .*Not printed.*
- 114.** Return to an address of the House of Commons, dated 17th February, 1909, for a copy of all correspondence, letters, despatches, memoranda, &c., between the Imperial government, or any member thereof, and the Governor General, government or any member thereof, relating to or bearing upon the question of Canada contributing to the support of the British fleet, or purchasing ships of her own, or assisting in any way in maintaining with the mother country the supremacy of the seas. Presented 17th March, 1909.—*Mr. Worthington*.. . . .*Not printed.*

CONTENTS OF VOLUME 17—*Continued.*

- 115.** Return to an order of the House of Commons, dated 22nd February, 1909, for a copy of all reports, memorials, documents and correspondence in possession of the government with regard to the superannuation and to making provision for the superannuation of officers and members of the crew of the winter or ice-breaking steamers owned or in the employ of the government. Presented 17th March, 1909.—*Mr. Warburton.*
Not printed.
- 116.** Return to an order of the House of Commons, dated 17th February, 1909, for a copy of all correspondence between J. H. Davis and the Department of Marine and Fisheries referring to the fisheries of Manitoba; and of all petitions and correspondence from the Fisherman's Union, Gimli, Manitoba, to and with the said department. Presented 17th March, 1909.—*Mr. Bradbury.**Not printed.*
- 116a.** Return to an order of the House of Commons, dated 17th February, 1909, for a copy of all correspondence or petitions received from F. W. Colclough, while he was inspector of fisheries for Manitoba, referring to the operations of commercial companies and others. Presented 29th March, 1909.—*Mr. Bradbury.**Not printed.*
- 117.** Return to an order of the House of Commons, dated 8th March, 1909, for a copy of all reports, correspondence, statements, receipts, vouchers and documents of every description with respect to the granting and payment of the railway subsidy authorized under 6-7 Edward VII., chapter, 40, section 1, subsection 16. Presented 17th March, 1909.—*Mr. Ames.**Not printed.*
- 118.** Return to an address of the House of Commons, dated 1st March, 1909, for a copy of all correspondence, documents and papers relating to the construction, or proposed construction, of a line of railway from a point at or near Caledonia to Liverpool, not exceeding 29 miles, referred to in the Acts of 1903, chapter 57, section 23d, and all orders in council, reports, contracts, agreements and other papers, relating to the same matters. Presented 18th March, 1909.—*Mr. Borden (Halifax).**Not printed.*
- 119.** Return to an address of the Senate dated 3rd March, 1909, calling for a statement showing the imports of oxide of aluminum for the years 1903, 1904, 1905, 1906, 1907, 1908, with value. Also a statement showing the exports of aluminum for the same years, with values. Presented 10th March, 1909.—*Hon. Mr. Domville.* . .*Not printed.*
- 120.** Return to an order of the House of Commons, dated 1st February, 1909, showing the number of applications made to the Board of Railway Commissioners for the privilege of crossing railway tracks with telephone and telegraph wires and with water mains, each, over the said period from 1st February, 1904, to the 1st January, 1908; the total number of applications granted over said period; the total number of applications refused; the date of each application; the date each application was granted; the length of time from the application to the granting of same; and what time should elapsed before the board should give its decision. Presented 23rd March, 1909.—*Mr. Barr.**Not printed.*
- 121.** Return to an order of the House of Commons, dated 17th February, 1909, giving detailed items of the sum of \$10,646.93, being revenue received from Kingston Penitentiary, other than from sale of twine, as shown on page L—36 of the Auditor General's Report, and stating what proportion of such revenue was derived from sales to officers of the penitentiary, with the names of such officers, and the amounts and nature of the goods purchased by them. Presented 23rd March, 1909.—*Mr. Barnard.* . . .*Not printed.*
- 122.** Return to an order of the House of Commons, dated 1st March, 1909, for a copy of all papers and correspondence between the government and the government of British Columbia with reference to the reduction of Indian Reserves in that province, proportionately to the decrease of Indian population as provided for by order in council. Presented 23rd March, 1909.—*Mr. Barnard.**Not printed.*

 CONTENTS OF VOLUME 17—*Continued.*

- 123.** Return to an order of the House of Commons, dated 17th February, 1909, for a copy of all correspondence, reports and papers of every description treating of or in connection with the application of or grant to Francis Percival Aylwin, of the city of Ottawa, of a tract of land in the province of Alberta for irrigation purposes. Presented 23rd March, 1909.—*Mr. Magrath*... ..*Not printed.*
- 124.** Return to an order of the House of Commons, dated 3rd March, 1909, showing the amounts on deposit in the Government Savings Department on 1st October, 1889, 1st October, 1896, and 1st October, 1897 and 1898; how many officials were employed in connection with the management of this fund in the years 1888, 1890, 1898, 1900 and 1908; the cost of the management of this fund in the years 1888, 1890, 1898, 1900 and 1908. Presented 23rd March, 1909.—*Mr. Sharpe (Ontario)*... ..*Not printed.*
- 124a.** Supplementary Return to No. 124. Presented 5th April, 1909... ..*Not printed.*
- 125.** Return to an order of the House of Commons, dated 1st February, 1909, showing what operations, including all expenditures, were carried on last year under the fishing leases granted to F. H. Markey, of Montreal, for Great Slave Lake, Nelson and other rivers; J. K. McKenzie, of Selkirk, for Lesser Slave Lake and Arthabaska Lakes; Archibald McNee, for parts of James Bay; Coffey and McRitt, Cedar Lake; The Capital City Packing Company (Limited) and the William Hickey Company (Limited). Presented 24th March, 1909.—*Mr. Bradbury*... ..*Not printed.*
- 126.** Return to an order of the House of Commons, dated 26th January, 1909, showing the names and places of registry of the several American fishing vessels seized by the Dominion fishery cruisers for illegal fishing in Canadian waters since 1900, and of the courts in which action for penalties or forfeitures were instituted, the mode of service of the writs or other process on such foreign fishing vessels, and in what court tried and a statement of the fines imposed, or proceeds of sale realized, and how such fines or proceeds of forfeiture were appropriated; also a copy of the judgment of the High Court of Justice for Ontario in the case of *Rex vs. American Gasoline Fishing Boat*. Presented 24th March, 1909.—*Mr. Macdonell*... ..*Not printed.*
- 127.** Return to an address of the House of Commons, dated 1st February, 1909, for a copy of all orders in council, reports, correspondence, deeds, conveyances, regulations, conditions and other documents relating to (a) the grant or conveyance to the Grand Trunk Railway Company of Canada of a portion of Major Hill Park, so-called, for the site of an hotel, or touching the use or purpose for which the said conveyance was made or proposed; (b) the grant or conveyance to the said company or to the Ottawa Railway Terminal Company or to any other person or corporation of any lands in or adjoining the city of Ottawa for the purpose of or in connection with the building of a station at Ottawa or for other railway purposes. Presented 24th March, 1909.—*Mr. Borden (Halifax)*... ..*Not printed.*
- 128.** Return to an order of the House of Commons, dated 3rd March, 1909, showing how many post offices have been transferred in the province of Manitoba since 1st November, 1908; who the former postmasters were, and who the present postmasters are, with the names of offices; and the reasons assigned for the transfers. Presented 24th March, 1909.—*Mr. Roche*... ..*Not printed.*
- 128a.** Return to an order of the House of Commons, dated 8th March, 1909, for a copy of all applications, correspondence, reports, documents and papers relating to the establishment and service of a post office at Hand Hills, Alberta. Presented 13th April, 1909.—*Mr. Magrath*... ..*Not printed.*

CONTENTS OF VOLUME 17—*Continued.*

- 128b.** Return to an order of the House of Commons, dated 22nd March, 1909, for a copy of all correspondence, petitions and reports addressed to the government, or Post Office Department, and all correspondence and orders consequent thereon, relating to the change of the name of the post office of Weymouth North, and of the post office of Weymouth Bridge to Weymouth. Presented 19th April, 1909.—*Mr. Jameson.*
Not printed.
- 129.** Return to an order of the House of Commons, dated 8th March, 1909, showing the names and addresses of the several immigration agents in Canada whose duty it is to locate or settle immigrants upon their arrival in Canada, what salary or remuneration has been paid to each such agent for the fiscal year 1908 and up to the 1st February, 1909, and on what basis they are paid. Presented 25th March, 1909.—*Mr. Macdonell.*
Not printed.
- 129a.** Return to an order of the House of Commons, dated 8th March, 1909, showing the names and addresses of the several inspectors of immigrants employed by the government; what salary or remuneration has been paid to each such inspector during the fiscal year 1908 and up to the 1st February, 1909; and on what basis they are paid. Presented 25th March, 1909.—*Mr. Herron.* *Not printed.*
- 129b.** Return to an order of the House of Commons, dated 10th February, 1909, for a copy of all correspondence, reports and documents between the Department of the Interior and the immigration agents in the United States; and between the Department of the Interior and the colonization societies since the 1st of January, 1908. Presented 30th March, 1909.—*Mr. Paquet.* *Not printed.*
- 130.** Return to an order of the House of Commons, dated 15th March, 1909, showing the amounts paid during the years 1903-4, 1905-6 and 1907-8 by the following Departments: (a) Marine and Fisheries, (b) Railways and Canals, (c) Customs, (d) Post Office, (e) Militia and Defence, and (f) Public Works, to the following persons, firms and companies, viz.—The Wilson Gas Buoys Company, the Canadian Fog Signal Company, James Murphy, William R. Blakiston, James Holliday, Allison Davie, J. B. Côté, Adolph Huot, Joseph Samson, Samson & Philion, E. Pelletier, Napoleon Mercier, Severin Martel, Michel Thibodeau, Edmond Belanger & Co., Marie & Themblay, Terreau & Racine, Rock City Tobacco Company, J. N. Martineau, George Marchand, Jean Drolet, Elie Amyot, Charles A. Parent, A. N. Melvin, W. G. Robertson, Wm. Robertson & Co., Howell & Co., St. John Iron Works, Charles McDonald, John A. Moore, Wm. J. Vroom, John A. McAvity Bros., George McAvity, Patrick J. Mooney, Polson Bros. or Polson Iron Works, Merwin & Company, F. L. Brooks & Company, F. S. Brooks, Safety Company, Submarine Company, Wm. J. Allen and Mr. Willard. Presented 25th March, 1909.—*Mr. Sharpe (Ontario).* *Not printed.*
- 131.** Return to an order of the House of Commons, dated 25th January, 1909, showing in relation to each dog-fish reduction plant or establishment for the reduction of dog-fish erected by or for the government or maintained in whole or in part by the government (a) the cost of construction, (b) the cost of maintenance for each year, (c) the location, (d) the quantity of dog-fish treated thereat in each year, and (e) the amount realized from the sale or disposal thereof in each year. Presented 25th March, 1909.—*Mr. Borden (Halifax).* *Not printed.*
- 132.** Return to an order of the House of Commons, dated 17th February, 1909, showing the amount of money paid by the government, including all branches of the service, from 1st January, 1897, to 1st January, 1909, to the Logberg Printing Company, Winnipeg. Presented 26th March, 1909.—*Mr. Bradbury.* *Not printed.*

CONTENTS OF VOLUME 17—Continued.

- 132a.** Supplementary Return to No. 132. Presented 6th April, 1909.*Not printed.*
- 133.** Return to an order of the House of Commons, dated 22nd March, 1909, showing the amount of produce of the following lines shipped to Great Britain or other countries in cold storage, or cooled air chambers, during the years 1907 and 1908:—Apples, in barrels or other packages, pears, plums, tomatoes, fresh meat, in pounds, fowl, fish, butter, eggs and cheese; to what country or countries they were shipped, and their condition on landing; the system of cold storage principally in use on the steamships carrying such produce. Presented 26th March, 1909.—*Mr. Sproule*.*Not printed.*
- 134.** Return to an address of the House of Commons, dated 10th February, 1909, for a copy of all correspondence, telegrams, papers, reports and valuations of officers or experts, and orders in council, in connection with the purchase, removal and repairing of the dredge *Industry* and parts thereof, including scow, boilers and parts. Presented 29th March, 1909.—*Mr. Foster*.*Not printed.*
- 135.** Copy of a letter sent to all officers of the Department of Public Works charged with the purchase of materials and supplies, and the certifying of accounts for same, under the different branches of the chief architect, the chief engineer and the superintendent of telegraphs. Presented 31st March, 1909, by Hon. W. Pugsley.*Not printed.*
- 136.** Return to an order of the House of Commons, dated 8th February, 1909, showing the Ross Rifles, Mark I. and Mark II., or any other description of Ross Rifle, used by the Canadian rifle team at Bisley last year in the regular team competitions; what Ross rifles of any description were used in the Bisley competitions, regular or extra series matches, by any member of the Canadian team, or any Canadian marksman engaging in such matches; with the name of the individual, and if in the employ of the Ross Rifle Company; the description of the rifle, and in what way it differs from the Ross Rifle, Mark I. and Mark II., both as to length of barrel and such expert accessories as wind gauges, sights, globe or ring, spirit levels, &c., if a target rifle or a service rifle, and if to be adopted by the government for the militia; and where the rifle was manufactured in toto. Presented 1st April, 1909.—*Mr. Worthington*.*Not printed.*
- 137.** Return to an address of the House of Commons, dated 10th February, 1909, for a copy of all correspondence, papers, reports, estimates, orders in council, &c., in connection with the surveys of and boring in, and called for tenders for dredging or excavation in the St. John Harbour and Courtney Bay, or either of them, during the year 1908; a copy of the advertisements, names of the papers in which they were inserted, the tenders received and dates, the names of the tenderers and the amount of each tender; which tender, if any, was accepted, the deposit required, and in which bank it was deposited. Presented 6th April, 1909.—*Mr. Daniel*.*Not printed.*
- 137a.** Return to an address of the House of Commons, dated 10th February, 1909, for a copy of all correspondence, papers, orders in council, advertisements, tenders, contracts, &c., in connection with dredging in the harbour of St. John, New Brunswick, covering the area dredged by Gershen B. Mayes, the Dominion Dredge Company, John Moore, or other parties, during the years 1904, 1905, 1906, 1907 and 1908; the quantities dug under each contract, the amounts paid to each contractor, the date of each payment, and to whom. Presented 11th May, 1909.—*Mr. Daniel*.*Not printed.*
- 138.** Return to an order of the House of Commons, dated 1st February, 1909, showing: 1. The total amount expended on public works by this government in the riding of Bonaventure prior to the general elections of 1900. 2. The total amount expended by the government in this riding, (a) on public works, and (b) in aid of the railways and other undertakings since said general election, and the estimated additional amount

CONTENTS OF VOLUME 17—*Continued.*

required, (a) to complete these public works, and (b) to meet the subsidies or grants in aid of railways or other undertakings. 3. The various public works undertaken by the Government in this riding between the general election of 1896 and the general election of 1900, the dates when the several works were undertaken, whether they were let by public advertisement, tender, and contract, or how otherwise, and the sums of money, stated separately, expended upon these works prior to the election of 1900. 4. Which of these several works were completed and which of them remained uncompleted at the date of the election in 1900. 5. The sums of money, stated separately, expended in or towards completing these works since the said election of 1900, and the dates of expenditure. 6. The various public works undertaken and carried on by the Government since the general election of 1900, the dates when the several works were inaugurated or commenced, the sums of money, stated separately, expended upon these works, and the estimated amount required to complete such of these works as have not been completed; and showing whether these works were done by tender or contract, or how otherwise. 7. The moneys granted by the Government by way of subsidy aid to railways or other undertakings in said riding since the general election of 1900, the sums of money paid under these grants and the estimated amount required to meet future payments. 8. The public works commenced and the money obligations incurred and moneys expended for public works within said riding of Bonaventure during the month of October last. Presented 13th April, 1909.—*Mr. Lennox*.*Not printed.*

- 139.** Return to an order of the House of Commons, dated 1st March, 1909, showing the names and addresses of all half-breeds living in the United States who have been allotted scrip since January, 1902, and to whom said scrip was sent or delivered. Presented 13th April, 1909.—*Mr. Bradbury*.*Not printed.*
- 140.** Return to an address of the House of Commons, dated 1st March, 1909, for a copy of all correspondence, orders in council, papers and other documents relating to the disallowance, or application therefor, of an Act of the Legislature of the province of Ontario, intituled: 'An Act respecting Cobalt Lake and Kerr Lake,' being chapter 15 of the Statutes of 1907. Presented 13th April, 1909.—*Mr. Clarke (Essex)*.*Not printed.*
- 141.** Return to an order of the House of Commons, dated 15th February, 1909, showing: 1. The total mileage of railways authorized to be constructed under charters granted by the Dominion Parliament, between the period from 1888 to 1908, inclusive, exclusive of the Grand Trunk Railway Company, the Canadian Pacific Railway Company, the Canadian Northern Railway Company, and the Grand Trunk Pacific Railway Company. 2. Exclusive of the above named companies, the number of miles actually constructed under said charters. 3. The number of said companies so incorporated. 4. The number of those that have actually constructed any portion of the railway so authorized. 5. The number of said charters which have lapsed. 6. The number granted an extension of time for construction. 7. The number granted two such extensions. 8. The number granted three such extensions or more. Presented 19th April, 1909.—*Mr. Middlebro*.*Not printed.*
- 141a.** Return to an order of the House of Commons, dated 17th February, 1909, giving a list of railway charters granted since 1st January, 1900, other than to the Grand Trunk, Grand Trunk Pacific, the Canadian Northern and the Canadian Pacific Railway Companies, showing those whose powers have lapsed, and the length of each of the proposed roads and branches, the date of charters and renewals, if any, the total mileage constructed, the capital stock authorized, subscribed and paid up. REPORT

OF THE

DEPUTY MINISTER OF INLAND REVENUE

To the HON. WM. TEMPLEMAN,
Minister of Inland Revenue.

SIR,—Herewith I have the honour to submit statements of the Inland Revenues collected by this department during the Fiscal Year ended March 31, 1908, with the usual information as to the cost of collection, and statistics respecting the sources whence these revenues were derived.

The following summary comparison shows the accrued revenue for the Fiscal Years ended June 30, 1904, 1905, 1906, for the Nine Months ended March 31, 1907, and the Fiscal Year ended March 31, 1908.

| | 1904 | 1905 | 1906 | 1907 Nine months. | 1908 |
|--|------------|------------|------------|-------------------------|------------|

8-9 EDWARD VII., A. 1909

The revenue derived from goods manufactured in bond during the Fiscal Year ended March 1908, and the four preceding Fiscal Years, has been as follows :—

| | |
|------------------------------|-----------|
| 1903-1904..... | \$ 45,343 |
| 1904-1905..... | 51,141 |
| 1905-1906..... | 56,115 |
| 1906-1907 (nine months)..... | 41,822 |
| 1907-1908..... | 66,524 |

ACETIC ACID :

The revenue derived from acetic acid during the Fiscal Year ended March 31, 1908, and the four preceding Fiscal Years, was as follows :—

| | |
|------------------------------|----------|
| 1903-1904..... | \$ 2,701 |
| 1904-1905..... | 7,694 |
| 1905-1906..... | 1,656 |
| 1906-1907 (nine months)..... | 1,945 |
| 1907-1908..... | 3,314 |

INSPECTION OF PETROLEUM :—

The quantity of Canadian Petroleum and Naphtha inspected during the Fiscal Year was as follows :—

| | |
|----------------|-------------------|
| Petroleum..... | 19,051,752 |
| Naphtha..... | 3,712,060 |
| Total | <u>22,763,812</u> |

PUBLIC WORKS :

The revenue accrued from this source was as follows :—

| | 1906-1907. | 1907-1908. |
|--------------------------------|-------------|-------------|
| Hydraulic and other rents..... | \$ 2,547 00 | \$ 3,647 00 |
| Minor public works | 184 83 | 1,154 75 |

WEIGHTS AND MEASURES AND ELECTRIC LIGHT :—

The usual special reports in relation to these services have been prepared, containing full statistical information.

The aggregate revenue accrued from these services was \$169,573.52.

The cost of the three services being \$150,323.99.

PREVENTION OF ADULTERATION OF FOOD AND AGRICULTURAL FERTILIZERS :—

The usual supplementary report in relation to this service will be submitted, containing details of the work done and the report of the analysts.

METHYLATED SPIRITS :—

The quantity of methylated spirits manufactured during the nine months was 105,175.92 proof gallons, and the sales 102,235.98 proof gallons. A statement of details appears on pages 68, 69.

SESSIONAL PAPER No. 12

The price of this denatured alcohol is practically the actual cost of manufacture and is as follows:—

Grade No. 1, 70c. per gallon and when containing 1 per cent. of benzine 60c. per gallon.

Grade No. 2, 80c. per gallon and when coloured violet 65c. per gallon.

Appendix **A** shows the consumption of, and revenue derived annually from spirits, tobacco and other goods subject to Excise, and of similar goods subject to duties of Customs, per head of the population of the Dominion.

Appendix **B** contains, as usual, the details concerning illicit stills seized during the year.

Appendix **C** shows the amount of Excise Revenue collected at each out-office and under various headings, separately.

I have the honour to be, Sir,

Your obedient servant,

W. J. GERALD,
Deputy Minister.

INLAND REVENUE DEPARTMENT,
OTTAWA, June 11, 1908.

APPENDIX A

TABLE showing the Annual Consumption per head of the undermentioned articles paying Excise and Customs Duties, and the Revenue per head derived annually.

REPORTS, RETURNS AND STATISTICS
OF THE
INLAND REVENUES
OF THE
DOMINION OF CANADA
FOR THE YEAR ENDED MARCH 31
1908

PART II
INSPECTION OF WEIGHTS AND MEASURES
GAS AND ELECTRIC LIGHT

PRINTED BY ORDER OF PARLIAMENT

O T T A W A
PRINTED BY S. E. DAWSON, PRINTER TO THE KING'S MOST
EXCELLENT MAJESTY
1908

REPORT

OF THE

DEPUTY MINISTER OF INLAND REVENUE

ON THE

INSPECTION OF WEIGHTS AND MEASURES, GAS AND ELECTRIC LIGHT

To the Honourable

The Minister of Inland Revenue.

SIR,— I have the honour to submit herewith my annual report on the inspection of weights and measures, gas and electric light, with the usual statements in connection therewith, for the Fiscal Year ended March 31, 1908.

1. The total revenue collected during the year for the inspection of weights and measures, was \$83,021.32, as against \$54,927.26 collected during the nine months ended March 31, 1907.

2. The total expenditure was \$101,492.24 as against \$69,466.15 expended during the nine months ended March 31, 1907.

3. Appendix 'A' gives a summary statement of the receipts and expenditures of each inspection division.

4. In Appendices 'B,' 'C' and 'D' will be found a detailed statement of weights, measures and weighing machines presented for verification, verified and rejected during the year. The number of all descriptions may be summarily stated as follows :

| | Presented. | Verified. | Rejected. | Percentage of Rejections. |
|--------------------------------------|------------|-----------|-----------|---------------------------------|
| Weights, Dominion..... | 71,020 | 70,728 | 292 | 0·41 |
| Measures of capacity, Dominion. | 117,217 | 117,180 | 37 | 0·03 |
| Lineal measures..... | 8,260 | 8,146 | 114 | 1·38 |
| Balances, equal arms.. .. | 14,980 | 14,798 | 182 | 1·21 |
| " steelyards..... | 5,723 | 5,632 | 91 | 1·59 |
| " platform scales | 42,315 | 41,355 | 960 | 2·27 |
| Miscellaneous weights..... | 442 | 428 | 14 | 3·17 |
| " measures of capacity. | 11,411 | 11,386 | 25 | 0·22 |
| " balances..... | 21,191 | 21,126 | 65 | 0·31 |

INSPECTION OF GAS.

5. The total revenue collected during the nine months ended March 31, 1907, for the inspection of gas and gas meters, was \$31,917.00, as compared with \$44,032.50, collected during the year ended March 31, 1908.

6. The total expenses were \$22,842.14 as against \$31,014.35 expended during the year ended March 31, 1908.

7. Appendix 'E' gives a summary statement of the receipts and expenditures of each gas inspection district.

8. A statement of the illuminating power and purity of gas inspected during the year will be found in Appendix 'F.'

9. The illuminating power, where inspection has been made, has been as follows :—

| Places. | Number of tests made. | Number of times below Standard. | Places. | Number of tests made. | Number of times below Standard. |

SESSIONAL PAPER No. 13

The revenue derived from the inspection of electric light was as follows :—

| | |
|--|--------------|
| Fees for inspection of meters, &c | \$36,600 20 |
| Registration of companies | 5,616 25 |
| | <hr/> |
| | \$ 42,216 45 |
| The expenses of inspection (annual)..... | \$ 12,345 55 |
| " re export of electric power.... | 456 80 |
| | <hr/> |
| | \$ 12 802 35 |
| | <hr/> |
| | \$ 29,414 10 |
| Expended on standard instruments, &c | 5,015 05 |
| | <hr/> |
| Leaving a net revenue of | \$ 24,399 05 |
| | <hr/> |

Since the year 1896-97 the two services of gas and electric light inspection, which are conducted largely by the same staff of officers have reached that point at which they have ceased to be a burden upon the general taxpayer, as shown below :—

| YEARS. | GAS AND ELECTRIC LIGHT. | | | |
|----------------------------|-------------------------|------|--------------|------|
| | Revenue. | | Expenditure. | |
| | \$ | cts. | \$ | cts. |
| *1899-1900..... | 35,523 | 50 | 26,424 | 48 |
| *1900-01..... | 37,536 | 57 | 28,247 | 20 |
| 1901-02..... | 45,663 | 05 | 33,328 | 48 |
| 1902-03..... | 49,054 | 55 | 36,006 | 47 |
| 1903-04..... | 50,218 | 75 | 33,426 | 15 |
| 1904-05..... | 62,561 | 37 | 34,774 | 02 |
| 1905-06..... | 76,539 | 00 | 38,917 | 48 |
| 1906-07 (nine months)..... | 57,868 | 18 | 30,793 | 84 |
| 1907-08..... | 86,552 | 20 | 48,831 | 75 |

* Exclusive of cost of standard instruments.

The kindred service of weights and measures inspection, it will be observed, earns slightly over 81 per cent of its actual cost, the expenditure as already stated having been \$101,492.24 against a revenue of \$83,021.32.

The International Commission on Electrical Units and Standards which was to have met in London, England, in the month of October last, will hold its sittings in September of this year.

The International Congress of Applied Electricity meets in Marseilles during the same month.

Mr. Ormond Higman, Chief Electrical Engineer, has been appointed Canadian representative to attend both meetings.

8-9 EDOUARD VII, A. 1909

Up to the present time over 700 sample sets of metric weights and measures have been sent out from the Department for use in educational institutions throughout the Dominion.

I have the honour to be, sir,

Your obedient servant,

W. J. GERALD,
Deputy Minister.

INLAND REVENUE DEPARTMENT,
OTTAWA, June 11, 1908.

REPORT

OF THE

DEPUTY MINISTER OF INLAND REVENUE.

INSPECTION OF FOODS, DRUGS AND FERTILIZERS

To the Hon. WM. TEMPLEMAN,
Minister of Inland Revenue.

SIR,—I have the honour to submit herewith the reports of the Official Analysts of the Dominion for the year ending March 31, 1908.

The following is a summary statement of the number of samples analysed by the District Analysts for the period mentioned.

| Description. | Genuine. | Doubtful. | Adulterated | Total. |
|-------------------|----------|-----------|-------------|--------|
| Fertilizers | 80 | 4 | 1 | 85 |
| Milk | 92 | 18 | 40 | 150 |
| | 172 | 22 | 41 | 235 |

The following statement shows the work done by the Chief Analyst and staff at Ottawa, for the year ending March 31, 1908.

| Description. | Genuine. | Doubtful. | Adulterated. | Sold as Compound. | Total. |
|--------------------------|----------|-----------|--------------|-------------------|--------|

| Well-waters..... | | | | | 128 |
| | | | | | 2,526 |

8-9 EDWARD VII., A. 1909

In addition to the above, 576 samples of miscellaneous character (detailed in the Report of the Chief Analyst) have been analysed, making the total number 3,202 samples, as against 2,201 samples for the preceding nine months, constituting the fiscal year 1906-7. It is to be remembered that, owing to the death of the Chief Analyst, a vacancy on the laboratory staff existed throughout the period 1907-8, but notwithstanding this fact the number of samples examined was relatively greater than during the preceding fiscal period.

The appointment of two assistants has placed the staff of the Chief Analyst on a fairly well equipped working basis, and even better results may be looked for in the future.

Reference has been made in previous reports as to the desirability of establishing standards of purity for food, but notwithstanding the consideration given by the Chief Analyst to this subject, he does not as yet feel warranted in making definite recommendations.

I have the honour to be, sir,
Your obedient servant,

W. J. GERALD,
Deputy Minister.

INLAND REVENUE DEPARTMENT
OTTAWA December 1, 1908.

REPORT OF CHIEF ANALYST.

OTTAWA, September 16, 1908.

W. J. GERALD, Esq.,
Deputy Minister of Inland Revenue.

SIR,—I beg to report as follows upon the work of this laboratory, for the fiscal year ending March 31, 1908.

During this period, 2,626 samples were collected by our inspectors. The results of analysis of these are detailed in Bulletins 135 to 150, as follows :—

| Number of Bulletin. | Subject. | Number of samples. |
|---------------------|---------------------------------|--------------------|
| 135 | Spirituous Liquors..... | 68 |
| 136 | Almond Flavouring Extracts..... | 65 |
| 137 | Ground Ginger..... | 30 |
| 138 | Ground Cinnamon..... | 33 |
| 139 | Fertilizers as sold..... | 107 |
| 140 | Maple Sugar..... | 257 |
| 141 | Maple Syrup..... | 244 |
| 142 | Milk..... | 343 |
| 143 | Drugs..... | 389 |
| 144 | Condensed Milk..... | 142 |
| 145 | Strained Honey..... | 253 |
| 146 | Drugs..... | 196 |
| 147 | Lard..... | 140 |
| 148 | Honey..... | 141 |
| 149 | Well-waters..... | 128 |
| 150 | Canned Salmon..... | 90 |
| | | 2,626 |

In addition to the above there have been performed the following occasional analyses, during the year :—

| | Samples. |
|----------------------|----------|
| Acetic Acid..... | 13 |
| Alcohol..... | 2 |
| Beer..... | 40 |
| Butter..... | 2 |
| Butterine..... | 11 |
| Baking Soda..... | 2 |
| Sugar..... | 1 |
| Coal..... | 1 |
| Caustic Soda..... | 1 |
| Candies..... | 4 |
| Cream of Tartar..... | 14 |
| Cider..... | 2 |
| Coffee..... | 2 |
| Carbolicene..... | 1 |
| Dextro-Maltine..... | 1 |
| Fusel Oil..... | 4 |

| | |
|-------------------------|-----|
| Fertilizers | 12 |
| Jam..... | 3 |
| Lard..... | 33 |
| White Lead..... | 1 |
| Patent medicines .. | 21 |
| Maple Sugar | 2 |
| Maple Syrup..... | 5 |
| Milk | 3 |
| Morphine Sulphate | 1 |
| Oils | 4 |
| Olive oil..... | 3 |
| Spirits | 7 |
| Snuff..... | 2 |
| Spices | 7 |
| Tea..... | 2 |
| Vinegar..... | 347 |
| Water..... | 14 |
| Worts..... | 1 |
| Wood Alcohol | 1 |
| Wax Candles | 6 |
| Total | 576 |

The total number of analyses made is therefore 3,202.

The following solutions have been prepared and supplied for the use of Excise Officers, in vinegar testings :—

| | | |
|--------------------------------|----|--------------|
| Normal Soda Solutions | 63 | Winchesters. |
| Standard Phenolphthalein..... | 14 | bottles. |
| “ Standard Sulphuric Acid..... | 4 | “ |

A considerable amount of investigatory work has been carried out, both in connection with the subject matter arising out of regular collections, and also in special lines. Some references to this class of work, which necessarily entails much expenditure of time and labour, will be found in the Bulletins already mentioned. Other portions of it are reported, confidentially to yourself, or remain on file here, as a guide to researches to be carried out later.

The matter of establishing standards for various foods has been kept in view, and it is hoped that it will be possible to make definite recommendations, in the case of certain articles, in the near future.

The following notes upon the work recorded in the several Bulletins, is intended to present, in epitome, the principal conclusions reached :—

Bull. 135.—In 68 samples of Whiskey, taken at different bars throughout Saskatchewan and Alberta, the absence of methyl alcohol (wood spirits) was conclusively proved. 43 per cent of the samples obtained in Saskatchewan and 88 per cent of those obtained in Alberta, were found to be up to proof strength.

Bull. 136.—In 65 samples of Almond Flavouring Extracts, 61 samples proved to be quite free from hydrocyanic acid (prussic acid). Only 3 samples contained a measurable amount, and this was too minute to be in any way dangerous.

Bull. 137.—Of 30 samples of Ground Ginger 29 were found to be genuine, or contained only traces of foreign starch. One sample contained 20 per cent of wheat starch.

Bull. 138.—Contains an examination of 33 samples of so-called Ground Cinnamon. A considerable amount of investigatory work was done with a view of establishing a difference between true Cinnamon and Cassia. These two varieties of spice run into

SESSIONAL PAPER No. 14

each other through so many gradations that it is nearly impossible to distinguish between them; and quite so, except in typical samples. Further work will be done upon this subject when opportunity offers.

Bull. 139.—This is a report upon 107 samples of Fertilizers, obtained on the market. Much difficulty has been found in making the present Fertilizer Act fulfil its intention of protecting the consumer against injustice and consequent serious injury. The main obstacles are *first*, securing the registration of all fertilizers offered for sale; *second*, the identification of the article as sold with the registered brand. A new Act has been drafted, and secured two readings in the present parliament, during last session. It is hoped that, when this becomes law, the difficulties just referred to will disappear.

Bull. 140 and 141.—These bulletins deal with the examination of 501 samples of Maple Sugar and Syrup, as found on the markets of Canada.

It has been found possible to establish fairly satisfactory standards for these products; and judged by such standards, the samples are classified as follows:—

| | Sugar. | Syrup. |
|----------------------|-----------|-----------|
| Found genuine..... | 185 | 185 |
| Sold as mixture..... | 5 | 37 |
| Found doubtful..... | 10 | 2 |
| “ adulterated | 57 | 20 |
| | <hr/> 257 | <hr/> 244 |
| | | 501 |

Bull. 142.—This bulletin deals with the examination of 343 samples of Milk collected throughout Canada. It contains a systematic study of the work done by this laboratory on the subject of milk, since 1887. The following sentences, which sum up my conclusions, may be quoted.

“In the face of what has been recorded I am compelled to admit that while I believe the standards for milk recommended by the late Chief Analyst to be reasonable, and already attained throughout the greater part of Canada, it is impracticable that they could be enforced by legal enactment over the whole of Canada. Without going so far as to say that the cow must herself be consulted in the matter of quality of milk, it is undeniable that the existence of many herds, whose average milk shows less than 3 per cent of fat, and less than 11.5 per cent total solids, makes the universal adoption of a three and a half per cent standard impossible.”

The standard referred to is:—

| | Per cent. |
|---------------------|-----------|
| Total solids..... | 12 |
| Butter fat..... | 3.5 |
| Non-fat solids..... | 8.5 |

Bull. 143.—Contains a report upon certain drugs, as follows:—

| | Samples. |
|--|-----------|
| Chloral Hydrate..... | 129 |
| Ammonium Bromide..... | 129 |
| Boracic Acid (sold as Am. Bro)..... | 1 |
| Potassii Tartras Acidus..... | 92 |
| Rochelle Salt (sold as Pot. Tart. Acid.) | 1 |
| Cream of Tartar..... | 36 |
| Bi-carb. Soda (sold as Cr. Tar.)..... | 1 |
| ‘ Total..... | <hr/> 389 |

8-9 EDWARD VII., A. 1909

All samples of chloral hydrate were found to be genuine. Ammonium bromide was found to be of very variable character, only 28·9 per cent of the samples reaching 97 per cent purity.

The question of fixing a standard for commercial cream of tartar of somewhat less rigour than that which the British Pharmacopœia requires for the drug (*Potassii Tartras Acidus*), is suggested; and will afford subject matter for later investigation.

Bull. 144 reports upon 142 samples of Condensed Milk. Many brands are sold as "Creams," although analysis show these brands to contain actually less butter fat than the ordinary condensed milk.

Suggestions having regard to the adoption of specific terminology and specific standards are made.

Bull. 145 is a report upon 253 samples of Strained Honey. Results may be summarized as follows:—

| | Samples. |
|--|----------|
| Genuine, and of normal character | 188 |
| " with high water content | 31 |
| Doubtful | 4 |
| Apparently adulterated | 16 |
| Sold as Compound | 14 |
| Total | 253 |

The adulterations consisted in addition of glucose, or of cane sugar.

Bull. 146 reports upon the following drugs:—

| | Samples. |
|------------------------------|----------|
| Bismuth subnitrate | 55 |
| Potassium Bromide | 57 |
| Phenacetin | 84 |
| Total | 196 |

All samples were found genuine.

Bull. 147 deals with 140 samples of Lard, collected throughout the Dominion. Two samples sold as genuine were found to contain cotton-seed stearin. Seven others were doubtfully pure lards.

Investigation of methods for the detection and estimation of beef stearin in lard is much needed, and will be proceeded with as leisure permits.

Bull. 148 is a further report upon Honey. 141 samples were collected in winter (December) at special suggestion of the Middlesex Bee-Keepers' Association.

| | Samples. |
|----------------------------|----------|
| Found genuine | 135 |
| " doubtful | 3 |
| " adulterated | 2 |
| Sold as compound | 1 |
| Total | 141 |

Bull. 149, deals with an important but much neglected subject, the care of Domestic Wells. I have attempted to present the subject clearly and simply, with a view to its being dealt with by the municipalities interested. Although water is the most important of foods, yet being neither manufactured nor sold, in the ordinary sense of these words, it cannot be said to come strictly under the Adulteration of Food Act. More-over anything like an effective supervision of public supplies would be too costly a business to be undertaken by this Department; while the great majority of wells are

SESSIONAL PAPER No. 14

private property, and unless cared for by their owners, are likely to become very dangerous for household supply. Typhoid fever has become characteristically a disease of the country; and every autumn sees numbers of city people returning from the country and developing typhoid fever, which had its origin in impure well water, used by them while spending their summers in the country. Even private wells may become a public menace. When situated near a school house, church or hall, a private well is frequently made available to the public. Private wells often supply factories, creameries, bakeries, breweries, &c. Most household wells are, for convenience of access, placed close to the house, and are thus, through ignorance and thoughtlessness, especially liable to contamination.

This bulletin contains a special report upon 128 wells examined in the towns of Weston, Richmond Hill and Oakville. The work recorded is rather to be considered in the light of an object lesson than as a thorough investigation of determinate water supplies. Unless the municipalities concerned take the matter up, it is not likely that this Department will feel justified in proceeding further with it.

Bull. 150 reports upon 90 samples of Canned Salmon. All were in good condition.

In addition to the above, 267 samples have been analysed by the District Analysts, during the year, details of which will be found in their reports, which accompany this.

I have the honour to be, sir,
Your obedient servant,

A. MCGILL,
Chief Analyst.

OTTAWA, June 24, 1908.

W. J. GERALD, Esq.,
Deputy Minister of Inland Revenue,
Ottawa, Ont.

SIR,—I have the honour to lay before you my report on the samples submitted to me by your Department during the fiscal year ending March 31, 1908.

Fourteen commercial fertilizers were the only samples received during the year. Two of these were found not to come within the category of commercial fertilizers as they contained none or but traces of the three essential elements of plant food : nitrogen, phosphoric acid, and potash. One was found below guarantee in potash, and the others were found equal to guarantee.

I have the honour to be, sir,

Your obedient servant,

APPENDIX A.**BULLETIN No. 135—SPIRITUOUS LIQUOURS.**

OTTAWA, July 5, 1907.

W. J. GERALD, Esq.
Deputy Minister of Inland Revenue,
Ottawa.

SIR,—Consequent upon your letter (40602) of 27th December last, addressed to the late chief analyst, a collection of spirituous liquors was ordered to be made by Mr. Food Inspector Conklin, throughout the province of Saskatchewan. Twenty-two (22) samples were obtained, and the results of their examination are given in Table I. Special mention was made of Wolseley, Stockholm and Neudorf, as points of collection, and instructions furnished our inspector, made note of this; but the blocking of railways at the time (January) made it practically impossible to visit the two last named places.

Your further letter (41163) of the 30th January, authorized a similar collection throughout the province of Alberta. Forty-six (46) samples were obtained in February and March; and the results of their examination (except two samples which were broken in carriage) appear in Table II.

The immediate cause of this inspection, was the reported death of some persons who were thought to have been poisoned by the use of adulterated liquors. The samples which form the subject of this report, were obtained at public bars, &c.; and may therefore be taken to represent the average whiskey of the provinces in which they were sold. It is gratifying to find that no drugs, nor poisonous additions of any kind have been found in these liquors.

Particular attention has been given to the detection of methyl alcohol (wood spirit), since this is known to have poisonous properties. Its absence has been proved in every instance.

I beg to submit to you, for publication, as Bulletin 135, the accompanying records of work done upon these samples.

I have the honour to be, sir,
Your obedient servant,

A. MCGILL,
Acting Chief Analyst.

SESSIONAL PAPER No. 14

Preliminary notes.

1. Canada has no generally accepted, or legally established spirit strength for alcoholic liquors. The British Foods Act, fixes 75 per cent proof, as the limit of reduction by water. On the basis of such a standard, the whiskey samples herein reported, may be classified as follows:—

| | PROVINCE OF | |
|---|--------------------|----------|
| | SAS- KATCHEWAN. | ALBERTA. |
| Samples within 2 degrees of 75 per cent proof.. | 4 | 30 |
| " below 75 degrees proof..... | 12 | 5 |
| " above 75 " " | 5 | 8 |
| Total examined. | 21 | 43 |

Percentage of the number examined which are found to be equal to, or above 75 per cent proof strength :

| | |
|----------------------|--------------|
| In Saskatchewan..... | 43 per cent. |
| In Alberta..... | 88 " |

2. Preliminary testing for methyl alcohol has been done by the determination of the refractive index of a carefully prepared distillate at 20° C.; the spirit strength of the distillate being accurately known, any marked lowering of the refractive index, as compared with that of ethyl alcohol, of the same strength, indicates the necessity of a specific search for methyl alcohol.

Experiment has proved that working errors need not produce a deviation of more than 0.5 degree (Abbe Immersion refractometer scale); and that the presence of one per cent of methyl alcohol is certainly detected by the method, in a properly prepared distillate.

APPENDIX B.

BULLETIN No. 136—ALMOND FLAVOURING EXTRACTS.

OTTAWA, July 10, 1907.

W. J. GERALD, Esq.,
Deputy Minister of Inland Revenue.

SIR,—I beg to submit a report upon sixty-five samples of Almond Flavouring Extracts, with accompanying note, and would respectfully suggest the publication of the whole, as Bulletin No. 136.

I have the honour to be, sir,
Your obedient servant,

A. MCGILL,
Acting Chief Analyst.

ALMOND FLAVOURING EXTRACTS.

In consequence of some reported cases of apparent poisoning from the use of Almond Extracts, supposed to contain more than traces of hydrocyanic (prussic) acid, (L. 40850), a collection of sixty-five (65) samples of Essence of Bitter Almonds, sold for the purpose of flavouring pastry, icecream, &c., was made in April and May of this year. Five samples were purchased in each of the thirteen Inspectoral Districts.

These have been carefully examined for prussic acid, by Mr. Lemoine, of this Laboratory, and his results are given in the accompanying table.

I may explain that prussic acid is not an essential constituent of an almond flavouring extract, except in the sense that it is naturally produced by a ferment present in the almond seed, which acts on the glucoside amygdaline to produce benzaldehyde and prussic acid, together with glucose. The benzaldehyde is the essential component, so far as development of flavour is concerned. For culinary purposes, the prussic acid should be removed by special treatment.

In modern practice it is usual to substitute an artificial benzaldehyde, made from toluene, for the article produced as above, by fermentation of amygdaline. The artificial benzaldehyde is, (according to Squire's Companion to the British Pharmacopœia, 17th edition, p. 90) 'scarcely inferior as a flavouring agent, to the natural oil.' It has the advantage of being entirely free from prussic acid, and I cannot regard the employment of pure benzaldehyde in the preparation of almond flavouring essences, as fraudulent; although I consider it desirable that a distinction should be made between such an essence and one made from the almond kernel, by appending the descriptive word '*Artificial*' to the same.

Nitrobenzol (oil of mirbane) is sometimes used as a substitute for benzaldehyde in the preparation of artificial almond flavouring. Since this article is quite different in chemical character, from the natural flavour, its employment is to be regarded as an adulteration. Its odour is somewhat like that of benzaldehyde, but more pungent. Nitrobenzol has not been found in any of the samples now reported. Dyes have been found in nine samples. There can be no reason found for the use of dyes, in almond essence, except the gratification of a popular demand for colour. It is to be regretted that a false taste should exist in this regard. So far as wholesomeness is concerned, there is no ground for complaint, as regards the traces of colouring matter found.

Hydrocyanic acid (prussic acid) is entirely absent from sixty-one (61) of the sixty-five (65) samples now reported. In one of the remaining four samples, a mere trace was found, and in only three (3) was the quantity measurable. In these cases the

SESSIONAL PAPER No. 14

amount is too small to have any practical danger to the user, and, although its presence may be taken to be a guarantee of the natural character of the article, I think it undesirable that even traces should remain in the flavouring essence.

| | |
|---|----|
| Total number of samples analysed..... | 65 |
| Number entirely free from prussic acid..... | 61 |
| " containing measurable amounts..... | 3 |
| " " trace only..... | 1 |
| " " dyes..... | 9 |

EXPLANATORY NOTE.

Essences used for experimenting purposes were compounded according to the U.S Pharmacopœia as follows :—

| | | |
|-------|-----------------------|---|
| Stock | Benzaldehyde | 1 part, alcohol 80 parts, water to 100. |
| " | Nitrobenzol | " " " |
| " | Oil of Bitter Almonds | " " " |

The methods followed in the above researches were those described by Leach, 'Food Inspection and Analysis, pages 749-51'; with the exception, as regards nitrobenzol that it was found easier to dip the test-tube in hot water instead of boiling the liquid on a naked flame. The appearance of a deep violet ring at the lower part of the tube was found to be a delicate test; three cubic centimetres of the essence of nitrobenzol giving an evident reaction. The two other prepared essences gave no reaction. Four cubic centimetres of the essence of nitro-benzol diluted to double quantity with an essence bought in the city also gave the reaction, the added essence having previously given no response to tests for nitro benzol.

The delicacy and accurateness of the silver cyanide test in the quantitative estimation of prussic acid was proved as follows. A few cubic centimetres of the distillate from a mixture of ferrocyanide of potassium and sulphuric acid were made up to 100ccs. and gave following results :—

| | | |
|--|---|-----|
| 1cc. required $2 \cdot 2 \frac{N}{10}$ | silver solution ; $\frac{1}{2}$ strength required | 1.3 |
| " 2.5 | " " | 1.2 |
| " 2.4 | " " | 1.2 |
| " 2.4 | " " | 1.2 |
| 25ccs. U.S.P. essence required..... | | 3.5 |
| " "..... | | 3.5 |
| " "..... | | 3.4 |
| " "..... | | 3.4 |

As 1cc. $\frac{N}{10}$ silver solution is equal to 0.0027 grmm. prussic acid, $3.5 \times 0.0027 = 0.0094$; $0.0094 \times 4 = 0.038$ grmm. per 100ccs. (1,680 minims).

The diluted hydrocyanic acid of the B.P. contains 2 per cent acid and is given at the dose of 2-6 minims = $\frac{1}{12}$ of a grain or 0.0054 grmm. for the maximum dose. It is not therefore probable that the three samples of essence containing respectively 0.0054, 0.0081, 0.0081 grmm. per 100 minims could become injurious. But it is to be desired that the oil of bitter almonds used in the manufacture of these essences should be absolutely free from prussic acid.

ALP. LEMOINE.

July 8, 1907.

SESSIONAL PAPER No. 14

APPENDIX C.**BULLETIN No. 137—GROUND GINGER.**

OTTAWA, July 15, 1907.

W. J. GERALD, Esq.,
Deputy Minister of Inland Revenue.

SIR,—I have the honour to submit you a report upon thirty (30) samples of Ground Ginger. These were collected throughout the Dominion, in November, 1906, in consequence of information received (t. 92549) which led to the belief that adulterated ginger was to be found on the Canadian Market.

Analysis shews 29 of these samples to be genuine, while adulteration is not absolutely certain in the remaining sample.

Ginger was made the subject of examination in 1896, and again in 1904. A synopsis of results shows the following :—

| | Total samples examined. | PERCENTAGE. | | |
|--------------------------------|----------------------------|-------------|--------------|-----------|
| | | Genuine. | Adulterated. | Doubtful. |
| Bulletin 48 — 1896 | 98 | 64 | 26 | 8 |
| Bulletin 95 — 1904 | 10 | 6 | 4 | 0 |
| Present report, 1907 | 30 | 29 | 0 | 1 |

The usual adulteration of ginger consists in the substitution of cheaper materials (flour, etc.), or in the use of exhausted rhizomes, i.e. stock from which the valuable principles have been more or less completely removed by washing. The examinations now made have had regard to the detection of such adulteration.

It is gratifying to find that ground ginger is now so largely unadulterated.

Some results obtained by the successive employment of certain solvents, are put on record ; and may be useful in the event of our having to make a more intimate study of the properties of ginger at a future time.

I beg to recommend the publication of this report, as Bulletin No. 137.

I have the honour to be, sir,

Your obedient servant,

A. MCGILL,
Acting Chief Analyst.

APPENDIX D.

BULLETIN No. 138--GROUND CINNAMON.

OTTAWA, July 16th, 1907.

W. J. GERALD, Esq.,

Deputy Minister of Inland Revenue.

SIR,—I beg to hand you herewith a report upon thirty-three samples of *Ground Cinnamon*, collected in November and December, 1906.

Cinnamon and *Cassia* are the dry barks of trees which belong to the same botanical genus, *Cinnamomum*. *Cinnamon* is the bark of *C. Zeylanicum*, chiefly grown in Ceylon and the East Indies; *Cassia* is the bark of *C. Cassia*, chiefly grown in China and India. The former bark is thinner, lighter in colour and exists (commercially) in smaller rolls than *Cassia* bark. It is sufficiently easy to distinguish the two articles, in the unground state; and there is a considerable difference in price between whole cinnamon and whole cassia. The botanical elements of the two are, however, practically identical; and, in the finely ground state, it becomes a difficult, if not an impossible thing, to discriminate between them. The darker colour of *Cassia* is almost the only distinctive character that remains.

Whether cassia is inferior to cinnamon for flavouring purposes, in cookery, is an open question. The general impression is that cinnamon is preferable. Its higher price is doubtless due to this preference. At the same time it is certain that much, if not most, of the ground cinnamon of commerce, is really ground cassia.

Several grinders distinctly label their goods with the word *Cassia*; and it is probable that the same spicemen put on the market a higher priced article under the name *Cinnamon*; but of this I have no conclusive proof. It is however quite certain that the spice in question is known to most domestic users as *Cinnamon*; while the term *Cassia* conveys a very vague meaning, or no meaning whatever. Throughout Quebec the article is known as *Canelle*, which means cinnamon as distinguished from cassia, to which belongs the term *Casse*, seldom mentioned except as a drug.

Under these circumstances, it will be seen that a discrimination between cinnamon and cassia, as spices, is difficult to maintain. It is open to question how far we may take the darker colour of cassia, as evidence of its presence. A sample of cinnamon, ground from the bark, was taken as the standard of colour; and among thirty-three samples, of spice bought as cinnamon, only two (2) were found to come up to the prepared standard. One of these was plainly labelled *Cassia* on the package. The sample in question contains no foreign starch, or other addition, which might account for its light colour; so that, unless bleaching has been resorted to, we must infer that some samples of cassia are as light in colour as normal cinnamon.

The difficulty of distinguishing between cinnamon and cassia, in the ground state, is recognized by the Committee of Standards at Washington, as shown by the following definitions, proclaimed as legal for the United States in June, 1906:

Cinnamon is the dried bark of any species of the genus *Cinnamomum*, from which the outer layers may or may not have been removed.

True Cinnamon is the dried inner bark of *Cinnamomum Zeylanicum*, Breyn.

Cassia is the dried bark of various species of *Cinnamomum*, other than *Cinnamomum Zeylanicum*, from which the outer layers may or may not have been removed.

SESSIONAL PAPER No. 14

Cassia buds are the dried, immature fruit of species of *Cinnamomum*.

Ground Cinnamon, *Ground Cassia*, is a powder consisting of Cinnamon, Cassia or Cassia buds, or a mixture of these spices, and contains not more than six (6) per cent of total ash, and not more than two (2) per cent of sand.

So far as admixture of Cassia is concerned, I do not think that the present state of our knowledge justifies me in pronouncing it an adulteration of the spice known as Ground Cinnamon. This aspect of the matter must be left open for the present.

With a single exception, no other foreign matters have been found; and in this sample (No. 26,045) the amount of (wheat) starch is so small, as to be negligible.

As regards ash, the limit of six (6) per cent fixed by American Standard, is exceeded in six cases. I shall, however, await further experience with cinnamon, as occurring on the Canadian market, before feeling warranted in accepting the standards quoted.

The work on this subject has been mainly done by Mr. Lemoine of this Laboratory. An explanatory note by him accompanies the Table.

I beg to recommend the publication of this report as Bulletin No. 138.

I have the honour to be, sir,

Your obedient servant,

A. MCGILL,
Acting Chief Analyst.

JULY 18

APPENDIX E.

BULLETIN No. 139—FERTILIZERS AS SOLD 1907.

OTTAWA, July 25, 1907.

W. J. GERALD, Esq.,

Deputy Minister of Inland Revenue.

SIR,—I have the honour to submit a report upon 107 samples of Fertilizers, purchased by our own Inspectors, and submitted to analysis for the purpose of ascertaining how far the articles sold are in conformity with the guarantee of the manufacturer.

Great difficulty has always been found in identifying with certainty the sample sold, with the corresponding article as guaranteed. The retail vendor is frequently ignorant of the registered name; and he is satisfied to sell as 'Ground Bone' an article which may be registered as 'Bone Flour,' 'Bone Meal,' 'Fine Ground Bone' with or without other distinguishing words. It is evident that without satisfactory proof of identity, it becomes impossible to speak with assurance of the conformity of the sample to a standard. The following classification of the samples now reported, is offered subject to limitations just mentioned.

| | |
|--|------------|
| Fully identified and up to guarantee..... | 62 samples |
| Doubtfully identified and up to guarantee..... | 18 " |
| " " and below "..... | 3 " |
| Apparently not registered..... | 24 " |
| | <hr/> 107 |

The samples classified as 'below guarantee,' are the following :—

No. 30371—*Bone Meal*, manufactured by W. Harris & Co., Toronto.

The sample in question was obtained at the factory, and shows a value of \$24.30 as compared with \$33.69 shown (on same scale) by the sample registered. It is noteworthy, however, that no explicit guarantee accompanied either of these samples; and comparison can only be made with the Standard deposited with the Department, as required by the Fertilizers Act. It is no unusual thing for a standard sample to possess a value greatly above the minimum value guaranteed by the manufacturer; and to require every sample sold to reach the value possessed by the manufacturer's sample deposited, would result in condemnation of a very large percentage of all fertilizers sold. Nor would it be just to the manufacturer, who sells on the basis of a plainly printed guarantee, which may be considerably below actual value, and all the purchaser has any right to do, is to require him to live up to this guarantee. The fault, in the present case, is the selling without such explicit guarantee; a fault, however, which cannot be held to justify us in substituting for such guarantee, the standard sample deposited here, and requiring the manufacturer to live up to such standard. The difficulty met here arises out of imperfections in our Fertilizer Act; and it would not, I conceive, be just to press the case against the manufacturer of No. 30371.

SESSIONAL PAPER No. 14

The 24 samples in question appear to represent 22 distinct brands. Of this number, two (Nos. 32440 and 32445) are not fertilizers, under the Act, since they do not contain phosphoric acid, nitrogen or potash. It is possible that some of these samples may be registered brands, but sold under names which do not suffice for their certain identification. This inference seems justified by the fact that several of the manufacturers named, have registered one or more brands, and are not likely to have, willingly, put unregistered brands on the market.

In the cases of samples 33273 and 33274 (also 33279 and 33280, which appear to be the same brands), it is worthy of remark that articles of very low value indeed are put on the market as chemical fertilizers. This fact, together with the fact of their non-registration, would appear to be sufficient ground for restrictive legal action.

Finally, I would respectfully draw your attention to the need of revising and improving our Fertilizer Act; so as to make it truly efficient in protecting the agricultural interests of Canada; and would recommend the publication of this report, with accompanying tables, as Bulletin No. 139.

I have the honour to be, sir,

Your obedient servant,

A. MCGILL,

Acting Chief Analyst.

8-9 EDWARD VII., A. 1909

APPENDIX F.**BULLETIN No. 140—MAPLE SUGAR, 1907.**

OTTAWA, July 27, 1907.

W. J. GERALD, Esq.,

Deputy Minister of Inland Revenue.

Sir,—I have the honour to submit the results of examination of two hundred and fifty-seven samples of maple sugar, purchased throughout the Canadian market by our inspectors, in April and May of the present year :

| Inspectoral District. | Samples declared as mixture. | Found genuine. | Found adultera- ted. | Doubtful. | Total. |
|---------------------------|------------------------------------|-------------------|----------------------------|-----------|--------|
| Nova Scotia..... | 0 | 15 | 5 | 0 | 20 |
| Prince Edward Island..... | 3 | 7 | 4 | 1 | 15 |
| New Brunswick..... | 0 | 18 | 2 | 0 | 20 |
| Quebec..... | 0 | 22 | 0 | 0 | 22 |
| St. Hyacinthe..... | 0 | 18 | 1 | 1 | 20 |
| Montreal..... | 0 | 20 | 0 | 0 | 20 |
| Ottawa..... | 0 | 13 | 7 | 0 | 20 |
| Kingston..... | 1 | 2 | 16 | 0 | 19 |
| Toronto..... | 0 | 13 | 5 | 2 | 20 |
| London..... | 0 | 14 | 7 | 0 | 21 |
| Manitoba..... | 0 | 15 | 5 | 0 | 20 |
| Calgary..... | 0 | 15 | 5 | 0 | 20 |
| British Columbia..... | 1 | 13 | 0 | 6 | 20 |
| | 5 | 185 | 57 | 10 | 257 |

The following synopsis of work done in the inspection of maple sugar since 1905 is of interest in this connection :

INSPECTION OF MAPLE SUGAR.

| Date of inspection. | Bulle- tin. | Sold as Mixture | Genuine | Doubt- ful. | Adulter- ated. | Total. | PERCENTAGE. | |
|---------------------|----------------|--------------------|---------|----------------|-------------------|--------|-------------|-------------------|
| | | | | | | | Genuine | Adul- terated. |
| March.....1905 | 102 | 0 | 12 | 2 | 8 | 22 | 55 | 37 |
| May.....1905 | 102 | 0 | 15 | 0 | 3 | 18 | 83 | 17 |
| March.....1906 | 120 | 0 | 11 | 3 | 12 | 26 | 42 | 46 |
| May.....1906 | 120 | 1 | 44 | 0 | 7 | 52 | 85 | 13 |
| May.....1907 | 140 | 5 | 185 | 10 | 57 | 257 | 72 | 22 |

It is worthy of note, that as was to be expected, the highest percentage of genuine samples has been found in the May collections, i.e., during the sugar-making season, and immediately after it.

SESSIONAL PAPER No. 14

The whole of the work recorded in this Bulletin has been done by Mr. A. Valin, of this Laboratory; and I am able to speak confidently of the care and assiduity with which he has carried out the task assigned to him. Mr. Valin has prepared a memorandum, describing his methods, which I include with this report.

With regard to the standards adopted, I may say that these have been determined by very extensive research work done in this laboratory; and can be depended upon to do full justice to the manufacturer of maple sugar. It is well known that many samples, perhaps most samples, of genuine maple sugar, give decidedly higher ash, and a decidedly heavier precipitate, than 0.50 and 2.00 per cent, as well as a higher malic acid value than 0.40.

It is therefore quite within the limits of possibility that manufacturers should take the advantage of these facts, and, under careful supervision, dilute a genuine article with cane sugar, and still keep such adulterated product within the limits fixed as characterizing genuine maple sugar. It is indeed not too much to say that several of the samples now reported and passed as genuine, appear to justify a suspicion of such treatment as indicated. Since, however, nothing short of certainty can be permitted to influence the analyst's decision, the cases in question get the benefit of whatever doubt may exist in his mind.

Finally I would respectfully recommend that this report be published as Bulletin No. 140.

I have the honour to be, sir,

Your obedient servant,

A. MCGILL,

Acting Chief Analyst

MEMORANDUM.

Maple sugar is a crude product of the maple sap, which cannot be refined without losing its special flavour. The special value of maple sugar is due, not to the sugar content, but to that delicate flavour destroyed by refining. The colour of pure maple goods varies from straw yellow to a dark brown. The colour has no relation to the flavour, but the demand is greatest for the lighter grades which command a higher price on the market. All pure maple goods do not possess the characteristic flavour, in the same degree. This is explained by (1) the nature of the sap, (2) manipulation in manufacture.

Adulteration of maple sugar is commonly effected by addition of granulated sugar; occasionally by the addition of light brown sugar. Of the 57 samples found adulterated, in the present collection, the adulterant seems to be, without exception, granulated sugar. Samples of pure maple sugar and those adulterated with granulated, are clearly differentiated by their ash content. Only a trace of ash is found in granulated sugar, while the percentage of ash in maple sugar reaches 0.50 to about 1. Commercial brown sugar has an ash content similar to that of the maple; but the chemical character of this ash is different.

Methods have been devised by C. Jones, Chemist to the Vermont Agricultural Experiment Station, for the detection of brown sugar in admixture with maple sugar. Maple products form a large precipitate with basic lead acetate, the exact composition of which is not known, but which permits us to detect the presence of refined sugar. The examination, in this laboratory, of a large number of samples of known purity has enabled us to set certain limits for genuine sugar. Granulated sugar forms but very little precipitate with the above reagent, while brown sugar gives about a third to one-half the amount of precipitate given by a normal maple sugar.

Another important constant is the malic acid value, which is much greater in genuine maple products than in adulterated samples.

The determination of the ash, and of the lead subacetate precipitate, together with the malic acid value is found to be sufficient for the detection of the adulterants now

8-9 EDWARD VII., A. 1909

in use. The following standards have been adhered to in judging maple sugar in the present bulletin :—

GENUINE.—Lead subacetate precipitate above 2 per cent. per 100 grmms dry substance ; total ash not less than 0.50 per 100 grmms dry substance ; malic acid value not less than 0.40.

DOUBTFUL.—Lead subacetate precipitate between 2.00 and 1.80 per 100 grmms dry substance ; ash not less than 0.50 per 100 grmms dry substance ; malic acid value not less than 0.40. Samples giving total ash slightly below 0.50 per 100 grmms dry substance, and low malic acid value have been classified as doubtful.

ADULTERATED.—Lead subacetate precipitate less than 1.80 per 100 grmms dry substance ; total ash less than 0.50 per 100 grmms dry substance ; malic acid less than 0.40.

In order to establish uniformity of standards for maple sugar and maple syrup, the ash and the lead subacetate precipitate have been expressed for 100 grmms dry substance.

The methods in use in the Inland Revenue Laboratory for the detection of the adulteration in maple products, may be described as follows :—

Lead subacetate precipitate. Five grammes sugar is weighed into a large test-tube and dissolved into 20cc water. Two cc of lead subacetate solution (sp. gr. 1.26) are added and the solution mixed. After standing two or three hours, the mixture is filtered into a sugar tube, washed four or five times with warm water, dried and weighed. The precipitate obtained, multiplied by 22.22 gives the lead subacetate for 100 grmms dry substance, assuming the sugar to contain 10 per cent. of water.* The standard lead subacetate solution is prepared as follows :—

Boil for half an hour 430 grmms of normal lead acetate and 130 grmms of litharge with 1000cc water. Cool the mixture, allow to settle, and dilute the supernatant liquid to 1.26 specific gravity. (United States Dept. Agric. Div. Chem. Bull. 65, p. 84).

NOTE.—It is of the greatest importance that the above solution should have a specific gravity of 1.26, and that an excess of reagent should be avoided.

The error of manipulation with the above method on 75 samples worked in duplicate has been found to be 0.22 for a lead subacetate precipitate varying from 2 to 0.20 per grmms dry substance.

ASH.—Ten grmms of the sample is weighed into a flat bottom platinum dish of 100cc capacity ; heated slowly over a bunsen burner, until charred, then burned at a low red heat to a white or grey ash. The dish is placed in a desiccator till cold, and weighed.

The number of milligrams of ash multiplied by 11.1 gives the percentage of ash per 100 grmms dry substance, assuming the sugar to contain 10 per cent. water.

MALIC ACID VALUE.—The method used was devised by Hortvet as follows :—

Six and seven tenths grmms of the sample is weighed into a 200cc beaker and water added to make a volume of 20cc. The solution is made slightly alkaline with ammonia, 1cc of a 10 per cent. solution of calcium chloride is added ; then 60cc of 95 per cent. alcohol. The beaker is covered with a watch glass and heated for one half-hour on a water bath, when the flame is turned off and the beaker left to stand over night. The material in the beaker is then filtered through a good quality filter paper, the precipitate washed with hot 75 per cent. alcohol to free from soluble calcium salt, dried and ignited. From 15 to 20cc of tenth normal hydrochloric acid is added to the ignited residue, the lime thoroughly dissolved by careful boiling, and the excess of acid titrated with tenth normal sodium hydroxide, using methyl orange as an indicator. One tenth of the number of cubic centimeters of acid neutralized expresses the result, which for the present will be called ' Malic Acid Value.'

A. VALIN.

* The determination of the water content in 32 samples of maple sugar give a maximum 11.17 and a minimum 3.05, mean 8.01. The same conclusion has been reached by C. H. Jones, Chemist, Vermont Experiment Station (Rep. 1905, p. 330).

APPENDIX G.

BULLETIN No. 141—MAPLE SYRUP

OTTAWA, July 31, 1907.

W. J. GERALD, Esq.,
Deputy Minister of Inland Revenue.

SIR,—I have the honour to report to you upon an examination of 244 samples of Maple Syrup, collected by our Food Inspectors during April and May of this year. The following synopsis shews the results of analysis :

| Inspection District. | Genuine | Doubt-ful. | Maple Flavour | Mixture or Com-pound. | Adul-terated. | Total. |
|-----------------------|---------|------------|---------------|-----------------------|---------------|--------|
| Nova Scotia..... | 17 | 0 | 1 | 1 | 1 | 20 |
| P. E. Island..... | 3 | 0 | 0 | 1 | 0 | 4 |
| New Brunswick..... | 18 | 1 | 0 | 0 | 1 | 20 |
| Quebec..... | 20 | 0 | 0 | 0 | 0 | 20 |
| St. Hyacinthe..... | 20 | 0 | 0 | 0 | 0 | 20 |
| Montreal..... | 20 | 0 | 0 | 0 | 0 | 20 |
| Ottawa..... | 15 | 0 | 0 | 2 | 3 | 20 |
| Kingston..... | 7 | 0 | 3 | 8 | 2 | 20 |
| Toronto..... | 9 | 0 | 3 | 4 | 4 | 20 |
| London..... | 12 | 1 | 0 | 0 | 7 | 20 |
| Manitoba..... | 18 | 0 | 1 | 0 | 1 | 20 |
| Calgary..... | 18 | 0 | 1 | 0 | 1 | 20 |
| British Columbia..... | 8 | 0 | 7 | 5 | 0 | 20 |
| | 185 | 2 | 16 | 21 | 20 | 244 |

Maple syrup has been made the subject of examination on six different occasions during the past eleven years. The work done in 1896 had for its object the special case of glucose substitutes for maple syrup; the other collections were studied with reference to substitution of any foreign substance for true maple syrup. The following table gives a resumé, of the results obtained.

| Date. | Bulletin | Genuine | Doubt-ful. | Adul-terated. | Sold as Com-pound. | Total. |
|-----------------|----------|---------|------------|---------------|--------------------|--------|
| July 1896..... | 45 | 82 | 8 | 6 | 0 | 96 |
| March 1905..... | 102 | 17 | 4 | 76 | 0 | 97 |
| May 1905..... | 102 | 44 | 2 | 29 | 0 | 75 |
| March 1906..... | 120 | 22 | 2 | 53 | 8 | 85 |
| May 1906..... | 120 | 88 | 17 | 57 | 9 | 171 |
| May 1907..... | 141 | 185 | 2 | 20 | 37 | 244 |

8-9 EDWARD VII., A. 1909

It will be noted that the proportion of adulterated samples is much greater for March 1905 and 1906, than for May of the same years. Expressed as percentage numbers, this fact becomes more striking :

| | PERCENTAGE OF | |
|------------------|------------------|----------------------|
| | Genuine Samples. | Adulterated Samples. |
| March 1905. | 18 | 78 |
| May 1905. | 59 | 38 |
| March 1906. | 26 | 62 |
| May 1906. | 51 | 33 |
| May 1907. | 77 | 8 |

It is, of course, to be expected that a large proportion of genuine maple syrup samples should be obtainable immediately after the season of manufacture, than at a later period. It is interesting to note that the fact of inspection appears to have had a beneficial effect upon the character of maple syrup sold in Canadian markets. Comparing the percentages of genuine samples found in May of 1905, 1906 and 1907, we have the numbers, 59, 51 and 77 ; the adulterated samples reported for the same periods are 38, 33 and 8 per cent. respectively. Greater care is taken to label artificial maple products, as mixtures or compounds, or as merely flavoured articles.

The work herein recorded has been done by Mr. Valin ; and I am able to vouch for the care taken in its performance.

I beg to recommend the publication of this report as Bulletin 141.

I have the honour to be,

Sir,

Your obedient servant,

A. MCGILL,

Acting Chief Analyst.

MEMORANDUM.

Maple syrup is the product of the evaporation of the juice or sap of the maple tree to a consistency in which about 28 to 36 per cent. of its weight is water. As far as its solids are concerned, the composition of maple syrup is identical with that of maple sugar.

Of the 20 samples found adulterated, in the present collection, the adulterant seems to be, without exception, granulated sugar.

The same standard as for maple sugar have been adhered to in judging maple syrup in this bulletin. Description of the method for the detection of the adulteration in maple products will be found in Bulletin No. 140.

On the assumption that a syrup contains 35 per cent. water, the factors are 30.77 for Lead subacetate precipitate and 15.4 for total ash. The determination of the water content in 40 samples of maple syrup gave a maximum of 37.70, and a minimum of 29.05, mean 33.74.

The same conclusion has been reached by C. H. Jones, Chemist, Vermont Experiment Station (Report 1905, p. 330).

A. VALIN.

APPENDIX H.

BULLETIN No. 142—MILK.

OTTAWA, Sept. 24, 1907.

W. J. GERALD, Esq.,

Deputy Minister of Inland Revenue.

SIR,—Milk, which enters so largely into the food of people in health, and forms the almost exclusive food of infants and invalids, is without doubt, the most important single article of diet. When we take into account the ease with which it can be adulterated by skimming and watering, to say nothing of the use of preservatives, dyes, thickeners, and other modes of falsification, it follows that the control of milk production and distribution should receive the attention of the Department of Inland Revenue, as charged with the administration of the Adulteration Act.

This conclusion was evidently arrived at by the late Chief Analyst, Mr. Thomas Macfarlane, and the first official publication issued under his direction had reference to the establishing of a Standard for normal milk. Since October, 1887, when Bulletin No. 1 was issued, there have been 17 bulletins (including the present one) dealing with this subject, published by the Inland Revenue Department. Up to the present time, it has been found impracticable to define, legally, a standard milk. In order to aid in the fixing of such a standard, as well as to show that earnest efforts have been made by the departmental laboratory to secure trustworthy and sufficient data for such a step, I think it well to synoptize, as briefly as possible, the work recorded in departmental publications, during the past twenty years.

The subject of milk is dealt with in the following Bulletins, issued by this Department :—

| | | | |
|--------------|------------------|---------------|------------------|
| No. 1 issued | October, 1887. | No. 53 issued | December, 1897. |
| " 2 " | December, " | " 61 " | January, 1899. |
| " 9 " | June, 1889. | " 64 " | May, 1899. |
| " 11 " | October, " | " 74 " | February, 1901. |
| " 17 " | September, 1890. | " 80 " | December, 1901. |
| " 21 " | January, 1891. | " 93 " | February, 1904. |
| " 28 " | " 1892. | " 121 " | June, 1906. |
| " 32 " | March, 1893. | " 142 " | September, 1907. |
| " 43 " | January, 1896. | | |

SESSIONAL PAPER No. 14

Bulletin No. 1 contains a report upon 162 samples of whole milk, obtained in June, July and August, 1887, under expert supervision, from herds of not less than four cows. The following synopsis of results is of great interest and importance :—

| | Nova Scotia. | New Brunswick. | Quebec. | Montreal. | Ottawa. | Toronto. |
|---------------------------------|-----------------|-------------------|---------|-----------|---------|----------|
| Number of samples examined..... | 32 | 11 | 20 | 33 | 29 | 37 |
| Butter Fat--Highest..... | 5.40 | 4.62 | 4.18 | 5.17 | 5.29 | 4.50 |
| " Lowest..... | 3.00 | 3.43 | 3.02 | 2.80 | 3.62 | 2.52 |
| " Average..... | 4.24 | 3.91 | 3.54 | 3.82 | 4.26 | 3.38 |
| Non-fat solids | 8.48 | 8.54 | 8.85 | 8.47 | 8.67 | 8.70 |
| Total solids | 12.72 | 12.45 | 12.39 | 12.29 | 12.93 | 12.08 |
| Water | 87.28 | 87.55 | 87.61 | 87.71 | 87.07 | 87.92 |

Based upon these results, the Chief Analyst suggested the adoption of the following constants for *Standard Quality Milk* :—

| | |
|----------------------------|----------------|
| Total Solids..... | 12.0 per cent. |
| Butter Fat..... | 3.5 " |
| Solids other than fat..... | 8.5 " |

Bulletin No. 2 contains the results of analysis of 105 samples of market milk, as supplied to twelve towns and cities, in September 1887. Nine samples containing above 5.4 per cent fat, are classified as being "partly cream," the remaining samples show the following averages :—

| City or Town. | Number of samples. | Water. | Fat. | Non-fat solids. | Total solids. |
|--------------------|--------------------------|--------|------|--------------------|------------------|
| Halifax, N.S..... | 12 | 88.22 | 3.51 | 8.27 | 11.78 |
| Pictou, N.S..... | 5 | 87.12 | 3.86 | 9.02 | 12.88 |
| St. John, N.B..... | 9 | 88.01 | 3.96 | 8.03 | 11.99 |
| Quebec..... | 17 | 87.84 | 3.94 | 8.22 | 12.16 |
| Montreal..... | 14 | 87.08 | 3.83 | 9.09 | 12.92 |
| Sherbrooke..... | 5 | 86.84 | 4.31 | 8.85 | 13.16 |
| Ottawa..... | 6 | 87.17 | 4.20 | 8.63 | 12.83 |
| Kingston..... | 6 | 88.70 | 3.15 | 8.15 | 11.30 |
| Belleville..... | 6 | 87.20 | 4.17 | 8.63 | 12.80 |
| Toronto..... | 5 | 88.04 | 3.52 | 8.44 | 11.96 |
| Port Hope..... | 5 | 87.74 | 3.50 | 8.76 | 12.26 |
| Peterborough..... | 6 | 88.01 | 3.87 | 8.12 | 11.99 |
| Market Milk..... | 96 | 87.69 | 3.82 | 8.49 | 12.31 |

Although this collection (from which all samples containing more than 5.4 per cent of fat have been excluded) includes nine samples which are adjudged as "skimmed" and twelve samples which are adjudged as "watered," the average content of butter-fat and total solids fully meets the standard set for genuine milk in Bulletin No. 1.

Bulletin No. 9 contains the results of analysis of 196 samples of market milk, collected in March and April, 1887. Omitting 5 samples which contained more than 5.4 per cent fat, and 41 samples found to be skimmed or watered, the remaining 150 samples give the following averages :—

| | |
|---------------------|----------------|
| Water..... | 87.42 per cent |
| Butter-fat | 3.79 " |
| Non-fat solids..... | 8.79 " |
| Total solids..... | 12.58 " |

8-9 EDWARD VII., A. 1909

It therefore appears that the limit of 12 per cent for total solids, and 3·5 per cent for butter-fat, as proposed in Bulletin No. 1, cannot be regarded as too high for genuine milk.

Bulletin No. 11. This important report upon 58 samples of milk, obtained in May and June, 1889, is intended to meet the point raised by the Dominion Dairymen's Association, that the standard of 12 per cent total solids, and 3·5 per cent fat proposed by Mr. Macfarlane, might be too high, so far as May and June milk was concerned; although satisfactory as regards the milk supply of other months.

Twenty four herds were examined, the average milk, morning and evening, being analyzed. Omitting one herd of pure Jerseys, whose milk averaged 5·54 per cent fat, and 15·08 per cent total solids, the mean results are:—

| | |
|---------------------|-----------------|
| Water..... | 87·38 per cent. |
| Butter-fat..... | 3·66 " |
| Non-fat solids..... | 8·96 " |
| Total solids..... | 12·62 " |

In this Bulletin there also appears the results of examining milk supplied to 16 cheese factories in the neighborhood of London, Ont. These milks include samples known to be skimmed or watered. The average results obtained are as follows:—

| | |
|---------------------|-----------------|
| Water..... | 87·42 per cent. |
| Butter fat..... | 3·80 " |
| Non-fat solids..... | 8·78 " |
| Total solids..... | 12·58 " |

When samples known to be skimmed or watered are omitted, these averages become:—

| | |
|---------------------|----------------|
| Water..... | 87·26 per cent |
| Butter fat..... | 3·93 " |
| Non-fat solids..... | 8·81 " |
| Total solids..... | 12·74 " |

As a conclusion from these results, Mr. Macfarlane formally recommends the adoption of 3·5 per cent fat and 12 per cent total solids as a legal minimum for milk of standard quality.

Bulletin No. 17 gives the results of analysis of 165 samples of milk collected in the smaller towns of Ontario in July and August, 1890.

Judged on the basis of 3·5 per cent fat and 12 per cent total solids, the results are as follows:—

| | Samples. | Per centage. |
|------------------------------|----------|--------------|
| Adulterated or inferior..... | 68 | 41 |
| Genuine..... | 97 | 59 |
| Total..... | 165 | 100 |

Bulletin No. 21 contains the result of analysis of 124 samples of milk from town supplies in Ontario and Manitoba in November, 1891. Judged on the basis of the proposed standard (3·5 per cent. fat and 12 per cent. solids) these were found to be as follows:—

| | Analyst. | BELOW STANDARD. | | GENUINE. | | Total Samples |
|------------------------|-------------|-----------------|-------|----------|-------|---------------|
| | | Samples. | p. c. | Samples. | p. c. | |
| Towns in Ontario..... | Ellis..... | 35 | 45 | 43 | 55 | 78 |
| Towns in Manitoba..... | Kenrick.... | 10 | 22 | 36 | 78 | 46 |
| | | 45 | 36 | 79 | 64 | 124 |

SESSIONAL PAPER No. 14

Professor Ellis expresses the opinion that it is impossible to assert that a milk has been adulterated with water, if the *solids not fat* are higher than 8 per cent; or that it has been skimmed if the fat exceeds 2·5 per cent.

Professor Kenrick questions the propriety of adopting any single standard for the whole of Canada.

Bulletin No. 28 gives the results of examination of 133 samples of milk collected in October, November and December of 1891 in the Kingston and London districts of Ontario and in Manitoba and the Northwest. The results may be summarized as follows:—

| — | Analyst. | BELOW STANDARD. | | GENUINE. | | Total. |
|----------------------------|--------------------|-----------------|-------|----------|-------|--------|
| | | Samples. | p. c. | Samples. | p. c. | |
| Kingston district. | Valade. | 8 | 30 | 19 | 70 | 27 |
| London district | Harrison | 11 | 20 | 43 | 80 | 54 |
| Manitoba, &c. | Kenrick | 10 | 20 | 42 | 80 | 52 |
| | | 29 | 22 | 104 | 78 | 133 |

The classification has reference to a standard of 3·5 per cent butter-fat and 12 per cent total solids.

Bulletin No. 32. This contains the results of analysis of 188 samples of milk collected throughout Nova Scotia, Quebec and Ontario in August, September and October, 1892. The results are summarized as follows:—

| — | BELOW STANDARD. | | GENUINE. | | Total. |
|-----------------------|-----------------|-------|----------|-------|--------|
| | Samples. | p. c. | Samples. | p. c. | |
| Nova Scotia | 21 | 50 | 21 | 50 | 42 |
| Quebec | 19 | 31 | 43 | 69 | 62 |
| Ontario | 29 | 35 | 55 | 65 | 84 |
| | 69 | 37 | 119 | 63 | 188 |

The classification is based upon a standard of 3·5 per cent fat and 12 per cent total solids.

Bulletin No. 43. This gives the result of analysis of 251 samples of milk collected throughout the Dominion during October, November and December of 1895. These are classified as follows:—

| | | |
|--|-----|--------------|
| Genuine | 181 | 72 per cent. |
| Watered. | 11 | |
| Partly skimmed | 7 | |
| Under average in total solids. | 15 | 28 " |
| " cream. | 18 | |
| " non-fat solids. | 19 | |
| Total | 251 | 100 |

The following important note, by Mr. Macfarlane, occurs in the text of this Bulletin:—

‘For the information of the public, and in order to obtain greater precision hereafter, it may be well to explain the manner in which I have made use of the above expressions, as regards whole milk. The term *watered* is used, when the non-fatty

8-9 EDWARD VII., A. 1909

solids are under 8 per cent, and the butter percentage is below the average (3·5), or at least, not above it. When the "non-fat solids" show the normal percentage (8·5) and a lower amount of fat than 3 per cent, it is characterized as "partly skimmed". When a sample falls below 2 per cent butterfat, the word "skimmed" is used. The expression "under average" has been used for the purpose of indicating those samples whose adulteration cannot be pronounced upon with certainty, but which are, in point of quality, inferior to those marked genuine. "Under average in total solids" is the expression used when the latter fall below 12 per cent and the sample cannot be positively characterized as "watered". When the fat ranges between 3 and 3·5 per cent, the non-fat solids being normal, the sample is said to be "under average in cream"; and when the non-fat solids fall below 8·25 per cent the sample is said to be "under average" so far as regards the latter constituents.

Bulletin No. 53. This Bulletin gives the results of analysis of 178 samples, collected throughout the Dominion in September and October 1897. The following is a synopsis:—

| | Samples. | Per cent. |
|--------------------|-----------|-----------|
| Genuine | 115 | 65 |
| Adulterated..... | 19 | 11 |
| Under average..... | 44 | 24 |
| | <hr/> 178 | <hr/> 100 |

The classification is based upon the explanations given in Bulletin No. 43.

Bulletin No. 61 contains the results of examination of 74 samples of milk, obtained in towns of Ontario, in October, November and December of 1898. These were found as follows:—

| | Samples. | Per cent. |
|--------------------|----------|-----------|
| Genuine | 54 | 73 |
| Adulterated | 3 | 4 |
| Under Average..... | 17 | 23 |
| | <hr/> 74 | <hr/> 100 |

Bulletin No. 64 contains the results of analyzing 29 samples of milk, taken in Montreal, St. Hyacinthe and Sherbrooke, Que., in January and February, 1899.

| | Samples. | Per cent. |
|------------------|----------|-----------|
| Genuine | 21 | 72 |
| Adulterated..... | 8 | 28 |
| | <hr/> 29 | <hr/> 100 |

This Bulletin also contains a study of the acidity of milk by A. L. Tournhot; and some work on the determination of Lactose and Casein.

Bulletin No. 74 contains the results of analysis of 131 samples, obtained throughout the Dominion, in November and December, 1900.

| | Samples. | Per cent. |
|---------------------|-----------|-----------|
| Genuine..... | 104 | 79 |
| Adulterated &c..... | 27 | 21 |
| | <hr/> 131 | <hr/> 100 |

Preservatives (especially borates) were looked for. None were found.

Bulletin No. 80 contains the results of analysis of 182 samples of milk, taken throughout the Dominion, in September and October, 1901.

| | Samples. | Per cent. |
|------------------|-----------|-----------|
| Genuine | 116 | 64 |
| Adulterated..... | 7 | 4 |
| Doubtful..... | 59 | 32 |
| | <hr/> 182 | <hr/> 100 |

SESSIONAL PAPER No. 14

In this Bulletin, the Chief Analyst gives more precise meaning to the term "Under average in non-fat solids"; applying it only in cases where the solids not fat are under 8.25 per cent; but the butter-fat above 3.75 per cent, and the total solids, not under 12 per cent.

Bulletin No. 93 gives the results of analysis of 224 samples of milk, collected in November and December of 1903, throughout the Dominion.

| | Samples. | Per cent. |
|--------------------|----------|-----------|
| Genuine | 159 | 71 |
| Adulterated | 23 | 10 |
| Under average..... | 42 | 19 |
| | 224 | 100 |

Bulletin No. 121. This Bulletin deals with the inspection of skim-milk, buttermilk and cream, as well as with whole milk. Results of analysis of 332 samples of whole milk collected throughout the Dominion in April and May, 1906, are as follows:—

| | Samples. | Per cent. |
|-------------------|----------|-----------|
| Partly cream..... | 13 | 4 |
| Genuine | 189 | 57 |
| Adulterated | 45 | 14 |
| Doubtful..... | 85 | 25 |
| | 332 | 100 |

Comment.

Bulletins 1 and 11 contain the results of analysis of a very large number of authentic milks; representative of 165 herds of cows, containing from 4 to more than 50 cows each. The period represented, includes the months of May, June, July and August. The following resumé, gives the results at a glance:—

| Locality. | | No. of Herds. | No. o Cows. | Average Fat. | Average Total Solids. |
|--|---------------------------|---------------|-------------|--------------|-----------------------|
| Bull. No. 1 | Nova Scotia..... | 32 | 203 | 4.24 | 12.72 |
| | New Brunswick | 11 | | 3.91 | 12.45 |
| | Quebec | 20 | 167 | 3.54 | 12.39 |
| | Montreal and vicinity.... | 33 | 466 | 3.82 | 12.29 |
| | Ottawa and vicinity | 9 | 326 | 4.26 | 12.93 |
| | Toronto and vicinity.... | 37 | (225)+ | 3.38 | 12.08 |
| Bull. No. 11, London and vicinity..... | | 23 | 680 | 3.66 | 12.62 |
| | | 165 | 2,067+ | 3.80 | 12.62 |

About 2,500 cows are represented in this synopsis and it is evident that, so far as averages are concerned, the minimum limits of 3.5 per cent fat and 12 per cent solids, are fully justified.

Closer inspection of the results shows that 10 herds (comprising about 118 cows) yielded milk containing less than 3 per cent of fat. (Mean fat = 2.78 per cent) and less than 12 per cent total solids (mean total solids = 11.36 per cent).

The lowest butter-fat given by any herd is 2.52 per cent. This is from a herd of 10 cows in the vicinity of Toronto; and it is noteworthy that the Toronto district shews the poorest quality of milk, an average for 37 herds, numbering about 400 cows, being 3.38 per cent fat, and 12.08 per cent total solids.

Thirty-five herds (numbering about 380 cows) show butter-fat between 3 and 3.5 per cent, the average for this lot being 3.2 per cent. The total solids average about 11.8 per cent.

8-9 EDWARD VII., A. 1909

It will be noted that the work recorded in Bulletins 1, 2, 9 and 11, is made a basis for determining the limits, below which milk should be regarded as "adulterated" within the meaning of the Act. As a result of this study, the late Chief Analyst concluded that 3·5 per cent of butter-fat and 12 per cent. total solids was a reasonable standard. Individual cows failed to meet this standard; and, indeed, 45 out of 142 herds, reported in Bulletin No. 1, yielded milk containing less than 3·5 per cent fat; ten (10) of these falling below 3·0 per cent. The fact that the remaining herds yielded milk so much above 3·5 per cent. as to bring the whole up to 3·86 per cent, was held to prove that the average of 3·5 per cent fat could easily be reached by any dairyman who properly selected and properly cared for his stock; and that the dairyman who purposely selected his cows with regard to quantity of milk, and without reference to quality, should not be permitted, unchallenged, to compete with those who, (constituting the large majority in every province of the Dominion) furnished milk which fully met the requirements of 3·5 per cent fat, and 12 per cent solids.

The work in subsequent bulletins consists of the analyses of market milks, interpreted in terms of the recommended standard.

The following table presents a synopsis of the results, and is important as showing how the adoption of a standard of 3·5 per cent fat and 12 per cent solids, affects the classification of market milk, as sold in Canada.

| Number of Bulletin. | Number of Samples. | Genuine (per cent.) | Doubtful (per cent.) | Adulterated (per cent.) |
|---------------------|--------------------|---------------------|----------------------|-------------------------|
| 17..... | 165 | 59 | 19 | 22 |
| 21..... | 124 | 64 | 26 | 10 |
| 28..... | 133 | 78 | 7 | 15 |
| 32..... | 188 | 63 | 22 | 15 |
| 43..... | 251 | 72 | 21 | 7 |
| 53..... | 178 | 65 | 24 | 11 |
| 61..... | 74 | 73 | 23 | 4 |
| 64..... | 29 | 72 | 11 | 17 |
| 74..... | 131 | 79 | 18 | 3 |
| 80..... | 182 | 64 | 32 | 4 |
| 93..... | 224 | 71 | 19 | 10 |
| 121..... | 332 | 57 | 29 | 14 |
| | 2,011 | 66 | 23 | 11 |

SESSIONAL PAPER No. 14

INSPECTION of 1907.

The work recorded in the tables now submitted, has been done upon 343 samples of whole milk, collected in July and August of this year. They represent all the inspectoral districts of Canada, with the exception of Manitoba.

I have applied to the interpretation of the analytical results the same standards for fat, total solids, and non-fat solids which my predecessor used in work of this kind. The following table shows, at a glance, the general conclusions.

| Inspectoral district. | Total samples. | Genuine | | Skimmed or partly skimmed. | Watered. | Doubtful. |
|-----------------------|----------------|---------|-----------|----------------------------|----------|-----------|
| | | Normal. | Abnormal. | | | |
| Nova Scotia..... | 30 | 21 | 4 | 1 | 4 | 0 |
| P. E. Island..... | 15 | 9 | 2 | 3 | 0 | 1 |
| New Brunswick..... | 30 | 22 | 5 | 1 | 2 | 0 |
| Quebec..... | 30 | 10 | 10 | 8 | 1 | 1 |
| St. Hyacinthe..... | 30 | 19 | 4 | 6 | 1 | 0 |
| Montreal..... | 30 | 9 | 20 | 1 | 0 | 0 |
| Ottawa..... | 30 | 19 | 11 | 0 | 0 | 0 |
| Kingston..... | 30 | 15 | 15 | 0 | 0 | 0 |
| Toronto..... | 30 | 3 | 10 | 7 | 8 | 2 |
| London..... | 28 | 15 | 13 | 0 | 0 | 0 |
| Calgary..... | 30 | 27 | 3 | 0 | 0 | 0 |
| British Columbia..... | 30 | 2 | 14 | 9 | 5 | 0 |
| | 343 | 171 | 111 | 36 | 21 | 4 |
| | | 282 | | | | |

The average percentage of genuine samples is 82, and is distinctly higher than at any previous inspection. The percentages of genuine samples for each district in regard to the total number of samples collected in that district, are as follows:—

| District. | Samples examined. | Genuine. |
|------------------------|-------------------|-------------|
| Nova Scotia | 30 | 83 per cent |
| P. E. Island..... | 15 | 73 " |
| New Brunswick..... | 30 | 90 " |
| Quebec..... | 25 | 69 " |
| St. Hyacinthe..... | 30 | 77 " |
| Montreal..... | 30 | 97 " |
| Ottawa | 30 | 100 " |
| Kingston..... | 30 | 100 " |
| Toronto..... | 30 | 43 " |
| London..... | 28 | 100 " |
| Calgary | 30 | 100 " |
| British Columbia | 30 | 53 " |

It thus appears that the districts of Toronto and British Columbia stand out prominently as those in which the milk supply is of very low quality.

In conclusion, I am of opinion that the standard proposed by the late Chief Analyst in 1887, is a reasonable one, and can easily be met by any dairyman who pays proper attention to his herd. Nor can it be urged that this standard is inapplicable to the summer months. Evidence to the contrary is furnished not alone by the collection specially made for this purpose in 1889 (Bulletin No. 11), but by many subsequent collections, including that now reported.

It is, however, undeniable that some individual cows, and even some herds, yield milk containing less than 3·5 per cent fat. We have on record, ten herds (118 cows) whose milk averaged only 2·78 per cent, and one herd of 10 cows gave only 2·52 per cent fat.

These herds were in Toronto district (1889) and it will be noted that it is in Toronto district that the poorest showing occurs, in the present inspection. Dr. Ellis, Public Analyst at Toronto, has recorded his opinion that it is impossible to assert that a milk has been adulterated with water, if the *solids not-fat* exceed 8 per cent, or that it has been skimmed, if the fat exceeds 2·5 per cent. This opinion is certainly justified, if certain herds in the Toronto district may be included among normal milk producers.

In the face of what has been recorded I am compelled to admit that while I believe the standards for milk recommended by the late Chief Analyst to be reasonable, and already attained throughout the greater part of Canada, it is impracticable that they could be enforced by legal enactment over the whole of Canada. Without going so far as to say that the cow must herself be consulted in the matter of quality of milk, it is undeniable that the existence of many herds, whose average milk shews less than 3 per cent of fat, and less than 11·5 per cent total solids, makes the universal adoption of a three and a half per cent standard impossible.

It remains, however, quite possible for towns and cities to fix local standards for their own milk supplies. And this, it seems to me, is the proper course to be pursued, at least for the present. In an appendix, I have given a list of cities and towns, in which by-laws regulating the quality of milk which may be sold therein, already exist. That the low quality of milk now produced in certain districts, could be raised to the proposed standard quality, by proper care on the part of dairymen, goes without saying. The natural incentive to needed improvement is, quite evidently, that the cities and towns purchasing such milk, should insist upon their supplies having a fixed minimum value in fat and total solids. The local authorities must of course, be charged with the responsibility of seeing that such enactments are enforced.

The work which this department can do, in aiding the improvement of this most important food substance, is apparently limited to an occasional inspection, throughout the whole country, with a view to ascertaining the general condition of milk supplies. To fix a lower standard than 3·5 per cent fat, and 12 per cent solids, would be to give endorsement to a quality of milk lower than the average quality now produced. I have already given my reasons for believing that it would be impracticable at present to enforce a standard of 3·5 per cent fat, and 12 per cent total solids, over the whole Dominion.

It is to be noted, in conclusion, that the work herein summarized has regard to the nutritive value of milk, i.e. its value as a food. But there is another aspect of the milk problem which ought not to be ignored. The cleanliness of market milk is second only in importance to its nutritive value. Apart from the disgusting character of the impurities which must be present in milk, unless the most scrupulous attention is paid to its production, the danger from disease germs present in it is very great indeed. It is not going too far to say that (omitting dessicated foods) just in proportion to the nutrient value of the material, is its suitability as a medium for the development of microbial life. It is at once apparent that milk may become a most efficient propagating medium for disease germs. The following quotation is from a recent publication of the Bureau of Animal Industry, Washington, D.C.

"EVIDENCE THAT MILK IS A CAUSE OF DISEASE."

1. It has been shown by the most painstaking investigations, extending over a long period of years, that certain diseases in the animal are communicable through the medium of the milk, this being especially true of tuberculosis, foot-and-mouth disease, anthrax and cowpox; and that diseases like garget, gastro-enteritis and septic fevers in the cow will render the milk morbid to men.

2. It has been shown that animals which have fed on poisonous forage plants or have been treated with strong medicaments are disqualified from producing a pure or sound milk.

3. During the past twenty-five years there have been published in the different medical journals the histories of 195 epidemics of typhoid fever, 99 of scarlet fever and 36 of diphtheria, all traceable to the milk supply.

SESSIONAL PAPER No. 14

In the recent exhaustive investigation conducted by the highest health authority in this country, viz., the United States Bureau of Public Health and Marine-Hospital Service, the commission definitely traced 85 of the 866 cases of typhoid fever (about 10 per cent) in the District of Columbia to the use of infected milk.

4. It has been shown in a former report that in the District of Columbia about one fourth, and in the country at large about one sixth, of all the children born perish before the completion of the first year; that nearly one-half of the deaths in children under 1 year of age are caused by gastro-enteric diseases, chiefly infantile diarrhœa; and that of the 54,047 infantile deaths which have been investigated at home and abroad with reference to feeding, 86.6 per cent had been artificially fed, all of which points with more than mere suspicion to the fact that the morbid agent is introduced into the body with the food (cow's milk).

This phase of the milk question must evidently be left to local action.

I have the honour to be, Sir,

Your obedient servant,

A. MCGILL,

Chief Analyst.

APPENDIX TO BULLETIN 142.

BY-LAWS TO LICENSE AND REGULATE MILK VENDORS IN THE FOLLOWING CITIES :

Halifax—No regulations so far.

Fredericton—No regulations so far.

Charlottetown—An inspector is appointed ; inspection of milk as delivered ; license fee of \$15 a year ; penalties, \$30 or 30 days jail.

St. John, N.B.—Inspection of herds ; inspection of premises ; inspector appointed ; inspection of milk as delivered ; vendor shall notify of any disease in family or herd ; penalties \$40 and license cancelled. Shall deliver statement of name and address, source or sources of milk supply, number of cows in his possession, quantity of milk disposed of, situation of dairies. Shall not offer skimmed milk unless asked for, and labelled with letters of not less than 2 inches long. Shall furnish certificate from Veterinary Surgeon that cows are free from disease, at least once a year.

Quebec—Has about the same regulations as St. John ; but the license fee is only \$1 per annum ; and there is a standard for fat of 3 per cent., 12 per cent. total solids and sp. gr. of 1.029 to 1.033 at 60° F. Penalties are \$20.

Montreal—Same as Quebec, but no specification for the sale of skimmed milk.

Hull—Same as above, but the standard for butter-fat is 3.25 and penalties from \$1 to \$50.

Ottawa—Same as Quebec, but 3.5 butter fat.

Kingston—3 per cent. butter fat and 12 total solids ; penalty, \$1 to \$50, otherwise the same as Ottawa.

Toronto—3 per cent. butter fat and 12 per cent. total solids ; inspector appointed and inspection of milk as delivered.

Brantford—3.5 butter fat and 12 total solids, and same as Toronto.

Hamilton—No standards, but has an inspector appointed for herds, premises, and milk as delivered, and a license fee of \$1 per annum.

Winnipeg—By-laws are in the hands of the printer.

Calgary—3 per cent. butter fat, and same as Hamilton.

Vancouver—Same as St. John, N.B.; 3 per cent. butter fat and a license fee of \$5 per annum and penalties from \$1 to \$100.

Regina—Has about the same regulations as St. John ; the license fee is \$5 per annum ; and there is a standard of 3.5 per cent for butter fat and 12 per cent. Total solids. Penalties are \$10 a day for each day after having been notified by the Health officer.

APPENDIX I.

BULLETIN No. 143—DRUGS

CHLORAL HYDRATE, AMMONIUM BROMIDE, PURIFIED CREAM
OF TARTAR

OTTAWA, December 3, 1907.

W. J. GERALD, Esq.,

Deputy Minister of Inland Revenue.

SIR,—I beg to hand you a report dealing with 389 samples collected as drugs, and more particularly described as follows :—

| | Samples. |
|--|----------|
| Chloral hydrate | 129 |
| Ammonium bromide | 129 |
| Boracic acid (sold as ammonium bromide)..... | 1 |
| Potassii tartras acidus. | 92 |
| Rochelle salt (sold as pot. tart. ac.)..... | 1 |
| Cream of tartar..... | 36 |
| Bi. carbonate of soda (sold as cream of tartar)..... | 1 |
| Total | 389 |

The collections were made in July and August last, and particular instructions were issued to guide the inspectors in their work. Unfortunately these instructions were ignored by four of the inspectors, and, in consequence of this fact, thirty-seven samples of cream of tartar were purchased under that name, a name which is not recognized by the British Pharmacopœia. Cream of tartar is not a drug, although *purified cream of tartar* is an official synonym for potassii tartras acidus. These samples must, therefore, in justice to the vendors, be judged as commercial cream of tartar, and not in terms of the pharmacopœal definition for the purified article.

Descriptive notes precede the tables, and the only other point which deserves mention here is the occurrence of serious blunders in dispensing. When one is served with boracic acid for bromide of ammonium, Rochelle salt for purified cream of tartar, and bi-carbonate of soda for cream of tartar, it is apparent that grave consequences are liable to follow in the filling of medical prescriptions. It will be further noted that one of the samples of bromide of ammonium contains nearly 18 per cent. of ammonio-chloride of mercury.

I think that everything further of importance in regard to these articles will be found in the notes appended to the tables. I have considered it unnecessary to give details of collection in regard to samples of chloral hydrate, since all of these samples were officially pure.

I beg to recommend that this report be published as Bulletin 143.

I have the honour to be, Sir,
Your obedient servant,

A. MCGILL,
Chief Analyst.

8-9 EDWARD VII., A. 1909

CHLORAL HYDRATE.

In July and August a collection of ten samples of this drug in each Inspectoral district was ordered. One hundred and twenty nine (129) samples were collected.

These were examined by Mr. Lemoine, of this office, and were found in every instance, to come up to the requirements of the British Pharmacopœia. As regards the Soda test, a remarkable homogeneity was found, the volume of normal soda corresponding to 4 grammes of the drug, varying between 29.5cc and 29.9cc. In no case was any trace of chloral alcoholate found; and eighty samples were quite free from chlorides, while the traces obtained in the remaining 49 samples were so small as to be negligible.

The examination shows that this important drug, as supplied in Canada, is of a uniformly high grade.

AMMONIUM BROMIDE—(SEE TABLE I).

One hundred and thirty samples were collected in August of this year; being ten in each inspectoral district.

Of these samples, two, namely Nos. 33424 and 29569 are not ammonium bromide. The former contains about 18 per cent of ammoniated chloride of mercury. No. 29569 is boracic acid.

The remaining samples (128 in number) are true to name; but of very different degrees of purity.

The distinctive pharmacopœal test for the purity of this drug is, titration with volumetric solution of nitrate of silver. The reaction is as follows:—

Hence *one gramme* of chemically pure ammonium bromide should require 102.2 cubic centimetres of the deci-normal solution of silver nitrate for complete decomposition. The closely allied chloride and iodide of ammonium (or other base) react similarly with silver solution. Owing to the lower molecular weight of the chloride, it would require $\frac{1}{100.585} = 186.9$ cubic centimetres of deci-normal solution to react with 1 gramme; while, the greater molecular weight of iodide would cause only $\frac{1}{114.5} = 69.0$ cubic centimetres to be used, in the case of the ammonium salts.

It is unlikely that the iodide should be present, as an impurity, on account of its higher value, and for other reasons. As a matter of fact, none of the samples now reported shows a lower titre than 102, except No. 33424, which contains ammonio-chloride of mercury, insoluble in water, and consequently not entering into reaction with the silver test.

The pharmacopœia provides for traces of chloride as an impurity, and permits samples requiring as high as 103.6 cubic centimetres of the test solution to pass as satisfactory.

Assuming excess of test solution (above 102.2 cc) as due to admixture of ammonium chloride, the percentage of this substance present may be calculated from the following:—

$$\begin{array}{l} \text{If } x = \text{percentage ammonium chloride} \\ 100 - x = \text{ " " " bromide} \\ \text{Let } a = \text{cc. volumetric solution used per gramme sample} \\ \frac{x}{.535} + \frac{100-x}{.98} = a \end{array}$$

$$\text{Whence, } x = 1.1782a - 120.23$$

Taking $a = 103.6$, it thus appears that the British Pharmacopœia permits as much as 1.83 per cent of ammonium chloride.

SESSIONAL PAPER No. 14

It will be seen, by consulting the appended table, that while a large number of the samples examined come very near to the B. P. Standard, not one sample quite reaches it, and a considerable number depart from it by notable amounts.

Chloride of ammonium is not a dangerous impurity, except in so far as it materially reduces the medicinal efficiency of the drug. The bromide is recognized as essentially a nerve sedative and depressant; while the chloride is a nerve stimulant. It is therefore evident that these substances tend to counteract each other. Moreover, the effective dose of chloride is smaller than that of the bromide; hence, the presence of relatively small percentages of the chloride is highly objectionable.

Since this is the first occasion upon which this drug has been subjected to inspection, it may be well to summarize the results of its examination, as below:—

PERCENTAGE OF PURITY.

| District. | 97 p.c. | 96 p.c. | 95 p.c. | 94 p.c. | 93 p.c. | 92 p.c. | 91 p.c. | 90 p.c. | Total. |
|---------------------------|------------|------------|------------|------------|------------|------------|------------|------------|---------|
| | | | | | | | | | Samples |
| Nova Scotia..... | 5 | 2 | 1 | | | 1 | | | 9 |
| Prince Edward Island..... | 3 | 7 | | | | | | | 10 |
| New Brunswick..... | 2 | 1 | 1 | 1 | | 2 | 1 | 1 | 9 |
| Quebec..... | 1 | 3 | 1 | 2 | | 2 | 1 | | 10 |
| St. Hyacinthe..... | 4 | 3 | 2 | | | | 1 | | 10 |
| Montreal..... | 3 | 6 | 1 | | | | | | 10 |
| Ottawa..... | 3 | 7 | | | | | | | 10 |
| Kingston..... | 2 | 7 | | | | 1 | | | 10 |
| Toronto..... | 2 | 5 | 1 | | | 1 | | 1 | 10 |
| London..... | 2 | 6 | 1 | | | 1 | | | 10 |
| Manitoba .. | 3 | 3 | | | | 2 | 2 | | 10 |
| Calgary | 7 | 2 | 1 | | | | | | 10 |
| British Columbia..... | - | 3 | 1 | | | 3 | 2 | 1 | 10 |
| | 37 | 55 | 10 | 3 | 0 | 13 | 7 | 3 | 128 |

This tabulation omits the two cases referred to above, where decided mistakes in dispensing occurred; in one case boracic acid being furnished; and in the other a bromide of ammonium highly contaminated with ammonio-chloride of mercury.

Expressed as percentages, we have the following:—

BROMIDE OF AMMONIUM.

| Of 97 to 98 per cent purity | Per cent. |
|-----------------------------|-----------|
| 96 " 97 " " | 28.9 |
| 95 " 96 " " | 43.0 |
| 94 " 95 " " | 7.8 |
| 93 " 94 " " | 2.3 |
| 92 " 93 " " | 10.1 |
| 91 " 92 " " | 5.6 |
| 90 " 91 " " | 2.3 |

100.0 per cent

of the collection.

Even if we allow a margin of 1 to 2 per cent. to cover possible errors in sampling, weighing, measuring and titration (a margin which is fully large even when work is not done in duplicate, and which entirely disappears under the conditions fulfilled in this laboratory), we find more than 20 per cent. of these samples below such standard, i. e., below 95 per cent. of purity.

8-9 EDWARD VII., A. 1909

This being a first inspection of the drug, it might be advisable to permit all samples reaching a purity of 95 per cent. to pass unquestioned. This suggestion is offered without prejudice to future inspection.

PURIFIED CREAM OF TARTAR.

Potassii Tartras Acidus: Acid potassium tartrate; Bitartrate of potassium, or purified cream of tartar, is to be carefully distinguished from commercial cream of tartar. For this last substance no legalized standard of purity exists, while for the first-named substance the British Pharmacopœia furnishes a perfectly definite standard "Each gramme of the dry salt should require for neutralization at least 5·2 cubic centimetres of the *volumetric solution of sodium hydroxide*. It should yield no characteristic reaction with the tests for lead, copper or iron, and only the slightest reaction with tests for calcium, magnesium, sodium, chlorides or sulphates. The total amount of impurities should not exceed $2\frac{1}{2}$ per cent. of the dried salt."

Commercial cream of tartar, for which no standard of purity has been, thus far made legal, is very largely used as a component of baking powders, of effervescing drinks, etc. It is found on the market in varying degrees of purity, and has been made the subject of inspection in 1887, 1889, 1896, 1900 and 1905. The following synopsis may be of interest:—

COMMERCIAL CREAM OF TARTAR.

| Date of collection. | Number of samples examined. | Found genuine. | Same expressed as percentage. |
|---------------------|-----------------------------|----------------|-------------------------------|
| 1887..... | 36 | 22 | 61 |
| 1889..... | 86 | 52 | 60 |
| 1896..... | 99 | 65 | 66 |
| 1900..... | 65 | 57 | 88 |
| 1905..... | 180 | 132 | 73 |

It is likewise of interest to note the *degree of purity* reached by the Cream of Tartar of commerce. For the inspection of 1887, 73 per cent of the genuine cream of tartars examined were below 90 per cent purity; for 1889, 60 per cent; for 1896, 30 per cent; for 1900, 63 per cent. As regards the inspection of 1905, 12·8 per cent of the genuine samples reached a purity of 97 per cent, *i.e.* were practically up to the pharmacopœal standard of purity; while 38·3 per cent were above 90 per cent of purity.

It must be remembered that these statements refer to Commercial Cream of Tartar. The inspection now reported has regard to the pharmacopœal *Bitartrate of Potassium*, for which a standard of $97\frac{1}{2}$ per cent purity is required. Our inspectors were instructed to ask for the article by one or other of the names recognized by the British Pharmacopœia. These names are (1) *Potassii Tartras Acidus*; (2) *Bi-tartrate of Potassium*; (3) *Acid potassium tartrate*; (4) *Purified Cream of Tartar*.

These instructions were disregarded by the inspectors for the Districts of London, St. Hyacinthe, Manitoba and Calgary, whose invoices show that *Cream of Tartar* has been asked for. This failure to observe my instructions has the important consequence that thirty seven (37) samples, of the present collection, must be judged as *Cream of Tartar* and not as *Purified Cream of Tartar*.

Of the 37 samples referred to, No. 28837 contains a small amount of bi-carbonate of soda. It is probable that this is unintentionally present (perhaps from the container having formerly contained bi-carbonate) and I have marked it as "doubtful." No. 25621 consists entirely of Bi-carbonate of soda, and is evidently an error in dispensing. No. 27878 consists of acid phosphate of lime and starch; and No. 30428, contains burnt alum and starch. These two samples are therefore adulterated, under the Act. The

SESSIONAL PAPER No. 14

remaining 33 samples must be passed as legal cream of tartar although their values, to the consumer, vary greatly. This is shown in the following table:—

| | Samples. |
|--------------------------------|----------|
| 95 to 100 per cent purity..... | 11 |
| 90 to 95 " " | 14 |
| 85 to 90 " " | 7 |
| Below 85 " " | 1 |
| | <hr/> |
| | 33 |
| Doubtful..... | 1 |
| Adulterated | 2 |
| Error in dispensing..... | 1 |
| | <hr/> |
| Total..... | 37 |

The samples just referred to are reported in detail in the accompanying Table No. III.

Table No. II. contains details of the examination of ninety three (93) samples purchased as *Potassii Tartras Acidus*, or Purified Cream of Tartar.

Of these samples Nos. 33415, 26309 and 33314 consist of burnt alum and starch, and are clearly adulterated. In the case of No. 26309 the word "Commercial" is pencilled on the label. Even as a commercial *Cream of Tartar* it would be pronounced adulterated. No. 32554 is a sample of Rochelle salt, and is clearly an error in dispensing.

Of the remaining 89 samples, only 21 samples fulfil the requirements of the British Pharmacopœia. The 68 samples which, although genuine, in the sense of being essentially Bi-tartrate of potassium, are below the standard of purity fixed by the pharmacopœia, differ so widely among themselves, that it seems scarcely just to place them in a single category. The variations referred to are clearly brought out, thus:—

| | Samples. |
|--------------------------------------|----------|
| From 97·5 to 95 per cent purity..... | 4 |
| " 95 to 92·5 " | 6 |
| " 92·5 to 90 " | 24 |
| Below 90 per cent | 34 |
| | <hr/> |
| Total..... | 68 |

The results of this examination of *Purified Cream of Tartar*, may therefore be summarized as follows:—

| | Samples. |
|---|----------|
| Genuine..... | 21 |
| Doubtful (Error in dispensing)..... | 1 |
| Adulterated (Burnt alum, &c.) | 3 |
| " (Commercial Cream of Tartar, below 90 p.c. purity). .. | 34 |
| " (Commercial Cream of Tartar, below B.P. standard, but from 90 to 95 p.c. purity)..... | 30 |
| " (Commercial Cream of Tartar, below B.P. standard, but above 95 p.c. of purity) | 4 |
| | <hr/> |
| Total..... | 93 |

While I have no power to change this classification, or to characterize as other than adulterated, any sample falling below 97·5 per cent purity, I would recommend a lenient treatment of such offenders, whose samples show a reasonably close approximation to the standard fixed by the British Pharmacopœia; particularly, as the failure to meet the high degree of purity required by the Pharmacopœia, involves no serious reduction of value in the drug, so far as the cases in question are concerned.

A. MCGILL.

APPENDIX J.

BULLETIN No. 144—CONDENSED MILK

OTTAWA, January 3, 1908.

W. J GERALD, Esq.,
Deputy Minister of Inland Revenue.

SIR,—I beg to hand you a report of work upon 142 samples of condensed milk collected in July and August of last year.

The numbers obtained from each Inspectoral district, are as follows :—

| | Unsweetened. | Sweetened. |
|----------------------------|--------------|------------|
| Nova Scotia. | 2 | 3 |
| Prince Edward Island. | 1 | 3 |
| New Brunswick. | 3 | 7 |
| Quebec. | 11 | 9 |
| St. Hyacinthe. | 0 | 5 |
| Montreal. | 3 | 12 |
| Ottawa. | 5 | 5 |
| Kingston. | 6 | 10 |
| Toronto. | 3 | 7 |
| London. | 3 | 4 |
| Manitoba. | 5 | 10 |
| Calgary. | 6 | 10 |
| British Columbia. | 5 | 10 |
| | 47 | 95 |

A sample (No. 31173) of an Infant's food, was collected, by mistake, in the district of Prince Edward Island. In the Calgary district, two different brands, as mistaken duplicates, were obtained, under the number 28780.

Details of work done in this laboratory, are given in Tables I, II, and III. In Table IV an attempt is made to calculate the degree of condensation of the original milk, and the fat content of such milk.

The conclusions thus reached possess considerable interest ; but they must not be taken as fully established, since the methods of calculation involve certain hypotheses as explained in the accompanying notes.

I may summarize the more important results of this investigation, as follows :—

1. Condensed milk, should mean the reduction of volume of normal milk, by evaporation of a greater or less portion of its water.

2. When sugar is added, this fact should be stated on the label : and preferably, if not necessarily, in the name of the article, as *Sugared* or *Sweetened* condensed milk.

3. The word *Cream*, is largely used to designate condensed milk. This is incorrect, and should be made illegal. As a matter of fact, these so-called "creams" are not any richer in milk fat than the sugared condensed milks, and many of them are distinctly poorer.

SESSIONAL PAPER No. 14

4. Among the samples examined, only one (No. 25628) is entitled to be called a cream.

5. The average milk value of most of these samples, shows them to be about 2·3 to 2·5 times the value of normal whole milk. Hence, a dilution to about two and a half (2·5) times their volume, results in converting them, for practical purposes, into milk.

The instructions for dilution printed upon the labels, are quite misleading in many cases. "For making a rich cream add from one to two parts pure water." The result would be a liquid containing about 3 to 4 per cent. of milk fat: and would be in no sense a "rich cream."

Several brands advise the addition of three parts water, to make "a pure rich, economical milk." Such a dilution would give a resultant containing about 2 per cent. of fat:—The sugared milks bear larger dilution, without evident reduction of "body"; but the fat content being practically identical with that of the non-sugared kinds, the product of dilution cannot be regarded as other than a very poor milk, thickened with sugar. One brand advises the addition of four (4) parts of water, to produce a rich milk. This would give an article containing distinctly less than 2 per cent. of milk fat.

It may be contended that the consumer should use his own judgment in diluting. While this is true, it is no justification of the manufacturer who states that the product will be "*a rich milk*," &c.

6. *Duplicates*, as collected by our inspectors, are always distinct, sealed packages. They do not necessarily represent the same batch, and even when they do so, it does not follow that they are strictly similar in composition. This matter has been considered exhaustively by the late Chief Analyst. (See Bulletin 69, page 20). "I am not convinced that *absolute* uniformity of product is attainable in any condensed milk factory." This conclusion was reached after very extended work done upon samples which had been manufactured under Mr. Macfarlane's direction, in five different factories, and with every attention to detail. The results now reported indicate that, while a general approximation to a type is found among samples bearing the same name, occasional deviations of considerable amount occur.

I beg to recommend the publication of this report as Bulletin No. 144.

I have the honour to be, Sir,
Your obedient servant,

A. MCGILL,
Chief Analyst.

CONDENSED MILK.

This is generally understood to be *whole milk*, from which a more or less considerable portion of the water has been removed by evaporation.

No legal definition or standard for this article has been established in Canada.

In the United States, the following definitions were legally authorized in June, 1906.

1. *Condensed Milk, Evaporated Milk*, is milk from which a considerable portion of water has been evaporated, and contains not less than twenty-eight per cent of milk solids, of which not less than twenty-seven and five tenths (27.5) per cent is milk fat.

According to this definition, Condensed Milk should contain at least seven and seven tenths (7.7) per cent of milk fat.*

2. *Sweetened Condensed Milk*, is milk from which a considerable portion of water has been evaporated, and to which sugar (sucrose) has been added, and contains not less than twenty eight (28) per cent of milk solids, of which not less than twenty seven and five tenths (27.5) per cent is milk fat.

3. *Condensed Skim milk*, is skim milk from which a considerable portion of water has been evaporated.

4. *Evaporated Cream, Clotted Cream*, is cream from which a considerable portion of water has been evaporated.

The same authority defines milk as containing a minimum of 3.25 per cent, and cream as containing a minimum of 18 per cent of milk fat.

To produce condensed milk of standard quality, as above defined, from milk of minimum standard quality, 2.37 lbs. of milk, are required for each 1 lb. of condensed milk;* that is, about 2.4 volumes will be concentrated into 1 volume, or the concentration will be 2.4. In order to make such a product represent normal milk, it is only necessary to add to it $(2.4 - 1) = 1.4$ volumes of water. Of course, where richer milk is used, the product will be of a higher grade, for the same degree of concentration; or, conversely, a less concentration will give a standard condensed milk.

When sugar is added, it is evident that the concentration must proceed further in order to give a product containing the same weight percentage of fat. The accompanying tables show that samples of plain, concentrated milks, containing about eight per cent of fat, possess a mean density of about 1.075; while sugared samples, as found on the market, with about 8 per cent of fat, have a density of 1.310 to 1.320.

In table IV, an attempt has been made to calculate from analytical data, the volume concentration, and the fat content of the original milk. In order to this end, it is necessary to make certain assumptions, chief of which are the following:—

(a.) That the non-fat solids of milk are not increased or diminished by the processes of manufacture.

(b.) That the non-fat solids of the milk are known. (This table is calculated on a basis of 9 per cent., and also, of 8.5 per cent., for non-fat solids. In Bulletin 142 will be found reasons for adopting 8.5 as a minimum for non-fat solids. Better grades of milk, as found in Canada indicate 9 per cent. non-fat solids.)

(c.) That, where cane sugar has been added, the amount used is 40 per cent. of the weight of the finished product.**

On account of the assumptions which it involves, this table must be regarded as approximately correct only. That its indications are not far removed from the truth is shown by their close correspondence with results derived from independent data. The concentration for non-sugared milks varies between 2.19 and 2.69; while it has been shown that, on the basis of the United States standard, this value, for minimum quality

* $\frac{27.5}{100} \times 28 = 7.7$.

† If m parts by weight of milk, lose w parts of water on concentration, the resultant concentrate will weigh $m - w$; and $\frac{3.25m}{100} = \frac{7.7(m - w)}{100}$ Whence $(m - w) : m :: 3.25 : 7.7 = \frac{1}{2.37}$

SESSIONAL PAPER No. 14

milk, would be about 2·4. Assuming 9 per cent for non-fat solids in the original milk, these extremes become 2·07 and 2·54. In the case of sugared milks, the concentration works out to from 2·43 volumes to 3·64 volumes, on the basis of 8·5 per cent non-fat solids.

The samples now reported (142 in number) are classified as *non-sweetened* condensed milk (Table II) and *sweetened* condensed milk (Table III).

A better name for the former class would be simply *Condensed milk*. But it happens that the sweetened variety was first placed upon the market, at least in large amount; † and the name *Condensed milk* carries with it, to most purchasers the idea of a sugared milk. Hence the term *Non-sweetened* or *plain* comes to be a more or less necessary distinction.

Many of the non-sugared milks now reported were sold as Cream; and one of them is distinctly named such on the label. With the single exception of a sample (No. 25628) obtained in Winnipeg, none of these are cream; and are, indeed, no richer in milk fat than most of the sugared milks. It is probable that the extensive use of the term *Creams* for this class of condensed milk, is due to its convenience as distinguishing them from the sweetened kinds; but such a use of the word cream should be made illegal, not only in the interest of the purchaser, but also in that of any manufacturer, who may wish to put a true cream on the market.

Owing to the absence of any legal standard for this class of goods, it is impossible to characterize the samples now reported, as genuine or otherwise. In Table II, the unsweetened milks are arranged alphabetically, according to the name of the brand; and in Table III, the sugared milks are treated in the same fashion.

It will be noted that, of nine (9) brands of unsweetened milk, only one reaches the United States standard of 7·7 per cent milk fat, (No. 25628, which contains 25·20 per cent of fat is a true cream; and cannot be classed with the other samples, which although sold under the name "Cream" are merely ordinary concentrated milks.)

Of nineteen (19) brands of sugared milks, only three fall distinctly below the 7·7 per cent standard for fat. One of these brands (Pheasant) contains only 5·10 per cent of fat; and is a condensed skim-milk.

Condensed milk was made the subject of inspection in 1897 (Bulletin No. 54), and in 1900 (Bulletin No. 69). Eighteen brands were represented in the collections made in 1897 and 1900. Of the 28 different brands, represented by the present collection, only eight bear names which appear in Bulletins 54 and 69. The following synopsis gives a comparison of results as found in 1900, with those recorded in the present report, for the eight brands which appear in both collections:—

| NAME OF BRAND. | INSPECTION OF 1900. | | PRESENT INSPECTION, | |
|-----------------|---------------------|----------|---------------------|----------|
| | Samples. | Fat p.c. | Samples. | Fat p.c. |
| Clover | 1 | 5·43 | 9 | 7·91 |
| Eagle | 23 | 8·78 | 12 | 8·00 |
| Expert | 13 | 10·32 | 3 | 8·23 |
| Jersey* | 9 | 6·25 | 8 | 8·08 |
| Mayflower | 4 | 8·94 | 2 | 7·50 |
| Nestle's | 4 | 8·98 | 3 | 7·87 |
| Owl | 13 | 9·38 | 2 | 7·68 |
| Reindeer | 15 | 9·25 | 20 | 8·61 |

** In Bulletin 54 (January 1898) appear the results of analysis of 92 samples of condensed milk, in which the added sugar was determined, as closely as possible, and an average of about 40 per cent was found. The amount, however, varied from about 36 per cent to 43 per cent, and in one brand reached 47 per cent.

† Thus, of 16 brands examined in 1898, only 3 contained no sugar; while of 12 brands examined in 1900, only 2 brands contained no sugar.

* From Bulletin 54, inspection of 1897.

8-9 EDWARD VII., A. 1909

In Tables II and III, it is apparent that a high degree of uniformity in milk-fat value characterizes the brands in which considerable numbers have been analysed. At the same time, occasional variation occurs; a matter not at all surprising when the conditions of manufacture are kept in mind. It makes it important however, to distinguish between results obtained from work upon a single sample, and those obtained from work upon a considerable number of samples. It is only when an average result, obtained by analyzing several samples, is presented that we are justified in accepting it as typical for the brand in question.

A. MCGILL,
Chief Analyst.

| | 142 | | | | | | | | | |

The 'Concentration,' i.e. number of volumes of milk which are condensed into one volume and the 'Original Fat,' i.e. percentage of fat in the milk employed in manufacture, are found by the following formulas:—

Let c = Concentration.

" a = Non-fat solids as found.

" a^1 = " in normal milk.

" s = Specific gravity of the sample.

" s^1 = " normal milk.

" f = Fat, as found, per cent.

" f^1 = " per cent in original milk used in manufacture.

Then $c = \frac{as}{a^1 s^1}$ and $f^1 = \frac{fa^1}{a}$

If we take $s^1 = 1.03$ and $a^1 = 9$, these formulas become

$$c = \frac{as}{9.27} \quad f^1 = \frac{9f}{a}$$

If we take $s^1 = 1.03$ and $a^1 = 8.5$, then the formulas become

$$c = \frac{as}{8.755} \quad f^1 = \frac{8.5f}{a}$$

These formulas have been used in calculating the numbers under the headings *Concentration* and *Original Fat*, in Table IV.

APPENDIX K.

BULLETIN No. 145—STRAINED HONEY

OTTAWA, January 13, 1908.

W. J. GERALD, Esq.,
Deputy Minister of Inland Revenue.

SIR,—I beg to enclose you a Report on 253 samples of so-called *Strained Honey* collected throughout the Dominion in April and May, 1907.

The following synoptical Table gives particulars of collection, and a classification based upon the results of analysis :—

| Inspectoral District. | GENUINE. | | Doubtful. | Apparently adulterated. | Sold as Compound. | Total. |
|-------------------------|----------|---------------------|-----------|-------------------------|-------------------|--------|
| | Normal. | High Water Content. | | | | |
| Nova Scotia..... | 12 | 8 | 0 | 0 | 0 | 20 |
| Prince Edward Island .. | 5 | 5 | 0 | 3 | 0 | 13 |
| New Brunswick..... | 17 | 0 | 3 | 0 | 0 | 20 |
| Quebec..... | 17 | 0 | 1 | 2 | 0 | 20 |
| St. Hyacinthe..... | 14 | 5 | 0 | 0 | 1 | 20 |
| Montreal..... | 13 | 1 | 0 | 1 | 5 | 20 |
| Ottawa..... | 10 | 2 | 0 | *1 | 7 | 20 |
| Kingston..... | 20 | 0 | 0 | 0 | 0 | 20 |
| Toronto..... | 17 | 1 | 0 | 2 | 0 | 20 |
| London..... | 17 | 1 | 0 | 2 | 0 | 20 |
| Manitoba..... | 14 | 2 | 0 | 3 | 1 | 20 |
| Calgary..... | 14 | 5 | 0 | 1 | 0 | 20 |
| British Columbia..... | 18 | 1 | 0 | 1 | 0 | 20 |
| | 188 | 31 | 4 | 16 | 14 | 253 |

All other necessary information, of a technical kind, will be found in the accompanying Memorandum.

The results of analysis are presented in the form of two Tables. Table I gives information regarding the source and general character of the samples, as well as the results of a preliminary analysis. Table II gives more detailed analytical work, performed upon samples which appeared doubtful, or unsatisfactory, on preliminary testing.

A further collection of Honey has been ordered, in consequence of a resolution of the Middlesex Beekeepers' Association. The work of analysis is already in progress, and a report will be made at the earliest possible date.

I beg to recommend publication of this Report, as Bulletin No. 145.

I have the honour to be, Sir,
Your obedient servant,

A. MCGILL,
Chief Analyst.

* The strip of paper, answering the purpose of a label, is so badly mutilated in this sample, as to make it possible that the word "Compound" in small letters, may have been originally on the package, as I find it on some very similar packages.

MEMORANDUM.

Honey is, in its nature, of somewhat variable character; being influenced by the special plants from which it is gathered; by the presence of "honey-dew" (1); by accessibility to the bees of maple or other sweet sap; by the weather, and other causes.

In order to define Honey, it becomes necessary to study the extent of this variability.

For Canada, no legal definition of Honey exists. The following definition was made legal for the United States on the 26 June, 1906:—"Honey is the nectar, and saccharine exudations of plants, gathered, modified and stored in the comb by honey bees (*Apis Mellifica* and *Apis Dorsata*); is laevorotatory, contains not more than twenty-five (25) per cent. of water, not more than twenty-five hundredths (0.25) per cent of ash, and not more than eight (8) per cent. of sucrose."

With regard to this definition it may be said that occasional samples of genuine honey have been found to give a right hand rotation. The number expressing such rotation is always very small; and the samples in question are of such rare occurrence as to be practically negligible. The fact, however, that they may occur, makes it impossible to charge adulteration against a producer having such samples in his possession. It need not, however, prevent dextrorotatory samples from being described as *below standard*: or even, as being "*non-honey*" under the Act.

The inspection of 183 samples in 1897, showed 47 to contain above 25 per cent. of water. (2) Of this number 7 were adulterated or doubtful on other accounts; leaving 40 (= 23 per cent. of those classed as apparently genuine) with above 25 per cent water. But as explained by the Chief Analyst, "the analysts did not follow a uniform process" in the estimation of water.

The inspection of 99 samples in 1903, showed 8 samples to contain above 25 per cent water, of which number 6 were adulterated or doubtful, on other grounds. This leaves 2 samples (= 2½ per cent of the number classed as apparently genuine) to contain above 25 per cent. water.

The inspection of 54 samples, in 1906, shewed 5 to contain above 25 per cent. water. Of this number, 2 are otherwise adulterated; leaving 3 samples (= 7 per cent. of those classed as apparently genuine) to contain above 25 per cent. water.

The inspection of 253 samples, now reported, shows 49 samples with 25 per cent. or more of water. Of this number, eleven (11) are sold as "compounds," and 7 are classed as adulterated or doubtful, on independent grounds. This leaves 31 samples (= 14 per cent. of the number classed as presumably genuine) to contain 25 per cent of water, or more than this. The highest amount of water found in any of these samples is 31.4 per cent. It is noteworthy that a sample of guaranteed honey, supplied by Mr. R. F. Holterman of Brantford, Ont., in 1897 contained 27.1 per cent. of water. See Bull. No. 47).

The ash of honey is due almost entirely to the accidental occurrence of dust, which sticks to the nectar, or other saccharine fluid, gathered by the bees. It is usually a mere trace; but exceptional instances are on record, when it has reached 0.3 of one per cent.

Many samples are recorded in Bulletin No. 47, which give a higher ash than this; but as every test indicated their genuineness, the high ash can only be interpreted as due to carelessness in handling the article, with consequent access of dust. The sub-

(1) Honey-dew is a sweet exudation which appears on the leaves of some plants, and especially of conifers, when stung by an aphid.

(2) Nearly all genuine samples of honey approximate 20 per cent. of water; and the number of samples falling below 18 per cent. or above 22 per cent. of water, is small indeed. This constancy of moisture content is due to the fact that bees find it impossible to deal with the substance if too dry or too wet. The definition quoted above, is amply liberal so far as water content of honey is concerned.

stances employed to adulterate honey are, like honey itself, characterized by a very low ash content. Owing to the valuelessness of this determination for purposes of detecting adulteration, I have not considered it necessary to carry out the test on the present collection.

Very few articles of food have been more extensively adulterated than honey; and it is important to examine how far the above definition of (U.S.) legal honey, enables surrogate samples to be detected.

Bees naturally gather the raw material for honey production at the nearest point; and this has been taken advantage of by bee-keepers. Sugar, syrup and other foods, are very properly fed to bees, in order to tide over periods of scarcity; but the feeding of syrup to bees to enable them to fill their combs with honey for the market, is another matter. Even when bees are fed exclusively on cane sugar (sucrose), the honey which they store up, consists chiefly of invert sugar, the organization of the insect effecting the change. But notable amounts of the cane sugar so fed, escape inversion; and as much as 30 per cent of the whole has been found, as unchanged sucrose, in the resultant honey. When bees have access to the normal, raw-material for honey making, it is well established that the honey will contain not more than from traces, to 10 per cent of cane sugar (sucrose). In the event of coniferous trees (pines &c.) being largely accessible, the honey may contain slightly higher amounts of cane sugar; but even in such case, 15 or 16 per cent of sucrose is a maximum amount. The Swiss Agricultural Chemists have fixed the maximum at 16 per cent. In northern climes, where the pine and other coniferous trees abound, it may be safer to fix a somewhat higher maximum for sucrose than 8 per cent as established by the United States standard already quoted.

I have, for purposes of this Bulletin, adopted 16 per cent sucrose.

Glucose (Corn syrup) is a frequent adulterant of *extracted* or *strained* honey, i.e. honey which has been separated from the comb. Such surrogate honey always shows a marked right-hand rotation; and, by this means, (and others) is readily detected.

Cane sugar syrup is less often employed, as a honey substitute,, partly because of its higher cost, and partly because of its ready detection, if employed in profitable amounts. There can, however, be no doubt that cane sugar syrup is in use, as an adulterant to honey. One of the samples now reported (See No. 25812) contains an explicit statement of the fact, that it consists of "*Honey and Sugar Syrup*." This sample gives a reading $+17.8^{\circ}$. The addition of cane syrup as already remarked, to the finished product, is not difficult of detection. This becomes quite otherwise when it is fed to the bees and subjected to the influence of the organism of the bee itself. There is a strong presumption against the purity of any honey sample which contains 10 per cent or more of cane sugar; but owing to circumstances already described, I consider it advisable, for the present, to give the benefit of any doubt, to the producer, and to permit samples, up to 16 per cent of cane sugar, to pass as "presumably genuine," in the absence of other evidence against them.

When cane sugar in solution is inverted (as by an acid) the resultant "*invert sugar*" is practically identical with honey, so far as the sugar content of the latter is concerned. Particulars as to the use of invert sugar as a honey substitute, or adulterant, will be found in the introduction to Bull. No. 90.

APPENDIX L.

BULLETIN No. 146—DRUGS

Bismuth Subnitrate; Potassium Bromide; Phenacetin.

OTTAWA, January 25, 1908.

W. J. GERALD, Esq.,
Deputy Minister of Inland Revenue

SIR,—I have the honour to report upon 196 samples of Drugs, collected in December last; and consisting of the following:—

| | | |
|---------------------------------|-----|----------|
| Table I—Bismuth Subnitrate..... | 55 | samples. |
| “ II—Potassium Bromide..... | 57 | “ |
| “ III—Phenacetin..... | 84 | “ |
| Total..... | 196 | |

These were obtained in each of the (14) inspectoral districts of the Dominion, and doubtless represent, very fairly, the character of the drugs named, as sold throughout Canada.

It is very gratifying to know that, in no case has anything which could be properly called adulteration been found.

Bismuth Subnitrate. (See Table I). The percentage of Bismuth has been determined by conversion to the oxide. Tests for Lead, Arsenic and Carbonic Acid have been carefully made. With exception of two samples (Nos. 26355 and 31562), the requirements of the British Pharmacopœia were fully met.

The two samples excepted are *Oxy-carbonate of Bismuth*, and are manifestly furnished as errors in dispensing. These two preparations of Bismuth (Subnitrate and Oxy-carbonate) are so similar in their medicinal value that the error is not a serious one. But such errors should not occur.

Potassium Bromide. (See Table II). The British Pharmacopœia describes this drug as required to be within *one per cent* of chemical purity; and to contain no trace of the heavy metals, or of Cyanides. In all these respects the whole of the 53 samples examined were found to be satisfactory.

Phenacetin. (See Table III). Six samples from each inspectoral district were examined as regards specific identity, and absence of Antifebrin (Acetanilide) and parphenetidin. All were found to be of requisite purity.

The analytical work herein has been done by Mr. Lemoine and Mr. Valin of this staff.

I beg to recommend the publication of this report as Bulletin No. 146.

I have the honour to be, Sir,
Your obedient servant,

A. MCGILL,
Chief Analyst.

APPENDIX M.

BULLETIN No. 147—LARD

OTTAWA, February 3, 1908.

W. J. GERALD, Esq.,
Deputy Minister of Inland Revenue.

SIR,—I beg to send you, herewith, a tabular statement regarding the collection and examination of 140 samples of Lard, obtained throughout the Dominion in December last.

The following synopsis gives the details by Inspectoral Districts :—

| — | Genuine. | Doubtful. | Adulterated. | Compound. | Total. |
|---------------------------|----------|-----------|--------------|-----------|--------|
| Nova Scotia..... | 9 | 1 | 0 | 0 | 10 |
| Prince Edward Island..... | 7 | 2 | 0 | 1 | 10 |
| New Brunswick..... | 7 | 3 | 0 | 0 | 10 |
| Quebec..... | 10 | 0 | 0 | 0 | 10 |
| St. Hyacinthe..... | 8 | 1 | 0 | 1 | 10 |
| Montreal..... | 10 | 0 | 0 | 0 | 10 |
| Ottawa..... | 9 | 0 | 1 | 0 | 10 |
| Kingston..... | 10 | 0 | 0 | 0 | 10 |
| Toronto..... | 10 | 0 | 0 | 0 | 10 |
| London..... | 10 | 0 | 0 | 0 | 10 |
| Manitoba..... | 10 | 0 | 0 | 0 | 10 |
| Calgary..... | 10 | 0 | 0 | 0 | 10 |
| Vancouver..... | 9 | 0 | 1 | 0 | 10 |
| Victoria..... | 10 | 0 | 0 | 0 | 10 |
| Total..... | 129 | 7 | 2 | 2 | 140 |

Ninety-two per cent of the samples examined are genuine ; and ninety-three (93) per cent of the samples *sold as genuine*, are found to be so.

Only two (2) samples are classified as adulterated. Among those samples (seven in number) which I have called doubtful, it may be that admixture, amounting to adulteration, exists in one or two cases ; but the results of analysis are sufficiently indecisive to warrant me in withholding definite judgment. The amount of foreign matter is either very trifling, or the characteristic constants which we possess admit of interpretation favourable to the vendor ; although doubtfully so.

It is to be regretted that a definite standard, capable of being expressed in numbers, does not exist for Lard. It is well understood that this article is essentially the fat of the hog, and should contain mere traces of other ingredients ; but just what these other ingredients may be, and at what point the 'traces' may become large enough to be taken into account, are points which remain unsettled.

The following definitions for Lard, became legal for the district of Columbia in 1906, and have since been accepted by several of the States of the Union.

1. *Lard* is the rendered fresh fat from hogs in good health at the time of slaughter, is clean, free from rancidity, and contains, necessarily incorporated in the process of rendering, not more than one (1) per cent of substances other than fatty acids and fat.

SESSIONAL PAPER No. 14

2. *Leaf Lard* is lard rendered at moderately high temperature from the internal fat of the abdomen of the hog, excluding that adherent to the intestine, and has an Iodine number not greater than sixty (60).

3. *Neutral Lard* is lard rendered at low temperatures.

These definitions are satisfactory, so far as they go ; but they are by no means as full and exact as could be wished.

The last systematic inspection of lard was made in 1889 ; and the results were published as Bulletin No. 7 of this Department.

109 samples were examined, of which only 35 were certainly Canadian. Of these, three samples were adulterated. Of 60 samples known to be of United States origin, a majority contained cotton seed oil, without acknowledgment.

No objection, on the ground of healthfulness, can be taken to the use of purified cotton seed oil ; but, the fact of admixture should, of course, be distinctly stated on the label. The same may be said of beef tallow.

I beg to recommend the publication of this report, as Bulletin No. 147.

I have the honour to be, Sir,
Your obedient servant,

A. MCGILL,
Chief Analyst.

APPENDIX N.**BULLETIN No. 148—HONEY**

OTTAWA, February 13, 1908.

W. J. GERALD, Esq.,
Deputy Minister of Inland Revenue.

DEAR SIR,—I have the honour to report upon a collection of Honey, made in December last. The immediate cause of this collection was a resolution passed by the Middlesex Beekeepers Association, in June, 1907, as follows :—"That this Association would recommend and ask that the Department of Inland Revenue at Ottawa, collect, annually, samples of honey, and that these samples be taken during the autumn or early winter; we would also request that those infringing the Pure Food Act be prosecuted."

I reported to you, on the 13th ult., the results of examination of 253 samples of honey (see Bull. 145), collected in April and May of 1907; and the present report may be considered as supplementary to that one. Its special interest lies in the fact of collection during the winter, in deference to the suggestion of the Beekeepers Association. It is to be presumed that this Association held that there would be greater likelihood of spurious samples being found on the market during the winter months.

It is gratifying to state that the report now submitted shows that strained honey, as found throughout Canada, is mainly a genuine article, true to name.

The following synopsis will bear out the statement :—

| | Samples. |
|------------------------|----------|
| Found Genuine | 135 |
| " Doubtful | 3 |
| " Adulterated | 2 |
| Sold as Compound | 1 |
| Total | 141 |

A memorandum giving details as to the inspection of honey, by this Department, in past years; and a brief account of the nature of the article, is published in Bulletin 145.

I would respectfully recommend the publication of this report as Bulletin No. 148.

I have the honour to be, Sir,
Your obedient servant,

A. MCGILL,
Chief Analyst.

APPENDIX O.

BULLETIN No 149—THE INSPECTION OF DOMESTIC WELLS

OTTAWA, March 23, 1908.

W. J. GERALD Esq.,
Deputy Minister of Inland Revenue.

SIR,—Two established facts regarding typhoid fever, and enteric fevers generally, are the following :—1st, the contagion of these fevers is essentially water-borne ; 2nd, they are characteristic of the Country rather than the City.

It is true that, when one case of typhoid fever originates in a city, we may generally expect to find it not a solitary case ; indeed, a more or less extended epidemic is the usual history. In country places, it is on the contrary, quite usual to find the malady restricted to individual families ; and most physicians, having large country practice, are acquainted with households in which a more or less continuous succession of fever patients are found from one year's end to another.

It requires no great ingenuity to explain these phenomena. They are just what one might expect, who is at all well acquainted with the conditions of domestic water supply.

The procuring of a satisfactory supply of water ; the maintenance of such supply in a state of purity ; and the more or less frequent inspection of the article, to ascertain its character, are matters which must chiefly interest the localities concerned.

When, as in the case of most cities and towns, the municipal supply is obtained from a single source, the problem of inspection becomes a comparatively simple one.

It is otherwise with smaller towns and villages, and with farms, where wells, usually the property of individuals are in use.

It is true that the widespread danger to health and life which results from the pollution of the single supply, in the case of a city or town, does not obtain in the case of wells. Excepting the wells of public schools, hotels, and a few of more or less public character, the danger is usually restricted to a single family. But wells supplying lodging houses, eating houses, factories, and especially bakeries, breweries and creameries, must not be forgotten.

While it is practicable and sometimes not difficult to effectively protect from pollution the river, lake, or other source of city supply, the protection of well supplies is much less easy. This is partly due to their great number, partly to their usually being placed in close proximity to the house, stables, privy, &c., and chiefly to the ignorance and thoughtlessness of those who use them.

The chief danger of water pollution lies in the readiness with which sewage may find entrance to an otherwise satisfactory supply.

The term *Sewage* has primary reference to the waste water carried by the sewers of towns having systematic drainage. It is applied generally to water rendered impure by having dissolved in it, the soluble matter from manure, privies, or household waste. It is characterized by both organic and inorganic impurities. The organic matter in sewage is partly living (microbial), and partly non-living (albumin, urea, &c.).

SESSIONAL PAPER No. 14

These contents of sewage are not necessarily poisonous, in the strict sense; but, among the bacteria there may be those of specific disease (typhoid, diphtheria, &c.) In any case, sewage is an objectionable and disgusting constituent of water intended to be used for drinking and cooking, and it is dangerous, even if not actually toxic.

The organic matters of sewage are changed in character, and may even be completely destroyed, by filtration through sand or gravel, charged with such bacteria as are always found in what we may call *normal* conditions.

The characteristic feature of the most objectionable component of sewage, is its nitrogen. In whatever form this may originally have been present (urea, albumin or other proteid, &c.) it turns up under the influence of efficient filtration, as nitric acid, or may be completely removed, by the agency of plant life.

The inorganic impurities of sewage may be in part removed (phosphates, sulphates) but the chlorides remain.

Common salt (chloride of sodium) is the most characteristic and constant inorganic ingredient of sewage. It is present in most human food, is fed to cattle, horses, &c., as such; and in consequence of this, it finds its way into the urine and faeces, and into dish water and general household slops. It persists in sewage, even after this has been, as already described, purified by filtration. Hence the presence of chlorides in drinking water cannot be taken as a conclusive proof that such water is unfit for food. We may go so far as to say indeed, that no naturally occurring water is free from chlorides.

It remains true, however, that the ground water of every locality is characterized by a certain limit of chlorine (in chlorides), and any considerable increase in this normal limit, especially if it is a fugitive or temporary increase, must be held to indicate pollution by sewage, unless other explanation can be furnished.

The reasonableness of this statement will appear if we make a brief study of the conditions of well supplies.

In March, 1900, the writer presented this subject in an address to the Ontario Provincial Health Association, and may be permitted to make some quotations from that address.

'When rain falls to the earth it is either absorbed by soakage, or it flows along the surface to lower levels. Usually both flow and absorption take place, but the ratio between the quantity carried off by surface flow, and that absorbed, varies with the nature of the soil, the degree of slope, and other conditions.

When the surface is nearly level, and porous, as is the case with ordinary arable land, most of the water will disappear by soakage, and if the rainfall is heavy, the ground will be wetted to a great depth.

In the diagram (Fig. 1) the dotted portion represents a layer of porous soil, S— (which may be sand, loam, gravel, etc.), underneath which lies a non-porous layer, C

Fig. 1.

(clay), represented by short lines, and underneath this again is a layer of rock—R. The rain which falls on the surface A, will gradually sink through the porous soil till it reaches the impermeable clay; and shortly after the rain ceases, we may have the state

of things represented at the right hand side of the diagram, which shows the porous soil thoroughly soaked from the surface of the clay up to the level B. This last is the so, called *ground-water level*; and it is evident that the depth of the ground-water level below the surface level, will vary with the rainfall, and with the thickness of the stratum S: will be highest after heavy rain, and lowest after prolonged drought.

For every region an average may be struck, which is known as the mean annual ground-water level, and we may suppose B to represent this mean level for the area under consideration. If now, a well be sunk, as at W, to the clay, this well will contain water to the depth of the average ground water of the locality. If the well be carried lower, *i.e.*, into the clay, the result will not be to change the character of the water, but merely to enlarge the storage capacity of the well. Extensive areas of level land, as in prairie regions, beaver meadows, etc., answer to the conditions described; but certain other characteristics of ground-water must be considered.

Ground-water is never stagnant, but is moving more or less rapidly towards some line of lower level, where a brook, or river, or lake will generally be found. In Fig. 2, D represents a section of a stream, whose waters will evidently rise and fall with the level of the ground water, which supplies them; and we must discriminate between this rise and fall, which is always gradual, and that sudden rise, of short duration, which results from the surface flow immediately following heavy rain.

Fig. 2.

The flow of the ground-water will be in the direction indicated by the arrows, *i.e.*, at right angles to the course of the stream, and the line B B, will be a gradually sloping one, so that the well W¹ will contain less water than W² at the same time, although the wells may be of the same depth, and penetrate identical strata of sand, gravel, etc.

It must not, however, be supposed that stratification of so simple a type as I have described, is at all common. Soil, by which I mean everything that is not rock, has resulted essentially from the operation of chemical and mechanical forces upon solid rock. The chief of these forces have been, (1) the freezing of water in the pores of the rock, thus breaking it up; (2) the action of rain; (3) the alternate expansion and contraction by heat and cold; (4) attrition of stone upon stone at the bottom of rivers and lakes; (5) the movement of large ice masses (glaciers); (6) solution of certain rock components, with the consequent falling apart of the residue; (7) action of the roots of plants, which action is both mechanical and chemical; (8) chemical action by oxidation, formation of carbonates, etc. Many of these changes have taken place under water, and every part of the earth's surface has again and again been the bottom of lake or sea, so that soil formed by the means described, does not necessarily remain on the spot which produced it, but may lie hundreds of miles away. Thus, soils which have re-ulted from the attrition of rock masses in the regions round about Algoma, now cover the fields of Southern and Eastern Ontario. This sort of thing has happened the world over; and the carriers of these immense masses of clay, sand, gravel and boulders, have been ocean and river currents; but above all glaciers and icebergs.

SESSIONAL PAPER No. 14

An iceberg is not a large block of clean, pure ice, but a section of a glacier, broken off by the lifting power of the ocean when the moving mass has been so far thrust into its waters that their buoyancy overcame the strength of the ice, and a huge mass snapped off, rose to the surface, and was carried out to sea. This ice mountain contains, frozen into it, perhaps thousands of tons of rock detritus. It floats out to sea, and wherever it melts, this soil-forming material is deposited, perhaps forming a heap or hill, perhaps being strewed along the course of the floating bergs. After a period of submergence, which may be hundreds of thousands of years in duration, subterranean forces cause, what was so long sea bottom, to become dry land; and we can imagine the condition of things described without too much difficulty, since a little observation of regions quite accessible to us, shows us very marked traces of the period itself. Of course the influence of new forces comes into play on what is now dry land. Atmospheric effects, vegetable and animal life, sunshine and storm play their part in altering the surface; and in the end this comes to be just what we find it, the very ground upon which we build our houses and in which we dig our wells.

In Fig. 3 we have a somewhat more complex section diagrammed, representing a state of things much more usual than the very simple conditions described in Figs. 1 and 2.

Fig. 3.

Here we have the rocky substratum R, more or less contorted throughout, and upheaved as a mountainous ridge at R³. Conformable to the surface of the rock, but of varying thickness, we have a stratum of gravel, G, which crops out on the surface between 1 and 2. Lying on this gravel is a layer of clay, C, which varies in thickness, and comes to the surface at 2. Overlying this, is the soil, S. The line B¹B², represents, as before, the mean level of ground water, with a gentle slope towards the drainage stream D. The rain, which falls on the region 2 to 3, supplies this ground water, which is tapped by the wells, W¹, W², W³. It is at once evident why a well at W⁴ remains dry, or only contains water when the season is abnormally wet. The rainfall on the rocky surface to the right of 1, is of course not absorbed to any great extent, but flows down to the gravelly surface between 1 and 2, and together with the rain falling on this surface, is absorbed by the gravel, and finds storage in it between the rock (R) and the clay (C). Here it accumulates in a second and lower water-bearing stratum, and the normal level for this water supply may be represented by the line N. Now it is evident that if any of the wells W¹ to W⁴ be continued through the clay, they will obtain a water supply from this lower gravel; and the well W⁴ can get a permanent supply from no other source. W⁴ then becomes an illustration of a so-called 'deep well,' and in wet seasons, when the level rises above the normal N, say as high as N¹, this well will over-

flow, or becomes what is called a 'flowing well,' on the principle that water rises to the same height in all tubes connected with a common reservoir.

If I have succeeded in making my subject understood, we are now prepared to begin the special enquiry that I wish to propose for your consideration. Up to this point, I have merely defined and illustrated certain terms that I shall have to use repeatedly in the sequel. To recapitulate briefly, I have spoken of three classes of wells, viz.: those fed from the normal groundwater, those fed from a deep or secondary water supply, and those so-called surface wells, which, like W^4 in Fig. 3, receive soakage water only, and contain a supply only when the ground in the immediate vicinity is wet, as in Spring and Autumn. All the ground-water wells diagrammed, are represented as dug down to subjacent clay; but this is not a necessary condition. W^3 for example, would be none the less a ground-water well, had it been made no deeper than W^1 and W^2 . We have now to consider the character of the water which fills these three types of wells.

Rain water is not the chemically pure substance which it is often described as being. In the later stages of a prolonged rainfall, it is indeed very nearly pure, but the first portions of every shower wash out from the air, not only the gaseous impurities, which are the products of animal and vegetable decay—(Ammonia, compound or organic ammonias, sulphuretted hydrogen, etc.)—but also those solid particles, rich in microbial life, which form the dust of the air, and are partly organic and partly inorganic in character. This rainwater, falling upon the surface of the ground, flows along this surface, or soaks into it, taking momentarily into solution more and more of the soluble matters with which it comes into contact. These are partly inorganic salts, chlorides, sulphates, carbonates, silicates, etc.—and partly organic matters of more or less complex nature, the products of the decay of vegetable and animal matter. If, for example, in Fig. 3, the region 2 to 3 is a cultivated farming country, somewhat sparsely inhabited, the organic impurities will chiefly be of a vegetable kind—rotting vegetation, the manure of the fields, etc.; but if it be a village or town, the organic matters will be more largely of animal, and especially of human origin. To these waste products the term sewage is properly applied. The ground-water of this region may be, therefore, much less pure than was the rain water that fell on the surface gathering-ground. I say *may be*, for reasons which will be presently given.

We may dismiss the *inorganic* impurities with a word, by saying that, unless they are present so largely as to give a distinct taste to the ground-water, they are rarely of a kind to be dangerous to health. The *organic* matters must be more carefully considered. If they have originated in normal decay, they may be harmless from the point of view of health, even though far from appetizing when we remember their origin; but if they come from those conditions of decay which we call *disease*, they may be actively poisonous, and may contain the living germs of specific diseases, such as fevers, diphtheria, cholera, etc.

Percolation, through a fully aerated soil, has, however, the effect of bringing about purification of such water by the process of oxidation, a process by which organic matter is changed and microbial life destroyed. That this should be effective, the water must filter through several feet of sand or gravel; and although it is impossible to fix a definite minimum limit to the depth of such a natural filter, it is safe to say that we should insist on ten feet, at least, and prefer as much more as we can get. To this end it is necessary that the upper ten feet of the wall of a well should be made quite impervious to water, and the accompanying diagram shows how such a construction can be brought about.

A well should be so constructed that no water could find entrance to it without filtration through a depth of soil, at least equal to the vertical distance between the ground level, and the lowest level of ground-water. To insure this it is necessary to have the mouth of the well raised a foot or more above the surface of the surrounding soil, and to have the brick (or stone) lining of the well backed up by a layer of puddled clay, a foot or more in thickness, and extending continuously from the level of the ground water quite up to the mouth of the well.

SESSIONAL PAPER No. 14

DIAGRAM of well: showing a backing of puddled clay or other impermeable material between the brickwork and the porous strata through which the well is dug.

FIG. 4.

A—porous strata, such as sand, gravel, loam, shale, etc. B—impervious stratum, such as clay, rock without flaws, etc.

The accompanying diagram will serve to explain what is meant. By this construction surface water is prevented, by the impermeable clay backing, from getting entrance to the well until it has percolated through the earth to the line of level of the ground-water.

It will be quite clear that no one of the wells in Fig. 3 can be free from unfiltered, and consequently dangerous water, unless this precaution is taken, since even those which reach the ground-water may be polluted by the soakage of unfiltered surface water.

If now we study the gathering ground 1 to 2 in Fig. 3, we have a wild, rocky, and probably unsettled tract of land, free from animal impurity, and comparatively free from vegetable decay. Moreover, its distance from the point at which the water collected on it is used (W^5), ensures thorough filtration, and we can see at once why the water of this deep stratum should be eminently pure and wholesome. Such water is, for obvious reasons, apt to contain more mineral matter in solution, and may even con-

form to the type of a true mineral water. Unless this be the case, it is evidently a very desirable domestic supply, and wells like W⁵ are always to be preferred when attainable. Even these, however, must be protected against soakage contamination, to which they are just as liable as those of any other type. This study has shown us that shallow wells, obtaining as they do, their supply from unfiltered soakage can never be safe for domestic use, although favorable circumstances may prevent them from becoming actively disease-producing; that ground-water wells, if properly protected from local contamination by soakage, are generally safe; while deep water wells, guarded from local soakage, are safest of all.

This study of well-water, in its origin, makes it quite easy to understand why the water contained in one well may be so different from that contained in other, and perhaps, contiguous wells.

Large towns and cities, as a rule obtain their water supplies from some single source, so that each family in a city of say 5,000 families is supplied with water of the same kind as the rest. It consequently becomes a matter of small cost to each family, to take care of this common source of supply, to have it examined from time to time, chemically and otherwise. There is generally a Board of Water Commissioners appointed to look after the matter, and an engineer whose special duty it is to see to the protection of the supply and its proper distribution.

Compare this with the case of 5,000 families resident in the country. It is probable that these obtain their supply from 5,000 different wells, each having its own peculiarities of situation and protection, and each well having a special interest only to the particular family drawing water from it. If the owner of one of these wells desires to have it examined with a view to determining its purity, the total cost of such examination falls upon himself, and any opinion procured by him, has no value for his neighbours, and does not help them to a conclusion as to the purity of their wells.

Can no way be devised whereby useful information regarding the safety of country wells may be obtained, which will be comparatively inexpensive, and therefore practicable? This is the question which I seek to answer affirmatively.

In the first place we may conclude that normal ground-water is a safe source of supply. Owing, however, to the fact, that the soil and sub-soil of one locality differs from that of another locality in nature of constituent materials, their depth, compactness or porosity; contiguity to neighbouring heights of land, or to swamp; as well as in amount of annual rainfall, we cannot expect ground-water to have the same characters everywhere. What we may expect is that in a given geological and topographical area, the ground-water will have a certain definite character. If the soil consist largely of limestone *debris*, we shall find bi-carbonate of lime in the water, if gypsum characterize the soil of the locality, we shall find sulphate of lime in the water, if chlorides be present in the soil, then chlorides will be found in the water, and so on. In a neighbouring area, separated, say, by a ridge of granite from the first, and having a soil resulting chiefly from the weathering and disintegration of granite, we shall find a ground-water much softer than the first, and having small quantities of silicates, and other products of the disintegration of granite in solution. Now all the wells, and there may be hundreds of them, which are dug into this ground-water, will fall into a class by themselves, and exhibit common characters, provided that local soakage is prevented and the water they contain be the uncontaminated ground-water of that region. How then will an individual well be affected, in whose case sewage finds entrance? Organic matter will increase, and especially will this be true of nitrogenous organic matter: phosphates and chlorides will be increased, nitrates and nitrites may be found in it, and a bacteriological examination may reveal the presence of the colon bacillus. To determine all this, a full analysis is of course needed. What I propose to do, is to confine attention to one characteristic, and to select that one which is most surely and certainly determined. This I find to be the *Chlorine in Chlorides*.

The determination of chlorine, in chlorides, is one of the simplest and most definite estimations that a chemist can be called upon to make. Owing to the presence of common salt (chloride of sodium) in human food, and its use by domestic animals, it is always

SESSIONAL PAPER No. 14

found in sewage, so that any notable admixture of sewage with a well water, at once raises the chlorine percentage.

Chlorine is, however, invariably present in normal ground-water, and the question arises for each region: "How much chlorine is normally present in the ground-water of this locality?" Of course the answer can only be given after analysis of normal samples, but once it is known, any marked variation from that standard, stamps a well of that region as suspicious, and justifies discontinuance of its use until fuller examination can be made. It must not, however, be forgotten that contiguous wells, like W² and W⁵ in Fig. 3, may obtain their water from entirely different sources, so that it becomes necessary to take depth, and other factors into consideration. The lower or second water-bearing stratum may have a very different normal content of chlorine from the first, or ground-water proper; but its number will also be a fixed one, and if once known, it will be as easy to detect any sewage contamination in this kind of well as in the other.

It is also to be noted that the normal chlorine number for a given area, will vary from month to month, and will be especially affected, by unusually heavy rainfall, or by prolonged drought. But experience shows that variations, due to these causes, are insignificant in comparison with those resulting from sewage contamination.

For many years past I have endeavoured to put this method to the test of experiment, and for that purpose I have collected personally and by deputy, over 730 samples of well water, chiefly within the drainage area of the Ottawa Valley. The difficulties which lie in the way of any single individual's accomplishment of so gigantic a task as this, are almost insurmountable; and I can only hope to illustrate the subject in a very imperfect way from the data in my possession. The first difficulty is to obtain samples which represent the normal ground-water, and the normal deep water supply or supplies. Very few country wells are protected against surface soakage by the method indicated in Fig. 4, and I may say here, that I think the Provincial governments might profitably entrust to certain of their officials whose work takes them to different parts of the country, as in the case of the Road Inspectors, the Board of Health Officers, &c., the additional duty of seeing that new wells are properly protected from surface drainage. It costs very little more to properly protect the well by tamping clay behind the stones when the well is being made, or by using concrete, than to finish it in the unscientific way in which we find this important matter usually performed, and I am sure that it is ignorance rather than any wish to save a few dollars at the risk of health, which explains the unsatisfactory condition of nearly all the wells which I have visited.

If, in each topographical area, we could find a few thoroughly protected wells, of known depths, and of whose history a full record had been kept, we should possess the data which we require, and which we cannot now obtain with any such certainty as would give a sure basis for the illustration of the scheme I have suggested.

It is by so much the more important that new wells should be constructed in such a way as to fulfil these conditions.

On 13th October, 1899, I personally visited forty-three wells, chiefly on farms, in the district between Kinburn and Pakenham, in the county of Lanark. This is an extensive clay region, fairly level, except quite near Pakenham, where the land dips towards the Mississippi river. The Mississippi rises in a series of small lakes, about eighty miles west of Pakenham, in the townships of Abingdon, Barrie and Clarendon, in Addington county. These townships are very thinly settled, and the whole course of the river is through a region but little affected by human habitation. With the exception of the towns of Perth and Almonte, it may be said to be quite as nature left it, and a purer gathering ground could not be wished. This is proved by the fact that a sample of the river water taken at Pakenham gave only two parts of chlorine per million. No doubt, this small content of chlorine is chiefly derived from sewage, for, although the organic matter of sewage may change by oxidation as already explained, the chlorine remains, to tell the tale of past sewage pollution. In the case before us, the amount is too small to give any concern for the purity of the river water. No doubt there are points on the river, (*e.g.* just below the town of Perth) where locally, a higher chlorine figure would be found, pointing to local and serious sewage contamination. But the volume of the river is so large, that by the time the sewage has distributed itself uniformly

8-9 EDWARD VII., A. 1909

throughout it, the figure 2 per million, for chlorine, has been reached, and the organic impurities have been fully oxidized.

The following numbers were obtained for seven wells in the region referred to, the wells having a depth of less than 10 feet, and being of the kind called surface wells :—

| Well. | Depth. | Chlorine per million. | Well. | Depth. | Chlorine per million. |
|--------|-------------|-----------------------|--------|-------------|-----------------------|
| 1..... | 9 feet..... | 4 | 5..... | 8 feet..... | 26 |
| 2..... | 9 "..... | 10 | 6..... | 7 "..... | 32 |
| 3..... | 9 "..... | 22 | 7..... | 8 "..... | 180 |
| 4..... | 10 "..... | 22 | | | |

Why are these numbers so much higher than the river water gave? There is but one answer—the wells are dug in soil which is more or less saturated with sewage. Not one of these wells, so far as I could learn, was protected by a clay backing (see Fig. 4) from soakage, and consequently, most of them are contaminated with sewage which has undergone no such amelioration by soil-filtration as would have resulted from proper construction. Not one of them is certainly a safe well, while No. 7 cannot but be a most dangerous supply.

In the following table I have placed the numbers resulting from examination of 21 wells, varying from 10 to 20 feet in depth. These samples were taken on the same day, and from the same region :—

| Well. | Depth. | Chlorine per million. | Well. | Depth. | Chlorine per million. |
|---------|--------------|-----------------------|---------|--------------|-----------------------|
| 1..... | 20 feet..... | 4 | 12..... | 17 feet..... | 84 |
| 2..... | 12 "..... | 4 | 13..... | 20 "..... | 54 |
| 3..... | 16 "..... | 4 | 14..... | 17 "..... | 88 |
| 4..... | 18 "..... | 6 | 15..... | 12 "..... | 90 |
| 5..... | 18 "..... | 14 | 16..... | 13 "..... | 92 |
| 6..... | 15 "..... | 16 | 17..... | 13 "..... | 98 |
| 7..... | 12 "..... | 22 | 18..... | 12 "..... | 114 |
| 8..... | 15 "..... | 24 | 19..... | 18 "..... | 128 |
| 9..... | 13 "..... | 32 | 20..... | 18 "..... | 194 |
| 10..... | 14 "..... | 32 | 21..... | 12 "..... | 370 |
| 11..... | 12 "..... | 44 | | | |

It is quite likely that most of these wells derive the main portion of their supply from the ground-water of the locality, but it is very certain that most of them are contaminated with soakage water. The first four are among the deepest of these wells, and as likely to be true ground-water wells as any, yet their chlorine content is not high, in fact, the very highest chlorine numbers in this list correspond to decidedly shallow wells, whose contamination by sewage is beyond a doubt.

The following six wells are examples of deep wells, and should give pure water ; if properly protected from soakage of surface water. This they are not, however, and I cannot feel sure that the chlorine they contain is not, at least in part, due to sewage.

| Deep well. | Depth. | Chlorine. | Deep well. | Depth. | Chlorine. |
|------------|--------------|--------------|------------|--------------|-----------|
| 1..... | 25 feet..... | 24 | 4..... | 25 feet..... | 170 |
| 2..... | 35 "..... | 56 | 5..... | 25 "..... | 195 |
| 3..... | 46 "..... | 58 (in rock) | 6..... | 25 "..... | 240 |

Two wells in this region answer to the type of mineral springs. They contain respectively 3775 and 3700 parts of chlorine per million. It is quite evident that this chlorine has a mineral, and not a sewage, origin, and I mention them to show how marked a distinction exists between such wells, and the ordinary domestic well.

Later in October, I collected, partly in person, and partly by deputy, seventy samples of well waters along the Montreal road, through the villages of St. Joseph,

SESSIONAL PAPER No. 14

Blackburn and Cyrville, and the adjacent country. Of the wells less than ten feet deep, eight contain less than eight parts chlorine per million and thirteen others gave chlorine varying from 16 to 250 parts, six wells yielding more than 100 parts per million. Most of these wells were so evidently unprotected that I was prepared to find them dangerously contaminated, as the result showed them to be.

Of thirty-one wells having a depth between ten and twenty feet, only two gave less than 10 parts of chlorine; fourteen gave more than 100 parts, and five more than 200. There can be no doubt whatever, that most of this chlorine has a sewage origin.

Of deep wells the following is the record:—

| Deep well. | Depth. | Chlorine. | Deep well. | Depth. | Chlorine. |
|------------|-----------|-----------|------------|-----------|-----------|
| 1..... | ? | 2 | 6..... | 22 feet.. | 86 |
| 2..... | 21 feet.. | 6 | 7..... | ?..... | 110 |
| 3..... | 26 " .. | 26 | 8..... | 27 feet.. | 280 |
| 4..... | 30 " .. | 52 | 9..... | 23 " .. | 670 |
| 5..... | 96 " .. | 52 | 10..... | 155 " .. | 860 |

It is noteworthy that the increase in chlorine corresponds to an increase in depth, if we omit the numbers six, eight and nine in this list. Number six is in a hotel yard, and the well is not properly protected; number eight is twenty-five years old, has no pump, and shows every sign of neglect in its surroundings, and number nine is eighteen years old, not protected from soakage, and dug in soil which has been used as a garden and otherwise from immemorable time.

I have made, at different times, similar collections of well-water samples near Peterboro, near Hamilton, and at several places nearer Ottawa. The analytical data have a special interest for the neighbourhood in question; but for such a general study as we are now making, it seems scarcely worth while to quote them. They emphasize the point to which I have already alluded, viz.: the difficulty of ascertaining the true chlorine value of normal ground-water. If any considerable number of properly protected wells existed in a given locality, there would be no difficulty about this matter, or at least, the difficulty would be much lessened.

As already pointed out, this work is properly the duty of township and village municipalities. During the eight years which have elapsed since I brought it to the notice of the Provincial Board of Health of Ontario, no attempt has been made by any municipality, so far as I know, to carry out the plan then outlined.

Because I am impressed with the importance of the subject, I have asked and obtained your permission to make some further investigations; and the subjoined report upon inspection of wells in the towns of Oakville, Weston and Richmond Hill, forms a second attempt to demonstrate the usefulness of the method of testing well supplies, which I have just described.

I may explain that I do not consider the subject as one properly belonging to this Department of the Public Service; and it is rather as an object lesson, than with any view to its further prosecution, by the Department of Inland Revenue, that I have recommended the undertaking of the work now reported. The municipalities immediately concerned are the proper agents in the matter. They are best acquainted with the details necessary to give maximum value to the investigation. It will be seen that the information obtainable in a hurried visit to distant towns, is far from complete or satisfactory. The depth of the wells, their age, the frequency with which they are cleaned, their protection, construction and other features; the depth of water which they contain at different seasons of the year; the nature of the strata which they penetrate, and many other details, are either quite unknown, or very imperfectly known to me. It would be a matter of no great expense for each municipality interested to obtain and record this information; and such a record would be of immense value to the chemist in forming his opinion.

The work recorded in the accompanying tables has been done upon 32 wells in each of the towns of Weston and Richmond Hill, and 64 wells in Oakville Ont.

The information obtainable in regard to the wells was so very limited that I have sought to secure a basis for interpretation of analytical results, by doing a much greater amount of work upon these samples than is contemplated by the plan already described. Thus, in addition to determining the chlorine values, I have determined the alkalinity, and the temporary and permanent hardness. This is done in order to ascertain whether the water supplied by neighbouring wells, of similar depth, is derived from the same ground-water.

The information thus obtained is far from satisfactory. Where a well is walled up with limestone, the hardness of the water will be much affected by this fact, and further influenced by the length of time that the water lies in contact with the stone.

By much the best way to get the information needed for interpreting results of analysis, is to have it at first hand, from the well-digger. The date of sinking, the depth, the nature of the soil, the protection of the well, the extent of flow, the variation of level with the season, frequency of cleaning, &c., these are the important facts needed, and they could easily be ascertained by local endeavour. A stranger visiting the town for a day or two, is fortunate if he secures the water itself, and a chance hint or two regarding the well.

The depth of the well, as given in the tables, is, in most cases mere guess work; an approximation made by the man employed as a guide.

The time of the year is favorable to the protection of wells from fresh sewage; so that much would be learned in regard to the safety of these wells, if a comparison could be instituted between their chlorine value as here recorded, and that found in April or May, when the frost is out of the ground.

Such conclusions as I think can safely be reached, are noted in the tables. The number designating each well, enables its location in regard to other wells, to be seen by reference to the accompanying diagram.

The order in which the wells appear in each table is chosen so as to put contiguous wells together, as far as possible. Where a considerable distance is known to separate wells, a line is left blank in the table. It will not do, however, to interpret juxtaposition of numbers in the table, as indicating juxtaposition in the wells. The linear distance between one well and the next, is unknown to me. In some cases it may not exceed 100 feet; in other cases it may be a quarter of a mile. It is evident that exact knowledge on this point, while easily attainable by the local authorities, would require the expenditure of much time and labour on the part of a visiting inspector.

All other information needed to make the tables useful, is contained in the column headed 'Remarks.'

Finally I would draw attention to the fact that the results contained in these tables cannot be expected to greatly interest others than the residents of Weston, Richmond Hill and Oakville, except in so far as they throw light upon the application of the method of inspection which I have already described.

Even to the municipalities named, they only serve as the beginning of an investigation, which if completed at all, must be completed by themselves. The town of Oakville, probably contains over 500 wells. Thus it will be seen that the sampling of sixty-four, selected almost at random, and examined only once, cannot be regarded as more than a very superficial treatment of the question. I trust that we shall hear further of the matter.

This is not alone a subject of interest to country and village dwellers. Very large numbers of city people spend their summers in the country, and make use of well-water. Every autumn finds them bringing back to town a certain amount of typhoid fever, contracted doubtless, through the use of impure well-water. This is an aspect of the case which may reasonably appeal to city dwellers.

I beg to recommend the publication of this report as Bulletin No. 149.

I have the honour to be, Sir,

Your obedient servant,

A. MCGILL,

Chief Analyst.

Oakville. Plan of wells.
February, 1908. (See Table III.)

Blocks are 313 ft x 208 3/4 ft.

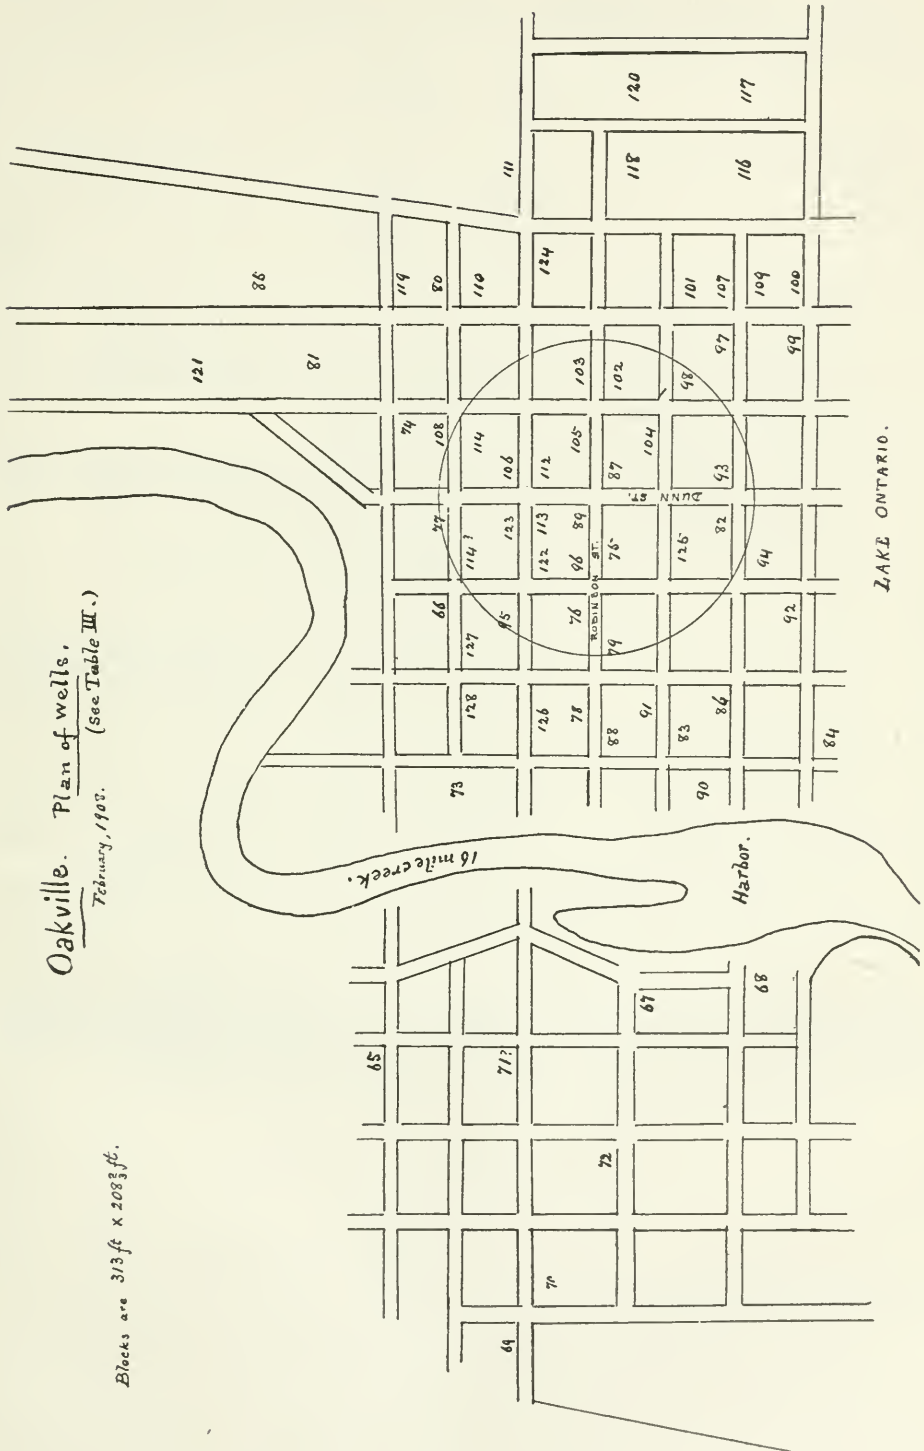

TABLE I.—WELL WATERS—TOWN OF WESTON, ONT., FEB., 1908.

| Number. | Depth in Feet. | Description. | Chlorine per Million. | Alkalinity. | HARDNESS. | | | Remarks. |
|---------|----------------------|--|-----------------------|-------------|-----------|------------|------------|--|
| | | | | | Total. | Permanent. | Temporary. | |
| 43 | 22 | Old, brick, iron pump..... | 24 | 120 | 207 | 84 | 123 | This may be mineral chlorine. |
| 61 | ? | Brick, wood pump..... | 28 | 112 | 146 | 28 | 118 | |
| 42 | 12 | Brick, wood pump, with strainer..... | 20 | 106 | 157 | 60 | 46 | |
| 37 | ? | New stone, iron pump..... | 202 | 129 | 291 | 175 | 116 | |
| 33 | ? | Brick, wood pump..... | 40 | 112 | 140 | 22 | 118 | These high chlorides suggest sewage. |
| 48 | ? | Old stone, wood pump..... | 162 | 140 | 246 | 118 | 128 | |
| 45 | 15 | Iron pump..... | 62 | 260 | 342 | 73 | 269 | |
| 46 | Shallow | Brick, iron pump..... | 54 | 207 | 302 | 151 | 151 | |
| 47 | 14 | Brick, wood pump..... | 122 | 109 | 268 | 162 | 106 | Is suspicious. This should be looked into, |
| 41 | 10 | Old well, wood pump..... | 34 | 151 | 190 | 34 | 156 | |
| 52 | 16 | Stone, wood pump..... | 14 | 115 | 123 | 0 | 123 | |
| 51 | 17 | Old, brick, wooden pump.... | 94 | 168 | 269 | 112 | 157 | |
| 57 | 30 | Iron pump, brick | 392 | 339 | 420 | 89 | 331 | The low chlorides in these wells is a proof that the normal ground water in the East end of Weston, does not contain mineral chlorine, except in traces. |
| 59 | 25 | " | 56 | 154 | 235 | 90 | 145 | |
| 54 | 20 | Wood pump, brick | 36 | 168 | 241 | 90 | 151 | |
| 60 | 19 | " | 42 | 120 | 235 | 140 | 95 | |
| 62 | 15 | " | 16 | 87 | 64 | 0 | 64 | Very suspicious. |
| 55 | 10 | " | 8 | 88 | 106 | 11 | 95 | |
| 63 | 30 | Iron pump, brick | 18 | 154 | 185 | 28 | 157 | |
| 53 | 30 | Wood pump, brick..... | 18 | 112 | 151 | 28 | 123 | |
| 58 | ? | " | 16 | 129 | 146 | 11 | 135 | Why are these wells higher in chlor- ine than is No. 34? |
| 64 | 20 | Iron pump, brick..... | 20 | 106 | 134 | 28 | 106 | |
| 38 | 102 | Iron pump, new well.. | 18 | 190 | 84 | 23 | 61 | |
| 39 | ? | Old well, brick..... | 46 | 126 | 196 | 56 | 140 | |
| 49 | 20 | Old well, brick..... | 106 | 129 | 280 | 179 | 101 | These are isolated wells, and no comparisons are possible. |
| 44 | 30 | Old, wood pump.... | 76 | 146 | 151 | 28 | 123 | |
| 34 | 20 | Wood pump, brick..... | 14 | 95 | 140 | 39 | 101 | |
| 35 | ? | " | 54 | 109 | 174 | 95 | 79 | |
| 36 | 20 | Iron pump, brick | 50 | 109 | 190 | 75 | 115 | |
| 49 | 30 | " | 34 | 92 | 118 | 50 | 68 | |
| 59 | 22 | Brick, cement, top, iron pump, 13 years in use..... | 72 | 137 | 213 | 95 | 118 | |
| 56 | 20 | Iron pump, brick..... | 32 | 160 | 207 | 78 | 129 | |

NOTE.—Alkalinity, is an expression, in terms of CaO, for the total bases existing as Carbonates. Hardness, is an expression, in terms of CaO, for the total alkaline earth bases (essentially lime and magnesia) present in solution. Hardness is known as ‘permanent’ when these bases are in combination as Sulphates or Chlorides, and as ‘temporary’ when they exist as Carbonates. When the Alkalinity is notably in excess of the temporary hardness, this is due to the presence of Sodium Carbonate in the water.

SESSIONAL PAPER No. 14

TABLE II.—WELL WATERS, TOWN OF RICHMOND HILL, ONT.—FEB. 1908.

| Number. | Depth in feet. | Description. | Chlorine per Million. | Alkalinity. | HARDNESS. | | | Remarks. |
|---------|----------------|---|-----------------------|-------------|-----------|------------|------------|---|
| | | | | | Total. | Permanent. | Temporary. | |
| 15 | 20 | Stoned, wood pump..... | 80 | 123 | 235 | 112 | 123 | } The shallow well is higher in chlorides. This is suspicious. |
| 11 | 30 | Brick, wood pump..... | 34 | 156 | 146 | 17 | 129 | |
| 7 | 75 | Iron pump, wind driven..... | 92 | 207 | 302 | 101 | 201 | |
| 10 | 20 | Old well, wood pump..... | 46 | 199 | 263 | 67 | 196 | } Water of similar character. |
| 12 | 20 | Iron pump, brick..... | 68 | 207 | 235 | 28 | 207 | |
| 8 | 20 | Old well, wood pump..... | 148 | 232 | 392 | 208 | 184 | } The high permanent hardness is noteworthy also high chlorine. Compare with No. 9. |
| 1 | 20 | Iron pump, stoned | 80 | 224 | 252 | 84 | 168 | |
| 20 | 20 | Iron pump, brick..... | 56 | 224 | 246 | 22 | 224 | |
| 9 | 25 | Brick, old wood pump | 110 | 168 | 297 | 129 | 168 | |
| 24 | 20 | Iron pump, brick..... | 60 | 157 | 202 | 45 | 157 | |
| 23 | 15 | Wood pump, cement top, springs from quicksand.... | 22 | 162 | 196 | 28 | 168 | } A 'mineral' water? |
| 3 | 38 | Brick, wood pump..... | 36 | 151 | 213 | 45 | 168 | |
| 30 | 33 | Iron pump, brick, water salty..... | 570 | 356 | 342 | 11 | 331 | |
| 25 | 20 | Old well, bricked, wood pump..... | 94 | 132 | 280 | 168 | 112 | |
| 17 | 25 | Brick, iron pump | 48 | 216 | 224 | 0 | 224 | |
| 28 | 20 | " | 46 | 148 | 179 | 28 | 151 | } Is this mineral chlorine? Is of suspicious character. |
| 18 | 30 | Wood pump, brick..... | 780 | 216 | 414 | 218 | 196 | |
| 21 | 30 | Brick, wood pump..... | 52 | 174 | 224 | 50 | 174 | |
| 32 | 30 | Wood pump, bad platform.. | 178 | 194 | 386 | 185 | 201 | } Suggestion of past sewage pollution |
| 27 | 80 | Wind mill pump, water from sand..... | 164 | 235 | 409 | 234 | 175 | |
| 26 | 30* | Brick, cleaned 4 mos. ago .. | 40 | 137 | 168 | 28 | 140 | |
| 31 | 55 | Flowing well..... | 26 | 132 | 129 | 0 | 129 | |
| 13 | 30 | Stone, wood pump..... | 52 | 168 | 252 | 95 | 157 | |
| 5 | 20 | Wood pump, bricked..... | 10 | 150 | 140 | 28 | 112 | |
| 6 | 26 | Brick..... | 98 | 160 | 274 | 129 | 145 | |
| 2 | 30 | Iron pump..... | 32 | 143 | 162 | 22 | 140 | |
| 4 | ? | Wood pump..... | 22 | 160 | 162 | 0 | 162 | |
| 16 | 40 | | 136 | 174 | 246 | 123 | 123 | |
| 14 | 20 | Brick, wood pump..... | 76 | 179 | 224 | 62 | 162 | |
| 19 | 15 | " | 48 | 140 | 174 | 45 | 129 | |
| 29 | 20 | Brick new well..... | 56 | 126 | 123 | 11 | 112 | |
| 22 | 20 | 35 years old, brick, wood pump..... | 132 | 134 | 308 | 168 | 140 | |

Chlorine is high, but may have a mineral origin, as the permanent hardness suggests.

8-9 EDWARD VII., A. 1909

TABLE III.—WELL WATERS, TOWN OF OAKVILLE, ONT.—FEB., 1908.

| Number. | Depth in feet. | Description. | Chlorine per Million. | Alkalinity. | HARDNESS. | | | Remarks. |
|---------|----------------|--|-----------------------|-------------|-----------|------------|------------|---|
| | | | | | Total. | Permanent. | Temporary. | |
| 77 | 15 | Iron pump, stoned..... | 34 | 123 | 134 | 22 | 112 | This group of 22 wells, situated within a square of about 16 blocks, would form an interesting study if they had the same depth, or if their individual depths were accurately known. |
| 114 | 15 | Open well, stoned..... | 30 | 101 | 129 | 28 | 101 | |
| 95 | 16 | Iron pump, cement curbing.. | 60 | 148 | 190 | 50 | 140 | |
| 123 | ? | Iron pump, stoned..... | 530 | 381 | 392 | 50 | 342 | |
| 106 | 16 | Iron pump..... | 56 | 171 | 241 | 101 | 140 | |
| 122 | 12 | Pump in kitchen connects both with well and cistern. | 98 | 154 | 252 | 140 | 112 | Considering those of about 15 ft. deep, the chlorine content should apparently be less than 100 parts per million. |
| 113 | ? | Iron pump, stoned..... | 86 | 134 | 230 | 118 | 112 | |
| 112 | 13 | Stone, iron pump, sand.... | 36 | 101 | 151 | 62 | 89 | What then is the meaning of the numbers found for No. 76, 96, 102 and 82? Nos. 105, 103, 79 and 87 show a very low chlorine content. Why so high chlorine in the remaining wells of the group? These questions can only be answered by further examination. But they should be disquieting to the residents of this part of the town. |
| 76 | 15 | Open well, stoned, low ground | 970 | 221 | 347 | 168 | 179 | |
| 96 | ? | Iron pump, stoned..... | 160 | 244 | 302 | 140 | 162 | |
| 89 | 15 | Open well, stoned..... | 74 | 126 | 218 | 112 | 106 | |
| 105 | 38 | Stoned, iron pump..... | 20 | 146 | 140 | 0 | 140 | |
| 103 | 16 | Tiled, iron pump..... | 24 | 140 | 146 | 6 | 140 | The hardness in Nos. 123, 76 and 96; also 102 and 82 implies that these may be fed from a distinct source. So little is known about the wells of this group, that no certain inference is possible. If Nos. 107 and 109 fix the chlorine of the region, the others should be further examined. |
| 79 | 18 | Iron pump, stoned..... | 10 | 112 | 112 | 11 | 101 | |
| 75 | 15 | "..... | 70 | 179 | 230 | 101 | 129 | |
| 87 | 14 | Open well, stoned..... | 16 | 146 | 151 | 14 | 137 | |
| 102 | 15 | No pump, stoned..... | 170 | 157 | 286 | 151 | 135 | |
| 104 | 14 | Open well..... | 92 | 151 | 235 | 123 | 112 | Not used for cooking, &c. Why has this well a bad reputation? |
| 125 | ? | Iron pump, stoned..... | 72 | 154 | 202 | 84 | 118 | |
| 82 | 15 | "..... | 148 | 148 | 286 | 146 | 140 | |
| 93 | 15 | "..... | 28 | 143 | 174 | 50 | 124 | |
| 98 | 12 | Stoned, no pump..... | 36 | 120 | 168 | 84 | 84 | |
| 97 | ? | Iron pump..... | 300 | 134 | 381 | 246 | 135 | Not used for cooking, &c. Why has this well a bad reputation? |
| 101 | ? | No pump..... | 70 | 148 | 202 | 62 | 140 | |
| 107 | ? | No pump, stoned..... | 18 | 70 | 78 | 6 | 72 | |
| 109 | ? | Iron pump..... | 16 | 104 | 112 | 0 | 112 | |
| 100 | ? | "..... | 196 | 193 | 392 | 252 | 140 | |
| 99 | 15 | No pump, stoned..... | 54 | 104 | 157 | 73 | 84 | Not used for cooking, &c. Why has this well a bad reputation? |
| 92 | 18 | Open well, stoned..... | 66 | 224 | 252 | 84 | 101 | |
| 94 | 20 | "..... | 40 | 188 | 241 | 84 | 157 | |
| 83 | ? | Iron pump, stoned..... | 78 | 188 | 276 | 112 | 164 | |
| 86 | 18 | "..... | 56 | 148 | 190 | 62 | 138 | |
| 88 | ? | Iron pump, stoned..... | 144 | 151 | 314 | 168 | 146 | Not used for cooking, &c. Why has this well a bad reputation? |
| 91 | 14 | Open well, stoned..... | 58 | 126 | 185 | 84 | 101 | |
| 78 | 14 | Open, stoned..... | 24 | 92 | 101 | 17 | 84 | |
| 126 | ? | "..... | 190 | 231 | 188 | 0 | 188 | |
| 66 | 15 | Open well, stoned..... | 58 | 154 | 216 | 112 | 134 | |
| 127 | ? | Iron pump..... | 80 | 171 | 213 | 112 | 101 | Said to have "sulphur" smell at times. |
| 128 | 20 | Iron pump, stoned..... | 34 | 146 | 78 | 0 | 78 | |
| 74 | ? | "..... | 64 | 146 | 202 | 112 | 90 | |
| 108 | 13 | Iron pump, tiled..... | 32 | 87 | 84 | 6 | 78 | |
| 80 | 36 | Open well, stoned..... | 64 | 140 | 140 | 17 | 123 | |
| 119 | 15 | Stoned, iron pump..... | 30 | 120 | 118 | 0 | 118 | Said to have "sulphur" smell at times. |
| 110 | 14 | "..... | 64 | 179 | 224 | 84 | 140 | |
| 118 | 15 | Open well, stoned..... | 52 | 157 | 185 | 73 | 112 | |
| 120 | 20 | Iron pump, cement platform, stoned..... | 16 | 126 | 140 | 56 | 84 | Said to have "sulphur" smell at times. |
| 116 | 16 | In shed, iron pump..... | 96 | 165 | 252 | 50 | 202 | |
| 117 | 63 | Iron pump, Artesian, 53 feet in rock..... | 20 | 140 | 146 | 0 | 146 | |

SESSIONAL PAPER No. 14

TABLE III—WELL WATERS, TOWN OF OAKVILLE, ONT.—
FEB. 1908.—*Concluded.*

| Number. | Depth in feet. | Description. | Chlorine per million. | Alkalinity. | HARDNESS. | | | Remarks. |

| 81 | 30 | " " | 64 | 199 | 286 | 112 | 174 | |
| 84 | 13 | " " | 242 | 266 | 498 | 263 | 235 | Should be further examined. |
| 85 | 15 | Open well, stoned. | 12 | 165 | 168 | 11 | 157 | |
| 121 | 13 | " " | 56 | 129 | 196 | 73 | 123 | |
| 90 | 15 | Iron pump, stoned | 50 | 165 | 224 | 50 | 174 | |
| 111 | ? | Stoned, Iron pump..... | 34 | 126 | 157 | 28 | 129 | |
| 115 | ? | " " | 164 | 132 | 286 | 151 | 135 | " " |

NOTE.—Judging by the number of wells in Oakville which shew less than 50 parts of chlorine, there is no apparent reason why any of these wells should contain more than this. The higher numbers are easily explained on the assumption that the gathering ground (the surface soil of the town) is more or less saturated with animal waste. It should be easy to demonstrate the correctness or otherwise of this suspicion.

APPENDIX.

I have been asked to describe apparatus, solutions, etc., needed to carry out the method of testing for Chlorine.

The following are needed :

Apparatus.

| | |
|--|--------|
| 1 Burette, 50 cc. graduated in 1-10..... | \$2.00 |
| 1 " stand..... | 1.00 |
| 1 glass funnel (2 inch.)..... | 0.10 |
| 1 " stirrer..... | 0.05 |
| 2 porcelain dishes (4 inch. diam.) | 0.60 |

(White saucers will do.)

| | |
|------------------------------|--------|
| 1 10 cc. pipette..... | 0.20 |
| 1 50 cc. graduate flask..... | 0.20 |
| | <hr/> |
| | \$4.15 |

Reagents.

1. Distilled water.
2. Solution of Nitrate of silver, 4.7887 grammes of the crystals to 1 litre.
Each 1 cc. of this solution corresponds to 1 milligramme of Chlorine, (in chlorides.)
3. Chromate of Potash, a 5 per cent. solution.
4. Solution of Sodium Chloride, 1.648 grammes per litre.

Each 1 cc. contains 1 milligramme of Chlorine.

The method of working is so simple that it may easily be learnt by any one having an elementary knowledge of chemistry, in a few hours. It is fully described in Sutton's Volumetric Analysis, (published by J. and A. Churchill, London) and in other similar works. Best, however, by personal instruction.

Exceptional samples of water may require preliminary treatment ; but these are so rarely met as to be negligible, or they may be sent to properly qualified analysts for an opinion.

APPENDIX P.**BULLETIN No. 150—CANNED SALMON**

OTTAWA, March 31, 1908.

W. J. GERALD, Esq.,
Deputy Minister of Inland Revenue.

SIR,—I beg to submit herewith a report upon the examination of ninety samples of canned salmon, collected in February of this year.

The collection consists of six (6) samples taken in each inspectorial district of the Dominion.

Details as to vendor and packer will be found in the accompanying tables.

All samples were found to be in good condition, and true to name.

I beg to recommend the publication of this report as Bulletin No 150.

I have the honour to be, Sir,
Your obedient servant,

A. MCGILL,
Chief Analyst.

CANNED SALMON.

REPORT

OF THE

MINISTER OF AGRICULTURE

1907-8

To His Excellency the Right Honourable Sir Albert Henry George, Earl Grey, Viscount Howick, Baron Grey of Howick, in the County of Northumberland, in the Peerage of the United Kingdom, and a Baronet; Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, &c., &c., Governor General of Canada.

MAY IT PLEASE YOUR EXCELLENCY:

I have the honour to submit to Your Excellency a report of the Department of Agriculture for the fiscal year ended March 31, 1908.

I.—GENERAL REMARKS.

A synopsis of the work of the department and of the operations of the various branches comprised therein is laid before Your Excellency. The work in each has been efficiently carried out.

Legislation affecting the department during the fourth session of the Tenth Parliament, to the 31st of March, 1908, consisted of;—

Chapter — 7 Edward VII., intituled ‘An Act to amend the Copyrights Act.’

The following communication from the Board of Agriculture and Fisheries, with its enclosure, being an extract from ‘The Times’ of July 2, 1907, relating to the embargo on Canadian cattle, was received under cover of a despatch addressed to Your Excellency, signed by the Right Honourable the Secretary of State for the Colonies, dated July 25, 1907.

BOARD OF AGRICULTURE AND FISHERIES,

4 WHITEHALL PLACE, LONDON, S.W., July 8, 1907.

SIR,—I am directed by the President of the Board of Agriculture and Fisheries to advert to Mr. Lucas's letter of the 8th ultimo No. 16467-1907, referring the board to the remarks made at the recent Colonial Conference by the Prime Minister of Canada as to the law regarding the importation of live cattle into Great Britain, and asking for a full expression of the views of the board on the matter for communication to the

Dominion Government, and in reply I am to ask you to be so good as to submit the following observations to the Secretary of State.

1. Experience has shown that the existing statutory requirement that all cattle imported into this country shall be slaughtered in wharfs provided for the purpose at the port of landing is no obstacle to the development and maintenance of a large and valuable trade. In the case of Argentina, the number of cattle imported into Great Britain steadily rose from 4,200 in 1891 to 85,000 in 1899, when the trade was interrupted by the discovery of foot and mouth disease in that country. The value of the imports in question was £68,000 in 1891, and £1,392,000 in 1899. During the whole of that period the requirement of slaughter was in force. The case of the United States shows similar results. The number of cattle imported thence into Great Britain in 1879 was 76,000, with a value of £1,782,000. In 1906 the number imported was 399,000 with a value of £6,937,000. Slaughter at the port of landing was required for the first time in 1879 in respect of cattle brought from that country, and has been enforced ever since. The board are glad to observe that similar results are indicated in the case of Canada, the imports from which during the past four years have been as follows:—

| | No. of cattle imported. | Declared value. |
|----------------|-------------------------|-----------------|
| 1903 | 190,812 | £3,315,762 |
| 1904 | 146,598 | 2,547,451 |
| 1905 | 148,714 | 2,491,144 |
| 1906 | 160,688 | 2,765,437 |

In the case of Canada, the highest figure recorded prior to 1892, when slaughter at the port of landing was first required, was reached in 1890. The imports in that year were 120,469 with a declared value of £1,892,298.

2. The existing law does not cast any stigma or discredit upon Canadian cattle, for it holds good not only in the case of the United States and other foreign countries, but also in that of every British colony, including both Australia and New Zealand, whence live stock have in the past been imported into Great Britain. It is in fact a sanitary law of universal application of great importance to stockowners at home as a valuable safeguard against the introduction of disease, but not at all inconsistent with the transaction of a large and growing trade, as has been shown above. Moreover foreign and colonial buyers of farm stock for export from Great Britain rely upon the freedom of this country from imported diseases which is maintained by the Diseases of Animals Acts, and an extract from 'The Times' of the 2nd instant, is sent herewith as a recent illustration of their attitude in the matter.

3. The experience of Argentine in 1900, and more recently of the United States in 1902 has shown how suddenly and unexpectedly Foot and Mouth diseases may make its appearance in a country, quite irrespective of the maintenance of an efficient veterinary organization. In the former case diseased animals were actually imported into this country, and it was only by dint of good fortune and the most strenuous exertions that the infection was kept within the limits of the Foreign Animals wharfs. A similar result might well have happened in 1902 in the case of the United States, notwithstanding the ability and the energy of the Department of Agriculture in that country.

4. The enormous losses which British agriculturists have suffered during the last thirty years, mainly by reason of the increased pressure of colonial and foreign competition, make it more than ever necessary that every possible precaution should be taken against the introduction of diseases, consistent with the reasonable requirements of colonial producers and the interests of consumers at home. The consequence of the recurrence in Great Britain of epidemics of disease, such as have been experienced in the past, would be disastrous, and consumers as well as producers would be affected throughout the country. It is, therefore, in the general interest that no risk should be taken which can be avoided by the maintenance of a law which provides a considerable measure of security against the introduction of disease, and which at the same time does so without any serious interference with trade, and without rendering it necessary

SESSIONAL PAPER No. 15

for any action of an invidious character to be taken in regard to the cattle imported from a particular colony or country.

The Dominion Government will probably have gathered from recent public utterances of members of His Majesty's Government both in parliament and elsewhere that there is no prospect of their being able to propose any reversal of the policy of their predecessors in this matter. In this connection I am to refer to the debate which took place in the House of Lords on April 5, and May 21, 1906; to the discussion in the House of Commons on April 6 in that year on the motion for the second reading of the Disease of Animals Act (1906) Amendment Bill; and also to the answer given in the House of Commons by Sir Henry Campbell-Bannerman on May 28 last to a question put by Mr. Mond on the subject of Sir Wilfrid Laurier's remarks at the Colonial Conference.

Earl Carrington therefore suggests that the Dominion Government might be informed that His Majesty's Government regret that after the fullest consideration and for the reasons above indicated, they are unable to propose to parliament any amendment of the existing law on the subject.

I am, &c.,

(Sgd.)

A. W. ANSTRUTHER,

Assistant Secretary.

Extract from 'Times,' July 2, 1907.

The magnificent display of pedigree live stock at Lincoln last week testified in no uncertain degree to the vital importance of stock breeding to the farming industry in this country. In quality as well as in extent the show was admitted by the numerous visitors who were present from foreign countries and the colonies, to stand out above anything they have ever seen outside the United Kingdom. Nor were their assurances meant merely as agreeable compliments, for their very presence—most of them were in quest for animals of one or other of the numerous breeds—was practical proof of the sincerity of their utterances. The important point to lay to heart in connection with this great question is the necessity of firmly rejecting any alteration in the conditions under which the existing state of prosperity and success has been attained. It is significant of the far-reaching importance of the subject that foreign and colonial buyers are even more emphatic in their advocacy of a policy of protection against invading diseases than are the home stockowners. One after another of the representatives from abroad at the Lincoln show vigorously asserted that it was only by maintaining absolute freedom from devastating diseases that this country would continue to attract their custom. Many of them suffer just as Canada does from the operation of the existing laws concerning the importation of live animals, but they recognize that they derive tangible compensation in being able to come to the United Kingdom for pure bred stock with the knowledge that they incur no risk of introducing disease by so doing. At the International Conference of Sheep Breeders on the Monday an idea could be gathered of the dread which foreign and colonial buyers entertain of introducing disease with purchased animals. Several speakers referred in uncomplimentary terms to the continued existence of sheep scab in this country, and in reply to the suggestion that the quarantine regulations imposed by Australia and other countries were needlessly irksome, emphatically asserted that after the trouble and expense that had been incurred in eradicating the disease in their respective countries, they could not recommend any concession until the United Kingdom had completely suppressed the scourge. Of their action in this matter we cannot fairly complain, as it is exactly parallel to our own policy respecting foreign disease. Our costly experiences with foot-and-mouth disease, pleuro-pneumonia, rinderpest and other maladies would be valueless, if we were not to be as careful to avoid the possibility of their reintroduction as Australia is concerning sheep scab.

By an order in council of March 20, 1907, authority was granted to Canada to adhere to the International Agricultural Institute to be established in Italy.

By an order in council of April 17, 1907, there was established an Historical Manuscripts Commission for Canada with a view to place on a sounder and broader basis the historical work done by the Dominion Government.

By an order in council of May 1, 1907, in virtue of the provisions of chap. 75 of the Revised Statutes of Canada, 1906, it was ordered that section 68 of the Regulations relating to Animals Quarantine and Health of Animals established by an order in council of January 14, 1907, should not apply to the ports of Margaree and Cheticamp in the province of Nova Scotia.

By an order in council of May 3, 1907, in virtue of the provisions of the Cold Storage Act of 1907, Your Excellency was pleased to approve of the regulations made in pursuance of the provisions of that Act. (See Appendix 15).

By an order in council of May 6, 1907, the resignation of Mr. Newton Wolverton, B.A., superintendent of the Experimental Farm at Brandon, Manitoba, was accepted, to take effect from June 1, 1907.

By an order in council of May 6, 1907, Mr. James Murray, B.S.A., of Regina, Saskatchewan, was appointed superintendent of the Experimental Farm at Brandon, said appointment to date from June 1, 1907.

By an order in council of May 9, 1907, Mr. J. A. Ruddick, the Dairy and Cold Storage Commissioner, was appointed to represent Canada at the third International Congress of Dairying held at The Hague, in the month of September, 1907.

By an order in council of June 10, 1907, in virtue of the provisions of section 28, chap. 75, R.S.C., 1906, the regulations authorized by order in council under date July 23, 1906, for the eradication of the disease of mange in cattle in the provinces of Saskatchewan and Alberta, were rescinded and new regulations substituted therefor. (See Appendix 16).

By an order in council of June 12, 1907, in virtue of the provisions of section 3, chap. 74, R.S.C., 1906, intituled 'An Act respecting Quarantine,' the quarantine regulations established by order in council of August 18, 1898, were rescinded and new regulations substituted therefor. (See Appendix 17).

By an order in council of July 10, 1907, the following amendments were made to the regulations relating to Animals Quarantine, established by Order in Council of January 14, 1907:—

1. Section 3 of said regulations is amended by expunging the word 'Quebec,' and adding the following sentence to said section 3, 'Quebec is also declared to be an animals quarantine station, in so far as importations into Canada by sea are concerned;'

2. Section 52 of the said regulations is rescinded and the following substituted therefor: '52. Animals other than swine may be admitted on inspection at quarantine and inspection ports only for purposes of exhibition or other temporary stay, subject to the usual customs regulations.'

By order in council under date August 21, 1907, in virtue of the provisions of section 20, chapter 27, 6-7 Edward VII., intituled, 'An Act respecting the inspection of meats and canned foods,' Your Excellency was pleased to approve of the regulations made in pursuance of the provisions of that Act, the same to come into force on September 3, 1907. (See Appendix 18).

SESSIONAL PAPER No. 15

By order in council of October 25, 1907, it was found necessary, owing to the revision and consolidation of the statutes of Canada, that the rules and forms under the Trade Mark and Design Act and the Timber Marking Act, established by order in council of May 9, 1887, should be amended and new rules and forms substituted therefor. (See Appendix 19).

By order in council of November 25, 1907, Robert C. Ruddick, Esq., M.D., of St. Martins, New Brunswick, was appointed inspecting physician of the St. John, New Brunswick, quarantine station (Partridge island) vice John Edgar March, Esquire, M.D., deceased.

By order in council of December 3, 1907, the rules and forms under the Copyright Act, approved by Your Excellency on April 12, 1887, were rescinded and new rules and forms substituted therefor. (See Appendix 20).

The participation by Canada in the Irish International Exhibition held in Dublin, during the past year (opening on May 11, and closing on November 9, 1907), resulted in a very creditable display of the Dominion's natural products and resources, attracting much attention. A report of this exhibition by the commissioner, Mr. Wm. Hutchison, will be found as an appendix hereto. (See Appendix No. 21).

In my annual report for the fiscal year ended March 31, 1907, reference was made to Canada's participation in the New Zealand International Exhibition held in Christchurch, which was marked with great success. A report of this exhibition by the joint commissioners, Mr. T. H. Race and Mr. W. A. Burns, will be found as an appendix hereto. (See Appendix No. 22).

It is with deep regret that I have to record the death of Dr. John Edgar March, who for many years was inspecting physician at St. John, N.B. He died on April 3, 1907.

I have also to report the death of Mr. David A. Routhier, who died on May 9, 1907. He had been a first-class clerk in the Patents Branch of the department for over forty-five years.

It is most gratifying to learn from the report of Mr. Charlan, the French expert, that the result of his labour in connection with Canadian tobacco is very encouraging, and that the prospects of this industry in Canada are increasing.

Appended is the report submitted by Mr. Charlan for the twelve months ended March 31, 1908. (See Appendix No. 23).

II.—ARTS AND AGRICULTURE.

DAIRY AND COLD STORAGE COMMISSIONER'S BRANCH.

This branch of my department, which is administered by Mr. J. A. Ruddick as Dairy and Cold Storage Commissioner, includes the divisions of dairying, fruit, extension of markets and cold storage. Although there is a separate staff for each division, composed of officers with expert knowledge of the various lines of work, and these have assigned to them certain specific duties, there is, owing to the close relation in the work of the several divisions, much co-operation in carrying on the work as a whole, all of which promotes efficiency and economy.

8-9 EDWARD VII., A. 1909

The branch of the Dairy and Cold Storage Commissioner deals more particularly with the commercial side of the various industries which it touches, and is not equipped or provided with facilities for carrying on experimental work, although special arrangements are made from time to time, as may be required. The publications of the branch are written in popular form, and are not descriptive of experiments or investigations, as a rule.

PUBLICATIONS.

During the year under review the following bulletins of the Dairy and Cold Storage Commissioner's series have been prepared and published:—

No. 15.—Gathered Cream for Buttermaking.

No. 16.—Subsidies for Cold Storage Warehouses.

No. 17.—Buttermaking on the Farm.

No. 18.—Co-operation in the Marketing of Apples.

No. 19.—The Packing of Apples in barrels and boxes.

No. 20.—The use of Ice on the Farm.

No. 21.—Cow Testing Associations.

A report of the District of Huntingdon Dairymen's Association was edited and published.

A map showing the approximate location of all the cheese factories, creameries and combined factories in Canada was prepared and published, with the assistance of Mr. James White, geographer of the Department of the Interior.

A Monthly Fruit Crop Report was compiled from information supplied by a large number of correspondents representing every fruit district in Canada. It was published from May to October, as usual.

A report of the Dairy and Cold Storage Commissioner will be published as an appendix to this report, giving the details of the work of the branch and other information of interest to dairymen, fruit growers and others.

MEETINGS.

The several officers of the branch have attended and given addresses at numerous agricultural, dairy and fruit meetings during the course of the year.

For the sake of clearness, further reference to work of this branch will be made under the heads of the four divisions.

DAIRYING.

The season of 1907 was marked by very dry weather and consequent shortage of feed in some of the most important dairy districts. Quite a large number of dairy cows were disposed of during the early part of the winter, because the owners found it impracticable to supply the necessary feed to carry them through. The high level of prices which prevailed, especially for cheese, during the manufacturing season, and for

SESSIONAL PAPER No. 15

butter during the winter months, has been some compensation for the shortage in milk. On the whole, the year has been a fairly satisfactory one for the dairymen.

The relatively high prices paid for cheese during the manufacturing season had the effect of inducing many of the combined factories to make cheese instead of butter. This fact, coupled with the increasing home demand, has resulted in materially reducing the exports of butter; so much so that the record for the season of 1907 is the lowest for many years.

INCREASED HOME CONSUMPTION.

Although the total exports of dairy produce for the year ended March 31, 1908, show a considerable falling off as compared with previous years, if the increased home consumption is taken into account it will be seen that the total production of milk has not shown any decrease. A fair estimate of the increase in the value of the home consumption of butter, cheese and milk for 1907, over that of 1900, places it at \$10,000,000. If this amount were added to the value of the exports for 1907, the total would be in excess of any previous record.

OFFICIAL REFEREE OF BUTTER AND CHEESE.

An officer of the Dairying Division was stationed at Montreal during the season of 1907, and acted as Official Referee of Butter and Cheese. During the whole season he was requested to examine only 288 lots of cheese and 40 lots of butter. In view of the comparatively small number of requests received, it is doubtful if I shall be justified in having an officer assigned to this duty in the future.

THE SHIPPING OF GREEN CHEESE.

The practice of shipping green cheese has given rise to very strong protests from the merchants in Great Britain, who point out that the trade will be seriously injured if this sort of thing is continued. The Dairy and Cold Storage Commissioner, who is in close touch with questions of this kind, has lost no opportunity of warning the dairymen and all others concerned against a continuance of a practice which constitutes so serious a menace to the cheese trade.

DAIRY LEGISLATION.

A Bill will be submitted to parliament in which it is proposed to amend the Inspection and Sale Act as follows:—

No person shall

(a.) incorporate in a new cheese, during the process of its manufacture, any inferior curd or cheese; or

(b.) knowingly sell, expose, or have in his possession for sale without giving due notice thereof, any cheese in which has been incorporated during the process of its manufacture any inferior curd or cheese; or

(c.) place in a cheese during the process of its manufacture, or at any time thereafter, any foreign substance of any kind.

COW TESTING ASSOCIATIONS.

The principal active dairy work carried on during the year by the Dairy Division was that which has for its object the improvement of dairy herds and is a continuation of the work of the cow testing associations. During the year 1907 there were 56 cow testing associations in operation, comprising 26 in Quebec, 24 in Ontario, 1 in Prince Edward Island, 2 in Nova Scotia and 3 in British Columbia. In addition to the various associations, a large number of dairymen, who are not in a position to join an association, have taken the matter up on their own account and are now keeping records of their cows. The cheese factories and creameries are being encouraged to undertake the work of testing cows for their patrons, and it is hoped that some progress will be made along this line during the coming season.

THE ASSISTANT DAIRY COMMISSIONER.

The Assistant Dairy Commissioner, Mr. J. C. Chapais, devotes his time and energies largely to the French districts of the province of Quebec, and resides at St. Denis (en bas). Mr. Chapais attends a large number of meetings during the year, giving addresses on dairying, fruit growing and general agricultural topics. He has also assisted in the course of lectures at the St. Hyacinthe Dairy School and visited, in company with the inspectors, a number of the cheese factory and creamery syndicates in the province of Quebec.

EXTENSION OF MARKETS DIVISION.

During the past year the inspection work of the Extension of Markets Division, which has for its main object the improvement of existing transportation facilities for the food products which we export, has been carried on by about the same staff as heretofore. Seven inspectors were employed for the full year, and eleven additional inspectors for the period from May 1st to November 30th, distributed as follows:— Seven cargo and three refrigerator car inspectors at Montreal; three travelling refrigerator car inspectors in Ontario and Quebec, and five cargo inspectors at ports in Great Britain.

During the season from May 1 to November 30, this division has carefully looked after the operation of the ice-d car services for butter, and maintained a close inspection over the loading of all perishable produce shipped from the port of Montreal. The inspectors placed thermographs in the refrigerator chambers and in the ordinary holds of the steamers, in order to secure records of the temperatures maintained in these different compartments during the voyage. In the old country our inspectors attended the discharge of each cargo of Canadian produce, reporting its condition, method and manner of discharge, &c. These inspectors also removed the thermograph charts and forwarded them to the chief of the division at Ottawa where copies were made and sent to the steamship agents, the Board of Trade, Montreal, and to the engineers of the steamers concerned. An exact record was also kept of the temperature of a number of packages of butter in each lot loaded into the steamers at

8-9 EDWARD VII., A. 1909

Montreal and the temperature of the same packages when discharged on the other side.

A cargo inspector was present each time the Empress steamers were loaded at Quebec and one was stationed at Halifax during the winter months to look after the loading of apples and to place thermographs in the steamers carrying fruit. Copies of these records of temperatures were sent to the Secretary of the Nova Scotia Fruit Growers' Association and to the interested steamship agents at Halifax.

Full particulars of the work of the cargo and iced car inspectors will be found in the annual report of the Dairy and Cold Storage Commissioner, published as an appendix to this report.

IMPROVED PORT FACILITIES AT MONTREAL.

Seven of the new freight sheds were in use for the first time last season and they were a great improvement over the old wooden sheds. The new sheds are built on a level with Common and Commissioner streets and are permanent structures of steel and concrete, two stories high. Railway tracks are laid along one side of the sheds so that freight can be removed from the cars to the sheds instead of having to be carted a considerable distance, as was the practice in the past. Seven sheds were finished this spring and seven more are under way. When these are completed stevedores will be able to carry on their work to much better advantage and our inspectors will be in a position to insist upon a still greater degree of care in the handling of perishable goods.

IMPROVED PORT FACILITIES IN GREAT BRITAIN.

When this department first undertook to inspect the condition of our food stuffs when landed at the principal old country ports the facilities there were vastly different to what they are to-day. At London, our butter was delivered to lighters, miles down the river, and our cheese at Tilbury dock from where it was railed to Commercial Road Station, and thence carted to destination. This meant that the cheese was handled five times in thirty-five miles, resulting in great damage to boxes and exposure to heat. Something over two years ago all this was changed and since then our butter and cheese have been discharged at the Surrey Commercial Dock, which is within two miles of Tooley street, the centre of the dairy produce trade in London. At this dock the butter is delivered direct into a cold storage chamber, and the cheese and bacon into cooled air rooms.

Until last season conditions at Liverpool were very unsatisfactory. Our butter was discharged from the steamships into freight sheds on the docks where it remained in some cases for days before it was removed. Since 1903 my department has been endeavouring to have better facilities provided, and last year our efforts bore fruit as the Canadian Pacific Railway Company erected a cold storage warehouse of four chambers, with a total capacity of 60,000 cubic feet on the dock where their steamers are berthed, and in the future, as far as the Canadian Pacific Railway line is concerned, the facilities at Liverpool will be similar to those afforded at the Surrey Commercial Dock, London.

SESSIONAL PAPER No. 15

At Avonmouth, the port of Bristol, our butter is handled with good despatch, but at Glasgow I regret to say conditions are not so satisfactory and there is little prospect of any immediate improvement.

COLD STORAGE DIVISION.

The Department of Agriculture has continued the policy of paying a bonus of \$100 to the owners of creameries who erect and equip a small ice cold storage, according to plans and specifications supplied by the Dairy and Cold Storage Commissioner, and who fulfil certain conditions in the matter of maintenance. During the year ended March 31, 1908, thirty-nine applications were received for this bonus. Of this number thirteen failed to comply with the necessary conditions of construction or maintenance, leaving only twenty-six to whom the bonus has been paid.

ICED CAR SERVICES.

The various iced car services which have been in operation now for several years, were continued during the season of 1907. Owing to the changes in the butter trade, it was necessary to rearrange the service to some extent, in order to avoid excessive loss on the guarantee basis. The records of temperature as secured by the inspectors of the Markets Division, were lower for 1907 than in any previous year, thus showing that the service is being gradually improved. It has required considerable education on the part of creamery managers, station agents and train men to get the best possible service out of the refrigerator cars. The inspectors employed by this branch, who travel continually with these iced butter cars pointing out defects in the operation of the service and reporting cases of negligence to the proper officials, have been the means of securing much improvement.

Iced cheese cars, on which my department paid icing charges to the extent of \$5 per car, were supplied by the railway companies on demand of shippers, to the extent of about 110 cars per week for ten weeks, beginning the second week of July.

The iced fruit car service has not been taken advantage of by the fruit shippers as much as it was expected it would be when it was inaugurated. These cars are supplied in the same manner as the cheese cars are.

OCEAN COLD STORAGE.

It is needless to refer at any length to the cold storage services provided on the steamships sailing from Canadian ports. These services are now so general and so well understood, that further reference would appear to be unnecessary. The Department of Agriculture has not paid any subsidies or bonuses for cold storage on steamships for several years past. There were 47 steamships sailing from the ports of Montreal and Quebec for British ports during the season of 1907, which were equipped with cold storage compartments.

The department continues to supervise the loading and stowing of perishable products and thermographs (recording thermometers) are placed in the various chambers with butter, cheese, meats, fruits, etc. Three hundred and eight of these records were secured during the year.

8-9 EDWARD VII., A. 1909

As a consequence of the large shrinkage in our exports of butter, the cold storage accommodation in steamers sailing from Montreal last season was not used to anything like its capacity, but a splendid service was nevertheless maintained by the different steamship companies. Generally speaking, the butter was delivered to the steamers at Montreal at a lower temperature than in previous years, and was discharged at the ports of London, Bristol, Glasgow and Manchester at a lower temperature than formerly.

Fewer pears were exported in 1907 than in 1906, but those shipped in cold storage were landed in excellent condition. One or two shipments of Keiffer pears were forwarded in ordinary storage, but were found to be over-ripe when discharged on the other side and inclined to slight waste.

SUBSIDIES FOR COLD STORAGE WAREHOUSES.

Applications were received from several companies and firms for the subsidy which is payable under the terms of the Cold Storage Act. Only two of these applications, so far, have been approved of, namely, that of the New Brunswick Cold Storage Company, St. John, N.B., and Scott, Ashton & Co., Morrisburg, Ont. Other applications are under consideration. The New Brunswick Cold Storage Company's warehouse has been completed and the first instalment of the subsidy has been paid. My officers inform me that this is a first-class warehouse of approved 'slow burning' construction and well equipped with modern machinery. It is expected that a large business will be done in handling fish, cheese and apples. The promoters expect to have apples shipped from the Ontario orchards to St. John, before the cold weather begins, to avoid the risk and loss occasioned by the freezing of apples when shipped to Great Britain via St. John, during the winter months.

FRUIT DIVISION.

INSPECTION AND SALE ACT.

The Fruit Division has been engaged largely with the enforcement of the Inspection and Sale Act as far as it is related to fruit and fruit packages.

The greater number of inspections are made at the points of Montreal, Halifax and St. John. A large number of inspections is made also at Winnipeg, Manitoba. This is rendered possible from the fact that Winnipeg is an important distributing point for the Northwest provinces.

INSPECTIONS.

Below are given statistics of inspection for the past seven years:—

| — | 1901-2. | 1902-3. | 1903-4. | 1904-5. | 1905-6. | 1906-7. | 1907-8. |
|---|---------|---------|---------|---------|---------|---------|---------|
| No. of lots inspected | 1,468 | 1,470 | 1,964 | 1,641 | 2,813 | 2,440 | 7,352 |
| No. of packages in lots inspected | 65,880 | 154,220 | 234,343 | 212,348 | 330,681 | 330,866 | 981,632 |
| No. of packages inspected | 3,155 | 8,341 | 10,702 | 8,798 | 11,423 | 13,406 | 43,243 |

SESSIONAL PAPER No. 15

The following table gives the statistics of convictions since the inception of the Act:—

CONVICTIONS.

| | 1901-2. | 1902-3. | 1903-4. | 1904-5. | 1905-6. | 1906-7. | 1907-8. |
|-----------------------|---------|---------|---------|---------|---------|---------|---------|
| Ontario..... | 9 | 15 | 23 | 6 | 22 | 22 | 155 |
| Quebec..... | 1 | 1 | 1 | | 6 | | 2 |
| Nova Scotia..... | 2 | 6 | 10 | 3 | 16 | 14 | 21 |
| New Brunswick..... | | | 5 | | 1 | | |
| Manitoba..... | | 14 | 2 | 2 | 1 | 1 | |
| British Columbia..... | | | 2 | 1 | 4 | 3 | |
| | 12 | 36 | 43 | 12 | 50 | 40 | 178 |

Notwithstanding the crop reports issued by the Fruit Division, apple buyers for the season 1907 underestimated the quantity of apples and offered prices early in the season beyond what the markets would warrant. The result was that a large quantity of inferior fruit was stored and shipped that would have been utilized in other ways had the prices been lower during the picking season. The attempt to realize the price which was paid for the fruit by grading it higher than it deserved, accounts, for the most part, for the large increase in the number of prosecutions made this year.

FRUIT PACKAGES.

There was no serious violation of Part IX. of the Inspection and Sale Act referring to fruit packages. The trade in early fruit and the convenience of importing fruit packages from the United States when there is a shortage in Canada, complicates the enforcement of the Act slightly; notwithstanding, very few packages appeared upon the market improperly marked.

FRUIT CROP REPORTS.

The Fruit Crop Reports were published regularly at the end of each month during the fruit season. The facts collected proved of very great advantage to the grower as well as to the trade generally.

Buyers from Great Britain and the United States, influenced by the reported shortage of apples in the apple producing districts of other countries and particularly of United States, came to Canada and offered prices for winter fruit that would only have been justified by a failure in the crop in Canada. The latest crop report of the Fruit Division indicated a crop of winter apples slightly above the average. This information was verified at the picking season.

FRUIT MEETINGS AND DEMONSTRATIONS IN PACKING.

Sixty-seven meetings were attended by members of the Fruit Division staff. In addition to these meetings some of the inspectors were engaged during the growing months in giving individual instruction in the orchards.

8-9 EDWARD VII., A. 1909

Short courses in horticulture were held at Truro Agricultural College, Macdonald College, St. Anne de Bellevue, and at the Ontario Agricultural College, Guelph. Members of the staff gave instruction in packing and marketing fruit at each of these colleges.

SEED COMMISSIONER'S BRANCH.

The work of the Seed Branch has continued along the same general plan as that followed during previous years. A great deal of it has been an innovation in educational work in agriculture, and being much needed, the services rendered by my Seed Commissioner and his staff of trained experts, have been appreciated by the farmers in all parts of Canada. It is already evident that, as a result of the educational propaganda that has been conducted by this branch of my department, substantial progress has been made in the production and use of cleaner and better seed grain and other seeds, and in the suppression and eradication of noxious weeds. The main object of this work is to increase the yield and improve the quality of field and garden crops.

THE SEED SUPPLY AND THE CROP OF 1907.

The cereal crop of 1906 was a satisfactory one, and from it a supply of good sound seed for last season's crop was available. The crop of 1907 was, on the whole, fairly satisfactory, although the spring was unusually late. Some of the districts in the western provinces suffered severely from the prolonged cold of the early spring, and the cool and rather moist weather of the summer months. As a result, the crops over a part of Manitoba, Saskatchewan and Alberta were late in maturing; the oats and barley, in particular, were seriously injured, for the purpose of seeding, by the early frosts. As soon as information was received that in some districts the crop had been injured by frost, I instructed the officers of the Seed Branch who are permanently located in the western provinces to thoroughly investigate the matter and determine the extent of the injury done. They were directed to institute a vigorous campaign of instruction, in order to prevent the use of apparently sound seed oats or barley, which had been frozen and rendered worthless for seeding, the use of which would endanger the crop of 1908.

A large number of samples of grain from the unfortunate districts were collected by my officers and submitted to germination test. Many samples were also sent in by the farmers themselves. Early in January the results of these germination tests of oats and barley, together with summary information as to the effect of using frozen seed grain, were printed in bulletin form and 60,000 copies were distributed to farmers. Arrangements were made for compiling the names and addresses of farmers, in districts where the crops were not injured by frost, who had good clean seed wheat, oats or barley in quantity for sale. The data thus obtained were printed in a pamphlet and generally distributed early in March of this year to the farmers who were forced to purchase their supplies of seed grain.

INSPECTION OF THE SEED GRAIN DISTRIBUTED.

On account of the condition of the money market, it was evident early in January, and even before that time, that the farmers whose grain had been injured for seeding

SESSIONAL PAPER No. 15

would not be able to negotiate loans that would enable them to procure their supplies of seed grain; and it was ultimately deemed advisable that the interested governments should co-operate in procuring and distributing seed grain to them. All the information that had been compiled by the Seed Branch was made available for that purpose, and the services of its officers were utilized in inspecting the grain purchased, in respect to its purity, and in making germination tests of the vitality of all seed about which there could be any question. For that work it was necessary to provide competent seed inspectors at London and Liverpool, in Great Britain, Pictou in the province of Nova Scotia, Kingston, Toronto, Ottawa and Fort William in Ontario, Winnipeg and Brandon in Manitoba, Regina and Moose Jaw in Saskatchewan, and Calgary and Edmonton in Alberta. Only seed grain of apparent good quality and of the standard of purity definitely fixed for the guidance of the inspectors was accepted by them.

THE SUPPLY OF GRASS AND CLOVER SEED.

On account of the partial failure of the clover seed crop for 1906 in the province of Ontario, the supply of clover seeds for the Canadian market was not as large nor of as good a quality as it would otherwise have been. The price too was unusually high. Quite large importations of red clover seed were made by seed merchants. The supply of timothy seed for the past year was about normal, and large quantities of timothy and other grass seeds were used because of the shortage and consequent high prices of clover seeds.

It is somewhat unfortunate to have to record that the clover seed crop of 1907 was also considerably below the average in quantity produced, although the quality of the red clover seed harvested during the past season is rather above the average in point of purity. The supply of grass and clover seeds from other countries where they are produced is also reported to be short, and it is anticipated that the price of grass and clover seeds will continue to be high during the coming spring months.

In general, the supply of seed corn, field root and garden seeds available to farmers last spring was of satisfactory quality. Some complaints have been made by onion growers because of onion seed sold by the retail trade that was not suitable for use in Canada. Careful inquiry has shown that such importations of onion seed were thought to be necessary because of the partial failure of the crop at the best sources of supply for Canadian use.

ENCOURAGEMENT TO SEED GROWING.

As a means to increase the yield and improve the quality of field and garden crops, special attention has continued to be given to the production of high class seeds of those crops that are grown for seed in Canada. My department has been able further to encourage and co-operate with the Canadian Seed Growers' Association in the production and selection of high class seeds of cereal grains, corn, potatoes and other farm crops. So far as the conduct of its business is concerned, this association is quite apart from the Seed Branch, but the educational work of the association is largely a part of the duties of this branch.

8-9 EDWARD VII., A. 1909

The Seed Commissioner, through the staff of expert officials who are permanently located at district headquarters, has assisted with the organization and conduct of ninety seed fairs during the past season. These are held during the winter and early spring months. Exhibits of seed grain grown by the farmers in the locality, and held for sale by them in quantity, are shown in competition. It is usual for the agricultural societies, under whose auspices seed fairs are conducted, to provide prizes for the best exhibits. My department provides competent judges to award such prizes and to give lectures. These seed fairs have been successfully held during the past six years and have largely increased in numbers and usefulness.

Competitions in standing fields of seed grain, consisting of not less than ten acres, were inaugurated at the instance of the Seed Branch, commencing two years ago in the western provinces. Sixty field competitions have been conducted during the past season and were extended to the province of Ontario, where five-acre fields were made eligible for entry. They have proven to be an effective means of awakening interest in the production and selection of good seed grain and have had a wholesome educational influence. I have authorized that the plan of conducting them be continued and enlarged upon for the eastern provinces. The Seed Branch organizes a corps of competent judges, who meet in conference, for training in the use of score cards, directly prior to judging. This is done free of cost to the agricultural societies, which conduct these competitions.

Special meetings of seed growers were held during the month of June in the districts of eastern Canada where grass and clover seeds are most largely produced. The object of these meetings was to give practical instruction, particularly about weeds and their eradication, at a time of year when weed and other plant growth is most in evidence. These seed growers' field meetings, many of which are held in the open air and in fields in which a seed crop is being produced, have proven to be exceedingly beneficial, and it is expected that they will be continued.

CONDITIONS OF THE SEED TRADE.

The retail seed trade in Canada is conducted in part by professional seedsmen, but a large portion of the business is done by grocers, druggists and other persons, whose main business is of an entirely different character. The number of men who devote a large share of their attention to the seed business has increased, and it is reasonable to expect that the further development of agriculture will be associated with an increase in the business of seedsmen.

A comparatively small part of the seed of cereal grains used in this country enters into the commerce of seeds, and the trade in Canada may be said to consist largely in purchasing grass and clover seeds from growers, recleaning them, and distributing them, either directly or through the medium of local seed vendors. In addition to the trade in grass and clover seeds, supplies of seed corn, field root, and garden seeds are gathered together by wholesale seedsmen, the greater part of them being imported from Europe and the United States, and distributed through the various channels of the trade.

SESSIONAL PAPER No. 15

While it is but fair to state that the seedsmen and seed vendors of Canada are as honourable and reliable as are those of any other country, the work of investigation into the condition of the seed trade, conducted by the Seed Branch, clearly indicates the need for continued watchfulness of the quality, in respect to both purity and vitality, of the various kinds of seeds that are sold in the retail trade; and I have instructed that this work of investigation be continued and that wanton carelessness or unscrupulous acts on the part of seed merchants be exposed, either as provided by the Seed Control Act, or if not covered by that Act, through publication of the results of such investigations. The crop losses that result through the use of seed that is foul with noxious weeds, or seed that is exceedingly low in percentage of vitality, amounts to very considerable in the aggregate; and it is expedient that every reasonable means be taken clearly to impress upon seed merchants the need for great care to prevent repetition of such crop losses.

THE SEED CONTROL ACT.

The Seed Control Act came into force in September, 1905. During the first year of its administration it was used as a basis for a vigorous educational campaign among seed merchants, who were provided with copies of the Act, the import of which was clearly explained to them by seed inspectors, who visited them at their places of business during the season of the seed trade. When found to be exposing seed for sale in violation of the Act, seed merchants were summarily warned that a repetition of such violation would not be excused. During the season of 1907 this educational campaign was continued. It was found necessary to enter prosecutions on eighteen counts against twelve seed merchants, which prosecutions were conducted during the months of June and July. There is no doubt in my mind but that this educational work, supplemented by prosecutions under the Act where necessary, has resulted in securing a general observance of the provisions of the Act on the part of seed merchants and farmers in general. Now that the Act may be said to be generally understood, on account of its operation during the past two years, the members of the seed trade will have less reason to expect lenient treatment when they are found by inspectors to have violated the provisions of the Act.

SEED COLLECTIONS.

In order better to enable the members of the seed trade to conform to the provisions of the Act, I authorized that comprehensive collections of weed seeds be provided to them at a nominal cost, which collections contain specimens of seeds of all of the noxious weeds that are legislated against in the Act. It is gratifying to know that seed merchants have appreciated this service and have availed themselves of the privilege of securing the means which better enable them to comply with the Act; and also that very few of the seed merchants who have provided themselves with these reference collections of seeds have been found thereafter to have unlawfully sold seed grain or other seeds containing the seeds of these noxious weeds.

SEED LABORATORIES.

The seed laboratories at Ottawa and Calgary, Alta., have tested 13,924 samples of seeds, for purity or germination or both, during the past fiscal year. This shows

8-9 EDWARD VII., A. 1909

a very large increase in the services rendered, and, in consequence, I found it necessary to augment the staff of temporary assistants employed in this work during the winter and early spring months.

A large proportion of the samples tested consisted of cereal grains sent in for germination test from the provinces of Manitoba, Saskatchewan and Alberta, and the increase of samples tested is of an extraordinary nature. When the normal seasonal conditions obtain in those provinces, a comparatively small number of samples are submitted for germination test, and it is not anticipated that the demand on the part of farmers for services from the seed laboratories will continue to be so great as has been during the past season. It is gratifying to be able to state that, on the whole, reasonably prompt service was rendered to both seed merchants and farmers who desired information about the quality of their seed. During the months of January and February some slight delays occurred in issuing reports on germination tests, but the information concerning all samples submitted was forwarded to farmers in ample time for seeding operations.

In addition to the 8,645 samples which were tested in the Ottawa seed laboratory, for farmers and seed merchants, six hundred and thirty samples were collected by purchase from the retail trade in all of the provinces, for the purpose of investigating the conditions of the trade in seed corn, field root, and garden seeds. The following tables give a summary of the work conducted in the seed laboratories for the year ended March 31st:—

SESSIONAL PAPER No. 15

SEED CORN—FIELD ROOT AND GARDEN SEEDS.

RESULTS OF INVESTIGATION.

| Kind of Seed. | Number of Samples Tested. | PER CENT OF GERMINATION. | | | | NUMBER OF SAMPLES. | |
|---------------------------|---------------------------|--------------------------|------|----------|-------------------------|--|---|

8-9 EDWARD VII., A. 1909

SAMPLES TAKEN BY SEED INSPECTORS AND TESTED UNDER REGULATIONS OF SEED CONTROL ACT.

| — | Red Clover. | Alsike. | Timothy. | Mixtures. | Cereals. | Total. |
|-------------------------|----------------|---------|----------|-----------|----------|--------|
| Ontario | 88 | 7 | 6 | 6 | 1 | 108 |
| Quebec | 15 | | | | 7 | 22 |
| New Brunswick | 24 | | 2 | | | 26 |
| Nova Scotia | 6 | | | | | 6 |
| Total | 133 | 7 | 8 | 6 | 8 | 162 |

Out of a total of 162 samples taken, 145 were suspected by the inspectors of being exposed for sale in violation of section 8 of the Seed Control Act, which reads as follows:—

‘No person shall sell, or offer, expose or have in his possession for sale, for the purpose of seeding in Canada, any seeds of timothy, alsike or red clover, or any mixture containing the said seeds, if the seeds of the weeds named in this Act are present in a greater proportion than five to one thousand of the seed sold, or offered, exposed or held in possession for sale.’

PUBLICATIONS.

The results of investigation work in connection with the trade in seed corn, field root, and garden seeds have been compiled and published in bulletin form for general distribution.

Summary results of the field competitions conducted in the western provinces, and also in the province of Ontario, were compiled, printed and distributed to the interested farmers in the respective districts.

A pamphlet giving the names and addresses of farmers who exhibited high class seed grain at sixty-three of the seed fairs in the provinces of Manitoba, Saskatchewan and Alberta was published early in March and distributed generally to the farmers in those provinces. The information contained in the pamphlet showed the total quantity of seed held for sale by the exhibitor and its condition in respect to both purity and vitality. This bulletin was issued this year because in parts of those western provinces the unfavourable climatic conditions had made the seed supply unreliable.

During the month of June circulars were issued to 25,000 farmers in the provinces of Quebec and Ontario, relative to the supply of clover seeds and outlining some precautions that would have to be observed in order to secure a reasonably good supply of desirable seed to meet the requirements of the trade for the coming season.

‘FARM WEEDS OF CANADA.’

I am very glad to have been able this year to issue an excellently illustrated and carefully prepared book dealing with the farm weeds of Canada. An edition of 15,000 copies has been received from the printer, and these are being distributed in a way to benefit the greatest number of people. The many favourable comments which I have

SESSIONAL PAPER No. 15

received concerning the excellence and usefulness of this publication has been a source of gratification to me. Copies of it have been sent to all the public libraries and to the educational institutions in Canada that are above the grade of elementary schools. An additional supply of 10,000 copies has been ordered. As soon as these are available for distribution, they will be sent to the rural schools in Canada in which libraries are maintained, for use as a reference book on noxious weeds for the teachers, pupils and farmers of the school districts. In order to meet the demand for this book from these public institutions, I found it necessary to withdraw it from general distribution to individuals, much as I should like to have provided every farmer in Canada with a copy of it.

THE LIVE STOCK BRANCH.

The Live Stock Branch, which, in July, 1906, was united for administrative purposes, under the control of the Veterinary Director General, with the Health of Animals Branch, the work of these two branches being very similar and having many points of contact, has during the past year been developed to a considerable extent.

The final steps in the organization of the National Records, with the exception of the admission of such new records as may from time to time seek incorporation, have been taken by completing the absorption of the old provincial records, which differed slightly in some respects from those at first nationalized. More or less difficulty was in some cases encountered in bringing about the desired assimilation, but all obstacles have been overcome with the happy result that there is not now in Canada more than one record of an official nature for any breed of live stock. The greatest trouble met with was in the province of Quebec, where not only were there two original records, viz.: those for French Canadian horses and French Canadian cattle, but where the rules of entry or registration for other classes of live stock, especially sheep, differed to a considerable extent from those recognized as authoritative in the other provinces. By the exercise of patience and the adoption of a policy of education and explanation, the questions in dispute have been settled in a manner satisfactory to all except a very few breeders, who were unfortunate enough to own animals the breeding of which could not be traced sufficiently far to entitle them to registration in the established records.

It was found necessary in order to bring about these results, to organize a small commission for the purpose of inspecting and examining into the breeding of such French Canadian horses as it was desired to record in the book of record organized for that breed. This commission was composed of two representatives of the French Canadian Horsebreeders Association, and two gentlemen representing my department, and with them travelled one of my veterinary inspectors, who also acted as secretary for the commission. The work done so far has been exceedingly satisfactory, and although not quite completed, will reach a conclusion early in the coming year, it having been decided to accept no horses for entry in this book after December 31, 1908. It is to be hoped that the efforts of the association, coupled with those of the department, will be successful in re-establishing on a sound and permanent basis, the old French Canadian breed of horses which, owing to the indiscriminate admixture of other blood has, of recent years, been threatened with extinction.

8-9 EDWARD VII., A. 1909

It was found necessary to follow a somewhat similar policy, although on a much smaller scale, with regard to the various breeds of sheep in the province of Quebec. These sheep had been registered in the old provincial records, the standard of which was not quite equal to that recognized by the sheepbreeders' associations elsewhere in the Dominion. This condition of affairs necessitated careful inspection of flocks and equally careful investigation as to the eligibility of the individuals for registration. By employing the services of an expert judge of sheep to visit all the flocks, the qualification of which for registration was in dispute, it has been found possible to admit to the national records all but a very few of the animals formerly recorded under provincial associations.

A number of new records have been organized, among which may be mentioned those for Percheron horses, Belgian horses, and Ponies. The work of the National Records Office is proceeding smoothly and satisfactorily, as is evidenced by the fact that practically no complaints are being received from any part of the country, and that this organization which, needless to say, involves the safety and welfare to a greater extent than all other factors combined, of the great stock breeding industry of Canada, is being conducted under the wing of this branch of my department not only without friction but almost without any one being made publicly aware of its existence.

A great deal of work has, as usual, been done by the Live Stock Branch in furnishing expert judges for fairs and speakers for institute meetings, as well as instructors for live stock judging classes. Many different series of meetings have been held, some organized by the Live Stock Commissioner himself, and many others by the various provincial departments of Agriculture with whom the officers of this branch of my department invariably co-operate when requests for their services are made.

The benefits resulting from these meetings have been very great, especially in the province of Quebec, where much interest has been manifested by farmers in advanced methods of agriculture and especially in the development of the live stock industry. In the Maritime Provinces also much good work is being done by the holding of institute meetings, and judging schools, at which our live stock experts delivered addresses and officiated as teachers, by the supplying of trained judges for live stock at various fairs and by the Amherst Winter Fair, which held under the auspices of the Maritime Stock Breeders' Association, with the assistance and support of the Live Stock Branch of my department, has been of incalculable benefit in arousing and maintaining interest in live stock production.

In Saskatchewan, Alberta and British Columbia much good has also been accomplished along similar lines, many of the new settlers having had but little experience in practical agriculture, being greatly encouraged and assisted by the advice of the experienced stock men sent out by my department, and by their practical demonstrations in the matter of live stock judging.

A new departure has been made by the present Live Stock Commissioner in devoting considerable attention to the interests of those agriculturists engaged in the production of live stock for commercial purposes as distinguished from those who confine their operations to the breeding of pedigreed animals.

SESSIONAL PAPER No. 15

Speaking generally, it may be said that among the farmers of Canada those engaged in the production of pure bred stock are well able to look after their own interests, being as a rule men of advanced ideas who from the nature of their transactions naturally and rapidly acquire a knowledge of modern business methods. On the other hand, the farmer who produces stock solely for commercial purposes is not unfrequently a loser owing to his lack of expert knowledge of the requirements of the market, the actual value of his produce or the conditions attending the sale, handling and transportation of live stock between the producer and consumer. With a view of improving matters in this regard, and protecting as far as possible the interests of the producer, steps have been taken to obtain and place in his hands all possible information likely to be of use to him in disposing of his produce.

This work is still in progress, but will to a limited extent be complete during the coming year, with, I trust, beneficial results to all concerned.

The establishment of the Record of Performance in the case of pure bred dairy cows is progressing favourably, the work having increased to such an extent as to render necessary the constant employment of another inspector in Ontario and Quebec, while in some of the outlying provinces work of the same kind is being performed by officers of the Dairy Branch, acting on behalf of the Live Stock Commissioner.

A number of valuable bulletins on live stock subjects have been issued during the year, while several productions of the same kind are at present in course of preparation.

Perhaps the most important event of the year, so far as this branch of my department is concerned, was the holding in Ottawa during February last of the large and representative Convention of the National Live Stock Association. The last meeting of this body was held in 1905, and I considered it advisable in view of the large interests involved, and of the great progress and development which has since taken place throughout the Dominion to again bring together the accredited representatives of the various live stock and record associations, so as to afford them an opportunity of exchanging views and discussing matters of general and special importance. The meeting, which lasted three days, was an unqualified success, delegates being present from all parts of Canada, and the discussions being interesting and beneficial to a marked degree.

Many important resolutions were debated, and such as were approved are receiving my earnest consideration and that of my officers.

On the whole the work of this branch has during the year been of an exceedingly satisfactory character, while the plans for future activity promise even more gratifying results.

EXPERIMENTAL FARMS BRANCH.

The experience of another year has added materially to the accumulation of useful facts which have been worked out by careful observation at the several experimental farms. The publication of these from year to year in the reports and bulletins issued, leads to their free use by the most intelligent and practical farmers in their daily

8-9 EDWARD VII., A. 1909

practice. The confidence of the farming community in the reliability of the results obtained at the experimental farms, leads to a constantly increasing demand for the publications issued which are carefully preserved and referred to from time to time as information is needed.

During the past year good progress has been made in all the separate branches bearing on farm work. In the cereal division many promising new sorts of wheat and barley produced on the farms have been further tested, some of which have been sent for trial to different parts of the Dominion, where their special properties are likely to make them most useful. Distinct gains are being made in the production of earlier ripening varieties of wheat combined with high quality and productiveness, which will no doubt make many of these products most valuable in the different climates of Canada. A new and important fact regarding the quality of wheat has been further demonstrated, that is that wheat kept over for a year, improves considerably in quality, which may have a direct bearing on the success of the proposed northern route for the transportation of grain.

In the Agricultural Division a most interesting series of tests have been made in the use of frozen wheat for the feeding of swine and the fattening of steers, which have shown that the lower grades of frozen grain may be very profitably used for this purpose. Many useful facts have also been accumulated in connection with the rotation of crops, and the growth of fodder plants and roots.

In the Horticultural Division many new seedling apples have been fruited during the past year, among which are some very promising late keeping sorts of good quality, which will probably become important varieties both for the home and export trade. Much interesting work has also been done with other fruits and vegetables.

In the Chemical Division much excellent work has been accomplished in determining the relative value of different sorts of cattle foods offered on the market, also in ascertaining the qualities of different sorts of wheat. Many varieties of barley have been analyzed especially with the view of determining the proportion of nitrogen in each. Investigations have also been conducted in many other lines bearing on farm crops.

In the Botanical and Entomological Divisions the life histories of many insects have been studied and remedies tested for those which injure crops. Further studies have also been made with weeds and the best measures for eradicating them. Many useful facts bearing on the subject of Bee Keeping have also received the attention of this division.

Experiments have been continued in the Poultry Division with trap nests, as a means of detecting good and poor layers, also with different sorts of foods and different methods of feeding. The usefulness and economy of frozen wheat in this connection has also been tested. Much other work has also been done in this branch helpful to those who are following this industry.

The numerous experiments with fertilizers begun by the director twenty years ago have been continued and much useful information in this connection has been worked out. The hardy cross-bred varieties of apples which have been produced for

SESSIONAL PAPER No. 15

the Canadian Northwest are proving reliable wherever they have been tried, and are fast establishing their reputation for general usefulness. These are now being freely supplied by the nurserymen, who are propagating them in considerable quantities.

AGRICULTURAL AND LIVE STOCK DIVISION.

In soil cultivation and crop growing very important lines of work continue to occupy attention. As among the more important might be mentioned:—

(1) Experiments to determine the cost of growing different crops under various conditions. The crops experimented with being chiefly corn for ensilage, mangels, turnips, rape, clover hay, timothy hay, and oats.

(2) Experiments to determine how most certainly to lower the cost of producing the unit of crop that is the ton of roots, ensilage, hay or grain, stored in each case. As a means to this end the introduction of larger machines is proving very effective. The increasing of the crop yield by growing the most productive varieties is being found to be of some value. The thorough cultivation of the soil and the following of proper rotations are, however, the apparently most effective means to this end.

(3) Experiments to determine the influence of depth of ploughing accompanied by deep cultivation or what might be called light subsoiling is being compared with deep ploughing. The work is not yet far enough advanced to permit of any conclusion being drawn.

(4) Experiments to determine the best rotations for different purposes. Rotations of varying duration are under test. The more practicable so far seem to be:—
(a) Three-year rotation as follows:—1st year, corn or roots; 2nd year, grain seeded down 10 lbs. clover, 5 lbs. timothy; 3rd year, clover hay. The crops are then repeated in the same order. (b) Four year rotation: 1st year, corn or roots; 2nd year, grain, seeded down, 10 lbs. clover, 10 lbs. timothy per acre; 3rd year, clover hay; 4th year, timothy hay or pasture. The crops are then repeated in the same order. If, however, it is desired to grow relatively more hay or leave a larger part of the farm under pasture this rotation might be expanded to a 5 or 6-year rotation by leaving down to hay or pasture for 3 or 4 years instead of for 2 years only. (c) Five year rotation: 1st year, corn or roots; 2nd year, grain, seeded down 10 lbs. clover, 10 lbs. timothy per acre; 3rd year, clover hay or pasture; 4th year, timothy hay or pasture, ploughed in August; 5th year, grain, 10 lbs. clover per acre for fertilizer. The crops are then repeated in the same order. It may be extended by leaving 3 or 4 years instead of 2, under hay or pasture.

(5) Experiments to determine the best methods of cultivating the soil are constantly being carried on. One finding of importance is that where it is desired to grow grain on sod, the following preparation has proven very much superior to any other. Plough the sod in August as early in the month as possible. Roll at once and cultivate at frequent intervals until the sod has rotted well. When the sod has broken down ridge up with a double mould board, plough into ridges two feet apart or thereabouts and 7 or 8 inches high, just as though preparing for roots. Leave in this shape till the next spring, when break down with disk harrow or other implement and seed.

8-9 EDWARD VII., A. 1909

Here as on most other farms in eastern Canada, live stock is considered of the very greatest importance. Its importance lies, it is considered, along several lines:—

(1) As a means of maintaining and even increasing the fertility of the soil, by producing manure.

(2) As a profitable home market for every product from the land.

(3) As profitable employment in winter when other farm work is impossible.

The classes kept are horses, cattle, sheep and swine. And in addition to the above mentioned reasons for the maintenance of considerable herds and flocks here they are used for experimental feeding and breeding purposes.

Feeding tests of various kinds are continually under way and considerable information *re* the values of different feeding materials is sent out from time to time. Pure bred animals are kept, for the most part, and the surplus stock of good quality is sold for breeding purposes.

Horses are not bred here, but are bought in from time to time as required. Experiments in feeding horses are frequently under way.

Dairy cattle are on account of the location of this farm the most important class. Four breeds are at present under test, Shorthorns, Ayrshires, Guernseys and Canadians. Butter is manufactured on the farm and sold locally.

Beef cattle are not bred save in so far as the milking strain of Shorthorns bred here may be said to produce beef animals. Steers are fed in considerable numbers, however. Experiments of various kinds with feeding steers are always under way.

Sheep are kept in small numbers only. The breeds represented are Shropshires and Leicesters.

Swine have been kept in very large numbers during the past year. Three breeds are handled, Yorkshires, Berkshires and Tamworths. Feeding experiments during the year were confined for the most part to testing the value of frozen wheat for pork production.

HORTICULTURAL DIVISION.

The Horticultural Division of the Central Experimental Farm may be divided into three departments, viz.: that relating to fruits and vegetables; that relating to forest trees; and that relating to the arboretum and botanic garden.

The main experiments which are being conducted with fruits and vegetables were continued in 1907. Some of these relate to the testing of varieties already on the market; the origination of new sorts from seedlings and by cross fertilization; the finding of seedlings of merit originated in different parts of Canada and testing them at the Experimental Farm. Experiments are also being carried on with different spray mixtures to determine which are the most effective and, if possible, to discover new ones. Experiments are also being conducted to determine if the individuality in trees is continued in grafted scions from them.

New strains of tomatoes, beans, and peas are being developed by selection with special reference to earliness. Efforts are also being made to obtain by selection strains of potatoes which are comparatively immune to blight and rot.

SESSIONAL PAPER No. 15

With especial reference to the season of 1907, it may be said that the apple crop at the Experimental Farm was the largest yet obtained. It was a good one, both in quantity and quality, and while complaints were made in some parts of Ontario and Quebec of the small size of the fruit and injury from spot, the results of the good cultivation and thorough spraying which the trees get from year to year at the farm were very apparent in the cleanness and fair size of the fruit. The plum crop was a medium one and the cherry crop rather light. One of the largest crops of grapes raised at the Central Experimental Farm was produced in 1907, but owing to the cool autumn the later varieties did not ripen so thoroughly as in some years, and a number of sorts did not ripen at all. As the results of the testing of a large number of kinds of grapes several are now known which ripen their fruit at Ottawa practically every year.

There was a medium crop of raspberries and currants of good quality. During 1907 a bulletin on bush fruits was written by the Horticulturist, in which the experiments for the past twenty years with raspberries, blackberries, currants, and gooseberries were reviewed, conclusions drawn from them, and recommendations made.

As already stated, one important line of work has been the origination of new varieties of cross-bred and seedling fruits. Many of these varieties fruited in 1907, and, as in 1906, a fair proportion of them were of such promise that they are being propagated with a view to more thoroughly testing their relative merits with the named varieties already on the market.

The Vegetable Growers having expressed a desire that some trial shipments of tomatoes be made to Great Britain to learn if Canadian tomatoes could be profitably sold there, four small shipments were made to Glasgow in cold storage in 1907. The tomatoes from all four shipments arrived in fair condition, but owing to the great quantities of tomatoes offered for sale of home grown and European production, the Canadian product, which was not so fresh nor so evenly coloured, could not be sold at remunerative prices. This condition of the market seems likely to occur every year.

In addition to other tests with potatoes, experiments were continued in 1907 to determine if it is possible to develop a strain which will be immune to blight and rot. Some varieties tested at the Experimental Farm are much more immune than others, and these were made the starting point for work in selection. The tubers from the most productive and most resistant hills are kept separate and planted from year to year. The results from this work are promising.

The branch of the Horticultural Division relating to forest trees is furnishing every year information which should prove valuable to the farmers of Canada. About twenty-one are devoted to timber trees grown as belts along two sides of the farm in solid blocks of individual species, and mixed together. Annual measurements are taken of the height and diameter of the trees. Notes are also taken of the effect which the stronger growing trees have on the others, and after twenty years' growth it is now possible to tell farmers, with a fair degree of accuracy, what kinds of trees will grow best together with the least injury and greatest good to both, and also the most satisfactory distance apart to plant the trees. In 1907 the trees on the whole con-

8-9 EDWARD VII., A. 1909

tinued to make good growth. The results of the work in the arboretum and botanic garden are of value to all Canadians who desire to improve their home surroundings, and to learn more about the individual characteristics of the many beautiful trees, shrubs, and herbaceous plants that will succeed in Canada. Students of botany will also find much to interest them. In this part of the farm there are now growing more than 3,000 species and varieties of trees and shrubs and more than 2,000 of herbaceous perennials. Records are kept of the hardiness, relative growth, flowering period and other interesting matters relating to the plants, and from time to time lists are published of the best plants for various purposes. The arboretum and botanic garden looked well in 1907, and attracted considerable attention from the visitors to the farm.

During the year a much-needed building was erected for the Horticultural Division in which is a good cellar for storing fruit with especial reference to the testing of the keeping qualities of the varieties being grown and the many seedlings which are now fruiting. There is also a cold storage chamber, exhibition room, work room, office room, and rooms for storing material used and produced in the Horticultural Division.

CHEMISTRY DIVISION.

Wheat.—A considerable amount of the time of the chemical staff has been devoted during the past year to investigation relating to this cereal. The various factors which are supposed to modify and control 'strength' or 'quality' in wheat and flour have been critically examined and correlated, as far as seemed practicable, with the results from the baking tests. The relation of the ash constituents to the nitrogenous compounds and the proportion of sugar present in flours, in so far as they may affect the shape and volume of the loaf, have also been studied. The results are set forth in Part II. of bulletin No. 57, on 'quality in wheat,' and Part II. of bulletin No. 60, on 'The Grades of Wheat of 1907,' now in press. In certain important particulars our knowledge respecting the chemistry of wheat has been materially advanced.

The development of soft or starchy kernels in the crop from hard wheat when sown on newly broken scrub land, in certain districts of the Northwest, has been studied. This deterioration, it would appear, results from prolonged vegetative growth of the wheat plant, in other words, a retardation of the maturation or ripening of the berry, and is caused by an excessive amount of moisture in a soil containing large percentages of vegetable matter and nitrogen. Presumably, it is only a matter of a comparatively short time before such soils will produce hard wheat, as with cultivation and fallowing they will necessarily lose a part of this organic matter and be less retentive of moisture.

As a result of the unfavourable weather conditions that prevailed last season in many districts of the Northwest, a considerable amount of 'frosted' wheat has been put on the market for feeding purposes. It has been found that this grain is characterized by a percentage of nitrogen somewhat higher than that in normally ripened wheat.

SESSIONAL PAPER No. 15

A small proportion of this nitrogen appears to exist in a non-albuminoid form—somewhat less valuable from the feeding standpoint than the true albuminoids or gluten. However, allowing for this, frozen wheat, provided it is digested by the animal, should possess a feeding value quite equal, if not superior, to ordinary well-ripened wheat. The excessive hardness of the frosted wheat necessitates that the grain should be finely ground (and possibly for certain classes of stock, soaked) so that it may be the more easily attacked by the digestive fluids and assimilated. Its judicious mixture also with a more bulky meal, as bran or ground oats, would undoubtedly further its digestion.

The influence of age on wheat and flour as it may affect their breadmaking value, has been investigated, but as yet the results from the chemical work do not allow any very definite conclusions being drawn as to the nature of the changes which apparently take place towards an improvement in quality.

Barley.—A considerable number of Canadian grown and imported barleys both two-rowed and six-rowed, have been submitted to analysis. The results, in the majority of instances, show that the nitrogen content is increased by the growing of European barley, at Ottawa.

Fodders and Feeding Stuffs.—The forthcoming report of the chemist will contain the analyses, with notes as to relative nutritive values, of many of the milling and manufacturing by-products on the Canadian market. This information allows our farmers to intelligently make their purchase of feeding stuffs and is consequently of considerable value.

Alkali Soils.—The occurrence of 'alkali' in certain districts of the Northwest provinces and British Columbia has made it necessary to study the nature of these injurious salts and methods of reclamation for lands so affected. The information gained from this research is now available, having been collected and published in bulletin form (Bulletin No. 4, Second Series.)

Insecticides and Fungicides.—The composition of several new materials of this character has been ascertained and their probable value outlined, and the information furnished our fruit growers.

Certain new and very promising sprays have also been devised, using flour instead of soap as an emulsifier. They are easily prepared, stable and apparently effective. Details of preparation with formulæ are given in the chemist's report.

Water from Farm Homesteads.—The work of examining well waters as to wholesomeness has been continued. During the past year over 100 samples have been analyzed. The waters have been forwarded from all parts of the Dominion and this branch of the chemical work is one that is much appreciated by the agricultural public.

As far as time permits the chemist's services in the examination of samples sent in by farmers and in the answering of questions relating to the chemistry of farming, have, as in the past, been freely given.

ENTOMOLOGICAL AND BOTANICAL DIVISION.

The work of the Entomologist and Botanist and his staff has been of the same nature as in past years. The large correspondence from farmers in all parts of the Dominion shows that they are appreciating the useful information which is being constantly disseminated concerning the habits of injurious insects and the best ways of preventing their attacks. While there has been no serious outbreak of any new kind of injurious insect during 1907, many of the older enemies have occurred in different districts and done appreciable harm.

Cereals.—Owing to the cold dry spring and the cool weather which prevailed throughout the year, crops of all kinds were backward and late throughout the country. In Manitoba the Wheatstem Sawfly was more than usually abundant, and the Grain Aphis was troublesome in a few localities in the eastern portions of Saskatchewan. Oats in Prince Edward Island were considerably injured by the same insect, and wheat in the same province was much reduced by the Wheat Jointworm.

The Pea Weevil, which has done remarkably little harm for a year or two, was again destructive in Bruce County, Ontario.

Grasshoppers were very abundant and wrought considerable destruction in restricted localities, as in some localities along the Ottawa River in Ontario and in the counties of Quebec province lying north of the same river. Complaints of these insects were also received from Manitoba and British Columbia.

Cutworms were the cause of more or less loss, as usual, in all parts of the Dominion. Most of these complaints were with regard to their injuries to garden plants; but there was a remarkable outbreak of the Variegated Cutworm in southwestern Ontario towards the end of July. The injury was most marked in the neighbourhood of Leamington, where hordes of this large and late-occurring species swept everything before them. The poisoned bran remedy was at once recommended and was used with great success.

Roots and Vegetables.—The Small White Cabbage Butterfly did much harm to cabbages of all kinds in Manitoba and in the older provinces. Dusting the plants with pyrethrum insect powder, one pound in four pounds of cheap flour, with freshly slaked lime, or with Paris green and flour, one pound in 25 pounds, were all quite effective when applied promptly.

The Black Blister Beetle was troublesome for a short time on potatoes in the prairie provinces.

Fruit Crops.—The Codling Moth was unusually destructive to apples in western Ontario. Regular spraying with poisoned Bordeaux mixture for the first brood, and then banding the trees with strips of burlap after the middle of July, are effective means for controlling this persistent enemy of the fruit grower. The burlap bands must be examined at least once a week and the cocoons destroyed, of all caterpillars which have resorted to them to spin up. The Codling Moth has appeared in two or three more localities in the province of British Columbia and is probably widespread than is as yet known.

SESSIONAL PAPER No. 15

Fruit insects of lesser importance which in 1907 appeared in unusual numbers, were: in the eastern provinces, the Rusty Tussock Moth, the Hickory Tussock Moth and the Spotted Tussock Moth, the Red-humped Apple-tree Caterpillar, and the Yellow-necked Apple-tree Caterpillar. These were all easily destroyed by spraying promptly with arsenical washes.

The Oyster-shell Scale was reported from many localities. The standard remedy for this insidious enemy are the invigorating of the trees by special cultivation or spraying them late in autumn with a weak lime whitewash, or in summer with kerosene emulsion or whale-oil soap solution.

The Brown-tail Moth, which was reported to have established itself in Nova Scotia and New Brunswick, has been carefully watched by the provincial government of Nova Scotia under the direction of Prof. Cumming, of Truro; and large numbers of the winter nests were destroyed during the winter. During the summer of 1907 comparatively little injury was done in the orchards of Nova Scotia; and it is to be hoped that this enemy of the New England States may be satisfactorily controlled, owing to the vigorous way in which it has been dealt with.

Grass and Fodder plants.—The collection of grasses and other fodder plants has been increased and has attracted much attention from visitors to the Central Experimental Farm.

Museum.—The collections of the plants and insects in the Division of Entomology and Botany have been very much increased, and now form a valuable source of reference to farmers and students, who make frequent reference to them.

The Entomologist and Botanist has been able during the past season to visit many places in different parts of the Dominion and deliver addresses upon insects beneficial and injurious, upon weeds and other plants, and also upon various nature study objects. He also prepared for the Seed Commissioner's Branch an extensive publication upon the worst farm weeds of different parts of the Dominion. The illustrations for this beautiful work were prepared by Mr. Norman Criddle, of Aweme, Manitoba, an expert naturalist and artist. The book has been received with very general satisfaction by those for whom it was prepared, and an enlarged edition with a few more plates is in contemplation.

CEREAL DIVISION.

The past season was very favourable for cereals at Ottawa and good progress was therefore made in the work of selecting and propagating new strains and varieties which are not yet ready for test at the branch experimental farms. The propagation on a large scale of such sorts as are particularly promising is carried on chiefly at Indian Head and Brandon. The season at Brandon was fairly favourable, but the grain at Indian Head did not in all cases reach full maturity before the autumn frosts. Fortunately, however, most of the important new sorts gave a crop which can be used for seed purposes and thus the propagation of these varieties for distribution will not be seriously delayed.

8-9 EDWARD VII., A. 1909

IMPROVED STRAINS OF WELL-KNOWN VARIETIES.

The improvement of the more important varieties of grain by careful selection is being pushed rapidly. Some of the new selections are now available in considerable quantity though of others only a very small amount is on hand. Selected strains of Preston and Stanley wheat are being distributed this year for the first time; and more carefully selected types of the same varieties are being propagated for distribution, along with improved early strains of Red Fife wheat.

NEW VARIETIES.

Though it is obviously undesirable to introduce into general cultivation a large number of new varieties of grain, which would cause much confusion, it is clearly essential that very many new sorts must be tested at the experimental farms in order that the best possible kinds may be discovered for the various grain growing districts of this country.

Among the new sorts introduced from abroad last season may be mentioned some extremely early varieties of barley from high altitudes in northern India and Tibet. Selected strains of some of these are being propagated, and may prove useful in our most northern agricultural lands. Some wheat from Tibet is also under test, but seems less promising than the barley.

The extensive work in the cross-breeding and selection of grain which has been carried on for the past few years by the cerealist, has now begun to give quite a large number of fixed varieties. About 130 new cross-bred sorts of wheat, oats, barley and peas are now ready for propagation this spring. Of these about 70 are early-ripening kinds of hard red wheat which have been specially selected with a view to the production of strong flour of good colour. These new varieties of grain (which represent only a part of the results of the work of cross-breeding done in the year 1903) will of course be considerably reduced in number while being propagated, all those being rejected which show noticeable defects when grown under ordinary field conditions.

Two new cross-bred sorts of early ripening wheat (Chelsea and Marquis) which are of great interest on account of their earliness and good quality, were tested at some of the branch farms last season, and are being propagated with a view to a limited general distribution next year.

QUALITY IN WHEAT.

During the past year Bulletin No. 57, of the Experimental Farm Series, on 'Quality in Wheat,' prepared by the cerealist and the chemist of the experimental farms, was published. In this bulletin a full account was given of the methods devised and used in investigating the important problem of the baking strength of flour; and the figures obtained for the strength of the flour from many different varieties of spring and winter wheat grown at Ottawa and elsewhere were also published. This bulletin, although containing a large amount of valuable information, left many unsolved problems in connection with flour strength. Research work of the same general character is therefore being continued, especially with a view to ascertaining

SESSIONAL PAPER No. 15

more definitely the effects of storage under different conditions on wheat and flour; as well as the effect of soil and climate on the strength of the flour from different varieties of wheat.

The milling and baking tests of this winter have confirmed the conclusions previously reached as to the radical improvement in the strength of many wheats and flours produced by storing them for a year, and have also shown clearly that the extent of this improvement varies greatly in different instances.

Many of the leading varieties of winter wheat and of durum ('Macaroni') wheat have also been studied this year. Striking differences in character were found within both of these classes, showing clearly that the question of variety is of great importance. Some of the winter wheats and some of the durum wheats proved excellent for bread making though in both groups the average of baking strength was rather low.

GRADES OF WHEAT IN THE MANITOBA INSPECTION DIVISION.

On account of the unusually cool character of the past summer in the prairie provinces, a considerable quantity of low grade, immature wheat has found its way into commerce. It seemed desirable, therefore, to determine the values of these lower grades for milling, baking and feeding purposes, and also to ascertain whether the coolness of the season had in any way adversely affected the higher grades. The officers of the cereal and chemical divisions have, therefore carefully studied the various grades of wheat and have obtained interesting results which are now ready for publication in Bulletin No. 60 of the Experimental Farm series.

CIRCULAR ON PRESTON AND OTHER WHEATS.

In view of the prominence into which Preston and certain other early-ripening wheats have come, a circular dealing with these varieties was lately prepared by the cerealist, and was distributed to farmers in the northwest provinces. In this circular full and precise information was given in regard to the characteristics and qualities of Preston and other early wheats, information which is based on field tests for many years and on extensive milling and baking tests in the laboratories at the Central Farm. With the facts thus fully presented to them, farmers will be enabled to reach wise decisions as to the advisability of growing any of these early varieties of wheat.

POULTRY DIVISION.

The experimental work of the past year, in connection with the Poultry Division, embraced many features of interest to poultry keepers. Among the most important are the following, which are briefly summarized:—

Continued trials of different styles of open front, unheated poultry houses. These patterns of houses are in marked contrast to the more elaborately and oft-times ill-ventilated structures of former years. The most advanced type of this description of poultry building has its southern front entirely of cotton in lieu of boards with a window in centre. It is claimed for this pattern of house that it is cheaper, easier of construction and is calculated to keep its inmates in better condition than any other.

A house of such pattern was on trial during the winter of 1907-08, in the poultry division and gave satisfactory results. Details as to construction of this house and results therefrom will be found in the annual report of the poultry manager.

The work of building up prolific egg-laying strains of fowls by means of selection by trap-nests was continued and interesting results secured. This system while sure, is unavoidably slow where fowls of different varieties are being experimented with.

The application of electricity to one or more incubators and brooders for the purpose of hatching and rearing chickens, promises to be most interesting and, if successful, to have most important and desirable results.

A trial of frozen wheat which was given to a certain number of fowls was commenced during the latter part of the winter. Results from this experiment will be learned with interest.

It is gratifying to note greater interest by farmers throughout the country in the poultry branch of their farm work. This is instanced by the increased inquiry by them as to the latest and best methods of poultry keeping.

BRANCH FARMS.

Experimental Farm for the Maritime Provinces.

At Nappan cold and wet weather in spring delayed seeding and the earliest sowing of grain there, was on May 20, and seeding was not completed until the beginning of June. In consequence of frequent wet weather later in the season the hay crop was saved with difficulty. Nevertheless fine growing weather later brought very fair crops of grain, field roots and potatoes, many of them being above the average. The experimental work at this farm included tests of all the more important farm crops.

The apple crop was not as heavy as usual, but a quantity of very fine fruit was produced.

The feeding of steers and swine has been continued, also some experiments with sheep, poultry and bees.

Experimental Farm for Manitoba.

At the Brandon experimental farm the spring also opened late, and the first spring wheat was not sown until May 9, which was more than two weeks later than usual. Notwithstanding this lateness in sowing, most of the varieties of grain ripened early enough to escape injury from frost. At this farm experiments have been conducted during the past year with many varieties of cereals, clovers, grasses and other forage and root crops.

An interesting comparative test was made during the past winter in the feeding of steers. Two groups were fed, one of which was fed and kept in the barn all winter, the other group was fed and kept outside all the winter. It is noteworthy that beef was produced on the animals kept outside at a somewhat less cost than those fed in the barn. Experiments have also been carried on with swine, poultry and bees. Tests have also been conducted with many sorts of fruits and vegetables, also with forest and ornamental trees and shrubs and flowers.

SESSIONAL PAPER No. 15

Experimental Farm for Saskatchewan.

At Indian Head, Sask, the first wheat sown in 1907 was on May 6, the sowing of oats began on May 14 and that of barley a day or two later. On this farm the average date for the sowing of wheat for the past five years has been April 17. There was thus a loss in 1907 of about three weeks in the early part of the growing period. This backward weather was characteristic of the greater part of the season and ripening was much delayed so that the frost which occurred on September 12 found the grain immature and injured it considerably. While the wheat crop was thus reduced in quantity and value the oat crop was an extraordinary one running from 100 to 110 bushels per acre.

Experiments have also been conducted here with all the more important farm crops. The trials made with many of these have been successful, and the large yields obtained from the sowing of certain varieties have encouraged many farmers to follow in the lead of the experimental farms.

Many tests have been made with fruit and vegetables and many sorts of cross-bred apples have been successfully grown. A distribution is made each year from this farm as well as from that at Brandon of samples of some of the best varieties of wheat, oats, barley and potatoes. Mail packages of young trees and shrubs are also sent out in response to requests, these are very much appreciated by the farmers who receive them. Experiments have also been conducted in the fattening of steers and swine.

Experimental Farm for British Columbia.

At the Experimental Farm at Agassiz, B.C., the weather during the spring months was also wet and cold, and for this reason the hay crop was below the average, and a similar shortage prevailed throughout the coast climate. Hot weather during June, July and the early part of August, hastened the ripening of the grain crops, and the results were quite up to the average.

The thirty-one varieties of oats under trial gave an average crop of 66 bushels 16 lbs. per acre. Fifteen varieties of six-rowed barley gave an average of 44 bushels 47 lbs. per acre; while the thirteen sorts of two-rowed barley tested gave an average of 47 bushels 13 lbs. per acre. The twenty-eight sorts of potatoes under trial gave an average crop of 474 bushels 25 lbs. per acre.

Strawberries were a medium crop. Other small fruits also did well and cherries were a good crop, but wet weather caused a large percentage of them to crack open and all fruit so injured is useless for market. Apples were a medium crop. The yield of pears was light while plums produced heavy crops fully up to or above the average. Most of the fruit crops in the interior districts were very satisfactory.

Experimental Farm for Southern Alberta.

The establishment of an experimental farm at Lethbridge in southern Alberta fills a long felt want. This farm which consists of 400 acres of land is located within that area in southern Alberta which has a scanty rainfall. One hundred acres of this land is situated so as to admit of irrigation, the remainder will be conducted in accord-

ance with the methods practised in what is known as dry farming, where the conservation of moisture is studied and provided for in every practicable way. Under such a system good crops can usually be grown with a very limited rainfall.

The past season has been devoted mainly to preparatory work, the breaking up of the land and the erection of buildings. The area broken during the season was 155 acres, of which 57 acres are in winter wheat. Experiments are being conducted to gain information as to the best time for sowing winter wheat and the quantity of seed to use per acre to obtain the best results. Thirty acres of land on the dry portion and 41 acres on the irrigable land have been got ready for spring crops. The planting of orchards, also belts and avenues of forest trees has claimed much attention and it is expected that another season will make quite a change in the appearance of this hitherto bare prairie land.

A dwelling for the superintendent, a cottage for the workmen and a suitable barn and implement shed have been erected. The land has also been enclosed by a substantial fence.

Experimental Farm for Northern Alberta.

Good progress has been made with the new experimental farm for northern Alberta which has been located at Lacombe. Notwithstanding the very unfortunate season of the past year which resulted in everything being sown late, some of the crops did fairly well. The fourteen varieties of spring wheat were all more or less injured by frost yet they gave an average yield of 21 bushels 51 lbs. per acre. Oats gave a good crop, the 31 varieties under trial averaging 86 bushels 31 lbs. per acre. The 15 varieties of six-rowed barley tested gave an average crop of 57 bushels 26 lbs. per acre, and the 13 varieties of two-rowed 39 bushels 39 lbs. per acre. Field roots and potatoes have also given very satisfactory crops.

Large supplies of forest and ornamental trees have been sent to this farm where they have been planted in windbreaks and groups. Orchards of apples have also been planted and plantations made of small fruits. Trials have been made also of many sorts of vegetables for the purpose of gaining information as to those sorts best adapted to the climate of northern Alberta.

This farm has also been substantially fenced and the following buildings erected: a house for the superintendent, a cottage for workmen, a barn and stable and an implement shed.

Experiments at Fort Vermilion on the Peace River.

Some experiments were begun this year at Fort Vermilion, where arrangements were made with a farmer to conduct experiments on his own land with most of the more important farm crops, also with fruits, vegetables, forest and ornamental trees. Owing to the difficulties attendant on a late season, the necessary supplies were delayed in transit and most of the grain late sown was injured by frost before it reached maturity. That part of the Peace River district usually produces very good wheat, and samples sent to the Central Farm of the growth of 1906 were plump and well ripened. Further experiments are being tried in that locality this year and should the season be a normal one there will no doubt be many successful trials on record.

SESSIONAL PAPER No. 15

MEETINGS ATTENDED.

The officers of all the branch farms as well as those of the Central Farm have attended many of the more important agricultural meetings held in different parts of the Dominion where opportunities have been afforded of bringing prominently before the farmers present some of the more important features connected with the work of the experimental farms.

GENERAL CROPS.

The larger part of the crops in most of the provinces of Canada in 1907 were below the average

ONTARIO.

In Ontario the cold and backward spring was followed in most instances by unusually dry and hot weather which resulted in a very light crop of hay. The average for the province was 1.18 tons per acre, whereas the average for this crop for the past 25 years has been 1.47 tons per acre. The area occupied by hay in 1907 was increased 219,635 acres, nevertheless there was a decrease in the total crop of 792,762 tons. Oats which in this province stand next to hay in importance also occupied an increased area 215,798 acres, but the crop reported was nearly 25 million bushels less than last year. The winter wheat and spring wheat crops were both somewhat above the average, but there was in each case a reduction in the area sown which had a marked effect on the total output. Most of the other important farm crops were below the average. The high prices which prevailed for all kinds of farm produce helped in many cases to make up for the shortage in weight of crops.

The scantiness of the pastures caused a falling in the production of cheese and butter, which brought a serious reduction in the volume of exports. The apple crop was on the whole a good one.

QUEBEC.

In most parts of Quebec the agricultural conditions were much the same as in Ontario a late cool spring followed by unusually dry weather resulted in a scanty hay crop and poor pastures, and both dairying and grazing suffered. The crops of grain in many districts were nearly up to the average, while in others they were distinctly below the average.

THE MARITIME PROVINCES.

The spring in these provinces was still more cold and backward, and wet weather delayed seeding very much. Higher temperatures in the later months brought the grain rapidly forward and fairly average crops were in most cases secured. In some localities the returns were above the average. The hay in many places was injured by unfavourable weather during harvest.

The apple crop was an average one and the quality of the fruit was good.

8-9 EDWARD VII., A. 1909

THE NORTHWEST PROVINCES.

The crops in the northwest provinces were disappointing. The cold and backward weather which prevailed during the greater part of the season made seeding late, and the maturing of the grain was also much delayed. In many districts frost occurred before the grain was ripe and much of it was injured. It is estimated that more than one-half of the wheat grown is fit for milling, the remainder is being used for the fattening of swine and cattle. A largely increased area of land has been brought under the plough and will be ready for crop in 1908.

BRITISH COLUMBIA.

In this province also the spring was late and on some parts of the coast the climate unusually wet and cold. Warmer weather followed which hastened the ripening of the grain, and crops were fully up to the average. The hay was a heavy crop and was well saved.

The growing of fruit in this province is extending rapidly, especially in the drier interior districts. Extensive orchards are being planted in many directions, and the quantities of fruit available for export will soon be very large. The bearing orchards in many parts of this province gave in 1907 satisfactory returns.

HEALTH OF ANIMALS BRANCH.

The work of development and organization in this branch has continued during the past year.

A quarantine station has been established at White Horse, Y.T., while the following places on the international boundary have been declared to be inspection stations: Noyan Junction, Quebec; Morrisburg and Kingston, Ontario; and Chopaka and Huntingdon, British Columbia.

New quarantine buildings have been completed at Lennoxville, Que., at Gretna and Bannerman, Man., and Kingsgate, B.C., while at Emerson, Man., North Portal, Wood Mountain and Willow Creek, Sask., Pendant d'Oreille, Coutts and Twin Lakes, Alta., and Osoyoos, B.C., existing facilities have been considerably improved. At the present time a new quarantine station is being erected at Sarnia Tunnel, the old premises at Pt. Edward being, since the building of the tunnel, inconveniently situated and altogether too large for the requirements of the service. The new buildings in course of erection are being constructed with material from those on the old grounds, which, having been built many years ago, are scarcely fit for use and could not be placed in proper repair without considerable expenditure, which, under the circumstances, it was not deemed advisable to undertake.

The introduction in March, 1907, of new regulations providing that all horses imported from the United States must be tested with mallein, has largely increased the work of inspectors at boundary points. It is, however, gratifying to be able to report that this important change has caused less irritation than was anticipated and that its results are undoubtedly of great value in preventing the introduction of diseased animals.

SESSIONAL PAPER No. 15

No serious changes have been made in the quarantine regulations since the date of my last report, except that the permit system has been extended to cover importations of animals from all parts of the world with the exception of horses brought from any of the countries of Europe. A slight change has also been made in the regulations governing the admission of animals on inspection for exhibition or other temporary stay, it having been found advisable to prohibit entirely the introduction of swine for any purpose whatever without undergoing the prescribed period of quarantine.

The work done by our officers at quarantine and inspection stations shows a marked improvement, with the result that the departmental check on importations of live stock is much more effective than formerly, and our statistics, in a corresponding degree, more reliable.

This is the more gratifying because of the continued large influx to western Canada of American settlers, most of whom bring live stock with them, the consequent pressure, especially at certain ports, entailing a vast amount of work on the inspectors stationed there.

Hog cholera is still being kept under control in a satisfactory manner, and although the year just past shows a slight increase in the amount of compensation paid, this is due almost entirely to new outbreaks apparently caused by animals surreptitiously introduced from the United States. A few very limited outbreaks have occurred in the old affected area, due evidently to chronic cases infected during previous outbreaks, and in which the disease had in the meanwhile assumed a latent form. The disease has not made its appearance except in Ontario and British Columbia, although a number of suspected cases have been reported and investigated by our officers.

The experimental work carried on at Antigonish, N.S., with the view of ascertaining firstly, the cause of the affection locally known as Pictou cattle disease, which was found to be due to the ingestion of rag-wort or *Senecio Jacobea*, and secondly, whether sheep can eat that plant with impunity, have been brought to a close. It has now been shown beyond question that no bad effects follow the eating of this plant by sheep and steps are therefore being taken to freely disseminate this information throughout those localities in which the disease is found, and in which the rag-wort grows in profusion. A strong public sentiment against the weed is being created, and as sheep are probably the most satisfactory agents for its eradication, especially in rough lands where cultivation is difficult or impossible, I am giving special attention to the development of the sheep industry in these districts.

The unusually severe winter of 1906-07 which led to the drifting for great distances of range cattle, many of which were affected by mange, caused a very serious spread of that disease and consequent heavy financial loss. A strong effort was, however, made during the summer to regain the advantage lost and at the close of the season the number of infected cattle had been greatly reduced. Unfortunately, however, the results of treatment were not as satisfactory as they might have been, owing to the fact that the use of oil emulsion was permitted. Although this form of treatment has been highly spoken of and recommended in different countries, it was found by my officers to be far less efficacious than the lime and sulphur dip, the use of which

8-9 EDWARD VII., A. 1909

only, was authorized in former years. As the result of this experience, the oil emulsion is no longer recognized as an official dip. All herds found to be affected after the weather became too cold for treatment have been held in quarantine and will be dealt with in a satisfactory manner before they are released.

In the light of our past experience it will be necessary to keep all the cattle in the infected area under much closer supervision than has hitherto been attempted, with the view of enforcing thorough treatment on the first appearance of the disease in a new locality.

During the summer and fall sheep scab was occasionally reported from a few districts in western Ontario. A systematic and thorough investigation was made in each case with results, so far, apparently very satisfactory, although owing to the insidious nature of the disease, it is impossible to state positively that it has been eradicated. The sheep trade, however, is being closely watched and the attention of breeders and dealers having been drawn to the importance of promptly reporting any suspected outbreaks, it is scarcely likely that it will now be permitted to spread to any serious extent before being detected and dealt with. In this connection I am glad to be able to report that it was last fall found possible to permit the movement of sheep without inspection from all parts of the Dominion, with the exception of a comparatively small area in western Ontario, which is, however, rather important owing to the large number of sheep bred and reared there.

Gratifying results are being obtained from the policy of slaughter and compensation adopted some years ago in dealing with outbreaks of glanders. The expenditure under this head, which was exceedingly heavy during the first year of the new policy, has shown an annual decrease, and as under the present quarantine regulations the introduction of fresh infection from the United States is likely to be largely, if not altogether prevented, I hope to be able in the course of a few years to report that the disease has been practically stamped out. The task is, however, far from an easy one, especially in the western provinces, where for many years glanders was allowed to spread practically unchecked. A marked advantage under the new policy is the general willingness of owners to report suspected cases due to certainty of obtaining reasonable compensation in the event of their animals being destroyed.

I am pleased to be able to say that during the year just past the British Board of Agriculture has adopted a policy involving the slaughter of reacting horses similar to that which this country was the first to adopt in 1904. There is every reason to believe that a number of other countries will shortly be forced to adopt similar measures.

Bovine tuberculosis continues to exist to a greater or less extent in a number of different localities throughout the Dominion, and several times during the past year I have been asked to adopt a more aggressive policy in dealing with this disease than that now followed by the officers of my department.

The question of the control of bovine tuberculosis is, however, one of great difficulty, and until some method of dealing with it, more intelligent and satisfactory than any of those hitherto tried, is evolved either by those now engaged in experimenting with the disease or possibly by their successors, I do not think it advisable to adopt the extreme measures so strongly advocated in some quarters. The position of those

SESSIONAL PAPER No. 15

members of the medical profession who without perhaps realizing the extent of their demands, ask for the universal testing of all cattle and the slaughter of such as react, would be greatly strengthened, if they themselves were to insist on the notification of ordinary cases of human tuberculosis. As long as the latter are allowed to mix freely with their fellow men and women, to occupy the same rooms, travel in public conveyances and act generally as infective agents, it is scarcely reasonable to attach so much importance to the comparatively insignificant part played by the domestic cow in the transmission of this fatal disease. Until some method involving a less serious economic loss than that inseparable from a policy of compulsory testing and slaughter, is discovered I do not think that much more can be done than we are at present doing.

Preventive inoculation for tuberculosis does not appear to be making many converts among practical veterinarians, but experimental work in this direction is still in progress, and it is possible that along this particular line, an effective method of dealing with the disease may yet be discovered.

The herd of tuberculous cattle which has been kept in the open air since December, 1905, still continues to flourish and has been the means of furnishing us with much valuable information which will be placed in the hands of the public at the earliest possible moment after the conclusion of the experiments.

Maladie due coit, or dourine, which for some years back has existed in southern Alberta, to which district it was introduced by animals imported from the United States, has been during the past year kept under control to a fairly satisfactory degree, although it has not yet been entirely eradicated. Experimental work on this disease has been continued by my pathologists at Lethbridge and Ottawa. The efforts of these gentlemen since the discovery in February, 1907, of the specific trypanosoma causing the disease have been and are now being directed towards the discovery if possible of methods of exact diagnosis and prophylactic treatment. Horse owners are becoming alive to the importance of promptly reporting all suspected cases, and I hope shortly to be in a position to state that the disease has been entirely stamped out.

A number of outbreaks of anthrax have as usual taken place during the year, although I am pleased to say that this disease has not been as prevalent as during many previous seasons. Stock owners are now generally adopting a policy of preventive inoculation, which appears to furnish a satisfactory means of dealing with the disease on premises which have unfortunately become infected. Evidence has from time to time been afforded that many of these apparently mysterious outbreaks of anthrax are really due to infection from imported wools and hides. My officers are now engaged in securing definite information on this point which may render advisable the adoption of preventive measures.

The biological laboratory continues to do work of great value to the stock owners of the Dominion. Large numbers of pathological specimens continue to be sent in for examination and diagnosis. The output of the preventive vaccines for anthrax, and especially for black quarter, continues to increase enormously, while the manufacture of the mallein and tuberculin used by my officers forms no small part of the work of the pathological staff at headquarters. A small branch laboratory has been estab-

8-9 EDWARD VII., A. 1909

lished in British Columbia, where the services of an able and experienced veterinary pathologist are being utilized in making an investigation as to the nature and causes of a disease known in that province as Red Water in cattle.

The passage of the Meat and Canned Foods Act during the session of last year rendered it necessary to provide the services of a considerable number of veterinarians specially trained in the work of meat inspection. Arrangements having been made through the Veterinary Director General a short course in meat inspection was arranged for in Chicago during March and April, 1907. As a result of this step, there were rendered available the services of a sufficient number of men to enable me to bring the Act into force on September 3, since which time all establishments packing or dealing in meat for export or interprovincial trade have been under close and systematic inspection. The results have been to all appearances eminently satisfactory, and although the number of animals condemned is, compared with some other countries, gratifyingly small, it is still large enough to show that the placing of this trade under government supervision was both necessary and advisable. I would add that the packers have with few exceptions, loyally accepted the situation and are according to the department a hearty and cordial support in its endeavours to place the meat trade in Canada on a plane entirely above the possibility of suspicion.

ARCHIVES BRANCH.

During the last fiscal year three members of the staff have been employed in making a survey of historical material in Ontario, Quebec and the maritime provinces.

In the province of Ontario, Mr. Robert Laidlaw has examined and reported on the following collections:—

Toronto Public Library.—About 400 volumes, including papers of D. W. Smith, W. Dummer Powell, Jarvis, Baldwin, Strachan, Scadding, Lord Selkirk, Bidwell and others.

Crown Land Department.—The land registers and records of original grants.

Department of Agriculture.—Record books from 1783-1808.

Canadian Military Institute.—Military records, bearing on the war of 1812-15.

Knox College.—Church records and letters from pioneer missionaries in Canada.

Victoria College.—Journals of Methodist conferences, and correspondence dating back to 1775.

Ontario Historical Society.—Original document and copies of old church registers.

In private hands.—Correspondence of Sir John A. Macdonald from 1847. Papers of the late William Kirby.

HAMILTON.

Miscellaneous documents of local character; muster rolls, 1812; diaries, &c., in private hands.

SESSIONAL PAPER No. 15

ST. CATHARINES.

In the possession of Miss Merritt.—Papers of the late William Hamilton Merritt and of his father. The war of 1812-15 and the building of the Welland canal figure largely in these, and the Francis Goring papers commencing in 1776.

The property of Mrs. J. G. Currie.—Letters (principally copies) bearing on the life of Laura Secord.

PORT DALHOUSIE.

In the possession of W. B. Clark.—Memoirs of Col. John Clark, written by himself, and dealing chiefly with the war of 1812-15 and the rebellion of 1837-38.

NIAGARA-ON-THE-LAKE.

Niagara Historical Society (Miss Janet Carnochan, secretary and curator).—A large collection of documents and relics of historical interest.

SIMCOE.

Norfolk Historical Society (Henry Johnson, curator).—Walsh family papers and other manuscripts, dating back to 1793.

Tisdale and Read.—Old minute books, 1800-1809.

ST. THOMAS.

James H. Coyne.—Talbot papers, 1801-1851. These belong to His Honour Judge Macbeth, of London, but are in Mr. Coyne's custody.

His Honour Judge Ermatinger.—Diaries kept by Edward Ermatinger while in the service of the Hudson's Bay Company, 1818-29; also letters, &c.

His Honour Judge Hughes.—Printed papers and documents.

LONDON.

Sheriff Cameron.—Military Records and old letter books.

Fred. W. Farncombe.—Field notes of surveys by Colonel L. Burwell, 1819-21.

London Historical Society (Dr. L. Woolverton, curator).—Papers by pioneers on the history of the city of London and the county of Middlesex.

Dr. Linus Woolverton.—Diary and letter book of Joseph Willecocks, 1800-1803.

Chas. J. N. Shanly.—Original manuscript of diary kept by Major E. B. Littlehales, aide-de-camp to Lieut. Governor Simcoe, of a trip from Niagara to Detroit, 1793.

DETROIT.

Chas. M. Burton.—A collection of over 700 volumes of original manuscripts, bearing chiefly on the early history of the country on both sides of the Detroit river between Lake St. Clair and Lake Erie. Many of the documents deal with matters of much interest to Canadians.

8-9 EDWARD VII., A. 1909

WOODSTOCK.

Mrs. J. M. Ingersoll.—Original manuscripts, including military commissions, land grants and list of settlers in Oxford in 1787 on lands granted to the Ingersoll family in 1783.

F. R. Ball, K.C.—Manuscripts, including military commissions and documents signed by Colonel Butler, of the Butler Rangers.

BRANTFORD.

Mohawk Institute (Rev. Robert Ashton, principal).—Registers of Indian baptisms, marriages, &c., beginning with 1827.

Miss Augusta I. G. Gilkison.—Captain William Gilkison papers, consisting of diaries, correspondence, &c., dating back to 1800.

WINDSOR.

John Davis.—Business papers, correspondence, &c., of Angus McIntosh, Hudson's Bay Company factor at Moy (now Windsor) beginning about 1768; also military records.

Windsor Armouries.—Military papers, 1812

WALKERVILLE.

Alex. H. Askin (Strabane).—Seven or eight thousand original manuscripts and printed documents covering a period from 1780 to 1830. These deal chiefly with commercial and military matters, although all phases of life are touched upon.

SANDWICH.

Church of L'Assomption.—Complete parish records of births, marriages and deaths, from 1760; also business records of the parish from 1756, and other documents of interest.

Albert Prince.—Papers of the late Colonel Prince.

Fred. Neal.—Collection of historical data concerning the pioneer families of Sandwich and that part of the county of Essex which adjoins.

AMHERSTBURG.

Capt. Wm. Caldwell.—Original manuscripts, including letters written by Captain Billy Caldwell, Chief of the Pottawatomes, General Procter and others.

STRATFORD.

J. Davis Barnett.—In this gentleman's library of over 26,000 volumes are many rare Canadiana.

SESSIONAL PAPER No. 15

ELORA.

John R. Connon.—Original manuscripts and copies of documents bearing on the early history of the village and the adjoining townships of Woolwich, Pilkington and Nichol.

Henry Wissler (Salem).—Papers connected with the settlement of part of the county of Waterloo by the German Land Company.

COLLINGWOOD.

The Huron Institute (D. Williams, secretary and curator).—Collection of documents of historical interest, chiefly of a local character.

PEFFERLAW.

W. H. Johnston.—Diaries kept by Captain William Johnston, beginning 1819.

ORILLIA.

Hale Brothers, publishers of 'The Packet.'—Collection of documents of local interest.

SUTTON WEST.

James Anderson.—Complete records, diaries, &c., kept by James Anderson (a) in command of an overland expedition sent from Great Slave Lake by the Hudson's Bay Company, under instructions from the British Government, in 1854, to follow up clues already obtained as to the fate of Sir John Franklin and his party. Autograph letters of Lady Franklin. Journals and diaries of trips through the Northwest Territories while in the service of the Hudson's Bay Company.

PETERBOROUGH.

Peterborough Historical Society.—Hon. Peter Robinson papers, consisting of lists of early settlers in that district, their location, &c.

BELLEVILLE.

Lieut.-Colonel Ponton.—Original manuscripts printed documents, and copies of the first newspapers published in the county of Hastings.

Dr. Yeomans.—Ketcheson family paper, military records 1812-1841.

KINGSTON.

Queen's College.—Letter book, Richard Cartwright, 1799-1815; Treadwell papers: military records; register of baptisms and marriages kept by Rev. Robt. McDowell, beginning 1800; pamphlets and newspapers of early date.

GANANOQUE.

Charles McDonald.—Joel Stone and John McDonald papers, from 1783, covering a long period.

Miss Colton.—Papers, mostly of a business character, left by R. P. Colton.

8-9 EDWARD VII., A. 1909

BROCKVILLE.

His Honour Judge McDonald.—Original register of births, marriages and deaths kept by Rev. Wm. Smart, 1812-1838; letters of Wm. Lyon Mackenzie; historical sketch of Stone and McDonald families.

W. S. Buell.—Orderly book, 1781-82; letters of Ogle R. Gowan; documents *re* building of steamer William IV. at Gananoque, 1830-34.

H. N. Gardiner.—Muster rolls, Leeds militia, 1825.

'Recorder' Printing Co.—Files of 'Recorder' newspapers from 1820.

James Bissell.—Minute book of Methodist circuit.

O. K. Fraser.—Court registers and records beginning 1789; register of marriages. Johnstown district, 1801-50.

Wm. Richardson (county clerk, Leeds and Grenville).—Hon. Charles Jones papers, dating back to 1793, and consisting of military records, letters of Rev. John Strachan, Ogle R. Gowan, Sir Allan Macnab and other prominent men, old maps and plans, &c. This collection, which was found in the court house at Brockville, is now in the Dominion Archives, having been donated by the counties council of Leeds and Grenville.

W. J. Wright.—Letters written by Wm. Lyon Mackenzie.

SMITH'S FALLS.

James H. Ross.—Record books of Rideau Methodist circuit, 1819-74; record of baptisms, 1825-43.

PERTH.

Mrs. Frank Davis.—Colonel Alex. McMillan papers, relating chiefly to the military settlement at Perth. These have been handed over to the Dominion Archives by Mrs. Davis.

John Hart.—Account and letter books of Perth Military district.

Robert J. Drummond.—Manuscript volume by Andrew Drummond, giving a history of the construction of the Rideau canal, with maps, and plans of the work.

PRESCOTT.

Edward Jessup.—Jessup papers, dealing almost entirely with military matters. 1780-1800. David Parish papers, letters to Parish, who was a resident of Ogdensburg, N.Y., 1813-15.

Rev. H. B. Patton.—District and general orders, issued at Kingston, Montreal, Fort Erie, and Niagara Falls, 1812-14.

MORRISBURG.

Miss Colquhoun.—District and regimental orderly books, 1838-39.

SESSIONAL PAPER No. 15

CORNWALL.

James Dingwall.—Records of Court of General Session for District of Lunenburg, beginning 1789; old marriage registers, &c.

R. A. Pringle, M.P.—Orderly books, 1779-80, and other interesting papers.

JASPER.

Elliott Ballantyne.—District of Johnstown records, and copies of old newspapers.

LANCASTER.

Miss Macdonald.—Diaries kept by Rev. Father John Macdonald, 1815 to 1875, also correspondence covering about the same period.

ALEXANDRIA.

J. A. Macdonell, K.C.—Military records, 1812-13; colours Royal Canadian Regiment, 1794; correspondence from Sir John A. Macdonald.

E. C. Tiffany.—Files of early Canadian newspapers.—These are now in the Dominion Archives.

A. G. F. Macdonald.—Hon. D. A. Macdonald papers—commercial and political.

WILLIAMSTOWN.

G. H. McGillivray.—Register kept by Rev. John Bethune, 1779-1815; orderly books and other documents.

ST. RAPHAELS.

Rev. Father Campbell.—Parish registers beginning 1797.

L'ORIGINAL.

John Higginson.—Papers relating to the seigneurie of Longueuil.

ALMONTE.

Andrew Bell, C.E.—Books and documents of early date.

ARNPRIOR.

Gerald Jarvis.—Papers and correspondence of the late Chief Justice Jarvis, of Prince Edward Island, 1806-1850.

RENFREW.

C. E. Smallfield.—Local historical records.

RICHMOND HILL.

E. Teefy.—Collection of early newspapers.
15—4½

MARITIME PROVINCES.

Dr. James Hannay, of Fredericton, who has been working the Archives Branch in the lower provinces, reports that he has examined the principal collections of papers in the following places:—

New Brunswick.—Dalhousie, Campbelltown, Bathurst, Newcastle, Chatham, Richibucto, Dorchester, Hopewell Cape, Hampton, St. John, St. Andrews, Georgetown, Fredericton, Woodstock, Andover, Edmundston.

Nova Scotia.—Digby, Weymouth, Annapolis, Bridgetown, Kentville, Windsor, Yarmouth, Shelburne, Liverpool, Chester, Lunenburg, Bridgewater, Halifax, Amherst, Parrsboro, Truro, Pictou, Antigonish, Guysboro, Sydney, Port Hood, Arichat, Baddeck.

Prince Edward Island.—Summerside, Charlottetown.

In many instances, detailed summaries have been prepared by Dr. Hannay and sent to the Archives. These are available to the student. The books of the registrars of deeds have been examined carefully, and a note has been made of the period covered by each. A fairly complete list has been obtained of the records of births, marriages and deaths. A catalogue of the records of the executive council of Prince Edward Island, the land papers and other records, is now deposited in the Archives Branch.

At Sydney, the Dodd's papers were communicated to Dr. Hannay. At Halifax he examined and catalogued the Aikin and Stewart papers.

In August, 1907, Dr. Hannay was instructed to visit Manitoba, Alberta, Saskatchewan and British Columbia. In the course of his investigations he examined the records in Winnipeg, Selkirk, Portage la Prairie, Brandon, Regina, Prince Albert, Calgary, Edmonton, Vancouver and Victoria. Many valuable records bearing upon the history of the far west have been brought to light, and when all the summaries are complete the department will be in the possession of much useful material of local and general interest.

Arrangements have been made with the province of British Columbia to furnish the Archives Branch with a memorandum of all material discovered relating to the province, so that students in other parts of the Dominion will find it to their advantage to consult the index at Ottawa.

Dr. Hannay is now engaged in examining correspondence deposited in Fredericton relating to boundary questions.

QUEBEC.

The Reverend P. M. O'Leary has continued his investigations in the province of Quebec. The transcription of records in the Archbishop's Palace is nearly complete, and copies have been made of some valuable manuscript plans in the seminary.

A catalogue has been made of a part of the collection of Colonel Neilson, and at a convenient time the work will be completed.

Collections of private papers have been examined by Father O'Leary in Montreal and other places.

SESSIONAL PAPER No. 15

THE HISTORICAL MANUSCRIPTS COMMISSION.

In order that the historical work done by the Dominion Government might be placed upon a sounder and broader basis, I thought it desirable to establish an Historical Manuscripts Commission for Canada to act in an advisory capacity.

By an order in council passed on April 17, 1907, it is set forth:—

‘That the members of the said commission shall be historical scholars of recognized attainments, whom the minister may deem it advisable to invite to take part in the task of shaping and of executing a systematic plan for the prosecution of all those activities that are carried out under the auspices of the Archives Branch.’

The members of the commission are the Hon. the Minister of Agriculture and his deputy; Professor Adam Shortt, of Queen’s University; Professor Joseph Edmond Roy, of Laval University; the Abbé Gosselin, Professor of History in Laval; Professor S. M. Wrong, Toronto University, Professor C. W. Colby, McGill University, and the Dominion Archivist.

In addition to such other duties as may be assigned to the commission by the Governor in Council, it is to examine the translation in the official reports of the branch: to consider what classes of documents should be copied or purchased; the methods to be adopted in publishing documents, and to ascertain the nature and extent of the materials for local history that exist in different parts of the Dominion.

The first meeting of the commission was held on May 10, 1907. As a point of departure, the commission thought it desirable to embody in a minute its deliberate opinion regarding the three following subjects;—

1. Tasks that are most urgently required.
2. Tasks which should be undertaken as increased facilities permit.
3. The methods to be adopted in carrying forward the work of the Archives Branch.

At subsequent meetings of the commission it was decided to make a new classification of the manuscripts; to prepare an inventory of all the documents, so as to render the collections easily accessible to students; and to publish from time to time a series of documents, summaries of papers, reports, &c., in the form of occasional bulletins.

The inventory is now in the course of preparation and will be ready for distribution, it is hoped, during next session.

THE FRENCH ARCHIVES.

During the nineteenth century four Canadians at least visited France for the purpose of making an examination of the manuscripts relating to Canada to be found in the French archives. In 1852-3 Mr. G. B. Faribault looked through the War Office papers at Paris, and had copies made at the Ministère de la Marine of various documents selected from the first 56 volumes of the series C (Correspondence Générale—Canada). In 1865 the Abbé Tanguay made notes on the series GG¹ of the same collection; and in 1874 the Abbé Verreau examined both this collection and also the manu-

8-9 EDWARD VII., A. 1909

script at the Bibliothèque Nationale, the Ministère des Affaires Etrangères and the Archives Nationales. Before leaving France he also paid a hurried visit to Lille, Metz, Rouen, Bordeaux, Toulouse, Annecy, Chambéry, Grenoble and Marseilles.

Funds not being available to pay for having copies made of these papers, nothing further was done until 1883, in June of which year Mr. Joseph Marmette was sent to Paris to make a fresh examination of the archives in that city. At the end of the year he published a list of the papers relating to Canada to be found in the Archives Nationales, the Bibliothèque Nationale and the Ministère des Affaires Etrangères. Returning to Paris in August, 1885, Mr. Marmette spent two years in drawing up an inventory of manuscripts relating to Canada preserved at the Mazarin Library, the Library of the Institute and at the Ministère de la Marine. At the latter depository he made an analysis of the whole of series C¹¹, entitled, Correspondence Générale—Canada.

The work of copying these papers did not begin until 1891, in which year Mr. Guët, the head of the Archives Department of the Ministère des Colonies (which had meanwhile been separated from the Ministère de la Marine and transferred to the Pavillon de Flore at the Louvre), was asked to have transcripts made of the papers calendared by Mr. Marmette, who had returned to Canada in 1887. By the end of 1894 the first 30 volumes of the Correspondence Générale had been copied, and two years later 61 volumes had been sent out to Ottawa.

About this time Mr. Guët was succeeded by Mr. Victor Tautet, who had entered the Ministère des Colonies in 1895. M. Tautet, to quote Mr. Richard's report for 1899, 's'est constitué en quelque sort l'agent de notre gouvernement, dirige l'ouvrage de nos copistes, solde leurs travaux et fait tout ce qu'il peut pour faciliter la tâche que nous avons entreprise.'

In March, 1897, Mr. Edouard Richard was sent to Paris by Dr. Brymner to continue the calendaring begun by Mr. Marmette, whose death in May, 1895, had been a distinct loss to the Archives Branch. In addition to compiling an excellent description of the whole collection at the Ministère des Colonies, Mr. Richard continued the detailed summaries of the documents in this collection that relate to Canada. In his report for 1899 he gave an analysis of the seventeen volumes of the Collection Moreau Saint-Méry, of the twelve volumes of the Randot-Pontchartrain correspondence, of the six volumes of the Etat-Civil of Iles Royale and St. Jean, as well as the first 42 volumes of the Series B (letters sent). His summaries of the remaining volumes of Series B have been published since his death in the reports for 1904 and 1905.

In addition to losing in March, 1904, the eminent services of Mr. Edouard Richard, the Archives Branch was on June 9, 1907, likewise deprived of the aid of M. Victor Tautet. At that date some 270 volumes, including Series B as far as volume 23, had been copied and sent out to Ottawa.

The work in Paris remained at a standstill until the autumn of 1907, since which date some 11 volumes have been copied. Two copyists are now at work at Series B in the Colonial Office, while of the Fonds Amérique in the Ministère des Affaires Etrangères some five volumes have been copied. A copyist is also engaged in transcribing those manuscripts in the Bibliothèque Nationale that relate to Canada.

SESSIONAL PAPER No. 15

Before being sent to Ottawa each volume is carefully collated by Mr. Th. Beauchesne, of the Baie de Chaleur.

ARCHIVES WORK IN LONDON.

During the fiscal year 1907-8, the work of the Archives Branch in London has been carried on without interruption. At the Public Record Office progress has been made with the papers relating to the Maritime provinces. In addition to the instructions to the governors of these provinces to 1840, copies have been made of the Nova Scotia papers as far as 1804, those of Prince Edward Island to 1813, and those of New Brunswick to the year 1825. The logs of a number of the British warships present at Louisburg in 1745 and 1756 have also been copied. Transcripts have also been made of the papers relating to the negotiations which culminated in 1783 in the Treaty of Versailles. In this connection the thanks of the Archives Branch is expressed to Lord Lansdowne for his kindness in allowing copies to be made of the Shelbourne manuscripts in his possession.

The records of the Canadian post office which are to be found at the General Post Office in London have been copied as far as the year 1843. The death in February of this year of Mr. J. G. Hendry, the curator of the Record room at the G. P. O., has been a great loss. Fortunately Mr. Hendry had already brought to light and placed in order ready for copying the records of the Canadian post office for several more years.

The minute books of the Hudson's Bay Company have now been transcribed as far as No. 14, which embraces the fiscal year 1691-2.

I have now to refer more particularly to the work that is being done in the Archives Branch at Ottawa.

This department is divided into three main sections, viz.; 1 manuscripts; 2 maps and plans; 3 printed material.

Manuscript Section.

At the time that the branch was reorganized in 1904, we had then the following collections of manuscripts;—

| | |
|---|-------|
| A. Bouquet collection.. . . . | 35 |
| B. Haldimand collection.. . . . | 247 |
| C. Military.. . . . | 1,064 |
| F. Official correspondence under the French régime.. . . . | 223 |
| M. Correspondence of the Colonial Secretaries and miscellaneous documents.. . . . | 719 |
| Q. Correspondence of the Colonial Office with the governors of Upper and Lower Canada.. . . . | 869 |
| | <hr/> |
| | 3,157 |

8-9 EDWARD VII., A. 1909

Since that time the following collections have been added to the manuscripts already in our possession:—

| Series. | Nature. | Number of Volumes. |
|---------|---|-----------------------|
| D. | Durham papers. | 12 |
| E. | Registers and documents from the Privy Council, Ottawa | 1,000 |
| Fi. | Registers and documents from the Finance Department. | 24 |
| G. | Correspondence of the governors with Downing street.. | 572 |
| GS. | Correspondence of the office of the Governor-General .. | 105 |
| MD. | Correspondence and documents from the Militia Department. | 70 |
| S. | Registers and correspondence from the State Department, Ottawa. | 7,841 |
| | | <hr/> 9,624 |

If we add to these new acquisitions the collections acquired since 1904, viz.:—

| | | |
|----|----------------------------------|-------------|
| C. | Military papers. | 968 |
| F. | French correspondence. | 149 |
| M. | Miscellaneous documents. | 327 |
| | | <hr/> 1,444 |

Making a total of. 11,068

Therefore the number of manuscript volumes has been quadrupled since 1904. To this number may be added nine volumes of correspondence from the Indian Department dating from 1723, and 280 deeds of surrender.

It is unnecessary for me to dwell upon the value of the manuscripts now deposited in the Archives. The inventory of the collections which is now in the course of preparation will be published during the coming year, and will serve as a preliminary guide to the Archives. A general index of the printed reports of the branch since 1873 is now complete. These two publications will facilitate research while the work of a definite classification is going on.

I should call attention to the fact that in addition to the extensive collection which has been copied in England relating to the history of the Maritime provinces, we have been engaged in making research concerning the boundary fishery questions.

The documents acquired in this manner have proved of great service in the preparation of the cases which are to be submitted by the Government to arbitration. We have now, for example, original or copies:—

11 volumes relating to the Hudson's Bay.

20 volumes Selkirk documents.

11 volumes Oswald correspondence relating to boundaries and fisheries of Labrador and Maritime provinces.

And in order to facilitate the preparation of a history of the Canadian post office, 14 volumes have been copied in the General Post Office in England.

SESSIONAL PAPER No. 15

This supplementary copying in England has not interfered with regular transcription of historical documents which has been going on for years.

The removal to the Archives from different departments of documents prior to confederation, and the arrangement of these records, has entailed considerable work, although the arrangement is only temporary. The records after being examined and put in chronological order have been placed in portfolios. While a part of the staff is engaged in this work which requires close and particular attention, several members are employed in preparing a card index indicating the names of persons, subjects and localities. About 700,000 of these cards have been prepared and arranged.

A nominal index has been made for the series A, B, F and Q, and a similar index for the series C is in course of preparation. Although the arrangement of the various collections on one is not final, it permits access to the volumes with some degree of facility.

The removal of departmental records to a central office and the numerous acquisitions of the last three years have stimulated historical research in all parts of the Dominion.

The demands for information are constantly increasing and entail considerable correspondence. Men of experience only can be relied upon for this branch of inquiry. A regiseter is kept of all such investigations, and of the information supplied, so that the notes accumulated will be of service to future students.

The inquiries are not limited to questions of historical character; there are frequent applications for searches relating to lands, the origin and genealogy of families, municipal matters, and questions affecting civil rights. The land registers which have been transferred to the Archives, and those which have been copied in other provinces, facilitate the investigations of lawyers. The register of marriages, births and deaths are also frequently consulted.

The services rendered by the Archives to the cause of historical science has been recognized by specialists far beyond our own borders, and I am pleased to note that a publication under the direction of the branch has been chosen by the University of Oxford as one of the text books for examination in the school of modern history. It is evident that the liberal grant made by parliament, which has been expended with care, has produced excellent results.

Map Division.

The division contains now 4,285 plans, maps, and charts, the larger portion of which are original. During the course of the year 1,884 maps have been restored and mounted on linen. A classification has been commenced, and a general index of seven thousand cards has already been made. The cards give the full title of the map or plan, the date and name of the author. The demands for copies of maps and plans is increasing, which is proof that the public recognize the value of this division.

Printed Matter.

During the last fiscal year 1,263 new volumes have been added to this division. The volumes deal mainly with questions pertaining to our history. A record is made

8-9 EDWARD VII., A. 1909

of all new books published relating to Canada, and a card index is kept of all the leading articles in newspapers or reviews which have any bearing on Canadian affairs. The value of this work to the future historian or bibliographer will be incalculable.

A new feature in connection with the work of the Archives has been the collection of prints and engravings illustrating the development of Canadian life. This department is a popular one, judging by the demands from authors for permission to copy the prints, and from the words of appreciation by the numerous visitors to the Archives.

III.—PATENTS OF INVENTION.

The following tables show the transactions of the Patent Branch of the Department of Agriculture from April 1, 1907, to March 31, 1908:—

| Applications for Patents. | PATENTS AND CERTIFICATES GRANTED. | | | Caveats. | Assignment of Patents. | Notices under Section 8. |
|---------------------------------|-----------------------------------|---------------|--------|----------|------------------------------|--------------------------------|
| | Patents. | Certificates. | Total. | | | |
| 7,406 | 6,774 | 744 | 7,518 | 317 | 2,900 | 607 |

DETAILED STATEMENT, Patent Office Fees.

| Patents. | Assignments. | Caveats. | Copies. | Subscriptions to Patent Record. | Notices to apply for Patent. | Sundries. | Total. |
|------------|--------------|----------|----------|---------------------------------------|------------------------------------|-----------|------------|
| \$ cts. | \$ cts. | \$ cts. | \$ cts. | \$ cts. | \$ cts. | \$ cts. | \$ cts. |
| 166,030 53 | 6,330 18 | 1,675 00 | 1,887 72 | 516 52 | 1,815 25 | 227 29 | 178,482 49 |

The Canadian patentees were distributed among the provinces of the Dominion as follows:—

| Ontario. | Quebec. | Manitoba. | British Columbia. | Nova Scotia. | New Brunswick. | Saskatchewan. | Alberta. | Prince Edward Island. | Yukon. |
|----------|---------|-----------|----------------------|-----------------|-------------------|---------------|----------|-----------------------------|--------|
| 424 | 178 | 61 | 52 | 27 | 25 | 15 | 25 | 2 | 0 |

Statement of the number of patents issued under the Act, on which the fees are paid for periods of six, twelve or eighteen years, at the option of the patentee; and of patents on which the certificates of payments of fees were attached after the issue of patents originally granted for periods of six and twelve years.

| Period for which Fees were paid on First Issue. | | | Patents on which Certificates were attached after issue. | | Re issues. |
|---|-----------|-----------|--|-----------|------------|
| 6 years. | 12 years. | 18 years. | 6 years. | 12 years. | |
| 6,750 | 8 | 16 | 724 | 20 | 12 |

The total revenue for the year ended March 31, 1908, was \$178,482.49, exceeding the receipts in all previous years, and resulting in an increase of \$8,933.71 over the same period in the preceding year, thus averaging a monthly increase of \$744.48.

8-9 EDWARD VII., A. 1909

The total number of reports issued by the examiners during the year was 10,111. and twelve patents were surrendered and reissued.

Out of the total number of patents granted by this office during the year, there were 5,030 issued to inventors, or their assignees, resident in the United States, being seventy-four per centum of the whole issue.

This branch of my department receives regularly the official reports of patents from Great Britain, Australia, United States, Mexico and Japan, in exchange for the Canadian Patent Office Record.

The number of new applications for patents presented during the year was 7,406. being an increase of 329 over the previous year, and an increase of 653 in the number of patents granted.

The number of notices filed under authority of section 8 of the Patent Act was 607, yielding a revenue of \$1,815.25

The attention of applicants for patents should be directed to the necessity for the greatest care in the preparation of their applications, a work which is generally advantageously performed by patent solicitors not only in Canada, but in other countries where patent laws are in active operation.

The utmost care and diligence have been observed by the Patent Office in scrutinizing all applications for patents, and in cases where the alleged invention possessed none of the requisites of a patent, under the provisions of the Patent Act, the applications were refused.

Patentees under the instalment plan who have paid fees for one or more partial terms of their patents not infrequently postpone payment of the further fees required to keep their patents in force until after the date within which they are payable; consequently, the patents expire and it is not in the power of the office to revive them. A revival can only be secured by a private Act of Parliament, the obtaining of which entails considerable expense to the patentee. The attention of patentees is therefore called to the necessity of making their payments in time.

In dealing with petitions for extensions of time to manufacture or import under sections 38 and 39, the law is applied according to its strict and literal meaning, and the petitions are granted only when the petitioner has clearly established, to the satisfaction of the office, by affidavit or solemn declaration that the failure to manufacture or import is due to no fault of his, but to reasons beyond his control. Although a large number of these petitions were presented during the past year, it was seldom that such a case was made out as to warrant the granting of the desired extension.

The requirements of the law in regard to manufacture have been kept in mind when considering applications from patentees or their assignees to have their patents brought under the conditions of section 44 of the Act. (Compulsory License system.) The applications which have been granted are those relating to patents for inventions such as the following:—

Certain patents for an art or process; certain patents for improvements on a patented invention when both patents are not held by the same person; patents for certain appliances or apparatus used in connection with railways, telegraph, telephone

SESSIONAL PAPER No. 15

and lighting systems, and other works usually under the control of public or large private corporations, and which appliances or apparatus cannot be installed or constructed without the consent of such corporations; and certain patents for inventions which are manufactured or constructed only to order and are not, according to custom, carried in stock.

IV.—COPYRIGHTS, TRADE MARKS, INDUSTRIAL DESIGNS AND TIMBER MARKS.

STATEMENT of Fees received by the Copyright and Trade Mark Branch from April 1, 1907, to March 31, 1908.

| Months. | Trade Marks. | Copy- rights. | Designs. | Timber Marks. | Assign- ments. | Copies. | Totals. |
|---------------------|-----------------|------------------|----------|------------------|-------------------|---------|-----------|

V.—PUBLIC HEALTH AND QUARANTINE.

The most noteworthy event within this year has been the breaking out of the bubonic plague in the United States of America.

There have been cases of this disease in San Francisco, Emeryville, Point Richmond and Oakland in California, and in Seattle on Puget Sound, State of Washington.

After one recognized case in May the disease made its appearance in San Francisco in August, and thence spread to the other places in California above mentioned.

In San Francisco there have been 121 cases of plague verified bacteriologically, and 77 deaths. Many rats infected with the disease have been also found.

In Seattle the bubonic plague appeared in October; 6 cases occurred with 6 deaths: 5 whites and one Asiatic. The rats in Seattle also gave proof of infection. The last plague-infected rats were found on the 26th and 30th instant.

Immediately upon the outbreak of this disease in Seattle I sent my Director-General of Public Health there to study the situation. Special medical inspections were established at Victoria, Vancouver, Blaine, Huntington, Grand Forks, Northport (for Rossland and Nelson), and Kingsgate, with guards at Rykert's and Gateway. Special precautions were taken and are still being enforced to prevent the importation of rats by sea or land from infected ports and places.

SESSIONAL PAPER No. 15

As there have not been any further cases of plague reported from Seattle since October 31, I am to-day raising the frontier and port special passenger inspection for plague, but the precautions against the importations of rats are to remain in force.

The bubonic plague has been present during the year in Africa, Arabia, Australia, Brazil, Cape Colony, Chile, China, Ecuador, Egypt, Great Britain (Glasgow), Hawaii, India, Japan, Mauritius, Peru, the Straits Settlements and Trinidad.

Cholera has prevailed in Arabia, Ceylon, China, India, Japan, Korea, Philippine Islands, Russia, Straits Settlements, and Turkey.

Smallpox has again this year been world-wide in its prevalence. Cases of this disease have come from both the Orient and from Europe to my several stations, but they have been stamped out there, and the infection not permitted to pass inland.

The reappearance of this disease in epidemic form in the State of Minnesota caused me to appoint temporary medical inspectors along the frontier north of that state. Such inspectors have been appointed and are now at work at Fort Frances, Emo and Rainy River, in Ontario, and at Sprague, Emerson, Gretna, Morden, Crystal City, Killarney, Boissevain, Deloraine and Waskada in Manitoba.

The administration of leprosy has been carried out by me throughout the Dominion.

Circulars of warning and instruction in public health matters have been sent to my coast and frontier public health officers, from time to time as occasion demanded.

The diseases which have been brought to my maritime quarantine stations during the year and stamped out there are: Smallpox, beriberi, diphtheria, scarlet fever, enteric fever, measles and chicken-pox.

The port of Prince Rupert has been selected by the Grand Trunk Pacific Railway Company for their Pacific terminal point. Although passenger travel through this port is not to be expected for several years, yet with the beginning of the building of the Pacific section of the road, supplies, materials, and men must come to the port, so that a merchant marine quarantine will be at once required; this to be elaborated into a passenger quarantine station later on. In view of these facts, I sent my Director-General of Public Health to inspect and report upon the quarantine facilities and requirements of Prince Rupert.

VI.—CENSUS AND STATISTICS.

The final report of the census of Manitoba, Saskatchewan and Alberta, taken in the summer of 1906, has been published during the year. The report contains 12 tables of population and 15 tables of agriculture. The tables of population give statistics by sex, age, conjugal condition, birthplace and immigration for the census years 1906 and 1901. The tables of agriculture show the number of horses, horned cattle, sheep and lambs and swine, the area of yield of field crops and the number of farms. Summaries of the most important of these tables were given in last year's report. Early in 1907 circular letters and schedules were sent to specially selected correspondents in each district of the Northwest provinces asking for the actual aver-

8-9 EDWARD VII., A. 1909

age yield for his own farm and his estimate of the average yield for the township in which he resided. These returns have formed the basis for the estimate of the yield of the harvest of 1906, which is included in the report, and it is believed that the results are substantially correct. The comparative yield of field crops in the three provinces in 1900, 1905 and 1906 is as follows:—

| Kinds of Crops. | 1900 | 1905 | 1906 |
|--------------------------|------------|------------|-------------|
| N. W. Provinces. | | | |
| Fall wheat | | | |
| On fallow land.....bush. | — | 240,732 | 384,998 |
| On other land....." | 20,505 | 869,335 | 1,840,283 |
| Spring wheat | | | |
| On fallow land....." | — | 24,921,710 | 29,428,632 |
| On other land....." | 23,436,354 | 56,429,850 | 78,932,911 |
| Oats....." | 16,653,681 | 68,810,855 | 110,569,628 |
| Barley....." | 3,141,121 | 10,971,775 | 18,684,609 |
| Rye....." | 37,217 | 163,599 | 323,904 |
| Flax....." | 85,011 | 608,242 | 1,818,780 |
| Potatoes....." | 3,155,391 | 5,569,613 | 9,489,081 |
| Other field roots....." | 464,042 | 710,356 | 2,081,932 |
| Sugar beets.....ton | — | 19,907 | 32,075 |
| Forage crops....." | 90,852 | 105,828 | 123,022 |
| Sown hay....." | — | 174,689 | 359,701 |
| Prairie hay....." | 904,481 | 2,630,313 | — |

The Canada Year Book, 1906, being the second volume of the second series of the Year Book, has been published. The statistics have been brought down to the end of the fiscal year, 1906, and a number of new tables have been added. The principal additions are the census of manufactures for the Dominion taken in 1906, and the census of population and agriculture for the Northwest Provinces, taken in the same year. The tables of the Year Book for 1907 have been compiled and the book is now in the hands of the printer.

The report of criminal statistics for 1905 was issued early in the year, and the report for 1906 is now in press.

In 1906 a census of manufactures was taken through the medium of the Post Office, for the calendar year 1905, and the statistics published in Bulletin II. The schedules were mailed to every manufacturer in Canada, and in nearly every instance the information asked for was willingly supplied and the results show the rapid development of our manufacturing industries.

In the census of 1901 returns were collected only from establishments employing five hands and over, but in the census of 1906 all manufacturing establishments were included. Therefore in preparing comparative tables for the two census years statistics of establishments employing less than five hands in 1905 were excluded. The total number of establishments in 1905 was 15,796, while the number with five employees and over was 12,547. The following table gives the principal statistics of the Dominion for establishments employing five hands and over in 1900 and 1905:—

| | 1905. | 1900. | Increase. |
|-------------------------|---------------|-------------|-------------|
| Establishments | 12,547 | 14,650 | 2,103* |
| Employees | 383,920 | 339,173 | 44,747 |
| Capital | \$833,916,155 | 446,916,487 | 386,999,668 |
| Salaries and wages.. . | 162,155,578 | 113,249,350 | 48,906,228 |
| Value of products .. . | 706,446,578 | 481,053,375 | 225,393,203 |

* Decrease.

SESSIONAL PAPER No. 15

The apparent decrease in the number of establishments is due chiefly to the fact that in 1905 in certain large establishments where several kinds of articles were manufactured all the returns of an establishment have been embraced under the head of the principal kind, whereas in 1900 separate returns were given for each kind. Another reason is the tendency towards the merging of several small establishments into one large concern. The table given below shows the principal statistics in 1905 for all establishments:—

| | |
|------------------------------|---------------|
| Establishments | 15,796 |
| Employees | 392,530 |
| Capital | \$846,585,023 |
| Salaries and wages | 165,100,011 |
| Value of products | 718,352,603 |

The following comparative table shows that the value of products in every group of industries, with the single exception of shipbuilding, has very largely increased:—

| Groups of Industries. | 1900. | 1905. | Increase. |
|---|-------------|-------------|-------------|
| | \$ | \$ | \$ |
| Food products | 125,202,620 | 172,017,002 | 46,814,382 |
| Textiles | 67,724,839 | 84,370,099 | 16,645,260 |
| Iron and steel products | 34,878,402 | 52,587,051 | 17,708,649 |
| Timber and lumber, etc. | 80,341,204 | 109,500,970 | 29,159,766 |
| Leather and its finished products | 34,720,513 | 41,201,872 | 6,481,359 |
| Paper and printing | 20,653,028 | 32,773,880 | 12,120,852 |
| Liquors and beverages | 9,191,700 | 13,928,701 | 4,737,001 |
| Chemicals and allied products | 11,437,300 | 15,290,822 | 3,853,522 |
| Clay, glass and stone products | 7,318,582 | 13,558,921 | 6,240,339 |
| Metals and metal products * | 19,561,261 | 50,063,669 | 30,502,408 |
| Tobacco and its manufactures | 11,802,112 | 15,189,720 | 3,387,608 |
| Vehicles for land transportation | 19,971,605 | 36,911,124 | 16,939,519 |
| Vessels for water transportation | 2,013,668 | 1,892,253 | 151,415† |
| Hand trades | 599,329 | 1,433,753 | 834,424 |
| Miscellaneous | 35,607,212 | 65,721,741 | 30,114,529 |
| Totals | 481,053,375 | 706,446,578 | 225,393,203 |

* Other than steel.

† Decrease.

Statistics of field crops and live stock for the provinces of Ontario, Quebec, New Brunswick, Nova Scotia and Prince Edward Island have this year been collected through correspondence with the farmers of those provinces, and the results are published in Bulletins III., IV. and V. It is not necessary to deal with Bulletins III. and IV. (field crops and live stock of the Maritime provinces and Ontario), as the statistics are given in more detail and with additional data in Bulletin V.

Bulletin V. is the final report of the census of agriculture for Ontario, Quebec, and the Maritime provinces, 1907. In Ontario the census was undertaken jointly by the Census and Statistics Office and the Ontario Bureau of Industries, the schedules being distributed and received through the post office by the former office and the returns being compiled by the latter. For the other provinces the work was done entirely by the Census and Statistics Office. The tables of this bulletin show by provinces and counties for 1907 and 1901 acreage of farm land cleared, in all crops and

8-9 EDWARD VII., A. 1909

in orchard and garden; acreage and yield of field crops and areas of field crops per 100 acres of occupied farm land, and the number of live stock by counties in 1907 and by provinces in 1901, together with the number of live stock per 100 acres of occupied land. In the six years 1901-1907, there was an increase of farm land cleared of 900,429 acres in Ontario, 1,092,652 acres in Quebec, 259,326 acres in New Brunswick, 590,527 acres in Nova Scotia and 35,058 acres in Prince Edward Island; the increase of land in all crops was 567,008 acres in Ontario, 556,049 acres in Quebec, 192,831 acres in New Brunswick, 163,306 acres in Nova Scotia and 56,485 acres in Prince Edward Island; while the increase in orchard and garden was 64,360 acres in Ontario, 44,084 acres in Quebec, 7,556 acres in New Brunswick, 21,193 acres in Nova Scotia and 2,957 acres in Prince Edward Island. In the comparative tables of the two census years a large decrease is noticeable in the acreage and yield of fall wheat and spring wheat in Ontario, the decrease of the former being 438,772 acres and 6,328,591 bushels, and of the latter 227,894 acres and 4,064,892 bushels. This decrease is no doubt due to the larger and cheaper production of these grains in our Northwest provinces.

In the five provinces there is an increase in acreage and yield of oats, barley, buckwheat, beans, potatoes, field roots, hay and corn for forage, an increase in acreage of corn in ear, mixed grains, and cereals, a decrease in acreage and yield of fall wheat, spring wheat, rye and pease and a decrease in yield of corn in ear and cereals.

The number of horses in the five provinces in 1907 was 1,240,171, of milch cows 2,353,456, of other cattle, 2,833,762, of sheep 2,478,688, of swine 3,006,234, and of poultry 20,565,580. Quebec shows a decrease in the number of sheep and Prince Edward Island of milch cows and sheep. The other provinces show increases in every class of live stock. Quebec leads with the largest actual increase of milch cows and is second with swine; Ontario is first with other cattle and swine, and Nova Scotia with sheep. The following table shows the increase of live stock in the six years by provinces:—

| Provinces. | Horses. | Milch Cows. | Other Cattle | Sheep. | Swine. | Poultry. |
|--------------------|---------|-------------|--------------|----------|---------|-----------|
| Ontario..... | 77,430 | 133,592 | 365,877 | 63,752 | 518,992 | 3,985,619 |
| Quebec..... | 68,395 | 141,701 | 76,723 | -23,428* | 341,452 | 1,413,899 |
| New Brunswick..... | 9,907 | 22,714 | 15,999 | 69,920 | 46,848 | 374,250 |
| Nova Scotia..... | 8,244 | 15,417 | 25,104 | 106,391 | 32,796 | 346,803 |
| P. E. Island..... | 769 | -2,512* | 4,988 | -14,189* | 7,589 | 154,635 |

* Decrease.

Statistics of butter and cheese are now being collected and compiled for the calendar year 1907, circular letters and schedules for returns having been mailed to owners or managers of all creameries and cheese factories in the Dominion.

The whole is respectfully submitted.

SYDNEY A. FISHER,

Minister of Agriculture.

PUBLIC HEALTH.

No. 1.

REPORT OF THE DIRECTOR GENERAL OF PUBLIC HEALTH.

(F. MONTIZAMBERT, I.S.O., M.D.Ed., F.R.C.S.E., D.C.L.)

March 31, 1908.

SIR,—I have the honour to submit this my report as Director General of Public Health for the year ending this day.

The most important public health event during the year has been the occurrence of cases of the bubonic plague in San Francisco, and other places in the state of California, and in Seattle in the state of Washington, this last place being in close proximity to and in daily close communication with this country, at many points, maritime and frontier.

The usual threatening of this disease from the Orient, and of this and other infectious diseases from the Orient and from Europe, South America, &c., have continued since my last report.

Strict measures, ordinary and special, have, therefore, been approved by you for the sanitary protection of the country.

Circulars of warning and instruction were issued from time to time to the regular quarantine officers and to the customs officers who are also ex-officio quarantine officers at the unorganized maritime and inland ports.

As early last spring as navigation permitted I proceeded by your instruction to the St. Lawrence quarantine station, Grosse Isle, to give Mr. George Dancause, an old and recently superannuated employee, the medal of the Imperial Service Order graciously conferred upon him by His Majesty in recognition of his long and faithful services. The investiture was in accordance with my instructions carried out on the scene of his labours and before a full gathering of his former fellow employees.

In June I proceeded by your instruction to inspect the Pacific coast stations of Vancouver and William Head, Victoria. And thence I went up to Prince Rupert, the terminal point on that coast of the Grand Trunk Pacific Railway. I made a careful inspection of that place and the neighbouring harbours. My report thereupon I had the honour to submit to you under date the 31st July last.

In view of the reported probability of railway extension to the west shore of Vancouver Island, I returned south along that coast and inspected for your information the quarantine facilities of its various sounds and inlets.

In August I inspected the leper lazaretto at Tracadie, N.B., the quarantine stations at Grosse Isle, Chatham, St. John, Halifax, Sydney, Louisburg and Charlottetown, and the quarantine buildings at Pictou, N.S.

In September I attended the meeting of the Canadian Medical Association in Montreal. The next annual meeting is to be here in Ottawa June 9, 10, 11 next. The association having now adopted a national constitution decided that its first meeting as a truly national body should be held in the national capital. The association did me the honour of electing me its president.

In the beginning of October I was present as your delegate at the annual meeting of the American Health Association held in Atlantic City, New Jersey.

8-9 EDWARD VII., A. 1909

At both the meetings of these two associations renewed resolutions were adopted in favour of the establishment of national departments of health.

I left again for the Pacific coast by your command on October 23, immediately upon the receipt of the news of the occurrence of cases of bubonic plague in Seattle in the state of Washington.

Before I left Ottawa, you had authorized me to appoint temporarily by telegraph the same inspectors who had been at work for smallpox. I also before leaving despatched to Dr. Watt by express the supplies received within the last year of Yersin's serum for the prevention and treatment of the bubonic plague. Anticipating some such emergency as this, I have been getting it out in monthly supplies for several years past, from the Lister Institute of Preventive Medicine, in London, where it is made according to the process of Yersin, one of the workers in the Pasteur institute. It remains good for a year, and does not depreciate more than ten per cent in eighteen months.

I reached Victoria on the 30th, where I saw Dr. Fagan, of the Provincial Board of Health; Dr. Robertson, the city health officer; Dr. Milne, of the Immigration Service; Dr. Fraser, who acts for you on occasion; and the Mayor of the city; and arranged for precautionary measures to be taken at Victoria, in all of which they promised co-operation. Here and at Vancouver I arranged that all boats from Puget Sound and from the Orient should be breasted out six feet from the piers to prevent rats jumping on and off; to have their mooring lines protected by metal discs, and the gangways reduced as far as possible and guarded by quarter masters watch and watch about. I arranged also for the fumigation with sulphur on the lay off days of any boats running a ferry service to the Sound, which lay off for one day in the week at Victoria or Vancouver.

When advising with the civic authorities of Victoria and Vancouver, instruction was given for the destruction of garbage to reduce the food supply of rats, and the poisoning of the rats when the food supply had been reduced, and the offering of a premium for each rat brought in.

The companies had arranged for the inspection at Seattle of the passenger boats between that port and Vancouver and Victoria; and I put Dr. Fraser on duty to inspect all other boats arriving from Puget Sound ports. I also introduced him, as Dr. Watt was to be absent, to communicate at once with the customs officers of Chemainus, Ladysmith, Nanaimo, Union and Comox, and to instruct them to treat Puget Sound vessels coming to them direct, under the regulations for this subject, calling for medical men to inspect them as suspected vessels.

On the evening of that same day I crossed to Seattle, reaching there at ten p.m., and went direct to the pier where the *Princess Beatrice* was leaving for Victoria at 10.30. I found Dr. McDowell on duty there, and a notice up at the shore end of the passenger gangway to the effect that no passengers were allowed on board before 9.30, at which hour Dr. McDowell arrived each evening, to inspect them. As soon as that boat sailed, I went over to another pier, where the steamer *Iroquois* left for Vancouver at midnight. There I found Dr. Kellog on duty, and a similar notice to passengers, limiting their reception on board to the last hour before departure. Both of these gentlemen appeared to be thoroughly up in their work, and to be conscientiously performing their duties. The next morning, October 31, I was down at another pier at 7.30 to see the inspection of the *Chippewa*, leaving daily for Victoria at 8.30.

I spent the most of the morning in the plague laboratory, where I thoroughly convinced myself that there was no doubt whatever of the presence of the bubonic plague in Seattle. The micro-organisms under the microscope from the glands of the Chinaman that died; from the sputa of the white woman who was dying from the pneumonic form that morning, and who died in the afternoon of the same day; and from the dissections of the guinea pigs and rats which were shown to me, and which had been killed by the inoculation from the human patients; rendered this matter beyond doubt. At the time I left Seattle there had been six cases—including the two above indi-

SESSIONAL PAPER No. 15

vidually referred to—all fatal; one of the Chinamen with the bubonic form, and the other five white people with the pneumonic form.

The United States Government has made the dealing with plague in Seattle an entirely federal matter; having, at the request of the state of Washington and the city of Seattle, sent twelve of the medical officers of the United States Public Health Service for action at Seattle and its neighbourhood.

I had a long conference with Dr. White, the chief officer of the United States Public Health Service, and with the medical officers of the state and the municipality; and they agreed to take the same precautions for all vessels in Puget Sound as I had already established for vessels at British Columbia ports. Dr. White used the federal authority delegated to him to issue orders that same afternoon to all the railway companies which connect with Seattle, instructing them to sprinkle chloride of lime in the empty freight cars, and that cars standing at station platforms should be kept closed, except when it was absolutely necessary to have them open, and in all cases to be closed at night.

I also saw Mr. Croker, of the Inland Navigation Company; Mr. Burns, of the Alaska Navigation Company; Mr. Cook, of the Western Steam Navigation Company; and the Frank Waterhouse Company, managers of the Boston Tow Boat Company and freight boats to the Orient.

The president of the State Board of Health being absent in Europe, and his work being done by Dr. Yocum, of Tacoma, I went over to Tacoma on Friday morning, and saw Dr. Yocum, and also called on Dodwell and Company, of the Blue Funnel Line, which load at Tacoma and then touch at Vancouver and Victoria. All these gentlemen—both the sanitary officers and the agents—received me most kindly; expressed themselves as being very glad to get suggestions from me, as we were all working for the common good, and undertook to have all suggested precautions carefully carried out.

On Sunday, the 3rd, and Monday morning, the 4th, I had conferences with Dr. Underhill, the city health officer Vancouver; Dr. McPhillips, who was replacing our Dr. McKechnie for the time; Dr. Brydon Jack, and Dr. Stuart, who came down for the purpose from Mission Junction. I saw also Mr. Brown, of the Canadian Pacific Railway Steamship Line, and Mr. Burns, of the Great Northern, about the breasting out, &c., of their vessels, and the care of their freight cars.

During the next few days I visited and conferred with our medical inspectors at Blaine, Huntingdon, Grand Forks, Northport, and Kingsgate, in British Columbia.

I am glad to be able to report to you that my mission was a successful one, and I cannot but feel that it has led to a greater degree of protection for Canada against this dread disease. My personal investigations in Seattle have tended to more cordial co-operation with us on the part of the United States steamboat and railroad lines, and have also encouraged our frontier medical officers in taking up their professional duties in connection with this threatened pestilence.

The press on both sides of politics gave great credit in repeated issues to the government for its prompt action in sending out its senior sanitary officer to take charge of this matter.

Precautions against the importation of rats are still being maintained. Two rats, in which plague was positively determined, were found at Seattle so late as the 26th and 30th instant.

The two new steamers for the quarantine service delivered to you this year have proved entirely satisfactory. They have added much to the efficiency of the service at their respective stations. The *Alice*, built by the Canadian Shipbuilding Company at Toronto, was sent by you to the quarantine station at Grosse Isle. The *Madge*, built by the British Columbia Marine Railways Company, Limited, at Esquimalt, you devoted to service at the William Head Station on the Strait of Juan de Fuca.

Of the seagoing and other good qualities of the *Madge* I can speak from personal experience. Only delivered to us in June, I took her on July 2, and a single crew ran

8-9 EDWARD VII., A. 1909

her for seventeen consecutive days up to Prince Rupert and Port Simpson, and back outside Vancouver Island. We met some heavy weather in the open Pacific, but the only delay caused by the boat was one of about two hours from a heated bearing. A very satisfactory record for so new a steamer.

Under authority of 'An Act respecting Leprosy,' passed in June, 1906, which gives you administration in leprosy throughout the Dominion, arrangements were made to meet the wishes of the eight Chinese lepers you took over at D'Arcy Island, B.C., lazaretto, and by your authority they were transferred in May last back to China. This was only done after everything had been arranged for their reception at the leper mission amongst their own people near Canton. Since that, three other Chinese lepers have been discovered in the initial stages of the disease, and they also have been sent home to China.

After the lepers left D'Arcy Island their old shacks were destroyed by fire.

There are not now as far as is known any cases of leprosy left in British Columbia.

As, however, it is a disease with a period of incubation lasting often over years, it is quite possible that some amongst the Asiatic population of the province may have contracted it in the Orient and may develop it later. To meet this possibility two new shacks of concrete have been erected at D'Arcy Island for their reception temporarily or permanently as the case may be.

At the Tracadie lazaretto continued benefit follows the use of the Chaulmoogra oil treatment in cases in the earlier stages of the disease. The two cured cases previously reported as discharged from the lazaretto under a sort of sanitary ticket-of-leave have not as yet shown any sign of the recurrence of the disease.

In your administration of leprosy generally throughout the Dominion, a leper was removed in January from Winnipeg to the Tracadie lazaretto. The case was a Doukhobor youth who has been in this country for eight years.

In addition to the frontier medical inspection for bubonic plague south of British Columbia, an outbreak of smallpox in epidemic form in the states of Minnesota and North Dakota, caused the appointment under your authority of temporary medical inspectors at Fort Frances and Rainy River in Ontario, and at Sprague, Emerson, Gretna, Morden, Crystal City, Killarney, Boissevain, Deloraine, and Waskada, in Manitoba. These inspectors are still on duty.

Your two new permanent quarantine officers, Dr. Baxter, at Chatham, and Dr. Ruddick, at St. John, have taken up their duties in a manner that leaves nothing to be desired.

The Royal Sanitary Institute of England did me the unexpected honour of electing me as one of their Fellows in December last.

Grosse Isle, Que.—Vessels inspected 378, being 350 at Grosse Isle, and 28 at its sub-station of Rimouski. Persons inspected, 204,080, being 157,359 at Grosse Isle, and 46,721 at Rimouski. Infectious disease was reported or discovered on eighty vessels. The admissions to hospital were 634, with an average of 50 to 150 at a time. The diseases include smallpox, enteric fever, scarlet fever, diphtheria, measles, chickenpox and whooping cough. The deaths in hospital numbered eleven, 3 from pneumonia complicating measles, 1 from scarlet fever, 2 from diphtheria, 1 from diphtheria complicating scarlet fever, 2 from general debility, 1 from convulsions, and 1 from enteric fever.

The carrying out of the western wharf into deep water so that infected vessels might come to it for the immediate landing of their passengers, and the prompt treatment and disinfection of the vessel, continues to be a matter that is of the gravest importance in the interests of the passengers and of the shipping. The new steamer *Alice* is a valuable addition to the equipment of the station.

The replacing of the old wooden detention sheds for 2nd class and steerage passengers, which sheds date back from 1832 and 1848, by brick buildings with modern appliances is more and more urgently pressing each year.

SESSIONAL PAPER No. 15

Halifax, N.S.—Vessels inspected, 304. Persons inspected, 69,923. Vessels arriving with infectious disease, 20. Admissions to hospital, 123. Deaths, 3. The admissions included smallpox, scarlet fever and measles. The three deaths were from scarlet fever. A new boat is much needed, and a wharf at Halifax for an inspecting base.

St. John, N.B.—Vessels inspected, 190. Persons inspected, 21,785. Vessels arriving with disease, 10. Admissions to hospital, 16. Diseases; scarlet fever, diphtheria, enteric fever, measles, and chicken pox. Deaths in hospital, 2, 1 from diphtheria and 1 from enteric fever. A larger steam sterilizer, and a deep water wharf continue to be the most pressing needs at this station.

Sydney, N.S.—Vessels inspected, 116. Admissions to hospital, 2 cases of diphtheria.

Louisburg, N.S.—Vessels inspected, 23. No quarantinable disease.

Chatham, N.B.—Vessels inspected, 35. No quarantinable disease.

Charlottetown, P.E.I.—No quarantinable disease.

William Head, Victoria, B.C.—Vessels inspected, 275. Persons inspected, 48,044. Of these, 12,573 were Japanese steerage passengers, 7,667 Chinese and 2,613 Hindus. Diseases: Smallpox, chickenpox, measles, beriberi, and dysentery. Six steamers brought smallpox. Admissions to hospital, 34. Seventeen cases of smallpox, three of chickenpox, four of measles, twelve of beriberi, one of dysentery, one of septisemia. Deaths; one from smallpox, and one beriberi.

Vancouver, B.C.—Vessels inspected, 5. No quarantinable disease.

Leprosy Generally.—In the administration of leprosy generally throughout the Dominion under the Act respecting leprosy, a leper lad was removed from the Winnipeg General Hospital to the Tracadie lazaretto in January last. He is a Doukhobor, and has been eight years in this country. Three other cases were deported to China.

Tracadie, N.B., Lazaretto.—There are at present sixteen inmates. One death occurred during the year, and three new cases have been admitted. The two 'cured' cases discharged but still under observation remain free from any recurrence of the disease.

The Chaulmoogra oil treatment continues to be of service, controlling and mitigating the progress of the disease, even in cases too advanced to hope for any more definite results.

D'Arcy Island, B.C. Lazaretto.—The eight Chinese lepers from this station were transferred to their great satisfaction to the leper mission near Canton. Two substantial cement shacks have been erected to serve as receiving houses for future cases, temporary or permanent.

Public Works Health Act.—Mr. C. A. L. Fisher reports as inspector for the territory from Winnipeg east to the Atlantic coast. He found the medical service more complete than and the sleeping quarters and boarding of the men to be fully equal to, the very good conditions reported last year.

Dr. T. R. Chamberlain, inspector for the territory west of Winnipeg, reports that there has been a marked improvement in the health of the men employed on railway building, and the sanitary conditions of the camps as compared with last year.

I have the honour to be, sir,

Your obedient servant,

F. MONTIZAMBERT, M.D.,

Director-General of Public Health.

The Honourable

The Minister of Agriculture,
Ottawa.

No. 2.

(G. E. MARTINEAU, M.D.)

GROSSE ISLE, QUEBEC, April 1, 1908.

SIR,—I have the honour to submit this my annual report of the St. Lawrence quarantine service to March 31, 1908.

There were 350 vessels examined at this station during the year, being a decrease of 52 as compared with the number reported last year; this being due to the fact that the last report was covering a period of seventeen months, while this one is covering the usual period of twelve months. For the first time on record there were no sailing vessels examined.

The total number of persons examined was 157,359, being an increase of 42,560 as compared with last year.

They were divided among the different classes of passengers as follows: First cabin, 4,241; second cabin, 28,828; steerage, 90,433; cattlemen, 1,158, crews, 32,574; stowaways, 125.

The number of stowaways was considerably decreased as a result of the new regulations regarding them.

Infectious disease was reported or discovered on each of the passenger vessels sailing to the St. Lawrence from one to four times, and also on the following freighters; SS. *Mohawk*, *Langfond* and *Ontarian*, in all eighty times.

The diseases so reported or discovered were smallpox, scarlet fever, measles, diphtheria, varicella, pertussis, and typhoid fever.

Smallpox.—SS. *Langfond*, Captain Hansen, sailed from Barbados June 18, with 23 persons on board (all crew), and arrived at quarantine at 6.30 a.m. June 28.

On June 20, this vessel called at the port of St. Georges, in the island of Bermuda for medical aid, and the medical officer of this port added to the bill of health the following note:—

‘The above ship called at this port for medical aid, only two of crew are presenting symptoms of smallpox in mild form. Persons (23) vaccinated and ship proceeds on voyage to Montreal.’

These two cases were conveyed to smallpox hospital at station, and all the rest of the crew was landed for quarantine and observation.

Owing to the fact that this vessel, after having been thoroughly disinfected, could not proceed on voyage unless her own crew took charge of her; and taking into consideration the fact that these cases of smallpox developed early on the voyage, and that all precautions possible were taken to prevent the spread of the disease on board, also, that the crew had been vaccinated first at Bermuda on June 20, those who had not been successful having been revaccinated at quarantine; the crew was under the circumstances, permitted by special authority of the department, to proceed with the steamer on July 7, the two that were in the smallpox hospital being well enough were released with the others.

Steerage passengers refusing vaccination arrived here on five different occasions, on the *Parisian*, *Victorian*, *Tunisian*, *Dominion* and *Corsican*, and numbered twenty-one persons. They were landed for the usual period of observation.

Deaths during the voyage were reported on 22 occasions, a total of 31 deaths, from the following causes; Heart failure, 7; meningitis, 2; broncho pneumonia, 3; bronchitis, 2; debility, 1; apoplexy, 1; convulsions, 4; dysentery, 1; delirium tremens, 1; typhoid fever, 1; chronic hydrocephalus, 1; congestion of lungs, 1.

SESSIONAL PAPER No. 15

Births during the voyage were reported on twelve different occasions.

The work at this station, especially at the hospital, has increased considerably and is likely further to increase. I would therefore respectfully recommend that the staff be increased accordingly.

There were 634 admissions at the hospital during the year, and we have always had a number varying from 50 to 150 persons at the same time suffering from different diseases.

The deaths numbered eleven; 3 from pneumonia, complication of measles; 1 from scarlet fever; 1 from diphtheria complicating scarlet fever; 2 from general debility; 1 from convulsions; 2 from diphtheria, and 1 from typhoid fever.

There was also landed for burial at quarantine the body of one child who died from dysentery on SS. *Lake Michigan*.

Quarantine staff.—Dr. E. Belisle continued to be in charge of the Rimouski sub-station.

Improvements and Requirements.—Deep water wharf.—The time has fully come when it is necessary to lengthen the western wharf; seeing that it is dangerous now for our boats to moor there at low tide, on account of there not being enough water; I would therefore respectfully recommend, as I have always done on every possible occasion, to have it prolonged into deep water, so as to enable the infected vessels to moor and land their passengers and effects, which would prevent many delays to the shipping and passengers.

The new quarantine steamer *Alice* was completed and delivered to the department last season.

The following improvements were carried out during last season :—

The eastern wharf has been prolonged. The administration building was completed and a new guard's house and boundary fence erected. New quarters were provided for the carter. The building where is to be installed the steam laundrying disinfecting apparatus has been erected, and I have reason to hope that it will be completed next season.

The necessary apparatus and instruments for the laboratory have been received, but the building where they are to be installed has not been commenced yet.

A new building for the accommodation of the second cabin passengers is required, also four new buildings, one for the hospital steward, one for the captain and chief engineer, one for a school house and the other one to be used as a store for the provisions, bedding, &c., necessary for the hospital.

There are still some other repairs and works necessary, the list of which is in the hands of the department.

All of which is respectfully submitted.

I have the honour to be, sir,

Your obedient servant,

G. E. MARTINEAU, M.D.,

Medical Superintendent of the St. Lawrence Quarantine Service.

The Honourable

The Minister of Agriculture,
Ottawa.

No. 3.

(N. E. MacKay, M.D., M.R.C.S.)

HALIFAX, N.S., March 31, 1908.

SIR,—I have the honour to submit my annual report of the year ended 31st March, 1908.

The number of vessels inspected during the year was 304, and the number of immigrants was as follows: First-class, 2,313; second-class, 11,677; third-class, 35,293; cattlemen, 130, and crew, 20,510. Total 69,923.

During the year just closed the work of the station was uneventful. Smallpox was found on one vessel—the American schooner *Fame*, from Boston. She arrived on the 7th of December, 1907, with a crew of 23 men. Only one man was sick with the disease. The well persons were vaccinated and detained in quarantine of observation the regular time—18 days. None developed the disease. The vessel and crew were disinfected in the usual way.

Measles were found on the following ships: SS. *Dominion*, from Liverpool, April 2; *Kensington*, Liverpool, April 7; *Empress of Ireland*, from Liverpool, April 12; *Southampton*, from Liverpool, April 14; *Armenia*, from Hamburg, April 29; *Ionian*, from Liverpool, April 29; *Siberian*, from Liverpool, June 26; *Empress of Ireland*, from Liverpool, November 21; *Dominion*, from Liverpool, December 1; *Corsican*, from Liverpool, December 14; *Empress of Ireland*, from Liverpool, December 19; *Pomeranian*, from Havre, January 3, and on *Empress of Ireland*, from Liverpool, March 27.

Scarlet fever was found on *Pomeranian*, from Havre, January 3, 1908. Diphtheria on *Empress of Ireland*, from Liverpool, November 21, 1907, and on *Corsican*, from Liverpool, December 14. Chicken-pox on *Canada*, from Liverpool, April 19 and December 14.

Non-quarantinable diseases occurred on the following ships: *Kensington*, April 27, phthisis; *Pomeranian*, Havre, April 11, pneumonia; *Numidian*, April 17, pleurisy; *Orinoco*, April 18, la grippe; *Victorian*, April 19, pneumonia; *Mongolian*, April 23, pleurisy; *Laurentian*, April 25, pleurisy; *Ottawa*, April 27, pneumonia; *Dahome*, April 30, pleurisy; *Hispania*, June 1, pneumonia; *City of Bombay*, June 6, la grippe; *Amethyst*, June 6, phthisis; *Carthaginian*, July 4, dysentery, and September 26, erysipelas.

Deaths occurred on following steamers: *Dominion*, April 2, rheumatism; *Kensington*, April 7, phthisis; *Pomeranian*, April 11, pneumonia; *City of Bombay*, June 6, pneumonia; *Empress of Ireland*, November 21, cerebral hæmorrhage; *Pomeranian*, January 3, scarlet fever; *Empress of Ireland*, February 27, convulsions, and *Sardinian* March 19, convulsions.

Outside our regular work, we had three coasting vessels at the station for smallpox, viz.: Government steamers *Aberdeen* and *Lady Laurier* and the *Scotia*. The *Lady Laurier* is in quarantine at the time of writing.

Three deaths occurred at the station hospital from scarlet fever. They were immigrants ex SS. *Pomeranian*, from Havre, and were all under three years.

There were 123 persons admitted to the hospital during the year just closed.

We need a bigger staff than we have at present. We need a resident engineer and a resident carpenter. They would find plenty of work to do in keeping the plant and buildings in thorough repair.

Since the new hospital was finished the staff has been increased by the appointment of an orderly and a matron and nurse. Miss F. Himelman, the matron and

SESSIONAL PAPER No. 15

nurse, is well qualified for the position to which she has been appointed. The work has been greatly facilitated by the opening of the new hospital and the appointment of a nurse and orderly. We can make the sick quite comfortable,

Mr. Himelman, the orderly, who has been laid up for two months with an attack of serious illness, is, I am pleased to report, improving fast, and will, I trust, be able to resume duty soon.

We need a new boat badly. It is to be hoped our quarantine boat is nearing completion. We should have her early in June. If the SS. *Argus* is to do much more work, there must be an outlay of from \$800 to \$900 put on her in the spring.

An inspecting station ashore is urgently required, and there is no better place for a station than the lumber yard. To make Lawlor's island an inspecting station is impracticable. It is hardly suitable for even a detention station and hospital. In the year 1907 eastern passage was frozen over from February till April 1, and therefore impossible. The ice was so solid that no steamer in the harbour could get through it. The SS. *Robling*, a powerful tug-boat, failed to break the ice up, as did also the government steamer *Aberdeen*. If an immigrant ship had come into port in the meantime with smallpox on board, it would have been difficult to handle her. I mention these things to show that to make Lawlor's Island an inspecting station is out of the question.

I have the honour to be, sir,

Your obedient servant,

N. E. MACKAY, M.D.,

Quarantine Officer.

The Honourable

The Minister of Agriculture,
Ottawa.

No. 4.

(R. C. RUDDICK, M.D.)

ST. JOHN, N.B., April 3, 1908.

SIR,—I have the honour to submit my report for the year ended March 31, 1908.

The number of vessels inspected, 190. The number of persons inspected, 21,785, classified as follows:—

Cabin, 1,032; intermediate, 1,484; steerage, 10,713; cattlemen, 282; crew, 8,274.

No vessels arrived with the graver quarantinable diseases.

Ten vessels arrived with the minor quarantinable diseases.

The following vessels arrived with the minor quarantinable diseases:—

SS. *Lake Champlain*, from Liverpool, April 9, 1907, measles (2).

SS. *Mount Temple*, from Antwerp, April 17, 1907, scarlatina (2).

SS. *Empress of Ireland*, from Liverpool, November 22, 1907, measles (3); diphtheria (1).

SS. *Victorian*, from Liverpool, December 1, 1907, measles (1).

SS. *Cassandra*, from Glasgow, December 13, 1907, measles (2).

SS. *Empress of Ireland*, from Liverpool, December 20, 1907, measles (1).

SS. *Oruro*, from Bermuda, January 18, 1908, typhoid (1).

SS. *Empress of Ireland*, from Liverpool, February 1, 1908, chicken-pox (1).

SS. *Montezuma*, from Antwerp, March 4, 1908, measles (1).

SS. *Virginian*, from Liverpool, March 8, 1908, chicken-pox (1).

8-9 EDWARD VII., A. 1909

The number of patients treated at our hospital during the year, 16.

The number of deaths occurring in hospital, 2; one from typhoid, and one from diphtheria.

There were 10 deaths reported on the following ships on their voyage to this port:—

SS. *Mount Temple*, April, 1907, scarlet fever (2).

SS. *Lake Champlain*, April, 1907, suicide (1).

SS. *Acamo*, August, 1907, phthisis pulmonalis (1).

SS. *Empress of Ireland*, December 17, 1907, cerebral hæmorrhage (1).

SS. *Montrose*, January, 1908, convulsions (1).

SS. *Dahome*, January 1908, suicide, (1).

SS. *Salacia*, January, 1908, heart failure (1).

SS. *Virginian*, March, 1908, delirium tremens (1).

SS. *Salacia*, March, 1908, accidentally killed (1).

A deep water wharf is very much needed at our station, and a boat sufficiently large to perform an all-year-round service; enlargement of our sterilizing plant is required, also fencing of the new quarantine grounds is very necessary.

I am, sir,

Your obedient servant,

R. C. RUDDICK, M.D.,

Quarantine Officer.

The Honourable

The Minister of Agriculture,
Ottawa.

No. 5.

(HORACE RINDRESS, M.D.)

NORTH SYDNEY, C.B., March 31, 1908.

SIR,—I have the honour to submit my report for the year ending March 31, 1908.

The total number of vessels inspected during the above period was 116. Of these 88 were steamships and 28 were sailing vessels. Two cases of diphtheria were found on the SS. *Fritzoe*, on May 21. They were removed and cared for at the quarantine station. The ship was disinfected and allowed to proceed at once.

With the above exception no quarantinable disease was brought to this port during the past year. There have been some needed repairs and improvements made at the Point Edward Station.

I have the honour to be, sir,

Your obedient servant,

HORACE RINDRESS, M.D.

The Honourable

The Minister of Agriculture,
Ottawa.

SESSIONAL PAPER No. 15

No. 6.

(F. O'NEILL, M.D.)

LOUISBURG, C.B., March 31, 1908.

SIR,—I have the honour to submit my report for the year ending March 31, 1908.

The total number of vessels examined for the year was 23 with 699 men. No quarantinable disease of any kind was brought to this port during the above period.

I have the honour to be, sir,

Your obedient servant,

FREEMAN O'NEIL,

Quarantine Officer.

To the Honourable

The Minister of Agriculture,
Ottawa.

No. 7.

(PETER CONROY, M.D.)

CHARLOTTETOWN, P.E.I., March 31, 1908.

SIR,—I have the honour to submit my report of the transactions at this station, for the year ending March 31, 1908.

No quarantinable disease was brought to this port during the year just ended. In the month of October last, by permission of the minister, the hospital was loaned to the local authorities here, for the accommodation of some cases of smallpox, an epidemic of that disease having developed in different parts of this province. The building has since been relinquished, after being thoroughly cleansed and disinfected.

A long-felt want has been supplied to the hospital, by the placing of a pump and tank in the building, for the furnishing of a sufficient supply of fresh water from the well.

The general state of the hospital quarters leaves at present little to be desired. There were nine arrivals of vessels from points beyond the line of exemption.

All of which is respectfully submitted.

I have the honour to be, sir,

Your obedient servant,

PETER CONROY, M.D.,

Inspecting Physician.

The Honourable..

The Minister of Agriculture,
Ottawa.

8-9 EDWARD VII., A. 1909

No. 8.

(J. MCG. BAXTER, M.D.)

CHATHAM, N.B., March 31, 1908.

SIR,—I have the honour to submit the following report from the Port of Miramichi, for the period during which I have had the honour of serving in the quarantine station here, viz.: the last thirteen months, from March 1, 1907, to date.

The number of vessels examined has been, beyond precedent, small, on account of so many of them having touched at some other quarantine port before arrival here or coming from ports in the United States that are at present by your orders exempt from examination here.

None of those, however, which have been examined during that time, have had cases on board which required detention, but have all been remarkably healthy; nor have there been any of these crews that contained in their number any Chinese or other persons that would be likely to cause complications.

The number of vessels examined during this time was 35.

These consisted of the following, viz.: 15 steamships, 17 barques, 2 barquentines, 1 three-masted schooner.

The total number of men examined during this time was 615.

There have been considerable changes made and repairs effected at the station here, but being interrupted by the cold weather last fall, all of these could not be completed, but will be resumed and finished in the spring. These will make the station much more efficient, and should it ever be called upon suddenly to be used for any contagious disease or otherwise, will, I hope, be found equal to the emergency.

I have the honour to be, sir,

Your obedient servant,

J. MCG. BAXTER, M.D.

The Honourable

The Minister of Agriculture,
Ottawa.

No. 9.

(A. T. WATT, M.D.)

VICTORIA, B.C., April 1, 1908.

SIR,—I have the honour to submit the following report regarding transactions at William Head Quarantine Station for the period of twelve months from April 1, 1907, to March 31, 1908.

During that period there were 275 vessels inspected, with a total personnel of 48,044; of this number 12,573 were Japanese steerage passengers, 7,677 Chinese and 2,613 Hindu steerage passengers. The Chinese members of crew numbered 6,825 and the Japanese crew 2,941. All these Asiatics underwent disinfection at ports of

SESSIONAL PAPER No. 15

departure or where this had not been the case they were bathed and had their effects disinfected at this station. The passengers coming by regular lines are always so treated before embarkation, but a number of Japanese came by chartered steamers from Honolulu, and these had not been disinfected before leaving.

Bubonic plague is still existent in many ports on the Pacific ocean and in the past year there has been a recrudescence of the disease in San Francisco and an outbreak has occurred in Seattle. Smallpox has been very prevalent in Japan and to a less extent in China, and several steamers have arrived at this station with the disease on board. Cholera was quite severe in Shanghai for a few weeks last fall, and one vessel arrived here which reported two deaths on board after leaving Shanghai, on which account the vessel had been disinfected by the Japanese authorities. I also learned of cholera having broken out amongst a number of Hindu passengers before they transhipped to the steamer which brought them here. These Hindus had been through quarantine on this account at Singapore.

The diseases found on arrival and for which hospital treatment was given at this station, were smallpox, chickenpox, measles, beriberi and dysentery, also one case of fever with enlargement of glands of septic origin.

Six steamers were quarantined on account of smallpox during the twelve months. The SS. *Empress of Japan* was the first. This steamer after being in Vancouver for seventeen days was on April 17, 1907, discovered to have some of crew sick with smallpox just as she was about to sail on outward voyage. The steamer was then under jurisdiction of the Vancouver Board of Health, but at the request of the company the vessel was dealt with at this station and put in condition for making voyage. The facts as they came out afterwards were that one of the firemen was taken ill two days after arrival of vessel in Vancouver. He was seen by the ship's doctor and given some medicine, and next day was reported all right by the 'No. 1,' but in reality the Chinese had recognized by that time that he had smallpox and had hidden him away, and afterwards at every muster of the firemen one of the stewards was substituted for the sick man. An engineer and fireman were taken down with smallpox in Vancouver, and on reaching here two more firemen were found to be developing the disease. By taking such precautions that substitution was impossible the original case was brought to light and the outbreak was explained. One more fireman developed the disease on the voyage to Japan, but as the ship's surgeon was able to isolate him immediately there was nothing further. Whilst vaccinating the passengers who had got on board it was found that one of the second cabin passengers had mild smallpox. The case had no connection with the outbreak on board. The man had acquired the infection whilst travelling through the United States. The expenses for fumigating vessel and the hospital charges were met by the company in the case of this steamer, as the disease occurred after passing quarantine and whilst vessel was in port. The voyage from Japan is made by the *Empress* steamers in from ten to eleven days, so that the voyage is less than the incubation period for smallpox, so with these steamers there is always the possibility of smallpox not being manifest before quarantine inspection is made.

The British SS. *Oanfa* arrived from Liverpool April 26, 1907, with smallpox on board. There had been an outbreak early in the voyage and the steamer underwent quarantine at Singapore. But a partly new crew was shipped at Hong-Kong, and three of these men developed smallpox after leaving Japan. One case was mild and was not believed to be smallpox and was consequently not isolated. The passengers were landed for detention, and it was the intention to have the steamer go on to the United States quarantine for fumigation, &c.; afterwards however the request was made that the work be done here, the company agreeing to make up time lost by our staff and replace disinfectants used. The prospect of being fumigated caused fourteen Japanese stowaways to appear. Three of these were women who were put inside some of the baggage and were lowered with a sling load of other baggage. They were not found until the boxes were ordered to be unpacked so that things could be sorted for disinfection.

On January 21, 1908, the British SS. *Bellerophon* arrived with five sailors suffering from smallpox, all pronounced cases. The disease had been contracted while vessel lay in Kobe, where a great epidemic of smallpox was raging. All shore leave had been stopped, but precautions had not been taken to prevent people coming on board, and a number of pedlars did so, and thus the infection was carried. From one of these people three of the crew bought boots. These men were all taken ill within twelve days, also two others who had evidently been at the same time exposed. The type of disease was severe and one man died a week after landing here. The steamer was disinfected in the usual way, and as she also proceeded to Puget Sound without first calling at Victoria, it was required that the time lost and materials used be made good.

On February 6, the Japanese SS. *Kaga Maru* arrived and a Japanese steerage passenger from Kobe was found to have mild smallpox. This case was of several days' duration and the man had remained unnoticed by the ship's surgeon. The steamer was disinfected and the steerage passengers detained, also the portion of the crew not protected by vaccination.

On February 25, the British SS. *Monteagle* reached here and smallpox was found on board. This steamer had undergone fumigation at Yokohama sixteen days previously on account of having landed a fireman with smallpox. On arrival here all were reported well. On examination, however, a fireman was found to have slight smallpox rash but well out. The man had been slightly ailing and had been put in hospital and then allowed to go back to work. The steerage passengers, of whom 196 were Hindus, were landed, also such of crew as were considered protected by vaccination. The saloon passengers had all been vaccinated in Japan and were considered protected on arrival here, and so were allowed to proceed.

On March 4, the Japanese SS. *Shinano Maru* arrived and an unrecognized case of smallpox was found in steerage. The steerage passengers for Victoria, 60 in number, were landed at this station and the steamer proceeded to the United States quarantine at Diamond Point for fumigation.

Owing to these four steamers following one another so closely there were 'suspects' at the station continuously for sixty days, and our staff had arduous work without any interval for that time.

Owing to the prevalence of smallpox in the neighbouring states of Montana, Idaho and Washington, it was necessary to institute a medical inspection of persons crossing the boundary line. This inspection was continued from April 3, to July 15, 1907. In the case of the steamers the various companies engaged the services of medical men to make inspection of passengers before coming on board. This examination has been done in an acceptable manner and the certificate given has relieved vessels of inspection at Victoria or Vancouver.

Last June acting under instructions to investigate conditions at various points where smallpox had occurred, I went to Spokane and other places and was able to report that the necessity of longer continuing the quarantine did not exist, as several railway construction camps where the disease had started had been broken up. While away at this time I had the opportunity of visiting the United States quarantine station for the Columbia river situated across from Astoria.

In San Francisco, where bubonic plague first appeared seven years ago, there was a recrudescence of the disease last summer, and since that time there have been 159 cases and 77 deaths from this disease in that city and some neighbouring towns. Since the first of January, however, the disease has subsided and since that time there have been but three cases. Vessels from San Francisco have been given careful inspection and precautions are taken to prevent rats coming on shore. Vessels before leaving San Francisco are given fumigation with sulphur dioxide for the purpose of destroying rats, and are furnished with a certificate that this has been done. In the case of the regular liners the fumigation is made once a month. The rats in San Francisco, of which many thousands have been examined, are found infected with plague in the proportion of 15 out of 1,000. Last October bubonic plague was found to be existent in Seattle,

SESSIONAL PAPER No. 15

and has been the cause of very great alarm. Fortunately the cases have been few in number, and but few rats have been found infected, and none of these since the first of the year. A medical inspection of passengers was instituted at railway points on the boundary, and passengers by boat were examined before going on board. This inspection remained in force from October 22, 1907, to March 31, 1908, when conditions were so far satisfactory that it was discontinued. Precautions were also taken to prevent rats coming on board vessels at Seattle and against any leaving vessels in British Columbia ports. Discs have been put on mooring lines and vessels breasted out from wharf so that rats could not jump on or off, and the gangway was not allowed out except when in actual use. It is arranged that these precautions will all be continued for some months yet. The special plague prevention work is to be continued in Seattle for two years at least and laboratory examinations are to be made of all rats brought in so that conditions will be known and if further precautions are necessary owing to finding of infected rats, they may then be taken. On the outbreak of plague being reported in Seattle, Dr. F. Montizambert, Director General of Public Health, personally investigated conditions, and after spending some time in Seattle, to which place I accompanied him, we went to the various points on the frontier where medical inspection had been instituted.

On May 1, 1907, the new quarantine steamer *Madge* was taken over from the builders, the British Columbia Marine Railway Co., Ltd. This steamer has proved most satisfactory and is most staunch and seaworthy. Last July the ss. *Madge* took to Prince Rupert, Dr. Montizambert, Director General of Public Health, and by your kind direction, myself also for the purpose of examining possible sites for the new quarantine station to be established there. Other ports were also visited and information gained which will be most useful in dealing with quarantine matters which may affect these various places.

The improvements made at the station this year have not been many, but are important. Foremost was the coming of the new steamer *Madge* already referred to. Considerable repairs were made to wharfs and some extensions and improvements made to small wharf so as to give better accommodation to ss. *Madge*. A new steam sterilizing chamber is now under construction, and although it may not be in place for a few weeks, it is to be regarded as an important improvement undertaken this year.

The lazaretto at D'Arcy island, which came under my charge in the previous year, has this year seen important changes. On May 8, 1907, I was enabled to have the eight lepers who were on the island returned to their own country and placed under care of the Presbyterian Mission at Canton. This disposition of these people was only attained after various difficulties had been overcome, but it has been a very satisfactory solution of the problem of caring for these unfortunates, and according to reports received they were comfortably settled at the mission. I was able through meeting with Dr. Andrew Beattie, a Canadian in charge of the mission to the lepers at Canton, to ascertain from him what could be done with regard to caring for the lepers in their own country. I found that acceptable arrangements could be made at small cost and that everything would be right, once they reached Canton. The difficulty was to get them there. Some of the cases were well advanced, and were not passengers that steamship people wished to have anything to do with. However, a steamer which was going to Hong-Kong direct was found ready to take the men, and special quarters were fitted for them, and they made the voyage without mischance. Our thanks are due to Dr. G. D. R. Black, of Hong-Kong, for having looked to the lepers on arrival there and for having seen to their transportation to Canton and settlement with the mission.

Since the first lot went I have returned three other lepers to China without much difficulty as in their cases, the disease was not objectionable. I also have knowledge of two lepers, one a Chinaman and the other a Japanese who returned home on their own initiative. These people are always ready enough to go back to their own country so that there is nothing in the way of so handling these cases, except the difficulty of booking their passage and arranging for separate quarters for them. As opportunities

8-9 EDWARD VII., A. 1909

are not frequent, however, it has been considered necessary to have a receiving station at D'Arcy island. Two small buildings have just been erected there for the temporary accommodation of any lepers who may be found. A cottage for the guardian at the lazaretto has also been built. The old frame shacks which had been occupied by the lepers since the colony was established in 1892, were burned after they were vacated.

I have the honour to be, sir,

Your obedient servant,

A. T. WATT, M.D.,

Supt. B.C. Quarantines.

The Honourable

The Minister of Agriculture,
Ottawa.

No. 10.

(R. L. FRASER, M.D.)

VICTORIA, B.C., March 31, 1908.

SIR,—I have the honour to submit my report for the year just ended.

On account of the prevalence of smallpox in Seattle, inspection of foreign coasting vessels was ordered from April 3 to July 15. Again on the appearance of bubonic plague at the same place inspection was ordered from October 22 to March 31.

By arrangement of the Superintendent of Quarantines for British Columbia, the inspection was done for a part of the time at the ports of embarkation, my duties consisting in seeing that properly signed bills of health were produced and that due precautions were taken against the landing of rats from any boat.

During the year I examined eighty-eight (88) vessels here, and I am pleased to say found no case of contagious or quarantinable disease on any of them.

I have the honour to be, sir,

Your obedient servant,

R. L. FRASER, M.D.,

Quarantine Officer.

The Honourable

The Minister of Agriculture,
Ottawa.

No. 11.

(L. N. MACKECHNIE, M.D.)

VANCOUVER, B.C., March 31, 1908.

SIR,—I have the honour to submit this my report for the year ending March 31, 1908.

Fifty-one vessels have been inspected at this port. No case of infectious or contagious disease has been found.

SESSIONAL PAPER No. 15

Measures continue to be directed against rats coming on shore.

Medical inspection at Seattle of passengers for Vancouver is discontinued at this date.

I have the honour to be, sir,

Your obedient servant,

L. N. MACKECHNIE, M.D.

The Honourable

The Minister of Agriculture,
Ottawa.

No. 12.

(A. C. SMITH, M.D., M.A., C.M.)

TRACADIE, N.B., March 31, 1908.

SIR,—I have the honour to submit my annual report as physician, &c., to the Tracadie lazaretto.

There are at present sixteen inmates of the institution—nine males and seven females. There was one death during the year, and three new patients were admitted. Of the inmates, eleven are of French, two of English, two of Icelandic, and one of Russian origin. The ages of the patients vary from eight to seventy-six years.

Classifying the patients, we have seven in the first stage of leprosy, five in the second, and four in the third, the final stage. Three suspected cases remain outside. Over these I keep a constant supervision.

During the winter months there has been much intercurrent illness among the inmates. No words of mine can do justice to the unremitting care bestowed night and day upon the sufferers by the religious ladies who oversee the wards of the hospital.

Chaulmoogra oil in combination is being used by our patients, and with benefit to all. In my last report, I alluded to the case of a patient, a woman, in whom the disease seemed arrested by the use of the oil. This woman has since been discharged as cured, and remains outwardly free from the malady. I have again to report my conviction that Chaulmoogra oil in combination will cure leprosy, if taken in the early stages of the disease; and that it will mitigate the suffering and prolong life even in advanced cases. I am carefully watching results of treatment by other drugs, as reported from foreign leper hospitals.

In no country in the world are lepers so tenderly treated as they are here by the Canadian Government. Recent improvements in connection with the lazaretto, made by direction of the Director General of Public Health, are of inestimable value to the institution, and they add materially to the public safety.

I have the honour to be, sir,

Your obedient servant,

A. C. SMITH, M.D.

To the Honourable

The Minister of Agriculture,
Ottawa.

No. 13.

(CHAS. A. L. FISHER, J.P.)

MONTREAL, March 31, 1908.

SIR,—I have the honour to submit this my report for the twelve months ended March 31, 1908, as Public Works (Health) Inspector, for the territory from Winnipeg east to the Atlantic ocean.

During that period I have personally visited and inspected all such works covered by the Public Works (Health) Act, 1899, as have in any way been brought to my notice.

The term has again been an exceptional one, in the almost non-appearance of contagious and infectious diseases among the men employed on the various public works of the Dominion, coming under my inspection, there being no outbreaks of smallpox, and only two cases of diphtheria, but in the neighbourhood of Fort William and Kenora, and some of the works east, there have been a good many cases of typhoid fever in the camp hospitals, mostly developing on new arrivals on the work.

I am sorry to have to report that at two of the public works, in my territory, the subcontractors had to be prosecuted, and were fined for non-fulfilment of the regulations in regard to the sanitary condition of their camps.

I am pleased to be able to report again, that on my several tours of inspection of the public works of the Dominion in my district for the past year, I found the medical service given to be more numerous and complete, and the sleeping quarters and boarding of the men to be fully equal to the very good conditions in that way reported last year.

The following is a detailed report of the works I have personally visited and inspected during the past twelve months, as coming, more or less, under the regulations of the Public Works (Health) Act, 1899.

RAILWAYS.

The number of public works coming under the regulations of the Act, in the territory east of Winnipeg, have been comprised exclusively of railway construction, the increased building of the National Transcontinental Railway from Winnipeg, Man., to Moncton, N.B., will add greatly to the railway mileage of the Dominion and will tend to open out a fine tract of agricultural land for settlement when completed.

NATIONAL TRANSCONTINENTAL RAILWAY.

This road is being built by the Dominion government, and at present eight sections have been given out on contract, between Winnipeg and Moncton, N.B., and are now under construction.

I am pleased to report that on my visit to the works on said sections I found excellent hospital accommodation provided, the men comfortably housed and well fed, the camps in good sanitary condition, and a duly qualified physician as district medical supervisor over each section of camps, which could be conveniently covered by him within the requirements of the regulations.

There had been no outbreak of contagious diseases, and the health of the men had been excellent, with the exception of some cases of typhoid fever.

SESSIONAL PAPER No. 15

I give below the extent and location of camps, with other particulars of the works carried on by the various subcontractors.

Section from Winnipeg east to junction of Grand Trunk Pacific branch, from Fort William, 245 miles. This is under contract to Mr. J. D. McArthur, of Winnipeg, about 4,050 men were employed thereon, located in seventy-nine camps, spreading over the route.

J. K. McLennan, M.D., of Winnipeg, is the chief medical officer on behalf of the contractor, with J. R. Gunn as medical superintendent at Kenora, Ont., which is central to the work, and he has ten district medical officers, resident at various points along the route, and excellent hospital accommodation is provided where necessary.

Whitemouth, Man., Camps.—W. Wardrop, sub-contractor. These camps are seven and fourteen miles from Whitemouth, a station on the Canadian Pacific Railway, and can be reached by team from the latter place. One hundred and twenty men were employed on grading thereat, who housed and boarded themselves in shacks and tents. There had been no contagious or infectious diseases, accidents or deaths, and their general health, and the water supply were good. The sanitary conditions of the camps, except for a very short period, were good.

The Winnipeg hospitals were used when necessary. Benjamin Lang and afterwards D. A. Volume were the resident district medical officers of the work.

Rennie, Man., Camps.—Rock work of one and one-half miles. Forty men were employed thereat, housed and boarded in log huts by the contractor, J. D. McArthur & Co., who was doing the work.

There had been no contagious or infectious diseases, deaths or accidents. The general health of the men, and the sanitary condition of the camps were good. The water supply was from wells and latrines were provided. A tent was supplied for temporary hospital use, but the Winnipeg hospital was used when necessary. J. B. Snyder, M.D., C.M., was the resident district medical officer on this work, he being succeeded last fall by D. A. McKay.

Rennie, Man., Camps.—J. V. Welsh, sub-contractor. Rock work of five miles. Fifty men were employed thereat, housed and boarded in lumber camps by the sub-contractor.

There had been no contagious or infectious diseases, accidents or deaths, and the health of the men and the sanitary conditions of the camps were good. The water supply was from wells, and latrines were provided.

A tent was provided for temporary hospital use, but the Winnipeg hospital was used when necessary.

J. B. Snyder, M.D., C.M., was the district medical officer of this work for some months, he being succeeded by D. A. McKay last fall.

Rennie, Man., Camps.—J. D. McArthur & Co., contractors. Rock work, four and one-half miles. Fifty men were employed thereat, housed and boarded in log camps by the contractors. There had been no accidents or deaths, and the general health of the men had been good, and the sanitary conditions of the camps fair. The water was from wells, and latrines were provided. The Winnipeg hospital was used when necessary.

J. B. Snyder, M.D., C.M., was the district medical officer of this work until last fall and was then succeeded by D. A. McKay, M.D.

Dagiro, Man., Camps.—McPherson, McNaughton & Blake, sub-contractors. Rock work, four and one-half miles. These camps are north from Dagiro, a station of the Canadian Pacific Railway, and twelve miles east from the Rennie camps. One hundred men were employed thereon, and housed and boarded in lumber and log camps by the sub-contractors.

There had been no contagious or infectious diseases, three accidents and two deaths, and the general health of the men, and the sanitary conditions of the camps

8-9 EDWARD VII., A. 1909

were good. The water supply was fairly good, being obtained from wells, and latrines were provided.

A tent was in use for temporary hospital purposes, but the Kenora hospital was used in case of necessity.

J. B. Snyder, M.D., C.M., was the district officer in charge of these camps, and was succeeded by D. A. McKay, M.D.

Dagiro, Man., Camps.—Anderson & Johnson, sub-contractors. Rock work, six miles. These camps are adjacent to, but east from the ones last mentioned.

One hundred men were employed thereat, and housed and boarded in lumber camps by the sub-contractors. There had been seven cases of typhoid fever, two accidents and one death, and the general health of the men, and the sanitary conditions of the camps good. The water supply was fairly good, being obtained from wells, and latrines were provided. A tent was supplied for temporary hospital purposes, but the Kenora hospital was used in case of necessity.

J. B. Snyder, M.D., C.M., was the district medical officer in charge of these camps, and was succeeded by D. A. McKay, M.D.

Kalmar, Ont., Camps.—Anderson & Johnson, sub-contractors. Rock work and grading. This camp can be reached from Dagiro, Man., or Kalmar, Ont., being about midway north of, and between the two stations named. Fifty men were employed thereat, housed and boarded in log camps by the sub-contractors. There had been no contagious or infectious diseases, one accident, one death, and the general health of the men had been good.

H. H. Christie, M.D., of Kalmar, Ont., was the district medical officer of this camp, but was replaced early in the season by P. McRitchie, who resides at, and has a good hospital at Lake Malachi, where patients from his camps are taken.

Kalmar, Ont., Camps.—Oleson & Larson, sub-contractors. Rock work and grading. These camps are fifteen miles north of Kalmar, a station on the Canadian Pacific Railway, and can be reached by team to Malachi lake, and then by boat.

Three hundred men were employed thereat, and distributed over five camps, No. 1 being Lake Malachi, No. 2 west two miles, No. 3 west four miles, No. 4 west six miles, and No. 5 at Rice lake. The men in each camp were housed and boarded by the sub-contractors, in good board and log buildings. There had been eight cases of typhoid fever, and one of diphtheria, but there were no other developments of contagious or infectious diseases, and there were no deaths and one accident. The general health of the men, and the sanitary conditions of the camps were good. A permanent hospital was provided at camp No. 1, but the general hospital at Kenora, Ont., would be used when advisable.

The water supply was fairly good, and taken from wells and lake. Latrines were provided at each camp.

H. H. Christie, M.D., was the resident district medical officer, but was replaced last spring by P. McRitchie.

Kalmar, Ont., Camps.—Guy Campbell, sub-contractor. Rock work principally and extending five miles. There were two main camps, known as No. 1 and No. 3, No. 1 being at Otter lake, and No. 3 two miles east. There were also two smaller camps known as No. 2 and No. 4. Two hundred and twenty men were employed thereat, housed and boarded by the sub-contractor, in comfortable log and frame buildings. There were no contagious or infectious diseases, or deaths among the men, and only a few minor accidents. The general health of the men was good, and the condition of the camps throughout excellent.

Water from wells was used for drinking purposes, and lake water for general use. Latrines were provided at all camps.

The permanent hospital at camp No. 1, Lake Malachi, was used, but the general hospital at Kenora, Ont., would be used in case of necessity. H. H. Christie, M.D.,

SESSIONAL PAPER No. 15

was the district medical officer of this work also, and was replaced by P. McRitchie, M.D.

A sudden death occurred at camp No. 1 on this work, in the person of Mrs. Guy Campbell, wife of the sub-contractor, and whom I had seen the previous day in apparently perfect health.

Kalmar, Ont., Camps.—Gordon Bros., sub-contractors. Rock work principally, extending two miles. One hundred men were employed thereat, located at two camps, one mile apart, and housed and boarded by the sub-contractors, in good log buildings. There had been no contagious diseases, accidents or deaths.

The general health of the men, and sanitary conditions of the camps were good.

The water supply was from lake and springs, and was good. Latrines were provided at each camp. At camp No. 1, Lake Malachi, hospital quarters were provided, but the general hospital at Kenora, Ont., would be used if thought beneficial.

H. H. Christie, M.D., was the district medical officer of these camps, and was replaced by P. McRitchie, M.D.

Winnipeg River Camps.—Chambers Bros., McQuigge & McCaffrey, sub-contractors. Ten miles of grading and rock work.

These camps are located fifteen miles north from Kenora, Ont., a station on the Canadian Pacific Railway, and can be reached from there by boat up the Winnipeg river, to Winnipeg river crossing, thence overland one or two miles. Three hundred and twenty men were employed thereat, located in five camps, situated west of the Winnipeg river, and housed and boarded by the sub-contractors in comfortable board and log buildings.

There had been no cases of contagious or infectious diseases, with the exception of one of typhoid. There had been minor accidents, but no deaths.

The general health of the men, and the sanitary conditions of the camps were good.

The water supply was good, and was from lake and springs. Two latrines were provided for each camp. Temporary hospital quarters were provided, with a permanent hospital east of the McFarland river, and the general hospitals at Kenora, were used when necessary.

H. A. Abraham, M.D., was the resident district medical officer of these camps in the early part of the season, and was then replaced by R. Wightman, M.D., and he by L. C. Panton, M.D.

Winnipeg River Camps.—Dutton & McArthur, sub-contractors. Five and one-half miles of grading and rock work. There were three camps situated east of the McFarland river, and three hundred men were employed on the work, who were housed and boarded by the sub-contractors in comfortable board and log buildings.

There had been five cases of typhoid fever, but no other cases of contagious or infectious disease. There were three accidents, and two deaths. The general health of the men, and sanitary conditions of the camps had been fair.

The water supply was good, and two latrines were supplied for each camp. There was a permanent hospital conveniently located for the various surrounding camps, with an hospital orderly and graduated female nurse employed thereat, under charge of H. A. Abraham, M.D., who was the district medical officer of this work, and was assisted by L. C. Panton, M.D., who succeeded him in charge of the hospital.

Winnipeg River Camps.—Courtney & McRae, sub-contractors. Five miles rock and earth work. There were two camps east of Basket lake, and one hundred and twenty men were employed on the work, who were housed and boarded by the sub-contractors in good log buildings. There had been three cases of contagious diseases, two accidents, no deaths.

L. C. Panton, M.D., was the district medical officer in charge of the men, and was succeeded by R. Wightman, M.D.

Winnipeg River Camps.—Baulf & Stinson, sub-contractors. Four miles rock and earth work. There were two camps situated on the side of a lake, and one hundred men were employed on the work, who were housed and boarded by the sub-contractors in good log buildings. There had been no contagious diseases or accidents, and no deaths. The general health of the men has been good. The permanent hospital at Winnipeg River was used. L. C. Panton was the district medical officer of these camps and was succeeded by R. Wightman, M.D.

Winnipeg River Camps.—McCaffrey & Hicks, sub-contractors. Two miles of rock grading. One camp situated fifteen miles east of Winnipeg River crossing.

About one hundred men were employed on the work, and were housed and boarded by the sub-contractors in log buildings. There had been one case of typhoid, one accident, and no deaths. The general health of the men had been good, and the permanent hospital at Winnipeg River crossing was used when necessary.

Robert Wightman, M.D., was the district medical officer of this camp.

Hawk Camps.—A. J. McDougald, sub-contractor. Grading and filling.

There are two camps, No. 1 located at Wild lake, and No. 2 at Spectacle lake. These camps are some miles north from Hawk, a station on the Canadian Pacific Railway, and can be reached by team and canoe from there, or from Margach, another station on the Canadian Pacific Railway, direct by canoe, with several portages to make.

One hundred and thirty men were employed thereat, housed in log buildings, and boarded by the sub-contractor.

There had been eight or ten cases of typhoid fever at camp No. 1, no accidents and one death. Camp No. 1 was very bad, being located on muskeg, and the water was badly contaminated. The sub-contractor after unheeded warnings, being prosecuted and fined, after which the buildings were removed to high ground, good water procured and used for drinking and culinary purposes, and then the general health of the men became good and the sanitary condition of the camps was properly looked after.

There was a good hospital (known as Wild Lake hospital) erected on a point of the lake opposite camp No. 1, which was at first in charge of Robert Wightman, M.D., as district medical officer, but he being taken down with typhoid, was removed as a patient to the Jubilee hospital at Kenora, and was temporarily replaced at the Wild Lake hospital by L. C. Panton, M.D., who was succeeded by J. O. Walker, M.D., as resident and district medical officer thereof, and he is still in charge. Two trained female nurses and an hospital orderly were employed at said hospital.

Hawk Camps.—T. O. Sullivan, sub-contractor. Grading and filling.

This camp was located at Cariboo lake, and about seventy-five men were employed thereat, who were housed in log buildings and boarded by the sub-contractor. There had been no contagious or infectious diseases, accidents or deaths, and the general health of the men, the water used, and the sanitary condition of the camp were good.

The hospital at Wild Lake was used when necessary. R. Wightman, L. C. Panton and M. J. O. Walker, being the district medical officers of this camp for various periods, the latter being at present in charge.

Hawk Camps.—Thompson & Egan, sub-contractors. Grading and filling.

There are three camps located, No. 1 on north shore of East lake, No. 2 east end of East lake, and No. 3 east end of Flavelle lake.

About two hundred and forty men were employed who were housed in log buildings, and boarded by the sub-contractors. There have been no cases of infectious diseases with the exception of one case of typhoid which recovered, one death, and no accidents of serious nature. The general health of the men, the water, and the sanitary condition of the camps were good.

The hospital at Wild lake was used when necessary.

R. Wightman, L. C. Panton, and M. J. O. Walker, have been district medical officers of these camps, the latter in charge at present.

SESSIONAL PAPER No. 15

Hawk Camps.—Welsh Bros., sub-contractors. Grading, filling and rock work. There are four camps, No. 1 being at east end of Cache lake, No. 2 at west end of Cache lake, No. 3 at Summit lake, and No. 4 (Sharp's camp), at Northwest lake.

About four hundred men were employed, who were housed in log buildings, and boarded by the sub-contractors, with the exception of a few Italians who housed and boarded themselves. There had been no contagious diseases, two accidents, and three deaths, one being from drowning.

At camp No. 1, the stable had to be removed to another site, owing to its contaminating the water of the lake, which had to be used, but otherwise the health of the men, the water supply, and the sanitary condition of the four camps were fairly good.

The hospital at Wild lake was used when necessary.

R. Wightman, L. C. Panton and M. J. O. Walker, have been the medical officers of these camps, the latter in charge at present.

Vermilion Bay Camps.—Anderson & Johnson, sub-contractors. Grading, rock work and filling. There are seven camps, the first of which is located fifteen miles north of Vermilion, a station on the Canadian Pacific Railway, and can be reached by team from there. Four hundred and sixty-five men were employed thereat, housed in log buildings, and boarded by the sub-contractors. There had been no contagious or infectious diseases. Three accidents, no deaths, and the general health of the men, the water obtained, and the sanitary condition of the camps, all first class.

There is a permanent hospital at Parsons camp No. 1, a few miles north on a good road and boat route, that is used when necessary.

H. L. Sims, M.D., is the resident district medical officer of this work.

Vermilion Bay Camps.—Cunningham & Nelson, sub-contractors. Eighty men were employed on this work, and were housed and boarded in good log buildings, by the sub-contractors. There had been no contagious or infectious disease, no accidents and no deaths. The general health of the men had been very good, the water supply and the sanitary condition of the camp fair.

The hospital at Parsons camp No. 1 was used when necessary. H. K. Sims, M.D., was the district medical officer in charge of this work.

Vermilion Bay Camps.—J. Woods & Co., sub-contractors. Thirty men were employed on this sub-contract, who were housed and boarded in log buildings, by the sub-contractors. There had been no contagious disease, three serious accidents, no deaths, and the general health of the men had been good.

The hospital at Parsons camp No. 1, was used when necessary. H. K. Sims, M.D., was the district medical officer in charge of this work.

Vermilion Bay Camps.—Leudstrom & Co., sub-contractors. Twenty-five men were employed, who were comfortably housed and boarded by the sub-contractors.

There had been no contagious diseases, accidents or deaths, and the general health of the men, and the condition of the camp good.

The hospital at Parsons Camp No. 1 was used when necessary. H. L. Sims, M.D., was the district medical officer in charge.

Vermilion Bay Camps.—H. Botham & Co., sub-contractors.

Twenty-five men were employed who were well housed and boarded by the sub-contractors.

There were no contagious diseases, accidents or deaths, and the general health of the men was good.

H. L. Sims, M.D., was the medical officer.

Vermilion Bay Camps.—Maudsith & Co., sub-contractors.

Twenty-five men were employed, who were comfortably housed and boarded by the sub-contractors.

8-9 EDWARD VII., A. 1909

There were no serious diseases, deaths, or accidents, and the health of the men was good.

Vermilion Bay Camps.—W. T. Parsons, sub-contractor. Rock work chiefly. These camps are situated about eighteen miles from Vermilion bay, and can be reached by team. Four hundred and fifty men are employed, who are located in seven camps, situated on Canyon lake, and housed and boarded in good log buildings, by the sub-contractor. There have been ten cases of typhoid, but no other contagious or infectious diseases, seven serious accidents and five deaths. The general health of the men has been good, and the sanitary conditions of the camps very fair. Good water is obtained from Canyon lake, and latrines are provided for each camp. A good hospital has been established at W. T. Parson's headquarters camp, with an orderly and trained female nurse employed.

D. G. Dingwall, M.D., is the district medical officer residing at these camps.

Vermilion Bay Camps.—Chas. Peterson, sub-contractor. Rock and sand work. One hundred and fifty men are employed on this sub-contract, who are located in two camps, and housed and boarded in log buildings by the sub-contractor. There have been no contagious diseases, only one serious accident and no deaths. The general health of the men, the sanitary condition of the camps, and the water supply has been good. The permanent hospital at W. T. Parson's headquarters is used when necessary.

D. C. Dingwall, M.D., is the district officer of these camps.

Vermilion Bay Camps.—Geo. Jachetta, sub-contractor. Rock work principally. One hundred and seventy-five men are employed on this work, located in two camps, situated on Little Canyon lake, and are housed and boarded in good log buildings, by the sub-contractor. There has been one case of typhoid, but no other cases of contagious or infectious diseases, some minor accidents, and no deaths. The general health of the men, the sanitary condition of the camps, and the water supply has been good. Latrines are provided, and the permanent hospital at Parson's head camp is used when necessary.

D. G. Dingwall, M.D., is the district medical officer of these camps.

Vermilion Bay Camps.—J. P. Morgan, sub-contractor. One hundred and twenty men were employed, who are housed and boarded in log buildings by the sub-contractor. There were two cases of typhoid, seven rather serious accidents, and one death from dynamite explosion. The general health of the men, the water used, and the sanitary condition of the camp has been good. The permanent hospital at Parson's camp was used when necessary.

D. G. Dingwall, M.D., is the district medical officer of the camp.

Dryden, Ont., Camps.—Geo. H. Webster, sub-contractor. Fourteen miles of rock and earth work. The camps are six in number, the first situated some eighteen miles north from Dryden, Ont., a station on the Canadian Pacific Railway, and can be reached by team from there. Three hundred and ninety-five men were employed on the work, who are boarded and housed in good log buildings by the sub-contractor. There had been no contagious disease, two accidents, seven deaths from dynamite explosion, and one from natural causes. The general health of the men had been excellent, and the water and the sanitary conditions of the camps good. A permanent hospital is established at No. 4 camp (which is headquarters), employs an hospital orderly and a trained female nurse, and is under the charge of John Brandon, M.D., as district medical officer of all these camps.

Dryden, Ont., Camps.—O. C. Thompson, sub-contractor. Rock cutting and excavation. One camp located at extreme western end of Webster's sub-contract. Sixty-five men were employed, and were housed in well built log buildings, and well boarded by the sub-contractor. One patient only had been taken to the hospital, and there had been no contagious diseases, serious accidents or deaths. The general health of the

SESSIONAL PAPER No. 15

men had been excellent, the water was good, being taken from a spring, and the camp is one of the cleanest I have seen on railway construction work. A well equipped hospital is provided for temporary use.

John Brandon, M.D., is the district medical officer attending the employees of this camp.

Dryden, Ont., Camps.—P. W. McLean, sub-contractor, eight miles of earth and rock work. These camps are three in number, and are situated twenty-eight miles northeast of Dryden, and can be reached from there by team. One hundred and twenty men were employed on the work, who were housed and boarded in good log buildings by the sub-contractor.

There had been no contagious or infectious diseases, no serious accidents, and no deaths. The general health of the men had been excellent, and the water and sanitary conditions of the camps were good. Temporary hospital accommodation was provided, and the permanent hospital at T. H. Webster's camp was used when necessary.

John Brandon, M.D., was the district medical officer of these camps.

Wabigoon, Ont., Camps.—Swan Swanson, sub-contractor, from the Eastern Construction Company, under their sub-contract from the J. D. McArthur Company. Ten miles of rock and earth work.

These camps are four in number, and are situated two miles northeast from the last above named and can be reached by team therefrom, or from Wabigoon or Dinorwic, both stations on the Canadian Pacific Railway by team and then by boats. Three hundred and fifty-five men were employed on the work, who were housed and boarded in good buildings by the sub-contractor. The general health of the men had been very good, and the water and sanitary condition of the camps had also been good. There had been no contagious or infectious diseases, accidents or deaths. Temporary hospital accommodation was provided, but the permanent hospital at camp No. 2 of the Eastern Construction Company, was used when the doctor thought it advisable.

F. H. Trousdale, M.D., had been the district medical officer of these camps for the first quarter of the year, and was succeeded by Dr. White, who only remained a short time, and was succeeded by W. W. Nasmith, M.D., who is now in charge of the camps.

Wabigoon, Ont., Camps.—Eastern Construction Company, sub-contractors. Twenty miles of rock and earth work.

There are five camps, running from the extreme easterly end of the McArthur contract, and can be reached by team from Wabigoon and then by boats and portages. About three hundred men were employed on the work, who were housed in good log and board buildings, and well boarded by the sub-contractors. The general health of the men had been excellent, and the water supply, and the sanitary condition of the camps good. There had been no contagious or infectious diseases, and no serious accidents or deaths. A permanent hospital was maintained at the headquarters camp No. 2, and was provided with an hospital orderly and a trained female nurse.

F. H. Trousdale, M.D., had been the district medical officer of these camps, but was succeeded by Dr. White for a short period, and he was replaced by W. W. Nasmith, M.D., who is now the medical officer residing at the camps.

Abitibi Section.—Districts 'C' and 'D.' From about eight miles west of the Abitibi river, crossing easterly for one hundred and fifty miles.

This section was let to the Grand Trunk Pacific Construction Company, and sublet by them to the J. H. Reynolds Construction Company, of St. Louis, U.S.A.

McDougalls Chute Camps.—The J. H. Reynolds Construction Co., sub-contractors. Access to these camps is by the Temiscaming and Northern Ontario Railway to McDougalls Chute, then fifty miles north by road in winter, and in summer by canoe on the Abitibi river to the crossing.

8-9 EDWARD VII., A. 1909

Construction work is only commencing on this section, and the sub-contractors have been getting in the necessary machinery, implements and supplies during the winter roads.

With the exception of some right of way camps, there are only two permanent camps at present, one located at McDougalls Chute, and the other fifty miles north at the crossing of Abitibi river. Only about one hundred men have been employed up to the present, who are housed in framed camps and boarded by the sub-contractors. The general health of the men and the sanitary conditions of the camps have been good. There were no serious diseases, accidents or deaths, and hospital accommodation was provided at the northern camp.

John McCombe, M.D., is the supervising medical officer for the sub-contractors, and George R. Johnson, M.D., is the resident district medical officer. Eastern section district 'B' from a point a few miles northwest of La Tuque village, to a point known as Weymonachene, a distance of about forty-five miles. This section was let to the Grand Trunk Pacific Construction Company, and was sub-let by them to Messrs. Macdonnel & O'Brien. There were ten sub-contractors under Messrs. Macdonnel & O'Brien on this section, who had twenty camps, and employed about seventeen hundred men, who were housed in good log buildings, and boarded by the sub-contractors on the work.

There had been twenty-five cases of typhoid, and one of diphtheria, no serious accidents, but there were five deaths. The sanitary condition of the camps, the quality of water used, and the general health of the men were good. A good-sized hospital was erected and maintained at the 'Little Farm,' Vermilion river, with an hospital orderly employed. B. Denovan, M.D., was the district medical officer of the westerly camps of the section, with residence at the hospital, and N. A. MacNab, M.D., had been district medical officer of the eastern camps of the section for some time, and was succeeded by D. Nathan, M.D., who is in charge at present. John McCombe, M.D., is the medical supervisor of the work on behalf of Messrs. Macdonnel & O'Brien.

Quebec Section.—From a few miles northwest of La Tuque village, southeast 100 miles, to junction of section of sub-contract let to Messrs. M. P. and J. T. Davis. This is under contract to Messrs. Macdonnel & O'Brien, of Montreal. Four hundred and twenty-five men were employed thereon.

John McCombe, M.D., of Buckingham, Que., is the chief medical officer on behalf of the contractors, and has two district medical officers, resident at suitable points on the route, with a hospital established under charge of a district medical officer and caretaker, in the neighbourhood of La Tuque village.

Drs. J. A. Ribirdy and James Franckum, being the district medical officers.

La Tuque Camps.—Brennan & Munro, sub-contractors. There was one camp at which about fifty men were employed, and who were well housed and boarded by the sub-contractors. There were no infectious diseases, serious accidents or deaths. J. A. Ribirdy was the district medical officer in charge.

La Tuque Camps.—A. Finlayson was the sub-contractor. There was only one camp, situated at Creek au Beauce, at which sixty men were employed, housed and boarded in wooden buildings by the sub-contractor. There had been three cases of typhoid, no deaths, and but one accident. The health of the men, water supply and sanitary conditions were good.

T. Hewitt, M.D., had been the district medical officer of this camp, and was succeeded by J. A. Ribirdy, M.D., who is at present in charge.

La Tuque Camps.—Jackson & Connolly, sub-contractors. There are two camps situated at Lac au Beauce, in the La Tuque district, at which ninety men were employed, who were housed and boarded in log buildings by the sub-contractors.

There had been one case of typhoid, no accidents or deaths, and the general health of the men, the water supply and the sanitary condition of the camps, were good.

SESSIONAL PAPER No. 15

Two latrines were provided, and also an hospital tent. The doctors last mentioned were the district medical officers of these camps.

La Tuque Camps.—O'Brien & Martin, sub-contractors for grading, &c., nine to ten miles.

There are two camps situated in the neighbourhood of La Tuque village, about fifty-two miles from Hervey Junction, on the Canadian Northern Railway, and can be reached by rail, by team or by boat, when the water in the river permits.

One hundred men were employed thereat, who were housed and boarded by the sub-contractors, with the exception of some who resided in the neighbourhood.

There had been one case of typhoid, no deaths and only one accident. The general health of the men, the water supply, and the sanitary condition of the camps were fair. A tent was provided for temporary hospital accommodation, but a permanent hospital was established in a convenient place. Latrines were provided for each camp.

T. Hewitt, M.D., has been resident district medical officer of these camps, and was succeeded by James Franckum, M.D., who is at present in charge and resides at the hospital.

La Tuque Camps.—There are two other small camps in this locality, one operated by A. Munson, as sub-contractor, and the other, by D. R. MacDonald, as sub-contractor.

Only about one hundred men are employed in the two camps, who are well housed and boarded by the sub-contractors, their general health being excellent, and there being no serious accidents or deaths.

James Franckum, M.D., is the district medical officer of these camps.

Reeds Camps.—The work at these camps, which are south of the La Tuque camps, is about completed, several of them being closed, and very few of the men being employed at any of the others. The health of these men had been generally good, but there were several cases of typhoid and one death therefrom, and one death from an accident at Hervey Junction, the man falling into the grating of the steam shovel.

B. Bordeleau, M.D., was the district medical officer over the few men employed.

St. Prospère Camps.—McInnes & McInnes, sub-contractors for grading, &c. These camps can be reached from Grandine, a station on the Canadian Pacific Railway. Sixty men were employed on the work, who were housed and boarded by the sub-contractors in good wooden buildings. There had been no contagious diseases, accidents or deaths, and all other conditions were good. A temporary hospital in charge of Dr. Bordeleau, at St. Thecile was used.

B. Bordeleau, M.D., was the district medical officer of the work.

Section from Quebec Bridge.—Fifty miles northwest. The contract for this work was given to Messrs. MacDonnel & O'Brien, of Montreal, together with the section reported above as being constructed by them, but they sub-let these fifty miles to Messrs. M. P. and J. T. Davis, of Quebec, who are constructing the same, with three sub-contractors under them. Messrs. Lothain, Rainboth, Roberge and Chagnon.

Several hundred men were employed thereon, but there are no special camps, the men living in their own homes, or boarding with residents scattered along the line.

There had been no contagious or infectious diseases and no deaths, but there were four minor accidents. The general health of the men and the sanitary conditions were good, the water supply being fair.

J. P. Lavoie, M.D., of Quebec, was the chief district medical officer early in the year, with A. Marcotte, M.D., as resident district medical officer at St. Basile, P.Q. This work is about completed.

Quebec Section, District 'B.'—From a point near Quebec bridge easterly for a distance of one hundred and fifty miles.

8-9 EDWARD VII., A. 1909

This section was let to Messrs. M. P. and J. T. Davis, of Quebec, who have sublet it in small sections to various sub-contractors.

J. E. Parent, M.D., of Quebec, is the chief medical officer of the whole work.

St. Lambert Camps.—Peacock & Leamy, sub-contractors for fifty miles. There were two camps with about one hundred and forty men employed, some of them housed and boarded by the sub-contractors, some by themselves. There had been no infectious diseases, accidents or deaths, and the general health of the men, and sanitary conditions of camps had been good.

A hospital at St. Anselme was used when necessary. J. E. Parent, M.D., was the district medical officer of these camps.

St. Isidore Camps.—Patrick Purigo, sub-contractor for five miles. About seventy men were employed, who housed and boarded themselves. There were no infectious diseases, accidents or deaths, the health of the men being good.

The hospital at St. Anselme was used when necessary. J. E. Parent, M.D., was the district medical officer of this work.

St. Claire and St. Anselme Camps.—A. Morrison, sub-contractor for fifteen and one-half miles. These were fair camps with about two hundred men employed, who were well housed and boarded, some by the sub-contractor, some by themselves.

There were no infectious diseases, serious accidents or deaths, the health of the employees being good. St. Anselme hospital was used.

J. E. Parent, M.D., was the district medical officer.

St. Malachie Camps.—A. McGougan, sub-contractor for seven miles. There were four camps, with two hundred and twenty men employed, who were well housed and boarded by the sub-contractor.

There was one case of typhoid, four serious accidents but no deaths, the general health of the men, the water used, and the sanitary conditions of the camps, being good.

The hospital at St. Anselme was used when necessary.

J. E. Parent, M.D., was the district medical officer of these camps.

St. Lazare Camps.—Beaurigard & Dufour, sub-contractors for seven miles. There were four camps and about one hundred and seventy-five men employed, who were housed and boarded by separate eaterers for each camp.

There were two cases of typhoid, but no other infectious diseases, one serious accident, and one death. The general health of the men, the water supply, and the sanitary state of the camps were good.

There was a hospital at St. Anselme that was used. J. O. Saint Pierre, M.D., of St. Gervais, county of Bellechasse, was the district medical officer.

Armagh Camps.—Johnson & Sabiston, sub-contractors for concrete work. There were about fifty men employed who lodged and boarded in surrounding houses.

There were no serious diseases, accidents, or deaths. This work is now completed. J. O. Saint Pierre, M.D., was the district medical officer.

Armagh Camps.—Gagnon & Massicotte, sub-contractors for five miles. About one hundred and seventy-five men were employed, who were located in two camps, and well housed and boarded by the sub-contractors. There had been no infectious diseases, serious accidents or deaths, and the general health of the men, and sanitary condition of camps good. The hospital for various camps was located here.

J. O. Saint Pierre, M.D., was the district medical officer.

Armagh Camps.—Murdock Bros., sub-contractors for ten miles. There were four excellent log camps, at which about four hundred men were well housed and boarded by the sub-contractors.

SESSIONAL PAPER No. 15

There had been two cases of typhoid, no serious accidents and no deaths. The general health of the men had been very good, and the water supply and sanitary conditions of the camps excellent.

The hospital for use of various camps was near by, and easily accessible from all camps. J. O. Saint Pierre, M.D., was the district medical officer.

Armagh Camps.—P. Pilot, sub-contractor from Murdock Bros. There was only one camp at which about forty men were employed, and there had been no serious diseases, accidents, or deaths. J. O. Saint Pierre, M.D., was the district medical officer.

St. Rosaire Camps.—A. M. Ryan, sub-contractor for ten miles. There were three camps, with about three hundred men employed, who were housed and boarded in good buildings and well boarded by the sub-contractor.

There had been one case of typhoid, two accidents, but no deaths. The general health of the men was excellent, and the water supply and sanitary conditions good.

The hospital at Arnagh was used. J. O. Saint Pierre, M.D., was the district medical officer.

Bras D'Apie Camp.—Perron & Co., sub-contractor for seven miles. About one hundred and fifty men were employed, who were well housed and boarded by the sub-contractors. There had been no serious diseases, accidents, or deaths, the general health of the men, and condition of the camp being good.

There was a hospital established at St. Perpetue, county of L'Islet, for general use of surrounding camps.

J. P. Masse, M.D., of St. Perpetue, was the district medical officer.

St. Perpetue Camp.—Stewart Bros., sub-contractors for eight miles. About fifty men were employed, who were well housed and boarded by the sub-contractors. There had been one case of typhoid, but no serious accidents or deaths. The general health of the men and the condition of the camp were good. The permanent hospital was established here.

J. P. Masse, M.D., was the district medical officer.

Lac Ste. Anne Camps.—Dibona, Orlando Bros., sub-contractors for seven and one-half miles. About forty men were employed, who were well housed and boarded by the sub-contractors. There had been no serious diseases, accidents or deaths, the health of the men and the condition of the camp being good. The hospital at St. Perpetue was used.

J. P. Masse, M.D., was the district medical officer.

Lafontaine Camp.—Wm. D. Scott, sub-contractor for five miles. There were only forty men employed in this camp, who were housed and boarded by the sub-contractor. There had been no serious diseases, accidents or deaths the general health of the men being good.

The hospital at St. Perpetue was used when necessary.

J. P. Masse, M.D., was the district medical officer of this camp.

New Brunswick Section, District 'A.'—From a point near Grand Falls, westerly to the boundary between the provinces of New Brunswick and Quebec, a distance of about sixty-two miles. This was let to Messrs. Lyons & White, who have made their headquarters at Edmundston, N.B., and have sublet the work to various sub-contractors.

Baker Brook and Lake Camps.—Messrs. Kennedy & MacDonald, sub-contractors. There are two camps with about one hundred and twenty-five men employed, who are well housed and boarded by the sub-contractors. There had been no contagious diseases, serious accidents or deaths. The general health of the men was good, the water was of excellent quality, being obtained from springs, and the sanitary conditions of the camps were good. The Hotel Dieu Hospital at St. Basil, N.B., was used

8-9 EDWARD VII., A. 1909

when necessary. P. H. Laporte, M.D., of Edmundston, was the district medical officer in charge.

Caron Brook Camps.—W. J. Sims & Co., sub-contractors. There are three camps, with about two hundred and fifty men employed, who were well housed by the sub-contractors, but boarded themselves. There had been no infectious diseases or deaths, but there were three serious accidents. The general health of the men and the condition of the camps were good, and the water used was first quality.

The Hotel Dieu Hospital at St. Basil, N.B., was used when required.

P. H. Laporte, M.D., was the first medical officer in charge.

St. Basile Camps.—W. J. Sims & Co., sub-contractors. There was only one camp with about thirty employed, who were housed by the sub-contractors, but boarded themselves. There were no serious diseases, deaths or accidents.

The Hotel Dieu Hospital was located near by and was used when required. J. Adolphe Guy, M.D., of Edmundston, was the district medical officer.

St. Basile Camps.—H. Sorette, sub-contractor. There were four camps, and about one hundred and twenty-five men employed, who were housed by the sub-contractor, and some of them boarded by him, the others boarding themselves.

There were no serious diseases, accidents or deaths, and the general health of the men was good. The Hotel Dieu Hospital was used.

J. Adolphe Guy, M.D., was the district medical officer.

St. Basile Camps.—L. W. Reade, sub-contractor. There were three camps, with about one hundred and twenty men employed, who were housed by the sub-contractor, and partly boarded by him, the others boarding themselves.

The local Hotel Dieu Hospital was used. There had been no serious diseases, accidents or deaths, the general health of the men being good.

J. Adolphe Guy, M.D., was the district medical officer.

St. Leonard Camps.—Allan & McInnes, sub-contractors. About seventy-five men were employed, who were housed and boarded in three camps by the sub-contractors.

There were no serious diseases, accidents or deaths, the health of the men being good.

C. G. Main, M.D., of Edmundston, was the district medical officer.

St. Leonard Camps.—Henry Sorette, sub-contractor. There was one camp with about thirty employees, who were housed and boarded by the sub-contractor.

There were no serious diseases, accidents or deaths. The hospital at St. Basile was used. C. G. Main, M.D., was the district medical officer.

St. Leonard Camps.—Wheaton Bros., sub-contractors. There were two small camps with about fifty men employed, who were housed and boarded by the sub-contractors.

There were no serious diseases, accidents or deaths, and the St. Basile hospital was used.

C. G. Main, M.D., was the district medical officer in charge.

Moncton Section, District 'A.'—From a point near the city of Moncton, N.B., westerly for a distance of about fifty miles. This was let to the Grand Trunk Pacific Construction Company, and was sublet by them to the Corbett Floesch Co. There is an adjoining section of eight miles, that was let to the John W. McManus Co., Ltd.

H. B. Hay, M.D., of Chipman, N.B., is the medical superintendent of both the above sections.

Chipman Camps.—John W. McManus Co., sub-contractors for eight miles. There were two camps, No. 1 at Chipman, No. 2 about three miles east. There were about forty men employed, some of whom were housed and boarded by the sub-contractors,

SESSIONAL PAPER No. 15

others by surrounding residents. There had been one case of diphtheria, but no other serious diseases. There was one serious accident, but no deaths.

Temporary quarters were provided for hospital purposes. The general sanitary conditions, and the water supplied was fair. H. B. Hay, M.D., was the district medical officer.

Chipman Camps.—Corbett, Floesch & Co., sub-contractors for fifty miles. There was one camp at Chipman with about fifty employees, housed and boarded by the sub-contractors. There had been no contagious diseases, serious accidents, or deaths, and the health of the men and condition of the camp was good. H. B. Hay, M.D., was the district medical officer.

Moncton Camps.—Corbett, Floesch & Co., sub-contractors. There were three camps, No. 1 being two miles from Moncton, No. A four miles therefrom, and No. 2 eleven miles therefrom. Three hundred and twenty-five men were employed, who were mostly housed and boarded by the sub-contractors, a few living with surrounding residents.

There had been one case of erysipelas, six accidents, but no deaths. The general health of the men, the sanitary condition of the camps, and the water used were good.

A. R. Myers, M.D., of Moncton, was the district medical officer attending these camps.

GRAND TRUNK PACIFIC RAILWAY.

Branch from Fort William to junction of National Transcontinental Railway, 210 miles.

Messrs. Foley Bros., Larson & Co., are the contractors with headquarters at West Fort William, Ont., from the commencement of the work, but which were removed to Dinorwic, Ont., and there are twenty sub-contractors.

About two thousand men were employed, located at thirty camps along the route, housed in wood buildings and boarded by the contractors. The sanitary condition on the work was good, there being latrines at each camp. The general health of the men has been excellent, with the exception that a good many cases of typhoid developed, owing to the poor quality of the water obtainable.

There were thirteen serious accidents, with six deaths in all. Three well equipped hospitals are maintained, well located, and each in charge of a resident medical man and a trained nurse, one at Fort William in charge of F. J. Ewing, M.D., and a medical assistant, one at Grasse Narrows, Ont., that was in charge of J. A. Speers, M.D., he being succeeded by Dr. Baillie, who is now in charge, and one at Camp Mile 180, that was in charge of A. E. Hylis, M.D., who was succeeded by F. H. Callahan, M.D., who is the resident district medical officer at present.

F. J. Ewing, M.D., is the chief medical officer for the contractors, and makes his headquarters at Fort William, Ont.

CANADIAN PACIFIC RAILWAY.

Kenora Section.—Rock work extending over seventy miles. Messrs. Foley Bros., Larson & Co., are the contractors, and they in the early part of the season, were double tracking the line in places, from Fort William to Winnipeg.

About two thousand men were employed who were housed and boarded in lumber camps by the contractors. There had been a good many cases of typhoid fever, with several deaths therefrom, and some serious accidents and deaths from dynamite explosions. The general health of the men was otherwise good, as were also the sanitary conditions of the camps, the refuse being either burned or carted away, and box closets supplied and regularly cleaned. The general hospital at Kenora is used when necessary.

8-9 EDWARD VII., A. 1909

W. J. Gunne, M.D., of Kenora, is the district medical officer of this work.

Toronto-Sudbury Branch.—Parry Sound to Byng Inlet, Ont., forty miles. The Ross-Harris Company, Limited, of Parry Sound, are the contractors. About six hundred men were employed who were housed in good log and board buildings, and boarded by the contractors.

Of contagious and infectious diseases, there had been none. There were many minor accidents and two deaths.

The general health of the men had been good. The water supply obtainable was poor, even from wells.

Latrines were supplied, and the sanitary conditions of the camps were good.

There was an excellent permanent hospital established in a central locality, under charge of J. P. Russell, M.D., who was the district officer of the work.

This work is about completed.

Walkerton-Lucknow Branch.—From a point on the Canadian Pacific Railway, near Picton, Ont., westerly to the town of Walkerton, Ont., a distance of thirty-seven and one-half miles. Messrs. Macdonald & Stephen, of Durham, Ont., are the contractors. About four hundred men were employed, who were well housed and boarded by the contractors.

There had been one case of scarlet fever, and one case of measles. There had been several serious accidents, and one death from Bright's disease.

The general health of the men and the sanitary conditions have been good.

The Walkerton General Hospital, and the Royal Alexandra were used when necessary.

Doctors Jamieson and Maclaurin, of Durham, Ont., were the district medical officers.

Georgian Bay and Seaboard Railway Branch.—From near Coldwater, Ont., to a point on Hogg bay, Victoria harbour, Ont., about fourteen miles, which is under contract to the Toronto Construction Company. About three hundred men were employed, who were well housed and boarded by the contractors. There had been no serious diseases, accidents or deaths, the general health of the men and the sanitary conditions good.

The hospital at Midland was used when necessary. Wm. B. Boyd, M.D., of Coldwater, Ont., was the district medical officer of the work.

Toronto, Grey and Bruce Railway Branch.—From near Bolton, Ont., to Weston, Ont., about nine miles. This is under contract to Messrs. G. A. Beggy & Co., of Woodbridge, Ont. There were three camps with about seventy-five men employed, who were well housed and boarded by the contractors.

There had been no serious diseases, accidents or deaths.

P. D. McLean, M.D., of Woodbridge, Ont., was the district medical officer.

CANADIAN NORTHERN RAILWAY.

Toronto-Sudbury Branch.—From north of Canadian Pacific Railway crossing to Hutton and Sudbury. Angus Sinclair, C.E., of Parry Sound, is the contractor for this work, which is now composed of tracklaying and ballasting. About three hundred men were employed, who were housed in boarding cars, and well boarded by the contractor.

There were no contagious diseases, one serious accident, man run over by train, and one death.

The general health of the men was excellent. There was a hospital at Sudbury, which was used if necessary.

R. B. Struthers, M.D., of Sudbury, was the district medical officer in charge.

This work is about completed.

SESSIONAL PAPER No. 15

Key Harbour Camps.—Angus Sinclair, C.E., is the contractor for tracklaying, ballasting, bridge construction, &c. From three to five hundred men were employed, who were well housed and boarded by the contractor.

There were no contagious diseases, four serious accidents and five deaths, but the general health of the men was good.

The Parry Sound General Hospital was used when necessary.

W. N. Robertson, M.D., was the resident district medical officer.

This work is about completed.

CENTRAL ONTARIO RAILWAY.

Bancroft to Maynooth, Ont.—Whitney extension of about twenty-eight miles. W. G. Gibson, of Port Hope, Ont., is the chief contractor, and the company are doing a small portion of the work themselves. About two hundred men were employed thereon, who were housed in shacks or wood buildings erected by the company along the line, or in farm houses and boarded by James Robinson on contract. The health of the men had been good, and no contagious or infectious diseases developed. There had been no deaths or serious accidents. Tents and houses were provided for temporary accommodation, and the Belleville General Hospital was used in case of necessity.

The water supply was from springs, and was very good. Latrines were provided in suitable locations and the general sanitary conditions of the camps were good.

A. T. Embury, M.D., of Bancroft, is the district medical officer of this work.

CANADIAN NORTHERN QUEBEC RAILWAY.

Montford Branch.—From Junction with main line near St. Jérôme, Que., to junction with the Montford and Gatineau railway, about sixteen miles. This work was carried on by Messrs. Mackenzie, Mann & Co., of Toronto, who sublet the same to Messrs. O'Brien & Mullarky, of Montreal, and they again sublet it in four divisions, to the following contractors: T. Kert, Morrison, Bonneville and Mulhern, and McDonald & Sunstrum. There were four camps, and three hundred and forty men were employed, who were housed and boarded in tents and wood shacks by the sub-contractors. There had been two cases of typhoid fever, one serious accident, and no deaths. The general health of the men, the water supply, and the general sanitary conditions of the camps were good. Temporary tents were provided for hospital use, and a Montreal hospital used in case of necessity.

D. Berthiaume, M.D., of St. Jérôme, Que., was the district medical officer of the work.

This work is now completed.

Extension of Main Line.—From near Shawinigan to Quebec city, about eighty-six miles. This work is also being carried on by Messrs. Mackenzie, Mann & Co., of Toronto, who have contracted with Messrs. O'Brien & Mullarky, of Montreal, for the construction thereof, and the latter have sublet parts thereof to four sub-contractors, viz., Bamfield, McManus, Sorret and S. Maloney. There are four camps, one at St. Casimir, one at St. Anne, one at St. Prospère, and one at St. Stanislas, in the county of Champlain. About two hundred men were employed in all, about one hundred of them being housed and boarded in tents and buildings by the sub-contractors, the remainder boarding with surrounding farmers. There had been no contagious or infectious disease, no deaths, and only one accident. The general health of the men, the water supply, and the sanitary conditions were good. Hospital quarters were provided in case of urgency, but one of the Montreal hospitals would be used in case of necessity. Rosario Frigon, M.D., of St. Casimir, was the district medical officer of the first three camps, and Ferdinand Trudel, M.D., of St. Stanislas, the district medical officer of the camp there.

This work is well advanced towards completion.

8-9 EDWARD VII., A. 1909

La Tuque Branch.—From La Tuque Junction to La Tuque village, about forty-two miles. This work had been under construction for some time, and is under contract to Mr. Joseph Paquette, who sublet the northwestern portion to Messrs. O'Brien, Fowler & Co. Four to five hundred men were employed, who were housed in good permanent buildings, and were well boarded by the sub-contractor. The general health of the men had been excellent, the water supply of the very best, and the sanitary conditions of the camps good.

There had been no contagious or infectious disease, no deaths, and only one accident. Latrines were supplied at the permanent camps.

The General Hospital at Quebec was used if necessary.

A. B. Camison, M.D., was the district medical officer for the sub-contractors. This work has been completed and trains are being operated by Mr. Joseph Paquette, the main contractor.

In closing this my report for the twelve months ended March 31, 1908, I am pleased to again be able to draw your attention to the abatement of contagious and infectious diseases (with the exception of typhoid fever), the general healthfulness of the men, the good sanitary conditions of most of the camps at said works, and the attention given by the companies, contractors, sub-contractors and medical officers in trying to comply with the requirements of the regulations under the Public Works Health Act, 1899.

I have the honour to be, sir,

Your obedient servant,

CHAS. A. L. FISHER,

Public Works (Health) Inspector.

The Honourable

The Minister of Agriculture,
Ottawa.

No. 14.

(F. F. CHAMBERLIN, M.D.)

TORONTO, April 4, 1908.

SIR,—I beg to submit my report for the year ended March 31, 1908, as to the condition of health of men employed on Public Works, west of Winnipeg, as required by the Public Works (Health) Act. Compared with last year, there has been a marked improvement in the health of the men employed on railway building and the sanitary conditions of the camps. This season having been an excellent cool one, better facilities for obtaining a purer supply of water for all purposes, and the contractors having given more attention to destroying camp garbage, together with a better supply of medical attendance along most of the lines of the work, has tended to produce this result. The present conditions of the Public Works (Health) Act, are such that it is, and will be difficult to strictly enforce it until amended so that it will meet the conditions existing in railway construction. The constant shifting of camps from place to place, the large number of sub-contractors, few men employed at many of the camps, and the distances between them, make it difficult to supply proper medical attendance, and to enforce proper sanitary conditions. The sub-contractors have nothing to say, or control over medical work, and as a result in many cases the men requiring medical aid do not get it unless the sub-contractor at his own expense calls the nearest medical man he can obtain, and pays him for his services, taking his chances of being reimbursed by the

SESSIONAL PAPER No. 15

railway company, the general contractor or the medical officer who supplies medical attendance, which is not always done owing to the late spring, and wet weather grading work did not commence until about May 15, some of the contractors not having their camps established at that date. My report of June 24, of my first inspections, gives conditions of the camps of the Canadian Northern Railway, from Brandon to Regina. At Brandon and west there were 120 men track-laying. This work was being done by the company. The Cowan Construction Company have the contract for grading from Brandon to Regina. They sublet to various parties who in turn sublet again.

There are about 20 or 25 men on the Canadian Northern line north from Prince Albert line, called the Hudson Bay or Fort Churchill Road, commencing at a place called Etomami. This road is built for some 50 or 60 miles north. There is very little difference, if any, in the sanitary conditions existing at all these camps.

There have been no serious cases of sickness or injury up to time of inspection, slough water is used for all purposes, but as soon as the weather gets warm they intend to dig wells. At the present time this slough water is cold, and in many places running. The food is good and well cooked. The men are housed and fed by the contractors, and are charged 75 cents per month for medical attendance, and I am told in some cases \$1 per month is charged in place of 75 cents. No hospital tents, and no latrines are provided as yet. No resident doctors. Doctor Cockrin, who resides at Maryfield on the C.P.R. convenient to camp at mileage 85 from Brandon, has been called a few times to see sick in Simpson & Craig's camps. On the Rosburn extension, Doctor Evans of that place is employed by Doctors McKenzie's, of Winnipeg, to attend the sick or injured at the camps in that locality. He receives 35 cents from each man in the camps, and Doctors McKenzie's, 40 cents. I left cards, copies of the Health Act at all the camps. My second inspection to the C.N.R. camps later in the season, and reported on October 4, 1907, east from Brandon. Track laying pretty well advanced, this work being done by the railway company, the men are housed and fed in box cars, which in every way were very comfortable. No sickness reported.

At the grading camps the men are housed and fed in tents, considerable fault finding by the men, and sub-contractors with the medical attendance; of late a number of local doctors have been employed by Doctors McKenzie's, of Winnipeg, chief medical officers of the company, the men being charged 75 cents per month.

| Operations— | |
| For typhoid perforation. | 1 |
| For hernia | 2 |
| For varicocele. | 1 |
| Deaths from accidents. | 3 |
| Deaths from diseases. | 1 |

CANADIAN PACIFIC RAILWAY.

Early in the season I drove over the line of the Canadian Pacific Railway and visited the camps from Sheho to Lanagan, Saskatoon and Battle river, on the short line to Wetaskiwin; from Battle river to Wetaskiwin the road is completed, and the bridge across the river well under way; there was very little sickness at any of the camps, and the sanitary conditions of the camps was fairly good, this may also be said of the work on the main line from Calgary to Swift Current, the Stressberg line, north and west of Moosejaw, there was no work on line west of Edmonton during the season. Starting from Sheho west the first camp.

Mr. G. K. Hargrave's contractor, J. G. Reid, engineer, 65 men. Hargrave's contract extends some 60 miles towards Lanagan Junction, where it intersects the Stressberg line. He sub-lets to various parties.

SESSIONAL PAPER No. 15

| 7th camp, sub-contractor, Mr. Finlay | 20 " |

The men at these camps are housed and fed in tents. Up to the present time, no doctor has visited these camps. There is no sickness, well and slough water is being used. No latrines; men charged 75 cents per month for medical attendance. Food good, no camp hospitals. Camp 8, which is one mile east of Lanagan Junction, P. R. Lambe, contractor; only a few men employed. Dr. Kidd, of Lanagan, attends the sick. There has been one case of typhoid fever. Well water is used. Men are housed and fed in tents, no hospital; food good. No proper latrines. Dr. Kidd also attends to men at the camps west of Lanagan Junction for 25 miles south on the Stressburg line for 25 miles. He has a shack hospital and nurse at Lanagan. Dr. Kidd is employed by Dr. William Black, of Winnipeg, who has part of the medical work of the C.P.R.

At camp 1, west of Lanagan, Mr. W. B. Neel, sub-contractor, 25 men; 2nd camp, O'Neil, 12 men; 3rd camp, Mr. Bishop, 20 men. Those latter parties sub-let from Mr. Lambe. West from this point the British Columbia Construction Company are the contractors. The camps just mentioned are moving very frequently and are all in about the same sanitary condition, having the same medical attendance as at the other camps east.

Camp No. 4 west of Lanagan, Mr. McLean, sub-contractor, from the British Columbia Company, 25 men.

Dr. Kidd, of Lanagan, attends those camps, and Dr. Humphries, also of Lanagan, takes the work west from this point to Saskatoon. There is practically no difference in the condition of any of those camps, the men are charged 75 cents per month for medical attendance, and the doctors visit the camp once a week. Very little sickness at those camps; few complaints.

I posted at all those camps from Sheho westward copy of the health regulations so that all parties may see what the law requires.

Coming south from Lanagan Junction on the Stressburg line we have Mr. Thomas' camp No. 1, sub-contractor from Mr. Lamb, 5 men.

Second camp, Mr. Lamb's own, 40 men.

Third camp, Croston Green, 5 men.

Fourth camp, Mr. Gundelin, 7 men.

Fifth camp, Lavergne, 9 men.

Sixth camp, MacLeod, 14 men.

Seventh and eight camps, British Columbia Construction Company, 35 and 30 men. At those camps the men are charged \$1 per month for medical attendance. No proper latrines at the above camps. No hospitals, well water. Men housed and fed in tents. Food good. Very little sickness. Dr. Kidd, of Lanagan, is supposed to attend the men at those camps.

There are 120 men at Govan, track-laying. From that point north to Lanagan Junction. They have had no doctor at those camps up to date, July. The men are housed and fed in tents and box-cars. The men made many complaints on account of no doctor and being compelled to pay \$1 per month. Dr. Black, of Winnipeg, promised me to attend to sending a doctor to this point at once, and I understand he has done so. The sick are taken to Brandon hospital. The track-laying is being done by the C.P.R. Co. themselves under the management of Mr. Arthur Williams, as general foreman.

The next camp is at the gravel pit, 30 men employed. Near Stressburg, 130 men are at work on the extension and they are housed and fed in box-cars; have had very

8-9 EDWARD VII., A. 1909

little sickness; no regular medical attendance, no hospitals, and have not been as careful of the disposition of their garbage as they should have been. This has been remedied since, I am informed.

The next camp south is at Lipton, a supply camp of 18 men. The men at those camps complain as to their medical attendance. Dr. Black, of Winnipeg, tells me that he has provided better medical attendance since my visits at the camps, as well as attending to the sanitary conditions of the cars. He has a Mr. Smith, an undergraduate of medicine at Govan, who is supposed to attend the sick south on the line to this point, but at the time of my visits he had no medicines or appliances for attending to the sick or injured.

The C.P.R. Toulon extension from Winnipeg to west side of Winnipeg Lake, J. D. McArthur, contractor. W. A. Mannaix has the sub-contract from them and has 30 men employed grading. This work is being done by shovels and hand barrows, as it is in a muskeg and horses cannot be used. They have had no sickness; well and slough water is used, no doctors, no hospitals, no latrines.

Moosejaw extension of C.P.R. P. R. Lamb & A. C. Smith, contractors; N. W. Butterfield, engineer. The steel is laid to Tuxford, 15 miles north of Moose Jaw. Grading north by W. J. Slater, who sub-lets from Lamb. Has 20 men. Kent & Brown sub-let from Smith, have 35 men. There are two or three small camps of four or five men each, and they are also sub-contractors. Dr. Knight, of Moose Jaw, looks after the medical work. He is employed by A. C. Smith, and is a good man. Dr. J. H. Storey, of Tuxford, assists Dr. Knight west from Tuxford. The men are housed and fed in tents, food is good. Well water is used, no hospital or latrines up to this date. Dr. Knight is now having them provided. The men have not been charged anything up to date, but will be at the end of this month, July. There has been very little sickness at those camps.

On the C.P.R. extension from Boston to Wolseley, J. D. McArthur, contractor. There are three camps south of Wolseley, Dutton & Smith, sub-contractors; 36 men at the first camp. As there are five cases of typhoid fever at this camp, the doctor has ordered the company to move their camp some distance east. The sick cases are in tents and attended every day by Dr. Cook, of Wolseley. They are getting along well. The doctor is employed by Tunson & Dutton.

Second camp, A. G. Young, sub-contractor, 30 men.

Third camp, William Shultz & Son, sub-contractors, 40 men. Very little sickness at those camps to the present time. Dr. Cook looks after the medical work very well. The men are charged 75 cents per month for medical attendance. Housed and fed in tents, food is good, well and slough water is used. No hospital tents. This work will be completed in about 15 days to Wolseley.

The C.P.R. east of Saskatoon to Lanagan Junction is grading, three miles east there are 21 men, 6 miles, 23 men. Mr. Miller sub-contractor from British Columbia Construction Company. Doctor visits those camps once in every week or two weeks, or whenever sent for. Eleven miles east the British Columbia Construction Company have a camp of 40 men. Dr. Humphries attends the men at this camp. I am told he is an undergraduate and lives at Lanagan. No hospital tents, pit latrines. Very little sickness, men are housed and fed in tents, are charged a dollar per month for medical attendance, well water is used. Nineteen miles east of Saskatoon, Mr. Rolison, sub-contractor, from B. C. C. Co., 27 men. There was no doctor at those camps during May and June, but three times in July. Men complain that doctors do not come to the camps. Very little sickness.

The next camp is Mr. Terney's, with a sub-contractor from Canadian White Company, 50 men. No hospitals or latrines. Men charged \$1 per month for medical attendance. Dr. Humphries visits the camp, but at no regular period. There was one case of measles and one of erysipelas. The men complain as to monthly payment and the attendance given.

The next camp is Finches, 27 men. Good camps, well water, good food. Dr. Humphries attends twice a week. Have latrines. No hospital camp.

SESSIONAL PAPER No. 15

Mr. Richard's camp, 50 men, sub-contract from B. C. C. Co. Mr. Merner, camp 25 men. Mr. Madden's, 35; Mr. McLean's, 18; Mr. Lamb, 60 men; sub-contractors from the B. C. C. Company. Drs. Kidd and Humphries, of Lanagan, attend at those camps pretty regularly. No complaints by the men, very little sickness. There is practically no difference between those camps and those previously inspected.

West of Saskatoon, on the C.P.R. line, the steel is laid to Askwith. J. D. McArthur is contractor and sub-lets to other parties. Andre Paulo acts as foreman of Mr. McArthur's camp No. 2., Mr. Dubuc is resident engineer. This camp is moving this week.

Camp No. 1, J. D. McArthur, 36 men. Dr. Parkinson attends those camps and visits them once a week. There has been no sickness, the camps are in very good condition, well water is used.

Camp No. 3, McArthur's, 42 men, very little sickness, no hospital tents. Men are attended by Dr. Parkinson and are charged 75 cents per month. A hospital tent is being put up at camp No. 3 to-day.

C. J. Cameron, a sub-contractor from J. D. McArthur, 13 men; no hospitals, no latrines. The men are housed and fed in tents, charged 75 cents per month for medical attendance. The doctor has only been at this camp once. Work started May 27.

Jos. Dandlin, sub-contractor from McArthur, 19 men. They use well and slough water. Men are housed and fed in tents, no hospitals, earth pit, no doctor at this camp for two months.. Sick are sent to Battleford, 35 miles. Men are charged 75 cents per month.

Henry Thacker, sub-contractor for McArthur, 19 men. No hospitals, no latrines, well water, men housed and fed in tents. Dr. N. D. Mather, of Hardstay, comes to the camps two or three times a month. Men are charged 75 cents a month. This camp is situated at Round Valley, where this road and the Grand Trunk Pacific run side by side for a number of miles.

Whitkles & Stevenson, sub-contractors for McArthur, 8 men. Dr. Mather also attends this camp two or three times a month. Well water, no hospital, one latrine. This camp is in section 24, township 24, range 26, east of the 4th meridian, and a little west of the Grand Trunk Pacific crossing, east of Battle river.

GRAND TRUNK PACIFIC RAILWAY.

Construction work from Portage La Prairie to Edmonton.

The men employed upon this work have been better supplied this season with medical treatment and attendance (under the direction of Doctor Hutchinson, chief medical officer of the company. There has been an improvement in the sanitary condition of the camps, especially in the camps managed by Foley Bros., contractors. There has been some grading work done between Winnipeg and Portage la Prairie; from there west steel is laid, and ballasting done to the McDonald & McMillan section, some 800 men being employed at this work; they are housed and fed in box cars, fitted up for that purpose at different points. McDonald & McMillan, contractors, have a considerable amount of grading to do, and bridge building through the Touchwood Hills, west of Portage la Prairie. The company used cars for sleeping, eating and hospital accommodation.

The cars are kept in very good sanitary condition. Well water, food good. Drs. McCloud and Little, well qualified, are on the works. Good latrines. A few cases of typhoid fever which were taken to the Portage la Prairie hospital. The men are charged 75 cents per month for medical attendance. At the gravel pit, part of the men are housed in tents. East of Saskatoon, first camp, Mr. Lake, sub-contractor, from the Canadian White Company, 55 men. He has 30 miles of grading. Earth pit latrine. Very little sickness. Dr. Peterson, of Saskatoon, attends the men, and visits the camp once in one or two weeks. Well water used. Men are housed and fed

in tents, which are very good. Food good. No complaints by men. Next camp is Mr. S. Farrel, sub-contractor from the Canadian White Company; 50 men. Mr. Farrell sub-let to F. Pratt, S. C. Dame and John Tate. S. Farrell has another of his own camps, east, with 117 men. Mr. Rote, Mr. Burridge, Graham and Talling and Mr. Thersin; 320 men in all. Drs. Genlmette, Crosby and Bryce attend the men at all these camps. Earth pit latrines at most of the camps. Men are housed and fed in tents. Very little sickness. Well and slough water used. Good food. No complaints.

West-of Saskatoon. 1st camp, Mr. Jackson, sub-contractor from Foley Bros., 42 men. Good camp. Well water. Men housed and fed in tents. Food good. Have latrines. Not much sickness. Dr. Roberts attends the men and goes to the camp once a week. Is paid \$50 per month. His headquarters at Foley Bros.,

Camp No. 5.—Men charged 75 cents per month. Has a small tent which is called a hospital at this camp.

Camp No. 2.—Pile driving, 6 men.

Camp No. 2.—Jackson's, 31 men. Dr. Roberts attends once a week. Good camp and latrines. Well water. Housed and fed in tents. Very little sickness.

Camp 3.—Mr. Stockey, sub-contractor from Jackson, 18 men. Dr. Roberts attends. Men complain that doctor does not come when required or at regular periods. A few cases of sickness. They are housed and fed in tents. Well water. No hospital. One latrine.

Camp 4.—Tomkins & Taplin, sub-contractors from Jackson, 20 men. Well water. No latrines. No hospital. Dr. Robert visits the camp once a week. No complaints. Moving camp this week to Round Valley.

Foley Bros. camp No. 4.—31 men. Housed and fed in tents. Very little sickness. Dr. Roberts attends once a week. Men charged 75 cents per month. Earth pits. Those camps are in Eagle Hill country. The C.P.R. line from Sheho to Wetas-kiwin runs close beside the G.T.P. line for a number of miles.

Foley Bros. camp No. 5.—49 men. Housed and fed in tents. Dr. Roberts attends. His headquarters is at this camp. Spring water used. Good food. Small hospital tent. Earth pit latrines.

Foley Bros. No. 1.—40 men. Housed and fed in tents. Spring water. Earth pit latrine. Dr. Roberts attends.

Foley Bros. camp No. 3.—30 men, housed and fed in tents. Well water. Good food, earth pit. The sick or injured at this and previous camp are sent to Battleford hospital for treatment, 40 miles. The doctor has been once to this camp. Not much sickness.

Foley Bros. camp No. 2.—46 men. Housed and fed in tents. Well and lake water. No hospital. Earth and pit latrines. Dr. Middlemiss attends the camp for 50 miles. He is located near camp No. 6, of Foley Bros. He attends the work very well and visits the camp once a week. Little sickness. Men pay 75 cents per month. At this point the Grand Trunk Pacific line crosses the C.P.R. line, under it to the north side.

Foley Bros. camp No. 10, 47 men. Housed and fed in tents. Well water. No hospital, no latrines. Dr. Middlemiss attends once a week. Not much sickness.

P. C. Hanson's camp, sub-entractor from Foley Bros. at Round Valley.—44 men. Housed and fed in tents. Spring water. One latrine. No hospital. Dr. Middlemiss attends once a week. Very little sickness. This camp is located in the Sand Hills country.

Morin & Boget, sub-contractors from Foley Bros.—10 men. No hospital or latrines. Housed and fed in tents. Dr. Middlemiss attends. Well water. Good food. No sickness.

Foley Bros. camp No. 9.—69 men. Housed and fed in tents. Well water. Food good. Dr. Middlemiss attends once a week. Not much sickness. No hospital. Earth pit latrines.

William Dumpster, sub-contractor for Foley Bros.—2 men.

SESSIONAL PAPER No. 15

Hanson & Co., sub-contractors for Foley Bros.—10 men. Dr. Middlemiss attends. No hospitals. Pit latrines. Men housed and fed in tents.

Foley Bros. camp No. 6.—53 men. West of this camp, 1 mile, Dr. Middlemiss has a hospital. Lake water. Men housed and fed in tents. One latrine. Doctor visits this camp once a week.

Foley Bros. camp No. 11.—48 men. Housed and fed in tents. Well water. No hospital. One earth pit latrine. Dr. Middlemiss visits once a week. Food good. No complaints.

Foley Bros. camp No. 8.—Men housed and fed in tents. Good water. Dr. Williams attends the men. He goes over 60 miles. Earth pit latrines used. Has hospital at Battle River. Men charged 75 cents per month. Very little sickness.

G. M. Collander, sub-contractor for Foley Bros.—30 men. Housed and fed in tents. Dr. Williams visits the camp once a week. No hospital. One latrine. [There are two or three small sub-contractors from this point to Battle river. The Foley Bros. camps are all very good and well looked after by their foreman. Most of those camps which I have inspected east of Battle river will soon be moved to the west side, between that and Edmonton.]

East of Edmonton, at Clover Bar, Dr. Ducklow, sub-contractor from S. Jackson, has a camp.—40 men. Housed and fed in tents. Well water. Earth pits. No doctor. No hospital. No sickness. Men have not yet been charged, but will be for the month of July. I left cards. Dominion Health Act, at all of the camps.

The Interior Department of Canada have some 30 men working, building roads and bridges, &c., at Elk Park, southeast of Fort Saskatchewan. Men are housed and fed in tents. No sickness. No doctor. No hospital. No latrines. Well and slough water.

Dr. Hutcheson, chief medical officer of the Grand Trunk Pacific Railway, at Montreal, has and takes full charge of the medical work on this road. He has Dr. Lenay, of Winnipeg, and Dr. Hyslop, of Edmonton, assisting him.

I attach synopsis of Dr. Hutchinson's report to me, as to sickness, accidents, deaths, doctors employed, contractors, sub-contractors, and number of men employed on the railway works during past year.

I have the honour to be, sir,

Your obedient servant,

T. F. CHAMBERLAIN, M.D.

The Honourable

The Minister of Agriculture,
Ottawa.

MISCELLANEOUS

No. 15.

REGULATIONS UNDER THE COLD STORAGE ACT.

- 1. The Minister of Agriculture may make appointments of inspectors and other persons for the enforcement of the Act.
- 2. No application shall be considered for any cold storage warehouses except those equipped with mechanical refrigeration, nor any place where any such cold storage already exists or where the proposed cold storage would compete directly with other establishments of the same class.
- 3. Applications for a subsidy under the Act must be made in the following form, which shall be known as Schedule A.

SCHEDULE A.

No.....

Application for Cold Storage Subsidy.

Application is hereby made on behalf of.....
.....
.....in the province of.....for the
subsidy offered under *The Cold Storage Act* for a public cold storage warehouse
equipped with mechanical refrigerating machinery, to be erected at.....

Particulars.

- Size of building in cubic feet.....
- Refrigerated space in cubic feet.....
- Number of separate chambers.....
- Kinds of produce to be stored.....
- System of mechanical refrigeration to be used.....
- Capacity of refrigerating machinery in tons of refrigeration per 24 hours.....
- Character of the available water supply.....
- Estimated cost of building, equipment and water supply.....
- Cost of site.....
- Will the whole building be used for the purposes of a public cold storage?.....
- If not, what proportion will be set aside for public use?.....

Attached are the following documents:—
Exhibit 1, being a copy of the plans and details of the insulation of warehouse.
Exhibit 2, being a true copy of the specification of warehouse and insulation.
Exhibit 3, being schedule of rates to be charged.

SESSIONAL PAPER No. 15

Exhibit 4, sketch showing location of warehouse or proposed warehouse in regard to connection with railway lines and wharfs.

4. The owners of cold storage warehouses in order to secure the subsidy, will be required to maintain the following temperatures therein, for the preservation of the various products mentioned.

| Kinds of Produce. | TEMPERATURE. | |
|---------------------------------------|--------------|------|
| | Min. | Max. |
| Apples and other fruits..... | 32 | 36 |
| Butter..... | | 20 |
| Cheese..... | 35 | 40 |
| Eggs, Meats and Dressed Poultry..... | 30 | 34 |
| Bacon and Hams..... | 40 | 45 |
| Fish (Frozen)..... | | 20 |
| Meats, Poultry and Game (Frozen)..... | | 20 |
| Vegetables..... | 34 | 38 |

5. Nothing in these regulations shall prevent owners of subsidized cold storage warehouses from entering into special contracts with customers for the maintenance of temperatures other than those herein specified.

6. The first instalment of the subsidy shall not be paid until the applicant shall have presented proper vouchers for the cost of building, equipment, site and other expenditures.

7. The owners of cold storage warehouses to which the subsidy or any part thereof had been paid, may be required to make an annual report to the Minister of Agriculture in such form as may be described.

No.

Application for Cold Storage Subsidy.

Exhibit 1, to accompany the application by
 of in the
 Province of for the subsidy offered under
The Cold Storage Act for the erection of a cold storage warehouse.

NOTE.—Attach a copy of plans to this sheet.

No.

Application for Cold Storage Subsidy.

Exhibit 2, to accompany the application made by
 of of the
 Province of for the subsidy offered under *The*
Cold Storage Act for the erection of a cold storage warehouse.

NOTE.—Attach a copy of the specifications of warehouse and insulation to this sheet.

Application for Cold Storage Subsidy.

Exhibit 3, being schedule of maximum rates submitted for approval in connection with the application made by
of in the
Province of for a subsidy for a cold storage warehouse under the provisions of *The Cold Storage Act*.

Proposed rates for storage—

- Apples, in barrels
- Apples, in boxes
- Pears, in baskets or boxes
- Other fruits
- Butter

Application for Cold Storage Subsidy.

Exhibit 4, to accompany the application made by
of in the
Province of for the subsidy offered under *The Cold Storage Act* for the erection of a cold storage warehouse.

NOTE.—Attach a copy of sketch showing location of warehouse or proposed warehouse in regard to connection with railway lines and wharfs.

MISCELLANEOUS

No. 16.

REGULATIONS RELATING TO MANGE.

‘Whereas the disease of Mange exists among cattle throughout those portions of the province of Saskatchewan and Alberta which may be described as bounded by the International boundary, the Rocky mountains and a line drawn as follows:—

‘A line from the Rocky mountains along the northern boundary of the Stoney Indian Reserve to the line between ranges 5 and 6 west of the 5th meridian, thence north along that line to the line between townships 28 and 29, thence east along that line to the line of the Calgary and Edmonton Railway, thence north along the Calgary and Edmonton Railway to the line between townships 30 and 31, thence east along that line to the line between ranges 26 and 27 west of the 4th principal meridian, thence north along that line to the line between townships 34 and 35, thence east along that line to the Red Deer river, thence north along the Red Reer river to the line between townships 38 and 39, thence east along that line to the 4th principal meridian, thence south along the 4th principal meridian to the Red Deer river, thence along the Red Deer and Saskatchewan rivers to the line between ranges 7 and 8 west of the 3rd meridian, thence south along that line to the line between townships 10 and 11, thence east along that line to the line between ranges 20 and 21, west of the 2nd meridian, thence south to the international boundary line.

‘And whereas it is of the greatest importance to the interests of stock owners and to the preservation of a profitable market for western cattle that the policy adopted in 1904 with a view to the eradication of the disease in question should be continued.

‘That after careful inquiry and due consideration it has been decided that the period between June 1 and August 15 is the most suitable and convenient for treatment with the above object.

‘Therefore the Governor General in Council in virtue of the provisions of section 28 of the Animal Contagious Diseases Act, chap. 75 of the Revised Statutes of Canada, 1906, is pleased to order that the above described tract of land shall be, and the same is hereby declared an infected place, and that all persons owning or being in charge of cattle within the above described tract must, except as hereinafter provided, during the said period, dip or otherwise treat such cattle in a manner satisfactory to the officers of the Department of Agriculture, provision being made that where it can be clearly shown to the satisfaction of the said officers that cattle kept under fence in any well defined area or district within said tract, are not affected with, and have not been in any way exposed to, the contagion of mange, or have been, during the present season, treated in a satisfactory manner and subsequently kept isolated from all other cattle, the Veterinary Director General may, on the facts being reported to him, exempt such area or district from such compulsory treatment, but this provision shall in no case apply to cattle kept on the open range, or on unfenced land.

‘Satisfactory treatment shall consist of:—

(a.) Immersion for not less than two minutes in a solution of lime and sulphur of a strength of not less than 10 pounds of lime and 24 pounds of sulphur to 100 gallons of water prepared according to the directions of the officers of the Department of Agriculture, the fluid to be applied at a temperature of not less than 105° nor more than 110° Fahrenheit, and the treatment to be repeated after an interval of not less than ten or more than fifteen days.

(b) Complete immersion in, or thorough saturation by spraying or otherwise, to the satisfaction of the inspector in charge, with an emulsion of crude petroleum, soft water and hard soap, prepared by first mixing these ingredients in the proportion of:—

| | |
|---------------------------|----------------------|
| Crude petroleum | 2 gallons |
| Hot soft water | $\frac{1}{2}$ gallon |
| Hard soap | $\frac{1}{2}$ pound |

the mixture thus formed to be subsequently diluted with not less than seven nor more than fifteen times its volume of soft water.

‘Treatment with crude petroleum or kerosene in any form other than an emulsion as above described will not be recognized by the department.

‘When approved by the inspector in charge of the district in which the cattle to be dealt with are kept, persons owning or controlling herds of not more than thirty head may be permitted to treat their animals by hand, in which case either the emulsion described above or the following preparation shall be used:—

| | |
|---------------------------|----------|
| Sulphur | 2 pounds |
| Oil of tar | 8 ounces |
| Raw linseed oil | 1 gallon |

‘In the event of any owner failing to treat or to make satisfactory preparation for the treatment of his cattle on or before August 1, the provisions of the order in council, dated June 27, 1904, regarding compulsory treatment as quoted below, shall be enforced:—

“Every veterinary inspector, and every person duly authorized by a veterinary inspector shall have full power to order animals affected or suspected of being affected with mange to be collected for inspection, and, when necessary, to be detained, isolated or treated in accordance with the instructions of the Veterinary Director General.

“The expenses of, and incidental to such collection, isolation and treatment shall be borne by the owners of the animals, and if advanced by the inspector or other authorized person shall, until paid, be a charge upon the said animals, without prejudice however to the recovery of any penalty for the infringement of these regulations.

“If such expenses are not paid within twenty days of the time when they have been incurred, the inspector or other duly authorized person may proceed to sell the said animals by public auction after giving the owner ten days’ notice in writing of such intention to sell, which notice may be effectually given, where the owner is known, by delivering the same to him personally or by sending it by mail addressed to him at his last known place of residence. Where the owner is unknown, such notice may be effectually given by publication in one issue of a newspaper published or circulating in the district where such animals are detained. The proceeds of such sale shall be applied first in payment of the reasonable expenses of the collection, isolation, treatment, giving of notice and conduct of sale, and the balance, if any, shall be paid to the owner of the said animals on demand. Any balance not so paid shall be remitted to the Minister, and if not claimed within twelve months from the date of sale shall be paid to the credit of the Receiver General.”

‘The Governor General in Council is further pleased to order that no cattle other than those consigned to Winnipeg or to points in Canada east of Winnipeg, shall be removed or be allowed to move out of the above described tract unless they are accompanied by the certificate of an inspector of the Department of Agriculture, stating that they have been examined by him and have either been found free from contagion of mange, or that they may be shipped for immediate slaughter as hereinafter provided. Any such cattle, however, shall, if deemed advisable by the inspector, be detained, dipped, sprayed or otherwise treated in such manner as the Veterinary Director General may from time to time prescribe.

‘No railway company shall accept or load at any point within the said tract any shipment of cattle destined for any point west of Winnipeg or for export to the United States or elsewhere via any point on the international boundary, west of Winnipeg,

SESSIONAL PAPER No. 15

unless such shipment is accompanied by the certificate of an inspector as above provided.

‘Cattle originating west of Winnipeg, whether within the above described tract, or not, consigned to Winnipeg, or to points east thereof, shall be inspected at Winnipeg, and no railway company shall release such cattle at Winnipeg or load such cattle for re-shipment therefrom until they have been submitted by daylight to an inspector of the Department of Agriculture and certified by him to be free from mange and other contagious or infectious diseases.

‘Cattle found on inspection to be affected with mange or other contagious or infectious disease shall be dealt with as may be ordered by the inspector.

‘At points where cattle originating in the said district are unloaded, they shall be placed in special yards and such yards shall be used for no other purpose and shall be cleansed and disinfected when so ordered by an inspector.

‘All cars and other vehicles used for the carriage of cattle originating within the said tract shall be cleansed and disinfected to the satisfaction of an inspector as soon as possible after being unloaded and before being used for any other shipment.

‘All way bills and bills of lading accompanying shipments of cattle originating within the said tract shall have plainly written or stamped across the face thereof a notification that the said cars are to be cleansed and disinfected immediately after being unloaded.

Cattle infected with, or which have been exposed to the contagion of mange, may be shipped for immediate slaughter to points within the above described tract under the following conditions:—

‘Unless loaded through special yards and chutes reserved exclusively for such shipments, all yards and chutes used by them shall be declared infected places, and shall not be again used for shipment of healthy stock until cleansed and disinfected to the satisfaction of the inspector; they shall not be allowed to come in contact with other animals; shall be consigned direct only to such slaughter houses within the hereinbefore described tract as are provided with private yards and chutes; shall not be unloaded at any point *en route*, and shall under no pretext whatever be removed alive from the slaughter house or the yards and premises immediately connected therewith.

‘Cars conveying such cattle shall be cleansed and disinfected to the satisfaction of an inspector immediately after being unloaded.

The transit of cattle through the said tract is permitted subject to the following regulations:—

‘Cattle for transit by rail through the said tract from one part of Canada to another shall, at points where unloading is necessary, be placed in yards reserved for their exclusive use, and shall not be permitted to come in contact with cattle which have originated within the said tract.

‘Cattle imported from the United States into the said tract destined for points in Canada outside thereof may, under compliance with the quarantine regulations, and with the provisions of the next preceding section hereof, be permitted to pass without unnecessary delay through the said tract direct to their destination without further restrictions.’

No. 17.

CANADIAN QUARANTINE REGULATIONS.

The whole of the quarantine service of Canada is controlled by the Minister of Agriculture. It is administered under him by the Director-General of Public Health.

Each quarantine station is in the immediate charge of a specially appointed medical quarantine officer.

At each unorganized maritime or inland quarantine station, the local collector of customs is the quarantine officer for the purpose of these regulations.

The Governor in Council may, however, from time to time appoint a temporary medical quarantine officer at any unorganized maritime or inland quarantine station, who shall supersede for the time being the collector of customs as the quarantine officer of the port.

THE QUARANTINE STATIONS.

The quarantine stations of Canada are:—

Province of Quebec—

- (a.) Grosse Isle, in the River St. Lawrence, with Rimouski, the Louise Embankment and the Grand Trunk wharf at Lévis, as sub-stations.

Province of Nova Scotia—

- (a.) Halifax, the harbour and Lawlor's Island.
- (b.) Sydney, the harbour and Point Edward.
- (c.) Louisbourg and the harbour.

Province of New Brunswick—

- (a.) St. John, the harbour and Partridge Island.
- (b.) Chatham, the harbour and Middle Island.

Province of Prince Edward Island—

- (a.) Charlottetown, the harbour and Keppoch.

Province of British Columbia—

- (a.) Victoria, the harbour and William Head.
- (b.) Vancouver and the harbour.
- (c.) Prince Rupert, the harbour and the Kinnahan Islands.

Every other maritime port, each such port being designated an unorganized maritime quarantine station.

And every inland port on the Canadian frontier, each such port being designated an unorganized inland quarantine station.

GENERAL PROVISIONS.

1. Every quarantine officer at a quarantine station in Canada, and every customs collector in his quality of quarantine officer, shall for the purpose of these regulations be a justice of the peace in virtue of the provisions of section 7 of the Act respecting Quarantine, chap 74, Revised Statutes.

2. Every person entering Canada, whether through a customs port or otherwise, shall be held to be subject to these regulations.

(a.) Once a person has been released from this outer ring of Dominion quarantine, he or she passes from under the health jurisdiction of this department.

SESSIONAL PAPER No. 15

3. Passengers for the purpose of these regulations are divided into two classes, cabin and steerage. Steerage passengers are those occupying compartments other than those of first and second cabin.

4. The graver quarantinable diseases are; Asiatic cholera, plague, smallpox, typhus fever and yellow fever. The minor: Chickenpox, diphtheria, enteric fever (typhoid), measles and scarlet fever.

(a.) In addition to the above recital, it is the duty of every quarantine officer to satisfy himself as to the presence or absence of any other contagious or infectious disease.

5. It is the duty of every quarantine officer to satisfy himself as to the fact of the presence or absence of leprosy among the passengers or crew; and in the event of any case of such disease being found, the person affected shall not be allowed to enter Canada, but shall be detained at quarantine at the vessel's expense until taken aboard by the same vessel when next outward, and in the event of the vessel failing to take back the said leper, he or she shall be deported by the government at the expense of the owners of the vessel after an interval of fourteen days from the date of the landing of such person unless satisfactory reasons be given for further delay.

6. Every vessel arriving from any port outside of Canada at any organized quarantine station shall be inspected by a duly appointed quarantine officer, at the place duly appointed for such inspection, and shall not be allowed to make customs entry at any port in Canada until it has received a clean bill of health from such officer at such place.

(a.) If a vessel from an infected foreign port bound for a port in Canada, which is an unorganized quarantine station, has first to pass an organized quarantine station, it shall be held to call at such station before proceeding to its destination.

(b.) Within the meaning of these regulations an infected port or country is a port or country where any one of the graver quarantinable diseases above designated exists as an epidemic, or has been communicated to one or more persons through the medium of an infected person, personal effects or otherwise. A port or country is not considered infected when a single case or a small number of cases has been reported, and the disease has not been communicated from such cases.

(c.) These regulations shall also apply to vessels arriving at any port in the province of Prince Edward Island from any port in any other province of the Dominion of Canada that has been declared by the Minister to be infected with any of the graver quarantinable diseases.

7. Coasting vessels from Newfoundland and from ports in the United States contiguous to Canada and, in the case of Prince Edward Island, vessels from ports in other provinces of the Dominion of Canada, and free from infectious disease may, from time to time, be excepted from these regulations by order of the Minister of Agriculture.

(a.) Vessels from Europe touching at Newfoundland ports on their way to a Canadian port will not be considered coastwise vessels under this regulation.

8. After having made customs entry at any port in Canada a vessel, if she proceed to any other port in Canada without first again going abroad, shall be held and regarded as a coastwise vessel and so not subject to these regulations.

9. His Majesty's ships of war and transports arriving at any port in Canada in a healthy condition are excepted from quarantine inspection and detention; but in the event of the presence on board any such vessel of any of the graver forms of quarantinable diseases as designated in section 4, these regulations shall apply as in the case of other vessels arriving from outside of Canada.

10. It shall be the duty of every pilot on boarding a vessel arriving at any port in Canada to furnish the master of such vessel with a copy of the regulations, under the penalty hereinafter prescribed.

11. Every vessel from any port outside of Canada requiring quarantine inspection shall, on arrival at any port in Canada, display a yellow flag at the fore by day, for a

distinctive quarantine signal, in order to inform the quarantine officer that his services are required, and any such vessel arriving by night shall display a red light at the fore for such signal.

(a.) No such vessel shall proceed past the quarantine inspection ground until she has been visited and released by the quarantine officer.

12. Every person who shall be on board any vessel arriving from any port outside Canada at any organized quarantine station, or who shall have gone on board any vessel after such arrival and before such vessel has been inspected by a duly appointed quarantine officer, shall be liable to the provisions of sections 18 and 23, and no such person shall leave such vessel without the permission of such officer until such vessel shall have been declared by such officer free from infectious disease. Any person violating this regulation shall be liable to a penalty not exceeding \$400 and imprisonment for 6 months.

The word 'person' as used in this regulation shall be deemed to include customs and revenue officers and other officers or servants of the Crown being on or going on board any vessel so arriving either in the discharge of their duty or otherwise.

13. Every vessel shall be inspected immediately on arrival.

(a.) With the exception that in periods of the epidemic prevalence of any of the graver quarantinable diseases, or to meet the special requirements of any particular port, the Minister of Agriculture may direct that inspection shall only take place between sunrise and sunset.

14. Every quarantine officer shall satisfy himself as to the presence or absence of infectious disease by the personal inspection of those on board or by the sworn statement of the captain or surgeon, in the form hereto appended, or by both.

15. Every maritime quarantine officer shall, when infectious disease is found on any vessel, notify the immigration agent of the port of the fact so that that official may complete and forward the schedule list of immigrants by destination to the secretaries of the boards of health in the provinces or states to which such immigrants are destined.

16. Passengers during a period of the prevalence in epidemic form of any of the graver quarantinable disease should be notified by steamship agents to dispense as far as possible with luggage that may be injured by wetting, in case of having to undergo disinfection—such as fabrics of which the dyes are likely to run—as the owners will be compelled to assume all risks of injury.

17. Vessels during a period of the prevalence in epidemic form of any of the graver quarantinable diseases should dispense as far as possible with woollen hangings, curtains, carpets, and upholstering, substituting non-absorbing coverings.

(a.) Every vessel carrying cargo, and liable to be disinfected, should have provided a plain frame shaft allowing a clear inside space of 12 inches each way, placed in the main hatch, in a sailing vessel; and one in each hatch of a steamship fitted by bulkheads. The frame work in this shaft to be set before loading and to extend from the hatchway to the bottom of the vessel. This simple arrangement would receive the fumigating pipe and avoid shifting cargo.

18. Every vessel with infectious disease on board, or coming from an infected port or country, shall be liable to be detained at a quarantine station for disinfection or observation, together with its passengers, crew, pilot, &c., luggage and cargo.

(a.) A vessel may be detained at quarantine for disinfection during the time necessary for that purpose.

(b.) The time during which a vessel, its passengers, crew, pilot, &c., may be detained for quarantine of observation is the accepted period of the incubation of the disease quarantined against from the ascertained date of last possible exposure.

19. When any vessel not originally bound for any port in Canada arrives at any seaport of Canada with contagious or infectious disease on board, and is allowed to remain in quarantine at or near such port, the master of such vessel shall pay to the collector of customs at the port the sum of two dollars, head money, for each person

SESSIONAL PAPER No. 15

on board said vessel at the time of her arrival; and the said sum shall be a lien on the vessel, and shall be paid before she shall be allowed to leave the port. R.S., c. 74, s. 11.

20. The master of any such vessel shall, before bulk is broken, have the right of putting to sea with such vessel, instead of allowing her to be quarantined, and if this right is exercised, and the vessel has not arrived at her port of destination, the bill of health shall be returned after the inspecting physician has mentioned thereupon the length and circumstances of the detention and the condition of the said vessel on her putting to sea; Provided always, that before the exercise of such right by the master of such vessel, the inspecting physician shall satisfy himself that the sick of the vessel will be taken care of during the remainder of the voyage; and if any of the sick prefer to remain at such port the said physician shall take care of them. R.S., c. 74, s. 12.

21. Every vessel provided with an isolated hospital for men and another for women, on the upper deck, ventilated from above and not by the door only, may, if the quarantine officer is furnished with satisfactory evidence that such hospital accommodation has been promptly and intelligently made use of, be allowed to proceed after the landing of the sick and those who in the judgment of the quarantine officer may have been immediately exposed to infection, and the disinfection of such parts of the vessel as he may judge to require it; any vessel, however, arriving with any infectious disease, without having such special isolated and ventilated hospital accommodation, or if having it, without satisfactory evidence that it has been promptly and intelligently made use of, shall be liable to be detained for disinfection at a quarantine station.

22. Any vessel detained by order of the quarantine officer shall forthwith be anchored or moored in such position as the quarantine officer shall direct, and its passengers, crew, pilot, &c., shall be retained on board or landed at quarantine as the quarantine officer shall direct.

23. And whilst such ship is so detained no person shall leave the same, nor shall communication be allowed with such vessel, without permission from the quarantine officer.

24. The quarantine officer detaining any ship as aforesaid shall immediately notify the Minister of Agriculture, stating the cause of such detention.

25. In the case of a vessel carrying His Majesty's mails and arriving by the St. Lawrence, clearance certificate shall be from a quarantine officer at Rimouski (or at any other port designated by the minister) or at Grosse Isle, and in the case of every other vessel from Grosse Isle only unless special permission to the contrary be obtained from the Minister of Agriculture.

(a.) In the event of his finding a quarantinable disease on board the quarantine officer at Rimouski (or any other port designated by the minister) shall withhold the final clearance for customs entry which shall only be given to the vessel when she has been released after quarantine inspection at Grosse Isle.

(b.) When, however, in the judgment of the quarantine officer at Rimouski (or at any other port designated by the minister), mails and persons and their effects may be permitted to land at Rimouski (or at any other port designated by the minister) from such a vessel a partial clearance shall be given by such quarantine officer covering only the mails and the persons allowed to land there with their effects. (*Vide Form appended hereto.*)

(c.) With the exception that during a time of epidemic prevalence of one of the graver quarantinable diseases the permission to a mail steamer from an infected port or country to land passengers at Rimouski (or at any other port designated by the minister) may be suspended by direction of the Minister of Agriculture.

(d.) And, in such conditions, the mails only to be landed at Rimouski (or at any other port designated by the minister), and the vessel to proceed to Grosse Isle for inspection.

(e.) In the event of a graver quarantinable disease having occurred on board a vessel during the voyage and where in the judgment of the quarantine officer the outer bags containing mail matter may have been exposed to infection, they shall be left on board the vessel for disinfection at Grosse Isle.

8-9 EDWARD VII., A. 1909

(f.) The quarantine officer at Rimouski (or at any other part designated by the minister) shall telegraph a statement of action taken and the disease for which full clearance is withheld to the quarantine officer at Grosse Isle.

26. With regard to vessels touching at Halifax on their way to St. John, when, after inspection, the quarantine officer at Halifax finds a vessel healthy he shall give a full customs clearance which shall be valid at the port of St. John, and the vessel shall then proceed there coastwise.

(a.) In the event of his finding a quarantinable disease on board the quarantine officer at Halifax shall withhold the final clearance for customs entry which shall only be given to the vessel when she has been released after quarantine inspection at St. John.

(b.) When, however, in the judgment of the quarantine officer at Halifax mails and persons and their effects may be permitted to land at Halifax from such a vessel a partial clearance shall be given by the quarantine officer at Halifax covering only the mails and the persons allowed to land there with their effects. (*Vide* Form appended hereto.)

(c.) The quarantine officer shall telegraph a statement of action taken and the disease for which the full clearance is withheld to the quarantine officer of the port of St. John.

27. Any steam tug or other vessel which shall have towed or otherwise communicated with any vessel of the class of vessels subject to quarantine or quarantine inspection shall thereby be held to the same regulations and requirements as apply to the vessel communicated with.

(a.) If the communication between the vessel and the steam tug is confined to attachment of a rope, afterwards loosed, the quarantine officer may decide to release such tug from quarantine detention.

28. Rags coming from a port or country in which infectious disease prevails may be prohibited, and the name of any port or country so infected shall, from time to time, be published in the *Canada Gazette*.

(a.) Rags arriving from prohibited ports at a quarantine station shall be liable to be burnt or otherwise treated on the order of the Minister of Agriculture based on a report of the quarantine officer.

29. New merchandise in general may be accepted without question.

VACCINATION.

30. Every passenger shall be required to furnish evidence, to the satisfaction of a quarantine officer, of having been vaccinated, or of having had the smallpox.

(a.) Every person not showing satisfactory evidence of having been vaccinated, or of having had smallpox, shall be vaccinated by a quarantine officer or detained under observation.

31. The production of an endorsement of the passenger's ticket, signed by the ship's surgeon, to the effect that the passenger has been successfully vaccinated, and the ship's surgeon's testimony under oath verifying the truth of such certificates or endorsements, may be taken by a quarantine officer as evidence of such vaccination and protection. Such quarantine officer shall, however, from time to time, make personal examination of holders of such certificates to satisfy himself of the manner in which they have been issued.

(a.) The ship's surgeon shall make examination of each steerage passenger as to his or her vaccinal protection as soon as possible after the vessel leaves the port of departure and shall endorse the result of such examination on the passenger's steamship ticket as follows:—

'Protected by previous vaccination or smallpox,'

'Vaccinated on board,' or

'Refused vaccination.'

SESSIONAL PAPER No. 15

(b.) In the event of smallpox having occurred on any vessel, or of the arrival of any vessel from any port or place which has been declared, by proclamation in the *Canada Gazette*, infected with smallpox, every person on board not showing satisfactory evidence of having been vaccinated within seven previous years, or of having had the smallpox within that period, shall be vaccinated by or under the supervision of the quarantine officer or detained under observation.

(c.) Persons who are found by the quarantine officer to require vaccination under the above regulations and who refuse to submit to it shall be landed at the quarantine station subject to detention for observation, and the maintenance of such persons and the pay and the maintenance of such guards as it may be necessary for the quarantine officer to appoint to look after and control them during their detention shall be a charge against the vessel.

(d.) In the case of persons so detained from a healthy vessel the period of detention shall be 18 days, such being taken as the ordinary period of incubation dated from possible infection at the port of departure, and in the case of persons from a vessel in which smallpox has occurred during the voyage the eighteen day period of detention shall date from the landing at quarantine of the persons refusing vaccination.

(e.) A vessel arriving at any quarantine station in Canada will be less liable to detention if the vaccination of all steerage passengers not showing proof within seven years is insisted on before embarkation.

DISINFECTION.

Disinfection under the quarantine service of Canada shall be by one or more of the following means:—

Fire, boiling, steam, formaldehyde, sulphur dioxide, mercuric bichloride solution, carbolic acid solution, formalin, chloride of lime, milk of lime.

Fire.—Thoroughly efficient, but seldom necessary as practically everything can be disinfected by less destructive means.

Boiling.—Articles to be wholly immersed in water actually boiling (100° C., 212° Fahr.) for not less than thirty minutes.

Steam.—Steam should be used for ship's hospital cabins, for all small apartments where it will not do much injury, and for divided steerages where steam pipes are provided as fire protection and the compartments are small.

It is also to be used under pressure with vacuum in special chambers for the disinfection of all clothing and effects that will not be injured thereby.

The exposure to the steam to be for not less than thirty minutes, the steam to be of the temperature of not less than 100° C., 212° Fahr., not greater than 115° C., 239° Fahr.

Articles injured by steam, such as leather, furs, skins, rubber trunks, valises, hats and caps, boots and shoes, bound books, silk, fine woollens and glued articles should not be disinfected by steam. For such articles washing with a disinfecting solution of mercuric bichloride, carbolic acid or formalin should be used. And for those which would be injured by wetting, disinfection by a gaseous agent, formaldehyde or sulphur dioxide.

Formaldehyde.—Such ship's cabins and saloons and articles as would be injured by steam may be disinfected by formaldehyde gas.

This may be evolved by:—

(a.) The free sprinkling or spraying of formalin (40 per cent solution of formaldehyde) on sheets suspended in small closed compartments, 10 ounces per 1,000 cubic feet. One sheet will hold about 5 ounces without dripping.

(b.) The formalin-permanganate method. Seven and a half ounces of potassium permanganate, powdered or in fine needles, and one pint of formalin for each 1,000 cubic feet of room space to be disinfected. *The permanganate must be put in before the formaldehyde solution.* The vessel in which the mixture is made should be of con-

siderable size else the vigorous foaming will overflow. A flaring ten quart tin pail may be used, or if a wide bottom vessel be used it need not be high. If the bottom of the dish be so wide that the requisite amount of permanganate just conceals it and the sides be eight inches high there will be no overflow from foaming or spattering.

The room in either of these methods should be closed up tightly for four hours.

With dry heat from the jacket and partial vacuum where formaldehyde appliances are attached to the chambers for steam disinfection, one hour's exposure. This method has great penetrating power, and is specially applicable to clothing, luggage, &c., that cannot be steamed.

Formaldehyde gas does not injure fabrics nor most colours.

It cannot be depended upon to kill rats, or other vermin, or mosquitoes.

Clothing, textiles and luggage, clean and in good condition, but suspected of infection can be efficiently and least injuriously disinfected by formaldehyde.

Where desired the smell of formaldehyde may be subsequently neutralized by the use of ammonia in liquid or gaseous form.

Sulphur dioxide gas.—(a.) By burning not less than three pounds of finely broken rolled sulphur per 1,000 cubic feet of space. The sulphur may be burned in iron pots standing in vessels of water. Ignition is best accomplished by alcohol.

(b.) Or liquified sulphur dioxide may be used, six pounds of the liquified gas for each 1,000 cubic feet of space.

(c.) The sulphur may be burned in a special furnace and the sulphur dioxide blown in by a powder fan.

Fumigation by sulphur dioxide is specially applicable to holds, steerages and other compartments too large for steam or formaldehyde, and which do not contain objects injured by it. It bleaches fabrics or materials dyed with vegetable and aniline dyes. It destroys linen or cotton goods by rotting the fibre through the acids formed. It injures most metals. It is promptly destructive to all forms of animal life. It is therefore specially valuable for the destruction of rats, &c., in plague ships, and of mosquitoes in yellow fever vessels.

In sulphur fumigation the time of exposure should be not less than twelve hours.

Mercuric bichloride.—This disinfectant is used in solutions not weaker than 1 to 1,000 of water. Its solubility is increased by using salt water, or by adding 2 parts per 1,000 of sodium (or ammonium) chloride. It is of use for the spraying, washing and drenching of free surfaces, alleyways, walls, floors, &c., where steam or gaseous disinfection cannot be used. It injuriously affects polished metals. It cannot be depended upon to penetrate substances in the presence of albuminous matters, dejecta, sputa, &c. These are best disinfected by burning or by chloride of lime or milk of lime.

Carbolic Acid.—In solution of 5 per cent this may be used instead of the mercuric bichloride solution for polished metals, bright work, &c.

Formalin (a 40 per cent aqueous solution of formaldehyde gas).—This in 5 per cent solution may also be used as a substitute for the mercuric bichloride solution or carbolic acid. It is non-injurious to metals.

GENERAL.

When it is necessary to disinfect the mails it can be done by steam superheated to dryness, sulphur dioxide or formaldehyde gas. Perforation of the letters facilitates penetration.

A simple method of disinfecting mails in their bags or boxes is by formaldehyde gas. A soft towel or bunch of clean cotton waste may be placed in each bag or box and formalin poured upon it in the proportion of 1 oz. for every cubic foot of air space, leaving the bag or box closed for 5 or 6 hours.

Textiles which are soiled with discharges of the sick or are in any other way presumably deeply infected, must be disinfected by boiling, or by steam, or by steeping in one of the above disinfecting solutions.

SESSIONAL PAPER No. 15

Cooking and eating utensils are to be disinfected by immersing in boiling water or by steam.

In generally infected vessels the bilges should be flushed out with sea or river water and then treated with steam, or one of the disinfecting solutions in large quantity.

33. During a time of cholera or other epidemic, the luggage of immigrants or passengers by every vessel arriving at any port in Canada, whether from an infected or healthy port or country, may by direction of the Minister of Agriculture be disinfected in each case.

(a.) When this disinfection is carried out at a sub-station, subsequent to the inspection and clearance at the main station, the clearance granted by the quarantine officer shall be conditional on the landing of immigrants and their luggage for disinfection.

(b.) The supervising officer of such disinfection to count the immigrants as they land, and if he find the number tallies with that marked on the clearance of the quarantine officer and has satisfactory evidence that all their luggage has been landed with them, he shall countersign the clearance which shall then become valid for Customs entry.

COSTS AND CHARGES.

34. All quarantine inspections, except those under section (45), shall be made without any charge against the vessel.

35. All costs incurred in the maintenance of and attendance upon healthy persons, who may have been exposed to infection, or who have refused vaccination (see section 31c.), detained for quarantine are to be at the charge of the vessel.

(a.) The master of a vessel shall make arrangements with the quarantine officer for the landing of the necessary provisions and for the attendance of stewards for serving them in cases where persons are so landed.

36. Persons sick will be treated and taken care of in the quarantine hospitals at the charge of the government.

37. In the event of a vessel being allowed to proceed, leaving its passengers in quarantine, the subsequent transfer of such passengers from quarantine to the port of destination shall be at the charge of the vessel.

38. The appliances, materials, and labour for disinfection are supplied by the government without charge to the vessel.

UNORGANIZED MARITIME QUARANTINE STATIONS.

39. Every maritime port at which there is no regular quarantine station and no regular quarantine officer permanently or temporarily appointed by the minister shall, for the purposes of these regulations, be constituted an unorganized maritime quarantine station.

40. Every collector or sub-collector of customs at every such unorganized maritime quarantine station shall be the quarantine officer.

41. Any collector or sub-collector of customs in his quality of quarantine officer at any unorganized maritime quarantine station in Canada, if he is informed of or has reason to suspect the presence on any vessel from abroad of any of the graver quarantinable diseases recited in section 4 of these regulations shall order a medical inspection to be made of vessel, crew, passengers, &c., on which such quarantinable disease exists or is suspected to exist.

42. A medical man making such inspection by order of the collector or sub-collector of customs shall, while engaged in such service, be the quarantine medical officer.

43. Every vessel arriving at an unorganized maritime quarantine station from an infected foreign port, or on board of which any death from infectious disease or out-

8-9 EDWARD VII., A. 1909

break of infectious disease has occurred during the voyage, shall remain outside until it receives permission to enter from the quarantine officer.

44. All the regulations applicable to regularly organized maritime quarantine stations shall also apply to every unorganized maritime quarantine station in so far as circumstances will admit.

45. In the event of a vessel arriving at an unorganized maritime quarantine station with quarantinable disease on board, the master shall pay a fee of \$5 for each medical inspection ordered by the quarantine officer, and such fee or fees must be paid before customs clearance is granted.

46. If no disease is found on board a vessel arriving at an unorganized maritime quarantine station and ordered to be inspected by the quarantine officer, the cost of such inspection shall not be a charge against the vessel, but will be defrayed by the government.

(a.) In submitting an account for a medical inspection ordered by him, a collector or sub-collector of Customs shall forward with the same a certificate setting forth the reason for his action (*Vide* Form No. 5 appended hereto).

47. If the disease found on board a vessel, or the history, conditions, or circumstances of a vessel be such as may seem to the collector or sub-collector of Customs to be beyond the capabilities for isolation or disinfection existing at an unorganized maritime quarantine station, he shall at once report the same to the Minister of Agriculture, who may, at his discretion, order that the vessel proceed to an organized quarantine station for quarantine clearance, before being allowed to make customs entry. And in such case the expense of the transfer of the vessel to the organized maritime quarantine station shall be a charge against the vessel.

48. In the case of Prince Edward Island the regulations with regard to unorganized maritime quarantine stations shall apply to vessels from all ports outside of that province.

UNORGANIZED INLAND QUARANTINE STATIONS.

49. Every inland port on the frontier of Canada at which there is no regular quarantine station and no regular quarantine officer permanently or temporarily appointed by the minister shall, for the purposes of these regulations, be constituted an unorganized inland quarantine station.

50. Every collector or sub-collector of Customs at every such inland frontier port shall be the quarantine officer.

51. Any collector or sub-collector of Customs in his quality of quarantine officer at any unorganized inland quarantine station in Canada, if he is informed of or has reason to suspect the presence of any of the graver quarantinable diseases recited in section 4 of these regulations, shall order a medical inspection to be made of the car, carriage, vehicle, boat or thing bringing or suspected of bringing such disease.

(a.) And such collector or sub-collector of Customs is empowered to detain such car, carriage, vehicle, boat or thing until such medical inspection shall have been made to his satisfaction.

(b.) A medical man making such inspection by order of the quarantine officer shall, while engaged in such service, be the quarantine medical officer.

52. And such quarantine medical officer shall have the power to cause vaccination of such persons as he may judge to require it, in the event of their refusing to be vaccinated, to prevent their entry into Canada.

53. The fee payable to such quarantine medical officer for each such inspection shall not exceed the sum of \$5, and in the event of any quarantinable disease being found, such fee shall be payable by the company or owner of the car, carriage, vehicle, boat or thing, bringing such disease.

(a.) In submitting an account for a medical inspection ordered by him the collector or sub-collector of customs shall forward with the same a certificate setting forth the reason for his action (*Vide* form No. 6 appended hereto.)

SESSIONAL PAPER No. 15

54. The customs collector or sub-collector in his quality of quarantine officer shall, on the report of the quarantine medical officer, in the event of any of the graver quarantinable diseases being found, cause the detention of the car, carriage, vehicle, boat or thing, bringing any person ill with such infectious disease until the requirements of these regulations are in his judgment satisfied.

(a.) Any such person shall not be allowed to enter Canada until in the opinion of the quarantine medical officer he or she can safely do so.

(b.) Any car, carriage, vehicle, boat or thing, bringing such person to the frontier shall have the option of returning as an alternative to quarantine detention; or

(c.) The customs collector or sub-collector in his quality of quarantine officer shall in his discretion, on the report of the quarantine medical officer, cause the removal and isolation of such person in any car or boat, set apart for the purpose, or in any suitable building sufficiently separated from other buildings to prevent contact or infection.

(d.) And such quarantine officer may cause the disinfection of the car, carriage, vehicle, boat or thing, bringing such person, by means of formaldehyde, sulphur dioxide, or any other mode of disinfection prescribed in these regulations adapted to the circumstances of the particular case.

55. All the regulations applicable to regularly organized maritime quarantine stations shall also apply to every unorganized inland quarantine station in so far as circumstances will admit.

56. In the event of an epidemic of one of the graver quarantinable diseases prevailing in any part of the United States near which a railway, crossing the frontier of Canada runs, and where there may not happen to be at that point of the frontier any adequate quarantine arrangements and apparatus to cope with an inroad of such epidemic disease, the Governor in Council may, on an order published in the *Canada Gazette*, made on a report, direct the complete cessation of passenger traffic at such point or such restriction thereof as may, in the circumstances, be deemed advisable.

QUARANTINE OFFICERS GIVE ALL NECESSARY ORDERS—PROHIBITED FROM RECEIVING FEES OR GRATUITIES.

57. Every quarantine officer is empowered to give any necessary order, or do any necessary act, to enforce these regulations, and it is his duty to report immediately to the Minister of Agriculture any breach or attempted breach of them.

(a.) No quarantine officer nor other person employed in the quarantine service of Canada shall directly or indirectly receive or take any fee or gratuity or reward for any service rendered to any company, owner, master, crew, passenger, or other person at or detained in any quarantine, maritime or inland.

(b.) Every person to whom the knowledge of any breach of these regulations may come shall forthwith report the same to the Minister of Agriculture.

PENALTIES.

58. Every pilot shall be furnished with printed copies of these regulations, one of which it shall be his duty to hand to the master of every vessel coming from a port outside of Canada, immediately on boarding such vessel, under a penalty of \$50.

60. Every master of a vessel, pilot or other person, shall be liable to a penalty of \$400 and imprisonment for six months, for allowing customs entry of any vessel in the absence of production of a quarantine clearance, in accordance with the requirements of these regulations.

60. Every master of a vessel, pilot or other person, shall be liable to a penalty of \$400 and imprisonment for 6 months, for any contravention of any of the foregoing regulations. The vessel shall be held liable for any pecuniary penalty imposed on the master.

8-9 EDWARD VII., A. 1909

61. Every ship's surgeon or other officer not answering with exact truth any of the questions contained in the form herewith appended shall be liable to a penalty of \$400 and imprisonment for 6 months.

62. Every breach of sub-section (a) of section 57 of these regulations shall be held to be a malfeasance of office, an offence punishable by dismissal.

No. 1.

QUESTIONS TO BE ANSWERED UNDER OATH TO QUARANTINE OFFICERS BY MASTERS, SURGEONS OR OFFICERS OF VESSELS.

Date

19

1. What is your vessel's name and your name?
2. From what port and on what date did your vessel sail?
3. What is your cargo, and whence taken on board?
4. Are there rags in such cargo?
5. Has your vessel touched at any place or places on her voyage?
6. Was such place or places, or any of them, to your knowledge infected with cholera, smallpox, plague or any pestilential fever or disease?
7. How many persons on board when the vessel sailed? Cabin passengers, ; intermediate, ; steerage, ; cattlemen, ; crew ; Total
8. State whether any person on board during the voyage has been, or is now ill with any of the diseases above referred to, and, if so, how many?
9. Has any person died on board during the present voyage, and if so, state all particulars?
10. Have you satisfied yourself by personal examination of the vaccinal marks that each of the steerage passengers has been vaccinated, and do you swear to the correctness of the endorsements on their tickets as to the vaccinal protection?
11. Have you vaccinated those of them on whom you failed to find such marks?
12. Did the vaccination of the steerage passengers take place at the time of, or before embarking?
13. How many have you vaccinated on your present voyage?
14. Did you or any of the crew or passengers, within your knowledge, land at any place or places within Canada during the voyage?
15. Is any person on board lunatic, idiotic, deaf, dumb, blind or infirm, and, if so, is such person accompanied by relatives or guardians?
16. Have you an isolated hospital for men, and another for women, ventilated from above and not from the passage?
17. Were such hospitals, or one of them, immediately made use of on the occurrence of the disease?
18. Are there any other facts which, in your opinion, should be communicated?
19. Have you personally, during the present voyage, examined each one of the passengers and crew for proof of vaccination within seven years, or of having had the smallpox in that period?
20. Have you vaccinated those of them on whom you failed to find such marks, and, if so, how many?

Quarantine Officer and Justice of the Peace, authorized by Order in Council under R.S., c. 74: 'An Act relating to Quarantine.'

No. 2.

QUARANTINE OFFICER'S CLEARANCE FOR CUSTOMS COLLECTOR.

Port of 19 .

I hereby declare that I have inspected the Master, and found this vessel to be free from infectious disease or well founded suspicion thereof, and it is hereby admitted to pratique.

.
Quarantine Officer.

Collectors of customs will take notice of the following regulations:—
Every vessel arriving from any port outside of Canada at any organized quarantine station shall be inspected by a duly appointed quarantine officer, at the place duly appointed for such inspection, and shall not be allowed to make customs entry at any port in Canada, until it has received a clean bill of health from such officer at such place.
Every collector of customs or customs officer shall be liable to a penalty of \$400 and imprisonment for six months, for allowing customs entry of any vessel in the absence of production of a quarantine clearance, in accordance with the requirements of these regulations.

These regulations must be strictly observed.
Department of Agriculture,
Ottawa.

No. 3.

QUARANTINE OFFICER'S PARTIAL CLEARANCE FOR CUSTOMS COLLECTOR.

(Vessels for Quebec or Montreal via Rimouski or any other port designated by the Minister.)

Port of.19 .

I hereby declare that I have inspected the. Master, and hereby permit the landing therefrom at this port of the mails and of the following persons with their effects, the vessel to proceed to. for her clearance for customs.

.
Quarantine Officer.

Collectors of Customs will take notice of the following regulations:—

In the case of a vessel carrying His Majesty's mails and arriving by the St. Lawrence, clearance certificate shall be from a quarantine officer at Rimouski (or at any other port designated by the Minister) or at Grosse Isle only, and in the case of every other vessel from Grosse Isle only, unless special permission to the contrary be obtained from the Minister of Agriculture.

In the event of his finding a quarantinable disease on board the quarantine officer at Rimouski shall withhold the final clearance for customs entry which shall only be given to the vessel when she has been released after quarantine inspection at Grosse Isle.

When, however, in the judgment of the quarantine officer at Rimouski (or at any other port designated by the Minister) mails and persons and their effects may be permitted to land at Rimouski (or at any other designated by the Minister) from such vessel a partial clearance shall be given by such quarantine officer covering only the mails and the persons allowed to land there with their effects.

Every collector of customs or customs officer shall be liable to a penalty of \$400 and imprisonment for six months for allowing customs entry of any vessel in the absence of production of a quarantine clearance, in accordance with the requirements of these regulations.

These regulations must be strictly observed.

Department of Agriculture,
Ottawa.

No. 4.

QUARANTINE OFFICER'S PARTIAL CLEARANCE FOR CUSTOMS COLLECTOR.

(Vessels for St. John, N.B., via Halifax, N.S.)

Port of19 .

I hereby declare that I have inspected the Master, and hereby permit the landing therefrom at this port of the mails and of the following persons with their effects, the vessel to proceed to for her clearance for customs.

.
Quarantine Officer.

Collectors of customs will take notice of the following regulations:—

With regard to vessels touching at Halifax on their way to St. John, when, after inspection, the quarantine officer at Halifax finds a vessel healthy he shall give a full customs clearance which shall be valid at the port of St. John, and the vessel shall then proceed there coastwise.

In the event of his finding a quarantinable disease on board the quarantine officer at Halifax shall withhold the final clearance for customs entry which shall only be given to the vessel when she has been released after quarantine inspection at St. John.

When, however, in the judgment of the quarantine officer at Halifax mails and persons and their effects may be permitted to land at Halifax from such a vessel a partial clearance shall be given by the quarantine officer at Halifax covering only the mails and the persons allowed to land there with their effects.

Every collector of customs or customs officer shall be liable to a penalty of \$400 and imprisonment for six months for allowing customs entry of any vessel in the absence of production of a quarantine clearance, in accordance with the requirements of these regulations.

These regulations must be strictly observed.

Department of Agriculture,
Ottawa.

No. 18.

REGULATIONS GOVERNING THE INSPECTION OF MEATS, 1907.

1. In these regulations, unless the context otherwise requires:

(a.) 'Act' means the 'Meat and Canned Foods Act.'

(b.) 'Minister' means the Minister of Agriculture.

(c.) 'Carcasses' means the carcasses of cattle, swine, sheep, goats or poultry.

(d.) 'Establishment' means any abattoir, packing-house, or other premises in which such animals are slaughtered, or in which any parts thereof or products thereof are prepared for food for export, or are stored for export.

(e.) 'Export' means export out of Canada, or out of the province in which the establishment is situated to another province.

(f.) 'Food' includes every article used for food or drink by man, and every ingredient intended for mixing with the food or drink of man for any purpose.

(g.) 'Inspector' means an inspector appointed under the Act.

(h.) 'Regulations' means regulations made under the Act.

(i.) 'Portions' means the usual cuts, known as sides, quarters, shoulders, hams, bellies, &c., and also entire organs, such as tongues, livers, hearts, &c.

(j.) 'Products' means food prepared from carcasses or portions.

(k.) 'Canada Approved' means that carcasses, portions, or edible products so marked have been inspected and found fit for food.

(l.) 'Rejected' means that carcasses or portions so marked may be rendered into lard or tallow.

(m.) 'Condemned' means that carcasses, portions or products so marked are unfit for food, and shall be destroyed for food purposes.

2. The following regulations shall not apply to any establishment within the meaning of the Act in which the sole products prepared for food for export, or stored for export, are fish, fruit or vegetables.

3. Every animal slaughtered, and all carcasses or products therefrom, prepared for food purposes, shall be inspected, and handled as required in these regulations.

4. The owner or manager of any establishment slaughtering animals, or preparing any carcass or portion thereof for food purposes, and which is intended for export trade, may make application to the minister for inspection, in accordance with the provisions of the 'Meat and Canned Foods Act.' Application shall be in writing, and shall give full particulars as to location, capacity per day, species of animals killed, quantity of meats and products thereof exported. Forms for application will be supplied by the Veterinary Director General on request.

On receipt of an application as above, the minister may, after ascertaining that the facts are as stated, and that the sanitary condition of the establishment applying is satisfactory, make provisions for inspection in accordance with the terms of the 'Meat and Canned Foods Act.'

5. In order that a distinctive mark may be given all carcasses, portions, or products thereof, slaughtered or prepared for food at every establishment at which inspection is maintained, the minister will assign to such establishment a number, which shall be used with the Crown and the words 'Canada Approved,' to mark all carcasses, portions or products thereof, passed as fit for food. Branch establishments may use the same number by placing a serial letter in conjunction with it.

6. At establishments for which inspection is provided the minister shall appoint an inspector to take charge of the inspection, detailing also such assistants as he may deem necessary.

SESSIONAL PAPER No. 15

Inspectors shall, when in the performance of their duties, wear a badge provided by the Department of Agriculture.

7. Establishments at which inspection is maintained shall furnish suitable accommodations for inspectors, such accommodations to include the exclusive use of a room, or rooms, suitable for office purposes, together with such fittings as may be required for the proper conduct of the business of the department connected with such establishment.

The inspector in charge shall be kept fully informed by the management of all details regarding the actual operation of the establishment, and such operation will not be permitted under any circumstances without the knowledge of the inspector in charge, and either under his supervision or that of an inspector detailed by him for that purpose.

Every reasonable arrangement must be made as regards hours of work and other details, for the mutual convenience of the management and the officers of the department.

This section shall have special reference to small establishments situated in the same town, or in close proximity to each other, when two or more are under the supervision of the same inspector.

8. All establishments having inspection shall be suitably lighted and ventilated. All appliances, such as tables, trucks, vats, machines, containers, &c., must be kept clean and sanitary. All steps in the course of production shall be carried on carefully and with strict cleanliness, and under the supervision of an inspector.

Rooms in which carcasses, parts, or products thereof, are prepared, shall be frequently whitewashed or painted, and shall contain facilities for cleansing all equipment.

Employees of the establishment engaged in handling foods must be free from tuberculosis or other communicable diseases, and must observe such general rules as to sanitation as may be deemed necessary by the inspector in charge.

No carcasses or parts thereof entering into the production of food, shall be allowed to come in contact with anything that will contaminate or deteriorate them.

Coverings used by employees to protect their clothing or persons shall be of material easily cleansed.

Dressing rooms and lavatory accommodations shall be ample, sanitary, and fully equipped, and shall be entirely apart from any room or compartment used for the storing or production of food.

The yards and pens belonging to, or used in connection with any establishment shall be maintained in a clean, comfortable and sanitary condition, and shall not be used for the fattening of swine or other animals, nor shall any offal or other refuse from the establishment be utilized for feeding purposes.

Inspectors in charge of each establishment will suggest to the manager or owner any needed changes in the sanitary conditions, and will be required to report weekly to the Veterinary Director General as to the general observance of this section.

Inspectors are authorized to refuse inspection if sanitary conditions are not observed.

9. Inspectors in charge of establishments will be required to furnish to the Veterinary Director General such daily and other reports as may be required.

Proprietors of establishments shall furnish to the inspector in charge, upon request, accurate information regarding receipts of stock, shipments and products on hand.

10. Every animal about to be slaughtered shall be examined by a veterinary inspector in the yards, or pens, of the establishment prior to entering the killing floor. Such establishments shall provide suitable facilities for separating healthy animals from those showing symptoms or suspected of being affected with disease.

Only such animals as are found on inspection to be healthy shall be slaughtered at the regular kill.

Animals found diseased or suspected of being diseased shall be tagged in the left ear with a metal tag, bearing the word 'Held,' and killed separately at the end of the regular kill.

Animals known as cripples and downers shall be tagged 'Held,' and may be slaughtered at the regular kill or otherwise, upon permission of the inspector in charge.

11. Inspectors shall make a thorough inspection at the time of slaughter of the carcass and all portions thereof. If the examination reveals no grounds for detaining or condemning the same, the inspector shall pass and mark such carcass or portions as required in section 13.

If the inspector deem it necessary to hold any carcass or part thereof for further examination he shall mark the same 'Held,' as required in Section 22.

Should the inspection show the carcass or any part thereof to be in any way unfit for food, the inspector shall at the time of inspection mark such carcass or portion thereof with a 'Condemned,' tag as provided in section 24.

Carcasses which may be rendered into lard or tallow shall be marked 'Rejected,' but only after all diseased parts have been removed as provided in section 23.

No part of any carcass shall be removed or so placed as to prevent its ready identification, except with the authority of the inspector.

12. The entire carcass of any animal affected with any of the following diseases or conditions is to be condemned and tanked as hereinafter provided:

1. Anthrax.
2. Black leg.
3. Pyæmia and Septicæmia.
4. Rabies.
5. Tetanus.
6. Malignant catarrh.
7. Hog cholera.
8. Swine plague.
9. Texas fever.
10. Parasitic ictero hæmaturia.
11. Inflammation (chronic or acute) of any of the following tissues; Lungs, pleura, intestines, peritoneum, or uterus.
12. Traumatic pericarditis.
13. Jaundice.
14. Uræmia.
15. Sexual smell.
16. Parturition (carcasses of animals having within ten days given birth to young, if showing signs of septic infection).
17. Immaturity. Every animal under three weeks of age.
18. Tapeworm cysts. *Cysticercus bovis*. *Cysticercus cellulosæ*.
19. Emaciation or anæmia.
20. Tuberculosis. Every carcass affected with tuberculosis and emaciated shall be rejected, together with other carcasses affected with tuberculosis. Except in those cases in which the lesions are small, encapsulated, or calcified, and confined to the following tissues:—

(a.) The cervical lymphatic gland and two groups of the visceral lymphatics in the thoracic or abdominal cavity; for instance, the cervical, bronchial and mediastinal glands, or the cervical, hepatic and mesenteric glands.

(b.) The cervical lymphatics, one group of visceral lymphatics and one organ in the thoracic or abdominal cavity; for instance, the cervical, bronchial and mediastinal lymphatics and the liver.

(c.) Two groups of visceral lymphatic glands and one organ in the thoracic or abdominal cavity; as, for instance, the bronchial and mediastinal lymphatics and the lungs or the mesenteric and hepatic lymphatics and the liver.

SESSIONAL PAPER No. 15

(d.) One group of visceral lymphatics in the thoracic and abdominal cavities and the cervical glands; the bronchial, mesenteric and cervical lymphatics, or the mediastinal, hepatic and cervical.

(e.) Two groups of visceral lymphatic glands in the thoracic cavity, and one group in the abdominal cavity, or vice versa; as for instance, the bronchial, mediastinal and the hepatic, or bronchial, mesenteric and hepatic.

(f.) Carcasses affected as above in which the lesions are in a state of caseation, or show softening centres, and those in which lesions are more numerous than above specified, yet are slight, calcified, or encapsulated, may be rendered into lard or tallow after the diseased parts are removed. Such carcasses must be cooked by steam at a temperature not lower than 220° F., and for not less than four hours.

(g.) Carcasses in which the cervical lymphatics, one organ, and the serous membrane in either the thoracic or abdominal cavity, as the cervical glands, lungs, and pleura, or the cervical, liver and peritoneum. Carcasses so affected may be rendered into lard or tallow. Such carcasses must be cooked by steam at a temperature not lower than 220° F., and for not less than four hours. Every head, organ or part showing lesions of tuberculosis must be 'rejected' or 'condemned.'

21. Actinomycosis and actinobacillosis, except when the disease is confined to the seat of primary infection and the carcass is well nourished and otherwise healthy. The head, including the tongue, or other organ which may be the seat of primary infection, must be destroyed.

22. Portions or products of any carcass showing the following lesions:—

(a.) Decomposition.

(b.) Abscesses, bruises, tumours, parasites. Every organ or part of carcass showing an abscess or tumour, or which is badly bruised or affected with parasites, shall be 'condemned'—(livers, flukes, &c.)

Any condition not herewith described must be dealt with as the judgment of the inspector directs.

The presence at any establishment of an animal affected with or showing symptoms of any contagious or infectious disease, must be promptly reported to the Veterinary Director General by the inspector in charge, who shall take immediate steps to ascertain the point of origin and address of former owner, and place from whence such animal or animals were shipped, at the same time taking further action under the provisions of the 'Animal Contagious Diseases Act,' as he may deem necessary and advisable.

Animals in an advanced stage of pregnancy shall be tagged 'Held.' They shall not be slaughtered at that time nor for ten days after parturition, but may be removed for stock or dairy purposes, provided they are not affected with and have not been exposed to infectious or contagious disease. Before such animals are released, permission shall be granted by the inspector in charge and 'Held' tag removed.

13. Every carcass found to be fit for food shall be stamped by the inspector according to the instructions of the Veterinary Director General. Such stamps shall show the Crown and the words 'Canada Approved,' and the establishment number.

Every portion or organ of any carcass previously inspected and which is to leave the establishment for export trade, shall have a stamp or mark bearing the Crown and the words 'Canada Approved,' and the establishment number. This wording or an abbreviation thereof may be included, with the approval of the Veterinary Director General, in any branding iron or instrument used for the purpose of branding or burning a trade mark or the packer's name upon any portion of swine. This wording shall be legible, and shall be accepted in lieu of other inspection marks. The marking and stamping of all carcasses, portions or products shall be supervised by an inspector.

14. Sausages, canned meats, and portions intended for cure, shall be prepared only from carcasses or portions which have been marked 'Canada Approved,' and which on reinspection are found fit for food. Their preparation and packing shall be supervised by an inspector, who shall not allow any fixture, appliance or receptacle to be used in the production of food, unless the same is clean and sanitary.

8-9 EDWARD VII., A. 1909

No food product shall contain any deleterious substance, drug, dye or preservative.

With the object of preventing the use of deleterious substances, the inspector shall as often as deemed advisable procure samples of the preservatives used, as also of the different food products during their preparation, or after the same have been prepared and shall submit them without delay to the department for analysis.

Inspectors in charge will be furnished by the department with the names of harmless preservatives and dyes which may be used; the addition of others will prevent the approval of the product.

15. The proprietor or manager of an establishment shall upon request of the inspector in charge, furnish to him free of charge any sample or samples of preservatives, food products, or any ingredient used in the preparation of foods. Samples so obtained must be sealed, labelled, and marked with a description of the same, together with the inspector's name, and the date, and forwarded at once to the Veterinary Director General.

16. All portions, or products of carcasses, prepared for food and packed in cans, or similar receptacles, or in any package, shall be subject to inspection during the whole course of preparation and packing; and all such cans or receptacles shall be marked, unless otherwise ordered by the Governor in Council, with :

(a.) The initials of the Christian names, the full surname, and the address, or, in case of a firm or corporation, the firm or corporate name and address of the packer;

(b.) A true and correct description of the contents of the package. No can, receptacle, or package subject to inspection shall be marked with anything which falsely represents the quantity, weight, contents, or date when contents of same were marked.

These requirements shall be embodied upon a trade label, duly approved by the minister, having thereon in addition to the crown and the name and address of packer and description of contents, the Crown and the words 'Canada Approved,' and the number of the establishment. Letters contained in such label shall be of uniform size.

A copy of every label used by each establishment shall be filed with the Department of Agriculture.

In cases where a large supply of trade labels are on hand, a sticker furnished by the department may be used on such labels, having thereon the Crown and the words 'Canada Approved,' and the establishment number. Such stickers may be affixed only under the supervision of an inspector.

17. When carcasses, portions, or products thereof are shipped for export from any establishment, in any case, or covering, concealing wholly or partially the contents, the case or covering shall have a number stamp having thereon the Crown and the words 'Canada Approved.' No other reference to inspection under the 'Meat and Canned Foods Act' shall be placed upon any cover so marked.

Proprietors of establishments shall supply all necessary help to affix labels and stamps, under the supervision of an inspector.

18. After the contents of any package or covering bearing a stamp having thereon the Crown and the words 'Canada Approved' have been removed, the stamp shall forthwith be destroyed.

19. No carcasses or portions thereof other than those bearing the words 'Canada Approved,' and which have been inspected and found fit for food, shall be allowed to enter any establishment at which inspection is maintained, except as hereinafter provided.

(a.) Carcasses, portions or products thereof shipped from the United States, and marked 'U.S. Inspected and Passed,' but to guard against possible deterioration, such carcasses, portions or products shall be reinspected and dealt with accordingly.

(b.) Carcasses, portions or products thereof shipped from other countries, if properly certified, whether by marking or otherwise, to have passed government inspection before leaving the country of origin, but such carcasses, portions or products shall be reinspected and dealt with accordingly.

SESSIONAL PAPER No. 15

- (c.) Dressed carcasses, with the head, heart, lungs and liver, held by their natural attachments, such carcasses to be inspected before entering the establishment, and if found fit for food to be marked with the Crown and the words 'Canada Approved'; if found to be diseased or otherwise unfit for food, to be dealt with as provided in the regulations.
- (d.) Carcasses, or portions, shipped from another establishment at which inspection is maintained, when the shipment is accompanied by a certificate from the inspector in charge of such establishment. Such certificates shall show number of carcasses or portions, together with car number and its initials.

In case of carload shipments, cars should be sealed on both sides, and seals shall be broken only by an inspector or his assistant.
- (c.) Dressed carcasses, with the head, heart, lungs and liver, held by their natural establishment having inspection, unless the inspector in charge or his assistant has been notified.
- (f.) Carcasses, portions, or products thereof, shall be permitted to enter establishments only through such doors, passages, or other means of entrance as are designated for the purpose, and at such times and under such conditions as may be approved by the inspector.

20. Inspectors may at any time reinspect any carcass, portion or product thereof, which has been prepared, stored in or returned to any establishment, or is about to be shipped therefrom. If upon reinspection such carcass, portion, or product is found to be unfit for food, by reason of adulteration or deterioration, it shall be marked and disposed of as provided in the regulations.

21. In every establishment there shall be set apart special rooms or compartments, one to be known as the 'Detention' room, in which all carcasses, portions, or products thereof, marked 'Held,' shall be placed until finally inspected. The other room shall be known as the 'Rejected' room, in which shall be placed all carcasses, portions, or products thereof marked 'condemned' or 'rejected.' Both rooms shall be well lighted, and so constructed and situated that they may be easily cleansed and disinfected. The doors shall be so fitted that they may be locked, with locks supplied by the Department of Agriculture, and the inspector shall retain charge of such locks and their keys.

If, after final inspection, in the detention room, of any carcass, or portion marked 'Held,' the same is found fit for food, the 'Held' tag shall be removed, and the carcass, or portion, stamped as required in section 22. Any carcass or portion marked 'Held,' and which on final inspection is found to be unfit for food, shall be marked as provided in the regulations, and removed at once to the 'rejected' room.

22. If at any time during the slaughter of an animal, or the production of any foods therefrom, the inspector deems it necessary to further inspect the carcass, portion or products, he shall firmly attach thereto a black paper tag, numbered and having thereon the word 'Held.' In all cases where the inspector making the post-mortem examination is not the same individual as the one making the final inspection, the former shall furnish to the latter a description of the animal, disease or symptom thereof and the number of tag. If on final inspection, which shall be made not less than twelve hours later, the carcass, portion or product, is found fit for food, the 'Held' tag shall be removed and the carcass, portion or product marked 'Canada Approved.' Should inspection show the same unfit for food, it shall be immediately marked as provided, and removed to the 'rejected' room for final disposition.

Carcasses showing diseased or injured portions which cannot be readily removed at the time of slaughter, shall be marked 'Held,' and placed in the 'detention' room until after carcass is chilled, when the inspector may, if he sees fit, remove and mark the affected portion, 'Condemned,' and the remainder of the carcass shall be marked 'Canada Approved.'

23. Each carcass, or portion thereof, found on inspection or reinspection to be unfit for food purposes, but the condition of which is such as to allow of its being

8-9 EDWARD VII., A. 1909

rendered into lard or tallow, shall be marked with a numbered red paper tag having thereon the word 'Rejected.'

All carcasses or portions so marked must be cooked by steam at a temperature not lower than 220° F., for not less than four hours.

24. Upon each carcass, portion, or product thereof, found on inspection, reinspection, or during the process of production, to be in any way unfit for food, there shall be placed a black paper tag bearing the number and the word 'Condemned.' All animals found dead, or in a dying condition, upon the premises of any establishment, shall be tagged in the right ear by an inspector with a metal tag bearing a number and the word 'Condemned.' Such tag shall under no circumstances be removed except by the inspector supervising the final disposition of the carcass, portion or product so marked, who shall report as to its disposition.

25. Every establishment having inspection shall be equipped with facilities satisfactory to the department for the tanking of all diseased carcasses, portions, or products thereof. They must be so placed or operated as to cause no odours or fumes to pervade any room wherein carcasses or products thereof are prepared.

All carcasses, portions, or products thereof, which have been marked 'Condemned' shall be tanked as hereinafter provided, under the supervision of an inspector. Tanks shall be sealed and seals broken only by the inspector, who shall see that the process of tanking is sufficiently thorough to render impossible the utilization of any of the condemned carcasses, parts or products in any way for human food. As a further precaution with the above object in view, the minister may authorize the use by inspectors of any colouring or other matter which may be considered suitable. Establishments not having the necessary equipment for tanking will be granted reasonable time in which to provide the same. Until then, inspectors will slash carcasses or portions thereof, in such a way as to render them unsaleable and easily identified, and will in addition be required to supervise their burning or proper burial.

26. No clearance shall be granted any vessel carrying any carcasses, portions, or products thereof (except ship stores), unless said carcasses, portions or products have been duly marked with the Crown and the words 'Canada Approved.' As evidence that this requirement and the provisions of the Act, have been complied with, it shall be deemed sufficient, if a certificate signed by the shipper or by the inspector in charge of the establishment from which the shipment originated has been filed, at the time of filing the manifest, with the Customs authorities by the master, owner or agent of the vessel. Such certificate shall certify that the carcasses, portions or products have been duly inspected and marked according to the provisions of the Act, and shall also contain thereon the number of carcasses, portions or packages, weight, description, shipping marks, shipper, consignee and destination. In the event of the certificate being furnished by the shipper, it shall be in the form provided for similar shipments in section 27.

On request of the owner of an establishment, the inspector in charge shall issue a certificate in triplicate covering any carcasses, portions or products thereof, which have been inspected and marked with the Crown and the words 'Canada Approved,' and which are to be exported. Such certificates shall be issued in serial numbers. The original and duplicate shall be given to the shipper; the original to be attached to the bill of lading accompanying the shipment for the information of the Customs authorities.

27. When any carcass, portion or product thereof intended for human food is offered for transportation, for export, the person, firm or corporation shipping the same shall fill out a certificate in duplicate, in one of the following prescribed forms, which shall be delivered to the common carrier or other person to whom such shipment is offered; and no common carrier or other person shall transport or accept for transportation for export any carcass, portion, or product thereof intended for human food, until such certificate in duplicate has been duly made and signed by the shipper.

(1) To be used when shipment consists of duly inspected and marked carcasses, or parts, or edible products thereof:—

SESSIONAL PAPER No. 15

.....19
 Name and address of shipper.....
 Name and address of consignee.....
 Name of carrier.....

I hereby certify that the following described shipment of carcasses, parts or products thereof, has been duly inspected and marked with the Crown and the words 'Canada Approved,' according to the 'Meat and Canned Foods Act,' and that the articles comprising it have not been tampered with or treated in any way other than by smoking since they were so marked, and that they are at this date wholesome and fit for human food.

No. of packages.....

 Description.....

.....
Signature of Farmer.

28. All certificates must be made in duplicate, and original shall be filed by the initial carrier and the duplicate forwarded by him to the Veterinary Director General.

29. Way-bills, transfer slips, running slips or conductors' cards accompanying any shipment of carcasses, portions or edible products thereof, shall have stamped thereon, or attached thereto the following certificate:—

In case of duly inspected and marked carcasses, parts or edible products:

‘Shipment inspected and marked ‘Canada Approved,’ as evidenced by shipper’s certificate on file with initial carrier.

Railroad company.....
.....
Agent.’

In case of shipments made by retail butchers or farmers.

‘Uninspected as evidenced by shipper’s certificate on file with initial carrier.
Railroad company
.....
Agent.’

30. All carcasses, portions or edible products, stored, packed or in cure at any establishment on September 3, 1907, shall be inspected, and any found unfit for food shall be marked ‘Condemned.’ Those fit for food shall not be marked ‘Canada Approved’ until such time as the carcasses, portions or products are ready for shipment, and upon reinspection at that time are found wholesome.

31. No person shall apply the words ‘Canada Approved,’ or any word or words of like meaning or effect, to any article subject to inspection under the Act or to any package containing the same, except under direction of an inspector or with his approval or consent.

No. 19.

RULES AND FORMS UNDER TRADE MARKS AND DESIGNS ACT AND
TIMBER MARKING ACT.

I.

There is no necessity for any personal appearance at the Department of Agriculture, unless specially called for by order of the Minister or the Deputy, every transaction being carried on in writing.

II.

In every case the applicant or depositor of any paper is responsible for the merits of his allegations and of the validity of the instruments furnished by him or his agent.

III.

The correspondence is carried on with the applicant or his agent, but with one person only, and will be conveyed through the Canadian mails free of charge.

IV.

All papers are to be clearly and neatly written on foolscap paper, and every word of them to be distinctly legible.

Drawings are not to exceed thirteen inches in length and eight inches in width.

V.

An application for registration shall be signed by the applicant or by an agent duly authorized.

A partner may sign for a firm. A director or secretary or other principal officer of a company may sign for the company.

No. 21.

IRISH INTERNATIONAL EXHIBITION.

LONDON, March 31, 1908.

SIR,—In view of Canada's participation in the Irish International Exhibition, and in accordance with your instructions that your exhibition staff should make as creditable a display of Canada's natural products and resources as was made in Milan, and better, if possible, I had the necessary plans executed for a more spacious pavilion than Canada has had at any previous exhibition in which we participated. The dimensions of the pavilion were 200 feet long and 90 feet wide, and the architecture was a blending of Renaissance and Elizabethan styles which presented a very nice external appearance.

I am pleased to state that the staff carried out the decoration of the interior, and the installation of the exhibits in a very satisfactory manner.

The contract for the construction of this pavilion was given to Messrs. Humphreys, Ltd., builders, of London, who had obtained from the exhibition committee the sole privilege of constructing buildings on the exhibition grounds. The contractors executed their work to my satisfaction, and I am glad to say the Canadian pavilion at the Dublin exhibition was the first one practically ready to receive visitors. I beg here to cite an extract of the *Dublin Sunday Independent* on the occasion of the opening of the Canadian pavilion: 'The opening of the Canadian pavilion was the great event yesterday, and hundreds of visitors availed themselves of the opportunity of seeing the magnificent collection of the agricultural and mineral products of Canada which were here displayed. The pavilion has already been fully described in our columns, and it is only necessary to say now that it promises to be one of the most popular features of the entire exhibition.'

As was the case in Liège and Milan, the Canadian pavilion at the Irish International Exhibition was the centre of attraction, and the exhibition staff were kept busy giving information about Canada to the many visitors who had relatives in Canada or who were desirous to become settlers.

Many of the Irish people were under the impression that our climate was inhospitable and that we raised very little grain and few vegetables, and had practically no idea of the area of Canada as compared to their own country; but when they realized the fact that tomatoes and grapes thrive and ripen in the open air in Canada, and only do so in a very few favoured spots in Ireland, they would acknowledge that Canada's climate was better than it had been pictured to them. As it is well known, the bulk of the Irish emigration was directed to the United States, and being aware that it was the desire of the Dominion Government to turn this movement towards Canada, or, at least, to show these people that Canada was a better field for agriculturists than the United States, we particularly drew the attention of the visitor to our actual resources and the possibilities of our agricultural, horticultural, mineral and manufacturing industries. Warning was given that Canada desired particularly soil tillers, to open up and cultivate the vast areas of arable lands she possessed and that success was practically assured to the intelligent and thrifty farmer. We held no inducement for the emigration of tradesmen and people engaged in a profession, informing them that there was already a lively competition in those lines in Canada. As an evidence that Canada wanted emigration to be directed to her borders and did not desire to deceive those who might choose to settle in its domains, two placards were conspicuously placed at the main entrance, one reading, 'Caution. Whilst reading matter in

8-9 EDWARD VII., A. 1909

this building is based on facts, do not be influenced by it. Canada wants settlers, but she does not want people who are satisfied with their present conditions to leave their native land.' The other reading; 'Attention. If it is your intention to go to America, remember that United States farmers are going to Canada in great numbers. Canada offers to settlers better inducements than any other country in the world. Canada will receive you with open arms instead of imposing on you an alien tax of \$4 per head.'

Whilst many leading men in Ireland deplored the drain made by emigration, they invariably said: 'If our people will leave home we are satisfied there are better prospects in Canada for them than in any other country.'

Besides the visit made by Their Majesties the King and Queen, we had His Royal Highness the Duke of Connaught, Lord and Lady Aberdeen, and many notabilities, who all expressed their appreciation of Canada's exhibit.

I might also quote here the sentiments of the *Londonderry Sentinel*, which said: 'Extremely popular is the handsome Canadian pavilion at the Dublin International Exhibition, and a great surprise to those who enter its portals expecting to see nothing out of the ordinary. More taste and ingenuity it is safe to say have been bestowed upon the decoration of this pavilion than upon any other in the exhibition. One leaves the Canadian pavilion with the conviction deepened that they who insist on the potentiality of the Dominion do not exaggerate.'

According to your instructions, the same policy followed at the Milan and Liège exhibitions was followed in Dublin. Canada's exhibition here was strictly an exhibition of Canada's natural products, and all displays which could be looked upon as provincial features were carefully avoided. I may say that this manner of exhibiting Canada's products has met with the unanimous approval of all the Canadian visitors at our pavilion.

I can truly say that the Dublin exhibition was a busy season for your exhibition staff. The inquiries received were constant and numerous, and I have every reason to believe that the result of Canada's participation at the Dublin exhibition will be practical and beneficial; and from conversations I had with Canadian emigration officials in England and Ireland, I understand that it has already largely affected the tide of emigration of the Irish people to the United States and directed it to Canada.

I am happy to express my satisfaction for the kind and courteous treatment received from the executive committee of the Irish International Exhibition. I may say that this exhibition was one of the best managed that I have had the pleasure to be connected with.

Some time after the closing of the Dublin Exhibition, I left for London to supervise the construction of the Canadian pavilion at the Franco-British Exhibition, plans of which had been forwarded to the contractors two months previously. After a great deal of correspondence with the executive of the Franco-British Exhibition, and annoying delays of the London City and County Council in finally adopting the plans, which I had to modify several times to suit their demands, the ground was broken and the construction of the Canadian pavilion at the Franco-British Exhibition, Shepherd's Bush, was actually begun the last week of February.

Trusting that the results obtained by Canada from her participation at the Dublin International Exhibition will realize your expectations and prove to be one of the best undertakings of the Canadian Government for the prosperity of the country.

I have the honour to be, sir,

Your obedient servant,

WM. HUTCHISON,

Canadian Exhibition Commissioner.

The Honourable

The Minister of Agriculture,
Ottawa.

No. 22.

REPORT OF CANADIAN COMMISSION, NEW ZEALAND INTERNATIONAL EXHIBITION.

Name.—New Zealand International Exhibition.

Place.—Hagley Park, Christchurch, New Zealand.

Dates.—November 1, 1906, to April 15, 1907.

Size.—Area of exhibit buildings, 30 acres. Area of gardens and experimental plots, 70 acres.

Cost of Building.—£90,000.

Attendance.—Total, 1,966,861, a daily average of 13,949 for the (141) days on which the exhibition was open.

OPENING CEREMONIES.

The exhibition was opened with elaborate ceremonies on the morning of November 1, 1906, in the presence of Their Excellencies Lord and Lady Plunkett, Sir Joseph and Lady Ward and other prominent persons. Speeches were delivered by the governor and premier, in the course of which reference was made to the excellence and size of the Canadian exhibit, and cables of congratulation and thanks were exchanged between Sir Joseph Ward and the Right Honourable Sir Wilfrid Laurier.

The installation and decorating of the Canadian court was completed on the evening of October 31, 1906.

CANADIAN EXHIBIT.

The Canadian exhibit was located in the main building and occupied an area of 14,000 square feet, furnished by the exhibition management at a cost of £1,000. It may be claimed for Canada that her display covered more space than that of any other exhibitor.

Canada's part in the exhibition was a more prominent one, and it may be said without undue pride or exaggeration that her exhibit attracted more attention and elicited more favourable comment than that of any other country exhibiting.

The colour scheme and general plan of the installation of the Canadian exhibit was quite new to the people of that part of the world, and was a feature which attracted so much attention that it became, and continued to be, a subject of universal comment.

To attempt herein to speak of the number and variety of compliments paid to Canada in connection with the part she took at the exhibition would seem effusive and self laudatory, but it might not be out of place to quote the Commissioner for South Australia in his report to the Governor of New South Wales:—

'Canada had a court which was the admiration of all visitors. It may not be out of place to state that Canada sent a consignment of apples which were thirty days on the voyage and were placed in cold storage on arrival. Every week a case was taken out of the storage and placed on display, and these apples retained their freshness and flavour for five months. The success of Canada is that it is always prepared for exhibitions. The Exhibition Bureau is up-to-date with everything, and as soon as a decision to exhibit is arrived at, the officers of the department are ready to proceed to any part of the world, and all is Canada. There are no separate provinces allowed to form their own commissions, and the result is that the advertisement the Dominion of Canada gets is always worth the money expended. Had the whole of the Australian courts

8-9 EDWARD VII., A. 1909

been combined (like Canada's), and a uniform style of decoration and arrangement followed, the cost would have been much less and the advertising benefits much greater. Unfortunately, Australia was divided into sections apart from each other, in striking contrast to the Canadian court, where all its provinces were merged into one Canada, and where its exhibits of products, photographs of industries, and illustrated books and pamphlets descriptive of the soil, climate and conditions of life made Canada the most widely advertised country throughout Australasia.'

MINERALS.

We were able to utilize, without extra expense, a duplicate collection of minerals, the property of the Exhibition Branch, held in store at Ottawa, besides the necessary number of glass show cases to properly display the same. The Canadian mineral exhibit was the most comprehensive one of its kind at the exhibition, and our scheme of showing the resulting products as well as the ore or mineral as it came from the mine, was most favourably commented upon. Geologists, students of geology and the general public paid special visits to the exhibition from all parts of Australasia, for the express purpose of examining this exhibit which had been most extensively advertised in the press throughout the colony and Australia.

AGRICULTURAL PRODUCTS AND FRUIT.

A section of the court was set aside for a display of fresh apples, preserved fruits, maple sugar, maple syrup, honey, potted cheese, condensed milk and cream, biscuits, cereal foods, whiskey, potatoes, besides agricultural and dairying machinery. Two hundred and ten cases containing (39) varieties of apples grown in British Columbia, were brought over in cool storage. These were arranged on plates, and renewed from time to time as required. The quality and variety of the apples proved an eye-opener to the visitors, who declared them to be superior in every way to those of California, of which a large number are imported each year. The difference in the geographical position of New Zealand as compared to Canada makes it possible for British Columbia fruit and vegetables to be imported at a time when supplies are almost exhausted in New Zealand. As a result top prices are obtainable; for instance, California apples sold freely during September and October of last year at 8d. per lb., while potatoes brought 6d. per lb. at the same time. The existing direct steamship service does not afford cool storage accommodation for transportation of perishable cargo. The installation of cool storage chambers on this line would be the means of increasing trade in both directions. For instance, fruit and vegetables could be handled for the New Zealand market, while New Zealand meat products could be exported to Canada.

Pure maple syrup is absolutely unknown in New Zealand, and our exhibit of the genuine Canadian product aroused much interest. During Easter week we prepared over two tons of maple sugar, putting it up in small cakes of 2 oz. each, and a general free distribution was made to the visitors during that week. Each cake was neatly wrapped up in white paper bearing the following inscription:—

MAPLE SUGAR
WITH
EASTER GREETINGS
FROM
CANADA.

N.Z.I.E. 1906-7. (Sample enclosed.)

The prime object of our participation at this exhibition was to promote trade relations between the two colonies. We found the feeling throughout New Zealand very

SESSIONAL PAPER No. 15

friendly towards Canada and there seemed to be a very general desire for closer trade relations.

The time proved a most opportune one, coming as it did soon after the inauguration of a direct steamship communication between Canada and New Zealand.

One of the most popular things among all classes there is the proposed 'All Red Route' and the mere mention of it in a public way will always bring a spontaneous and hearty response.

MANUFACTURES.

About seventy-five per cent of the space was devoted to the display of manufactured articles, and these were neatly arranged throughout the court in such a manner that visitors were enabled to pass freely among them and examine each article from all sides. The various exhibits bore signs giving the name of the manufacturer in Canada, and the name and address of the New Zealand agent. To each article was attached a neat sign in green and gold, impressing upon the visitors the fact that it was 'Made in Canada.' The Canadian Government, through the Exhibition Branch of the Department of Agriculture, sent out thousands of circulars to manufacturers and advertised freely in the Canadian press, the fact that it was prepared to accept articles made in Canada for display in the Canadian court on the following liberal conditions:—

The Canadian Government offered free transportation, free space, free installation, free care and free attendants and to negotiate for the appointments of agents where the exhibitor was not already represented. About (75) manufacturers responded to this offer, and about (350) tons of exhibits were collected from this source. Arrangements were made with the Alley Steamship Company for the transportation of the exhibits to New Zealand, and the goods were assembled at different centres in Canada and forwarded to Vancouver, where they were shipped by the ss. *Pondo* and arrived in Christchurch about the middle of October.

From reports received from agents in New Zealand and from manufacturers in Canada, a large business has been done as a direct result of the exhibition. Business in lines already introduced has been greatly stimulated, and several lines hitherto unknown in this market have been introduced. Other lines not exhibited were inquired for, and as a result of the information given a large amount of new business was opened up.

A specific report giving full details as to the requirements of this market in the several articles of Canadian manufacture that could be sold in New Zealand might be prepared from an examination of the stocks now being carried by the leading wholesale houses in the different centres.

The manufactured articles displayed in the Canadian court consisted of:—

| | |
|----------------------|--------------------------|
| Mineral water. | Typewriters. |
| Churns. | Potted cheese. |
| Rubber goods. | Butter-making machinery. |
| Boots and shoes. | Metallic roofing. |
| Cereal foods. | Nails. |
| Wall paper. | Stoves. |
| Printing paper. | Ranges. |
| Manufacture of pulp. | Oil stoves. |
| Biscuits. | Enamelled ware. |
| Carriages. | Kitchen utensils. |
| Wagons. | Filing devices. |
| Motor cars. | Wind mills. |
| Bicycles. | Wooden pipe. |
| Office furniture. | Ladders. |
| Chairs. | Wooden ware. |

8-9 EDWARD VII., A. 1909

| | |
|--------------------|---|
| Tables. | Carriage bodies. |
| Canoes. | Musical instruments (string and brass). |
| Pulleys. | Bird cages. |
| Wheels. | Wire work. |
| Pianos. | Oils. |
| Organs. | Salt. |
| Butchers' skewers. | Manufactures of mica. |
| Incubators. | Manufactures of asbestos. |
| Wicks. | Petroleum products. |
| Tweeds. | Shelf hardware. |
| Whiskey. | |

The location and construction of our court afforded us ample wall space for the display of pictures of Canadian scenery, charts, maps, &c. Eight large oil paintings showing the advancement of a settler in the Canadian Northwest were of special interest to visitors. In addition to this we had large photos of the Grand Trunk Railway and the Canadian Pacific Railway, showing some of the best natural scenery and physical features along their respective lines. Seventy photos, the property of the Exhibition Branch, showing scenes from different parts of Canada, were also displayed.

LITERATURE.

We were careful not to give the impression that we were sent to New Zealand to do emigration work, but notwithstanding that fact we had hundreds of inquiries regarding the possibilities for settlers in Canada. We had a large number of hand-books entitled 'Dominion of Canada,' these we gave away to responsible parties, and distributed to the different libraries, Chambers of Commerce, &c., throughout the colony.

VISITORS.

We had several distinguished visitors at the Canadian court: among them were Lord and Lady Plunkett, Sir Joseph and Lady Ward, and all the members of the cabinet, the mayors of the different cities, the Lord Mayor of Melbourne, all of whom were loud in their praises of the comprehensiveness of the exhibit and the attractiveness of the arrangement. Our thanks are due to the New Zealand Government, mayor and deputy mayor of Christchurch, executive commissioners, general manager, railway and customs officers, Mr. Th. de Schryver, representative of the Canadian Manufacturers' Association, the Press of New Zealand, and many others whom we came in contact with during the term of the exhibition.

AWARDS.

Owing to irregularities in connection with the judging of the exhibits, we deemed it advisable to withdraw the individual exhibits in the Canadian court from competition. The wisdom of this step is now quite apparent, for the awards are not considered of any value, and in some cases where offered have been absolutely refused.

CLOSING CEREMONIES.

The closing ceremonies took place on the evening of April 15, 1907, on which occasion the New Zealand Government, wishing to recognize in some way the manner in which the Canadian Government had contributed to the success of the exhibition by its excellent exhibit, caused four special premiums to be issued as follows:—

- 1st. Extra Special Award and Gold Medal for general installation.

SESSIONAL PAPER No. 15

2nd. Special Award and Gold Medal for agricultural products, fruit, maple sugar, honey, &c.

3rd. Special Award and Gold Medal for comprehensive mineral exhibit.

4th. Special Award and Gold Medal for collective exhibit of manufactured articles.

If we may be permitted to make a digression from the affairs of the exhibition, we would like to embody in this report a few observations on the very unsatisfactory state of transportation between the two countries. Everywhere in New Zealand we heard complaints about the length of time it required to get goods from Canada and the uncertainty as to when they would arrive. This interfered very much with the placing of orders with Canadian houses, and in some cases increased to almost a hardship the bulk of the orders placed. This latter is especially true in the matter of printing paper. Four-fifths of the print now used in New Zealand is of Canadian make, and most of the consumers are compelled to carry very large supplies to insure them against running out before the next consignment comes to hand, so uncertain is transportation. In the matter of field and garden seed, one importer told us that his firm could not afford to take the chances of the Vancouver route and had all their Canadian stock sent round by London.

Still more unsatisfactory are the mail facilities. Trade in this age is largely dependent upon postal and cable correspondence. Between here and New Zealand the latter is very expensive, while the former is very unreliable as to date of arrival and delivery.

Permit us also to intimate that among the native products of New Zealand that came under our observation one at least, in our opinion, might be introduced into Canada with great advantage to the latter country. We refer to the native flax plant. But a few years ago many of the low-lying districts in both the north and south islands were looked upon as useless wastes. Now many of these waste places have been converted into the most profitable lands in the country simply by the introduction of the native flax plant. A study of its nature and habits has led us to the conclusion that it would thrive quite as well in the low lands of British Columbia and Southern Ontario, where the frosts of winter are not so severe as further north. The plant requires no cultivation; when once established in the soil it takes care of itself to the exclusion of all other vegetation, and its return per acre is enormous.

T. H. RACE,

W. A. BURNS,

Joint Commissioners.

No. 23.

TOBACCO.

(Report of F. Charlan.)

OTTAWA, March 31, 1908.

SIR,—I have the honour to submit the following report of the work done by the tobacco division, for the year ended March 31, 1908.

The latter part of the spring of 1907 was spent in establishing trial plots in both provinces of Quebec and Ontario, and supervising the operations of preparing and seeding seed-beds at the Central Experimental Farm.

The varieties of tobacco grown at the experimental farm were the Comstock Spanish and Connecticut Seed Leaf. The Connecticut made a slow growth, on account of the cool weather which prevailed throughout the season. The seed used was not, apparently, from a selected strain. It was purchased from a common dealer with no better guarantee of quality than is generally offered in such case.

The plants were poorly developed, the tissue was rather coarse, and the product, being unsatisfactory, was disposed of by retail sales as soon as it was cured, as it was not thought advisable to carry the experiment as far as the sweating stage.

The Comstock variety comprised two different lots. One lot was grown from seed imported two years previous, the other from seed produced in Canada, grown from the first, the year before. The object was to find out whether the seed grown in Canada would give products similar to the imported seed.

There was practically no appreciable difference between the products of the two lots. The season was rather unfavourable (spring late and rainy, summer short and dry, fall cold and damp), and the products obtained were poorly developed, like the Connecticut, but the texture was fairly good. However, so far as the appearance of the plants, the rapidity of growth, and the shape of the leaves are concerned, the results were identical, and we may conclude from this experiment that seed grown in Canada will yield products similar to imported seed, and well adapted to certain requirements of our industry.

The yield suffered greatly from the lack of development of the products. While the yield per acre reached 1,800 lbs. in 1906, the yield of 1907 did not go higher than 1,200 lbs. It should be stated here, however, that the piece of land on which the crop of 1906 was grown was heavily manured in the fall, while the crop of 1907 was grown on corn stubble, unmanured, and already seeded to oats which were ploughed in shortly before the setting out of the seedlings. This was on account of the fact that at the last moment the place of the experimental plot had to be changed, and the field which had been specially prepared for the growing of tobacco had to be abandoned.

Owing to the poor development of the products and the large number of diseases noticed, we gave up the idea of saving seeds from the crop.

The experimental plots established in the province of Quebec were in the parishes of St. Jacques l'Achigan, Montcalm county and of St. Cesaire, Rouville county.

The object of the experiment in the county of Montcalm was to determine the influence of the nature of the soil on the quality of tobacco. All things being equal, it was to be expected that the light clay soils south of St. Jacques would yield smaller and coarser products than the loamy and light soils at the north part of the parish. But the conditions prevailing in the year 1907 do not allow us to form an opinion on

SESSIONAL PAPER No. 15

this matter. The tobacco grew slowly, did not ripen well and yielded a very large proportion of products with a thick tissue.

However, judging from the results of experiments carried on at St. Jacques—results confirmed by the experiments of St. Césaire, as will be seen later—it would appear that fairly close planting gives a better yield in weight than planting wide apart, the tissue is finer and of a better quality, which favours rapid drying, and the yield of 1,000 lbs. per acre which has so far been the average for the Comstock grown in Canada, can be easily made much larger. On the experimental plots of St. Jacques in 1907, in spite of the unfavourable weather conditions, the yield per acre was between 1,000 to 1,200 lbs. per acre.

Two varieties, little known in the province of Quebec, were also tried in 1907, in the parish of St. Jacques.

The first of these, 'General Grant' proved rather early and yielded a well developed product, of fine texture, with a bright colour and easy to cure. This variety called a great deal of attention at the St. Jacques exhibition, held last spring, in which several tobacco manufacturers participated. The 'General Grant' might take the place of the Burley, which does not ripen well in this part of Ontario, owing to the weather conditions.

The second variety, 'Big Ohio,' yields large size products with a somewhat prominent mid-rib, apparently suitable for pipe use, but rather slow in maturing, although earlier than the Connecticut. If this earliness can be maintained, the farmers who are looking for heavy yields in weight and who are now growing the Connecticut for this purpose, would do well to drop this variety, which is very slow in ripening, and adopt the 'Big Ohio.'

Two growers of St. Césaire who had selected for this experiment an alluvial piece of land, much higher than the soil of St. Jacques, obtained yields varying in weight from 1,200 to 1,400 lbs. These yields, much higher than those of St. Jacques, lead us to think that in some parts of Canada the land is not kept in as good a state of fertility as is desirable. Thus a new field for experiments opens to our division: the maintenance of the fertility of the soils on which tobacco is grown and the kinds of fertilizers.

The trials of Comstock Spanish at St. Jacques de l'Achigan and St. Césaire put an end to a controversy which has been going on for two years, as to whether this variety of tobacco could give satisfactory yields in weight. The yield of 1,600-1,800 lbs. per acre obtained in 1906—a favourable year—on the experimental farm at Ottawa seemed to many Canadian farmers an impossibility. In 1907, at St. Césaire, in spite of the poor development of the products, the weight of the crop reached as high as 1,500 lbs., and it is generally conceded that in a normal year, the yield obtained at the experimental farm in 1906 could be duplicated on a number of farms.

A trial in hybridizing, undertaken by a farmer of St. Jacques, met with partial success. Although the weather was rainy and cold when the artificial fertilization was effected, the capsules grew well and apparently ripened well, but the seed obtained, sown in the spring of 1908, did not germinate. It should not be inferred from this that the hybrid 'Havana Seed Leaf—Canelle' is sterile, but simply that the seed did not ripen perfectly, and this is further proved by the fact that seed of another variety, not crossed, supplied by the same farmer, gave a yield of only 25 per cent in a germination trial—a yield much below the average yield of tobacco seed.

The object of the trials with Seed Leaf varieties in Essex county, in 1907, was simply to ascertain what these varieties would do under the climate of this part of Canada.

The trials were not by any means conclusive, and besides, serious mistakes were made which considerably interfered with the results.

The weather conditions were no more favourable in Ontario than in the counties of Rouville and Montcalm, Que., and at the Ottawa Experimental Farm. Considerable injury was done by the variegated cutworms, and some crops also suffered from the caterpillars. Generally speaking, the products were cut over-ripe, and therefore,

8-9 EDWARD VII., A. 1909

their elasticity and their colour were not so good, nor were they in so good a condition for sweating. This mistake, which might have been avoided, had the staff of the tobacco division been larger, is such as might well be expected from farmers familiar with the growing of Burley only, a variety which is cut when the ripening is far advanced and when the crop takes on a light yellow hue.

A variety of the 'Big Havana' kind was tried by an Ontario grower, from imported seed. The product is thick, fairly well developed, but showing a tendency to remain green in curing. Sweating improves it considerably, and develops a straight and pleasant aroma. Although a little strong, the product may be considered as a filler of good quality. We propose to experiment further with this variety if a sufficient quantity of seeds can be secured.

Last fall, I had the opportunity of visiting the valley Okanagan, B.C., where the industry of tobacco growing has been rapidly developing for the last few years.

The progress made by the industry in such a short time is really surprising. I was much pleased also with the quality of the product. The aroma is very fine, very agreeable, much like that of some Hayanas. This tobacco would make an excellent filler. The seed is imported from Cuba and renewed every four years.

The Comstock Spanish which is also grown, does not seem to have as bright a future as the Cuban varieties. Owing to the dry climate of the Kelowna valley, it is difficult to obtain products sufficiently well developed and fine enough for the manufacture of binders or wrappers. Irrigation may possibly correct this defect, but it will be necessary to devise a process of irrigation sufficiently economical.

While in Kelowna, I devoted some of my time to the study of various practical questions, and particularly, a program of experiments which will be undertaken in 1908.

I also visited some of the tobacco plantations in Connecticut, Pennsylvania, Wisconsin and Virginia, during the growing period. To complete my inspection a visit to the packing houses later in the season, when the crop was manipulated, would have been necessary, but I could not spare the time to do so, nor could I visit other tobacco producing states such as Kentucky, Ohio and Maryland, as I intended. These trips gave me the opportunity to become acquainted with some of the experts of the U.S. Government, and enabled me to secure some choice seed by means of which I hope we shall be able to introduce some more profitable varieties into Canada.

In the course of my trip, I noticed that the production of seeds was not always done with the necessary care, and I came to the conclusion that we should strive in future to produce our own seeds in Canada, instead of depending for the same upon foreign seedsmen, not always as scrupulous or as careful as they might be. By producing our own seeds we will also get acclimatized varieties.

The growing experiments of 1907 show that some varieties of American tobacco alter very slowly, if at all, under the climate of Canada. The first generations secured from successive crops of Canadian seeds are sufficiently similar to the ordinary American standards. On the other hand, by careful selection, we may perhaps, as intimated, above, fix truly Canadian varieties. The tobacco division has started in this work, beginning with the American varieties which show the greatest improvement.

The year 1907 was marked by an important event: the readjustment of duties on tobacco imported and manufactured in Canada.

All interested in the future of Canadian tobacco hope that these changes will enable the Canadian tobacco to compete successfully against its rival, the American tobacco. Packers have already begun work, and large quantities of light tobacco from the crop of 1906 have been treated. These products after treatment, have proved very satisfactory, and it is probable that a number of manufactures which have so far remained rigidly closed, will be thrown open to some of our Canadian tobacco, when the quality of the latter is better known.

This division proposes to carry some experiments in sweating, which, although remaining for some time at least, in the theoretical part of the laboratory, may nevertheless prove interesting, in view of the lack of definite information on the products.

SESSIONAL PAPER No. 15

Towards the end of winter, arrangements were made for a series of lectures in the chief tobacco growing districts of the province of Quebec, with a view to diffuse information on the methods of selection and the use of suitable rotations. I found many evidences of the progress made during the last two years by growers of Canadian tobacco, and especially of light tobacco, the products of which on account of the improvements in the methods of growing, will be called upon to supply the packing industry.

On March 25, 1908, I was called to give evidence before the Committee of Agriculture and Colonization. I seized this opportunity to submit to the members of this committee some samples of our home products, as well as some cigars manufactured with Canadian tobacco. Judging from the satisfaction of the audience, I do not hesitate to say that we are making decided progress, and that some of our Canadian products are of excellent quality, and quite suitable for manufacturing purposes. The tobacco division was called upon to prepare the exhibit of Canadian tobacco for the Franco-English Exhibition, and the manufacturers to whom we applied gave us conclusive proofs of their eagerness to help the interests of the Canadian tobacco industry.

I have the honour to be, sir,

Your obedient servant,

F. CHARLAN,

Chief of the Tobacco Division.

The Honourable

The Minister of Agriculture,
Ottawa.

EXCELLENT MAJESTY

1908

[No. 15a—1908.]

APPENDIX

TO THE

REPORT OF THE MINISTER OF AGRICULTURE

BEING THE

REPORT OF THE DAIRY AND COLD STORAGE COMMISSIONER

OTTAWA, March 31, 1908.

To the Honourable

The Minister of Agriculture.

SIR,—I have the honour to submit my report, as Dairy and Cold Storage Commissioner in your department, for the year ending March 31, 1908.

Although the work of the several divisions of this branch is closely related and cannot be separated fully, it is presented for the sake of clearness in six parts as follows:—

Part I. Dairying Division.

Part II. Report of the Assistant Dairy Commissioner.

Part III. Fruit Division.

Part IV. Extension of Markets Division.

Part V. Cold Storage Division.

Part VI. Visit to Great Britain and Holland.

Dairying.—The branch has not conducted many lines of active dairy work during the year, but there is always a large amount of correspondence arising out of various matters connected with the industry. Your Commissioner took a strong stand at the beginning of the season against the practice of shipping cheese to Great Britain in a green condition, and was able to quote from opinions, given by importers in the old country, to the effect that the practice, if continued, would be detrimental to the cheese industry, by curtailing the consumption of cheese and thus lessening the

8-9 EDWARD VII., A. 1909

demand for it. An effort was made to impress the factorymen with the importance of the question, by means of circulars sent out, and addresses delivered at some of the cheese boards. I am pleased to report that these representations were followed by improvement in some districts.

The Cow Testing Associations have been continued, and some very interesting figures will be found in Part I, which have been compiled from the records by Mr. C. F. Whitley, who has charge of the details of this work.

Part I. also includes an interesting and instructive report by Mr. George H. Barr, who was acting official referee of butter and cheese at Montreal during the season. Mr. Barr, with his good judgment and thorough practical knowledge of dairy work, is proving himself to be a very useful and reliable officer.

The Assistant Dairy Commissioner, Mr. J. C. Chapais, has written a report of his year's work, principally in the French speaking districts of the province of Quebec, where he has addressed numerous dairy and fruit meetings, and visited several of the factory syndicates in company with the inspectors appointed by the Dairymen's Association of the province of Quebec. Mr. Chapais has also given some assistance in the way of lectures at the St. Hyacinthe Dairy School. Mr. Chapais has his residence and office at St. Denis (en bas), Que.

Fruit.—That part of the report which deals with the work of the Fruit Division has been prepared by Mr. A. McNeill, chief of the division. Mr. McNeill's energy, devotion to duty and thorough grasp of the fruit situation have enabled him to accomplish much for the benefit of the industry. He has been given a pretty free hand in dealing with the work assigned to him. The Dominion fruit inspectors report to him and carry on their work under his immediate supervision. He has also handled the monthly Fruit Crop Report, issued by this branch.

The fruit inspectors, with the experience of previous years to help them, have covered more ground than in any previous year, as a reference to Part III. of this report will show. The position is a difficult one, often unpleasant, but I have reason to believe that the inspectors, as a whole, have performed their duties in a creditable manner. The season was an extraordinary one and the fruit inspection presented unusual difficulties. The very nature of the work precludes the possibility of pleasing every person.

Judging from the experiences of the past year, it would seem to be necessary to increase the staff of fruit inspectors before the beginning of another season.

Extension of Markets.—Part IV. of this report, in which is presented the work of the Extension of Markets Division, has been prepared by Mr. W. W. Moore, chief of that division. Under this head come the inspection of the iced car services, the cargo inspection at Canadian and British ports, and any other work which may be undertaken with a view of improving the handling and transportation of Canadian perishable products, and the extension of the markets for such products.

The work of the division is organized and conducted on the theory that the surest and best way to extend the market for any product is to deliver to the customer a first class article in the best possible condition.

SESSIONAL PAPER No. 15a

The grower or manufacturer may produce fruit, butter, cheese, &c., of the very choicest quality, but if it is spoiled in the handling, or in transit to the consumer, the skill and care which may have been exercised in its production go for nothing.

It is only fair to acknowledge the capable manner in which Mr. Moore has performed his duties as supervisor of the work of this division. The degree of efficiency which has been attained may be credited in a large measure to his thoroughness and good judgment. Having had an opportunity during the year of investigating, on the spot, the work of the cargo inspectors in Great Britain, I desire to put on record my appreciation of the faithful and efficient manner in which their duties have been performed. Mr. A. W. Grindley, the chief inspector, has served the department well in other ways, notably in connection with the purchase of seed grain for the Northwest.

Cold Storage.—The routine administration of 'The Cold Storage Act' of the session of 1906-7 having been assigned to this branch, has naturally increased the work and the importance of the Cold Storage Division. The division also deals with the bonuses for creamery cold storage, and the arrangement of the iced car and other cold storage services. Part V. of this report, which covers cold storage, has been written with a view of giving some information to producers of food products rather than to the cold storage engineer or expert. We have not been carrying on any work during the year calculated to furnish new data on the subject. We hope to make some tests and experiments during the coming season which should be of general interest.

Mr. J. G. Bouchard, who has been attached to the Cold Storage Division as Inspector of Creamery Cold Storages in connection with the payment of bonuses, has also rendered good services as a creamery and butter making expert.

Mr. R. J. Cochrane, who was connected with cold storage projects for some years before joining the service, is now attached to the Cold Storage Division.

Visit to Great Britain and Holland.—Having been appointed Canadian Government representative to the Third International Dairy Congress at The Hague, Holland, September 16 to 20, I took advantage of the occasion to visit the chief produce markets in Great Britain for the purpose of keeping in touch with the situation, and the position of Canadian produce on those markets. I also availed myself of the opportunity which a visit to Holland afforded, of spending a few days in the country districts for the purpose of studying the methods of intensive dairy farming which are followed there. A report on the Dairy Congress, some impressions of Holland, and information gathered in Great Britain, will be found in Part VI.

ACKNOWLEDGMENTS.

It is my pleasure to again bear testimony to the faithful work done by the officers and employees of this branch of your department. Their loyalty, devotion to duty, and general diligence have made the matter of maintaining proper discipline and efficiency exceedingly light and easy.

8-9 EDWARD VII., A. 1909

In connection with my visit to Great Britain, I am indebted to Lord Strathcona, the High Commissioner for Canada, and the Secretary, Mr. W. L. Griffith, Esq.; to Messrs. W. A. MacKinnon, Bristol, P. B. Ball, Birmingham, and P. B. McNamara, Manchester, Trade Commissioners for the Department of Trade and Commerce; to officials of the Department of Agriculture and Technical Instruction for Ireland; and to the National Cider Institute for assistance in furthering my enquiries.

I also wish to record my appreciation of the valuable aid received from *The Journal of Commerce*, and *The Courier*, Liverpool; *The Guardian* and *The Grocers' Review*, Manchester; *The Herald*, *The Scottish Trader*, and *The Scottish Farmer*, Glasgow; *The Grocer*, *The Morning Post*, and *The Canada Gazette*, London; and *The Western Dairy Press*, Bristol. The columns of these prominent journals were freely opened to reports of meetings; they contained many kindly editorial comments, and I was asked to furnish for publication several special articles dealing with Canadian trade, and in line with the object of my mission.

I have the honour to be, sir,

Your obedient servant,

J. A. RUDDICK,

Dairy and Cold Storage Commissioner.

REPORT

OF THE

DAIRY AND COLD STORAGE COMMISSIONER

FOR THE

FISCAL YEAR ENDING MARCH 31

1908

PART I.—DAIRYING DIVISION.

TABLE OF CONTENTS.

The Season of 1907—Decline in Exports—Increased Home Consumption—Official Referee of Butter and Cheese at Montreal—Identification Marks on Cheese—The Dairying Industry, A Lecture—Statistics of Dairying—Cow Testing Associations—Dairy Records.

PART I.—DAIRYING.

THE SEASON, 1907.

The season of 1907 was marked by very dry weather and consequent shortage of feed in some of the most important dairy districts. The scarcity prevailed during August and September, when the cows were on pasture, and has been severely felt during the winter months. Some farmers found it necessary to reduce the size of their herds, because of their inability to provide sufficient winter feed. The poorest cows were naturally the ones disposed of, and as the poorest cows in the average herd are often unprofitable, the loss may not prove to be as great as it may have appeared to be.

It is to be hoped also that dairy farmers will realize the advisability of providing against dry seasons by growing more corn. Previous to 1907, we have had a succession of good years, which has probably engendered a feeling of security that is not warranted by average climatic conditions. Apart from being an insurance against short pasturage or failure of the hay crop, corn is the cheapest and best winter feed which can be provided in the principal dairy districts, especially if preserved in the form of silage. If the lesson which has been taught by the experiences of 1907 has been learned by the dairy farmers in the affected districts, it will in the end prove to have been one of those proverbial 'blessings in disguise.'

The high level of prices which prevailed, especially for cheese, was some compensation for the shortage in the milk, so that on the whole, the year has been a fairly satisfactory one.

The relatively high prices paid for cheese had the effect of inducing many of the combined factories to continue to make cheese instead of butter. This fact, coupled with the increasing home demand, has resulted in materially reducing the exports of butter, so much so that the record for the season of 1907 is the lowest for many years. This will be a decided disadvantage if the exports are to be revived in the future, because much lost ground will have to be recovered; but it is doubtful if we shall have much surplus for export as long as prosperous times and the present rate of immigration continue.

DECLINE IN EXPORTS.

Disappointment has been expressed in some quarters at the slight falling off in the total exports of dairy produce, which is taken as indicating a decline in the industry. This is a mistake which arises from the habit of estimating the progress of the industry upon the export end of the business, instead of upon the total production. That basis served fairly well during the years when the annual growth of population was comparatively small, but in recent years, for obvious reasons, it has proved to be less reliable. The increased prosperity of the people generally has also been a somewhat indeterminable factor, but there is no doubt that butter is spread on the bread much thicker when the family exchequer is in a flourishing condition than it is when funds are low.

INCREASED HOME CONSUMPTION.

A fair estimate of the increase in the value of the home consumption of butter, cheese and milk for 1907 over that of 1900 places it at \$10,000,000. If this amount

15a—1½

8-9 EDWARD VII., A. 1909

were added to the value of the exports for 1907, the total would be largely in excess of any previous record.

The only annual statistics of the dairy produce trade, which are available, are those which are obtained from outward entries at the customs ports, but estimates based on the figures of the decennial census of 1901 would go to show that the home consumption of butter and cheese is nearly equal in value to that which is exported. The following tables, prepared by the Commissioner of Census and Statistics, are interesting in this connection.

TABLE I.—PRODUCTION OF BUTTER AND CHEESE IN CANADA BY PROVINCES IN THE YEAR 1900 AS SHOWN BY THE CENSUS OF 1901.

| Provinces. | BUTTER. | | | Cheese Factory made. |
|---------------------------|-------------|---------------|-------------|----------------------------|
| | Home made. | Factory made. | Total made. | |
| | Lbs. | Lbs. | Lbs. | Lbs. |
| Canada..... | 105,343,076 | 36,066,739 | 141,409,815 | 220,833,269 |
| British Columbia..... | 1,092,555 | 395,808 | 1,488,363 | |
| Manitoba..... | 8,676,661 | 1,557,010 | 10,233,671 | 1,289,413 |
| New Brunswick..... | 7,842,533 | 287,814 | 8,130,347 | 1,892,686 |
| Nova Scotia..... | 9,060,742 | 334,211 | 9,394,953 | 568,147 |
| Ontario..... | 55,378,568 | 7,559,542 | 62,938,110 | 131,967,612 |
| Prince Edward Island..... | 1,398,112 | 562,220 | 1,960,332 | 4,457,519 |
| Quebec..... | 18,357,188 | 24,625,000 | 42,982,188 | 80,630,199 |
| The Territories..... | 3,536,717 | 745,134 | 4,281,851 | 27,693 |

TABLE II.—PRODUCTION OF BUTTER AND CHEESE IN CANADA, BY PROVINCES, IN THE YEAR 1900, AS SHOWN BY THE CENSUS OF 1901, AND THE EQUIVALENTS OF AGGREGATE PRODUCTIONS CONVERTED TO BUTTER AND CHEESE RESPECTIVELY, AT A RATE OF 1 POUND OF BUTTER EQUALS $2\frac{1}{2}$ POUNDS OF CHEESE.

| Provinces. | Butter made. | Cheese made. | Equivalent of Butter and Cheese to | |
|---------------------------|--------------|--------------|---------------------------------------|-------------|
| | | | Butter. | Cheese. |
| | Lbs. | Lbs. | Lbs. | Lbs. |
| Canada..... | 141,409,815 | 220,833,269 | 229,743,123 | 574,357,807 |
| British Columbia..... | 1,488,363 | | 1,488,363 | 3,720,908 |
| Manitoba..... | 10,233,671 | 1,289,413 | 10,749,437 | 26,873,590 |
| New Brunswick..... | 8,130,347 | 1,892,686 | 8,887,421 | 22,218,554 |
| Nova Scotia..... | 9,394,953 | 568,147 | 9,622,211 | 24,055,530 |
| Ontario..... | 62,938,110 | 131,967,612 | 115,725,155 | 289,312,887 |
| Prince Edward Island..... | 1,960,332 | 4,457,519 | 3,743,340 | 9,358,349 |
| Quebec..... | 42,982,188 | 80,630,199 | 75,234,268 | 188,085,669 |
| The Territories..... | 4,281,851 | 27,693 | 4,292,928 | 10,732,320 |

NOTE.—The whole number of milch cows in the Dominion in 1901 was 2,408,677, and computed at an average yield of 3,000 pounds of milk per cow in the season the possible total production would be 280,000,000 pounds of butter, or 722,600,000 pounds of cheese.

It is probable that a demand for more frequent statistics of the dairy industry will be met by an effort on the part of the Census and Statistics Branch of the Department of Agriculture, to obtain annual or at least periodical returns during the interval between the decennial census years. The apparent impossibility of persuading the producers to supply the information required has made the collection of such statistics a matter of great difficulty in the past. It is to be hoped that an interest in the welfare of their industry will induce dairymen to co-operate in future attempts.

SESSIONAL PAPER No. 15a

THE PROGRESS OF DAIRYING IN CANADA.

It must be admitted that the dairy industry has not shown the same rate of expansion in recent years that it did during its boom days. This statement does not imply that there is any lack of interest in it, or that it has ceased to be as attractive as it formerly was. The real reason is that the territory where dairying is likely to be successful in Ontario and Quebec—the two principal dairying provinces—is now pretty well occupied, and there is not the field for expansion that there was 10 years ago. With the exception of a few localities in the extreme southwestern part of Ontario, where an attempt was made to establish cheese factories some years ago, all the old districts are holding their own.

The buttermaking industry continues to grow in Northern Alberta, and there are signs of a revival of the creamery business in Manitoba and Saskatchewan. The crop conditions of 1907 were favourable to the development of mixed farming in those provinces.

IMPROVEMENT IN BUILDINGS.

It is gratifying to note that there is a tendency to provide more permanent and more sanitary factory buildings to replace the unsuitable and temporary structures which have in many cases done duty too long. Most of the new factories are being provided with cool curing rooms, and no factory is now considered to be quite up-to-date without this equipment. The 'Ruddick' system for cool curing room construction is being generally adopted.

One of the chief obstacles in the way of having more general improvement in factory buildings is the absurdly low rate for manufacturing which prevails. It cannot be urged too often that patrons are following a shortsighted policy in this respect. If the manufacturer, especially at proprietary factories, does not receive a fair remuneration for carrying out his part in the chain of production, he is bound to resort to cheapness, and that means poor service and loss to those who own the product.

CONDENSED MILK.

Several new condenseries have been started during the year, and this branch of the dairy industry is making some headway in Canada.

THE OFFICIAL REFEREE OF BUTTER AND CHEESE AT MONTREAL.

The position of Official Referee of Butter and Cheese at Montreal was vacant during the year 1906. To meet the requests of cheese boards and individual salesmen, it was decided to assign an officer to this work for the season of 1907. Mr. Geo. H. Barr, who joined the dairy staff in April last, was named as acting referee, and he fulfilled the duties of the position in a very acceptable manner.

In previous years it was the practice for the referee to make examinations, and give certificates, upon the request of the buyer only, if the salesman could not be reached immediately, so as to avoid delay and the risk of defects in the cheese or butter becoming more pronounced while waiting for the authority of the salesman. We still think that is the best way, because it is certainly in the interest of the owner of the cheese. The salesmen, however, pretty generally expressed themselves against that plan, insisting that they should be consulted before the referee is called in. As the salesmen undoubtedly have the right to be consulted, and to say whether their cheese or butter shall be examined by the referee or not, regulations were made to meet their views. The delay in making examinations was obviated in many cases by the salesmen giving the referee a standing order, in writing, to examine his cheese or

8-9 EDWARD VII., A. 1909

butter at any time on the sole request of a buyer. The following circular was issued in reference to this work, giving the rules and the standards on which the cheese are graded by the referee:—

DEPARTMENT OF AGRICULTURE, BRANCH OF THE DAIRY AND COLD STORAGE
COMMISSIONER.

OFFICIAL REFEREE OF BUTTER AND CHEESE.

I am authorized by the Honourable the Minister of Agriculture to announce that an officer of the Dairy Division will be stationed at Montreal to act as Official Referee of Butter and Cheese after May 15th next, in compliance with the urgent requests received from dairymen in various districts.

In view of the representations which have been made by salesmen, the Referee will act only on request of both buyer and seller. While it is recognized that the delay which may ensue before the salesman can be communicated with, will result in any defect in the quality of the cheese or butter becoming more pronounced, and that it may interfere with the prompt exportation of the lot in question, the right of the seller to be consulted before any reference is made cannot be denied.

Any salesman who desires to avoid the risk of increased loss, consequent on the delay of final inspection, may do so by giving the Referee a standing order, in writing, authorizing the examination of his cheese or butter at any time on request of buyer alone. Such authorization must come direct from the salesman himself. Verbal notices will not be accepted. Any authorization of this kind may be cancelled by the salesman giving due notice to that effect.

In giving certificates on the quality of butter or cheese, the Referee will be guided by the classification and standards adopted two years ago. In this classification 'First Grade' is equivalent to 'Finest,' a term used for many years to denote first-class quality; and 'Under Finest' is divided into second and third grades, with clear definitions for each grade. The advantage to the seller of having the grades clearly defined and of having three grades instead of two must be obvious to all.

The following are the classifications and standards referred to:—

Standards for Grading Cheese.

First Grade—

Flavour.—Clean, sound and pure.

Body and Texture.—Close, firm and silky.

Colour.—Good and uniform.

Finish.—Fairly even in size, smoothly finished, sound and clean surfaces, straight and square.

Boxes.—Strong, clean, well made and nailed. Ends to be of seasoned timber. Close fitting. Weights stencilled or marked with rubber stamp.

Second Grade—

Flavour.—'Fruity,' not clean, 'turnipy,' or other objectionable flavour.

Body and Texture.—Weak, open, loose, 'acidic,' too soft, too dry.

Colour.—Uneven, mottled, or objectionable shade.

Finish.—Very uneven in size, showing rough corners, black mould, dirty or cracked surfaces, soft rinds.

SESSIONAL PAPER No. 15a

Boxes.—Too large in diameter; top edge of box more than $\frac{1}{2}$ an inch below the top of the cheese. Made of light material. Ends made of improperly seasoned material.

Third Grade—

Flavour.—Rancid, badly 'off,' anything inferior to Second Grade.

Body and Texture.—Very weak, very open, showing pinholes or porous, very 'acidic,' very soft or very dry.

Colour.—Badly mottled, or very objectionable shade.

Finish.—Anything worse than second grade.

Boxes.—No question of boxes sufficient to make Third Grade if other qualities are good.

Explanations.

The definition for first grade cheese is practically the same as what was adopted several years ago for 'Finest' quality, except under the head of 'Boxes,' wherein there are some new and very necessary requirements.

The standard for first grade does not imply perfection. For instance, a 'clean, sound and pure' flavour means only an absence of bad flavour. A strictly fancy cheese must not only possess this negative quality, but must have a positive quality in a typical cheese flavour, which many first grade cheese never have.

It would be impossible to define exactly the qualities or defects which may appear in cheese. The standards given are intended to indicate the range of quality for the different grades rather than to establish hard and fast rules to guide the grader.

The expression 'good colour' means that the colour must be of a proper shade. There are cheap, inferior cheese colours used, which do not give the proper shade no matter what quantity is used.

The expression 'clean surfaces' in the definition for First Grade does not exclude from that grade cheese with a slight growth of blue mould, although it is desirable that the cheese should not show any signs of mould. 'Black mould,' (see definition for Second Grade), is simply the advanced stage of the ordinary blue mould.

The following scale of points will indicate the relative values of the different divisions of quality: Flavour, 40; body and texture, 30; colour, 15; finish and boxing, 15; = 100.

It is obvious that a defect in flavour of a certain degree counts nearly three times as much in determining the grade as a defect in finish or boxing of the same degree.

Cheese which are strictly sour, or otherwise inferior to Third Grade, will be designated as 'culls,' for which there is no classification.

Any lot of cheese shall be considered third grade if it shows three or more defects of Second Grade class.

If there are not more than 15 per cent of defective cheese in any lot, the inferior ones may be sorted out and classed separately. If more than 15 per cent are defective, the classification for the defective cheese may apply to the whole lot.

This does not apply when inferior cheese have been properly marked so as to be identified, in which case the inferior cheese shall be treated as a separate lot.

Standards for Grading Creamery Butter.

First Grade—

Flavour.—Sound, sweet and clean.

Body and Grain.—Waxy; not too much moisture.

8-9 EDWARD VII., A. 1909

Colour.—Even, no streaks or mottles, not too high.

Salting.—Not too heavy if salted butter. Salt all dissolved.

Finish.—Good quality parchment paper lining, neatly arranged. Package well filled; bright, even surface.

Packages.—Well made, of good material, and clean. Boxes to be of right size to hold 56 lbs. of butter when properly filled. Paraffined on inside. Neatly branded. Tubs to be lined with parchment paper of good quality.

Second Grade—

Flavour.—Not quite clean, or other objectionable flavour.

Body and Grain.—Salvy; overworked; too much moisture.

Colour.—Slightly mottled or streaky; too high, or objectionable shade.

Salting.—Too heavy; salt undissolved, or unevenly distributed.

Finish.—Very light or poor quality parchment paper lining; lining not arranged to protect butter; mould on parchment paper. Rough uneven surface. Package not properly filled.

Packages.—Rough, badly made, or of poor or unseasoned material, including sapwood. Dirty packages. Uneven weights.

Third Grade—

Flavour.—Very stale; very strong stable flavour, or anything inferior to Second Grade.

Body and Grain.—Very salvy; 'mushy;' mould in butter.

Colour.—Very mottled or otherwise inferior to Second Grade in regard to colour.

Salting.—No question of salt alone sufficient to make Third Grade if other qualities are up to First Grade.

Finish.—No parchment lining. Very rough finish. Dirty surface.

Packages.—Inferior to Second Grade.

Explanations.

It is difficult to explain exactly the qualities or defects which may appear in butter. The standards which have been adopted are intended to indicate the range of quality for the different grades, rather than to establish hard and fast rules for the guidance of the grader.

'Fresh,' or saltless butter will be judged on the same standards as for salted butter, by leaving the matter of salting out of the consideration.

A package is not considered well filled if the butter is more than half an inch below the top of the package.

It is very important that all boxes should hold only 56 lbs. No other weight should be marked thereon. Tubs should be of uniform size and weight.

The following scale of points will indicate the relative values of the different divisions of quality: Flavour, 40; Body or Grain, 25; Colour, 10; Salting, 10; Finish and Packing, 15; = 100. It is obvious that a defect in flavour of a certain degree counts nearly three times as much in determining the grade as a defect in finish or packing of the same degree; and so on.

The expression 'too much moisture' applies to all butter which contains over the legal limit of 16 per cent of water, or to any butter that according to the custom of the trade would be described as containing too much water. (From many tests made finest Canadian butter does not contain, or should not contain, on the average, over 13 per cent of water.) The Official Referee will not be expected to determine the actual percentage of water.

'Too heavy salt' means more salt than is generally demanded by the trade for salted butter.

SESSIONAL PAPER No. 15a

'Too high colour' means over-coloured, or too much colouring material used. 'Objectionable shades' or unnatural colours are those which result from the use of inferior or unsuitable colouring material.

J. A. RUDDICK,
Dairy and Cold Storage Commissioner.

OTTAWA, Ont., April 20, 1907.

Mr. Barr has submitted the following report on his work as Acting Referee for 1907.

Mr. J. A. RUDDICK,
Dairy and Cold Storage Commissioner,
Ottawa.

SIR,—I have the honour to submit my report as Acting Official Referee for Butter and Cheese at Montreal for the season of 1907. I began my duties on May 16 and finished on November 26.

LOTS OF CHEESE EXAMINED BY MONTHS AND WITH GRADES GIVEN.

| MONTH. | 1ST GRADE. | | 2ND GRADE. | | 3RD GRADE. | | CULLS. | | TOTAL ALL GRADES. | |
|----------------|------------|--------|------------|--------|------------|--------|--------|--------|-------------------|--------|
| | Lots. | Boxes. | Lots. | Boxes. | Lots. | Boxes. | Lots. | Boxes. | Lots. | Boxes. |
| May..... | | | 4 | 107 | | | | | 4 | 107 |
| June..... | 1 | 40 | 35 | 1,846 | 7 | 316 | | | 43 | 2,202 |
| July..... | 3 | 92 | 92 | 4,902 | 21 | 1,238 | | | 116 | 6,232 |
| August..... | 1 | 28 | 54 | 2,591 | 8 | 317 | 2 | 13 | 65 | 2,949 |
| September..... | | | 23 | 1,088 | 2 | 77 | | | 30 | 1,165 |
| October..... | | | 14 | 840 | 3 | 74 | | | 17 | 914 |
| November..... | 1 | 72 | 12 | 379 | | | | | 13 | 451 |
| | 6 | 232 | 239 | 11,753 | 41 | 2,022 | 2 | 13 | 288 | 14,020 |

Of the cheese examined 2 per cent are placed 1st grade; 83 per cent are placed 2nd grade, and 14 per cent are placed 3rd grade. The chief defects in the cheese may be classed as follows:—

| DEFECTS IN FLAVOUR. | | | | DEFECTS IN TEXTURE. | | | DEFECTS IN COLOUR. | OTHER DEFECTS. |
|---------------------|---------|---------|--------|---------------------|------------------|-------------------|---------------------|---------------------------|
| Not Clean. | Fruity. | Rancid. | "Off." | Loose and Open. | Acidic or Mealy. | Too soft or weak. | Uneven or too Pale. | Poor finish Mould Stains. |
| p.c. | p.c. | p.c. | p.c. | p.c. | p.c. | p.c. | p.c. | p.c. |
| 73 | 6½ | 6 | 3.8 | 60 | 33 | 29 | 22½ | 15 |

It will be seen that 'Not clean in flavour' is the chief defect, and it is due, no doubt, largely to taints in the milk. Yet quite frequently the flavours appeared to be caused by the use of bad starters and impure water at the factories. There were very few cases where defect in flavour could be described as 'feed' flavours. In the spring a number of lots had a 'lecky' flavour, caused, no doubt, by the cows eating leeks.

'Loose and open texture,' which is the next greatest defect, appeared to be caused by leaving too much moisture in the curds, either by insufficient cooking or not

8-9 EDWARD VII., A. 1909

stirring the curds sufficiently when the whey is removed, and by salting the curds too soon.

'Acidy' or 'mealy' texture is a very common defect and is usually due to too much acidity in either the milk or curd, and to the use of too much salt on the curd.

'Soft or weak body' is a defect very common in the extreme eastern part of Ontario and some districts in Quebec. Insufficient cooking of the curd, and leaving an excessive amount of moisture in the curd after the whey is removed, not only gives a soft or weak body, but often injures the colour as well.

Quite frequently the colour was mottled by mixing in old curd, especially about the time the cows were going out on the grass.

BOXES AND BOXING.

There is still room for improvement in the cheese boxes. They are made too light, and even after being coopered, many shipments present anything but an attractive appearance as they are being loaded on to the steamships. Improvement can also be made in putting on the factory brands and weights of the cheese. The factory brand should be put on the lap close to the edge, and the weight figures stencilled on just beside the lap of the box.

SMALL FACTORIES SHOW LARGEST PERCENTAGE OF POOR CHEESE.

The following figures will give a fairly good idea as to the size of the factories which are turning out inferior cheese. In most cases the number of boxes in each lot represents a week's make of cheese: 6.5 per cent of the lots examined contained over 100 boxes; 93.7 per cent of the lots examined contained under 100 boxes; 83.3 per cent of the lots examined contained under 70 boxes, and 43.7 per cent of the lots examined contained under 40 boxes.

Bearing in mind that about 98 per cent of the total lots examined were second and third grade, it will readily be seen that the great majority of our inferior cheese come from small factories. It does not necessarily follow that fine cheese cannot be made in small factories, but it is true that the best men cannot be secured to operate them. It requires men with decidedly greater ability to manage a large business than to manage a small one, and just as long as we have small and poorly equipped factories, just so long will there be weak or inferior cheesemakers in them, and one of the solutions for doing away with a great many of our second and third grade cheese, is larger factories and strong capable men to operate them.

LOTS OF BUTTER EXAMINED EACH MONTH.

| MONTH. | 1ST GRADE. | | 2ND GRADE. | | 3RD GRADE | | TOTAL ALL GRADES. | |
|----------------|------------|--------|------------|--------|-----------|--------|----------------------|--------|
| | Lots. | Boxes. | Lots. | Boxes. | Lots. | Boxes. | Lots. | Boxes. |
| May..... | | | 2 | 47 | 1 | 27 | 3 | 74 |
| June..... | | | 5 | 911 | | | 5 | 911 |
| July..... | | | 9 | 1,237 | 3 | 115 | 12 | 1,352 |
| August..... | 1 | 230 | 8 | 877 | | | 9 | 1,107 |
| September..... | | | 2 | 82 | 1 | 42 | 3 | 124 |
| October..... | | | 2 | 43 | | | 2 | 43 |
| November..... | | | 6 | 144 | | | 6 | 144 |
| | 1 | 230 | 34 | 3,341 | 5 | 184 | 40 | 3,755 |

SESSIONAL PAPER No. 15a

The defects in the butter may be classed as follows:—

| | Per cent. |
|---------------------------|-----------|
| Not clean in flavour..... | 95 |
| Too dry and crumbly..... | 12½ |
| Too soft in body..... | 7½ |
| Colour mottled..... | 40 |
| Uneven salting..... | 15 |
| Badly finished..... | 15 |
| Two lots mouldy. | |

Some flavours are difficult to describe otherwise than 'not clean,' but in the majority of cases the flavours were what is known as 'old or sour cream' flavours. As all the butter I examined came from Quebec province, it is evident that those interested in the creamery industry will have to look carefully after the milk and cream that are being delivered to the creameries. One large creamery had considerable trouble with the flavour of their butter during the early part of the season. The trouble was removed by discarding their cream vats, which were made of tinned copper. The tinning had become worn off and apparently the cream became tainted by standing in them over night.

During the month of November, some of the butter was entirely too dry and crumbly, a decidedly bad defect, and one which could be easily avoided by proper ripening and churning temperatures.

Creamery men would do well to remember that the past season has been an exceptional one in the butter trade on account of the strong local demand, which made it possible for dealers to pass many lots of butter that would not have passed inspection for export purposes.

The regulations requiring a written order from the salesmen, before cheese or butter would be inspected, had no doubt a tendency to lessen the number of calls upon the referee.

During the season I received standing orders from 51 salesmen to examine 77 different brands of cheese and butter when found fault with by the buyers, and specific orders from 59 salesmen to examine 111 different lots that had been rejected by the buyers.

The only serious objection that can be raised to this regulation which has been insisted on by the salesmen, is that defective cheese are usually growing worse, and occasionally a shipment will remain in the warehouse for a week or more after being rejected, before the referee receives authority from the salesman to examine it. The cheese sometimes are left in rooms where the temperature is so high that the quality is injured. I am pleased to say that this does not often occur, as nearly all the merchants put the rejected lots into cool rooms with the rest of the cheese. Butter is always placed in cold storage.

I consider the methods of handling and the facilities for storing cheese and butter in Montreal are such that the quality is well preserved. Some of the export firms have facilities which are not surpassed in the world and immense amounts of money are being spent each year in equipping the warehouses with modern cold storage.

It should be the duty of the salesmen of cheese and butter to acquaint themselves with the conditions which exist in the different warehouses in regard to facilities for handling their products, in a safe and reliable manner, upon arrival in Montreal.

I am of the opinion that the conditions under which butter and cheese are inspected in the warehouses in Montreal are not in the best interests of the trade, nor are they as fair to either the buyer or the seller as they should be.

IDENTIFICATION MARKS ON PACKAGES.

It is important that all inspections or examinations of butter and cheese, after sale, should determine, as nearly as possible, the actual quality of the whole lot in

8-9 EDWARD VII., A. 1909

question. If the shipment contains one 'batch' of cheese, or churning of butter, of inferior quality, it is very unwise on the part of the salesman to allow the chance of the whole lot being reduced in grade by the inclusion of part, or all, of the inferior packages among those on which the average quality is arrived at. It would never do to use the trier on every package of butter and cheese. The injury thus caused would be serious. There is more or less injury, loss and disfigurement whenever the trier is applied. The general practice for determining the quality of each lot of butter or cheese at Montreal is to select a certain number of packages at random, and the quality of the whole lot is judged from the result of this examination. It is frequently unfair to the factory or creamery and sometimes it is unfair to the buyer.

If the packages were marked so as to distinguish the cheese from every 'batch' or vat, or the butter from every churning, it would then be possible to select one package from each vat or churning, and when these were examined, an absolutely correct indication of the quality of the whole lot would be obtained without unnecessary injury by use of the trier.

It often happens that the cheese from one vat, or the butter from one churning, is very inferior in quality while the rest of the shipment is quite up to the standard. When the inspection is made and the package representing this lot is found, the others bearing the same mark can then be set aside and the reduction in price figured on the actual quantity of inferior butter or cheese, instead of being averaged over the whole lot.

The following instances will suffice to illustrate the point:—

On May 31 I was asked by a salesman of a creamery to examine a lot of butter, which had been rejected by the buyer on account of flavour. The salesman picked five boxes out of the lot and I found two of these with a strong, leeky flavour. I said to the salesman, 'There may be only one churning with that flavour, but we cannot test every box in a lot of 31 boxes.' He found out from the maker afterwards that there was only one churning with this flavour. The buyer cut the price $\frac{1}{2}$ cent per pound on the whole lot, which amounted to \$8.68. If each churning had been marked and the cut had been 1 cent per pound on the inferior boxes, it would only have amounted to \$2.80.

The reverse happened with a shipment of cheese later in the season. A lot of some 50 boxes had been rejected. I found each batch numbered, a fact which the buyer was not aware of, as he had not been advised to that effect. I asked to see a box of each number, and found only the cheese bearing one number defective, which made a cut on five cheese instead of on fifty.

During the latter part of the season, after your circular on the subject was sent out, I found quite a number of cheese factories and creameries in Quebec marking each batch of cheese and churning of butter, and in more than one case they saved money by doing so.

The educational advantages of such a plan are very important. The maker, in numbering his different batches or churnings, should keep a corresponding record, with notes on the conditions and circumstances attending the manufacture of each lot. If, for instance, the cheese bearing a certain number are reported to be 'acidic,' the cheesemaker's record will give him an idea as to how this defect originated. If a certain churning of butter is said to be 'mottled' or over salted, such notes would indicate how to avoid such errors in future.

GEO. H. BARR,

Acting Official Referee of Butter and Cheese.

MONTREAL, December 31, 1907.

SESSIONAL PAPER No. 15a

IMPORTANCE OF IDENTIFICATION MARKS ON CHEESE AND BUTTER PACKAGES.

Mr. Barr has touched on a very important point in referring to the advisability of having each 'batch' of cheese or churning of butter so marked as to be easily identified when the inspection is made. The cheese should be marked as they come from the press. If the cheese are inspected in the factories it is not important whether the boxes are marked or not, but if inspection is to be made at the car door or at Montreal, the packages also must be marked. Butter, of course, can only be marked on the package. This practice has been common in western Ontario for years, and the makers there would not think of neglecting it.

The marking of the packages may be done by giving each batch of cheese or churning of butter a number, to run consecutively for each shipment, which usually covers a period of one week. Thus Monday's cheese would be marked 1, 2, 3 and so on according to the number of vats. If there are three vats in use, Tuesday's cheese would be marked 4, 5 and 6, and thus to the end of the week. Another plan would be to use both numbers and letters, the numbers to represent the vats and the letters the

day of the week put on like this: $\frac{1}{A} \frac{2}{A}$ and so on.

THE ADVANTAGE OF THREE GRADES WITH DEFINITE STANDARDS.

The writer has frequently urged that all sales of butter and cheese should be made on the basis of three grades, according to the standards and definitions already given on page 6. The advantage of this improvement from the standpoint of the factory is that the salesman would have fuller information concerning the degree of defect in his cheese or butter, if it was rejected on account of quality, and would then be in a stronger position to effect a fair settlement. The complaint is often heard, and we believe it is sometimes justified, that two lots of cheese or butter with the same defect are 'cut' very different amounts. This sort of thing is possible when the description is that the goods in question are simply 'under finest,' which may mean anything. With three grades established as suggested, and as used by the official referee, there would come to be recognized in a very short time a fairly definite relation in value between first and second grades. It has been argued by some salesmen and makers that the standard for first grade cheese is too high and that it cannot be reached by the average factory. Probably the best answer to that assertion is the fact that the great bulk of Canadian cheese *does* reach this standard, and would pass it anywhere. The definition of flavour for first grade simply implies that the cheese must be free from any defect in flavour. Surely no one will say that if there is anything wrong with the flavour of a cheese it can be placed in first grade or called 'finest.' Such a cheese never was and never will be anything better than second grade, or 'under finest.' The words 'clean, sound and pure' do not call for perfection in flavour by any means. The perfect flavour is rich, 'nutty' or 'cheesy,' and a large percentage of cheese which are simply 'clean, sound and pure' never have those qualities.

These two measures, the marking of the cheese and butter so that it may be accurately inspected, and the adoption of three grades instead of two ('finest' and 'under finest') as at present, mean more in the writer's judgment, to the factories, than the particular point at which the cheese or butter should be inspected.

SANITATION IN THE DAIRY.

The world wide movement looking to better conditions surrounding the production of milk and its manufacture into butter and cheese has not missed this country.

8-9 EDWARD VII., A. 1909

Higher standards are being set to guide those engaged in this line of work, and stricter attention to matters of sanitation and hygiene is being insisted on. In Ontario, recent legislation, and its enforcement by the provincial dairy staff, are having a wholesome effect in improving the conditions in and around cheese factories and creameries. This in itself is bound to exert a good influence on the producers of milk, even if no further pressure were being brought to bear on them.

The milk supply of towns and cities is attracting the most attention, and considerable activity is being shown on the part of municipal authorities who have to deal with this important question. The opposition of producers to all reasonable suggestions and regulations for the improvement of market milk is as futile as it is foolish and shortsighted. If the doubt and distrust in the minds of consumers, to say nothing of positive knowledge of the unsatisfactory conditions surrounding the production of much of the milk supply, were removed by an evidence of a desire on the dairymen's part to meet the demands of modern standards, the consumption of milk would increase enormously at higher prices than those which now prevail. There are many practical proofs that this contention is correct, in the success which has attended the efforts of the wide awake milk producers to supply a high class article.

One of the difficulties in securing a reform of methods in milk production lies in the fact that the term 'cleanliness,' which is so strongly and so properly urged in this connection, is only a relative one, that conveys very different shades of meaning to different persons. Everything depends on the individual standards, which are fixed very largely by environment and custom. A practice, or a condition, which fails to offend the senses of a man who has always been accustomed to it, may be repulsive and absolutely unbearable to another. Specific rules for dealing with these questions, as far as they can be devised, are necessary to secure desirable results.

PRESERVATIVES IN MILK.

The use of preservatives in market milk should receive more attention than it does, for not only may the substance used be harmful, but its use is evidence that the milk is being produced or handled under conditions which cause it to sour quickly, or that it is being kept beyond a reasonable limit of time before being consumed.

The supervision of the milk supply should be carried beyond the point where it leaves the purveyor's hands and passes into those of boarding house, restaurant and hotel keepers. Why should those who buy their milk as an item in a bill-of-fare not be protected as well as those more fortunate people who consume it in their own homes?

THE DAIRYING INDUSTRY.

(By J. A. Ruddick.)

The following lecture, delivered before the May Court Club of Ottawa, was intended to interest those who are not familiar with the dairy situation in Canada, and to give them some idea of the importance and possibilities of the industry.

While I am pleased to have been given an opportunity of assisting in a small way in the splendid work which the May Court Club is doing in this city, I can assure you that I realize fully the difficulty of dealing with the subject on which I have been asked to speak, in such a manner as to make it interesting to an audience composed largely of young ladies.

One would need to have a more fertile imagination than I have, to be able to put much poetry into a description of the dairy industry. It is, however, not only one of the greatest industries in Canada from a material point of view, but it is one of the great industries of the world. The dairy

SESSIONAL PAPER No. 15a

industry supplies all civilized people with at least two of their most indispensable articles of food. There may not be many people induced to engage in the business of dairying from a pure love of it, but it cannot be denied that it does offer attractions to those who are obliged to consider the money getting possibilities of whatever line of effort their energies are employed in.

There are not many persons in this audience, or in the whole Dominion, for that matter, who do not derive, either directly or indirectly, some benefit from this great industry which has contributed so largely to the prosperity of Canadian agriculture. This assertion will be the more readily believed when I state that the total value of the products of Canadian dairies, including milk, butter, cheese and condensed milk, amounts to something like \$100,000,000 annually.

A very important point in this connection is the fact that while we recover, with the aid of the gentle cow, this large amount of wealth from mother earth, by the transmutation of pasturage and fodder crops into milk, the soil is not impoverished in the process, but on the contrary, is left in better condition every year to produce another \$100,000,000. If you dig a million dollars out of a gold mine, you have nothing left but a hole in the ground, and I am told that you are much surer of the hole in the ground than you are of the million dollars. In a country like ours where agriculture is the true basis of all wealth, this question of the conservation of soil fertility is of fundamental importance.

In view of these facts, I have no further apology to offer on behalf of the dairy industry.

A VARIED INDUSTRY.

A broad application of the term 'dairying industries,' would include milk production, the milk supply of towns and cities, the manufacture of butter, cheese and condensed milk and the numerous by-products obtained from the cascin of milk, such as substitutes for ivory and celluloid, adhesives, woodfillers, paint, pencil erasers, toilet cream, &c., &c. But knowing the short time at my disposal, and believing that the patience and endurance of the members of the May Court Club and their friends must have limitations, I am obliged to use the term in a more restricted sense this evening. I shall confine myself, therefore, to a brief reference to the two great branches of the industry, namely, the manufacture of butter and the manufacture of cheese, with particular reference to the butter and cheese which are made in factories. It has been the common practice to base all estimates of our progress on the factory end of the business, because the home end of dairying is such an unknown quantity that accurate figures are not obtainable, although it is estimated that the milk which is used for direct consumption, and the butter which is made on farms have a value which is at least double the value of the butter and cheese made in factories.

ANCIENT ORIGIN.

The use of milk and its products as food for man dates back to the very earliest times. We find frequent mention of butter and cheese in the early books of the Bible. Cheese was known to the Greeks before the time of Homer, and Cæsar relates that the German tribes supplied the Romans with cheese in his day.

Tradition says that butter was discovered by the nomadic tribes of the east, who found that it was produced by the agitation which milk received when transported long distances on the backs of camels. It is said that in

8-9 EDWARD VII., A. 1909

Arabia, even to this day, a sort of oily butter is procured by placing the milk in a vessel made from the skin of an animal, and shaking it to and fro suspended from the limb of a tree or other convenient support.

COMPOSITION OF BUTTER AND CHEESE.

Butter, as we know it, consists of the fat of milk, in solid form, mixed with a certain percentage of water, which may vary according to the skill or intention of the buttermaker, but 12 to 14 per cent is considered to be about the right proportion. Sixteen per cent of water is the legal limit in this country. The process of buttermaking is practically the same wherever scientific methods are followed, and it requires an expert to detect the slight differences of flavour and texture which may be found in well made samples of butter brought together from the ends of the earth. Of course, there is good and bad butter to be found everywhere, and it is the proportion of the two kinds produced in any country that makes or mars its reputation in this respect, rather than any distinctive quality or characteristic in the product which may be traced to locality of origin.

Cheese is made by precipitating the protein compounds of milk with rennet. The curd which is thus formed holds the fat of milk mechanically, and a certain amount of the water is also retained. A Canadian Cheddar cheese, for instance, consists, roughly speaking, of one-third fat, one-third protein or casein compounds, and one-third water.

The art of cheesemaking is infinitely more intricate and difficult than that of buttermaking. It deals with several constituents of the milk, two of which, the sugar and the casein, unlike the comparatively inert and stable fat, are peculiarly subject to bio-chemical changes, as yet not fully understood or studied by the chemist and the bacteriologist.

It requires only slight modifications of the process of cheesemaking to produce marked differences in the finished product. As a result, there are probably 100 distinct, different varieties of cheese made in various parts of the world, and at least 25 well known classes, varying greatly in appearance, texture and flavour—particularly in flavour.

They vary in texture from the Schabzieger of the Swiss Alps, so hard that it must be grated, or rasped, as the name suggests, to the soft and creamy French cheeses, like Brie or Camembert; in the matter of flavour, there is the mild and genteel Cheddar on the one hand, and the loud and vigorous Limburger on the other; and as for size, they range from the dainty Neufchatel, a few ounces in weight, to the ponderous Gruyère, which may weigh over 100 lbs.

THE SCIENCE OF DAIRYING.

While the preparation of cheese as an article of food is undoubtedly one of the oldest of the technical arts, the science of cheesemaking is of very recent origin. Until only twenty or thirty years ago, our knowledge of the art was almost wholly empirical, having been handed down from father to son, or more correctly speaking, from mother to daughter, each generation adding its quota of experience to the rules which then did duty for the more exact knowledge that is available to the cheesemaker of the present day.

The brilliant researches and discoveries of Pasteur, although they did not include a study of milk, nevertheless blazed the track along which other scientists have followed to show us the why and the wherefore of many of the changes that take place in milk and its products. We know now that the profound changes which result from milk fermentations are not natural to

Creamery at Sabrevois, Que.

Creamery at Terrebonne, Que.

A Prince Edward County (Ont.) Cheese Factory.

SESSIONAL PAPER No. 15a

the milk itself, but depend upon the entrance of germs which are introduced either accidentally or intentionally after the milk is drawn. Thus that common phenomenon, the souring of the milk, is not due to any inherent tendency in the milk itself, but to the introduction of the *lactic acid bacilli* which split up the sugar of milk and produce lactic acid. The investigations of bacteriologists and chemists, supported by the work of practical experimenters, have established during these recent years what appears to be a sound basis for the science of dairying.

It is only fair to say here that the sum of original knowledge on this subject has received some valuable contributions through the investigations of the experts of the Canadian Departments of Agriculture and the agricultural colleges. It may also be said that Canadian cheesemakers have led the van in applying the teachings of science to the practice of their art.

But we must not pursue this phase of the subject any further, or we shall get into technicalities which would neither be profitable nor interesting to this audience. It will be more in keeping with the aims and objects of the Court in arranging the course of lectures, of which the present is one, if we now proceed to consider the origin, status and possibilities of the dairy industry in Canada.

DAIRYING IN CANADA.

The early French settlers introduced cows from Brittany, and no doubt made butter from their milk. It is quite likely that they made cheese also, and that the 'Fromage raffiné' still made on the Island of Orleans is a relic of their early efforts. Cheese of a more or less nondescript character was made for home use by the early settlers of Ontario, but neither the art nor the industry made any progress in Canada until the factory system was introduced in the year 1864. The first cheese factory was established in Oxford county, Ontario, by one Harvey Farrington, who came from New York state for that purpose. Another factory was started in Hastings county in 1866, and from that time forward the extension of the industry forged rapidly ahead in Ontario. The first cheese factory was established in the province of Quebec, in Missisquoi county, about the same time as the first ones in Ontario, but there was very little development of the industry until after the year 1880.

The dairy industry has not grown as much in New Brunswick or in Nova Scotia as one would expect to find in districts so well adapted for it. Fruit growing, lumbering and fishing have divided the attention of the farmers to some extent, and dairying does not prosper unless it is made the special business of the farm. There are, however, a number of successful cheese factories and creameries in these two provinces, and they supply the local demand for butter and cheese and have a considerable surplus for export to the West Indies. I was gratified to find, when I visited Bermuda and Jamaica a year or two ago, that the 'Bluenose' and the 'Evangeline' brands of butter and cheese were the most popular of any sold in those islands.

Co-operative or factory dairying was begun in Prince Edward Island in 1892 under the guidance of my predecessor in office, Dr. James W. Robertson. In a few years there were some 40 factories in operation and Prince Edward Island became recognized as a successful dairying province. It has been generally acknowledged that the prosperity of the island has been wonderfully quickened by this adoption of systematic dairy practices.

Following the trend of events rather than a geographical sequence, let us now turn our attention to the West for a few moments. In Manitoba, organized dairying began to make headway about 1894, and there are now a

8-9 EDWARD VII., A. 1909

fair number of cheese factories and creameries in that province. In what was then the territories of Assiniboia and Saskatchewan, there were at one time 14 creameries in active operation, but the reign of King Wheat has proved inimical to the growth of the dairy industry and it has not been developed extensively in what is now the province of Saskatchewan.

Proceeding westward into Alberta, we find more favourable conditions, especially in that section of the province lying between Calgary and Edmonton, where the progress of the dairy industry has kept pace with the settlement of the country. Beginning in 1896, the increase has been steady and substantial, with the result that to-day there are 45 creameries and 8 cheese factories in the sunny province of Alberta. There is every indication that Northern Alberta will become one of the best dairy sections of Canada.

These two western provinces have been the scene of a unique and rather abrupt departure from the line which has generally been followed by governments in assisting agricultural effort. A few creameries had been started in the early nineties as private or co-operative ventures, but at the end of two or three years, they were, for various reasons, and without exception, acknowledged to be failures. The new settlers, who were depending almost wholly on dairying as a means of livelihood, were in a serious position, because, while it was possible for them to make butter on their farms, their facilities were very poor, and there was no way by which the individual farmer could find a profitable market for his butter at that time.

The Dominion Government came to the rescue, and the Dairy Commissioner was authorized by the Honourable the Minister of Agriculture to take over the management of the existing creameries, to advance sufficient money to pay off their pressing debts, and to make loans for the equipment of new creameries that would come under the same management. Confidence was at once restored and under expert supervision the business grew and prospered so that the Department of Agriculture was able, at the end of 1905, to give up the active control of a large number of creameries which had been assisted to a position of independence and stability. New markets had been found for the butter in the Orient and in the Yukon, and a reputation had been established that is of great value to the industry in that part of the country to-day. The money which was advanced to the creamery associations has all been repaid except a few trifling amounts.

The new provincial governments are following the policy adopted by the Federal authorities, and with a modified plan, continue to foster the industry. Knowing the circumstances, as I do, I have no hesitation in asserting that this action on the part of the government, call it paternalism if you like, saved what was then known as 'the Territories' from a most serious setback, and carried the early settlers over the most critical and trying period of their experience.

Crossing the Great Divide into British Columbia, we find a successful creamery business established at different points in the fertile Okanagan Valley, along the Lower Fraser river and on Vancouver island.

Thus we see that the dairy industry is well established in every province of the Dominion from the Atlantic to the Pacific. The total number of cheese factories and creameries in Canada at present is 4,355. Of this number, 1,284 are in the province of Ontario, and 2,806 are in Quebec, leaving 265 fairly evenly distributed among the other seven provinces. The factories in Ontario average much larger than those in the other provinces.

THE EXPORTS OF CHEESE AND BUTTER.

The first cheese was exported from Canada to Great Britain in 1864 or 1865. (See page 24.) The shipments grew year by year and reached the

SESSIONAL PAPER No. 15a

maximum in 1903, when the total value of the butter and cheese exported amounted to the sum of \$31,667,561.

The slight falling off in the quantity exported during the last year or two has been attributed to a decline of the industry, but the true reasons for it are much more satisfactory and are really a cause for congratulation. The large growth in our population and the increased purchasing power of the people generally, easily account for the decrease in the exports.

STILL ROOM FOR EXPANSION.

There is no reason why the dairy industry should not be largely extended in every province of the Dominion. I have visited every important dairy country in the world, except Siberia, and am bound to say none of them is better fitted by nature for successful dairying than Canada is. With a climate which produces healthy, vigorous animals, notably free from epizootic diseases, with a fertile soil for the growing of fodder crops and pasture, with abundance of pure water, and a plentiful supply of ice for all purposes of the dairy, we have almost ideal conditions, and advantages which should be of great assistance in holding a fair share of the world's trade in dairy products.

Great Britain is our chief market for butter and cheese, although we send comparatively small quantities to Newfoundland, Bermuda, the West Indies, British Guiana, Mexico and South Africa. We also sell some butter in the Orient and of late years a small quantity has gone to Germany.

The quantity of butter and cheese annually imported into Great Britain is enormous. The value of the butter alone amounts to over \$100,000,000, of which the little kingdom of Denmark supplies nearly one-half. Siberia comes next and is credited with over \$15,000,000 worth, closely followed by Australia. Next in the order of their importance are France, New Zealand, Sweden, the Netherlands, Canada, the United States and Argentina. Small and irregular quantities are received from some other countries. It will probably surprise many of you to hear that the dairymen of Iceland send occasional shipments of creamery butter to Scotland.

The value of the cheese annually imported into Great Britain is a little over \$33,000,000, of which Canada has the distinction of furnishing 72 per cent of the whole, or 84 per cent of the kind which we make. The other countries from which supplies of cheese are obtained are New Zealand, the Netherlands, United States, France, Switzerland, Italy and Australia. These facts are important, especially in regard to butter, because they show us what a great field there is for a further extension of our butter trade. Canadian butter stands high in the British market, not only for its superior quality, but because our laws relating to its manufacture and sale are the most stringent of any country in the world, and are a standing guarantee of its absolute purity. I need hardly say that Canadian cheese easily ranks first in quality among the imports into Great Britain of the class to which it belongs.

FOOD VALUE OF MILK AND CHEESE.

The comparative food values of milk and cheese are becoming better known, and as this appreciation grows, as it should, these products will enter more largely into our daily dietary than they do at present. A quart of good milk is said to be equal in food value to a pound of meat, and one pound of well ripened cheese contains as much nourishment as two and a half pounds of the best beefsteak; therefore, milk at 12 cents a quart and cheese at 20

8-9 EDWARD VII., A. 1909

cents a pound are among the cheapest of foods, compared with the present prices of other things.

GOVERNMENT AID.

The governments of Canada, both federal and provincial, have been liberal in their policies concerning the dairy industry. It has been generally agreed that the provincial authorities should undertake all work which is educational in character, while the Dominion government deals with questions pertaining to markets, transportation and cold storage, or what may be termed the commercial side of the industry. The Dominion government also assumes the responsibility for the enactment and the administration of the laws relating to the manufacture, sale and exportation of dairy products.

All the provincial departments of agriculture, except Nova Scotia, have regularly organized dairy divisions. Dairy schools are maintained in Ontario, Quebec, New Brunswick and Manitoba. Experts are employed who visit the cheese factories and creameries during the working season, for the purpose of giving instruction to the cheese or butter makers and to advise with those in charge of factories on questions of general management. Canada was the first country in the world to adopt this system of factory instruction, and there are now nearly 100 of these experts employed by the different provincial governments. Much of our success in cheesemaking can be attributed to this system of factory instruction.

The Dominion officials endeavour to keep in touch with the tendencies and requirements of the markets to which our butter and cheese are shipped, and to disseminate among the cheese and butter makers such information as may be acquired with that end in view.

A large staff of men are employed under the Dairy and Cold Storage Commissioner, who watch and report on the handling of butter and cheese from the time it leaves the factory in Canada until it reaches the consumer in Great Britain. The information thus collected is passed on to those who may be interested, or who are responsible for the defects which have been noted, and as a result there is constant improvement being made, not only in the quality of the butter and cheese and in the appearance and style of the packages, but also in the services provided by the transportation companies. The cold storage services, both on land and sea, which were inaugurated through the initiative of the Department of Agriculture, at the head of which is the Hon. Sydney Fisher, who is our chairman this evening, have been of incalculable benefit to the dairying industries.

SOME STATISTICS OF DAIRYING.

DAIRY LEGISLATION.

The dishonest and fraudulent practice of 'stuffing' cheese, or in other words, disposing of inferior or worthless curd or cheese when the curd is being put to press, is apparently somewhat on the increase, as more cases have been reported during the last few years than previously. This is believed to be the result of undue publicity given to a case two or three years ago. It is said that any person guilty of this act could be prosecuted for fraud, but the difficulties in the way of having prosecutions made on that basis would seem to make special legislation desirable to deal with this question, in order to protect the reputation of the Canadian cheese trade from unscrupulous and dishonest persons.

The silly and reprehensible practice of putting bottles or boxes containing notes, &c., in the centre of cheese, must also be stopped. Very serious complaints have been made by receivers in Great Britain who find these bottles broken and liable to cause serious injury to persons eating the cheese. It is a disgusting thing to find any foreign substance in the centre of the cheese in any case. It is, therefore, proposed to amend the Inspection and Sale Act (Revised Statutes of Canada, 1906) by the addition of the following section:—

238a. No person shall

(a) incorporate in a new cheese, during the process of its manufacture, any inferior curd or cheese; or

(b) knowingly sell, expose, or have in his possession for sale without giving due notice thereof, any cheese in which has been incorporated during the process of its manufacture any inferior curd or cheese; or

(c) place in a cheese during the process of its manufacture, or at any time thereafter any foreign substance of any kind.

Section 279 of the said Act is amended as follows:—

(g) 'Foreign substance' means any substance not necessary to the manufacture of the cheese into which it is introduced.

The penalty for violations of the foregoing sections are not more than five hundred dollars, not less than twenty-five dollars for each offence.*

* These proposed amendments became law on July 20, 1908.

THE FIRST CHEESE EXPORTED.

Mr. A. A. Ayer, the well known cheese exporter of Montreal, writing in reference to the statement published over the signature of Adam Brown, Esq., of Hamilton, Ontario, at page 9 of our report for 1907, rather takes exception to Mr. Brown's claim to have been the first exporter of Canadian cheese to England in 1866. Mr. Ayer says: 'The late Mr. Heath, of the firm of Heath & Finnimore, London, Ontario, was living in Waterloo, Quebec, for some time before and after 1864-65. He bought and shipped to England, the first product of the Dunham factory, including the make up to August 1, 1865. The Dunham factory was started in 1864. I am positive about the shipments to England from May 1, 1865, but not so positive about any shipments having been made in 1864.

'I personally bought about 1,100 cheese from the Dunham factory, being the make of August, September and October, 1865. Only a small portion of this, however, was shipped to England, the balance being required for the local trade in Montreal and Quebec. From that date forward there was a gradual increase in the shipments of Canadian cheese to England, and the writer has been actively connected with the trade from the time that the first factory cheese were made in Canada.'

We are pleased to give space to Mr. Ayer's remarks, and to record these historical facts concerning the beginning of the Canadian export trade in dairy products before they are forgotten.

THE COW TESTING ASSOCIATIONS.

INTRODUCTION.

The principal active dairy work carried on during the year by this branch, was that which has for its object the improvement of dairy herds, and is a continuation of the work of the cow testing associations, which was dealt with in the report for the year ending March 31, 1907. The records of each month's tests have been widely published in press bulletins issued regularly, and it is not intended in this report to give the records with as much detail as was done last year.

It is a very gratifying result of this campaign to find that many more dairymen have become interested in the matter of keeping records of individual cows, and have taken it up on their own account. We continue to supply blank forms for recording the weight of milk to all who apply for them.

We have endeavoured from the first to secure the co-operation of the owners and managers of the cheese factories and creameries, and at the time of writing the indications are that nearly all the testing will in future be done by some person connected with a factory. An announcement has been made to the effect that competent persons will be paid for this work at the rate of five cents per test, the department to furnish the blank forms and the chemicals used in making the tests.

The owners of the herds must supply their own outfits and deliver the samples at the appointed time and place of testing. The record of the weight of milk and the percentage of fat is sent to this office, where all calculations are made; a copy of the monthly report is returned to the owner of the herd along with the record of all the other herds, designated by number only, belonging to the same association. At the end of the year a complete report is sent to each member, giving him full particulars of the record of the individual cows in his herd. Mr. C. F. Whitley of the dairy staff, who has become well known to the dairymen of Canada, through his connection with this work, and to whom I am indebted for careful and intelligent supervision of it, has worked out the instructive comparisons and compiled the interesting tables which will be found in the following pages.

SESSIONAL PAPER No. 15a

GENERAL.

In 1907 there were 56 cow testing associations in operation in the Dominion, comprising 26 in Quebec, 24 in Ontario, 1 in Prince Edward Island, 2 in Nova Scotia, and 3 in British Columbia. This was a marked increase over the work of 1906, when there were only 16 associations. The members increased from 297 to 876, and the number of cows entered to be recorded, from 3,750 to 9,160. Better than the mere growth numerically was the enhanced interest taken by the members in the work. The weighing of the milk was more regular, the samples seem to have been more carefully taken and were sent in more promptly for testing; while the work, generally speaking, was continued longer, so that more records for longer periods are available than last year. Further than this, there was a greater disposition evinced on the part of the members to meet the officials from the department who were doing the testing, so as to ask questions on all manner of subjects pertaining to dairying. This is an indication of what could easily be accomplished with most beneficial results, namely, the making of the cheese factory or creamery a real centre of dairy education. One of two associations also, at the suggestion of the department, arranged for an occasional meeting of the members, just among themselves, to discuss the records and take steps for the improvement of their herds. This feature is one of great promise. One great advantage of records of dairy cows is the opportunity afforded for comparisons. Enquiry naturally is made regarding 3 distinct points of difference:—(1) between yields in various districts or counties, (2) between yields of herds in the same associations, but most important of all, (3) between individual cows in the same herd under the same management. This brings into most prominent thought the ultimate aim of the work undertaken by members of all cow testing associations, namely, a real study of each individual cow in the herd, with the object of developing strains of animals producing abundant quantities of milk economically.

Taking the districts question first, one or two noteworthy contrasts may be mentioned. Others will be noticed in the tabulated statements which follow.

In July 133 cows at North Oxford, Ont., gave 123,800 lb. milk, 4,128 lb. fat; but 143 cows at Woodburn, Ont., gave only 107,010 lb. milk, 3,444.1 lb. fat. That is, 10 more cows at Woodburn gave 16,790 lb. milk, 684.3 lb. fat less.

In August 142 cows at Ste. Emelie, Que., gave 70,245 lb. milk, 2,962.7 lb. fat; but 136 cows at St. Prosper, Que., gave 104,490 lb. milk, 4,263.5 lb. fat. That is 6 more cows at Ste. Emelie gave 30,245 lb. milk, 1,300.8 lb. fat less.

The September yields in various associations afford some interesting and striking comparisons: Cowansville, Que., 111 cows, 48,795 lb. milk, 2,139.1 lb. fat. St. Marc, Que., 114 cows, 60,045 lb. milk, 2,675.0 lb. fat. St. Prosper, Que., 113 cows, 78,455 lb. milk, 3,304.8 lb. fat. From practically the same number of cows the owners at St. Prosper obtained 27,660 lb. milk and 1,165.7 lb. fat more than did the owners at Cowansville.

In October 54 cows in the Star, Ont., association gave 19,330 lb. milk, 751.9 lb. fat. During the same time 106 cows in the East and West Oxford association gave 65,830 lb. milk, 2,347 lb. fat; this is a better yield by 70 per cent.

The total production of 54 cows in one association in Victoria county during October was 19,330 lb. milk, containing 751.9 lb. butter fat. During the same period 106 cows in Oxford county gave 65,830 lb. milk, 2,347 lb. fat, or again a better yield by 70 per cent. Many men in the former association are looking for the dual purpose cow; probably all members of the latter association aim at special purpose cows. In the former district some farmers leave the whole care of the cows to the women of the household, purely as a 'side line,' and if they can make anything out of the cows besides keeping the house in milk, cream and butter, they are satisfied. Some keep a scrub bull running with the herd, and have no idea when the cows should freshen. The latter is a real whole-hearted, progressive, money making dairy district. Taking other records from the same two counties, it is found that in the six months, May to

8-9 EDWARD VII., A. 1909

October, 1907, the total production per cow stood at 4,793 lb. milk and 165 lb. fat in the one case, and 2,724 lb. milk, 99 lb. fat in the other. This is a difference of 76 per cent. One moment's thought will indicate the tremendous possibilities for Victoria county if its 19,000 cows were 76 per cent higher in their returns than they are at present. Why should they not be?

Another contrast in 30-day yields is found in two Quebec associations, where 65 cows at Cowansville in November gave a total of 1,321·4 lb. fat, but 60 cows at St. Jerome gave only 566·3, considerably less than half.

Similar differences might be instanced for every month in many districts. Enough have been quoted to weight the argument for better cows. The difference in herd averages, though comparatively small, aggregates a tremendous total. The extra profits could easily be made.

There is possibly a difference in the adaptability of the districts to dairying, but there is certainly a more pronounced difference between the individuality of the owners of the herds. A real affection for the dairy cow means better care of her, and consequently better returns financially. Care means cash.

The differences between herds in the same district and the same association illustrate, possibly better than the above, the aptness and efficiency of one man's methods over another's in the application of intelligent, up-to-date business methods to the science and practice of dairying. In this industry to-day there is no room for shiftless, haphazard, hit or miss methods; the dairy herd has to be run as a commercial undertaking. Over and over again can be found instances of ten cows producing just as much milk as twenty. Such contrasts are in herds in associations in Ontario, Quebec and British Columbia, indicating that there is room for little short of a perfect revolution in dairy management in many localities. Let the records speak to the question for a moment. Nine cows in one herd at St. Marc, Que., gave a total yield of 265 lb. fat, while in another herd in the same association 18 cows gave only 260 lb. during September. All of them calved in April. Again, 10 cows in one herd gave 9,550 lb. milk, while 16 in another gave only 7,000 lb.

Another instance, at Cowichan, B.C., in July, 209 cows averaged 631 lb. milk, 3·7 test, 24·0 lb. fat. But one herd averaged 1,067 lb. milk, 4·3 test, 46·4 lb. fat; while another averaged only 417 lb. milk, 3·9 test, 16·5 lb. fat, or only a fraction over one-third as much butter fat.

One lot of cows in the hands of a careful dairyman, during 5 months, averaged 4,194 lb. milk each, but another lot yielded only 2,727 lb. each. If the earning capacity of the latter had been equal to that of the former, they would have given 16,130 lb. of milk more than they did.

Sprinkled all through the detailed records of each association as given below are to be found scores of similar examples of the striking differences in the average production of herds in the same district, whether for short or long periods.

The third point of contrast is that between cows in the same herd. This individuality of animals is so strongly marked that only by careful observation on the part of the owner can be determined the most profitable cows for selection as the foundation stock of the herd. The very fact that in any breed there are so many departures from the characteristics and particular type that may be expected—the difference in the animals' ability to use feed, their variation in yield of milk and fat under similar conditions, their persistency in milking or their tendency to dry off quickly—emphasizes the importance of continuous watchfulness and intelligent action, wherever a herd is kept. Such action must follow a study of each cow's record.

To illustrate some of these points, one does not usually expect to find a high fat content in Holstein milk. Here and there have been noticed some individuals of this breed that averaged over 4·0 per cent fat for the season. Are there many more to be discovered? Why should we rest content with so many cows testing only 2·5, 2·2 and even 2·0 per cent? Is it equitable to other patrons at the cheese factory to let

SESSIONAL PAPER No. 15a

the burden of making up the milk to a fair standard of quality as regards fat rest on their better cows?

There is certainly virtue in inherited tendencies; the transmission of dairy quality is possible. Judicious selection aims at this. Heavy milking ancestry is a very live factor in the capabilities of animals of the present generation. A twelve-year-old grade that calved in October, 1906, gave in the 8 months, January to October, 1907, over 8,360 lb. milk testing 3.8 every month. She has had no special treatment, but comes of good milking stock. Selection pays.

It has been stated that if the shrinkage per month in milk yield for the first six months is not over 10 per cent of the previous month, it is not abnormal. Very few indeed, of the animals recorded here show as little as that. A few run from 13 to 16 per cent, but a very great many have a shrinkage of 20, 30 and even 35 per cent, even in the first four months of milking. There is certainly room for improvement at this point. In one herd there were noticed cows calving in spring that gave only 500 lb. milk in September, but others calving at the same time were still giving in September 900, 1,000 and 1,100 lb. These are the animals to select and breed from.

The tendency in far too many cases seems to be to have the cows milk just for the cheese making season only. Ten months is not too long.

The evident preference of the cow for methodical habits has been vigorously commented on by some of our members. Her objection to a change of milkers is very apparent. The establishment of a perfect sympathy and mutual understanding between the cow and the milker, and not only that, but regularity as to the hour of milking is insisted on most strongly by our best men, who find that careful attention to these details pays, and pays well.

The herds with the poorest records were almost always found to be those with the greatest mixture of grades and the largest number of cross-breds.

In some localities, those not quite alive to the enormous possibilities of high class dairying, farmers were to be found taking this attitude, 'I don't care whether the cow pays with milk or not, as long as she raises a good steer calf'; and again, 'Where can I replace a cow if she does not pay?' The obvious rejoinder was that it is a man's duty to see that each cow in the herd does pay; any dairy farmer with a good head on his shoulders ought so to direct and control the forces surrounding him that his whole herd is made profitable. The 'grading up' of a herd by selection of the best cows at present on the farm, by the use of pure bred sires of good dairy descent, has frequently been advocated, but there still seems need of its constant reiteration. Hundreds of dairymen in the Dominion have turned run down farms and poor herds into highly productive lands and excellent herds by the use of brains.

A large number of last year's members discontinued because they are not farming any longer. This also explains the brevity of many tests in some localities.

One argument in favour of more frequent weighings than the six times per month as at present, is the statement of several members that on the three days appointed for weighing, their cows invariably seemed to fall off in milk for some reason or other; hence some cows, they think, gave more milk than would appear in the records. The advisability of daily weighing has always been recommended and strongly advised by representatives of this branch at meetings of members.

It seems necessary to repeat that one main object of this work is to increase the milk production through a systematic study of each individual cow in the herd. Even after all that has been said and written on this subject it is found that many men still rest content to-day with the presumption that the total herd production of milk is 'fairly good,' and the average test is 'pretty fair.' This is altogether too vague. Until there is determination to check up the performance of each animal definitely, some of these 'loafers' that give an unprofitable weight of milk and a poor test are almost certain to be retained, to the detriment of the owner and the herd standard.

Taking eight months, April to November, 46 per cent of all the cows recorded

8-9 EDWARD VII., A. 1909

were 100 lb. milk below the average every month. The average in May for all the cows tested in Ontario associations was 764 lb. milk, and 46 cows out of every 100 gave only 653 lb. Similarly in August the average yield was 638 lb., and 46 per cent gave only 529 lb.

Taking the total number of milch cows in Ontario as 1,100,000, and then assuming that 46 per cent of them could easily give 100 lb. of milk more than they do at present, with milk at 90 cents per 100 lb. the dairymen of this province could easily have an extra income of three and a half million dollars. Note that this is simply by improving those below the average, which should not be difficult, and does not consider the immense possibilities involved in further improving the average and the good cows.

INSTANCES OF THE VALUE OF TESTING.

One member relates the incident of a neighbour purchasing a cow for \$100, but being dissatisfied with her, he resold her, gaining \$5 on his bargain. She fell into the hands of a man using the scales and Babcock test, who as soon as he could show a few months' records disposed of her for \$500.

Another cow, 8 years old, was bought for \$32 from a man who evidently did not realize her value; for her milk brought in \$140 from the factory in one year.

A buyer who picked up four cows out of one stable remarked to the owner he could not give much for one particular animal. Nevertheless that same cow as a 3-year-old gave 10,326 lb. milk, testing 3·7. Before recording her production the cow was valued at \$35, but \$100 is refused now.

One member who had set his standard for each cow at 7,000 lb. milk per year, has now decided to make it 10,000 lb. per cow, and is quickly working up to that.

Another member offered a heifer for sale at \$25 when she first came in; he says now that he would not sell her at all, as she is proving herself by the test to be one of his best cows.

As one result of this record work some members have already set about improving the herds of the district by purchasing animals whose value is supported by records of milk and butter fat production.

Many members owning cows that until tested had been booked for the butcher, admitted that the weighing and testing had proved such animals to be the best in the herd; this testing has thus been of inestimable value in opening men's eyes to facts.

Following a good example set at one association where the proprietor of the creamery offered cash prizes at the fall fair for the cows with the best association records, the suggestion is made that directors of other fairs might do likewise.

PERCENTAGE OF FAT.

In 1906 the number of cows tested each month in Ontario and Quebec varied from 36 in January to 2,869 in July, with a total number of tests during the twelve months of 17,135, giving a total yield of 9,420,860 pounds of milk and 363,990.9 pounds of fat, which means an average test of 3.86 per cent of fat.

In 1907 the number of cows tested each month in the Dominion varied from 204 in February to 7,140 in June, with a total number of tests during the twelve months of 41,257, giving a total yield of 24,672,000 pounds of milk and 923,944.9 pounds of fat, which means an average test of 3.74 per cent of fat.

AVERAGE PER CENT OF FAT, 1907.

| | Total Number of Cows Tested. | Total Milk. | Total Fat. | Average Test. |
|--------------|---------------------------------------|-------------|------------|---------------|
| Ontario..... | 17,723 | 11,573,913 | 402,962.1 | 3.48 |
| Quebec..... | 17,835 | 9,735,103 | 387,171.4 | 3.97 |
| Canada..... | 41,257 | 24,673,000 | 923,944.9 | 3.74 |

The following table shows the average percentage of fat in milk from the number of cows indicated, by months, for the calendar year of 1907, in Ontario and Quebec.

FEED.

So many members have been inquiring about the question of feed, evidently with the thought in mind that feed is expensive, that the experience of one man may well be quoted for general encouragement. He has one pure-bred cow with a certified record of 13,158 lb. milk, and 485 lb. fat in 365 days. His estimate of the cost of feed is \$70. But his actual cash receipts, from milk sent to a cheese factory part of the year and to a condensery for the balance, amounted to \$170. In other words, for every dollar invested in feed, the cow returned two dollars and forty-two cents worth of milk. As a large money-making investment a cow of this individuality is surely an excellent type. Where else could such interest be guaranteed? This farmer is milking over 40 cows, and expects each one to produce over 8,000 pounds of milk. The evident moral is that it pays, and pays abundantly well, to select cows of good individual

SESSIONAL PAPER No. 15a

capacity, whether grades or pure-breds, and to feed judiciously. Why should any man rest content with giving thirty dollars worth of feed to a cow that will only return thirty dollars worth of milk?

Through the courtesy of Mr. J. H. Grisdale of the Experimental Farm, Ottawa, a circular issued by him, relative to the growing of soiling crops, was mailed to each member. Our officials who were doing the testing report that by many farmers the suggestions were ignored, much to their regret later in the season. Others, fortunately, were quick to take good advice and were well repaid.

Those who were feeding soiling crops state that even if in some cases there was no substantial increase in the yield, they have succeeded in keeping up the flow in spite of the unfavourable weather (late spring, practically no summer, and rainy fall), and considered that they were well repaid for the extra work. Had it not been for the extra care and extra feed given to the cows in addition to the pasture, they state, the cows would in September and October have given practically nothing.

In the Shearer, Ont., association, one member fed chop all summer, chiefly oats and pease. His 7 cows gave in July, August, September and October 2,943 lb. milk, 101.8 lb. fat each. A neighbour stated that this was the first for many seasons that he gave no extra feed, and said that he was ashamed of his weights. During the same four months his 16 cows gave only 2,230 lb. milk, 78.7 lb. fat. If they had produced as well as the first herd these 16 cows would have given an extra 11,408 lb. milk. At 90 cents per 100 lb., this means \$102.60 lost, in four months.

The members at St. Prosper, Que., who were feeding soiling crops averaged 913 lb. milk and 29.3 lb. fat more per cow in 6 months than the other members who were not feeding soiling crops.

At St. Marc, Que., one herd of 8 cows in August gave an average of 706 lb. milk, 3.8 test, 26.8 lb. fat. In September they averaged 792 lb. milk, 3.7 test, 29.5 lb. fat. While other men were wondering at the shrinkage of their cows, this particular farmer, thanks to his provision of green feed at the suggestion of this department, was rejoicing in an extra 688 lb. milk and 21.6 lb. of fat over his August receipts.

A contrast between two herds in two Quebec associations is given below in tabulated form for the purpose of emphasizing two points: first, the advantage of liberal feeding; second, the advantage of selecting cows according to each cow's ability to produce paying quantities of milk and butter fat.

The owner of herd A feeds liberally, giving grain every day in the year, and providing green soiling crops. Further, he has, through the use of scales and the Babcock test, systematically practiced selection for nine years. Has it paid him?

Though the feed cost \$15 per cow more than it cost per cow in herd B, the profit on more feed with the better cows was over five times as much.

COMPARISON OF TWO GRADE JERSEY HERDS, QUEBEC, 1907.

| Herd. | Number of Cows. | Total Yield of Milk. | Fat. | Cost of Feed per Cow. |

8-9 EDWARD VII., A. 1909

COMPARISON OF NET PROFIT FROM A GOOD AND AN AVERAGE COW.

Looking into the records of two cows in a Quebec association, it is found that a good cow produced 7,900 lb. skim milk and 350 lb. fat; or a total value of product of \$99.55. Another cow in the same herd gave 3,700 lb. skim milk and 205 lb. fat, or a total value of product of \$56.85. Presuming that feed cost \$30, the net value stands for No. 1 cow at \$69.55, and for No. 2 cow, at \$26.85. But are there not other expenses besides cost of feed? Some provision must be made for such items as interest on the value of the cow, her depreciation, cost of caring for her, interest and taxes on buildings. Her share of cost of maintenance of a first-class dairy sire may be offset by the value of the calf, and manure should be credited. In some dairy sections in the state of Ohio these expenses have been averaged at \$21 per cow. Applying these figures to the two animals here considered, the deduction from the total value of product will now be \$51. Hence it is seen that No. 1 cow gave \$48.55 net profit, and No. 2 cow gave a net profit of only \$5.85. Therefore, the one cow gave 8 $\frac{2}{3}$ times as much net profit as the other. In other words, to obtain \$1,000 net profit, one would need to keep only 20 cows like No. 1, but actually 171 cows like No. 2. Which is the preferable kind? Yet in such extraordinary proportions are cows being kept to-day. Should not such contrasts sound the bugle call to action on every dairy farm?

ASSOCIATIONS IN ONTARIO, PRINCE EDWARD ISLAND AND BRITISH COLUMBIA.

AVERAGE YIELD OF 438 COWS TESTED FOR SIX MONTHS, 1907, IN ONTARIO.

| East and West Oxford..... | 26 | 4,322 | 3.5 | 151.3 |
| Culloden..... | 38 | 4,323 | 3.6 | 154.3 |
| Rockford..... | 28 | 5,206 | 3.3 | 171.4 |

Average yield of all the 438 cows, 3,757 lb. milk, 3.5 test, 130.3 lb. fat.

These records for the periods of 6, 7 and 8 months would have to be increased slightly to arrive at the actual total production for the full period of lactation. A careful estimate of Ontario records indicates that an additional 12 per cent of milk and fat for the 6 months, 7 per cent for the 7 months, and 5 per cent for the 8 months records would be a liberal weight to add.

Hence, adding 12 per cent to the above 6 months average, the actual production for these 438 cows for their full milking period may be taken as 4,207 lb. milk, 145.9 lb. fat.

FIG. 1.—Grade Shorthorn Cow in Pine Grove Association, seven years old; eleven months' record 9,072 lbs. milk, 5.2 test, 472.9 lbs. fat.

FIG. 2.—Grade Holstein Cow in Central Smith Association, eight years old; ten months' record 13,370 lbs. milk, 3.0 test, 399.6 lbs. fat.

SESSIONAL PAPER No. 15a

AVERAGE YIELD OF 195 COWS TESTED FOR SIX MONTHS, 1907, IN PRINCE EDWARD ISLAND AND BRITISH COLUMBIA.

| Name of Association. | Number of Cows. | Average Milk. | Average Test. | Average Fat. |
|-------------------------|-----------------|---------------|---------------|--------------|
| | | Lbs. | | Lbs. |
| New Glasgow, P.E.I..... | 47 | 3,102 | 3.8 | 117.9 |

| North Oxford..... | 33 | 6740 | 3.3 | 225.0 |
| New Glasgow, P.E.I..... | 13 | 4182 | 3.6 | 148.3 |

Average yield of these 477 cows recorded 8 months, 5,186 lb. milk, 3·46 test, 179·7 lb. fat.

With an additional 5 per cent to these average weights, as explained already, the approximate actual production of the 477 cows for their full milking period may be taken at 5,445 lb. milk, 188·6 lb. fat.

AVERAGE YIELD OF 186 COWS TESTED FOR 9 MONTHS, 1907, IN ONTARIO.

| Name of Association. | No. of Cows. | Average Milk. | Average Test. | Average Fat. |

SESSIONAL PAPER No. 15a

Average yield of the 74 cows, 7,081 lb. milk, 3.2 test, 229.3 lb. fat.

AVERAGE YIELD OF 9 COWS TESTED 11 MONTHS, 1907, IN ONTARIO.

| Name of Association. | No. of Cows. | Average Milk. | Average Test. | Average Fat. |
|----------------------|--------------|---------------|---------------|--------------|
| | | Lbs. | | Lbs. |
| Shearer..... | 2 | 6,952 | 3.5 | 242.5 |
| Keene..... | 3 | 7,673 | 3.5 | 267.2 |
| North Oxford..... | 4 | 7,802 | 3.5 | 273.2 |

Average yield of the 9 cows, 7,579 lb. milk, 3.5 test, 272.2 lb. fat.

ONE COW RECORDED FOR 12 MONTHS, 1907, IN ONTARIO.

| Name of Association. | No. of Cows. | Milk. | Average Test. | Fat. |
|----------------------|--------------|-------|---------------|-------|
| | | Lbs. | | Lbs. |
| North Oxford..... | 1 | 8,455 | 3.1 | 265.0 |

The yields of 733 individual cows for periods of 8, 9, 10, 11 and 12 months in Ontario associations are classified as follows:—

| Number of Months. | TOTAL YIELD OF MILK IN POUNDS. | | | | | | | | | Total No. of Cows. | Number of Herds Represented. | Number of Associations. |
|--------------------|--------------------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|---------------------|--------------------|------------------------------|-------------------------|
| | 1,000 to 2,000 lb. | 2,000 to 3,000 lb. | 3,000 to 4,000 lb. | 4,000 to 5,000 lb. | 5,000 to 6,000 lb. | 6,000 to 7,000 lb. | 7,000 to 8,000 lb. | 8,000 to 9,000 lb. | 9,000 to 10,000 lb. | | | |
| | No. of Cows. | No. of Cows. | No. of Cows. | No. of Cows. | No. of Cows. | No. of Cows. | No. of Cows. | No. of Cows. | No. of Cows. | | | |
| 8. | | 10 | 44 | 161 | 96 | 120 | 31 | 1 | | 463 | 91 | 16 |
| 9. | 1 | | 2 | 37 | 55 | 39 | 37 | 8 | 6 | 185 | 41 | 11 |
| 10. | | | 2 | | 8 | 27 | 21 | 11 | 6 | 75 | 20 | 3 |
| 11. | | | | | | 3 | 4 | | 2 | 9 | 5 | 3 |
| 12. | | | | | | | | 1 | | 1 | 1 | 1 |
| Total No. of cows. | 1 | 10 | 48 | 198 | 159 | 189 | 93 | 21 | 14 | 733 | | |

Thus, out of 733 cows, 189 of them, or over 25 per cent, gave yields of milk varying between 6,000 lb. and 7,000 lb. each, for the full lactation period. Of those 189, 120 of them were milking for 8 months, 39 for 9 months, 27 for 10 months, and 3 for 11 months.

LORNEVILLE, ONT., ASSOCIATION.

Sixteen cows tested for 6 months averaged 2,916 lb. milk, 3.5 test, 102.6 lb. fat. Eleven cows tested 7 months averaged 3,252 lb. milk, 3.5 test, 115.6 lb. fat.

8-9 EDWARD VII., A. 1909

Nine cows tested 8 months averaged 4,039 lb. milk, 3·5 test, 140·1 lb. fat.
Two cows tested 9 months averaged 5,972 lb. milk, 3·4 test, 203·7 lb. fat.

BEAVERTON, ONT., ASSOCIATION.

The cows in this association were mostly grade Shorthorns. The 24 cows recorded for 6 months had an average yield of 3,364 lb. milk, 3·6 test, 122·6 lb. fat. The highest individual yield of milk was 4,464 lb. from a 9-year-old. The highest yield of fat during the six months was 175·6 lb. also from a 9-year-old.

The 27 cows recorded for 7 months gave an average of 3,614 lb. milk, 3·6 test, 130·8 lb. fat, only slightly more than the 6 months' average. The best individual yield was 5,375 lb. milk, 3·4 test, 184 lb. fat from a 9-year-old.

Out of the 27 cows recorded for 7 months, 8 of them gave less than the average of those recorded for 6 months. Similarly, 8 out of the 27 recorded for 8 months gave less than the average yield of those recorded for 7 months.

The average yield of 27 cows tested for 8 months was 3,923 lb. milk, 3·6 test, 140·5 lb. fat. The best record for 8 months was from a 5-year-old that gave 5,765 lb. milk, 3·5 test, 202·4 lb. fat. An 8-year-old cow in the same herd gave 1,440 lb. milk and 34·5 lb. fat less than that record during the eight months. Some cows in the Central Smith Association gave over 8,000 lb. milk in 8 months.

These averages indicate clearly the general room for improvement; the highest yields recorded should show to interested members the possibilities of the district; and the contrasts noted above indicate the need for selection.

KINMOUNT, ONT., ASSOCIATION.

Nine cows recorded for 6 months had an average production of 2,539 lb. milk, 3·6 test, 89·4 lb. fat.

The best individual yield was 4,075 lb. milk, 3·2 test, 130·1 lb. fat, so that better results are obtainable.

The 4 cows tested 7 months gave, on the average, 3,154 lb. milk, 3·7 test, 114·7 lb. fat. The highest yield was 3,970 lb. milk, 3·9 test, 136·3 lb. fat.

This appears to be a district where more attention is necessary to the essentials of good dairying. More liberal feeding and better care of the cows already on hand should speedily work a transformation.

OAK LEAF, ONT., ASSOCIATION.

The average yield of 6 cows for 6 months was 3,006 lb. milk, 3·5 test, 107·5 lb. fat.

The average production of 42 cows for 7 months was 3,860 lb. milk, 3·6 test, 139·3 lb. fat.

The average production of 19 cows for 8 months was 4,333 lb. milk, 3·7 test, 160·0 lb. fat. The best yield during that period was 5,365 lb. milk, 3·9 test, 211·9 lb. fat; and the poorest yield was 3,839 lb. milk, 3·4 test, 128·4 lb. fat, from a 10-year-old cow.

WOODBURN, ONT., ASSOCIATION.

The average production of 34 cows for 6 months was 3,914 lb. milk, 3·4 test, 133·2 lb. fat.

In one herd a 4-year-old cow gave only 4,325 lb. milk (though this is higher than the general average production), but a 5-year-old in the same herd gave 6,530 lb. milk in the same time, just 2,205 lb. more.

The average production of 57 cows for 7 months was 4,345 lb. milk, 3·4 test, 147·8 lb. fat.

SESSIONAL PAPER No. 15a

The difference between the best and poorest yield of milk from two cows in the same herd was 3,332 lb., which at 90 cents per 100 lb. means \$29.98, or at the rate of \$4.28 per month difference in the returns per cow.

The average production of 17 cows for 8 months was 4,207 lb. milk, 3.4 test, 144.6 lb. fat.

The average production of 4 cows for 9 months was 4,547 lb. milk, 3.6 test, 166.1 lb. fat.

BROCKVILLE, ONT., ASSOCIATION.

The average yield of 21 cows for 6 months was 4,184 lb. milk, 3.3 test, 140.0 lb. fat.

The average production of 24 cows tested for 7 months was 4,301 lb. milk, 3.4 test, 146.4 lb. fat.

One herd averaged 4,913 lb. milk against 3,421 lb. milk produced by another herd. If the 6 cows in the latter herd had yielded as well on the average as the former herd, they could have put another \$81 into the pocket of their owner in the 7 months.

The average production of 22 cows for 8 months was 5,340 lb. milk, 3.2 test, 174.7 lb. fat.

The extremes here are noticeable: a 10-year-old cow gave 7,730 lb. milk, 3.4 test, 265 lb. fat, but a 14-year-old cow gave only 2,650 lb. milk, 3.5 test, 94.4 lb. fat during the same time. This is practically equivalent to saying that one cow is three times as valuable as the other.

WARSAW, ONT., ASSOCIATION.

The average production of 70 cows for 6 months was 3,521 lb. milk, 3.4 test, 121.1 lb. fat. A 6-year-old gave the poorest yield of all the 70 cows, namely 3,130 lb. milk, 3.0 test, 93.3 lb. fat, and a 3-year-old gave the best yield, namely 5,410 lb. milk, 3.6 test, 196.4 lb. fat.

One herd of 15 cows averaged only 3,185 lb. milk, while a herd of 9 close by gave 4,225 lb. milk each. If the 15 cows had been as good producers as the 9, they would have given an extra weight of 15,600 lb. milk, which at 90 cents per 100 lb. would have brought in to their owner an additional sum of \$140.40 in the six months.

The average production of 39 cows for 7 months was 3,762 lb. milk, 3.4 test, 131 lb. fat. The highest yield of any one cow was only 4,540 lb. milk, 3.7 test, 171.2 lb. fat.

In this lot of cows recorded 7 months the best cow in one herd brought in \$42.80, while the poorest earned only \$24.05, or \$2.68 per month less. What a revolution there would be in cow land if each individual earned only one dollar per month more than she does at present. Another twenty million dollars is only a low estimate of the extra sum that might come into the pockets of Canadian farmers from this slight increase in the milk production. Is not this well worth keeping in sight?

The average production of 21 cows for 8 months was 4,733 lb. milk, 3.5 test, 165.0 lb. fat.

Twenty-eight cows tested 9 months averaged 5,590 lb. milk, 3.3 test, 184.3 lb. fat.

The highest and lowest yields for this period were both in the same herd of 13 cows; in the one case a 6-year-old gave 3,882 lb. milk, 3.3 test, 124.3 lb. fat, while the best cow gave 7,557 lb. milk, 3.3 test, 244.4 lb. fat.

PINE GROVE, ONT., ASSOCIATION.

The average production of 31 cows for 6 months was 3,120 lb. milk, 3.4 test, 107.4 lb. fat. The variation was all the way from 2,695 lb. milk to 4,050 lb.; in each case the cow was 11 years old.

The average production of 18 cows for 7 months was 4,373 lb. milk, 3.5 test, 1,560 lb. fat.

8-9 EDWARD VII., A. 1909

The average production of 64 cows for 8 months was 4,876 lb. milk, 3·5 test, 171·0 lb. fat. The poorest yield was that of a 6-year-old cow giving 3,230 lb. milk, 3·6 test, 117·0 lb. fat; while the best yield was that of a 5-year-old, 6,730 lb. milk, 3·4 test, 233·5 lb. fat, practically double.

The average yield of 7 cows for 9 months was 4,929 lb. milk, 3·5 test, 176·2 lb. fat.

CENTRAL SMITH, ONT., ASSOCIATION.

The average yield of 11 cows for 6 months was 4,056 lb. milk, 3·3 test and 132·5 lb. fat. The best individual yield was 4,880 lb. milk, 3·0 test, 145 lb. fat. Five cows in two herds, being representatives of the Jersey, Shorthorn and Ayrshire breeds, as well as so-called 'scrub' animals were below the average yield, indicating that selection is necessary and requisite as well in one breed as another. No one of these 5 cows was under 5 years old; one was 12.

Forty-one cows recorded for 7 months had an average yield of 4,866 lb. milk, 3·3 test, 163 lb. fat. Herd 19 has the very satisfactory average from 20 cows, including 2 3-year-olds, for 7 months, of 5,243 lb. milk and 172·5 lb. fat, thus being well above the average. In this herd the highest individual yield was 6,850 lb. milk and 202·9 lb. fat. As a contrast to this herd average, another herd of 5 cows had an average yield of only 3,726 lb. milk, 3·2 test, 120·9 lb. fat; the youngest cow was 6 years old, and the best individual yield was 4,430 lb. milk, 3·1 test, 138·0 lb. fat.

Thirty-eight cows tested 8 months gave an average yield of 5,657 lb. milk, 3·3 test, 185·7 lb. fat.

The average yield of herd 20 for 8 months was 7,246 lb. milk, 3·4 test, 246·4 lb. fat. One would naturally suppose that must be a fine herd. A closer examination of the records reveals immediately that the high average was due entirely to the heavy production of one cow, an 8-year-old that gave 11,720 lb. milk, 2·9 test, 342·8 lb. fat. Six of the remaining seven animals were below the herd average. The lowest yield was from a 4-year-old that gave 5,680 lb. milk, 3·8 test, 215 lb. fat, a decidedly different yield from 11,720 lb. This, again, lends emphasis to the paramount importance of considering each animal in the herd on its own individual merits, its ability to produce milk and butter fat economically, instead of resting content with fair 'average' yields.

Twelve cows tested 9 months gave, on the average, 6,551 lb. milk, 3·3 test, 214·4 lb. fat. The best yield was 8,152 lb. milk, 3·2 test, 258·5 lb. fat from a 7-year-old grade.

KEENE, ONT., ASSOCIATION.

The average yield of 21 cows for 6 months was 4,052 lb. milk, 3·3 test, 137·2 lb. fat.

The average production of 39 cows for 7 months was 4,308 lb. milk, 3·5 test, 153·1 lb. fat. One herd of 4 cows averaged only 3,293 lb. milk each in the 7 months. Another herd of 5 cows averaged 224·6 lb. milk more, or 5,539 lb. each during the same time. The 4 cows should easily have brought in \$15 each more than they did to their owner, and probably would have done so if they had had some green soiling crops.

The average production of 19 cows for 8 months was 4,903 lb. milk, 3·4 test, 171 lb. fat.

In the group tested for 8 months one herd of 4 cows had an average of 3,985 lb. milk, 3·5 test, 141·4 lb. fat; the best yield was 5,815 lb. milk, 3·2 test, 183·5 lb. fat, and the poorest yield was from a 7-year-old, 2,645 lb. milk, 3·2 test, 85·4 lb. fat, or almost 100 lb. of fat less.

Another lot of 4 cows gave, in 8 months, 6,558 lb. milk, 3·3 test, 219·6 lb. fat, or an average of 2,573 lb. milk each more than the 4 noted above. In this herd the highest yield was 8,135 lb. milk, 3·6 test, 292·8 lb. fat; and the lowest, from a

SESSIONAL PAPER No. 15a

4-year-old, 4,990 lb. milk, 3.1 test, 156.3 lb. fat, or 136.5 lb. fat less than the highest yield.

This clearly indicates the general unevenness in herds, in average and good herds alike, and the necessity of this work of noting the actual production of each single individual.

The average yield of 4 cows for 9 months was 6,627 lb. milk, 3.4 test, 222.9 lb. fat. The highest was 8,151 lb. milk, 3.2 test, 264.3 lb. fat.

For 10 months, the average production of 7 cows was 6,262 lb. milk, 3.4 test, 217.1 lb. fat, or a lower average than those recorded for 9 months. The highest yield was 6,968 lb. milk, 3.3 test, 229.8 lb. fat.

The average production for 11 months of 3 cows was 7,673 lb. milk, 3.5 test, 267.2 lb. fat. The best individual cow gave 8,505 lb. milk, 3.5 test, 294.1 lb. fat.

SHEARER, ONT., ASSOCIATION.

Twenty cows tested for 6 months averaged 3,990 lb. milk, 3.3 test, 131 lb. fat.

Twenty-one cows tested for 7 months averaged 4,551 lb. milk, 3.3 test, 152.9 lb. fat.

The average yield of 14 cows for 8 months was 4,755 lb. milk, 3.5 test, 170.1 lb. fat.

Twelve cows tested for 9 months averaged, 4,996 lb. milk, 3.3 test, 165.7 lb. fat. The highest yield was 5,330 lb. milk, 3.4 test, 191.7 lb. fat, valued at 25 cents per lb. fat, \$47.92; but the lowest yield was only 3,250 lb. milk, 3.7 test, 118.9 lb. fat, valued at 25 cents per lb. fat, \$29.72, or \$18.20 less.

For 10 months, 10 cows gave an average yield of 5,961 lb. milk, 3.5 test, 211.3 lb. fat.

Two cows tested for 11 months averaged 6,952 lb. milk, 3.5 test, 242.5 lb. fat.

ROCKFORD, ONT., ASSOCIATION.

The average production of 28 cows for 6 months was 5,206 lb. milk, 3.3 test, 171.4 lb. fat. One herd of 20 cows had the very satisfactory average of 5,656 lb. milk, 3.2 test, 183.2 lb. fat; so evidently, the remaining eight cows must have been dreadfully low in yield to affect the general average so materially.

The best individual record was from a 6-year-old grade that gave 7,012 lb. milk, 3.1 test, 222.7 lb. fat. The lowest record was from an 11-year-old that gave only 4,080 lb. milk, 3.5 test, 143.0 lb. fat, or nearly twenty dollars worth of butter fat less than the best record.

SHEFFIELD, ONT., ASSOCIATION.

The average production of 30 cows for 6 months was 3,350 lb. milk, 3.7 test, 124.4 lb. fat. The best herd average was 3,627 lb. milk, 3.7 test, 135.2 lb. fat from 7 cows. The highest individual yield was 4,730 lb. milk 3.5 test, 165.8 lb. fat; while in the same herd a 10-year-old cow gave only 2,340 lb. milk, 4.0 test, 93.1 lb. fat.

Eighteen cows in 7 months averaged 3,550 lb. milk, 3.9 test, 141.7 lb. fat. Four cows comprising one herd gave only 2,308 lb. milk each, but another herd of four cows produced 4,245 lb. milk each.

The average yield of 18 cows for 8 months was 5,075 lb. milk, 3.6 test, 185.5 lb. fat. The lowest yield of milk was 4,040 lb. from a 3-year-old, while the highest, from an 8-year-old in the same herd, was 2,700 lb. *more*, or 6,740 lb. in all. With milk at 90 cents per 100 lb. the one cow's revenue was \$24.30 greater than the other's.

MILTON, ONT., ASSOCIATION.

The records for 6 months show 17 cows to have given an average of 3,134 lb. milk, 3.8 test, 120 lb. fat. The best individual yield was 5,584 lb. milk.

8-9 EDWARD VII., A. 1909

The average production of 33 cows for 7 months was 3,954 lb. milk, 3·7 test, 152·6 lb. fat. One herd of 7 cows gave an average yield of 4,510 lb. milk, 3·9 test, 177·8 lb. fat; but another herd of 5 cows gave only 3,041 lb. milk, 3·6 test, 110·2 lb. fat.

Seventeen cows' records for 8 months averaged 4,438 lb. milk, 3·8 test, 166·6 lb. fat.

The highest yield of any one cow was 7,630 lb. milk, 3·2 test, 242·3 lb. fat. The 5 best cows gave altogether 29,536 lb. milk, 1,049·3 lb. fat; but the 5 poorest gave only 17,276 lb. milk, 658·4 lb. fat. This is a difference of 12,260 lb. milk and 390·9 lb. fat; or, with fat at 25 cents per lb. the 5 best cows recorded for 8 months gave \$97·72 more than the 5 poorest.

Nine cows were tested 9 months, and gave 4,235 lb. milk, 3·8 test, 159·7 lb. fat. This means one whole month longer in which to milk them every night and morning for less milk than those milked 8 months.

Taking all the cows recorded for 6, 7 and 8 months, and calculating fat at 25 cents per lb., there was an average difference of \$4·13 per month between the earning power of the best and poorest cow. If these records had been extended to 10 months, which is not too long a milking period, the difference in revenue between two cows would have stood at \$41·30. This is what testing reveals.

CULLODEN, ONT., ASSOCIATION.

The average production of 38 cows recorded for 6 months was 4,323 lb. milk, 3·6 test, 154·3 lb. fat.

There was but very slight variation among the general average production of each herd, but between the best and poorest cow in the same herd the difference in yield was as high as 2,760 lb. milk and 98 lb. fat, and in no case was the poor yield from any cow under 5 years old.

The average yield of 144 cows for 7 months was 5,146 lb. milk, 3·5 test, 181·9 lb. fat. One herd of 54 cows had an average of 5,478 lb. milk, 3·6 test, 201·1 lb. fat. The highest individual yield of any cow was 8,570 lb. milk, 3·3 test, 288·9 lb. fat; the lowest yield in the same herd was from a 6-year-old cow that gave 4,119 lb. milk, 3·8 test, 156·2 lb. fat, or *less than half* the weight of milk.

The average yield of 69 cows tested for 8 months was 5,873 lb. milk, 3·4 test, 203·3 lb. fat. The average yield of 23 cows in one herd was 6,018 lb. milk, 3·5 test, 209·3 lb. fat. The best individual production was 8,220 lb. milk, 3·2 test, 266·0 lb. fat; the poorest was, from a 7-year-old, 4,240 lb. milk, 3·4 test, 144·2 lb. fat.

The poorest cow in each of the 5 herds recorded for 8 months was, on the average, 1,256 lb. milk lower than the general average of production. There are probably thousands of cows now being kept that should easily earn at least eleven dollars each more during the year than they do at present.

SPRING CREEK, ONT., ASSOCIATION.

The average yield of 20 cows for 6 months was 3,369 lb. milk, 3·5 test, 119·7 lb. fat.

The average production of 32 cows for 7 months was 4,433 lb. milk, 3·5 test, 158·0 lb. fat. The lowest yield was 3,628 lb. milk, 3·1 test, 111·1 lb. fat from a 6-year-old cow; but the highest yield was 6,460 lb. milk, 3·6 test, 230·2 lb. fat.

The average production of 44 cows for 8 months was 5,306 lb. milk, 3·6 test, 192·6 lb. fat.

One herd of 6 cows had an average of 6,602 lb. milk, 3·4 test, 228·8 lb. fat.

The highest individual yield was 7,080 lb. milk, 3·8 test, 264·4 lb. fat, but the lowest was, from a 12-year-old, 3,370 lb. milk, 4·1 test, 136·6 lb. fat. The possibilities are evident.

SESSIONAL PAPER No. 15a

The average production of 66 cows for 9 months was 6,183 lb. milk, 3.6 test, 223.1 lb. fat.

One herd of 6 cows gave the very satisfactory average of 9,260 lb. milk, 3.3 test, 306.8 lb. fat.

In another herd the best individual yield was 10,570 lb. milk, 3.2 test, 335.2 lb. fat from a 7-year-old; in the same herd a 7-year-old, also, gave the poorest yield, scarcely half as much.

COMPARISONS FOR 10 MONTHS, 1907.

| Average Production of Herds. | | | | | Yield of Best Cow in each Herd. | | | | Yield of Poorest Cow in each Herd. | | | |
|------------------------------|----------------------------|-------|-------|-------|------------------------------------|--------|-------|-------|---------------------------------------|-------|-------|-------|
| Herd No. | No. of Cows in Herd. | Milk. | Test. | Fat. | Age. | Milk. | Test. | Fat. | Age. | Milk. | Test. | Fat. |
| | | Lbs. | | Lbs. | | Lbs. | | Lbs. | | Lbs. | | Lbs. |
| A | 6 | 7,068 | 3.5 | 246.2 | 7 | 10,570 | 3.2 | 335.2 | 5 | 5,510 | 3.6 | 197.9 |
| B | 5 | 6,428 | 4.4 | 280.3 | 8 | 6,980 | 4.4 | 305.3 | 6 | 4,780 | 5.1 | 244.9 |
| C | 8 | 8,597 | 3.5 | 302.9 | 7 | 10,944 | 3.4 | 374.7 | 4 | 7,100 | 3.6 | 253.0 |
| D | 6 | 9,373 | 3.8 | 352.3 | 8 | 10,528 | 4.4 | 464.1 | 10 | 9,450 | 3.7 | 352.4 |

The average production of 36 cows for 10 months was 7,391 lb. milk, 3.0 test, 223.8 lb. fat.

While 3 individual records are particularly encouraging, it should be noted that the 4 poorest cows in each herd are just 3,045 lb. milk, 3.6 test, 108 lb. lower than the yields of the best cows. Such a marked difference indicates the room that exists for raising the production of some individual animals, or else getting rid of them. For instance, can the poorest cow in herd B be made to yield as much as the poorest cow in herd D, or should she be discarded?

NORTH OXFORD, ONT., ASSOCIATION.

The average production of 16 cows for 6 months was 3,717 lb. milk, 3.5 test, 129.1 lb. fat.

The average yield of 33 cows for 7 months was 5,136 lb. milk, 3.4 test, 176.0 lb. fat. As revealing differences in yield between herds and individuals the following comparisons are interesting.

COMPARISONS FOR 7 MONTHS.

| Herd. | No. of Cows in herd. | Herd Average. | | | Yield of Best Cow. | | | | Yield of Poorest Cow. | | | |
|-------|----------------------|---------------|-------|-------|--------------------|-------|-------|-------|-----------------------|-------|-------|-------|
| | | Milk. | Test. | Fat. | Age. | Milk. | Test. | Fat. | Age. | Milk. | Test. | Fat. |
| | | Lbs. | | Lbs. | | Lbs. | | Lbs. | | Lbs. | | Lbs. |
| A | 4 | 3912 | 3.4 | 132.7 | 5 | 4,616 | 3.3 | 151.6 | 10 | 3,325 | 3.9 | 133.0 |
| B | 8 | 5053 | 3.5 | 175.6 | 6 | 6,000 | 3.1 | 213.2 | 5 | 4,553 | 3.4 | 157.6 |
| C | 6 | 7178 | 3.3 | 240.7 | 10 | 6,875 | 3.9 | 269.4 | 5 | 7,100 | 3.1 | 217.5 |

Two cows in herd C gave within 92 lb. milk of the total weight given by four cows in herd A. The poorest cow in herd A gave 3,775 lb. milk, 84.5 lb. fat less than the poorest cow in herd C.

8-9 EDWARD VII., A. 1909

The average production of 33 cows for 8 months was 6,740 lb. milk, 3.3 test, 225 lb. fat. One herd of 12 cows gave an average of 7,498 lb. milk, 3.3 test, 249.2 lb. fat. The lowest yield of a 6-year-old cow in one herd was 6,202 lb. milk, 3.1 test, 190.1 lb. fat. The highest yield of milk was 8,860 lb., testing 2.9.

The average yield for 9 months of 23 cows was the same weight of milk as given by those recorded 8 months, namely, 6,736 lb., testing the same. There was no higher yield in 9 months than the 8,860 lb. given in only 8 months. In fact the heaviest flow was 8,540 lb., testing 3.3, thus containing 27.2 lb. fat more than the 261.0 lb. in the 8,860 lb. milk.

The average production of 17 cows for 10 months was 7,255 lb. milk, 3.4 test, 249.0 lb. fat. The best yield was 8,750 lb., testing 3.5, and the poorest was, from a 7-year-old, 5,415 lb. testing 3.6.

Four cows were recorded for 11 months; the average was 7,802 lb. milk, 3.5 test, 273.2 lb. fat. The highest yield was, from a 3-year-old, 12,495 lb. milk, 3.2 test, 401.3 lb. fat. The photo of this cow was in last year's report. The lowest yield was also from a 3-year-old, 6,225 lb. milk, 3.5 test, 222.3 lb. fat.

One cow recorded for 12 months gave 8,455 lb. milk, 3.1 test, 265 lb. fat.

EAST AND WEST OXFORD, ONT., ASSOCIATION.

The average yield of 26 cows for 6 months was 4,322 lb. milk, 3.5 test, 151.3 lb. fat. A 6-year-old cow gave the poorest result, 2,760 lb. milk, 3.6 test, 100.9 lb. fat; while the best yield was 6,030 lb. milk, 3.5 test, 213.6 lb. fat to the credit of a 9-year-old. This was more than twice as much.

The average production of 26 cows for 7 months was 5,412 lb. milk, 3.3 test, 181.7 lb. fat. Another 6-year-old cow in another herd was again responsible for the lowest yield, 3,900 lb. milk, 3.3 test, 130.3 lb. fat. During the same 7 months an 8-year-old gave the highest yield, 8,141 lb. milk, 3.4 test, 273.3 lb. fat, which was again double the yield of the poorest cow.

The average production of 33 cows for 8 months was 5,715 lb. milk, 3.3 test, 190.1 lb. fat. When during that time one cow gave 294.8 lb. fat, and another cow only 131.4 lb. fat, the advantages of keeping records is immediately apparent.

COMPARISONS FOR 8 MONTHS, 1907.

| Herd No. | Herd Average. | | | | Highest Individual Yield. | | | | Lowest Individual Yield. | | | |
|----------|---------------|-------|-------|-------|---------------------------|-------|-------|-------|--------------------------|-------|-------|-------|
| | No. of Cows. | Milk. | Test. | Fat. | Age. | Milk. | Test. | Fat. | Age. | Milk. | Test. | Fat. |
| | | Lbs. | | Lbs. | | Lbs. | | Lbs. | | Lbs. | | Lbs. |
| A | 10 | 4,311 | 3.3 | 146.2 | 8 | 5,210 | 3.4 | 179.0 | 4 | 3,620 | 3.6 | 131.4 |
| B | 9 | 5,577 | 3.4 | 193.0 | 4 | 5,880 | 3.8 | 223.8 | 6 | 5,305 | 3.3 | 176.5 |
| C | 6 | 7,680 | 3.2 | 248.9 | 10 | 8,145 | 3.6 | 294.8 | 7 | 8,607 | 3.0 | 261.5 |

SESSIONAL PAPER No. 15a

The 19 cows recorded for 9 months averaged 7,301 lb. milk, 3.4 test, 248 lb. fat. The herd and individual records are so dissimilar that a perusal of the details below is suggestive in the extreme.

COMPARISONS FOR 9 MONTHS, 1907.

| Herd No. | Herd Average. | | | | Highest Individual Yield. | | | | Lowest Individual Yield. | | | |
|----------|---------------|-------|-------|-------|---------------------------|--------|-------|-------|--------------------------|-------|-------|-------|
| | No. of Cows. | Milk. | Test. | Fat. | Age. | Milk. | Test. | Fat. | Age. | Milk. | Test. | Fat. |
| | | Lbs. | | Lbs. | | Lbs. | | Lbs. | | Lbs. | | Lbs. |
| A | 11 | 6,814 | 4.0 | 242.6 | 5 | 11,535 | 3.2 | 364.3 | 5 | 4,260 | 3.8 | 162.1 |
| B | 6 | 8,423 | 3.1 | 266.5 | 3 | 9,769 | 3.7 | 357.8 | 8 | 6,649 | 3.0 | 202.8 |

The average production of 4 cows for 10 months was 8,302 lb. milk, 3.2 test, 2,653 lb. fat.

NEW GLASGOW, PRINCE EDWARD ISLAND, ASSOCIATION.

Forty-seven cows recorded for 6 months gave an average yield of 3,102 lb. milk, 3.8 test, 117.9 lb. fat. Four cows comprising one dairy gave only 2,800 lb. milk, 3.7 test, 103.9 lb. fat; but the average of another dairy herd of 7 cows was 3,348 lb. milk, 4.1 test, 139.0 lb. fat. One 5-year-old cow gave only 2,575 lb. milk, 3.4 test, 88.3 lb. fat; but an 8-year-old gave 3,860 lb. milk, 3.8 test, 148.6 lb. fat, thus earning at least \$15 more in the 6 months.

The average production of 32 cows for 7 months was 3,546 lb. milk, 3.5 test, 124.1 lb. fat. The lowest yield of milk from any one cow was 3,119 lb. testing 3.7, and the highest was 4,843 lb. testing 3.2 per cent fat.

Thirteen cows averaged for 8 months 4,182 lb. milk, 3.6 test, 148.3 lb. fat.

COWICHAN, B.C., ASSOCIATION.

Forty-eight cows in 14 herds recorded for 6 months gave an average yield of 3,191 lb. milk, 4.2 test, 132.8 lb. fat.

Twenty-two cows in 7 herds recorded for 7 months gave an average yield of 3,240 lb. milk, 4.1 test, 133.6 lb. fat.

EDEN BANK, B.C., ASSOCIATION.

Sixty-seven cows were recorded for 6 months, with an average production of 3,751 lb. milk, 4.1 test, 153.0 lb. fat.

The poorest herd had an average yield of 110.7 lb. fat, and the best herd gave 210.8 lb. fat. In the one case 5 cows gave a total yield of 553.7 lb. fat, while in the other case 6 cows gave a total yield of 1,264.9 lb. fat.

The extremes of milk yield in the 6 months were 2,165 lb. from the poorest, and 6,020 lb. from the best cow; 33 cows out of the total of 67 gave less than 3,700 lb.

In 13 herds 81 cows were recorded for 7 months, the average production per cow being 4,522 lb. milk, 4.0 test, 183.3 lb. fat. The lowest average herd yield was from a lot of 3 cows giving only 3,423 lb. milk, 4.0 test, 137.3 lb. fat. Three herds are worthy of special note; one of 28 cows averaged 4,550 lb. milk, 4.2 test, 192 lb. fat, this included the yields of 5 2-year-olds and 5 3-year-olds; another herd of 10 cows averaged 5,588 lb. milk, 3.8 test, 214 lb. fat, and one herd of 5 cows averaged 5,934 lb. milk, 3.9 test, 228.0 lb. fat.

8-9 EDWARD VII., A. 1909

It will be observed that the poorest herd is 1,099 lb. milk and 46.0 lb. fat below the average yield, while the best herd is actually 2,511 lb. milk and 90.7 lb. fat above.

The lowest individual yield in all herds was on the average 1,856 lb. milk and 75.4 lb. fat less than the highest during the 7 months. Make a liberal deduction of one-third from this difference, and the fact appears that scores of cows in this association should have brought in about \$15 apiece more than they did in 7 months.

CHILLIWACK, B.C., ASSOCIATION.

Thirty-three cows were tested for 6 months with an average record of 3,630 lb. milk, 3.8 test, 139.0 lb. fat.

Valuing fat at 25 cents per lb., the poorest individual yield in one herd was \$11.38 below the best individual yield.

Eighteen cows were tested for 7 months, and averaged 4,540 lb. milk, 3.3 test, 152.9 lb. fat.

The highest yield was 6,364 lb. milk, 4.2 test, 266.8 lb. fat, but the lowest was less than half that, or only 3,105 lb. milk, 3.6 test, 113.7 lb. fat from a 7-year-old cow that calved April 11.

This system of weighing and sampling certainly does reveal some unprofitable servants.

ASSOCIATIONS IN QUEBEC.

AVERAGE YIELD OF 652 COWS TESTED FOR 6 MONTHS, 1907, IN QUEBEC.

| Lotbiniere..... | 34 | 3,837 | 4.1 | 156.7 |
| St. Prosper..... | 58 | 4,211 | 4.0 | 170.0 |

Average yield of all the 652 cows, 3,266 lb. milk, 4.0 test, 130.3 lb. fat.

Probably the low average yields in one or two districts can be accounted for by the fact that the owners were not working the farms, but had them rented out. Hence there was not much incentive to the tenants to test, or, should we not rather say, the tenants did not seem to realize the need or importance of looking for better returns per cow.

When such a startling difference is noticed as is found between the average yields at St. Armand and St. Prosper, equal to 1,616 lb. milk and 66.2 lb. fat per cow in 6 months, it is surely time to see if many cows cannot be made to earn at least \$16 more.

SESSIONAL PAPER No. 15a

It will be observed how many districts fall below the average yield of milk and fat; while on the other hand the 58 cows at St. Prosper were as much as 900 lb. milk and 38.8 lb. fat above the average.

AVERAGE YIELD OF 473 COWS TESTED FOR 7 MONTHS, 1907, IN QUEBEC.

|----------------------|-----------------------|----------------|-------|-------|
| | | Milk. | Test. | Fat. |
| | | Lbs. | | Lbs. |
| St. Edwidge..... | 20 | 4,496 | 3.9 | 176.4 |
| St. Armand..... | 113 | 4,375 | 4.1 | 180.4 |
| Cowansville..... | 34 | 5,620 | 4.7 | 264.0 |

Average yield of all the 167 cows, 4,631 lb. milk, 4.2 test, 197 lb. fat.

This average yield for a full period of 12 months must be understood as including one or two particularly good herds in the respective districts, and is not necessarily indicative of the general average yield in the province.

Further, the figures for the 34 cows in three herds at Cowansville are pregnant with suggestion, because one poor herd is included with a particularly low average from 7 common grade cows of 2,780 lb. milk, 4.0 test, 111 lb. fat. This indicates again how misleading 'averages' may be. These seven cows are credited in the 'average' of the 167 with almost double their actual yield.

The second herd in the Cowansville group is one of 6 pure-bred Guernseys and one grade Shorthorn with an average of 5,680 lb. milk, 256.8 lb. fat and 4.5 test, which is more than double that of the herd preceding.

The third herd is a lot of 20 high grade Jerseys that produced on the average 6,593 lb. milk, 4.8 test, 319.8 lb. fat. The owner of this herd estimates the average cost of feed at \$45 per cow for the 12 months. This last highly satisfactory record is the result of some years' careful work of recording the individual yield of each cow and discarding the poorest, and may be taken as a standard attainable by any intelligent farmer in Quebec.

SESSIONAL PAPER No. 15a

The yields of 410 individual cows for periods of 8, 9, 10, 11 and 12 months in Quebec associations are classified as follows:—

| Number of Months. | TOTAL YIELD OF MILK IN POUNDS. | | | | | | | | | Total No. of Cows. | Number of Herds Represented. | Number of Associations. |
|--------------------|--------------------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|---------------------|--------------------|------------------------------|-------------------------|
| | 1,000 to 2,000 lb. | 2,000 to 3,000 lb. | 3,000 to 4,000 lb. | 4,000 to 5,000 lb. | 5,000 to 6,000 lb. | 6,000 to 7,000 lb. | 7,000 to 8,000 lb. | 8,000 to 9,000 lb. | 9,000 to 10,000 lb. | | | |
| | No. of Cows. | No. of Cows. | No. of Cows. | No. of Cows. | No. of Cows. | No. of Cows. | No. of Cows. | No. of Cows. | No. of Cows. | | | |
| 8..... | 2 | 16 | 59 | 48 | 32 | 9 | | | | 166 | 23 | 5 |
| 9..... | 3 | 8 | 23 | 12 | 3 | | | | | 49 | 12 | 4 |
| 10..... | | | 1 | 3 | 4 | 6 | 4 | | | 18 | 6 | 2 |
| 11..... | 2 | 1 | 2 | 3 | 1 | | | 1 | | 10 | 3 | 2 |
| 12..... | 4 | 19 | 30 | 48 | 38 | 16 | 7 | 2 | 3 | 167 | 11 | 3 |
| Total No. of cows. | 11 | 44 | 115 | 114 | 78 | 31 | 11 | 2 | 4 | 410 | | |

Thus, out of 410 cows, 114 of them, or 28 per cent, gave yields of milk varying between 4,000 and 5,000 lb. each for the full lactation period. Of these 114, 48 of them were milking for 8 months, 12 for 9 months, 3 for 10 months, 3 for 11 months and 48 for 12 months.

Mr. I. Trudel, who was doing the testing at five centres in Quebec, reports:—

‘In general, there is not as much interest in dairying as some years ago, in the territory I have been travelling in. This is due to the changed conditions by which feed has doubled in price, while labour is also higher, and cows have remained about the same with regard to their capacity as producers. Farmers are inclined to pronounce dairying unprofitable, because it is not comparatively as remunerative as formerly; while it is only their imperfect methods of breeding and feeding that are responsible for this, no improvement having taken place in the quality of the stock or in the production of feed. The same old system of keeping cows on pasture, hay, straw and grain seems to exist generally with but little progress in raising soiling crops and roots. There is no silo in any of the localities where I have been working this summer. There is a tendency to neglect the cows for other lines of farming such as producing hay and grain for the market; or to devote time to lumbering and other commercial operations.

‘St. Prosper, St. Mare, and Lotbinière, where the soil is of the very best quality, are producing large quantities of hay, while the chief products at Champlain are oats and potatoes. The conditions at Ste. Emelie are different, the land being poorer and farms in general smaller; and I have found the people there are more easy to interest in dairy matters, as they have to depend a good deal more on their cows for a large proportion of their income.

‘I do not think it is an exaggeration to say that in too many parts of Quebec, dairying has only been regarded until now as the most profitable way of disposing of a waste product, milk; keeping cows being considered essential to maintaining the fertility of the soil. The proportion of farmers who have specialized in dairying, making it a business by which they make their farms earn them more profit, is still small. But with the high prices now ruling for all farm products, the cost of keeping cows is forced on the attention of farmers, and our campaign for the improvement of dairy herds is most opportune.

8-9 EDWARD VII., A. 1909

'Unfortunately, farmers are very ignorant on matters concerning breeding and feeding of dairy cattle, and in most cases are sceptical as to the possibility for them coming to own herds of high producing cows, such as are sometimes pointed out to them; or of producing with advantage the crops recommended by the best authorities as good feed for dairy cows. Information on these subjects is very slowly diffused among the farmers in Quebec, as we have no dairy papers in French, and the large daily newspapers do not devote much space to agricultural matters.'

ST. PROSPER, QUE., ASSOCIATION.

The average production of 58 cows for 6 months was 4,211 lb. milk, 4.0 test, 170.0 lb. fat. The poorest yield was 2,910 lb. milk, 3.7 test, 107.8 lb. fat from an 8-year-old cow; but the best yield was 6,775 lb. milk, 4.0 test, 272.0 lb. fat, also from an eight-year-old. There should not be much doubt as to which is the more profitable cow.

The average production of 16 cows for 7 months was 5,548 lb. milk, 3.9 test, 214.0 lb. fat.

ST. MARC, QUE., ASSOCIATION.

The average production of 63 cows for 6 months was 3,324 lb. milk, 3.9 test, 130.0 lb. fat.

Taking the best cow's yield in each of the eight herds represented, it is found that each gave nearly 700 lb. milk and 38 lb. fat above this general average; and when it is pointed out that the best yield of one cow was 1,676 lb. milk and 87 lb. fat above the average yield, and actually 2,750 lb. milk and 138.8 lb. fat above the poorest yield of 2,250 lb. milk, 3.4 test, 78.2 lb. fat given by an 8-year-old, then the immense possibilities involved in selection should begin to dawn on all concerned.

The average production of 18 cows for 7 months was 4,634 lb. milk, 3.9 test, 182.0 lb. fat. In one herd of six cows the best cow gave 1,529 lb. milk and 58.9 lb. fat more than the 5-year-old poorest cow in that same herd during the 7 months.

At St. Marc is one of the oldest factories in Quebec, having been established nearly thirty years ago, but it was receiving at one time nearly double the quantity of milk that is being sent at present. The soil is of the very best quality; and the chief crops raised at St. Marc, as well as in the whole county of Verchères, are hay and oats, hundreds of tons of hay being exported every year to the United States. However, all the farmers are keeping a certain number of cows; but with very few exceptions, they do not pay any particular attention to their dairies, being satisfied to get what they can out of the cows while at pasture, and feeding in the winter on straw and the poorer quality of hay that has not been exported.

Some farmers who used to grow corn and roots some years ago say they have given it up on account of the difficulty in getting help, and others expressed the opinion that it did not pay to try to produce milk in the winter.

The comparative yields of two herds in this association are full of interest. In the first herd 15 cows for the 6 months, June to November, gave an actual yield of 36,555 lb. milk, 1,450 lb. fat. The second herd consisted of only 8 cows, but gave almost as much, namely 35,966 lb. milk, 1,400 lb. fat. Both herds are managed by the same man, but are rented from two different owners. In the first case the owner limited the farmer to pasture for summer, and straw and poor hay for winter; in the second case the owner supplied everything necessary for fairly good feeding. The first herd wintered poorly and was in bad condition in spring. The second herd was wintered on hay, straw and oats cut green, with a ration of bran and other meal. In summer, besides pasture, they got soiling crops, and in the fall they had roots. This is one definite illustration of the necessity of abundant and suitable feed if cows are supposed to yield milk. Eight cows, fed, did the work of 15 that were just kept alive.

SESSIONAL PAPER No. 15a

LOTEINIÈRE, QUE., ASSOCIATION.

COMPARISON FOR 6 MONTHS, 1907.

| Average Production of Herds. | | | | | Yield of Best Cow in each Herd. | | | | Yield of Poorest Cow in each Herd. | | | |

Average of 34 cows for 6 months, 3,837 lb. milk, 4.1 test, 156.7 lb. fat.

During the 6 months that these 34 cows were recorded, the best cow in herd 'E' gave 1,018 lb. milk and 62.3 lb. fat above the average yield of the 34 cows; but during the same period the poorest cow in herd 'B,' a 6-year-old, gave 963 lb. milk and 41.4 lb. fat below the average of all the 34 cows, while actually falling 2,133 lb. milk and 85.5 lb. fat below the record of the best cow in the same herd with her. Most emphatically let it be repeated, there is urgent need of a careful study of each animal in the herd so that all, every single one, may be brought up to a reasonable standard of production.

COMPARISONS FOR 7 MONTHS, 1907.

8-9 EDWARD VII., A. 1909

The average production of 14 cows for 6 months was 3,088 lb. milk, 3·8 test, 117·7 lb. fat.

The average production of 2 cows for 7 months was 3,272 lb. milk, 4·1 test, 135·7 lb. fat.

HENRYVILLE, QUE., ASSOCIATION.

The average production of the 101 cows tested for 6 months was 3,278 lb. milk, 3·7 test, 123 lb. fat.

The poorest yield was 2,210 lb. milk, 3·5 test, 77·9 lb. fat from a 9-year-old cow, while the best yield was 5,015 lb. milk, 3·4 test, 171·8 lb. fat from a 4-year-old.

The average production of 23 cows for 7 months was 3,740 lb. milk, 3·8 test, 143·5 lb. fat.

ORMSTOWN, QUE., ASSOCIATION.

Thirty-five cows were recorded for 6 months, the average yield being 3,953 lb. milk, 3·7 test, 147 lb. fat.

The production of the best cows in five different herds for six months is given below in tabular form, showing a difference in earning power in six months of \$16·89, between the best cow in herd A and the best cow in herd E.

TOTAL PRODUCTION, 6 MONTHS, OF THE BEST INDIVIDUAL COWS IN FIVE DIFFERENT HERDS.

| Herd | Breed of Cow. | Date of Calving. | Age. | Milk. | Test. | Fat. | Value of Fat at 25c. per pound. |
|------|---------------------|------------------|------|-------|-------|-------|---------------------------------|
| | | | | Lbs. | | Lbs. | \$ cts. |
| A | Grade Ayrshire..... | April 14.. | 8 | 3,685 | 3·6 | 132·3 | 33 07 |
| B | "..... | May 5.. | 9 | 4,655 | 3·8 | 175·4 | 43 85 |
| C | Grade Holstein..... | 3.. | 9 | 5,100 | 3·6 | 183·0 | 45 75 |
| D | Grade Ayrshire..... | April 15.. | 9 | 4,945 | 3·9 | 191·5 | 47 87 |
| E | Grade..... | May 3.. | 9 | 5,384 | 3·7 | 199·8 | 49 96 |

The *best herd* record for 6 months is that of a herd of 6 cows giving an average yield of 3,934 lb. milk, 4·1 test, 160·6 lb. fat.

In that herd the highest yield was 5,384 lb. milk, 3·7 test, 199·8 lb. fat, from a 9-year-old calved May 3, and the lowest yield was 4,087 lb. milk, 4·2 test, 173·0 lb. fat from an eight-year-old calved May 9.

The *poorest herd* record for 6 months is that of a herd of 5 cows with an average yield of 3,202 lb. milk, 3·6 test, 114 lb. fat. In this herd the highest yield was 3,685 lb. milk, 3·6 test, 132·0 lb. fat from an 8-year-old, calved April 14, and the lowest yield was 2,585 lb. milk, 3·5 test, 91·5 lb. fat, from a 5-year-old calved May 12.

These contrasts between the averages of the best and poorest herds, including as they do the highest and lowest yields of any cow in the association, tested for six months, are rendered all the more striking when it is noted that no farrow cows are included, nor any cow under 5 years old. Reduced to a cash basis, it means that **one** cow in six months brings in over *twenty-seven dollars more* than another. There is certainly an opportunity for selection.

The average yield of 6 cows for 7 months was 6,085 lb. milk, 3·3 test 199·0 lb. fat.

BAGOTVILLE (ST. ALPHONSE), QUE., ASSOCIATION.

The average production of 9 cows for 6 months was 3,738 lb. milk, 4·1 test, 152·7 lb. fat.

SESSIONAL PAPER No. 15a

The average production of 81 cows for 7 months was 4,096 lb. milk, 4.2 test, 164.7 lb. fat.

The lowest yield of any one cow was 2,800 lb. milk, 3.6 test, 100 lb. fat; but the highest yield was 5,320 lb. milk, 4.4 test, 232.9 lb. fat. Why keep two cows to do the work of one?

ST. PRIME, QUE., ASSOCIATION.

The average production of 20 cows for 6 months was 3,119 lb. milk, 4.2 test, 132.8 lb. fat.

ST. JEROME, QUE., ASSOCIATION.

Fifteen cows averaged for 6 months, 2,858 lb. milk, 4.2 test, 119.7 lb. fat.

Twenty-four cows in 7 months averaged 3,177 lb. milk, 3.9 test, 123.4 lb. fat. In one herd a cow with 4,650 lb. milk produced 19 lb. fat less than another cow with 3,550 lb. milk.

ST. DOMINIQUE (JONQUIÈRES), QUE., ASSOCIATION.

Fifty-two cows averaged for 6 months 2,716 lb. milk, 4.6 test, 116.6 lb. fat.

If these 52 cows had averaged as well as the 20 recorded in the St. Prime association they would have given 30,940 lb. milk more than they actually did in the six months.

Thirty cows averaged in 7 months 3,090 lb. milk, 4.2 test, 129.1 lb. fat.

If these 30 cows had yielded as much milk and butter fat on the average as did the 81 cows recorded in the Bagotville association they would have given 30,180 lb. milk and 1,068.0 lb. fat more than they actually did yield in seven months.

One herd is lagging a long way behind, as the 13 cows had an average yield of 2,585 lb. milk, 4.1 test, 107.0 lb. fat. A herd of 11 cows in the same neighbourhood gave, on the average, 3,589 lb. milk, 4.2 test, 150.1 lb. fat, or over 1,000 lb. milk more in the 7 months. One cow out of the 11 gave 5,295 lb. milk, 4.3 test, 231.9 lb. fat.

CHICOUTIMI, QUE., ASSOCIATION.

The average production of 9 cows for 6 months was 3,153 lb. milk, 4.1 test, 131.1 lb. fat.

Thirty cows tested 7 months averaged 3,512 lb. milk, 4.1 test, 144.2 lb. fat.

The average production of 52 cows for 8 months was 3,900 lb. milk, 4.0 test, 158.8 lb. fat.

Herd 'D' has the commendable average from 23 cows of 4,662 lb. milk, 4.1 test, 194.0 lb. fat, though only slightly better than the 3 best herds in the Bagotville association recorded for only 7 months instead of 8.

The 4 remaining associations of this group in the district of Chicoutimi and Lake St. John, namely Normandin, St. Felicien, St. Charles (La Décharge) and St. Ambroise (Rivière à l'Ours), had no records for a long enough period from which to make deductions.

| E..... | 4 | 3,245 | 4.4 | 143.2 | 10 | 4,065 | 4.3 | 177.8 | 10 | 3,229 | 4.2 | 136.9 |

8-9 EDWARD VII., A. 1909

The average production of 25 cows for 6 months was 3,216 lb. milk, 128.2 lb. fat; average test 4.0 per cent fat.

Three out of the 5 herds compared did not measure up to the average yield of the 25 cows. As is frequently the case, the general average is greatly helped by one or two good cows. Hence, note the good yield of the 10-year-old cow in herd 'E,' 975 lb. milk and 54.6 lb. fat above the average.

This table indicates the difference in production among herds in the same locality. The average of herd 'E' was 35.6 lb. of fat better than that of herd 'A.' The more important difference to note is that in herd 'A' the poorest cow, 5 years old, not a heifer or a farrow cow, gave 55.6 lb. of fat less than the best cow in that herd during 6 months. This shows the need of studying each individual in the herd to make sure of profit from each.

COATICOOK, QUE., ASSOCIATION.

COMPARISONS FOR 7 MONTHS, 1907.

| Average production of Herds. | | | | | Yield of Best Cow in each Herd. | | | | Yield of Poorest Cow in each Herd. | | | |
|------------------------------|-------------------------|-------|-------|-------|---------------------------------|-------|-------|-------|------------------------------------|-------|-------|-------|
| Herd. | Number of Cows in Herd. | Milk. | Test. | Fat. | Age. | Milk. | Test. | Fat. | Age. | Milk. | Test. | Fat. |
| | | Lbs. | | Lbs. | | Lbs. | | Lbs. | | Lbs. | | Lbs. |
| A..... | 9 | 3,385 | 3.6 | 123.5 | 7 | 4,305 | 4.3 | 161.2 | 9 | 2,155 | 4.2 | 90.5 |
| B..... | 12 | 3,924 | 4.1 | 161.7 | 5 | 4,600 | 5.1 | 235.2 | 7 | 3,155 | 3.7 | 117.6 |
| C..... | 8 | 4,147 | 4.1 | 176.8 | 10 | 4,682 | 4.2 | 196.4 | 10 | 3,860 | 4.1 | 159.6 |

The average yield of 29 cows for 7 months was 3,984 lb. milk, 159.3 lb. fat; average test 4.0 per cent fat.

The best cow in herd 'B' gave 800 lb. milk and 81.2 lb. fat more than the average yield of all the 29 cows compared, and out-distanced the 9-year-old cow in herd 'A' by 2,445 lb. milk and 144.7 lb. fat in the 7 months' race.

Such differences should make every dairy farmer inquire into the capacity of every single cow he owns. With milk at \$1 per 100 lb. during 1907, the one cow earned \$24.45 more than the other, during just 7 months.

STE. EMELIE, QUE., ASSOCIATION.

The average yield of 74 cows for 6 months was 2,985 lb. milk, 4.2 test, 125.5 lb. fat.

Seven cows in one herd averaged only 2,537 lb. milk, 3.9 test, 100.0 lb. fat. In that herd the poorest yield was 2,410 lb. milk, 3.9 test, 94.0 lb. fat from a 5-year-old.

SESSIONAL PAPER No. 15a

The average production of 20 cows for 7 months was 3,073 lb. milk, 4.2 test, 130.7 lb. fat.

In the foregoing table the yield of young stock, 2 and 3-year-olds, has not been given as the 'yield of the poorest cow in each herd,' their low records pull down the average production; but leaving them out, the record of the mature cow with low production is rendered the more unenviable.

MANSONVILLE, QUE., ASSOCIATION.

Out of 110 cows recorded by the members of this association 17 ran for 7 months, 6 for 6 months, 17 for 5 months, and the remainder for less than 5 months.

It would almost appear from this that the real advantages and objects of weighing and sampling are not appreciated. A spasmodic rush to the spring balance will not reveal a cow's capacity of production. The total yield during the full period of lactation must be known before any man can gauge the possibilities of the individual cow. Similar testing associations, wherever inaugurated, invariably have shown that the best records, whether of herds or individuals, are found where there is persistent, not abortive, effort.

Six cows tested for 6 months averaged 3,375 lb. milk, 4.2 test, 142.4 lb. fat.

Sixteen cows in two herds tested for 7 months averaged 4,281 lb. milk, 4.1 test, 176.9 lb. fat.

The average value of production of 9 cows in one herd was \$44.50, while the other 8 cows gave \$43.25. Is this a pretty even lot? No, for on taking the 9 cows, it is found that the best record was from a 3-year-old that gave 4,850 lb. milk, 4.4 test, 213.9 lb. fat, value \$53.47; while the poorest record in that herd was from another 3-year-old that gave 3,320 lb. milk, 4.7 test, 154.9 lb. fat, value \$38.72. That is to say, far from being an even lot, there was a difference between these two cows in the same herd, of 1,530 lb. milk, 59 lb. fat, value \$14.75. When one cow is found to be earning \$2.10 every month more than another, it is evidently to the interest of every dairy farmer to determine for himself which are the profitable cows, and which are not.

DIXVILLE, QUE., ASSOCIATION.

The average yield of 47 cows for 7 months was 3,291 lb. milk and 130.7 lb. fat, average test, 4.0 per cent fat.

The 5-year-old cow in herd 'A' gave 3,340 lb. milk and 117.6 lb. fat less than the 8-year-old cow in herd 'F'; and all the 15 cows in herd 'A' averaged 1,628 lb. milk and 76.8 lb. fat less than the average of herd 'F.' Had they averaged as well, the owner of herd 'A,' with milk at \$1 per 100 lb. would have received in 7 months an additional income of \$244.20. Such comparisons should sound the death knell of many poor individual cows, and ring in the day of systematic improvement.

COMPARISONS FOR 8 MONTHS, 1907.

8-9 EDWARD VII., A. 1909

COMPARISONS FOR 9 MONTHS, 1907.—AVERAGE PRODUCTION OF HERDS.

| Herd. | No. of Cows in Herd | Milk. | Average Test. | Fat. |
|--------|------------------------|-------|------------------|-------|
| | | Lbs. | | Lbs. |
| 1..... | 4 | 3,822 | 3·8 | 146·8 |
| 2..... | 4 | 4,251 | 4·1 | 176·4 |
| 3..... | 4 | 4,438 | 4·1 | 182·9 |

The average yield of 13 cows for 9 months was 4,186 lb. milk, 4·0 test, 167·4 lb. fat.

ST. ARMAND, QUE., ASSOCIATION.

Six herds, 113 cows, were tested for 12 months in this association.

During this period, 6 of these cows were dry for 5 months, 20 for 4 months, 35 for 3 months, 36 for 2 months, 8 for 1 month and 8 cows were milked during the whole 12 months. Manifestly the milking period is far too short in very many instances.

The average production of these 113 cows for the whole 12 months was 4,375 lb. milk, 4·1 test, 180·4 lb. fat. The best individual yield was 9,265 lb. milk, 3·9 test, 367·2 lb. fat; and the lowest yield was 2,905 lb. milk, 4·3 test, 124·4 lb. fat.

AVERAGE PRODUCTION OF SIX HERDS FOR TWELVE MONTHS.

| Herd. | Number of Cows. | Total Milk. | Average Test. | Total Fat. | Value of Production at 25c. per pound of Fat. |
|--------|--------------------|----------------|------------------|---------------|---|
| | | Lbs. | | Lbs. | \$ cts. |
| A..... | 22 | 3,429 | 4·7 | 161·4 | 40 35 |
| B..... | 27 | 3,754 | 4·2 | 168·8 | 42 20 |
| C..... | 20 | 4,382 | 3·9 | 171·6 | 42 90 |
| D..... | 7 | 4,687 | 4·0 | 186·5 | 46 62 |
| E..... | 22 | 5,136 | 3·7 | 190·3 | 47 57 |
| F..... | 15 | 5,614 | 4·0 | 223·4 | 53 85 |

This indicates a difference in the average production of \$15.50 per cow between the best and poorest herds. Thus, if the 22 cows in herd 'A' were as good as the average of herd 'F' they would have earned \$341 more.

PRODUCTION OF THE BEST COW IN EACH OF THESE SIX HERDS.

| Herd. | Milk. | Average Test. | Fat. | Value at 25c. per lb. of Fat. | Age. | Breed. |
|--------|-------|------------------|-------|-------------------------------------|------|-----------------|
| | Lbs. | | Lbs. | \$ cts. | | |
| F..... | 9,265 | 3·9 | 367·2 | 91 80 | 8 | Ayrshire. |
| E..... | 6,645 | 4·4 | 297·2 | 74 30 | 12 | Grade. |
| B..... | 6,165 | 4·1 | 254·8 | 63 70 | 8 | Guernsey. |
| C..... | 5,430 | 4·3 | 234·9 | 58 72 | 5 | Grade Ayrshire. |
| A..... | 4,810 | 4·8 | 234·7 | 58 67 | 7 | Grade Jersey. |
| D..... | 5,729 | 4·0 | 233·0 | 58 25 | 7 | Grade Ayrshire |

SESSIONAL PAPER No. 15a

Whereas in herd 'F' the 8-year-old produced \$91.80 worth of butter fat, in herd 'D' the 7-year-old, again the best cow in that herd be it noted, produced \$33.55 worth of butter fat less, or only \$58.25 worth.

PRODUCTION OF THE POOREST COW IN EACH OF THE SAME SIX HERDS.

| Herd. | Milk. | Average Test. | Fat. | Value at 25c. per lb. of Fat. | Age. | Breed. |
|--------|-------|---------------|-------|-------------------------------|------|-----------------|
| | Lbs. | | Lbs. | \$ cts. | | |
| F..... | 6,232 | 3.3 | 205.9 | 51 42 | 6 | Ayrshire. |
| D..... | 4,431 | 4.0 | 179.3 | 44 82 | 5 | Grade. |
| C..... | 3,837 | 4.0 | 153.8 | 38 45 | 8 | Grade Ayrshire. |
| E..... | 3,680 | 3.5 | 128.8 | 32 20 | 8 | Grade. |
| B..... | 3,535 | 3.6 | 128.3 | 32 07 | 14 | Grade Guernsey. |
| A..... | 2,905 | 4.3 | 124.4 | 31 10 | 5 | Grade. |

There is a difference of \$20.37 between the value of the yields of the poorest cow in herd 'F' and the poorest cow in herd 'A.'

In these six herds the average difference in the value of production between the best and poorest cow in the same herd is \$29.20. There is evidently much yet to be done in getting every cow up to a profitable level, even in these good herds.

NOTE.—None but the yields of cows 5 years old, or over, were taken in making the above comparisons.

Some striking instances of the necessity of testing in order to determine the value of a cow as a butter producer, appear in the records of some herds in this association.

| Herd No. 8. | Milk. | Average Test. | Fat. |
|-------------|-------|---------------|------|
| | Lbs. | | Lbs. |
| Cow A..... | 4,175 | 5.4 | 227 |
| Cow B..... | 4,370 | 3.7 | 164 |

Thus cow 'B' gave 195 lb. milk more than cow 'A,' but produced 63 lb. fat less.

| Herd No. 10. | Milk. | Average Test. | Fat. |
|--------------|-------|---------------|-------|
| | Lbs. | | Lbs. |
| Cow A..... | 6,435 | 3.5 | 225.7 |
| Cow B..... | 5,302 | 4.1 | 221.2 |
| Cow C..... | 4,370 | 4.6 | 200.2 |
| Cow D..... | 5,830 | 3.6 | 208.7 |

Cow 'A' gave 1,132 lb. more milk but only 4.5 lb. more fat than cow 'B.'
Cow 'D' produced 1,460 lb. more milk, but only 8.5 lb. more fat than cow 'C.'

| Herd No. 15. | Milk. | Average Test. | Fat. |
|--------------|-------|------------------|-------|
| | Lbs. | | Lbs. |
| Cow A..... | 6,230 | 3.3 | 206.0 |
| Cow B..... | 5,200 | 4.2 | 220.0 |

In this herd cow 'B,' with 1,030 lb. milk less than cow 'A' produced 14 lb. fat more.

In going over the records of each herd, the usefulness of keeping records as a guide in making intelligent selection, as well as breeding after correct principles, is abundantly demonstrated.

Herd No. 1 averaged 3,427 lb. milk and 161.4 lb. fat. Out of the 22 cows that compose this herd, ten were below the average of 161 lb. fat, eight of them only yielded an average of 2,510 lb. milk and 118.9 lb. fat; there were only two three-year-old heifers among these eight cows, the balance being from 5 to 12 years old. The difference between the best and poorest cow in this herd was 1,905 lb. milk and 110.3 lb. fat, value \$27.27.

In herd No. 8 the average production was 3,754 lb. milk, 168.8 lb. fat. The difference between the best and poorest cow was 2,630 lb. milk and 126.5 lb. fat; age of poorest cow, 14 years. Out of the 27 cows, 14 were below the average for the herd; only five were heifers, two or three years old; the balance were all mature cows. The best cow was milked ten months, and the poorest only eight months during the year.

In herd No. 10 the difference between the best and poorest cow was 2,765 lb. milk and 168.4 lb. fat, valued at \$42.10.

In herd No. 15, six of the 15 cows which compose this herd were two and three-year-old heifers. The average production for the whole herd was 223.4 lb. fat, and the average for just the six heifers reached the respectable figure of 184.6 lb. fat each.

One illustration of 'weeding out.' In one herd of 22 cows in this association the total value of production at an average of 3,429 lb. milk and 161.4 lb fat per cow, stood at \$888.08. Allowing \$35 as the average cost of feed, the profit was \$118.08. Suppose now, that the poorest eight cows, that averaged only 2,510 lb. milk, 118.9 lb. fat, had been disposed of, leaving only fourteen in the herd, the proposition would have thus resolved itself:—

| | |
|------------------------------------|----------|
| The same herd, less 8 cull cows— | |
| Total value of production..... | \$619 50 |
| Cost of feed, 14 cows at \$35..... | 490 00 |
| Profit..... | \$129 50 |

This means that all the labour attendant on the care of 8 cows for one year could have been saved, that \$280 worth of feed would have been on hand and that the profit even then would have been eleven dollars more. In these days of scarcity of efficient help on the farm this should appeal to every owner of a herd. In this particular case the 8 cows were all of mature age, and the 14 proposed to be left included 3 heifers, capable of development, but which stood below the average yield. These figures are commended to the earnest thought, and application, of all dairy farmers.

ST. EDWIDGE, QUE., ASSOCIATION.

Thirty-three cows in 7 different herds were tested for 6 months with an average yield of 3,494 lb. milk, 3.8 test, 133 lb. fat.

SESSIONAL PAPER No. 15a

Valuing fat at 25 cents per lb., the return per herd varied from \$23.38 to \$46.93. This is another illustration of two cows being kept to do the work that should be done, and is done, by one cow.

Fifty-seven cows in 11 herds were recorded for 7 months, and gave an average of 3,680 lb. milk at 3.9 test, 143.4 lb. fat.

Taking butter fat again at 25 cents per lb., 3 cows composing one herd returned \$50.70 each from 202.8 lb. fat, while 4 cows in an adjoining herd gave only \$26.53 each from 106.3 lb. fat in the same time. This was a difference of \$24.12, or \$3.44 per month. Are there not hundreds more of such herds and individual cows that should be giving over \$3 a month more?

Twenty-seven cows were tested for 8 months, the individual yields running from 2,090 lb. milk, 4.7 test, 99.4 lb. fat. up to 6,320 lb. milk, 3.7 test, 235.8 lb. fat.

Four cows tested 10 months averaged 4,889 lb. milk, 3.8 test, 187.7 lb. fat.

Twenty cows in 3 herds were tested for the entire 12 months with an average yield of 4,496 lb. milk, 3.9 test, 176.4 lb. fat. Detailed comparisons are given below.

AVERAGE PRODUCTION OF THREE HERDS, TWELVE MONTHS.

| Herd No. | Number of Cows. | Milk. | Average Test. | Fat. | Value at 25c. per lb. |
|----------|-----------------|-------|---------------|-------|-----------------------|
| | | Lbs. | | Lbs. | \$ cts. |
| 16..... | 10 | 5,058 | 3.9 | 195.6 | 48 90 |
| 18..... | 4 | 3,074 | 4.0 | 122.8 | 30 70 |
| 32..... | 6 | 4,508 | 4.0 | 180.4 | 45 10 |

PRODUCTION OF BEST COW IN EACH HERD.

| Herd No. | Age of Cow. | Milk. | Average Test. | Fat. | Value at 25c. per lb. |
|----------|-------------|-------|---------------|-------|-----------------------|
| | | Lbs. | | Lbs. | \$ cts. |
| 16..... | 3 | 6,370 | 3.7 | 240.0 | 60 00 |
| 18..... | 10 | 3,950 | 3.7 | 148.0 | 37 00 |
| 32..... | 13 | 5,605 | 4.3 | 244.5 | 61 12 |

PRODUCTION OF POOREST COW IN EACH HERD.

| Herd No. | Age of Cow. | Milk. | Average Test. | Fat. | Value at 25c. per lb. |
|----------|-------------|-------|---------------|-------|-----------------------|
| | | Lbs. | | Lbs. | \$ cts. |
| 16..... | 3 | 3,828 | 3.7 | 141.0 | 35 25 |
| 18..... | 5 | 2,294 | 4.4 | 102.5 | 25 63 |
| 32..... | 13 | 4,660 | 3.6 | 167.2 | 41 80 |

From the above tables it will be seen that the cows in herd 16 gave almost 2,000 lb. of milk per cow more for all of the 10 cows than did the 4 cows in herd 18.

In herd 32 the best cow gave 945 lb. milk and 77.3 lb. fat more than the poorest cow, or a difference in cash value of \$19.32. Both of these two cows were 13 years old. Questions of age, breed, conformation to type, may all well be sunk in the more pertinent inquiry as to actual performance. Ability to produce has to be secured.

COWANSVILLE, QUE., ASSOCIATION.

Twenty-four cows tested for 6 months averaged 2,961 lb. milk, 3.9 test, 115 lb. fat. The best cow in one herd gave 3,630 lb. milk, 4.1 test, 150.0 lb. fat, which valued

8-9 EDWARD VII., A. 1909

at 25 cents per lb. equals \$37.50. The poorest cow in the same herd, a 5-year-old, calved in April, gave only 1,850 lb. milk, 5.0 test, 92.0 lb. fat, which at the same valuation equals \$23, or \$14.50 less return than the other cow in 6 months.

Nineteen cows were tested for 7 months and averaged 3,689 lb. milk, 3.9 test, 144.8 lb. fat. Again taking fat at 25 cents per lb., the best cow in one herd earned \$15.70 more than the poorest in the 7 months.

Twenty-eight cows tested for 8 months averaged 4,591 lb. milk, 4.0 test, 185.9 lb. fat. One herd averaged 4,706 lb. milk, 4.0 test, 189.1 lb. fat. The highest yield of any one cow was 6,300 lb. milk, 3.9 test, 247 lb. fat, age 9, calved February 1st. The lowest yield was 3,530 lb. milk, 4.4 test, 154 lb. fat, age 4, calved March, or a difference of 2,770 lb. milk and 93 lb. fat in 8 months.

Fifteen cows were tested 9 months, and averaged 4,281 lb. milk, 4.3 test, 183.5 lb. fat.

The poorest herd averaged 2,782 lb. milk, 3.9 test, 109 lb. fat, while the best herd averaged 5,332 lb. milk, 4.1 test, 220.4 lb. fat. Valuing fat at 25 cents per lb., the one herd earned \$34.25 per cow, while the other herd returned \$62.75 per cow in the same period. Such differences indicate the imperative necessity of determining the production of each cow. There is no surer method than systematic weighing and testing.

Fourteen cows tested 10 months averaged 5,395 lb. milk, 4.7 test, 254.6 lb. fat. In the herd with the poorest average of 2,778 lb. milk, 4.0 test, 112.2 lb. fat, the best yield of any one cow was 3,480 lb. milk, 4.0 test, 141.3 lb. fat. A happy contrast to this, the best herd of 8 cows averaged 6,491 lb. milk, 4.8 test, 313.6 lb. fat, or practically three times as much, and the best cow in this herd gave 8,845 lb. milk, 4.8 test, 424.6 lb. fat, virtually four times as much fat as the best cow in the first mentioned herd. Is it not time, high time, for improvement?

For the full 12 months 34 cows in three herds gave an average yield of 5,620 lb. milk, 4.7 test, 264 lb. fat.

The old saying that 'extremes meet' is once more exemplified here. To illustrate: the best herd, one of 20 cows, included in this lot of 34, had an average yield of 6,593 lb. milk, 4.8 test, 319.8 lb. fat; but the neighbouring and the poorest herd, one of 7 cows, gave only 2,780 lb. milk, 4.0 test, 111 lb. fat, practically only one-third as much.

As a further contrast, the best individual record in each of the three herds should be noticed.

YIELD OF THE BEST COW IN THREE HERDS, TWELVE MONTHS.

| Herd. | Milk. | Average Test. | Fat. | Value at 25c. per lb. of Fat. |
|--------|-------|------------------|-------|-------------------------------------|
| | Lbs. | | Lbs. | \$ cts. |
| A..... | 9,545 | 4.7 | 450.8 | 112 70 |
| B..... | 7,100 | 4.3 | 303.6 | 75 90 |
| C..... | 3,480 | 4.2 | 141.3 | 35 32 |

The highly satisfactory totals credited to the best cow in herd 'A,' and to the herd of 20 cows, as noted above, are a magnificent tribute to the brains, pluck and perseverance of this herd's owner. These results illustrate in tangible form how a man is rewarded for liberal feeding, wise selection of good grades through the medium of the scales and the Babcock test, and the use of a good dairy sire.

Last year's feed averaged \$45 per cow in this herd, but the return from the best cow was \$112.70, or 60 per cent on the investment. Calculating feed at any reasonable price, what was the return on the investment in the best cow of herd 'C'?

REPORT
OF THE
DAIRY AND COLD STORAGE COMMISSIONER
FOR THE
FISCAL YEAR ENDING MARCH 31
1908

**PART II.—REPORT OF THE ASSISTANT DAIRY
COMMISSIONER.**

TABLE OF CONTENTS.

*Summary of Work—Visits and Lectures—Provincial Conventions—Fruit Tree
Survey—St. Hyacinthe Dairy School—Inspection of Factory Syndicates.*

PART II.—REPORT OF THE ASSISTANT DAIRY COMMISSIONER.

ST. DENIS (EN BAS), COUNTY OF KAMOURASKA, P.Q., March 31, 1908.

Mr. J. A. RUDDICK,
Dairy and Cold Storage Commissioner,
Ottawa.

SIR,—I beg leave to present you my eighteenth report as Assistant Dairy Commissioner, which covers a period of twelve months beginning April 1, 1907, and ending on this date.

SUMMARY OF MY WORK.

During the last twelve months I have devoted all my time to the province of Quebec, and have made, in all, 139 visits to 86 localities in 31 counties. I have delivered 237 lectures before 13,532 persons, 445 of whom were cheese or butter makers. Exclusive of the lectures delivered before the students of the provincial dairy school at St. Hyacinthe, Que., the average attendance at those lectures was 62 persons. Of the 86 localities I visited 25 for the first time in my capacity as Assistant Dairy Commissioner. In performing my work I have travelled 5,858 miles.

The following is a list of the counties and localities in which I have delivered lectures, with reference letters indicating the purpose of the meetings.

TABLE OF VISITS AND LECTURES.

PROVINCE OF QUEBEC.

| Counties. | Localities. | Visits. | Lectures. | Reference Letters. |

Reference letters indicate:—(a) Provincial conventions; (b) county and district conventions; (c) farmers' club meetings; (d) parish meetings; (e) St. Hyacinthe Dairy School; (f) English lectures; (g) visits to schools; (h) factory inspections and lectures.

The foregoing table shows that I have delivered (a) nine lectures at provincial conventions, not including the provincial courses at the St. Hyacinthe Dairy School; (b) twenty-eight at county and district conventions; (c) twenty-six at farmers' club meetings; (d) five at parish meetings; (e) twenty-two to the students at the St. Hyacinthe Dairy School; (f) seven in English; (g) two in schools of domestic science, and that I have made eighty-two factory inspections, in the course of which I have delivered 152 lectures to the factory patrons.

PROVINCIAL CONVENTIONS.

The first of the provincial conventions I attended during the last twelve months was the annual spring meeting of the Province of Quebec Syndicate Inspectors, held

SESSIONAL PAPER No. 15a

at the St. Hyacinthe Dairy School on April 24th. There were 70 inspectors present. I delivered two lectures to them, one in French and one in English, on the necessity for them to qualify as instructors as well as inspectors and to fit themselves for delivering lectures before the patrons of the factories which are under their control. Dairy farming, cattle raising, care and feeding, the care of milk, milk testing, &c., are so many subjects with which they should make themselves familiar so as to teach them to the patrons. My address on that topic included a programme of the lectures they should prepare themselves to deliver. This would enable our federal and local departments of agriculture to utilize their services as lecturers at farmers' institutes and club meetings, in winter time, when their work as inspectors is not required. A few of them are at present doing useful work in that line.

The second provincial convention I attended was the annual meeting of the Agricultural Missionaries of the Province of Quebec, held at Three Rivers on July 16 and 17, in the college buildings. I prepared and delivered at that convention a lecture on 'Theory vs. Practice in Agriculture,' of which the following is a short summary:—

Theory is the exposition of principles governing an art or a science; practice is the application of these principles to the art or science to which they pertain. According to this definition, no theory about a fact is correct that does not lead to a correct application of the principles pertaining to that fact. In agriculture it is a most important thing for the farmers to accept no theory that in its application conflicts with facts. The great variety of climate we have in the province of Quebec, in which there are three sections each differing considerably from the others in climatic conditions, implies that many good theories which can be applied in one of these sections cannot be applied successfully in the other two. One of these districts is the Lake St. John and Saguenay region; another extends from the city of Quebec along the south shore of the St. Lawrence river to the eastern extremity of the province; and the third one comprises the rest of the province, west of Quebec city.

These climatic divisions being taken into consideration, we find that as to the cultivation of the soil, the selection of plants to grow, the raising of cattle for various purposes, the practice of horticulture, &c., many theories that are excellent in their application in the western part of the province are not so when applied in the eastern and northern sections. This has been the cause of much disappointment in the past to those who, wishing to apply principles considered good in the every-day practice of the western farms, on the farms in the eastern and northern districts, have been unsuccessful. Hence has arisen a feeling of diffidence towards what is called 'book farming,' taught in the courses of the western agricultural colleges of the United States and Ontario.

If we wish to cope successfully with the false position now taken by our farmers in the province of Quebec, we must first find out and then teach them what they can do under the adverse circumstances they must encounter. Can we do that by having only one big agricultural college in the west of the province for the whole province? Assuredly not. First, their prejudice will prevent them from going there. Second, they are not at all prepared to take the courses given in such colleges. Even in the States they have found that it is absolutely necessary to have secondary agricultural schools to prepare the students to take advantage of the higher courses in agriculture.

Then, what we have to do, and that as soon as possible, is to have three of those secondary agricultural schools in the three sections of our province above mentioned. Two are already in existence, one at Oka, Two Mountains county, for the west, and another at Ste. Anne de la Pocatière, Kamouraska county, for the east. Let us have a third one at Lake St. John for the north and then we shall have a good foundation for a first-class agricultural education for all our farmer boys, who in a few years will be numerous enough to warrant the establishment of a big central college where they may go to obtain the highest class of agricultural knowledge. May our

economists take hold of this idea and bring about its solution as soon as possible, and we shall soon see the production of our land more than doubly increased.

At the same convention I took part in an important discussion on fertilizers.

The summer convention of the Quebec Pomological Society was the third provincial gathering I attended. It was held at St. Jean Port Joli and Village des Aulnaies, L'Islet county, on September 24 and 25. The semi-annual fruit exhibition of the L'Islet Horticultural Society was held on the 24th, and I was appointed a judge for that exhibition. I also delivered at the convention the following lecture on

PULP WOOD AND DEFORESTATION BELOW QUEBEC.

'We hope that, though we are the first to bring the subject of forestry before this association, we shall not incur the displeasure of any of the members. We do it because we wish to speak of a forestry question which is of the greatest importance to the section of our province in which we are holding this convention. This question is the wholesale deforestation of our district, for the production of pulp wood.

'Everybody knows how detrimental wholesale deforestation is to the distribution of water, to regular rainfall, to the normal conditions of climate and to the value of cultivated lands. By wholesale deforestation we mean completely clearing the land of all the trees that cover it. When the forest is dense it is seldom we see that complete denudation, but when it takes place it hastens the melting of the snow in the spring and brings a great quantity of water all at once into the rivers, which overflow and cause great damage in the districts through which they run. That water, which in the forest would ooze slowly through the humus and roots contained in the soil and constitute a reserve which would flow slowly down the mountain slopes all summer, is carried away in a few days instead of a few months, and the rivers are left dry during summer. Thus land and animals, as well as people, are deprived of water which they imperatively need, and the decrease in evaporation causes long periods of drought and such a change in the climate that agriculture and all concerned in it suffer greatly. Let us remember, too, that it lessens very much the value of the cultivated lands in the vicinity of the destroyed forest, which can supply no more fuel nor timber to the owners of those lands, for their use.

'Now, the conditions brought about by wholesale deforestation will before long obtain in eastern Quebec, owing to the fact that the owners of the land, after having cut many of the trees for timber, lumber and firewood, are now making a complete clearing of all the soft wood fit for pulp. Every year great numbers of trees, some as small as three inches in diameter, are cut for this purpose, and soon there will be no more wood, even for fuel, in the Alleghany district.

'We know localities on the shores of the St. Lawrence river where there is so little maple or black birch for firewood that we have to pay \$5 a cord for it, and where we shall soon have no more spruce. As things stand now, those kinds of wood cost, ready for the stove, \$5 and 3 a cord, respectively, to those who pay to have it drawn home from the forest, and there is so little of them that we may say that in some localities, in ten years from now, all that is available will have disappeared.

'Is there any way to check that systematic wholesale deforestation? This is the question we wish you to discuss with us, gentlemen. We know that our forests are one of the best of our national resources; that their exploitation is one of the great sources of revenue; that we still have very large areas of our province so completely covered with forest that with a systematic exploitation, by the parcelling-out method, we can obtain a large quantity of wood every year from them without destroying the forest itself. We know also that in those parts of our province where the forest will disappear on account of the devastation now going on so extensively, through lack of foresight on the part of its owners, we shall suffer all the disadvantages met with by those who, in older countries, have made the same mistakes.

SESSIONAL PAPER No. 15a

'Of course, we recognize that it is a very difficult question to deal with. We cannot compel land owners by law to stop making pulpwood on their own property. We understand that it is a very great temptation for a man to know he can get \$6 for a cord of spruce, and it always induces him to cut that cord of wood. What, then, can we do? But, first of all, let us try to find out if anything can be done.

'As to ourselves, we think that our society should communicate with the Canadian Forestry Association and ask it to consider thoroughly, at its next convention, the question of deforestation in the long settled sections of the Dominion and especially in our relatively old province, which was the first in Canada to be settled. After having given its attention to the question it could issue a bulletin, in French as well as English, dealing with it fully. The association would in that way try to convince the farmers that the forest is an asset entrusted to us by God, so that we may use it as a source of revenue, but that we must accumulate rather than squander, by practising economy, which is a moral duty; for, as we benefit by the savings of those who have lived before us, so those who will come after us will have the right to benefit by our own savings. The bulletin should also show the cost of the stupendous work of reforestation that other countries have been obliged to do in order to repair the great damage done by deforestation.

'Such a bulletin, distributed amongst the population, should have the same educational effect on the people as we hope will result from the dissemination of bulletins and tracts for the purpose of checking tuberculosis or intemperance.

'We hope, gentlemen, that whatever may be your opinion as to the means of checking the evil pointed out in this paper, you are unanimous in looking upon it, as we do, as one which calls for a prompt consideration of the means of remedying it. Further, we beg leave to suggest that after our discussion of this question—if there is any, as we hope there will be—our committee on resolutions should draft a summary of our suggestions, to be sent as a resolution adopted by this convention to the secretary of the Canadian Forestry Association.'

The second day of the convention was spent at Village des Aulnaies, nine miles from St. Jean Port Joli, where Mr. Albert Verreault's nursery and the residence of Mr. Auguste Dupuis, the president of the Pomological Society, whose guests we were, are situated.

The winter convention of the Pomological Society was held at Ste. Anne de Bellevue on December 18 and 19. The directors of the society were the guests of the Macdonald College, having accepted the kind invitation of Dr. James W. Robertson, principal of that institution. This was the fourth provincial convention I attended. Besides interpreting in English two French lectures written by members of the society for that convention, I delivered the following address on:

TREE SURGERY.

The paper I am going to read may seem to have a queer title. Surgery is an art which applies more to men and beasts than to trees, if we take it in the general acceptation of the word; but, as you will readily see in listening to the development of my subject, the word 'surgery' is much better than any other to qualify the kind of operations I am going to describe, for the preservation of ornamental and fruit trees.

First I must say that my paper has been written less for the benefit of owners of large orchards covering acres and acres of land, or of forest-like parks, than for those owning small orchards of one or two acres in extent, or a few ornamental trees around their house and farm buildings. The owner of a large orchard or park can without much detriment suffer the loss of a few trees through the action of heavy falls of snow, the violence of stormy winds, or the overbearing of fruit; and it would not be practicable for him to undertake the restoration of a large number of broken trees, on account of the high cost of the operation. On the contrary, a man owning a small orchard, or a village lot surrounded by ornamental trees, has great interest in keeping

all his trees in the best of condition, and cannot afford to lose a fine tree about fifteen or twenty years old, occupying a prominent place on his small holding, especially if there is any way of saving it.

I beg you to bear in mind that I am not referring at all to pruning when I speak of surgical operations to be performed on damaged trees. To nip off a new shoot, to cut out a small branch with the pruning knife, to shorten a young limb with the pruning shears, to remove a large branch with the pruning saw, all this means pruning; but to preserve two branches torn asunder by the splitting of the crutch of the tree, where they were united, to straighten bent or broken limbs, to set upright a branch growing crooked from the trunk, that is what I call tree surgery.

The tree surgeon should have a good and complete set of instruments to perform his operation, viz.: a hatchet, a hammer, a saw, a chisel, a monkey wrench, a brace with an assorted set of bits, two or three gimlets of various sizes, a piercer; then he should have in readiness a good assortment of bolts of all sizes, from 8 inches to $\frac{1}{2}$ inch, with nuts and washers, assorted wire nails from 12d to 3d, i.e., from 3 inches to 1 inch, some galvanized wire of 8, 10, 12 and 14 gauge, an assortment of hardwood splints of various sizes, strips of cotton 2 and 3 inches wide, grafting wax, &c.

There are three special classes of surgical operations to be performed on trees in order to preserve their limbs and their shape. Sometimes, as has been mentioned above, a tree is split in the first crutch, from where the larger limbs branch off. This happens most often in winter, after a heavy fall of snow, and the damage thus caused is noticed only in the spring. There are two ways of dealing with such an accident. If the tree is rather small, cut clean with the chisel all the inside splinters so as to obtain a smooth, adhering surface, taking good care not to touch the bark; tie the branches together with a rope so as to join the two split parts; drive through both a wire nail long enough to protrude; carefully clinch the point of the nail; put on a good application of grafting wax, so as to prevent the entrance of water, air and insects; wrap the united parts with strips of cotton wound round and overlapping; then take off the rope, and after two seasons of growth take away the cotton if it is still there.

With big trees, the operation is a little different. The first part is performed as described above, but, when the branches are to be tied with a rope in order to join them together, you may have to raise them by putting a piece of board under them while some one else lifts them up. Then you proceed to make a hole with the brace and bit, and instead of a nail you use a bolt and nut long enough to fit the diameter of both branches united. Always use washers with the bolts. Then you continue and finish the operation as in the first case.

Sometimes you may have to deal with what I call the second class of operations. These are performed on branches that have been bent down and kept so bent, either by the weight of snow on the limbs or by overbearing of fruit. If the injury has been caused by the presence of snow, as soon as the ground is bare and there is no more frost in the limbs, have somebody lift the branch for you and straighten it up. Sometimes you will find that the bend is so sharp that the branch is half broken, but do not get discouraged at that. Straighten it with great care and take away the splinters, if there are any, so as to get a close union of the broken parts. Take a splint of hardwood about 1 inch wide, $\frac{1}{2}$ inch thick and 2 feet long, as stiff as possible; apply it to the bent or broken branch, on the outside of the bent part; tie the two ends of the splint to the branch with a rope, in order to make it adhere tightly. Then use the brace and bit to make a hole at each end of the splint and through the branch, and bore a similar one in the middle of the splint. Insert three bolts of a size suiting the diameter of the branch, tighten them with the nut and take off the rope. If the bent branch thus repaired is broken, put some grafting wax on that part, wrap it with strips of cotton, taking in the splint and branch together, and everything will be O.K.

The third class of operations the tree surgeon may have to perform necessitates the use of the pruning saw and of some wire. This happens in the case of stout

SESSIONAL PAPER No. 15a

branches or limbs which have been bent under the weight of a heavy crop of fruit and which have remained so bent during the whole summer, till the gathering of the fall fruit. In such cases wood growth on the bent limbs has taken place for at least three months and it is absolutely impossible to straighten such a branch without running the risk of breaking it. I shall indicate a sure method of performing the operation without injuring the limb. For about two feet on the outside of the sharpest part of the bend, make with the pruning saw, half way through the wood of the branch, saw-cuts at intervals of half an inch, taking good care before beginning to place a support under the branch to prevent it from splitting during the operation. After the branch is so cut, tie it with a rope to a sound branch while some one else straightens it up. It yields readily to the pressure from below and the narrow gaps left by the saw-cuts are filled up. When the branches are well straightened, make with the brace and bit, or gimlet, a hole in each of the straightened limbs at a height of about two feet above the part where the operation has been performed. Pass through each of the holes a wire of a gauge or strength corresponding to the weight of the branch, and clinch it on the outside of each branch so that it may hold the branches together tightly. Then apply a dressing of grafting wax and cotton strips, as mentioned for the other classes of operations, and in two seasons of growth all will be healed.

I have practised the three classes of operations on many trees in my own orchard for many years, and always with the best of success. I have trees with as many as fourteen bolts in their branches, not one of them to be seen now, because they are covered with the growth of new wood. Of course it may happen that in future years, when such trees are old and replaced by new ones, somebody may find, when splitting the old trunks for firewood, some hard knots to crack, but this is of no consequence to the man who wishes to save a valuable tree from destruction. Those trees are all healthy and good looking and bear abundant crops of valuable fruit.

I wish to add a word of caution to what I have already said on this subject. Never use a wire or a tie of any kind *around* the branches or trunk of a tree when it is to remain more than one season on the tree. Always pass it *through* the branch or trunk, never around it.

I have given you my experience in that matter because I have seen so many people wondering how a tree may stand such treatment and still live and bear fruit. As some of the operations above mentioned may seem a little extraordinary, I am glad to have here Mr. Raynaud, the able nurseryman of the reverend Trappist Fathers of Oka, who, from what he has seen at my place, can testify to the success obtained with such methods of saving trees.

On February 4th and 5th I attended the twenty-sixth annual convention of the Dairymen's Association of the province of Quebec, at Three Rivers, and delivered a lecture on foreign work in dairying.

I classify as having the character of provincial conventions the courses of lectures which I delivered to the students of the St. Hyacinthe Dairy School.

COUNTY AND DISTRICT CONVENTIONS.

I have delivered, during the last twelve months, twenty-eight lectures before county and district conventions.

Twenty-one of those lectures were delivered last winter in a series of farmers' institute meetings held between February 26 and March 13, in the counties of Two Mountains, L'Assomption, Montcalm, Joliette, Berthier and Rouville. I was accompanied on that trip by Mr. Félix Charlan, specialist in tobacco culture, of the Department of Agriculture, Ottawa, and Mr. Victor Fortier, assistant poultry manager of the Central Experimental Farm, Ottawa.

This series of lectures was held in localities where the farmers devote much attention to tobacco culture, and Mr. Charlan and I were sent with special instructions

8-9 EDWARD VII., A. 1909

to speak more on that subject than on any other. The subjects treated by Mr. Charlan were: 'Tobacco Culture,' 'Selection of Varieties,' and 'Special Method of Production of Tobacco Seed.'

Mr. Fortier spoke on 'The Importance of Poultry Raising on the Farm,' 'The Cold Poultry House,' and 'Statistics on Poultry and Eggs.'

As to myself, I addressed the farmers on 'A Special System of Rotation for Tobacco Culture,' and when we had two meetings in the same locality I gave a general lecture on dairy husbandry. In my address on a rotation for tobacco I advocated a three-year rotation: first year, tobacco; second year, a grain crop, especially barley if possible, with clover seed; third year, clover crop.

I am glad to be able to say that during the trip I saw plenty of evidence of the progress farmers have made in tobacco culture and poultry raising, by following the advice given in the last two years by Messrs. Charlan and Fortier. The tobacco crop has in many places increased from 1,000 to 1,500 lb. to the acre, and I have visited many cold poultry houses giving much profit to their owners by the production of eggs in winter.

The following condensed table contains a few notes on the localities visited, the meetings held, the number of farmers present and the success of the series.

| Counties. | Localities. | Date. | First meeting attendance. | Second meeting attendance. | Remarks. |
|----------------|---------------------|-----------|---------------------------|----------------------------|--|
| Two Mountains | St. Scholastique .. | Feb. 27.. | 225 | 100 | Very good meetings, attended by farmers eager to get information. Many samples of tobacco exhibited. |
| " | St. Eustache..... | " 28.. | 25 | 20 | Very poor attendance and little interest shown. |
| Assumption.... | L'Assomption.... | " 29.. | 125 | | The audience was composed of the very best farmers of the locality. |
| " * | L'Epiphane..... | " 29.. | 75 | | Much attention was paid to the three lectures. |
| Montcalm..... | Ste. Julienne..... | Mar. 3.. | 200 | 15 | The afternoon meeting was attended by a good class of general farmers, but we had only 15 in the evening, these being all the first class tobacco growers of the vicinity. |
| " | St. Esprit..... | " 4.. | 200 | | These two meetings were composed of farmers much interested in tobacco growing, poultry raising and dairying. |
| " | St. Alexis..... | " 4.. | 200 | | These meetings were the largest of the series. We saw here the finest tobacco and the best cold poultry houses. |
| " | St. Jacques..... | " 5.. | 300 | 250 | |
| Joliette..... | Ste. Marie Salomée | Mar. 6.. | 100 | | The farmers we met at these two meetings seemed to be anxious to develop tobacco-growing in their localities. |
| " | St. Paul..... | " 6.. | 80 | | |
| Berthier..... | Berthierville..... | " 7.. | 225 | | There are only a few farmers interested in tobacco-growing, but one of them is the largest grower in the whole district. Poultry raising and dairying have many enthusiastic adepts. |
| Joliette..... | St. Ambroise..... | " 9.. | 200 | | |
| " | St. Elizabeth.... | " 10.. | 100 | | A good locality for tobacco-growing, which seems to be developing. |
| Rouville | St. Césaire..... | " 11.. | 125 | 125 | |
| " | Marieville..... | " 12.. | 100 | | It is in these two parishes that the best success has been obtained by following Mr. Charlan's method. |

*We were to hold two meetings at St. Liguori, Montcalm county, on March 2nd, but we were prevented from holding them by a violent snow storm which stopped all communication for that day.

Besides the twenty-one lectures given at county and district conventions mentioned above, I attended two other county meetings, one at Louiseville, Maskinongé

SESSIONAL PAPER No. 15a

county, and another at Frampton, Dorchester county. I attended the former to meet the buttermakers of Maskinongé county, with Mr. J. D. Leclair, inspector general of creamery syndicates of the province of Quebec. I attended the second one with Mr. J. A. Plamondon, assistant inspector general of cheese factory syndicates, for the purpose of meeting the cheesemakers of Dorchester county.

I was also invited to visit the Roberval Domestic Science School of the Reverend Ursuline Sisters, at Lake St. John, on the occasion of the 25th anniversary of the foundation of that school, which was celebrated on August 1, 1907, and to visit the Stanstead Domestic Science School of the Reverend Ursuline Sisters, which is a relatively new institution. On those two visits I developed the ideas expressed in a lecture on 'Schools of Domestic Science,' which I summarized in my last report.

The three remaining lectures at county meetings were delivered at Malbaie, Charlevoix county, and at St. Jean Port Joli, L'Islet county.

LECTURES BEFORE FARMERS' CLUBS.

I delivered twenty-six lectures before farmers' clubs, of which there are now nearly 600 in the province of Quebec. The lectures dealt with the following subjects: 'Bacon Production,' 'Selection of Milch Cows,' 'Co-operation amongst Farmers,' 'Cow Testing Associations,' 'Sheep Raising,' 'Economy in Agriculture,' 'Improvements in Dairying,' and 'Seeds.' Synopses of these lectures are contained in my previous reports.

LECTURES AT PARISH MEETINGS.

In seven parishes where there are no farmers' clubs I delivered addresses on 'Economy in Agriculture' and 'Improvements in Dairying,' and one on the benefits of farmers' clubs.

ST. HYACINTHE DAIRY SCHOOL.

On account of a change in the management of the St. Hyacinthe Dairy School, I attended only two courses and the annual spring meeting of the syndicate inspectors there during the last twelve months.

INSPECTION OF FACTORY SYNDICATES.

I made a complete inspection of all the factories in three syndicates, two composed of cheese factories and one of creameries.

In inspecting the creamery syndicate of Mr. Henry Bouchard, in Maskinongé and St. Maurice counties, I visited 24 factories, met 838 patrons and delivered 48 lectures in 8 parishes.

My second inspection was made in the cheese factory syndicate of Mr. L. E. Faucher, in Beauce and Dorchester counties. I inspected 29 factories there, met 728 patrons and delivered 56 lectures in 10 parishes.

In the cheese factory syndicate of Mr. Elzéar Dumas, in Témiscouata and Rimouski counties, I inspected 19 factories, met 1,178 patrons and delivered 38 lectures in 15 parishes.

Summing up the work of those inspections I find that I travelled 1,012 miles, inspected 72 factories and delivered 150 lectures in 39 days, in 6 counties and 33 parishes.

In the course of the inspections I distributed among the factory patrons 3,000 copies of our bulletin No. 12, on 'Cow Testing Associations,' after lecturing on that subject.

8-9 EDWARD VII., A. 1909

OFFICE WORK.

Though most of my time is devoted to travelling for lecture and inspection work, yet I have to spend some of it in my office attending to correspondence, the preparation of lectures, the writing of articles for the agricultural press and the reading and classification of the numerous papers, reviews and bulletins coming from various sources. Inquiries on various topics come from many quarters, very often on subjects not at all related to dairying, and especially on fruit growing.

With these last remarks I beg leave to close the eighteenth annual report of my work as assistant dairy commissioner.

I have the honour to be, sir,

Your obedient servant,

J. C. CHAPPAIS,

Assistant Dairy Commissioner.

REPORT

OF THE

DAIRY AND COLD STORAGE COMMISSIONER

FOR THE

FISCAL YEAR ENDING MARCH 31

1908

PART III.—FRUIT DIVISION.

TABLE OF CONTENTS.

*The Staff—Fruit Inspection—Prosecutions—Convictions under the Fruit Marks Act
—Fruit Crop Reports—Fruit Districts—Meetings—Correspondence re administration of Fruit Marks Act.*

PART III.—FRUIT DIVISION.

OTTAWA, March 31, 1908.

Mr. J. A. RUDDICK,
Dairy and Cold Storage Commissioner,
Ottawa.

SIR,—I have the honour to submit a report of the Fruit Division for the year ending March 31, 1908.

THE STAFF.

The staff consists of nine permanent inspectors and nine temporary inspectors.

A change was made in the method of inspection in the province of Nova Scotia. In former years most of the inspection, during the shipping season, was made on the docks at Halifax. Owing to the fact that the carloads of apples are not taken down to the freight sheds until the ship is ready to receive the fruit, no proper opportunity for examining the fruit was given to the inspectors. Their work was confined to the short time which it took the combined force of longshoremen to load five or six carloads of fruit. This gave the inspectors only about an hour, and sometimes less, for the work of their examination, which was quite inadequate.

Fortunately, the mode of packing the fruit has changed somewhat among the fruit growers. The practice is becoming more common of gathering the fruit into fruit houses and re-packing there into export packages, which are then loaded directly on the cars. The packing warehouses, therefore, become a convenient place in which the inspectors can examine the fruit after it has been marked and graded, and before it is loaded on the cars. In this way the work of inspection can be done with some thoroughness and with advantage to both packers and inspectors.

The apples of Ontario are orchard packed until about the first or middle of November; after that they are gathered into warehouses and repacked for export.

The plan was tried this year, in a limited way, of examining fruit in orchards over the district from Toronto to Belleville. Mr. W. W. Brown was detailed to work within these limits, not confining himself specially to orchard packing but including as well carload lots ready for shipping at the stations. By this method fewer examinations can be made, but there are compensating advantages that would very strongly recommend the extension of this system. The presence of an inspector in a district has a salutary effect. Packers who lack experience in grading have an opportunity of meeting an inspector who can give them definite instructions with reference to grading, and thus help materially to establish uniformity in the grades.

THE PECULIAR DIFFICULTIES OF THE SEASON.

The season of 1907 was, in many respects, a remarkable one in the apple industry. The spring was very late. During the months of July and August and the first part of September, very little rain fell. As a consequence of the late spring and the mid-summer drought, the apples, prior to the ripening period, were very small and quite immature. Fortunately, during the latter part of September and in October there was a copious rainfall, making the conditions of growth excellent for the apple.

But this change in the weather came too late to correct the injuries of the early part of the season. The third week of October a very heavy frost occurred that

8-9 EDWARD VII., A. 1909

caught many of the winter apples still on the trees. It is needless to say that these were materially injured for storing purposes.

One of the results of these conditions was that the harvesting of the fruit was crowded into an exceedingly short period of time. Help, as is usual at this time of the year, was very scarce; and, even if everybody had been anxious to pack in accordance with the Fruit Marks Act, it would have been impossible to secure, under the present system, a sufficient quantity of labour intelligent enough to pack the fruit uniformly and well. Combined with this, the confidence which had been inspired in the minds of the buyers by the enforcement of the Fruit Marks Act since its inception, induced many prominent dealers from England to advance large sums of money to local men. So great was their confidence in the influence of the Fruit Marks Act, that they did not take any precaution to follow their money with any efficient system of inspection to determine whether they were getting the fruit for which they had paid.

Owing to many causes, very high prices were paid in the early part of the season, and apples were bargained for in extraordinary quantities long before they were ready for picking. The high prices naturally induced the owners of the apples to pick, ship and store everything on the trees that could be called fruit, no matter how defective. Unfortunately, too, the buyers found it easier to purchase apples by the orchard, that is, buying all the apples of every grade just as they were upon the trees at a definite sum of money for the whole. This is called buying by the 'lump.' It was not difficult to trace many of the breaches of the Fruit Marks Act directly to this system of buying by the 'lump.'

A local buyer who had received advance money from an English firm, upon the agreement of furnishing No. 1 and No. 2 apples at a fixed advance for each, had strong temptations, when he purchased orchards by the 'lump,' to pack as much fruit inferior to No. 2 as he possibly could. Owing to the dry weather the apples were particularly clean and bright, but small, so that buyers found themselves with a large quantity of very clean, bright coloured apples in their possession, but too small to grade No. 1. As their only difficulty was one of size, and as this difficulty would not have been counted seriously against a limited quantity of any particular variety, buyers had no compunction of conscience, and, indeed, there was no law to prevent them, in grading this clean, bright fruit as medium sized No. 1. As there is no standard of size more definite than the word 'medium,' it is easy to see that there might be a wide difference of opinion with reference to any particular specimen as to whether it was a medium sized fruit or not; consequently, the complaints this season from Great Britain have been greater than any year since the passing of the Fruit Marks Act.

ADDITIONAL EFFECTS OF HIGH PRICES.

The high prices that were paid primarily as the result, possibly, of the supposed shortage and partly the result of extraordinary advances of money from Great Britain, naturally induced the buyers of 'lump orchards,' and indeed all who had control of the apples at the time of picking, to store a much lower grade of fruit than would have been stored had the prices promised to be medium or low. This class of fruit would have gone to the evaporator or the cider press, and much of it would probably have been fed to live stock. Having incurred the expense of picking, packing and freight to the storerooms, the temptation was naturally great to include a portion of this fruit in the grades No. 1 and No. 2. As might have been expected, such fruit was not accepted in the British market, except at very low prices.

After the first of November there was a continuous drop in the wholesale price until the middle of January. This made it difficult for the apple merchants of Great Britain to dispose of even the best stock at a profit. Inferior grades on this falling

SESSIONAL PAPER No. 15a

market were a source of serious loss. Had the quantity of these inferior grades been normal and had the price at which they were bought been low, in all probability they would have been readily absorbed at a paying price, and no complaints would have been forthcoming, even though the packing was not what it should have been. The complaints then are the result of a somewhat larger proportion of apples wrongly graded and marked, and partly of the heavy financial losses of the dealers as the result of a continuously falling market.

INSPECTION.

Anticipating some of the difficulties of the season, the staff of the Fruit Division were on the alert for violations of the Fruit Marks Act. The organization of the inspectors was never better and, as the statistics will show, a larger number of inspections was made this season than ever before. It is to be regretted that the proportion of violations is also greater this year than any year since the inception of the Fruit Marks Act.

Below are given the statistics of inspection for the past seven years:—

| — | 1901-2. | 1902-3. | 1903-4. | 1904-5. | 1905-6. | 1906-7 | 1907-8. |
|--------------------------------|---------|---------|---------|---------|---------|---------|---------|
| No. of lots inspected..... | 1,468 | 1,470 | 1,964 | 1,641 | 2,813 | 2,440 | 7,352 |
| No. of pkgs in lots inspected. | 65,880 | 154,220 | 234,343 | 212,348 | 330,681 | 330,866 | 981,632 |
| No. of pkgs inspected..... | 3,155 | 8,341 | 10,702 | 8,798 | 11,423 | 13,406 | 43,243 |

PROSECUTIONS.

Whenever an inspection is made constituting an offence sufficiently serious to justify a prosecution, the inspector notes upon the report a recommendation that a prosecution be made. The inspector brands the packages he has inspected 'falsely marked' or 'falsely packed' as the case may require, and a notice is sent immediately to the person whose name appears upon the brand. At the same time, the report is sent to the head office at Ottawa. The person packing such fruit is notified from the office that a prosecution is recommended and an explanation is asked for. Usually in the case of a first offence, or where there are other extenuating circumstances, a prosecution does not follow. In all other cases a prosecution is instituted. As a case has to be tried where the offence was committed, it is frequently necessary to take the inspectors, who are witnesses, long distances to attend court. Since the law allows a period of six months in which to lay an information, it is often deemed inexpedient to take the inspectors away from the work of inspection during the busy shipping season for the purpose of acting as witnesses at distant points. Many of the prosecutions, therefore, are made after the close of the port of Montreal in the latter part of November. This year, however, several cases were prosecuted early in the season for the purpose of impressing the shippers with the fact that the Fruit Division would follow the recommendations of the inspectors and prosecute any cases advised by them. Notwithstanding this warning, many packers continued to violate the Fruit Marks Act, with the result that the number of prosecutions this year is greater than ever before in the history of the Act.

8-9 EDWARD VII., A. 1909

CONVICTIONS UNDER THE FRUIT MARKS ACT.

The following persons have been convicted of violation of the Fruit Marks Act during the season 1907-8.

| Name. | Address. | Number of Charges. |

A few more cases are still pending. The fines imposed have been absurdly small considering the nature of the offence, the magistrates in most cases imposing the minimum of twenty-five cents per barrel—a penalty which experience has shown is not a sufficient deterrent.

It has been found that some of the packers have taken advantage of the 20 per cent allowance in the definition of No. 2 apples to include that proportion of absolute trash, which if not a violation of the letter of the law is certainly contrary to the spirit of the law. Parliament has been asked to amend the law as follows* :—

A new section is added to define the term 'culls,' namely:

'(c) "Culls" shall include fruit that is either very small for the variety, or immature, or the skin of which is broken so as to expose the tissue beneath, or that is so injured by insects, fungi, abnormal growths, or other causes, as to render it unmerchantable.'

The definition of No. 2 grade as proposed reads:

'No person shall sell, or offer, expose or have in his possession for sale, any fruit packed in a closed package, upon which package is marked any designation which represents such fruit as of No. 2 quality, unless such fruit *includes no culls and*† consists of specimens of not less than nearly medium size for the variety, and not less than 80 per cent free from worm holes and such other defects as cause material waste, and properly packed.'

The penalties for first offences have been increased, with further increases for second, third and subsequent offences. The new penalty sections of the Bill are as follows :—

'328. Every person who by himself or through the agency of any other person, violates any of the provisions of sections 320 and 321 of this Act (marking and packing), shall be liable, for the first offence, to a fine not exceeding twenty-five dollars and not less than ten dollars; for the second offence, to a fine not exceeding fifty dollars, and not less than twenty-five dollars; and for the third and each subsequent

* These amendments were assented to and became law on July 20, 1908.

† The words in italics are new.

8-9 EDWARD VII., A. 1909

offence, to a fine not exceeding two hundred dollars and not less than fifty dollars, together, in all cases, with the costs of prosecution; and in default of payment of such fine and costs shall be liable to imprisonment, with or without hard labour, for a term not exceeding one month, unless such fine and costs, and the costs of enforcing them, are sooner paid.

'2. Whenever any such violation is with respect to a lot or shipment consisting of fifty or more closed packages, there may be imposed, in addition to any penalty provided by this section, for the first offence twenty-five cents, for the second offence fifty cents, and for the third and each subsequent offence one dollar, for each closed package in excess of fifty with respect to which such violation is committed.'

Section 329† of the said Act is amended by striking out, at the end thereof, the words 'forty dollars,' and adding thereto the words 'one hundred dollars for the first offence, and two hundred dollars for the second and each subsequent offence, together, in all cases, with the costs of prosecution; and in default of payment of such fine and costs shall be liable to imprisonment, with or without hard labour, for a term not exceeding one month, unless such fine and costs, and the costs of enforcing them, are sooner paid.'

The following table gives the statistics of the convictions secured under the Fruit Marks Act since its inception:—

FRUIT CROP REPORTS.

Five fruit crop reports were issued during the fruit season, at the end of the calendar month, from April to September. They were particularly useful this year owing to the exceptional nature of the season.

The winter of 1906-7 was severe and some injuries were reported to trees of all kinds. The Japanese plums suffered particularly, as did also peach trees in the Essex district. Peaches were particularly affected among the tree fruits, and unmulched strawberries and raspberries among the small fruits.

The exceptionally cold spring retarded the opening of the leaf buds and blossom buds from one to three weeks. Relatively the southern portions of Canada were later than the northern portions of the fruit belt. These conditions had a very marked effect upon the markets, especially for small fruits. Usually there is a difference of two or three weeks between the time of ripening of strawberries in Southern Ontario and in the neighbourhood of Montreal and Ottawa, the largest markets for the small fruits of Southern Ontario. Owing to the conditions prevailing this season the small fruits from Southern Ontario reached these large cities only a few days earlier than the local crop; and, notwithstanding the fact that there was a decided shortage in small fruits in the aggregate, yet, as both the distant fruit and the local fruit arrived on the market at the same time, prices were not always as good as the shortage would have indicated. The canneries, however, were short in their acreage for the season, and they came into the markets with a much higher price than usual, offering fre-

† Section 329 refers to the offence of altering or effacing marks after inspection.

FIG. 1.—One of the few remaining French pear trees on the Canadian side of the Detroit River reputed to have been planted by the Jesuit Fathers who first explored this district. This tree is eighty feet high and bears abundant crops of fruit.

SESSIONAL PAPER No. 15a

quently five or six cents per box at the canneries. This relieved the situation, and on the whole the small fruit growers had a prosperous season.

The tree fruits blossomed freely, and all kinds promised a full crop, with the possible exception of peaches.

The weather during the month of June proved very favourable on the whole for fruit, and trees of all kinds rapidly recovered from the check which they received by the late spring.

The general outlook for apples was a light or medium crop of early and fall fruit, with better prospects for the winter fruit. July and August proved very dry in Ontario, so that the prospects at the end of August showed a decline over the previous months. Fortunately rain fell during September, relieving the gloomy outlook; and though the fruit did not develop to the usual size, it was nevertheless comparatively bright and clean.

Apples coloured well towards the middle of October, and everything promised not only a fair yield of winter fruit, but fruit of good colour and fair quality, though lacking in size. Unfortunately, on the 20th and 21st of October there was a very serious frost that caught fully 50 per cent of the winter fruit in Ontario. Where the apples were left upon the trees undisturbed until the frost had left the apples, the evil results were not directly apparent. Many packers made the mistake of handling their apples while still frozen. In all such cases the results were disastrous. Of course the keeping qualities of the apples frozen on the trees proved poor, and this helped to swell the large number of slacks and shakes so conspicuous in this year's business.

On October 8 a terrific wind storm swept over the Annapolis Valley in Nova Scotia and fully one-third the apples were shaken from the trees. Many of these were so slightly injured that it was impossible to distinguish clearly between the windfalls and hand-picked apples. Many slightly bruised apples found their way into barrels and afterwards deteriorated rapidly. The rain during the gathering season was excessive in Nova Scotia, and the frost of October 21 also did considerable injury. It was accompanied here by a heavy fall of snow. The winter has been very mild, too mild for long storage. Hence the late winter and spring shipments have shown a very serious percentage of loss.

The fruit crop in the Annapolis Valley proved somewhat better than was expected even from the latest reports, while the fruit was on the trees, and, though prices nominally ruled high early in the season, the fact that many of the speculators failed to pay for their purchases has rendered the season only a moderately good one financially.

FRUIT DISTRICTS IN THE DOMINION.

The value of mapping the Dominion into fruit districts was well demonstrated by the irregularities of the distribution of the apple crop this season. For the purpose of the Fruit Crop Report the Dominion has been divided into ten districts, which may be briefly defined as follows:—

District No. 1.—Counties bordering on Lake Erie.

District No. 2.—Counties on Lake Huron and inland to York county.

District No. 3.—Counties bordering on Lake Ontario north to Sharbot Lake and Georgian Bay.

District No. 4.—Ottawa and St. Lawrence valleys to Lake St. Peter and southwestern Quebec.

District No. 5.—New Brunswick with northeastern Quebec.

District No. 6.—Hants, King's, Annapolis and Digby counties, Nova Scotia.

District No. 7.—Nova Scotia not included in District 6.

District No. 8.—Prince Edward Island.

District No. 9.—Lower mainland and islands, British Columbia.

District No. 10.—Inland valleys, British Columbia.

Those who would get full value from any fruit crop report would do well to study closely the nature of the crop in each of these districts. Taking it particularly in connection with the apple crop, it may be said that District No. 1 grows a large quantity of apples of good size, fine colour and excellent quality. Their one defect is that even the winter varieties ripen so early in the fall that they deteriorate very materially before the cold weather of the early winter sets in and, therefore, unless they are placed in cold storage as soon as they are matured in October, they are apt to show a large amount of waste if any attempt is made to keep them during the winter months. The apples, therefore, in this district must all be regarded as fall and early winter varieties, because there are no cold storage facilities to enable the holding of them for winter shipping stock. Consequently, if it should appear that there was a large crop in District No. 1, it would not materially affect the quantity of winter shipping apples, but would be counted in with the fall and early winter apples, no matter what the varieties were. To this we might make the possible exception of such varieties as the Ben Davis, Stark and similar varieties that are very little grown in this district.

District No. 2 grows excellent winter apples. It is far enough north, or the elevation above the sea level is such, that the winter varieties like the Greening, Baldwin, Spy and Russet, ripen just as the early winter sets in; consequently, these varieties may be picked and stored, with advantage, as winter shipping apples.

A very marked peculiarity of the district is that orchards, though numerous, are small. The district is a very large one and apples can be grown to perfection in any part of it; but the farmers are engaged, for the most part, in mixed farming, with a general preference towards a specialty in stock, if anything. The orchards, therefore, are usually not well taken care of, and from the fact that they are small and often some distance apart, it is expensive for the ordinary itinerant buyer to buy and harvest them. In view of this fact, when winter apples are plentiful elsewhere, many portions of this district are not visited by apple buyers; and the crop then goes to the evaporator and, in more cases, to the cider mill, or perhaps, more frequently still, is used locally or fed to stock.

At three or four points selling associations have been formed, and wherever these have been organized apple growing is exceedingly profitable.

In years like the present, when there was a probability of apples being scarce, this whole district was overrun with buyers; and, though the orchards were far apart and small, yet the district is so large that the aggregate of fruit becomes an exceedingly important factor in determining the total quantity of winter apples available from Canada. Should there be a large crop of apples in Europe and the United States, as well as in Canada, next year, it would be a fair inference that very few apples comparatively would be shipped from this district, and the farmers who did sell, except in a few districts where they are organized, would secure very low prices.

The aggregate number of trees in this district, according to the most reliable reports, would be about 2,311,539 trees. Even with a very moderate crop of one barrel per tree, it will be readily understood that high prices will bring out a large quantity of fruit from this district; but it is equally important to bear in mind that, owing to the conditions enumerated above, low prices would fail to get any appreciable quantity even in a year of an average crop.

District No. 3, the Lake Huron and Georgian Bay district, grows an equally good quality of winter apples; but the orchards are larger and the fruit growers are taking better care of them. Pruning, spraying and cultivating are common. The varieties planted are fewer in number and confined almost exclusively to winter apples. The aggregate of trees in this district is about 3,900,000 trees. Even if we were to estimate that the trees gave no larger yield than in District No. 2, the aggregate of fruit suitable for winter shipment might easily double or quadruple that from District No. 2.

Another significant feature that must be taken into account in all future apple reports is that planting is being done quite freely in District No. 3. The number of

SESSIONAL PAPER No. 15a

young trees under ten years old probably equals the present plantings. Consequently, each succeeding year there will be a large addition to the aggregate of the crop coming from District No. 3 as the result of new orchards coming into bearing. There will be a tendency, therefore, to underestimate the crop from this district on this account.

District 4 includes the Ottawa and St. Lawrence valleys in Ontario and the counties in Quebec south of the St. Lawrence and as far east as Lotbinière. This district has a large quantity of apples of the Fameuse and Wealthy type. The climate is too severe for the standard winter varieties grown in Ontario. The varieties, such as the McIntosh Red, Wealthy, Wolfe River and a number of other hardy varieties, are all fall and early winter apples. In estimating the apple crop, therefore, consideration must be given to this fact, that a large crop of apples in District No. 4 will materially affect the market only during the fall and early winter months, and even in such cases the apples grown in this district are more desirable for desert purposes than for cooking purposes. They, therefore, occupy a special position in the market.

District No. 5 has comparatively few trees. The quantity of fruit raised here is not enough for home consumption, so that it need scarcely be taken into consideration in an estimate of the crop for commercial purposes. This district includes New Brunswick. The possibilities of orcharding in the St. John valley are so great that there is a probability in the future of having to make a separate division of this part of district 5 to secure greater accuracy in the estimate.

District No. 6 is an exceedingly important one in apple production. It includes the four counties of Hants, Kings, Annapolis and Digby in Nova Scotia. The most probable estimate of the number of trees in these counties is in the neighbourhood of one million. It would be quite possible then, considering the high state of cultivation in which a large number of the orchards are kept, to have a surplus of five or six hundred thousand barrels for export.

It will be readily seen that this is a very important fruit district in estimating the marketable crop for any particular year. The Gravenstein forms the largest bulk of their earliest shipments. This variety, however, is being less planted, and the district is becoming more and more confined to the winter shipping varieties. The Blenheim Orange type appears to flourish here better than the varieties so successful in districts 1, 2 and 3. Fortunately these are extremely popular in the English market and, therefore, are always likely to be in good demand.

District No. 7 embraces the rest of Nova Scotia not included in District No. 6. A few isolated and protected valleys, particularly in the county of Lunenburg, are demonstrating their capacity for growing fruit in commercial quantities; but as a whole it may be said that there is not enough winter fruit grown for home consumption, nor is there sufficient quantity to affect appreciably any results obtained from the other divisions.

District No. 8 includes Prince Edward Island. There is a small quantity of early fruit grown here for export, which may increase somewhat in the near future, but is not enough at present to appreciably affect the market. This district still imports winter fruit for home consumption.

District No. 9 includes the valley of the Fraser from Lytton southward, the lower coast line and the Island of Vancouver in British Columbia. This is a mild and moist climate, favourable to fruit growing, which is carried on under very different conditions from those prevailing in District No. 10.

District No. 10 includes the interior valleys of British Columbia, which have a comparatively dry, warm climate. Irrigation is required in many of these valleys, and it is therefore desirable that they should be grouped together, inasmuch as though they differ among themselves slightly, yet for commercial purposes the fruit is similar.

Districts 9 and 10 will become in the near future much more important factors in estimating the total crop of the Dominion.

In making an estimate, therefore, of the crop of the Dominion, special attention should be given to the different districts according to the kind of fruit and the season in which it is marketed. If, for instance, an estimate is being made of the apple crop available for shipment up to Christmas, the whole apple crop of District No. 1 and District No. 4 will receive special attention. If prices were specially high at this season of the year, there would be then a tendency to force part of the long-keeping apples of districts 2, 3 and 6 on the market immediately. If prices in the summer and fall months were low it is probable that some of the apples of districts No. 1 and No. 4 would be held for early winter shipments. If an estimate were being made of the good winter shipping stock of the Dominion, special attention would be given to Districts 2, 3 and 6.

The commercial pear and peach crop would be largely in District No. 1, with, however, a few commercial pear orchards in districts 2 and 3.

The commercial plum crop is confined largely to districts 2 and 3.

The commercial peach and grape crop is confined entirely to District No. 1 and, indeed, to two or three counties in this district.

The small fruit for commercial purposes is grown very generally in all the districts, but larger plantations are in Districts 1, 2 and 3 and District 6 is increasing the acreage of small fruit very rapidly.

Districts 9 and 10 have so far affected only their local markets and the markets of the Northwest to a limited extent. Their capacity, especially for small fruit, is such that they can easily, in a few years, have a very marked effect upon the markets of Manitoba, Saskatchewan and Alberta.

It will thus be seen that a simple lumping of the Fruit Crop Reports and striking an average, would by no means give a proper idea of the commercial fruit crop of Canada. The capacity of the different divisions, as well as a general average of the crop, must be taken into account.

The prices for the many kinds of Canadian fruits are determined by the prices in foreign markets. Therefore, in order to arrive at a satisfactory conclusion with reference to prices, the fruit crop of the countries entering into competition with Canadian fruit must be estimated. For practical purposes the crop of Great Britain, our largest foreign market, and the crop of the United States, our largest competitors in that market, will suffice. The fruit crop of Europe, however, does exercise considerable influence and must always be taken into account in any accurate estimate upon which to base prices.

MEETINGS.

A very important feature of the work of the inspectors is their attendance at gatherings of fruit growers, where they are in great demand to explain all features of the Fruit Marks Act, which include the practical work of grading and packing fruit. Meetings have been attended by members of the staff as follows:—

| | |
|------------------------------|----|
| Prince Edward Island.. . . . | 12 |
| Nova Scotia.. . . . | 26 |
| New Brunswick.. . . . | 2 |
| Quebec.. . . . | 15 |
| Ontario.. . . . | 12 |

In addition to this, members of the staff attended the annual meetings of the Provincial Fruit Growers' Associations of Prince Edward Island, Nova Scotia, New Brunswick, Quebec, Ontario and British Columbia.

In conjunction with other members of this branch, I attended five meetings in the County of Kent last May. The object of these meetings was to stimulate the dairy and fruit interests. The meetings were all well attended, and much good will result, no doubt.

SESSIONAL PAPER No. 15a

During the month of June, I attended a series of twelve meetings in Prince Edward Island. These meetings were purely fruit meetings under the auspices of the Provincial Department of Agriculture. The object of the meetings was to arouse some interest with reference to marketing the fruit already grown on the Island and to make suggestions with reference to the future development of the fruit industry there.

The Island is peculiarly well situated for the growing of certain varieties of apples. The climate is too severe to admit of growing the common winter varieties, but the Duchess, Astrachan, Wealthy, Pewaukee, Alexander and Wolfe River and other varieties of this class, do remarkably well there, and promise to be a remunerative addition to the system of mixed farming practiced on the island.

A scheme was suggested for the co-operative buying of nursery stock, which may be the means of increasing the plantings to some extent for the ensuing year.

I attended the short course in horticulture at Guelph, February 4, 5, 6 and 7, during which demonstrations were given in apple packing in boxes and barrels. I also delivered addresses on the subject of grading and marketing apples. I attended a similar course at Ste. Anne de Bellevue, March 18 and 19. The attendance at both was exceptionally large, and indicated that such courses are likely to be extremely popular.

THE BROWN TAIL MOTH IN NOVA SCOTIA.

In April of 1907 the Brown Tail moth was discovered in Nova Scotia. Measures were immediately taken by Professor Cumming, Secretary of Agriculture for Nova Scotia, to inspect large areas of the province, with the result that the pest was found to be quite generally scattered over Kings, Annapolis and Digby counties. To assist in the work of locating the boundaries within which the insect was to be found and to devise means for its destruction, the Provincial Department of Agriculture asked for the services of Mr. G. H. Vroom, Dominion Fruit Inspector. During the months of April and May and at intervals through the summer, Mr. Vroom was engaged in this work. It is satisfactory to note that the efforts of the Department of Agriculture in conjunction with those of the fruit growers of Nova Scotia are likely to keep this dreaded pest in check.

IDENTIFICATION OF VARIETIES.

A large number of fruit growers took advantage of the facilities we have for naming fruits. This work is much appreciated and very much needed at the present time in connection with the fruit industry of Canada. For the best results, we should have access to a collection of wax models, of the rarer varieties at least.

I have the honour to be, sir,

Your obedient servant,

A. McNEILL,
Chief of Fruit Division.

CORRESPONDENCE *RE* THE ADMINISTRATION OF THE FRUIT MARKS ACT.

Extracts from Statement re Grading and Marking, sent to the Press in Great Britain.

In view of certain criticisms which have reached this office concerning the administration of the Fruit Marks Act and the marking and grading of Canadian apples as received in Great Britain during the present season, I desire, as head of the branch of the Department of Agriculture which is charged with the administration of this Act, to make the following statement:

The complaints regarding the grading or marking of Canadian apples this year are confined largely to the question of the size of the apples, and it is alleged that many barrels marked No. 1 should properly have been marked No. 2 on account of the small size of the apples.

The section of the Fruit Marks Act which defines No. 1 grade reads as follows:—

‘Sec. 321. No person shall sell, or offer, expose or have in his possession for sale, any fruit packed in a closed package, upon which package is marked any designation which represents such fruit as No. 1 quality, unless such fruit consists of well grown specimens of one variety, sound, of *not less than medium size* and of good colour for the variety, of normal shape and not less than ninety per centum free from scab, worm holes, bruises and other defects, and properly packed.’

It will be observed that medium sized apples come properly under grade No. 1. That is to say, a package containing only medium sized apples may be correctly marked No. 1 if the apples conform to the requirements in other respects. Those who drew up this definition had in mind the fact that in ordinary seasons there is along with medium sized apples a large proportion of large or very large apples which go to improve the general appearance and character of the No. 1 grade. The past season was an extraordinary one in this respect, as all varieties grown in Ontario and many varieties in Nova Scotia were undersized. Thus many packers who have fully observed the provisions of the Fruit Marks Act in a strict legal sense, have been unable to make as good a showing as usual, although the crop was unusually clean and bright.

As for the administration of the Fruit Marks Act, it is evident from some of the comments received that there is considerable misapprehension on this point as well as in reference to the definition of grades in the Act itself.

In the first place, it should be made clear that there is no attempt made to carry out a general inspection or official grading of all apples. There is no government supervision of the packing, as has been suggested. There are many reasons why it is impracticable to carry out such a scheme, but they need not be given here.

There is this to be said, however, that the staff of inspectors was increased in 1907, and the actual number of packages inspected so far this season is greatly in excess of any previous year. Any suggestion that the enforcement of the Fruit Marks Act, as far as it has ever been undertaken by the Department of Agriculture, has been less vigorous or effective during the present season than in past years is absolutely without foundation.

There is one more point on which there appears to be a misunderstanding. We find that a number of f.o.b. contracts have been made this year in which it has been either stipulated by the purchaser, or promised by the seller, that the apples were to be subject to ‘government inspection,’ &c. A contract

SESSIONAL PAPER No. 15a

which rests on such a clause cannot be carried out, because it would be impossible for the government to undertake such inspection or to assume any responsibility in such cases. A definiteness might be given to contracts if it were provided that the apples should be packed and marked according to the definitions and grades as provided in the Fruit Marks Act, but that would not imply government inspection.

Dealers and importers in Great Britain may be assured that the Department of Agriculture is desirous of assisting the trade in every possible way. Suggestions and criticisms are invited, but it is desirable that there should be a clear understanding of the work which is undertaken by the Department.

J. A. RUDDICK,

Dairy and Cold Storage Commissioner.

OTTAWA, Ont., Jan. 13, 1908.

The publication of this statement in the press of the United Kingdom brought out several replies, both direct and in the newspapers.

From Mr. Fred. Pritchard, in Liverpool 'Journal of Commerce,' January 31, 1908.

THE GRADING OF CANADIAN APPLES.

To the Editor:

Mr. J. A. Ruddick, the commissioner in Ottawa for dairy and cold storage produce, does not appear to be very happy in his defence of the workings of the Fruit Marks Act, put in operation by his department. Mr. Ruddick also appears to have misquoted himself in his defence of the breaches of that Act, because he distinctly says that if we have no No. 1 apples we must call the second grade No. 1's.

Now, our friends in Malaga, Spain, who send us muscated raisins of No. 1 quality, as designated by the maximum number of crowns on the box, do not go so far as Mr. Ruddick, as when a season happens when the highest grade of raisins are not obtainable, the highest designation of marking is not used. So ought the Canadian Department of Canada to enforce their Act.

I am prepared for Mr. Ruddick's question: 'How do you propose to improve matters?' and I am willing to give him my suggestions as to how the trade in Canada, both to the speculator and the farmer, or, in other words, the taxpayer in the province of Ontario, can be made to bring about a much more profitable industry than that which now exists.

The whole difficulty which the Department of Agriculture has to contend with is one which it has not yet in the slightest degree taken into consideration. It is the ridiculous system of contracting for apples by the orchard in the months of July and August, before either the grower or the buyer can form any conception as to the eventual maturing of such apples, influenced as they are by the climate, hail storms, wind storms, and so forth. Buyers flood the country, and with the wish as father to the thought, they make arrangements in their own mind for apples which are hardly visible on the trees at the time of purchase, to mature and yield them something like 75 to 80 per cent of No. 1 grade, as required by the Fruit Marks Act. Season after season these expectations are not realized, and, as in this season it was easy to make a contract in the month of August for 75 per cent No. 1 fruit, it was difficult in the month of November to buy carloads yielding 40 per cent of No. 1 fruit. How is this difficulty to be done away with? First of all by the exercising of a very strong hand on the part of the Agricultural Department;

8-9 EDWARD VII., A. 1909

by the continuation of the Act as it is now, but with the insertion that No. 1 ranging in size between $2\frac{1}{2}$ and $2\frac{1}{4}$ inches in diameter, that No. 2's shall not be less than $2\frac{1}{4}$ inches in diameter, and that No. 3's shall be good apples of perhaps some deformity not of great moment to their marketable value, but ranging in size between $2\frac{1}{2}$ and $2\frac{1}{4}$ inches in diameter, and not less. It should also be inserted in the Act that should any barrels be found under a mark which are not in accordance with this Act the entire mark shall be described as falsely branded, as a protection to the trade here and as a benefit to the industry ultimately. Buyers here do not understand thoroughly the intention of the Act, and if they see three or four barrels in a mark branded 'Falsely marked,' they naturally come to the conclusion that this is a guarantee that the balance of the mark is as described on the barrel. As it is true that Canadian inspectors cannot open every barrel, so it is true in a large distributing centre like Liverpool that buyers here cannot open every barrel, and the trouble has only to be faced when these apples come into the hands of their ultimate receivers. I have seen apples in Liverpool this year, and thousands of barrels of them, which for false packing compare very unfavourably with all tricks of marking, the predominance of which some ten or twelve years ago brought about the good intentions of the Canadian government in endeavouring to eliminate the difficulty.

* * * * *

I trust these few remarks from one who has covered the ground for a considerable number of years—who has lost on bad apples, and profited by good ones—will be looked upon as only an endeavour to bring about a better state of affairs. Englishmen are becoming more addicted to the use of good apples, and it appears to me a pity that a profitable industry like this should go from bad to worse, especially in view of the glorious prospects which are before the Canadian apple producer, buyer and dealer, in the system of preference which before long must assuredly enhance the value of this produce.

Yours, &c.,

(Sgd.) FRED. PRITCHARD.

6 Sir Thomas Street, Liverpool,
January 30, 1908.

From Mr. Ruddick in Journal of Commerce, February 13, 1908.

To the Editor:

SIR,—I have received a copy of the *Journal of Commerce* of the 31st ult., containing a communication from Mr. Pritchard in reply to my statement *re* the administration of the Fruit Marks Act and the marking and grading of Canadian apples.

Mr. Pritchard says, 'Mr. Ruddick also appears to have misquoted himself in his defence of the breaches of that Act, because he distinctly says that if we have no No. 1 apples we must call the second grade No. 1's.'

This is such a surprising assertion that I can scarcely believe that Mr. Pritchard intended to be fair when he penned it. I did not defend violations of the Act in my statement, nor did I say if we have not No. 1 apples we must call the second grade No. 1. We recognize the fact that there is a tendency on the part of the growers and packers of apples to grade the best of each season's crop as No. 1, but we have been combating that idea as vigorously as possible, laying down the principle that No. 1 grade, as defined in the Act, is *not* an elastic definition to be varied from year to year. In my communication, which appeared in your issue of the 30th ult., I merely quoted from the

SESSIONAL PAPER No. 15a

Act to show that medium sized apples, (i.e., medium size for the variety), may be correctly marked No. 1, if the requirements of the Act in other respects are met, and I pointed out that owing to abnormal conditions this last season, there were practically no larger apples, such as in ordinary years are packed along with those of medium size.

Mr. Pritchard then says, 'The whole difficulty which the Department of Agriculture has to contend with is one which it has not yet in the slightest degree taken into consideration. It is the ridiculous system of contracting for apples by the orchard in the months of July and August,' &c.

We realize quite as fully as your correspondent does that the system which he refers to is a bad one, but I would like to ask, does he seriously mean to suggest that the Department of Agriculture should attempt to dictate to the farmers of Canada as to how, when, or to whom they should sell their produce? Surely not. There is another side to this question, Mr. Editor, and I would like to suggest that as the agents who make these contracts are mostly representatives of the large receivers in Great Britain who furnish the money for the purchase of the apples, it is not unreasonable to look to them for a remedy. These agents are chiefly concerned to secure the quantity of apples that their principals in the old country expect from them. To make sure of this they resort to the pernicious contracting system which Mr. Pritchard very properly condemns. When the fruit is picked, the buyer often finds that while he may have the requisite number of barrels of apples, he is unable to furnish as many properly graded No. 1's or No. 2's as his agreement calls for, and he resorts to overgrading to make up the quantity, and takes the chance of getting the consignment out of the country without examination by the inspectors. If the firms who advance the money would hold their agents responsible for the proper grading and packing of their purchases, instead of expecting the Department of Agriculture to supervise their work, the apple business would be very much improved. It is the policy of the Department of Agriculture to assist in every legitimate way in the promotion of the apple trade, but that does not relieve dealers from their share of responsibility.

I hope this discussion of the question will do good on both sides of the water, and I hope I have made it clear that there is no attempt to defend or offer excuses for violations of the Fruit Marks Act. We desire only to have things put in a proper light.

I may add that since the opening of the present season down to February 10, there have been 40 convictions for violations of the provisions of the Fruit Marks Act and many other cases are pending. The inspectors prosecute every person against whom they find a clear case of violation of the law.

Yours very truly,

J. A. RUDDICK,

Commissioner.

Mr. Ruddick wrote Mr. Pritchard on March 9, and received the following reply:—

From Mr. Pritchard to Mr. Ruddick.

LIVERPOOL, March 23, 1908.

MY DEAR SIR,—Your kind letter of March 29 is a very delightful conclusion to the friendly correspondence we have had through the medium of our *Journal of Commerce*. I thank you most cordially for your kind expression, which I fully reciprocate.

We are entirely in accord with one another that there is something very wrong in the trade. Frankly, the whole difficulty originates with the excess

8-9 EDWARD VII., A. 1909

of money lent by receivers here to secure large consignments and when speculators with the prospect of making large profits at other people's expense, become possessed of such funds, the result is very readily conceived by those with even a primitive knowledge of the trade.

A point we did not discuss and a further disgrace of 'lump buying' is the relative value of one variety against another—hence 'Ben Davis,' probably the largest crop this season, have hardly on any occasion realized over 15 s. for No. 1, and thousands of barrels are now being sold, as holders have to unload, at 11 s. 6 d. for No. 1; 8 s. 6 d. to 9 s. for No. 2; 7 s. for No. 3. These apples were all 'bulk bought,' and most of them probably cost \$3 cars. Now, had bulk buying not been usual, there was no time during the season that Bens were worth on market quotations more than 50 cents for the fruit, and they are not realizing this now.

Against such shrinkage as this I know how hard it is to make men honest, but I am sure you agree with me that we have in some measure probed the root of the evil.

I am, sir,

Very faithfully yours,

(Sgd.) FRED. PRITCHARD.

REPORT

OF THE

DAIRY AND COLD STORAGE COMMISSIONER

FOR THE

FISCAL YEAR ENDING MARCH 31

1908

PART IV.—EXTENSION OF MARKETS DIVISION.

TABLE OF CONTENTS.

*Transportation Facilities—Inspection of Iced Car Services—Butter Temperatures—
Cargo Inspection—The Export Butter Trade—The Export Cheese Trade—The
Export Bacon Trade—The Export Apple Trade.*

PART IV.—EXTENSION OF MARKETS DIVISION.

OTTAWA, March 31, 1908.

J. A. RUDDICK, Esq.,
Dairy and Cold Storage Commissioner,
Ottawa.

SIR,—I have the honour to submit herewith the annual report of the Extension of Markets Division.

During the past year the inspection work of the division has been carried on by about the same staff as heretofore, seven inspectors being employed for the full year and eleven additional inspectors for the period from May 1 to November 30. The distribution of the staff was as follows: Seven cargo inspectors at Montreal; three iced car inspectors at Montreal; three travelling iced car inspectors in Ontario and Quebec; five cargo inspectors at ports in Great Britain.

TRANSPORTATION FACILITIES.

The inspection work referred to in the preceding paragraph has for its main object the improvement of existing transportation facilities for the food products we export, and the Extension of Markets Division has charge of this work because of the fact that one good way of extending the markets for our perishable food stuffs is to so perfect our system of transport that such products as butter, cheese, eggs, fruits and meats may be carried from the initial shipping point to the ultimate market with the least possible risk of deterioration.

[The first attempt in this country to provide something better than the ordinary freight car for the transportation of perishable produce was made in 1895, when the Department of Agriculture arranged with the railways to run a special iced car service to Montreal for the carriage of less than carload lots of butter, covering eight routes east and south of Montreal and four routes west of Montreal. From these twelve routes in 1895 an improved service has been extended to 62 routes in 1907, covering about 5,600 miles of railway, over which some fifteen hundred cars were operated.

In 1896 not a single steamer sailing from Canadian ports was equipped with a mechanical refrigerating plant, whereas, during the season of navigation in 1907, there were forty-five steamers so fitted sailing from the port of Montreal with a combined cold storage space of 1,014,157 cubic feet. As these steamers made two hundred and thirty-seven trips in the season, the total cold storage space available was therefore 5,001,819 cubic feet. In addition nineteen steamers with cooled air accommodation of 907,440 cubic feet were in commission last season, the total available cooled air space for the season amounting to 4,119,354 cubic feet. Very great progress has also been made in the direction of improved ventilation in the ordinary holds in the steamers, nearly every steamer engaged on the St. Lawrence route now being fitted with exhaust fans which provide forced ventilation of the holds.]

During the year this division has carefully looked after the operation of the iced car services for butter and maintained a close inspection over the loading of all perishable produce shipped from the port of Montreal. In addition our inspectors placed thermographs in the refrigerator chambers and in the ordinary holds in the steamships, in order that we might have records of the temperatures maintained in these different compartments during the voyage. In the old country our inspectors

8-9 EDWARD VII., A. 1909

attended the discharge of every cargo of Canadian products, reporting their condition, method and manner of discharge, &c. These inspectors also removed the thermograph charts and forwarded them to this office, where copies were made and sent to the steamship agents, the Board of Trade, Montreal, and to the engineers of the steamers concerned. An exact record was also kept of the temperature of a number of packages of butter in each lot loaded into the steamers at Montreal and the temperature of the same packages when discharged on the other side.

INSPECTION OF ICED CAR SERVICES.

From May 1 to October 20, we had three travelling iced car inspectors at work, one in Ontario and two in the province of Quebec. These inspectors travelled on the freight trains carrying the iced cars, taking a different route each week, and reported the conditions under which the butter was hauled from the creamery to the railway stations, the temperature of the butter when loaded into cars, the conditions of the cars and the quantity of ice in them. The packages tested by the inspectors were marked so as to be easily detected at Montreal and re-tested there. At Montreal we had two iced car inspectors employed and a third man during the busiest period. These men were in constant attendance at the railway terminals and examined the butter arriving in the iced cars, noting the temperature of the butter, condition of the packages and cars, quantity of ice in the bunkers, &c. They also kept an eye on the men who unloaded the butter and cheese and were careful to see that no butter was allowed to remain on open platforms where it would be exposed to the sun.

ICED BUTTER CAR SERVICE, SEASON 1907.

During the past season it has been most difficult to maintain a satisfactory iced butter car service. The late spring, the labour difficulties at Montreal and the reduced output of butter all contributed to make the service costly to the government and to militate against its efficient operation. At the beginning of the season the Longshoremen's strike caused the railway companies to put an embargo on the shipment of perishable freight to Montreal. After that was settled the G.T.R. teamsters went on strike and that road promptly re-imposed the embargo on perishable freight from western points, while the C.P.R. attempted to carry their own perishable freight and, from competitive points, that of the Grand Trunk as well. As a result of these unfortunate conditions the iced car service became disorganized and it was not until the latter part of June that the regular schedule was restored. After the service got back to normal conditions the shipments of butter were so light, especially from western points, that often the men at the icing stations thought it unnecessary to completely fill the bunkers, as we recommend, and only partially filled them instead. Owing to our complete system of inspection, however, we were enabled to keep close tab on the different services and to promptly notify the railway companies of any irregularities that existed.

DRAWBACKS IN THE SERVICE.

The cars in use were, generally speaking, of the latest type and were well constructed, but they were not always kept perfectly clean, and were seldom disinfected. The icing facilities, too, at many icing points were of the most primitive nature, involving unnecessary labour and waste of time. A small expenditure in this direction by the railways would often reduce the actual cost of icing and promote despatch. The most serious drawback, however, was the irregularity in the running of the way-freights carrying the iced cars. In some sections these trains were often ten hours late, to the detriment of the butter awaiting shipment at the different stations, especially

SESSIONAL PAPER No. 15a

during warm weather. In the districts referred to these way-freights are bound to run irregularly, and it seems to me that one way out of this difficulty would be for the railways to provide small cold storage rooms at the principal butter shipping stations on routes where irregularity in the running time is most marked.

Before closing this general reference to our iced car service I wish to refer briefly to a misconception entertained by a great many shippers and others regarding refrigerator cars. These people apparently make very little distinction between an iced car and a cold storage warehouse equipped with mechanical refrigeration, and imagine they can pile a car full of warm butter or fruit and that after a day or two the goods will come out as cool as the proverbial cucumber. This, of course, is an absolute fallacy. A refrigerator car is simply an insulated box about 31 feet long, 8 feet wide and $6\frac{1}{2}$ feet deep, with an ice-box at each end $2\frac{1}{2} \times 5\frac{3}{4} \times 7\frac{1}{2}$ feet, holding from one and a half to two and a half tons of ice each. As the capacity of the car is thirty tons of freight it is absurd to expect that three tons of ice will remove the heat from a full carload of goods which are packed so closely that there is little chance for the air to circulate. I wish, therefore, to emphasize the fact that all that may reasonably be expected of an iced car is that it shall carry freight at an even cool temperature, provided the goods are in a *cool* condition when loaded into it.

ICED CAR SERVICE FROM WESTERN ONTARIO.

The shipments of creamery butter from western Ontario points were very light last season, many cars running each week with very small loads, and as usual we found it difficult to arrange for a satisfactory service west of Toronto, especially on the Grand Trunk Railway, as there were many branch lines which had to be covered but which did not furnish sufficient butter to permit of the running of a through car to Montreal. A considerable number of cars, therefore, ran only as far as Toronto, where the butter for Montreal was consolidated into one or more cars, and on account of these trans-shipments we were unable to get, at Montreal, the temperatures of all the packages that were marked by our Ontario inspector. The shipments of dairy butter were, as usual, in a warm condition when loaded and undoubtedly raised the temperature of the creamery butter carried with them.

TEMPERATURES OF ONTARIO BUTTER.

In the season of 1907 our Ontario inspector secured the temperatures of 99 packages of butter at shipping points, which were afterwards re-tested at Montreal with the following results:—

Marked Packages of Butter from Ontario, Season 1907.

(Creamery and Dairy.)

| | |
|--|-----------|
| Number of cars carrying marked packages. | 14 |
| Number of packages tested at shipping points, marked and re-tested at Montreal. | 99 |
| Average temperature at shipping points. | 61.7 deg. |
| Average temperature at Montreal. | 56.1 “ |
| <hr/> | |
| Reduction in temperature. | 5.6 “ |

8-9 EDWARD VII., A. 1909

(Dairy only.)

| | |
|---|-----------|
| Number of cars. | 13 |
| Number of packages tested at shipping points, marked and re-tested at Montreal. | 75 |
| Average temperature at shipping points. | 65.3 deg. |
| Average temperature at Montreal. | 56.8 " |
| Reduction in temperature. | 8.5 " |

(Creamery only.)

| | |
|---|-----------|
| Number of cars. | 6 |
| Number of packages tested at shipping points, marked and re-tested at Montreal. | 24 |
| Average temperature at shipping points. | 50.2 deg. |
| Average temperature at Montreal. | 53.7 " |
| Increase in temperature. | 3.5 " |

It will be noted that the average temperature at Montreal was 5.6 degrees lower on both creamery and dairy butter; 8.5 degrees lower on dairy alone, and 3.5 degrees higher on creamery alone. Considering the long haul from western points, the high temperature of the dairy butter when loaded, the frequent opening of the car doors, and trans-shipments en route, I think it will be admitted that the above showing is reasonably satisfactory.

As shown in the foregoing table, the creamery butter was loaded at an average temperature of 50.2 degrees, the tests ranging from 41.3 to 61.3 degrees, and the dairy butter at an average temperature of 65.3 degrees, the tests ranging from 50.7 to 78.0 degrees. The average temperature of the butter from each creamery was as follows:—

| Creamery. | Station. | Number of Packages Tested. | Average Temperature. |
|---------------------|---------------------|----------------------------|----------------------|
| | | | Deg. |
| O. A. C. | Guelph. | 4 | 41.3 |
| Neustadt. | Neustadt. | 4 | 42.3 |
| Teeswater. | Teeswater. | 5 | 42.8 |
| Dungannon. | Lucknow. | 6 | 50.5 |
| Peterboro. | Peterboro. | 3 | 53.0 |
| Merlin. | Merlin. | 4 | 54.5 |
| Baden. | Baden. | 6 | 55.0 |
| New Dundee. | Petersburg. | 3 | 61.3 |

The O. A. C., Neustadt and Teeswater creameries have splendid averages, but Peterboro', Merlin and Baden make a poor showing, while New Dundee is out of the running entirely.

TEMPERATURES OF DAIRY BUTTER.

Out of 105 tests of dairy butter made by our inspector, 92 lots were over 60 degrees, while 20 lots were over 70 degrees.

Creamerymen will no doubt say that this warm dairy butter should not be allowed in the same car with the factory article, because the iced car service was primarily

A wharf shed in course of erection at Montreal.

SESSIONAL PAPER No. 15a

intended to encourage the export creamery butter trade. There are two sides to this a to most other questions, however. In the first place, if the loading of dairy butter in these cars was prohibited we would have to cancel the service on many routes where creameries are few and far between, otherwise the deficit the department would have to pay would be extremely heavy; in fact, more than the butter shipped on these route would be worth. The second and more important consideration is the fact that the bulk of our dairy butter is consumed in this country and, as at present our domestic butter trade is of more importance than our export trade, we are bound to consider it and make some provision for its proper transportation. There is little use, however, in this department providing facilities to transport butter at a temperature of from 45 to 50 degrees if the butter is to be delivered to the cars at a temperature of 70 degrees and over, and it is unfair to the creameryman who has a good cold storage and who is endeavouring to keep his butter at a low temperature to allow warm butter to be placed in a car alongside of his shipment, the temperature of which is raised as a result. Something will have to be done, and I am of the opinion that shippers of dairy butter should be obliged to provide a small cold storage room on the premises where they re-pack and grade their butter, so that it will be reasonably cool when it is handed over to the railway. If this is not done we may yet be compelled to refuse to allow butter of a temperature of say 50 degrees or over to be put into iced cars which are operated under a government guarantee.

TEMPERATURES OF QUEBEC BUTTER.

The following tables show the temperatures of butter at railway shipping points in the province of Quebec during the season of 1907:—

AVERAGE TEMPERATURES OF BUTTER AT QUEBEC RAILWAY SHIPPING POINTS, SEASON 1907.

It will be observed that in 1907 the average temperature ranged from 36.6 degrees to 56.8 degrees. In 1906 the extremes were 38 degrees to 64 degrees, and in 1905, 41.8 degrees to 63.5 degrees. Fifty-one of the creameries tested in 1907 had an average of under 50 degrees as compared with forty-five in 1906 and twenty-eight in 1905.

The foregoing table shows that in the season of 1907 thirty-five of the creameries tested shipped their butter at an average temperature under 50 degrees, as compared with eleven in 1906 and none in 1905. In 1907 the lowest average was 39.5 degrees, highest 68 degrees; in 1906 the lowest was 42.4 degrees and the highest 63 degrees; in 1905 the lowest was 51.1 degrees and the highest 67.7 degrees.

As already stated, special marks were placed by the travelling inspectors on a few of the packages of butter tested by them at the railway stations and these packages were again tested at Montreal in order to ascertain if the butter had become cooler or warmer while in the car. These tests have been carefully calculated and the average temperatures worked out as shown in the following table:—

SESSIONAL PAPER No. 15a

SEASON OF 1907.

IMPROVED PORT FACILITIES AT MONTREAL.

Several of the new freight sheds were in use for the first time last season and were a great improvement over the old wooden sheds, which necessarily were of temporary construction as they had to be removed at the close of navigation each year on account of the danger from ice in the spring. The new sheds are built on what is called the 'high level piers,' that is on a level with Common and Commissioner streets, and are permanent structures of steel and concrete. They are two stories high and at the time of writing seven have been completed, with as many more under way. The upper story in each shed will accommodate cargo for two steamers, so that when all the sheds are finished it will be possible to have on hand, when navigation opens, cargoes for twenty-eight ships with ample room on the lower floors to handle the inward

8-9 EDWARD VII., A. 1909

cargoes. Both floors are of concrete. Railway tracks are laid along one side of each shed so that freight can be removed directly from the cars to the sheds instead of having to be carted a considerable distance as was the practice in the past.

A seventy ton floating derrick which can be operated in any part of the harbour will be provided to handle heavy freight and the docks will be equipped with unloading cranes which can be moved in either direction.

Previous to last season each railway company handled its own cars on the harbour front, but last year the new Harbour Board organized a general traffic office to look after the movement of all freight on the wharves. The railway companies turned over the cars to the officer who had charge of this work and he moved them as required. A further improvement contemplated is elevated tracks which would leave the driveways free for foot and vehicle traffic.

When all the new sheds are completed the stevedores will be able to carry on their work to much better advantage and our inspectors will be in a position to ask for a still greater degree of care in the handling of perishable goods.

IMPROVED PORT FACILITIES IN GREAT BRITAIN.

When this department first undertook to inspect the condition of our food stuffs when landed at the principal old country ports the facilities there were vastly different from what they are to-day. At London our butter was delivered to lighters miles down the river, and our cheese at Tilbury Dock, from where they were railed to Commercial Road Station and thence carted to destination. This meant that the cheese were handled five times in thirty-five miles, resulting in great damage to boxes and exposure to heat. Something over two years ago all this was changed and since then our butter and cheese have been discharged at the Surrey Commercial Dock, which is within two miles of Tooley Street, the centre of the dairy produce trade in London. At this dock the butter is delivered direct into a cold storage chamber and the cheese and bacon into cooled air rooms.

Until last season conditions at Liverpool were very unsatisfactory. Our butter was discharged from the steamships into freight sheds on the docks, where it remained in some cases for days before it was removed. Since 1903 our department has been endeavouring to have better facilities provided, and last year our efforts bore fruit, as the Canadian Pacific Railway Company erected a cold storage warehouse of four chambers with a total capacity of 60,000 cubic feet on the dock where their steamers are berthed and in future, as far as the Canadian Pacific Railway line is concerned, the facilities at Liverpool will be similar to those afforded at the Surrey Commercial Dock, London.

At Avonmouth, the port of Bristol, our butter is handled with good dispatch, but at Glasgow I regret to say conditions are not so satisfactory, and there is little prospect of any immediate improvement.

CARGO INSPECTION ON MONTREAL DOCKS.

At the commencement of the season of navigation in 1907, the following letter was sent to each of the steamship agents at Montreal:—

OTTAWA, May 6, 1907.

DEAR SIRS,—I beg to inform you that this department will continue the work of cargo inspection at the Montreal docks during the coming season along lines similar to those followed in former years. Mr. Wm. Macfarlane will again be in charge of the cargo inspectors and will have his office in the Custom House building as heretofore. The duties of the inspectors will be to report the condition of all perishable products when loaded into the steamers,

SESSIONAL PAPER No. 15a

the kind of handling these products receive, the parts of the ship in which they are stowed, &c.

Thermographs will also be placed in the cold storage and cooled air chambers and in the ordinary holds with apples and cheese. As soon as these temperature records are received here from the other side copies will be made and forwarded to your office, and copies will also be furnished the chief engineers of the steamships concerned. Tests will also be made of the temperature of the butter when delivered to your ships, and a list of these temperatures handed to the chief engineer before the steamer sails. Special attention will be paid this year to the loading and unloading of perishable goods by carters, as we think there is room for considerable improvement in their work.

I believe that your company appreciates the value of this inspection work, and I take this opportunity of thanking you on behalf of this department for the courtesy with which your dock superintendents and other officials have treated our inspectors in the past and for the support they have given them in their work. This season I trust the same cordial relations will exist between your dock officials and our inspectors.

Yours truly,

(Sgd.) W. W. MOORE,

Chief, Markets Division.

During the season our cargo inspectors closely supervised the handling of perishable freight both in the freight sheds and in the ships, and made full reports on all cargoes shipped during the period of navigation. When the apple-shipping season opened one inspector was detailed to look after the unloading of the cars and he did good work in reporting cases of rough handling by the carters. We submitted reports to the superintendents of the Shedden Forwarding Company and the Dominion Transportation Company, who thereupon notified their teamsters that apples must be handled with the greatest possible care.

As the carters who haul the cheese from the warehouses of the exporters to the docks are often responsible for the breakage of a number of boxes while unloading their teams in the freight sheds, I instructed the inspectors last season to immediately notify the office of the shipper concerned, by telephone, whenever they found a carter unloading his cheese roughly. The same course will be followed this season and if our complaints are promptly followed up by the shippers cases of rough handling by the carters will soon become few and far between.

We continued last season to inspect the discharge of cheese and butter from the river boats at Montreal and found the usual tendency in some of the boats to load dairy produce close to the engine room, where it was liable to become heated. Owing to the efforts of our inspector, however, this practice is being gradually discontinued.

CARGO INSPECTION AT QUEBEC AND HALIFAX.

A cargo inspector was present each time the Empress steamers were loaded at Quebec and one was stationed at Halifax during the winter months to look after the loading of apples and to place thermographs in the steamers carrying fruit. Copies of all thermograph records of temperatures obtained in the Halifax boats were sent to the secretary of the Nova Scotia Fruit Growers' Association and to the interested steamship agents in Halifax.

CARGO INSPECTION IN GREAT BRITAIN.

In Great Britain we maintain a staff of five cargo inspectors the year around, covering the ports of Bristol, Glasgow, Liverpool, London and Manchester. These men

8-9 EDWARD VII., A. 1909

are on hand while Canadian cargoes are being discharged, and report the condition of the different products. They also test the temperature of the marked packages of butter and remove the thermograph records, which they mail at once to Ottawa.

THE EXPORT BUTTER TRADE.

[In the season of 1907 the exports of butter from the port of Montreal showed a great decrease, being only 66,773 packages against 361,400 packages in 1906 and 554,041 packages in 1905.] As a consequence of this great shrinkage in our exports the cold storage accommodation in the steamers last season was not used to anything like its capacity, but a splendid service was nevertheless maintained by the different steamship companies.

In order to show the comparative temperatures for the past three years of butter when delivered to the steamers at Montreal and when landed at the port of discharge in Great Britain, the following table is submitted:—

MONTREAL TO LIVERPOOL.

| | No. of Packages Tested. | Average Temperature at Montreal. | Average Temperature at Port of Discharge. | Average Reduction in Temperature by Ships' Refrigerators. |
|------------------|-------------------------------|--|---|---|
| | | Deg. | Deg. | Deg. |
| Season 1905..... | 843 | 39.3 | 24.9 | 14.4 |

| " 1907..... | 7 | 40.9 | 34.0 | 6.9 |

It will be noticed that last season, with one exception, the butter was delivered to the steamers at a lower temperature than in previous years and that it was discharged at the ports of London, Bristol, Glasgow and Manchester at a lower temperature than heretofore.

Our Liverpool cargo inspector in his annual report for the year 1907, refers as follows to the trade in Canadian butter:—

SESSIONAL PAPER No. 15a

'There has been very little butter shipped to this port during the past season, but it has been in good order and condition. There was a great improvement in taking butter from the quay last season, but there is still room for further improvement in that respect. This should come about next season for there are now plenty of cold stores near the quay and the Canadian Pacific Railway have finished their own cold store. There is still a large percentage of butter coming forward without sacking on the box or tub, and this is a serious mistake, as all butter should be sacked. Butter has been carried at a very low temperature during the last season and has been well looked after generally by the steamship companies.'

Under date of January 31, 1908, our Glasgow inspector made the following comments regarding Canadian butter imports for the season of 1907:—

'The imports of Canadian butter were exceedingly small, being barely 6,000 packages, as compared with over 28,000 during 1906.

'The bulk of the butter was of very fair quality, some being very choice, and gave great satisfaction, the only drawback being that the state of the butter market did not permit of merchants importing Canadian on a profitable basis. I observed one or two parcels which were of too deep a colour and these I afterwards learned were railed to the northeast coast of England, where a deeper shade of colour is demanded than that popular in the Glasgow trade.

'The condition on arrival of imports was good, the shipping companies maintaining a lower temperature in their refrigerators than last season, ranging from 10 to 20 degrees for the bulk, a few only being above these figures. The majority of the packages were sacked, quite 64 per cent being so.

'Still considerable delay in taking delivery from the docks is manifested by some consignees. Of the total imports 1,362 packages lay for 2 days, 192 for 3 days, 673 for 4 days, 22 for 5 days, 65 for 6 days, 93 for 7 days and 100 for 9 days, the latter rising in temperature from 10 to 53 degrees. Other than this total of 2,705 packages the remainder was either lifted the date of discharge or the day following.'

The average price in London for Canadian creamery butter for the seven months, May to November, was 110 shillings, with an average in the Bristol market for the same period of 115 shillings. Since the first of the year almost a butter famine has been experienced in Great Britain owing to the tremendous falling off in imports, chiefly from Australia, the shortage in imports for the year ending March 31 amounting to 4,414 tons compared with the previous year.

The following table shows the average price each week in the London market for Danish, Russian, Australian, New Zealand and Argentine butter for the period from November 28 to March 26.

| Week Ending. | | Danish. Cwt. | Russian. Cwt. | Australian. Cwt. | New Zealand. Cwt. | Argentine. Cwt. |

8-9 EDWARD VII., A. 1909

The following table shows the quantities of butter imported into the United Kingdom, from the countries named, for the years 1900 to 1907, inclusive, together with the percentage received from each country each year during the period named. It will be observed that the imports increased by 837,919 cwts. in seven years, and that this increased quantity was practically supplied by Russia, Australia and New Zealand, the former country supplying 15·6 per cent in 1907 against 6·2 per cent in 1900.

THE EXPORT CHEESE TRADE.

The exports of Canadian cheese for the year ended March 31, 1908, amounted to 189,710,463 lbs., valued at \$22,887,237. These figures show a considerable decrease over those of the previous year. The shrinkage in the exports was caused by the reduced make, due to an unfavourable season, but on the whole the quality was good and high prices were realized throughout the year. Following are the figures showing the quantity and value of cheese exported in the years ended March 31, 1904, 1905, 1906, 1907 and 1908:—

| Year ended March 31st. | Lbs. | Valuc. |
|------------------------|-------------|--------------|
| 1904..... | 242,432,366 | \$25,975,998 |
| 1905..... | 216,080,606 | 19,969,363 |
| 1906..... | 214,438,960 | 23,679,419 |
| 1907..... | 213,614,643 | 26,160,856 |
| 1908..... | 189,710,463 | 22,887,237 |

Practically no complaints were received from Liverpool, London or Bristol regarding the quality and condition of the cheese and fewer complaints than usual regarding

SESSIONAL PAPER No. 15a

broken boxes. With respect to the Glasgow market our inspector there in his review of the season writes as follows:—

‘The quality generally has been fairly satisfactory, but the early season’s cheese came to hand in a very green state and occasioned much loss through extraordinary shrinkage in weight. This circumstance was so much felt in the early season by importers as to determine several to leave the Canadian article severely alone, and similarly retail shopkeepers refused to trade in them. The loss of weight in the cheese when cut in their stores was too pronounced to permit of trading in them at a reasonable profit.’

‘The arrivals this season showed a higher percentage of broken boxes than those of last, due apparently in some cases to the use of not sufficiently seasoned wood in the manufacture, and bad boxing, viz.:—A large number of boxes were badly fitted, being both too wide and often too short. The shipments from several factories continued weekly to arrive with 30 or 50 per cent of the boxes broken. Of such were the “Monalea,” “Apsley,” and “Faraday” factories. A few others commenced badly, but I am glad to report improved throughout the season. The importance of strong and well fitting boxes cannot be too forcibly commended, as intended buyers are always impressed with the appearance of the boxes, and after reaching Glasgow the boxes may be railed several hundred miles.’

CHEESE IMPORTS INTO THE UNITED KINGDOM FROM BRITISH TRADE RETURNS, YEARS
ENDED DECEMBER 31st.

The above figures for 1907 show the smallest importation of cheese into the United Kingdom during the past eight years, caused probably by the very greatly increased make of home cheese and a lessened consumption due to high prices.

THE EXPORT BACON TRADE.

The following table, showing bacon imports into the United Kingdom for the years 1900 to 1907 inclusive, together with the percentage supplied by the different countries in those years, is of interest chiefly in showing the strides made by both Denmark and Canada in the export bacon trade; [Denmark increasing her exports from 19.4 per cent in 1900 to 33.6 per cent in 1907, while Canada advanced from 9.4 per cent to 22.4 per cent in the same time.] During the eight year period the total quantity imported annually shows very little variation.

THE EXPORT APPLE TRADE.

The export apple trade for the season of 1907-8 was the greatest on record, the exports for the year ending March 31 amounting to 1,629,400 barrels, valued at \$4,823,645. The season of 1903-4 had been the leader previously, but is now in second place as the following figures show:—

EXPORTS OF APPLES.

| Year ended March 31st. | Brls. | Value. |
|------------------------|-----------|-------------|
| 1904..... | 1,577,285 | \$4,529,500 |
| 1905..... | 997,488 | 2,551,474 |
| 1906..... | 1,280,789 | 4,217,704 |
| 1907..... | 998,618 | 2,702,623 |
| 1908..... | 1,629,400 | 4,823,645 |

Owing to the partial failure of the apple crop in many portions of the United States a very considerable quantity of the early apples grown in Ontario were shipped to Chicago and other western cities, and on account of this movement the shipments of early apples to Great Britain were less than would otherwise have been the case.

SHIPMENTS BY PORTS.

The bulk of the apples exported were shipped through the following ports:—

| | Barrels. |
|--|----------|
| Montreal, to end of November | 614,110 |
| Halifax, to end of March. | 367,175 |
| Portland, to end of March. | 271,111 |
| St. John, N.B., to end of March. | 71,079 |

The balance of the exports went by way of Boston and New York.

SESSIONAL PAPER No. 15a

FROSTED SHIPMENTS.

During the months of December and January the weather was comparatively mild, but very severe frost was experienced during February and the first part of March, which caused damage to apple shipments while in transit from Ontario points to the seaboard. Up to January 25 thirteen cars were reported as containing more or less frosted apples when delivered to the steamship at Portland, while between that date and March 7 sixty-five cars were so reported. These seventy-eight cars contained 13,206 barrels of apples (all of which, of course, would not be frosted), or 5.96 per cent of the total quantity shipped during that period.

According to my reports no frosted apples were received at Halifax, while the Dominion fruit inspector at St. John estimates that 2,715 barrels of frosted apples ex. cars from Ontario points were delivered to the steamers at that port during the season.

HANDLING OF APPLES.

Montreal.—The apples were fairly well handled at Montreal the past season, and when all the new freight sheds are completed the facilities for prompt yet careful handling will be greatly improved.

Halifax.—We had a cargo inspector at Halifax during the apple shipping season, and at its close he reported as follows:—

‘I find the handling of apples very satisfactory; the apples are rolled from the cars to the hatchways and the greatest trouble I have had is keeping the shed floors clean. I have insisted, however, that the shed floors should be kept covered with clean sawdust so that the fruit would arrive at its destination in clean packages. I have found in a few cases very dirty barrels; these must have been dirty on leaving the packing houses, as I was present when they were taken from the cars and found the cars clean. The D. A. Ry. carry most of the fruit from the packing houses to the steamers and in most cases I found the cars in good condition.

‘Most of the apples are handled at night. Special trains are started out in the morning and arrive at the port in the evening, and the apples are taken from the cars as quickly as possible and loaded on the steamers, very often the handlers working all night.

‘The barrels are made of strong spruce and fir staves with six shaved birch hoops, and it is very seldom we see a barrel broken.

‘Most of the apples shipped from this port are carried by the Furness Withy S.S. Co., and I find them very careful in handling and stowing, and they are always willing to give any information required.

‘The C. P. R. and Allan Steamship Companies carry a few apples, and I find their work satisfactory.’

Portland.—This department does not carry on any inspection work at Portland, but the writer generally visits that port once each year. On my last trip, about the first of February, 1908, I found as usual good facilities for the transfer of apples from the cars to the steamers; but the apples were not handled so carefully as at Montreal and Halifax. In view of the fact that there has never been a cargo or fruit inspector stationed at Portland and that there is only the ordinary supervision of the railway and steamship officials to prevent rough handling, it is not to be wondered at that the comparison should be in favour of the two ports mentioned, where, for some years past, this department has carried on, by means of cargo inspectors, a campaign for the better handling of perishable goods.

St. John.—A Dominion fruit inspector was on duty at the port of St. John, N.B., during the winter season, and he reported that the transfer of the apples from the cars to the steamers was carefully carried out under his immediate supervision.

8-9 EDWARD VII., A. 1909

TENDER FRUITS.

With respect to the exports of tender fruits from Canada in the season of 1907-8, the annual report of our cargo inspector at Glasgow makes the following reference to pears and tomatoes:—

‘The shipments of pears from Canada were on a reduced scale from last season, but Duchess and Anjou were of fine quality and where carried in cold storage were landed in excellent condition. One or two of the later arrivals of Keiffers carried by ordinary storage were over-ripe on arrival and inclined to slight waste.

‘Several trial shipments of tomatoes arrived per cold storage, but came to hand in a somewhat unsatisfactory state, generally a large number per box being soft and inclined to waste. Better results might be obtained by shipping them smaller and greener than packed this season, though I fear in a normal year there does not appear to be much prospect of a profitable trade in importation of the Canadian article to this market from August onwards, as it is then well supplied with the Scotch and English grown tomatoes.’

In concluding this report I take pleasure in stating that the inspectors on the staff of this division discharged their duties faithfully and that their work generally was satisfactorily performed.

I have the honour to be, sir,

Your obedient servant,

W. W. MOORE,

Chief, Markets Division.

Montreal Harbour from G. T. R. Elevator.

REPORT

OF THE

DAIRY AND COLD STORAGE COMMISSIONER

FOR THE

FISCAL YEAR ENDING MARCH 31

1908

PART V.—COLD STORAGE DIVISION.

TABLE OF CONTENTS.

Creamery Cold Storages—Iced Car Services—Ocean Cold Storage—List of Steamers with Cold Storage Accommodation—Subsidies for Cold Storage Warehouses—Cold Storage Warehouses in Canada—Cold Storage of Eggs—Cold Storage for Cheese—Cold Storage of Furs.

PART V.—COLD STORAGE DIVISION.

CREAMERY COLD STORAGE BONUSES.

The Department of Agriculture has continued the policy of paying a bonus of \$100 to the owners of creameries who erect and equip a small ice cold storage according to plans and specifications supplied by this branch, and who fulfil the conditions laid down in the following circular:—

DOMINION OF CANADA, DEPARTMENT OF AGRICULTURE, BRANCH OF THE DAIRY
AND COLD STORAGE COMMISSIONER.

To Creamery Owners:

I am directed by the Honourable the Minister of Agriculture to state that Parliament will be asked to extend the bonus of \$100 for cold storage at creameries to the year 1908.

Conditions of Payment.

Payment for the full amount of the bonus will be made at the close of the buttermaking season, upon fulfilment of the following conditions, viz.:—

(1) An efficient cold storage must be built according to plans and specifications supplied, or approved, by the Dairy and Cold Storage Commissioner, Ottawa.

(2) A sufficiently low temperature must be maintained in the cold storage to protect the butter against injury for a reasonable length of time.

Creamery owners desiring to take advantage of this bonus will be required:

(1) To make application before May 1, 1908, on forms provided for the purpose;

(2) To send in a daily record of temperature maintained in the cold storage, once a month during the season.

The construction of the cold storage will have to pass inspection by an officer of the department, or some person designated to make a report on it. The efficiency of the cold storage will be determined by this report and by the monthly reports of temperature.

Inspectors of the Department of Agriculture, Ottawa, must be permitted to examine the construction of the cold storage and to make tests of temperature at any time during reasonable working hours.

The temperature of the butter in any package which has been three days in the cold storage will be taken as representing the average temperatures of the cold storage.

Revised plans and specifications for creamery cold storages, on the 'Air Circulation' system and the 'Cylinder' system, will be furnished on application.

Some experiments in insulation were conducted by the Cold Storage Division in 1905, and as a result of the information thus obtained, we are able

8-9 EDWARD VII., A. 1909

to recommend a rather cheaper form of construction than has hitherto been considered advisable. The plans have been revised accordingly.

The inspector of creamery cold storages will visit, on request, as far as possible, all creameries applying for the bonus, for the purpose of giving assistance in the planning and construction of the cold storage.

The necessary forms will be supplied, free of cost.

All subject to ratification by Parliament.

Address all communications to the Dairy and Cold Storage Commissioner, Ottawa, Ont.

Yours respectfully,

J. A. RUDDICK,

Commissioner.

OTTAWA, ONT.,

January 13, 1908.

Forms for making application, and blue print working plans, are sent to those who apply for them to the Dairy and Cold Storage Commissioner, Ottawa. During the year ending March 31, 1908, thirty-nine applications were received for this bonus. Thirteen of the applicants failed to comply with the necessary conditions of construction or maintenance, leaving only twenty-six who were entitled to the bonus. Following are the names and addresses of those whose applications were approved of, and to whom the bonus has been paid during the year ending March 31, 1908:—

ICED CAR SERVICES.

The various iced car services which have been in operation now for several years were continued during the season of 1907. It was necessary to re-arrange the iced butter car service, to some extent, in order to avoid excessive loss on the guarantee basis, because of the fact that a number of factories were making cheese instead of butter, and, as a result, the shipments of butter had fallen off considerably on various routes. In other cases, however, the service was extended, and, we think, in many respects, very much improved. As a matter of fact, the temperature records as ascertained by the inspectors in the Markets Division, go to show that the butter is being handled at lower temperatures every year.

The iced cheese cars were continued on the same plan as heretofore. That is to say, the government agrees with the railways to pay icing charges to the extent of \$5 per car on a limited number of cars per week for about ten weeks beginning in July. Cars are supplied by the railway companies on demand of shippers for shipments of cheese in car lots, at regular tariff rates.

The iced fruit car service has not been taken advantage of by the fruit shippers as much as it was expected it would be when it was inaugurated. There has been no

SESSIONAL PAPER No. 15a

limit placed on the number of cars, which are supplied in the same manner as the cheese cars are.

A full report of these services, including records of temperature and method of control and inspection, will be found in the report of the Markets Division. (See page 94, Part IV.)

OCEAN COLD STORAGE.

The cold storage facilities provided on the steamships sailing from the port of Montreal, are now so well known, that it is unnecessary to repeat in detail what has so often been told before. There are ample cold storage and cooled air facilities provided for all the perishable products which are offered. As a matter of fact, owing to the falling off in the shipments of butter, one of the greatest difficulties experienced by shippers at the present time, is to be found in the fact that the refrigerators are often not operated, because of lack of freight of the description requiring cold storage. With chambers designed to hold from three to ten thousand packages of butter, one cannot blame the steamship companies if they hesitate to operate the chambers for a few hundred packages, not only because of the expense of operation, but because by putting butter in the chamber, they are prevented from using it for other cargo, and thus the empty space is a dead loss. The steamship companies have shown a desire to meet the needs of the shippers as far as possible, and, on the whole, there appears to have been very little ground for complaint. Large quantities of American produce are offered for shipment in Montreal, on account of the superior facilities offered through the Montreal service. This United States traffic has been a help to Canadian shippers, for without it, the services could hardly have been maintained on their present footing since the exports of butter have fallen off.

PRODUCTS SHIPPED IN COLD STORAGE AND COOLED AIR.

The following figures have been compiled from the reports of the cargo inspectors employed by the Department of Agriculture during the period of navigation at Montreal and Quebec, for the season of 1907:—

| | In Cold Storage. | In Cooled Air. |
|-------------------------------------|------------------|----------------|
| Cheese (boxes)..... | | 290,076 |
| Butter (packages)..... | 66,896 | 52 |
| Meats (boxes)—Canadian..... | 2,858 | 29,071 |
| " "—U.S.A..... | 33,707 | 11,615 |
| Beef (quarters)—U.S.A..... | 4,991 | |
| Lard (packages)—Canadian..... | | |
| " "—U.S.A..... | 19,635 | 6,711 |
| Apples (bbis.)—Canadian..... | 6,131 | 1,729 |
| " (boxes)—Canadian..... | 500 | 3,232 |
| " (bbis.)—U.S.A..... | | |
| " (boxes)—U.S.A..... | | 796 |
| Tender Fruits (boxes)—Canadian..... | 754 | |
| " "—U.S.A..... | 11,118 | |
| Eggs (cases)—Canadian..... | | 938 |
| " "—U.S.A..... | 1,436 | |

The proportion of products carried in cooled air was really much larger than what is shown in these figures, because only those shipments on which the extra freight was paid are included. Many shipments were carried in cooled air at ordinary rates, but in such cases they are shown on the ship's papers as ordinary cargo.

8-9 EDWARD VII., A. 1909

There are no figures available to show the proportion of the various products carried in cold storage, cooled air and ordinary stowage since the close of navigation in the St. Lawrence, but it may be stated that practically everything is carried in ordinary stowage during the winter months.

BUTTER TEMPERATURES ON BOARD STEAMSHIPS.

During the season of navigation of 1907 the cargo inspectors at Montreal tested the temperatures of 776 packages of butter as these were being loaded into the steamers. After taking the temperatures each package was marked so as to enable the inspector at the port of discharge to get the temperature of the same package as soon as it was unloaded from the steamer. The temperatures for each line have been averaged for the season, and the results are shown in the following table:—

| Steamship Line | Number of Sailings with Butter. | Number of Packages Tested. | Average Temperature at Montreal. | Average Temperature at Port of Discharge. | Reduction in Temperature. |
|-------------------------|---------------------------------|----------------------------|----------------------------------|---|---------------------------|
| Montreal to Bristol— | | | | | |
| Dominion..... | 10 | 112 | 36.1 | 22.1 | 14.0 |
| C. P. R..... | 5 | 74 | 34.3 | 23.7 | 10.5 |
| General average.... | | | 35.4 | 22.9 | 12.5 |
| Montreal to Glasgow— | | | | | |
| Donaldson..... | 14 | 135 | 35.2 | 17.1 | 18.1 |
| Allan..... | 7 | 48 | 37.6 | 23.0 | 14.6 |
| General average.... | | | 35.9 | 19.2 | 16.7 |
| Montreal to Liverpool— | | | | | |
| Allan..... | 11 | 110 | 34.3 | 21.8 | 12.5 |
| Dominion..... | 7 | 67 | 33.2 | 25.1 | 8.1 |
| C. P. R..... | 1 | 6 | 29.7 | 26.8 | 2.9 |
| General average.... | | | 33.7 | 23.1 | 10.6 |
| Montreal to London— | | | | | |
| Allan..... | 7 | 65 | 33.6 | 18.1 | 15.5 |
| Thompson..... | 12 | 152 | 30.7 | 20.6 | 10.1 |
| General average.... | | | 36.2 | 15.3 | 20.9 |
| Montreal to Manchester— | | | | | |
| Manchester Liners..... | 1 | 7 | 40.9 | 34.0 | 6.9 |

If the foregoing records are compared with those in the report for 1907, it will be found that the temperatures were lower at both Montreal and ports of discharge in Great Britain in 1907 than they were in 1906.

AMOUNT OF COLD STORAGE SPACE AVAILABLE FROM MONTREAL AND QUEBEC DURING THE SEASON OF 1907.

There were 47 steamships sailing from the ports of Montreal and Quebec, for British ports, during the season of 1907, with a total space of 1,014,157 cubic feet for cold storage and 907,440 cubic feet for 'cooled air.'

Adding together the total sailings for the season, the available space was 5,001,819 cubic feet of cold storage, and 4,248,797 cubic feet of cooled air.

In addition to the services to the United Kingdom there is cold storage on the following lines: (1) to South Africa, (2) to the West Indies, (3) to the Bahamas, Cuba and East Coast of Mexico, (4) to West Coast of Mexico, and (5) to New Zealand.

8-9 EDWARD VII., A. 1909

THERMOGRAPHS IN STEAMSHIPS, SEASON 1907.

During the season 385 temperature records were secured, by placing thermographs (recording thermometers) in cold storage and cooled air chambers, and also in ordinary holds with cheese, meats and apples.

The following table shows the kind of produce which these records cover:—

| Placed with. | WHERE PLACED IN STEAMSHIP. | | |
|-------------------------------|----------------------------|-------------|-------------------|
| | Cold Storage. | Cooled Air. | Ordinary Storage. |
| | Times. | Times. | Times. |
| Butter | 57 | | |
| " and lard..... | 10 | | |
| " and frozen pork..... | 1 | | |

SUBSIDIES FOR COLD STORAGE WAREHOUSES.

Applications for subsidies under 'The Cold Storage Act' were received from the following companies or firms:—

The New Brunswick Cold Storage Co., St. John, N.B.; The Scott, Ashton Co., Morrisburg, Ont.; The Edmonton Produce Co., Edmonton, Alta.; Scott & Hogg, Peterboro, Ont.; The Halifax Cold Storage Co., Port Hawkesbury, N.S.; The Canadian Fish & Cold Storage Co., Prince Rupert, B.C. Inquiries have been made by several other firms.

Contracts have been entered into with the New Brunswick Cold Storage Co. and with the Scott, Ashton Co., and others are under consideration.

The Act provides:

(1) The Governor in Council may enter into contracts with any person for the construction, equipment and maintenance in good and efficient working order, of public cold storage warehouses equipped with mechanical refrigeration, in Canada, and suitable for the preservation of all food products.

(2) The Governor in Council may, out of any moneys appropriated by Parliament for the purpose, grant towards the construction and equipment of any such warehouse, a subsidy not exceeding in the whole 30 per cent of the amount expended or approved of in such construction and equipment, and payable in instalments as follows: upon the warehouse being completed and cold storage at suitable temperatures being provided therein, all to the satisfaction of the Minister of Agriculture, a sum not exceeding

SESSIONAL PAPER No. 15a

15 per cent of the amount so expended; and at the end of the first year thereafter 7 per cent of the said amount; at the end of the second year thereafter 4 per cent of the said amount, and at the end of each of the two next succeeding years 2 per cent of the said amount: provided the warehouse is maintained and operated to the satisfaction of the Minister of Agriculture.

The New Brunswick Cold Storage Company's warehouse has been completed and the first instalment of the subsidy has been paid. This is a first-class warehouse of approved 'slow burning' construction and well equipped with the most modern machinery. The cost, according to the statement of the company on which the claim for the subsidy is based, is less than 25 cents per cubic foot of refrigerated space. That is a very low cost for a building of its class.

The proposal of The Canadian Fish & Cold Storage Co., is an important one, which if carried out, should help very materially in developing the fresh fish trade of the Pacific coast.

It is probable that the extension of the cold storage business in the near future will be confined largely to centres of production for various products and will be in the hands of those who deal in these goods. The joint management of a warehouse and trading business reduces working expenses and removes any conflict of interest between the owners of the goods and the management of the warehouse.

If the owner of the warehouse is also the owner of the goods in store, he is more likely to give that close attention to operating details which ensures success.

The necessary forms for making application for a subsidy, and full information concerning the payment of subsidies may be obtained from the Dairy and Cold Storage Commissioner, Ottawa.

COLD STORAGE WAREHOUSES IN CANADA.

The following is a list of the public cold storages in Canada as far as replies have been received to a circular which was sent out asking for the information.

| Name. | Location. | Capacity of Storage for Butter, Fish, &c. | Capacity of Storage for Cheese, Butter, Fruit, &c. | System of Refrigeration. |

| The Vancouver Ice and Cold Storage Co..... | Vancouver, B.C..... | 350,000 | 50,000 | Mechanical. |
| The Pacific Cold Storage Co..... | Dawson, Y.T..... | 44,675 | 9,760 | Mechanical. |

THE COLD STORAGE OF EGGS.

Cold storage has, during recent years, almost superseded other methods for the preservation of eggs in large quantities. Experience and improved equipment of cold storage warehouses, have combined to produce better and better results, and certain imperfections which have been believed in some quarters to be unavoidable in cold storage eggs are now known to be due to bad management, poor equipment, or the poor quality of the eggs when placed in store. Eggs for long keeping in cold storage, should be gathered during the months of April, May and possibly the early part of June. Earlier eggs are apt to be thin shelled and weak bodied, and after the first few days of June when the weather becomes hot, the eggs deteriorate so quickly that the difficulty of securing them in good condition is very much increased.

A considerable change of opinion has taken place in regard to the minimum temperature for egg storage during recent years. At one time, 40 degrees was considered to be low enough, but the temperature has been gradually reduced, until now the most experienced egg men hold the temperature as low as possible without freezing the eggs. The critical temperature for perfectly fresh eggs is about 27 to 28 degrees, and 29 to 30 is as low as it is practicable to keep the temperature in the egg rooms. Very perfect equipment and exceedingly good insulation are required to maintain a temperature of 29 to 30 degrees without having some part of the room too cold. The indirect or air circulation system is generally approved for the equipment of egg storage rooms, and it is needless to argue that if the insulation is very efficient a smaller amount of refrigeration will be required to maintain the temperature of the room at the desired point, and there will be less difference between the average temperature of the rooms and that of the air at the point where the circulation enters.

It is an advantage also to have the inlets for cold air well distributed, so as to reduce the flow of air at any given point.

In piling the egg cases in a storage room, it is necessary to put dunnage between the different tiers so as to make provision for a free circulation of air among the cases. When eggs are kept at 29 or 30 degrees, it does not seem to be necessary to turn the cases from time to time as it is when the temperature is higher. The low temperature stiffens the white of the egg to such an extent that the yolk is prevented from floating and becoming attached to the shell. In connection with this point, it is also advised that the eggs should be placed in the fillers with the point down, because it is obvious that the yolk in rising will not come in contact with the shell as quickly with the big end up as it would if the point were up. It is very often supposed that the yolk settles in the egg, but being lighter than the white of the egg, the contrary is what occurs.

One of the defects of cold storage eggs in the past has been a tendency to develop mustiness of flavour due to the growth of mould or 'fungus' on the shell. Two conditions which promote the growth of mould are moisture and high temperature. It follows, therefore, that the lower the storage temperature is, and the drier the air in the room is kept, the less will be the trouble from mould, other things being equal. Of course, there is a practical limit to the reduction of the relative humidity, because if carried too far, it will cause excessive shrinkage of the eggs. It is now generally recommended that 75 to 85 per cent of relative humidity is about right at a temperature of 29 to 30 degrees. Where the air circulation system is used, the humidity is controlled, to some extent, by passing the air over expansion coils which are kept continually wet with calcium chloride brine. If this is not sufficient, calcium chloride can be exposed in trays or racks in different parts of the room and for the purpose of absorbing the moisture, the affinity of this salt for water being very great. Some German authorities claim that the calcium chloride has a germicidal effect also, and that the air of the room passing over surfaces wetted with calcium chloride brine, is more or less disinfected.

SESSIONAL PAPER No. 15a

A psychrometer should be provided for determining the relative humidity. The sling psychrometer is largely used in the United States. This consists of two accurate thermometers firmly fixed to a frame which is attached to a handle with a swivel so that it can be whirled in the air. The bulb of one thermometer, which should project about one inch below the frame, is covered with a piece of muslin, and before whirling, this bulb is moistened with water at the same temperature as the storage room. After whirling for about half a minute, the readings should be quickly taken. The evaporation of moisture from the muslin covered bulb reduces the temperature on that thermometer, and the drier the room is the more rapid will be the evaporation, and hence the greater the difference in the readings of the two thermometers. Tables are provided for calculating the relative humidity from the difference in the two readings. Another form of the wet and dry bulb thermometer is provided with a device for keeping the muslin constantly wet. These instruments should be fanned vigorously for a half minute before taking the reading.

Only clean, sound eggs will keep satisfactorily in cold storage. It is important that they should be put into store as quickly as possible after they are laid.

The cases and fillers, it is needless to say, should be new and made of odourless material. Many eggs are tainted by 'musty' fillers or fillers which become musty in store.

Any person who uses second-hand cases or old fillers is liable to meet with very much disappointment and financial loss. Care should be taken to see that any material which is used as a cushion for the bottom and top layers of eggs, should be thoroughly dry and free from any signs of mould or 'mustiness.' For that reason, new excelsior is probably the best material to use for that purpose.

Difficulty is usually experienced in removing eggs from low temperatures into the ordinary atmosphere, without injury, especially in climates where the relative humidity is high. The cold egg collects moisture from the air. One plan of avoiding the condensation of moisture is to remove the eggs by successive stages through rooms of different temperature until the outside temperature is approached. Another plan for handling small quantities of eggs, is to bring them into a moderate temperature room a few hours before they are to be taken away from the warehouse, and there they should be covered with a tarpaulin or canvass to prevent the circulation of air in and around them, while they are being warmed to the temperature of the air in the room.

Too much care cannot be given to egg storage rooms to have them thoroughly disinfected every year. As soon as they become empty they should be thoroughly dried by ventilation and heating, if necessary, and then given a good coat of white-wash. For the purpose of thorough disinfection, a scrubbing of the interior surfaces with a solution of one part bi-chloride of mercury (corrosive sublimate) to one part of water, before whitewashing, will thoroughly destroy all spores of mould or other germs.

COLD STORAGE FOR CHEESE.

Cheese is unlike any other product for which cold storage is employed in its preservation. In cold storing butter, meat, poultry, fish or fruit, the object is to preserve them as nearly as possible without change, for the reason that they are at their best when first available either for storage or consumption. Cheese improves with age, under proper conditions, for many months. It is difficult to say how long it will continue to improve. Much depends on the character of the particular cheese, and also on the tastes of the consumer.

The highest type of Cheddar cheese—that which is produced in Great Britain—is never placed in cold storage, but is cured and stored at a temperature of 60 to 65 degrees, and it is at that temperature that the most desirable flavour is developed. In

8-9 EDWARD VII., A. 1909

Canada the conditions are different, and the temperature which prevails during the summer months, in ordinary cheese curing rooms and warehouses, is too high for good results, as it often rises to 85 or 90 degrees. If cheese is exposed to these high temperatures for a few days only, at any time after it is made, certain ferments are encouraged and developed which, if not checked by comparatively low temperatures, will eventually produce results which are detrimental to the quality of the cheese.

It may be said, therefore, that the temperature at which cheese should be held in a cold storage will depend upon whether such cheese have been cool cured, or have been exposed to unduly high temperatures. Strictly cool cured cheese of good quality should not be stored at temperatures under 55 or 60 degrees. At that temperature the desirable flavours will develop and the texture of the cheese will continue to improve for many months. If cool cured cheese are received into store within a week or two after they are made, it is necessary to allow the ripening to proceed normally for some time, otherwise the cheese may not be in best condition for consumption when required.

On the other hand, if cheese have been exposed to high temperatures, the ripening processes will have proceeded further, as well as those undesirable changes already mentioned, and in order to check these injurious ferments, a comparatively low temperature is necessary, say 36 to 40 degrees, according to the condition of the cheese. A Cheddar cheese will never develop its highest quality at these low temperatures. The flavour will be lacking in that peculiar, rich 'cheesy' quality from which it derives its highest value. It is a case, however, of choosing the lesser of two evils. We cannot secure the fancy quality, but we prevent the serious deterioration in quality, and value, consequent on the development of bad flavours. These remarks apply more particularly to cheese intended for long storage.

One disadvantage attending the storage of cheese at the higher temperature is that they lose much more in weight by the evaporation of moisture than they do at the lower temperature.

COATING CHEESE WITH PARAFFIN WAX.

The shrinkage of cheese while in storage at any temperature may be almost entirely prevented if the cheese are coated with paraffin wax when they are ten days or two weeks old. It will pay to 'paraffin' any cheese which are to be stored for one month or over. (For particulars *re* paraffining cheese see Dairy Commissioner's Report for 1906.)

THE USE OF ICE FOR CHEESE STORAGE.

In view of the comparatively high temperature at which cheese may be stored under certain conditions, the use of ice as a cooling medium should not by any means be considered as obsolete for such a purpose, especially in sections of the country where natural ice is available at a reasonable cost. A basement, fitted with a cement concrete floor, and fairly well insulated walls, may be maintained at a temperature of 50 to 60 degrees with a supply of ice for the season equal to about one ton for every 200 cubic feet of space to be cooled. The cement floor, being a fairly good conductor of heat, acts as a cooling medium down to the point of the constant temperature of the earth underneath, which varies from 50 to 55 degrees. Of course, it follows that if we desire to have a lower temperature, the uninsulated cement concrete is very unsuitable, because as soon as the temperature of the room goes below the constant temperature of the earth, the floor will give off heat, just as it absorbs heat when the room is warmer. Ice storage for cheese is not confined to basement rooms. Any other part of a building, which is on a slightly lower level than the ice chamber so as to permit of a circulation of air, may be used, but a larger amount of ice will be required to keep the temperature down to 55 or 60 degrees where the cement floor lying on the ground is

SESSIONAL PAPER No. 15a

not available as an auxiliary cooling medium. Nor is ice storage for cheese limited to temperatures of 55 to 60. If lower temperatures are desired, it is quite practicable to go as low as 38 to 40 or even a degree or two lower in a well built storage and after the cheese have all been cooled off.

Coating cheese with paraffin wax is especially useful in an ice storage, as it prevents the excessive growth of mould, which is favoured by the high relative humidity of ice stores, as a rule.

One of the serious objections to ice storage in the past has been the rapid decay of the insulation and the structural parts of the warehouses, owing to the dampness arising from the melting of the ice. While this weakness, or defect, as it may be called, is more pronounced in some systems than it is in others, it is more or less inseparable from all forms of wood construction, which material has been almost universally used for interior finish of ice storages. There is no reason, however, why the permanent and fire-proof materials now used in the construction of many of the large mechanical plants should not be used for ice storages, especially for the construction of ice chambers. Combinations of sheet cork, asphalt, glazed tile, cement, &c., are now made practically water and damp proof, and although more expensive to install, such materials are durable and sanitary, and probably cheaper in the end than wood. One difficulty in country places where such materials have not yet come much into use is to have them properly erected, but that difficulty will gradually grow less as this use of these materials becomes better known to mechanics and builders.

COLD STORAGE OF FURS AND WOOLLENS.

All goods subject to attacks by 'moths' are absolutely protected from such injury if kept in a temperature under 40 degrees. In large centres of population a profitable trade is being developed in the storage of this class of goods, which includes fur in all forms, woollen clothing, blankets, carpets, rugs, drapery, &c. The cold storage of furs also prevents the deterioration which follows their exposure to a hot, dry atmosphere. The softness, therefore the durability of the skin, and the glossiness of the fur is preserved by low temperatures.

Garments in cold storage are usually suspended on forms without covering, but securely tagged for identification. A very good arrangement for the storage of garments would be to have a series of lockers of suitable size, constructed of heavy wire netting or gratings, which could be rented to customers at a fixed rate.

No attention is necessary during the period of storage, but the warehouseman, in his own interest, should make a careful inspection when the goods are received, and note on the receipt any defect or injury which may be apparent at that time. All goods should be well shaken and brushed before being placed in storage, and all traces of 'moth balls' or other evil smelling substances carefully removed, in order to avoid risk of injury or taint of food products in the same warehouse. A special room should be set aside for this class of custom, if the quantity of goods received will warrant it.

SANITATION IN COLD STORES.

It frequently happens that goods are offered for storage in an advanced state of decomposition and are placed in store simply because they cannot be kept any longer at ordinary temperatures. The deterioration of butter, meat, fish, eggs, &c., when kept at suitable low temperatures, is very much slower if the goods are placed therein in a perfectly fresh condition than it is if the deterioration has reached an advanced stage before they are put in store. For that reason it is highly important that the cold storage manager should take cognizance of the condition of all produce which is offered for storage, and refuse all goods which are already in bad condition. Con-

8-9 EDWARD VII., A. 1909

sumers should not be too ready to blame this process of preservation, unless they know something about the condition of the goods when placed in storage.

There is a prejudice in some quarters against cold storage goods which is unreasonable. There are very few housekeepers in Canada who do not avail themselves of the principles of cold storage every winter. When we place our supplies of meat, milk or cream, in a cool place in order that they may not spoil too quickly, we are utilizing the same agency as the cold storage man does with the goods which are committed to his care. It is a very common practice to buy poultry and meat in the early winter and to keep them in a frozen condition until required for consumption during the winter months. There is no difference in principle between the system of freezing poultry and leaving it out of doors in winter, and in putting it into cold storage in the summer months.

Cold storage sometimes fails to preserve food products in a satisfactory condition, if the sanitation of the warehouse is not properly attended to. The air of cold storage chambers must be changed from time to time and the humidity regulated to avoid excessive growth of mould, and some thorough method of disinfection must be employed to keep the rooms in a sweet and wholesome condition, so that goods stored therein will not be injuriously affected. For this purpose there is nothing better than a liberal use of lime water or whitewash at least once a year on all the interior surfaces of the cold storage rooms. In addition to the purification which is effected with lime, a thorough disinfection of mouldy rooms by washing the walls, ceilings and floors with a solution of bi-chloride of mercury (1-1000) in water, will be found most effective in destroying mould, and it has the further advantage of preserving a wooden structure from decay. It is not the dampness which causes wood to rot, but it is because the dampness favours the growth of mould, which feeds on the wood. Cold storage men have not, as a class, paid sufficient attention to these features of their business. They have accepted without question goods in various stages of decomposition. This brings discredit on the whole question of cold storage. They should bear in mind also that the condition of the goods coming out of store will be very much affected by the sanitary conditions of the rooms in which they are stored.

REPORT

OF THE

DAIRY AND COLD STORAGE COMMISSIONER

FOR THE

FISCAL YEAR ENDING MARCH 31

1908

PART VI.—VISIT TO GREAT BRITAIN AND HOLLAND.

TABLE OF CONTENTS.

*Canadian Produce in Great Britain—Cheesemaking in Somerset—Meetings Addressed
—Canadian Fruit in Great Britain—The Cider Industry—The International
Dairy Congress—Dairying in Holland—Congress of Gouttes de Lait.*

PART VI.—VISIT TO GREAT BRITAIN AND HOLLAND.

The Branch of the Dairy and Cold Storage Commissioner deals largely with the commercial side of the dairy, fruit and allied industries, and as the export of the products of these industries to Great Britain forms so large a part of the trade in them, it is important that those who direct the work assigned to the branch should keep in close touch with the tendencies and requirements of that market. There is no better way for the head of the branch to secure this desirable information than to make occasional visits to the old country for the purpose of getting into personal touch with importers and others connected with the trade.

An official visit from a representative of the Canadian Department of Agriculture attracts considerable notice, and the occasion is given such publicity through the press that the attention of all readers is drawn to Canadian produce. The knowledge that the Canadian government is looking after these things is an assurance to merchants and consumers, and a material assistance in establishing confidence in Canadian food products.

Arriving in Liverpool on July 27, the writer spent the month of August in visiting the various produce centres, addressing meetings, interviewing merchants and discussing with them the various aspects of the Canadian trade in butter, cheese, fruit and other produce.

CANADIAN BUTTER IN GREAT BRITAIN.

Much disappointment was expressed over the decline in the shipments of Canadian butter, which had reached the point in 1905 where it was beginning to have a distinct place in the British market. If the quantity exported had shown an increase instead of a decline, or if the shipments had even been maintained at the level of 1903-5, the demand for our butter should have shown considerable improvement. As it is now with the insignificant amount shipped in 1907, nobody is taking much interest in it.

A marked feature of the butter trade of the United Kingdom in 1907 was the large increase in the shipments from Australia and Siberia, the supplies from both countries having exceeded those in all previous years. The quantity of Irish creamery continues to increase and to improve in quality, but as it is a home production, the figures do not appear in the Trade and Navigation tables. The importance and volume of the Irish supply is therefore often overlooked. The total value of the Irish butter shipped annually to England and Scotland is variously estimated at from \$20,000,000 to \$30,000,000. About two-thirds of the whole quantity is made in creameries. There are now nearly 900 creameries in Ireland.

THE BUTTER AND MARGARINE ACT.

Much interest was aroused in produce circles over the passage of 'The Butter and Margarine Bill,' a measure which has been before the British Parliament in various forms for many years, but which was always allowed to stand over for various reasons.

8-9 EDWARD VII., A. 1909

The provisions of the new law, known as 'The Butter and Margarine Act, 1907,' which are of interest to Canadians are as follows:—

PROVISIONS AS TO THE IMPORTATION OF BUTTER, MARGARINE AND MILK-BLENDED BUTTER.

5. (1) There shall be included in the list of articles importation of which is made an offence by section 1 of the Sale of Food and Drugs Act, 1899, the following articles:—

- (e) Butter containing more than 16 per cent of water;
- (f) Margarine containing more than 16 per cent of water, or more than 10 per cent of butter-fat;
- (g) Milk-blended butter containing more than 24 per cent of water;
- (h) Milk-blended butter, except in packages conspicuously marked with such name as may be approved by the Board of Agriculture and Fisheries for the purpose;
- (i) Butter, margarine, or milk-blended butter which contains a preservative prohibited by any regulation made under this Act, or an amount of a preservative in excess of the limit allowed by any such regulation.

CANADIAN CHEESE IN GREAT BRITAIN.

Canadian cheese continues to hold its own in the market. New Zealand shipments of cheese are attracting considerable attention, because it is probable that the quantity imported in 1907-8 will be very nearly double what it was during the season of 1906-7. The actual increase, however, in New Zealand shipments is not expected to be over 100,000 boxes. The quantity is not large enough to seriously affect the market, and not more than the variation in the Canadian output from year to year. (See page 109.)

THE GREEN CHEESE EVIL.

I heard many complaints about the shipping of green cheese, especially from the smaller dealers, who buy only in sufficient quantities to supply their current demands. The large dealers, in some cases, were more or less indifferent on the question, probably because their large stocks enable them to hold such cheese as are not fully matured until they are in better condition for consumption. The idea was advanced in some quarters that the large dealers were encouraging the shipping of green cheese, knowing that the practice if continued would seriously curtail the trade of the smaller dealer, and thus tend to give them (the large dealers) a monopoly of the business. One thing is certain: the consumption of cheese was checked by the shipment of green cheese during the early part of the season of 1907.

CUTTING OF PRICES.

The action of some of the large multiple shop companies in reducing the retail cut of cheese to a price which was lower than that at which the cheese could be purchased in Canada, created considerable stir in certain quarters. This competition was very keenly felt by the small shopkeeper, who must sell his cheese at a profit in order to live. While he was compelled to keep cheese for those who asked for it, the less he sold of it the better off he was, therefore, he kept it under the counter as much as possible. Whether this cutting of prices was the result of competition between the large companies and was adopted by them as a matter of advertising, or whether it was a deliberate attempt to freeze out the smaller shopkeeper, I am unable to say. If continued long enough, however, such a course could not be otherwise than detrimental to the cheese trade, because while the low price has a tendency to encourage consumption on the one hand, the loss of profit to the small shopkeeper would mean that he would cease to push the sale of cheese. The shopkeeper is a very important factor in controlling the consumption of any food product. It is natural that he urges the sale of the article on which he is making the biggest profit, and which he can handle with

SESSIONAL PAPER No. 15a

most satisfaction to himself. To give the shopkeeper a reasonable profit is one of the surest ways of increasing the consumption of any article. Customers are very much influenced by the suggestions and persuasions of the merchant from whom they purchase their supplies.

CHESHIRE CHEESE.

The Cheshire cheese was also somewhat of a disturbing factor in the market of 1907. The output was said to be a record one, although it seems to be impossible to secure an accurate estimate of the actual quantity manufactured. While the Cheshire cheese is not sold to any extent outside of Lancashire, that is to say, in Liverpool, Manchester and surrounding districts, comparatively small quantities were offered on the London market during the past season. There are two kinds of Cheshire cheese. The old Cheshire is a slow-ripening cheese which is allowed to develop considerable 'tastiness' before it is offered for sale. The new Cheshire is a very soft, loose-textured, acid sort of cheese, which is put on the market in a very green condition, but which owing to the excessive moisture, has a softness that seems to pass for maturity. Although the supply of this cheese has increased in recent years, it does not seem to be very popular except with certain classes and in a limited district. The increased supply has so reduced the price during the last year or two that it will probably cease to be as popular as it has been with farmers who produce it.

IMPROVED FACILITIES AT LIVERPOOL.

A very important improvement was completed at Liverpool in October last, when the Canadian Pacific Railway Company opened a cold storage warehouse in the shed at the Sandon dock, where the Montreal-Liverpool steamers of that line discharge. Butter, cheese, bacon and fruit can now go direct from ship to cold storage, and the exposure consequent on delay in removal from the quay is avoided. The equipment is first class, and there is ample room for extension as the needs of the traffic may warrant.

Judging by the expressions of appreciation from the importers of Liverpool, the facilities which this improvement provides will be fully utilized.

With the opening of the new King Edward Dock at Bristol, added to the splendid arrangements at London, Canadian produce should now be well cared for on being landed at these three important ports. Glasgow is still without these special dock facilities, but it must be admitted that owing to climatic conditions the need is not so great at that port as it was at the more southerly ports.

CHEESEMAKING IN SOMERSET COUNTY.

Most Canadian cheesemakers know that the type of cheese to which the Canadian variety belongs had its origin, many generations ago, in the picturesque county of Somerset, England, and that it derives its name from the old village of Cheddar, situated therein. The county still retains its supremacy and reputation for high-class Cheddar cheese, and an enormous quantity is produced within its borders every year. There are no factories such as we have in Canada, the cheese still being manufactured on the farms where the milk is produced. The art of cheesemaking has been reduced to a systematic basis of recent years, mainly through the efforts of the county council, which has established schools where the dairymaids are given courses of instruction in the theory and the art of cheesemaking. Having a day or two to spare, the writer concluded that the time would be well spent in acquiring some first hand knowledge of the conditions which enable the Somerset cheesemakers to win such a high place for their product in competition with the outside world.

Through the kind offices of Mr. W. A. MacKinnon, Canadian Trade Commissioner at Bristol, a trip was planned in advance, so that no time was lost in unnecessary travelling.

A LEADING SOMERSET DAIRY.

Starting from historic old Bristol one beautiful August morning, accompanied by Mr. MacKinnon and Mr. E. G. Walker, a well known agricultural writer who is thoroughly familiar with the dairy industry of the district, the first stop was made at Taunton Drew Manor. At the Rectory Farm, Mr. Walter J. Keel runs a high-class cheese dairy, using the milk of 40 milking Shorthorns. Mr. Keel is one of the committee in control of the Somerset Cheese School, and a first-class dairyman, who understands every detail of the business from the management of the herd to the disposal of the product. As an evidence of the care which he bestows on his dairying, it may be mentioned that his cheese sell regularly for 84 shillings a cwt. (18 cents a pound). The methods which produce such a result should be interesting to Canadian dairymen. In the first place, the pasture lands are carefully cleared of all weeds and foreign growths, leaving nothing but the sweet flavoured grasses from which the cows obtain their sustenance. Mr. Keel will tell you that there are two reasons for this, namely, that he cannot afford to waste the fertility of the soil growing useless weeds, and that he dare not run the risk of having his milk tainted with weedy flavours. The cows are milked in the pasture field, in opposition to the practice which prevails in Scotland of milking in the stable, but there is no fixed or stationery milking yard where filth and dust accumulate, as they will in a place where cows are regularly milked. He lays much stress on this point, and we think very properly so, because there is serious contamination of the milk from the germs which are found in the dust arising from the dried droppings of animals. Although the nights are cooler in Somerset than they are in Canada, the milk is well cooled when carried to the dairy. The dairy adjoins the house, and needless to say, it is as clean and free from offensive odours as the best kept kitchen. The process of cheesemaking does not differ essentially from that which is practiced in Canada, but to that we shall refer again. The cheese are cured slowly at 60-65 degrees (cool cured) and are not moved from the curing room until they are two and a half months old.

SOMERSET CHEESE SCHOOL.

The next point of interest was the Somerset Cheese School, where we were most cordially received by the capable instructress, Miss M. J. Cannon, a daughter of another well known Somerset dairyman, Mr. Henry Cannon, of Milton Clevedon, Everecreech. The school is conducted at Dudwell Farm, Chewton Mendip, where there is a fine, large dairy. The courses given are thoroughly practical, the students taking part in the actual work of making cheese every day. The apparatus in use in these dairies naturally differs considerably from that which is employed in Canadian cheese factories. In the first place, the cheese vat is simply a round tin tank somewhat resembling a large weigh can. It has no steam jacket nor other provision for heating. The 'scald,' as it is called in England, is effected by dipping out a portion of the whey at a certain stage, heating it over a fire or with steam, then pouring it back into the vat, and thus raising the temperature of the whole contents. This operation is usually repeated a second time in order to complete the scald. Curd knives somewhat similar to Canadian knives are used. The peg curd mill is almost universally used in Somerset. The acidimeter is exclusively used to determine the various stages of the process. A sufficient quantity of rennet is added to the milk, at a temperature of 84 degrees, to effect complete curdling in 45 minutes. The milk is required to show an acid test of .21 when the rennet is added. The 'cooking' temperature, or highest 'scald,' is somewhat lower than in the average Canadian practice, but this is offset

SESSIONAL PAPER No. 15a

by breaking the curd very much finer in the whey, and by use of the peg mill, which grinds the curd into smaller particles. Miss Cannon likes to have it take three hours after the rennet is added until the curd is finally removed from the whey, with the acidity at '17. The curd is milled a short time before salting, when it has become leathery and flakey when torn asunder. It takes about three hours from the time the whey is removed until the curds are put to press. The curds are salted at the rate of $2\frac{1}{2}$ pounds of salt to 112 pounds of curd. (About $2\frac{1}{4}$ pounds per 1,000 pounds of milk.) The cheese remain in the press two or three days.

The cheese are cured at 60 to 65 degrees, and are kept in the curing room for two or three months. It may seem rather curious to Canadian cheesemakers to be told that these cheese are made on what is known as a 'quick ripening' system in England, which only goes to prove that such terms are merely relative. All the cheese examined at the school were of fancy quality, showing a fine, waxy texture, and a delicious 'cheesy' flavour.

These notes are written as a matter of interest to Canadian cheesemakers and not with a view of suggesting that the practice outlined should be adopted in any way.

I did not find that the Somerset makers had any greater technical skill than well trained Canadian makers have—they probably have less—but they have better material to work with, i.e., milk in better condition, and they are much more thorough and careful in their methods. The question of sanitation receives more attention than it does from Canadian makers.

The next point of interest was the old village of Cheddar, which is not now a cheesemaking centre, but is the resort of a large number of tourists who go there to see the extraordinary cliffs and the wonderful caves in the limestone rocks adjoining the village.

SHEPTON MALLET SHOW.

It was our good fortune to visit the district when the Mid Somerset Agricultural show was being held at Shepton Mallet. An introduction to the president and secretary secured for us every attention and courtesy at their hands, and the writer was enabled to inspect the large exhibit of cheese and butter with every facility. (Plate IX.)

There were over 1,000 full sized Cheddar cheese on exhibition, besides numerous half loaf cheese and also a large class of Caerphilly. There was one prize for the makers who had not taken a first prize in any class at the society's show during the past three years. This class showed the largest number of entries, although the prizes were not as large as they were in the open classes. The most striking characteristic of the cheese at this exhibition, as well as of those which were seen in the various dairies, was the remarkably fine flavour. The Somerset cheesemaker is not content with the mere absence of bad flavour, his cheese must have a positive quality as well as a negative quality and a decided 'cheesy' flavour is considered essential for a strictly fancy cheese. The cheese are not so uniform in size, appearance or quality as one would find in a large exhibition of Canadian cheese, and I think possibly some of the cheese were quite as inferior as anything which would be seen at a similar exhibition in Canada.

SOME IMPRESSIONS.

By way of summary the following impressions may be recorded as a result of this brief visit to the home of the Cheddar cheese, taking into account at the same time information gleaned from other sources.

The most striking characteristic of the finest cheese made in Somerset, or anywhere in Great Britain for that matter, is the typical cheese flavour, sometimes spoken of as a 'nutty' flavour, and the absence of objectionable taint of any kind. In

trying to account for this superiority, one must take note of the alleged special fitness of the soil and herbage of England and Scotland, although it cannot be said that this point has been clearly established. It is claimed, however, that certain farms have been noted for producing a specially fine quality of cheese, while every effort has failed to produce similar results on certain other farms.

These finer distinctions are lost sight of in the factory system, where the milk from several farms of different character is mixed together, and while it tends to uniformity of product, it probably does not permit of the individual excellence which some of these farm dairies reach.

Mention has already been made of the exceptional prices obtained for the product of certain dairies. A point worth noting in this connection is the fact that articles of the highest excellence of quality always command a price out of proportion to the actual superiority which can be discerned. The demand of the connoisseur, who is determined to have the very best, gives the highest quality of cheese an adventitious value, which is sometimes not justified by intrinsic worth. Thus we find that there is a much wider range of prices for cheese all of which will pass as first grade, than there is between the average price at first grade and that which is inferior. This shows how foolish it is for a maker of the factory management to be satisfied with producing cheese which merely 'pass' as first grade.

It is true that the factory does not always receive the full advantage which should come from having turned out a superior article, but that is due to the fact that a reputation must be earned and established before the full benefit can be reaped.

While Canadian factories can never hope to secure the high prices that have been quoted herein, there is hardly a factory in the country the product of which could not be improved in value, if due attention were given to certain details in the production of the milk and in the manufacture of the cheese itself. Let us see, then, what are the means employed by these old country dairymen to secure these special results:

(1) They give careful attention to the pastures and keep them free from noxious herbage in the shape of weeds, &c.

(2) Milking is done under strictly sanitary conditions, avoiding contamination with germ laden dust, foulness of any kind in the surroundings, or the use of improperly cleansed utensils.

(3) The night's milk is cooled in warm weather.

(4) The dairy (cheese factory) is well constructed, perfectly drained, and is kept scrupulously clean.

(5) The cheesemaker is qualified and takes sufficient pride in his or her work to do his or her best every day.

(6) The cheese are cool cured and are not offered to consumers in an unripened condition, and before they have developed the typical cheese flavour.

It must be admitted that when there are 50 or 100 patrons to deal with, and the milk is exposed in so many different ways, the problem is a much more complex one, and therefore much more difficult of solution with us than it is with those dealing only with the milk of a single herd. But we must have some ideal if we are to make progress, and for those who do give attention to these details the reward is sure and substantial.

MEETINGS IN GREAT BRITAIN.

Invitations were received from the Manchester Produce Association, the Glasgow Provision and Fruit Trades Association and the Liverpool Produce Exchange, to give addresses before the members of these associations. Needless to say these invitations were gladly accepted. There was a good attendance of members, many of whom took part in the discussions, thus adding very much to the interest and usefulness of the meetings. These gatherings afford excellent opportunities for removing wrong impres-

SESSIONAL PAPER No. 15a

sions, and for getting new ones from the point of view of both the Canadian producer and the receivers in the old country. It was gratifying to observe the cordial feeling which exists towards Canada, and things Canadian, and while it was frequently asserted that sentiment did not count in matters of trade, one could not help feeling that the large place which Canada now occupies in the minds of the people in Great Britain is a strong, though possibly unconscious, influence towards increasing and strengthening our trade with the mother land.

In the discussions at these meetings the following points were emphasized: (1) that it will check consumption and injure the trade seriously to ship cheese in a green condition, (2) that during the last year or so there has been a heavy loss from short weights, and that importers will have to protect themselves against such loss by having a wider margin on their purchases, (3) that cool curing is a great benefit to Canadian cheese and (4) that the British market will take largely increased quantities of all Canadian produce, including bacon and eggs and fruit, if only the quality is of the best.

The more familiar one becomes with the whole question of supplying Great Britain with food stuffs, the stronger must become the conviction that the great desideratum is to have only goods of choicest quality to offer. If we make sure on that point, all other difficulties will very largely disappear.

FACTORY BRANDS ON CHEESE AND BUTTER PACKAGES.

The advisability of each factory placing its own brand on every box of cheese or butter was frequently discussed with importers. Opinion is somewhat divided on this point, but the majority evidently prefer to depend on the Montreal shippers' brand. While it would appear to be an advantage to a factory which produces a uniformly fine quality of cheese or butter to sail under its own colours, especially if the factory be a large one, as a general rule there is nothing gained in the use of a factory brand unless there is discrimination in its application to prevent it being put on anything but No. 1 quality. A brand which is found on cheese or butter of both good and bad quality cuts both ways and has no value. For the small and irregular lots of cheese, of which we have so many in Canada, the shippers' brands which are now pretty generally used, seem best adapted to meet the needs of the situation. The Canadian exporter establishes brands for cheese of certain characteristics as well as for particular grades of quality and then sorts his numerous lots accordingly. He is bound to keep up the standard for each brand if he wishes to retain the confidence of his correspondents, and the result is that business is facilitated and fewer misunderstandings occur than if the cheese were exported under factory brands only.

The attempts to establish district brands can never serve any good purpose unless great care is exercised in the use of the brand. The so-called 'impress' brands which are applied indiscriminately, have little or no value for the reasons already given. Take the 'Brockville' brand, for instance. While some dealers express satisfaction with the quality, others have told the writer that they would not buy any more of these cheese because 'the last lot was very inferior.' Curiously enough, the cheese bearing the 'Brockville' brand are more generally known as the 'stamped' cheese than as 'Brockvilles.' As a matter of fact, the words 'Brockville' and 'Ingersoll' and some others, have come to signify a certain grade of quality or character of cheese rather than locality of origin.

THE DATING OF CHEESE.

It was frequently represented to me that all Canadian cheese should bear an indelible mark showing month of manufacture. It was charged that orders for

8-9 EDWARD VII., A. 1909

September cheese are sometimes filled with cheese manufactured in other months. My replies to these representations are summed up in a letter which I addressed to *The London Grocer* on the subject, as follows:—

‘First allow me to quote the Canadian law as it bears on this question:

“No person shall knowingly and with intent to misrepresent, sell, or offer, expose or have in his possession for sale, any cheese or butter represented in any manner as having been made in any month other than the month in which it was actually made.”

‘I believe this law was enacted for the purpose of preventing as far as possible any practice which might have a tendency to destroy confidence on the part of the old country merchant, and I am heartily in sympathy with any movement or action having that object in view.

‘I do not believe, however, that the month of manufacture is a proper basis for the determination of values, because it does not represent anything which has to do with the intrinsic quality of the cheese. September-made cheese have been appreciated in the past because on the average the climatic conditions during that month have been favourable for curing cheese in the ordinary curing room so as to give the cheese the character most desired. It is a great mistake, however, to suppose that all September made cheese are better than those made in any other month. No greater fallacy could be entertained. It has often happened that the cheese made during the month of August, as a whole, were quite as good as those made in September of the same year. The same can be said for at least the first half of October.

‘New Zealand cheese are not classified, as far as I am aware, according to month of manufacture, for the very good reason that climatic conditions in that country do not vary sufficiently during the cheesemaking season to materially affect the curing. The cool curing movement in Canada is intended to overcome the defects in hot weather cheese, and when it becomes general, as it will, such variations of quality as are due to climatic conditions, and the defects caused by high temperatures, will very largely disappear.’

OTHER REASONS FOR DATING CHEESE.

If the practice of shipping green cheese is persisted in by the producers and exporters, it is possible that the compulsory marking of every cheese and every box containing cheese with the day and month of manufacture, may be found to be the most practicable and effective means of putting a stop to it. There is this also to be said, that if the cheese were marked with the date of manufacture, the prejudice against the cheese made in certain months of the year would very soon largely disappear.

CANADIAN FRUIT IN GREAT BRITAIN.

The close of the season of 1906 found the apple trade in fairly satisfactory condition and importers and receivers generally expressed themselves as pleased with the improvement which had been made in the packing and grading under the operation of ‘The Fruit Marks Act.’ There was a decided note of increased confidence in the expressions of those with whom the subject was discussed. That this confidence has been somewhat disturbed by the unsatisfactory experiences of some receivers of the crop of 1907 is evident from the reports which have come to hand and the communications which have been received on the subject. It is to be regretted if the progress which has been made toward putting the apple business on a more stable basis has received even a temporary setback. The situation affords a striking object lesson for Canadian orchardists of the necessity for better organization on their part, and points plainly to the advisability of the growers assuming a fuller control over the preparation of their product for the market.

SESSIONAL PAPER No. 15a

Interviews with the Fruit Brokers' Associations at Liverpool and Bristol and with other receivers at Glasgow and London brought out the opinion that the sale of Canadian apples could be largely increased if a good standard of quality and honesty of packing are maintained. It was continually asserted that there is no market for inferior fruit and the experiences of the past season certainly confirm this view. The demand for choice apples in boxes appears to be growing, although the auction rooms naturally discourage the use of this package. The London market, being more accustomed to variety of package, is probably more favourable to the box than any of the other centres.

AUSTRALIAN SHIPMENTS.

The Australian shipments are increasing and although they arrive during the 'off' season for the northern hemisphere, the competition is being felt to some extent. The state of Tasmania especially is giving considerable attention to apple growing. The largest shipment of apples ever landed in Great Britain from one steamship came from Tasmania during the past season. The quality of their apples does not come up to the Canadian standard, but like Australasians generally, the Tasmanians apparently recognize more fully than Canadians do that it is bad policy to export anything of an inferior character, and at the same time they give careful attention to packages and the packing. This is a hard kind of competition to meet, and the comparisons which are made, even though the apples are not on the market at the same time, are detrimental to the Canadian trade. Northern Italy is now sending some apples to the London market. These are not shown in the table of imports, probably because they arrive from some port in France and are thus credited to that country.

Table I. shows the importation of apples into the United Kingdom by countries for the years ending December 31, from 1903 to 1907.

FRUIT PULP AND CANNED APPLES.

My attention was drawn to the large demand for fruit pulps of various kinds, and especially for raspberry pulp. A Glasgow firm imported last year some 250 tons of this

pulp from Tasmania. Some criticism was heard of Canadian canned apples, the complaint being that different varieties were often found in the same can, with the result that owing to different cooking qualities, one kind is reduced to pulp, while others are underdone.

PEARS.

There is undoubtedly a good market for pears in Great Britain. Several shipments of Bartlett's were made last year to Glasgow, Liverpool and Manchester, and turned out very well. The greatest difficulty in the way of successful pear shipments at present is in securing cold storage for comparatively small lots. If the quantity is large enough to fill or nearly fill a chamber, it is very easily arranged, but as the smallest chambers hold about 2,000 pear cases it will easily be understood that with shipments of a few hundred cases the difficulty is a serious one. It would seem to be a case where combination among shippers would work to advantage.

THE CIDER INDUSTRY.

There is a large quantity of inferior apples produced in Canada every year which might well be utilized in the manufacture of cider. If these inferior grades of apples were utilized in this way the export stock would be correspondingly improved, very much to the advantage of the trade. There is not, at present, a large demand in Canada for fermented cider as a beverage, but undoubtedly the demand would increase if a good article were more generally available, because it is a pleasant, wholesome beverage.

Cider is the fermented juice of the apple. Unfermented or sterilized apple juice is not cider in the strict sense of the term. A considerable quantity of apple juice is made in Canada, some of which is consumed while fresh, a portion is made into cider vinegar and a comparatively small quantity is fermented, more or less perfectly, and converted into cider. The methods which are employed by cidermakers in Canada, are for the most part crude and unsanitary to a degree which makes successful cider-making an impossibility. The process is one of fermentation, due largely to the yeasts which have their natural habitat on the skin of the apples. Foreign fermentations arising from moulds or other germs which have been encouraged by lack of cleanliness in the handling of the apples, or in the care of apparatus and premises, make it impossible to produce a good article.

Cider has been made for centuries on farms in the western and southwestern counties of England, and it was with a view of learning something of the conditions under which cidermaking is carried on there that the writer made some inquiries on the subject.

English cider is made very largely from apples which are grown specially for that purpose. The fruit is very small and is known as 'bitter' or 'bitter sweet,' according to the amount of tannin and malic acid which it contains. These so-called 'vintage' apples are grown extensively in Hereford, Gloucester, Somerset and Devon, and these are the principal cider making districts. In Norfolk and other eastern counties, the culinary or edible varieties of apples are used to some extent. There is a difference of opinion among cider authorities as to whether a good cider can be made from the ordinary apples as from the vintage varieties, but it must be admitted that the advocates of the vintage fruit seem to have the best of the argument. In France, where cider has probably been brought to the highest degree of perfection, the seedling or vintage apple is the favourite. One authority took this view of the matter, namely, that the connoisseur prefers the fuller and more pronounced qualities of the vintage cider, while a person not accustomed to drinking it would prefer the cider made from culinary or eating apples. The cider is practically all made on farms

SESSIONAL PAPER No. 15a

in England. In many cases it is intended only for home use, and is a very common drink for farm labourers in the summer months. It is frequently specified in the terms of engagement that the labourer is to have free cider. They want something that 'scratches' as it goes down. It is quite possible that those who provide this cider have their own reasons for preferring the coarser quality, because it no doubt goes much further than a sweeter or milder quality would.

The question for Canadian apple growers is not, however, whether vintage fruit is better than the ordinary varieties, but whether the inferior grades of the culinary or eating apples can be turned into a marketable cider at a profit.

A considerable quantity of Canadian cider has been imported into England and used for blending with the stronger vintage cider of Hereford and Gloucester. It is reported to have given good satisfaction for that purpose. A Norfolk county firm made cider from Canadian apples a few years ago and they claim that the quality was excellent, judged according to English standards.

There is a market for a large quantity of good cider at 16 or 17 cents a gallon, and probably more, delivered on the quays at English ports. The through freight rates from Western Ontario points to Liverpool range from 33 to 37 cents per 100 pounds, or including the weight of the barrel, about 4 cents per gallon.

The yield of cider should be from 8 to 10 gallons per barrel of apples, according to the composition of the apples and the efficiency of the methods employed for extracting the juice.

Suitability of apples for cidermaking depends on the proportion of at least three constituents, namely, sugar, acids and tannin. The French include mucilaginous substances in their estimate. During the process of fermentation, the sugar is converted into alcohol and thus gives strength and stability to the beverage. The tannin is the substance which imparts a bitter taste to apples and tends to pucker the mucous membrane of the mouth. Its action in cidermaking is to coagulate the albuminous constituents of the apple and thus it helps to clarify the juice. It also has some effect in preventing too rapid fermentation and adds to the soundness and keeping quality of the cider. The acids, chiefly malic, give a refreshing quality to the cider which is important, especially in warm weather.

It is not at all likely that cidermaking will be developed to any extent on farms in Canada as it is in England and France. Labour and other conditions favour the factory plan in the same way as the cheese factory and the creamery have taken the place of the private dairy.

THE NATIONAL FRUIT AND CIDER INSTITUTE.

The National Fruit and Cider Institute at Long Ashton, near Bristol, was established about six years ago for the purpose of carrying on investigations with the object of 'reducing the manufacture of cider to a definite method and system.' The institute receives financial support from the Board of Agriculture and the Bath and West Society. The director, Mr. B. P. T. Barker, M.A., was absent on sick leave when the writer called, but the man in charge did everything possible to make the visit interesting and instructive. The science and art of cidermaking are here receiving careful study and investigation. The influence of the composition of the apple and the apple juice on the quality of the cider is studied by making cider from single varieties of apples in conjunction with full analyses at the different stages. The writer had an opportunity of sampling some twenty-five or thirty ciders from as many different varieties of apples, in which there was found a wide difference in quality, but very few, if any, were as good as those ciders which were the result of blending two or more varieties. It is recommended that each variety of apples should be worked up separately, so that the composition of the juice and cider may be determined and thus permit of scientific and accurate blending after fermentation.

8-9 EDWARD VII., A. 1909

The manufacture of perry (from pears) which is quite an extensive business in the southwestern counties, is also studied at Long Ashton.

THE INTERNATIONAL DAIRY CONGRESS AT THE HAGUE.

The writer had the honour of representing Canada at the great International Dairy Congress at The Hague, September 15 to 20.

THE ORGANIZATION AND ORIGIN OF THE INTERNATIONAL DAIRY CONGRESS.

As this was the first congress at which Canada has been represented, it may be interesting to give a short account of the origin of these international dairy congresses and of the International Dairy Federation, which undertakes their organization. The first congress was held in Brussels in 1902, through the initiative of the National Dairy Society of Belgium. This conference was semi-official, the Belgian government having been requested to invite foreign countries to send representatives. The outcome of the meeting was the organization of the International Dairy Federation with the following constitution:—

STATUTES OF THE INTERNATIONAL DAIRY FEDERATION.

Establishment.

Art. 1. On the initiative of the First International Dairy Congress an International Dairy Federation was established.

Object.

Art. 2. The object of the International Dairy Federation is:

The promotion of scientific and technical interests of dairy work, by:

1. Continuing in the scientific advance in dairy work, to undertake the study of various matters relating to technical dairy work regarded from different points of view.

2. By taking the initiative in advancing scientific measures and thus ensure regular advancement of the trade in dairy produce.

The International Dairy Federation does not interfere in the different countries in circumstances of an internal nature.

Means.

Art. 3. To attain its object the International Dairy Federation will adopt the following measures:

1. The International Dairy Federation shall organize international dairy congresses. These congresses shall successively be held in various countries. At the congress problems of actual interest in regard to dairy work shall be discussed.

2. The International Dairy Federation shall use its influence with the government towards the conclusion of international conventions; in these international conventions regulations shall be laid down by the different countries for the purpose of checking fraud and ensuring the purity of the product from a hygienic point of view.

3. The International Dairy Federation shall organize international exhibitions (in connection with the congresses).

4. The International Dairy Federation shall issue rewards for such works as are highly meritorious from their importance in the advancement of dairy work.

SESSIONAL PAPER No. 15a

5. The International Dairy Federation shall in the chief markets establish special committees under its own control, whose duty it shall be to enlighten the international market on the selling conditions in that centre.

6. The International Dairy Federation shall issue a bulletin keeping the members acquainted with the doings of the Federation. If possible also a report shall be issued containing a notice of discoveries and applied inventions, the course of the international butter market and information relating to the condition of the market.

Members.

Art. 4. The Federation consists of:

1. Dairy associations.
2. Ordinary members.
3. Honorary members.

Art. 5. The dairy associations may be represented in the Federation by one or more delegates; the contribution is 10 guilders (16s. 8d.) for which they have the right to send one delegate. For every additional delegate an extra annual contribution of f. 2.50 (4s. 2d.) shall be paid.

The working members pay an annual contribution of f. 2.50 (4s. 2d.) towards the general expenses besides the costs of printing and circulation of the reports issued by the Federation.

The contributions shall be sent directly or through the national committees to the central treasury.

Resources.

Art. 6. The resources of the Federation consist of:

1. Members' contributions;
2. Donations;
3. Subsidies from the governments.

Committee.

Art. 7. The International Dairy Federation shall be represented by a permanent international committee and by the national committees which have been constituted in the different countries and have joined the Federation.

Art. 8. The permanent international committee is established at Brussels; it consists of ordinary members, honorary members and five secretaries.

The ordinary members are chosen by the national committees; each committee appoints a representative, who represents his country.

The president is chosen by the ordinary members of the committee.

The honorary members, to an unlimited number, are chosen from persons of various countries, who have done service in matters relating to dairy work.

The secretaries shall be appointed by the international committee, one of them acting as secretary-general.

The ordinary members and the secretaries only have a vote.

The international committee provides for the good management of matters relating to the Federation.

From the international committee an executive committee is chosen, consisting of the president, the secretary-general and the Belgian member.

The executive committee manages all matters arising between two successive meetings of the international committee.

8-9 EDWARD VII., A. 1909

It is authorized to act quite independently, provided its decisions be approved at the first subsequent meeting of the international committee.

Resolutions, however, only become definitively effective after approval at the first subsequent international dairy congress.

Art. 9. The national committees are constituted in every country in accordance with special local regulations.

Where there is no national committee in any country, the committee of the International Dairy Federation shall assume the initiative in establishing such a committee and towards the temporary indication of a representative who shall represent that country on the committee.

Art. 10. The committee shall meet at least once a year, upon the summons thereto from the president, to decide upon all measures that may be adopted in the interest of the Federation.

All correspondence should be addressed to the secretary-general.

Art. 11. The authority of the permanent committee lasts throughout the period falling between two successive international congresses.

The members are eligible for re-election.

The permanent committee of the International Dairy Federation has its headquarters in Belgium, under the presidency of Baron Peers Van Neuwburg. National committees have been appointed in all the principal dairying countries of the world. The writer has been named as the Canadian representative on the British committee.

The Second International Dairy Congress was held at Paris in October, 1905. It was organized by the French committee of the International Dairy Federation and was held under the auspices of the French government, which gave a special grant towards the expense, and invited foreign countries to send official delegates.

The third and last congress held at The Hague, September 15 to 20 last, under the auspices of the Dutch government, was organized by the Dutch committee of the International Dairy Federation.

The programme of the congress, which follows, will indicate the scope of the papers and discussions.

PROGRAMME.

1st Section—Legislation and Regulations.

1. Uniformity of chemical methods for the examination of milk, butter and cheese.
2. Uniformity of methods of control of milk and milk products (other than butter and cheese) in the places where they are produced and in the market.
3. Butter control.
4. Cheese control.
5. Dairy control: by whom should it be exercised and to what shall it relate?

2nd Section—Hygiene.

With subdivision 'Veterinary Problems.'

1. Conditions to be imposed on the sale of milk wholesale and retail.
2. Conditions to which milk must conform if intended for use as such, and especially as food for children.
3. 'Pasteurization' of milk in the creameries and the conditions under which pasteurized buttermilk is to be returned to the producers.
4. Sterilization of milk for preserving purposes.
5. 'Gouttes de lait.'
6. Sanitation of cowhouses in connection with the production of milk.
7. Danger of milk from cows submitted to the tuberculine test and which were thus found tuberculous.

Combined cheese factories and creameries in Friesland, Holland (co-operative).

Combined cheese factories and creameries in Friesland, Holland (co-operative)

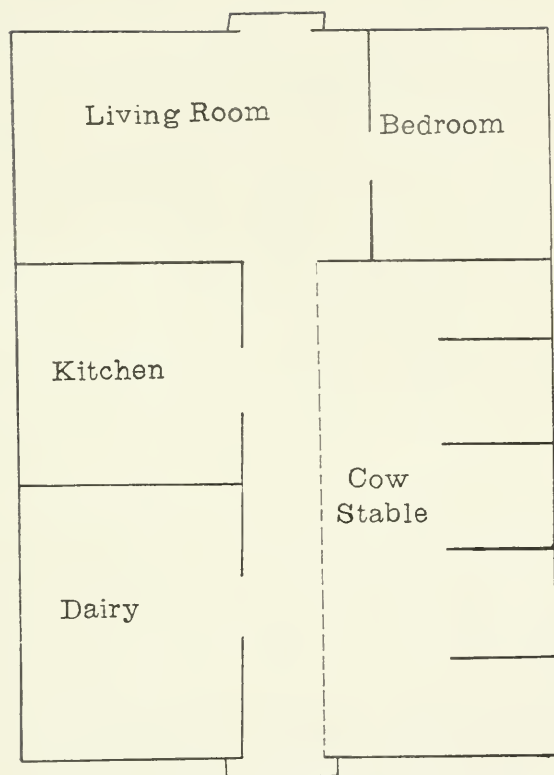

FIG. 1.—Arrangement of an old Dutch Farm House.

SESSIONAL PAPER No. 15a

3rd Section—Industry.

1. Pure ferment 'cultures' for the manufacture of butter and cheese.
2. Causes which influence the proportion of water in butter.
3. Preservation of butter.
4. Results obtained by application of improvements on the quality of butter.

The following countries were represented officially at the congress:—

Argentina, Sweden, Denmark, Norway, Hungary, Italy, the Netherlands, Belgium, Roumania, France, Austria, Great Britain, Canada, New Zealand, Spain, South Australia, Russia, Switzerland, Germany, Victoria, New South Wales.

In addition to these official delegates a large number of voluntary delegates representing dairy schools and dairy societies of one kind or another were in attendance, making a total of about 600 delegates.

The official language of the congress was French, but discussions were carried on in German, Dutch, English and French, and a summary of each day's proceedings with the full text of all resolutions was printed in both French and English and distributed the following morning.

The sessions of the congress were held in the various halls of the Kursall at Scheveningen, a suburb of The Hague, and a famous watering place. The opening ceremonies were attended by the Prince Consort, several diplomats, and members of the Dutch government and many other notable people.

The British delegates held a meeting before the congress opened and appointed a special committee to follow the proceedings of the congress, in its different sections, and to report from time to time to the whole body of delegates on anything which came up of special interest to the British delegation. The following gentlemen comprised this committee: J. Lloyd-Baker (chairman); Hon. T. W. Taverer, Victoria; Hon. W. P. Reeves, New Zealand; J. A. Ruddick, Canada; A. E. Balleine, Board of Agriculture, London; E. C. Treppin, secretary.

The chief interest in the discussions centred around two points, namely, the control of the manufacture and sale of butter in countries where the manufacture and sale of margarine are permitted and where there is some difficulty in preventing adulteration of butter; and the question of regulations dealing with tuberculosis. As Canadian delegate, the first question was not of very much interest to me, as we have settled all such matters of control in this country by prohibitory legislation. The papers were all printed in French and English before the congress opened, so that delegates had an opportunity of studying them with a view of taking part in the discussions.

The findings of the congress were embodied in resolutions which were proposed by the various sections, and finally passed at the last general session of the congress. It will be seen that the resolutions are not very decided on any of the points raised. There seemed to be a tendency to amend and modify so as to satisfy all parties until in the end most of the resolutions were pretty much neutralized.

RESOLUTIONS ADOPTED BY THE THIRD INTERNATIONAL DAIRY CONGRESS.

1st Section—Legislation and Regulations.

The Congress adopts the principle of unification of the methods for analyzing milk and its sub-products and recommends all countries to adopt the method employed by Leffman-Beam for the determination of the Reichert-Meissl figure in butter fat.

The Congress is of opinion that it is necessary to make the control of milk efficient during all its processes from the milking until it is sold and

consumed, and expresses the opinion that a control should be established based on principles which, although general, may be differentiated according to the local customs in different countries and according to the different qualities for pure milk, at the same time not prohibiting the consumption of any milk.

The Congress, considering the importance of public hygiene and the principles involved, is of opinion that supervision in the dairy should be generally adopted; that, however, the interested parties should previously or simultaneously be convinced of the necessity of such supervision, and that they should be encouraged to adopt all necessary measures, but that the provisions should be made compulsory, and that the provisions should involve severe penalties in case of serious negligence.

The Congress, considering the great importance of the dairy industry from an economical point of view, is of opinion that in those countries where it would be in accordance with the customs and habits of the country, the government should from an economical point of view establish a compulsory supervision, but on the contrary, in countries in which such intervention would be impossible or unpopular, the creameries themselves should organize an economical control service as general and complete as possible; that the public authorities should encourage by subsidies the organization of independent control, and if necessary promote the observance of its provisions; that it is necessary to call frequently together the persons charged with this control, more especially with a view to establish general principles and as far as possible to maintain a certain unity of action and of technical as well as of economical organization.

The Congress is of opinion that the countries represented at the congress must prohibit the importation:

1. of all butter coming from such countries, which have not rendered it obligatory to add latent colouring material to all fats that could be mixed with butter, or which have not adopted an efficient system of control in order to guarantee the purity of butter;

2. of all butter, not bearing a guarantee mark, and coming from countries which have an efficient system of control to guarantee the purity of butter.

The Congress takes note of the following written statement of the English members:—

‘There is no guarantee against the importation of adulterated butter, except by prohibiting the importation of all butter which is not made under the supervision or inspection of the government of the country of origin.’

Further note is taken of Mr. Harald Faber’s amendment to the above written statement, reading as follows:—

‘And which does not bear any mark showing that the butter has been subjected to such control.’

The Congress takes for notification the following statement of Mr. Hoffer:—

‘In making legal measures to regulate the butter trade—which is a matter of international character—the idea and the meaning “butter” must be exactly defined and legally be determined as a definition of origin.

‘Butter is the nourishing fat of exclusively animal origin, which is obtained by churning cow’s milk.

‘The use of the term butter for eatable fats of other origin is to be prohibited by legal measures.’

The Congress expresses the desire that in view of the importance of cheese making and the promotion of honest trade in those countries where cheese is made, measures should be adopted to guarantee the purity and the quality of the product.

SESSIONAL PAPER No. 15a

The Congress expresses the desirability that the president of the permanent bureau of the International Dairy Federation shall take the necessary steps to have a special section added to the programme of the Fourth Dairy Congress at Budapest, relating to political economy, namely, with regard to the international trade in pure milk—either sterilized or pasteurized—in butter and in cheese and with regard to the advocacy of such trade.

2nd Section—Hygiene.

The Congress is of opinion that the veterinary, the chemical and the bacteriological control must be generalized as much as possible.

The Congress is of opinion that the retail trade in milk must be confined to specially licensed localities, in which no other articles are sold than milk or food products which are not detrimental for the milk.

The Congress is of opinion that producers and consumers in all countries should be convinced of the necessity to avoid all sources of infection of the milk.

The Congress is of opinion that the milk destined for consumption in its raw state, and especially that for infants' food, must be supplied from healthy and well fed cows which have been milked dry; further, that it should be well cooled after milking and be of a normal composition.

The Congress is of opinion that public authorities should endeavour to eradicate tuberculosis, and for this purpose to institute veterinary supervision of cattle as well as hygienic supervision of the cowhouses and medical supervision of the persons charged with the milking and with the treatment of the milk at the farms.

The Congress is of opinion that the dairy industry should endeavour as far as possible to avoid middlemen between the producer of milk and the consumer.

The Congress resolves that the following proposition proposed by Prof. Porcher be referred to the next Congress: 'Under the present condition of science it may be difficult to solve the problem as to the relative value of sterilized, pasteurized and raw milk. It seems possible, however, to admit that when one has good raw milk, of which the origin is known, it is not necessary to submit it to either of such treatments. On the contrary, it becomes imperative that such treatment be adopted, when the origin of the milk destined for infant food is not known.'

The Congress being of opinion that milk coming from dairies which have at their command healthy animals and in which all the necessary hygienic precautions have been adopted, may be supplied raw, but deems it necessary from a general sanitary point of view as well as with regard to tuberculous infection by means of milk, to recommend the use of milk which has been sterilized or sufficiently boiled or pasteurized, but by methods the efficiency of which with regard to the tubercle bacillus has been scientifically proved, with due observance of the varying power of resistance observable with this micro-organism.

The Congress recommends the method of Dr. Bang for combatting tuberculosis in cattle where this is applicable; moreover Dr. Ostertag's method of combatting tuberculosis in cattle by removing such animals as are clinically affected and by breeding calves free from tuberculosis, is practicable in all countries, and it is imperative that the public authorities without delay take effective steps towards this end.

The Congress is of opinion that the elimination of animals which are acknowledged to be clinically affected with tuberculosis and the breeding of

calves free from tuberculosis, retain their importance, even when expectations, based on preventive inoculation against tuberculosis, might have been realised.

The Congress deems it desirable that the bureau of the next International Dairy Congress shall enter into correspondence with the bureau of the International Congress of the 'Gouttes de Lait,' in order to effect a closer relationship than exists at present.

The Congress requests the International Dairy Federation to institute a permanent and independent committee, based upon the legal security in the several countries; this committee to be formed from the delegates of the various countries and shall be charged with the preliminary operations for the solution and practical adoption of great dairy problems of international importance. This committee shall report to the International Dairy Congresses.

The Congress deems it desirable that the question relating to the use of the refuse products of the dairy industry as fodder for milch cows, providing milk for infants, shall be referred to the programme of the next International Dairy Congress.

2nd Section—Hygiene.

Sub-section: Veterinary Questions.

The Congress is of opinion with regard to milk production, that cow-houses should be constructed according to hygienic requirements.

The Congress is of opinion that to encourage the improvement of cow-houses it is highly desirable that cowhouse competitions should be established.

The Congress is of opinion that besides having hygienic cowhouses it is desirable that the milk producing animals be afforded ample opportunity for open air exercise.

The Congress deems it desirable that except where particular circumstances make it impossible, legal prescriptions should be made for the construction of cowhouses and to safeguard the hygienic side of the production of milk in general. The object in view must be that in all countries the building of new cowhouses be only allowed on condition that they answer reasonable hygienic requirements.

The Congress is of opinion that cowhouses should be constructed in such a way that prophylaxis of diseases in general be possible and more particularly to guard against diseases of the udder and to prevent their development. The best method of housing cattle is that adopted in Holland, namely that of a raised flooring. It is recommended that the cowhouses be subjected to disinfection with lime water.

The Congress is of opinion that the veterinary control of cowhouses and milk producing animals must be considered as of great value from a hygienic point of view. It ought to be compulsory in those countries where legal regulations do already exist. This control must be exercised as frequently as possible, but not less than every three months.

The Congress considers the removal of animals with udder tuberculosis and with other clinical forms of tuberculosis as the most important measure to prevent the infection of milk.

The Congress deems it advisable, when milk is wanted entirely harmless in respect of tuberculosis, that such milk be taken from animals:

- (a) which are free from tuberculosis:
 - 1. which do not show any symptom of this disease;
 - 2. which do not react on tuberculine;
- (b) which are not kept in an infected cowhouse.

SESSIONAL PAPER No. 15a

The Congress is of opinion that, when milk coming from such animals, which react on tuberculine, is supplied to the public, and still altogether harmless milk is wanted, it is desirable that this should be sufficiently heated before it is used.

3rd Section—Industry.

The Congress is of opinion that the use of pure ferment 'cultures' for buttermaking is essential for rational processes of manufacture, because it permits the conduct of the fermentation of the cream with certainty and method.

The Congress is of opinion that it generally is absolutely necessary to use for the culture of ferments only such seeds as have been prepared in the laboratory under the stringent rules provided by the bacteriological expert.

The Congress is of opinion that it is also necessary to mention the age of the cultures, because of the rapid attenuation to which the milk ferments are submitted under influence of different physical and chemical conditions.

The Congress is of opinion that in order to make experiments in cheese factories, it is necessary to use pure cultures and to eliminate beforehand all the detrimental ferments present in milk. It is desirable to carefully determine the nature of the ferments to be used and the quantity to be added.

The Congress is of opinion that the pasteurization of the milk for cheesemaking must be carried out under special precautions as regards the method employed for heating.

The Congress is of opinion that it is absolutely necessary that laboratories give every assistance to the cheese factories and that they on the other part can be assured of finding collaboration and the support which has hitherto never been withheld.

The Congress is of opinion that the factors influencing the quantity of water in the butter are chiefly:

- (a) the temperature when churning;
- (b) the degree of density of the particles of butter prior to the removal of the buttermilk; and further;
- (c) the condition and treatment of the cream (pasteurization, fermentation, acidity, concentration);
- (d) the method of working the butter (kneading and salting).

The Congress agrees with the wishes embraced in the conclusions of M. Maze. Hence it urges that the dairy instructors and the interested industrial men must keep them well in mind and consider them carefully in order to thoroughly grasp the principles upon which those claims are based, which the butter industry has still to effect.

These conclusions are as follows:

1. The butter industry in connection with its perfect working arrangement is capable of regularly producing a good product;
2. Its cream separators guarantee a proper output; its refrigerating machines permit the exact application of the prescriptions in regard to the temperature which suit best for the method of working followed;
3. Its steam generators facilitate the cleaning and sterilization of the apparatus and implements.

But it is not perfectly familiar with the exact method of securing the good process of fermentation.

As unfavourable factors may be mentioned:

- (a) insufficient pasteurization, which is often done in a manner contrary to the principles of bacteriology;
- (b) bad quality (chiefly lack of energy) of the starters supplied by the trade;

8-9 EDWARD VII., A. 1909

- (c) bad quality of the rinsing water, which frequently causes the butter to become rancid;
- (d) lack of every supervision in regard to the efficiency of the pasteurization, the purity of the fermentation process and the sterilization of the appliances used for buttermaking;
- (e) ignorance of the operators, who are unacquainted with the signification of infection.
- (f) carelessness on the part of the farmers, who do not seriously enough follow the advice given when the advantages of cooling the milk immediately after milking are pointed out to them.

For the executive committee of the Third International Dairy Congress,

DR. A. J. SWAVING,
The Secretary-General.

DR. H. P. WIJSMAN,
The Chairman.

For the permanent committee of the International Dairy Federation,

L. GEDOELST,
The Secretary-General.

BARON PEERS,
The Chairman.

The Dutch government apparently spared no effort to make the Congress a success, and they contributed in many ways to the enjoyment and comfort of the *Congressistes*. The writer is personally indebted to the Hon. J. D. Veegens, Minister of Agriculture, Industry and Commerce; H. S. J. Maas, Esq., Consul General for the Netherlands in London, and Dr. J. J. L. Van Ryn, Friesland Commissioner in Great Britain, for many courtesies and much assistance in the way of getting information.

It was the general opinion of the delegates that the chief value of the Congress was to be found in the intercourse which it permitted between persons engaged in dairy work from all over the world, and in the excursions which enabled the delegates to visit the farms and dairies in different parts of Holland, in which there was much to be seen that was both interesting and instructive.

A DUTCH AGRICULTURAL EXHIBITION.

A large agricultural exhibition was held at The Hague concurrently with the Dairy Congress. Unfortunately, owing to the outbreak of the foot-and-mouth disease, the government would not allow exhibits of dairy cattle, which was a matter of considerable disappointment to the delegates. As dairying is the national industry of Holland, the exhibition was particularly strong in exhibits of butter, cheese and dairy machinery. In the class for foreign cheese, Canada competed with England, New South Wales, New Zealand and Italy, and carried off the first prize. These exhibits were sent by a merchant in London. There was a very large entry of Dutch cheese, principally of the Gouda and Edam varieties. There was also a large exhibit of butter, which was shown in such a way that only the surface of the butter in the package could be seen by the judge or other person examining it. The packages were placed under a sort of closed counter with openings over each package about eight inches in diameter which were kept covered with a piece of glass. The dairy machinery on exhibition was of a very superior character in point of durability, finish and suitability. No question of expense seems to be permitted to interfere with having all dairy apparatus made in the best possible manner.

The agricultural educational exhibits from the various institutions in Holland were the subject of very favourable comment and attracted considerable attention. The thoroughness with which experiments appear to be conducted and the practical way in which the results were shown, called for considerable comment.

SESSIONAL PAPER No. 15a

NOTES ON DAIRYING IN HOLLAND.

A DUTCH CHEESE MARKET.

An interesting excursion took a number of the delegates to the province of North Holland, by which name the peninsula lying between the North Sea and the Zuider Zee is known. This district is famous for its large output of Edam cheese. Alkmaar is the principal market, but there are also markets at Hoorn and Edam. The quantity of cheese which is annually sold at Alkmaar equals about 200,000 boxes of Canadian cheese, and yet the whole district in which these three markets are located is not much larger than a good sized Canadian county. The cheese are all brought in by barge or wagon from the surrounding country and piled in separate heaps on the square in the market place. If the weather is showery, a tarpaulin is used to cover the cheese. The market officials have the cheese all weighed before the sale takes place. The individual cheese weigh about 4 pounds each, and they are weighed in drafts of about 100 cheese. The weigh house is a very ancient institution in all market towns in Holland, and usually has some very interesting features. (Plate XI.)

AN EDAM CHEESE FACTORY.

A drive through the district brought us to one of the co-operative Edam cheese factories (plate XI.), which are organized on lines very similar to those on which co-operative factories are run in this country, except that the true spirit of co-operation seems to have more place in their management than it does with us. An association is formed to build and operate a cheese factory or a creamery, the members of which give their joint and several note to some bank which furnishes all the money required. There is no share capital, but a certain amount of revenue is set aside each year to pay off the indebtedness.

A DUTCH FARM HOUSE.

During the same drive a visit was made to one of the old farms where the cows are kept during the winter months under the same roof as the family. The accompanying diagram will give an idea of the arrangement of the building. (Fig. 1.) While the cows are on pasture during the summer months, the stable is used as a cheese curing room. The winter's fodder is stored in the loft. The floors of the stable are of tile, the mangers and stalls of glazed earthenware, and everything is kept scrupulously clean. The Dutch passion for cleanliness makes this sort of thing possible.

A MODEL STABLE.

The most interesting and instructive feature of this trip was a visit to the farm 'Oud-Bussem.' (Plate XII.) Here we found 200 cows, kept under the most sanitary and hygienic conditions for the production of market milk. The stable floors are laid with tile, and the walls and ceilings finished smoothly with some kind of white enamel. The drainage and facilities for cleaning are perfect. A tunnel passes under the stable, and through this outlet all droppings are removed by means of a ear running on light iron rails. The accommodations for the milkers and the conveniences for securing the utmost cleanliness leave nothing to be desired. A heavy thatched roof makes the building warm in winter and cool in summer. Ample light and ventilation complete one of the finest stables that the writer has ever seen. The surroundings of the stable are laid out in lawns, with flower beds and shrubbery, and the whole place is attractive in the highest degree. The milk of the herd is bottled and shipped to Amsterdam in

8-9 EDWARD VII., A. 1909

very much the same manner as is now followed by the best dairies in this country. We were not allowed to enter the stables where the cows were, for fear of carrying the infection of the foot-and-mouth disease, but there was plenty of opportunity to view the interior through the open doors and windows.

AN ANCIENT DWELLING.

During a trip through the province of Gelderland, the excursionists visited a 'loshuis' or ancient farm dwelling. The 'loshuis' are said to have been built originally by the Anglo-Saxons, the primitive inhabitants of Holland. Like the other Dutch farm houses, they consist of one square building, covered with a high-pointed roof, but they differ to the extent that the various parts of the house are not separated, being, strictly speaking, all in one room. In one side of the building there is a door which gives access to the space in the centre. Around this space, which has no floor, are arranged on one side the cows; on the other side a piggery and horse stable; at the back the space for the family, on either side of which the beds are placed, each in a sort of narrow cabinet. In the centre of the family space there is a fireplace provided with the usual hangers for pots and kettles. Animals and people live there in common. It would be easy to place partitions in these farmhouses to make them similar to the Frisian or other Dutch farmhouses. This building, although kept in a clean condition, presented a great contrast to the elegant Weldan manor house and its beautiful park in the immediate vicinity.

LARGE PRODUCTION PER ACRE.

The total area of Holland is 12,648 square miles, a little over half the size of Nova Scotia, or equal to that part of Ontario lying southwest of a line drawn from the city of Hamilton to Southampton on Lake Huron. The population according to the latest returns is 5,104,137. The total exports of dairy produce for the year 1906 were 66,000,000 pounds of butter and 104,355,600 pounds of cheese. With butter at 22 cents per pound and cheese at 12 cents, the total value of the exports would amount to \$27,042,432, or very nearly as much as the value of the butter and cheese exported from Canada during the same period. These figures convey some idea of the enormous production per acre compared with Canada.

On a farm of 105 acres there were found 35 cows, 8 heifers, 25 calves, 2 horses and 25 milk ewes. These animals were fed entirely from the produce of the farm, with the exception of some linseed meal which is bought for winter use. In some of the best pasture districts it is quite common to keep two cows to three acres the year round.

The cow 'Alida' gave in a milking period of 365 days, 21,529 pounds of milk testing 3.09 per cent of fat.

Of course, the pasturage is most luxuriant and abundant and does not suffer from drought, because the water level in the ditches is not, as a rule, more than two feet below the surface of the fields.

The total number of cows in Holland in 1906 was 973,098, a few thousand less than the total number in the province of Ontario.

The average percentage of fat in the milk of the Dutch cows is a fraction over 3 per cent, but the yield of milk is very large.

CHEESE FACTORIES AND CREAMERIES IN FRIESLAND.

The province of Friesland is one of the most important dairying districts in Holland. There are 130 co-operative or semi-co-operative cheese factories and creameries in this small province consisting of 1,282 square miles. (Plates XIII and XIV.) The following description of the co-operative creamery at Uitwellingerga will

SESSIONAL PAPER No. 15a

indicate the character of these establishments. The building and equipment cost \$54,000, for which funds were secured from a bank on the joint and several note of the members of the association. There is no share capital. The indebtedness is being paid off at the rate of about \$1,000 annually, so that it will take over 50 years to pay for the building and equipment. It may be remarked in that connection that these buildings are so well put up and so permanent in every respect that they will be practically as good as ever at the end of the 50 years. That is one way in which the Dutchmen show more wisdom than we do in this country. A feature of the business end of the organization is that the patrons vote according to the number of cows from which they supply milk. The quantity of milk received at this factory in 1906 was 9,041,296 pounds from 1,150 cows, or an average of 7,860 pounds each. Both butter and cheese are made on the following plan. The milk is received twice daily. A portion of the cream is removed by a gravity method similar to the old Swedish 'Swartz' system. The cream is skimmed in a sweet condition and pure culture is added to it after pasteurization. The half skim milk thus obtained is manufactured into Gouda and Edam cheese. The patrons receive about \$1 per 100 pounds of milk. The cost of manufacturing is about 10 cents per 100 pounds of milk.

BAD WATER SUPPLY.

Probably the most serious drawback which the Dutch dairymen have to contend with is a lack of a good water supply. It is mostly surface water, more or less contaminated with sewage.

AN INTERESTING COUNTRY.

A visit to Holland must always be a delight to an observant person. The student of history will find much that will interest him in the scenes made famous in the long and stirring record of this sturdy and valiant people; the student of art may revel in the wonderful picture galleries, hung with the most celebrated canvasses by the great masters Rembrandt, Reubens, and a host of others, and in the quaint but stately mediæval architecture; the engineer will be interested in the great system of dykes by which large areas of the most productive of land have been reclaimed from the seas, and which prevent its encroachment at all times; the student of agricultural economics, particularly in relation to dairying, the national industry, cannot fail to see many things that will interest and instruct him. While it is true that labour and other conditions differ so materially as compared with those which prevail in Canada as to make it impossible for us to copy or adopt much in matters of method or practice, there are many underlying principles in their practices which are worthy of careful study. The true spirit of co-operation has been accepted by these so-called conservative Dutchmen to an extent scarcely thought of by Canadian farmers. The foresight and sense of real economy displayed by them in providing suitable and permanent buildings and equipment for carrying on their business, furnish us with a standing example that should not be lost sight of. There is much to be learned from a visit to the Netherlands.

THE SECOND INTERNATIONAL CONGRESS OF GOUTTES DE LAIT.

(PROTECTION OF INFANT LIFE.)

As this Congress was held at Brussels just before the International Dairy Congress at The Hague, I was instructed to attend it as a representative of Canada. The sessions of the Congress were held in a beautiful hall of the Palais des Academies. It met in accordance with the decision of the First Congress of 'Gouttes de Lait,' which was held in Paris in 1905, and of which it was a continuation, so to speak. The

first 'Goutte de Lait' was organized at Fécamp in 1894 by Dr. Léon Dufour, for the purpose of combatting the excessive mortality of the infants in that city who were artificially nursed, especially those in the poorer classes. Professor Budin had previously, in 1892, established in Paris a 'Consultation de Nourisson.' Dr. Eugene Lust, the secretary of the Brussels Congress, founded an institution in Brussels in 1897, having for its object the prevention of the excessive infant mortality so prevalent in that country, under the name of the 'Laiterie Maternelle' (Mothers' Dairy). These examples were followed and similar institutions were founded successively at Hodimont, Antwerp, Liège, Ghent, Charleroi, and to-day they exist in many localities in Belgium. The Brussels group alone numbers fourteen. These various institutions, which are generally referred to by the name of 'Gouttes de Lait,' have been instituted for the purpose of preventing or decreasing infant mortality by (1) giving advice to mothers, (2) by encouraging breast feeding, and (3) by giving carefully prepared milk to those infants for whom breast feeding is either impossible or insufficient.

It is said that in Belgium at one time one quarter of the 200,000 children born annually, died within a year, but that the percentage of mortality has been very materially reduced since the establishment of these institutions for the education of mothers and the supplying of wholesome milk, especially to the poorer classes.

The delegates to the Congress numbered over 600, and came from 29 different countries.

As the proceedings of the Congress and the questions discussed in the various sections belong to the realm of medical science, or hygiene, rather than to dairying, it does not seem advisable to make any extended reference to them in this report. Those readers who may desire to obtain a full report of the proceedings and papers (in French only) may secure them by applying to the general secretary, Dr. Eugene Lust, Rue de la Limite 27, Brussels, Belgium.

An effort was made to extend the scope of the Congress by the formation of an International Union of Institutions for the Protection of Child Life, with correspondents in practically all civilized countries. Dr. E. Pelletier, 9 St. James St., Montreal, is the Canadian correspondent, and I am sure he will be pleased to give full information regarding this very important movement.

It was decided that in future the congresses should be called 'Congress for the Protection of Infant Life,' with the words 'Gouttes de Lait' as a sub-title.

We have in this movement another evidence of the world-wide awakening to the importance of producing and handling milk under strictly sanitary and hygienic conditions. The old standards are no longer acceptable.

REPORT

OF THE

VETERINARY DIRECTOR GENERAL

AND

LIVE STOCK COMMISSIONER.

J. G. RUTHERFORD, V.S.

For the Two Years ending March 31, 1908.

PRINTED BY ORDER OF PARLIAMENT

OTTAWA

PRINTED BY C. H. PARMELEE, PRINTER TO THE KING'S MOST
EXCELLENT MAJESTY

1909

REPORT OF THE VETERINARY DIRECTOR GENERAL.

HEALTH OF ANIMALS AND LIVE STOCK BRANCHES,

OTTAWA, March 31, 1908.

SIR,—I have the honour to present my report as Veterinary Director General and Live Stock Commissioner for the two years ending March 31, 1908.

The period in question has been, from an official point of view, both busy and eventful and it is gratifying to be able to state that the progress made in the development of the live stock industry and in the direction of securing effective control of contagious diseases among our domesticated animals, may fairly be termed satisfactory.

Our animal industry has kept pace with the general growth and prosperity in other lines and although, the season of 1906 was in some districts, far from favourable, there is every evidence of a marked increase in the numbers as well as the value of the live stock of the country.

The continued rapid settlement of the western provinces has had a two-fold effect in augmenting the animal population, as not only have there been large importations by and for the use of our new citizens, but the breeding industry has received a fresh impetus from the ever growing demand for all classes of farm stock.

While, to the careless observer, this activity may appear of little moment, it is in reality a matter of paramount importance to the nation. Our present prosperity is based, to a far greater extent than is at first sight apparent, on the products of the farm, and while among these the western grain crop may just now bulk more largely than any other, it is an old story, scarcely needing retelling, that grain growing, without crop rotation on the use of fertilizers can only be continued for a limited period.

Even on the fertile plains of the west, this rule has full force, as is well known to those familiar with actual conditions, and today, in the older districts of Manitoba, Saskatchewan and Alberta, the best and brainiest farmers are gradually changing their methods and adopting mixed husbandry as the only means of conserving the income earning powers of the land.

Needless to say, mixed farming cannot, under ordinary circumstances, be carried on without animals, so that it is only a matter of time till every one of our western grain farms will either be abandoned to the weeds or maintain its proper quota of live stock.

The older provinces have already learned this lesson and that it has been a profitable one is clearly evidenced by the marked improvement in farming conditions, say in the Western Ontario peninsula, over those prevailing twenty years ago. To state the case in a few words, the good farmer is the backbone of Canada and stock raising is the sheet anchor of good farming.

The live stock industry is therefore one of our most valuable national assets and its present active and prosperous condition should be appreciated accordingly.

Previous to July 1, 1906, the date of my appointment as Live Stock Commissioner, my official duties were confined to the work of guarding, to as great an extent as possible, the live stock of the Dominion from the attacks of the various conta-

8-9 EDWARD VII., A. 1909

gious diseases, to which, from the earliest times, the herds and flocks of the husbandman have been subject.

Until a comparatively recent date, these scourges, like those affecting our own race, were but little understood, being looked upon as visitations of Providence, against which human skill was of little or no avail, but with the remarkable advance in medical science achieved within the last century and particularly within the last four decades, the view point has completely changed, and it is now realized that intelligent effort wisely directed, can do much to prevent their occurrence, as well as to modify their ravages.

The work of the veterinary sanitarian has, by these recent discoveries, been rendered much more effective and satisfactory than formerly, especially in the older and more thickly settled countries of the globe, where the conditions are such as to render possible the close supervision and control of live stock.

In Canada, however, and particularly in the west, the problems which confront our officers are often exceedingly serious.

The somewhat slipshod methods of handling stock which prevail among western farmers and ranchers constitute a heavy handicap to effective quarantine work. Many of these people permit their animals to wander at will, for months at a time, making no attempt at intelligent supervision: Scarcity of feed often gives rise to almost unsurmountable difficulties in maintaining the isolation of infected stock while severe weather such as that experienced during the season just past, makes any attempt at restriction practically impossible, suitable accommodation being frequently entirely lacking.

Under such conditions, disease may and often does become widespread before discovered and reported, while the tracing of contaminated herds or individuals over immense areas of open country, is an almost impossible task.

The situation has, during recent years, been still further complicated by the continuous influx of new settlers, many of whom bring animals with them and whose mode of entry as arranged by the immigration agents and railway officials, namely in large parties, renders it difficult to secure an effective inspection at the boundary.

In some of the districts from which these people come disease is rife and the risk of its introduction is correspondingly serious, but so eager are they to come in, and so anxious are many of our officials, and perhaps from their point of view, properly enough, to get them across the line and to remove all obstacles from their path, that the position of a conscientious veterinary inspector at one of the boundary ports is anything but a happy one.

It is, therefore, not surprising that while the efforts of the Health of Animals Branch to stamp out disease in Eastern Canada have been perhaps more than fairly successful, its work in the west has not so far been, productive of equally gratifying results.

The past two years have, however, been marked by one or two important forward steps in the perfecting of our organization for preventing the introduction of diseased animals and dealing with those already in the country, and I trust that I am not too sanguine when I venture the prediction that even in the face of the adverse conditions to which I have just directed your attention, we will, in the near future, be able to show a clean bill of health from ocean to ocean.

The work of organizing the Health of Animals Branch into an effective disease fighting force has been continued. Owing to the extra duties arising out of my appointment as Live Stock Commissioner and later, in connection with the new meat inspection legislation, it has not been possible for me to devote as much time as in former years to personal work in the field. A tour through the maritime provinces in the early summer of 1906 enabled me to inspect the new quarantine buildings at St. John and Halifax and the Experimental Station at Antigonish, as also to visit

SESSIONAL PAPER No. 15a

our inspectors at Sydney, Cape Breton, and Charlottetown, P.E.I. Later in that year a hurried trip was made to Chatham owing to a reported recrudescence of hog cholera in that neighbourhood and the opportunity was taken to visit Windsor and Sarnia, two of our most important frontier ports.

During the month of August I attended the annual meeting of the American Veterinary Medical Association which was held at New Haven, Connecticut, and while there read a paper on the control of glanders, the greater part of which is embodied in the special report dealing with that disease, which is issued herewith.

In October a visit was made to Washington for the purpose of conferring with Dr. Melvin, chief of the United States Bureau of Animal Industry, on matters connected with changes in our quarantine regulations regarding the importation of American horses, which have since been put into effect. During the fall and winter numerous trips to Toronto, Montreal and other points were rendered necessary in order to meet the various live stock associations or their representatives, as well as to attend the meetings of the Record Committee on business connected with the National Records.

In February I visited Chicago to complete arrangements for a special course in meat inspection for Canadian veterinarians in order to enable them to qualify for employment under the new Act. This trip was extended to Manitoba, where many local matters received attention and where I also attended the annual convention of the live stock associations and the winter fair, which this year, were held in Brandon. In March I again visited Chicago and had the pleasure of seeing the special course, above referred to, in full swing, and the studies progressing in a very satisfactory manner.

From Chicago I proceeded to Emerson where some matters in connection with the Quarantine Station demanded attention, later visiting Winnipeg where a permanent office is now maintained for the use of both branches, under the general management of Mr. G. H. Greig. This office is the headquarters of Dr. McGilvray, Chief Veterinary Inspector for Manitoba, and of all the officers engaged in the health of animals and meat inspection work in that province.

From Winnipeg I went to Calgary for the purpose of attending the show and sale held there early in April. The occasion was somewhat enlivened by a discussion on the question of the continuation of the grant made by the Live Stock Branch for the support of the show and sale, in view of the fact that the Alberta breeders had passed a resolution prohibiting entries from stockowners outside the province, an action on their part which, in my opinion, warranted the withholding of assistance from your department.

While in the west I visited Macleod and Lethbridge, going carefully over the work being done at the Quarantine and Experiment Station at the last named place.

Returning via St. Paul, I was able to make arrangements with Dr. S. H. Ward, secretary of the Live Stock Sanitary Board for Minnesota, and a gentleman of considerable executive experience, to take the position of chief of our new meat inspection service. While in St. Paul at this time, and on the various occasions on which I visited Chicago, I took every opportunity of familiarizing myself with the work of meat inspection as conducted in those centres. I was fortunately able to be present at the final examination of our Canadian meat inspectors in Chicago, and to address them on the subject of the duties which they would have to perform in the event of their appointment to the service of your department.

Early in May I found it necessary to return again to Calgary in order to attend the annual meeting of the Western Stock Growers Association, the question of the control of mange being one of such importance as to necessitate a personal discussion with the principal owners interested.

While there I was fortunate in being able to take up with Commissioner Perry, of the Royal North-west Mounted Police, the question of taking over from that

8-9 EDWARD VII., A. 1909

force the work of this branch in the Provinces of Saskatchewan and Alberta. It was decided to make the change on July 1, at which time Dr. Hilton went west and assumed charge.

Although his services in Ottawa were much missed, events have since shown that his temporary removal to Regina was in the best interests of the service, as he has succeeded in the most admirable manner in reorganizing the work. I trust that in the near future it will be possible to make other arrangements, which will permit of his being able to return to Ottawa.

During the remainder of the year a number of visits were paid to boundary points, as also to Montreal and Toronto, for the purpose of attending meetings of the various live stock associations.

In November I accompanied you to Cowansville for the purpose of discussing with a number of farmers there the question of the control of bovine tuberculosis.

Altogether the period covered by this report has been an exceedingly busy one, and the work has involved a good deal of travelling, which naturally interferes to a considerable extent with my personal control of the office work in Ottawa.

The operations of the Health of Animals Branch are now so extensive and far reaching, while those of the Live Stock Branch are also constantly extending, that the correspondence, much of which from the nature of the work carried on, is of a most exacting character, makes very serious inroads on my time, rendering it somewhat difficult to give due attention to other matters. Among the various matters dealt with during the period covered by this report, the following may be considered worthy of special mention.

New quarantine stations at Halifax, N.S., St. John, N.B., Lennoxville, Que., Guelph and Bannerman, Man., and Kingsgate, B.C., were erected and are now in full working order, while at Emerson, Man., North Portal, Wood Mountain and Willow Creek, Sask., Pendant d'Oreille, Coutts and Twin Lakes, Alta., and Midway, Osoyoos and Victoria, B.C., existing facilities have been considerably improved. A new quarantine station is at the present time being erected at Sarnia tunnel, the old premises at Point Edward being, since the building of the tunnel, inconveniently situated and altogether too large for the requirements of the service.

I regret to say that the existence of sheep scab has again been demonstrated in several districts of western Ontario. No effort was spared to secure its complete eradication, a result which was subsequently effected.

Hog cholera appears to be at last under control, a few outbreaks only having been reported, and these either attributable to old chronic cases or to fresh infection from United States sources. The district in the Counties of Essex, Kent and Lambton, so long under quarantine, was finally released from all restrictions in September, 1906, since which date, however, it has been found necessary to quarantine a few single farms on account of the sporadic outbreaks above referred to. Full statistics will be found in the special report on this disease.

Although, through the work done at the experiment station at Antigonish, it was conclusively shown that the malady locally known as Pietou Cattle Disease, is due to the ingestion of Ragwort, or *Senecio Jacobæa*, the experiments at that station were continued with a view to demonstrating whether or not sheep could eat the weed, green or dry, with impunity. These experiments were finally brought to a conclusion when it was shown beyond question that no bad effects follow the eating of this plant by sheep, and steps are therefore being taken to disseminate this information freely throughout the districts infested by this weed.

The results attending the compulsory treatment for mange of the cattle in southern Alberta and southwestern Sask., conducted by the department in 1904 and 1905, were so gratifying that the stockmen in 1906 decided that a renewal of this policy was unnecessary, with the result that infected herds, drifting over immense

SESSIONAL PAPER No. 15a

areas, again spread the disease broadcast. A strong effort was made during the succeeding summer to regain the advantage lost, and at the close of the season, when 380,000 cattle in the district referred to had been treated, the number of infected cattle had been greatly reduced. Unfortunately, however, the results of treatment were not as satisfactory as might have been owing to the fact that the use of oil emulsion was permitted. Although this form of treatment has been highly spoken of and recommended in different countries, it was found by our officers to be far less efficacious than the lime and sulphur dip, the use of which only was authorized in former years. As a result of this experience, the oil emulsion is no longer recognized as an official dip. All herds found to be affected after the weather became too cold for treatment have been held in quarantine, and will be dealt with in a satisfactory manner before they are released.

Glanders is, I am satisfied, being brought under control as rapidly as could be expected when we consider the insidious nature of the disease and the tremendous hold which it had obtained among the horses of several provinces, through being left for many years practically untouched.

The expenditure in compensation shows a most gratifying decrease, which ought to be more and more marked as the work of eradication progresses. A great forward step has recently been taken by prohibiting altogether the importation from the United States of unbroken horses, and insisting upon the application of the mallein test to all others imported from that country. As matters formerly stood, fresh centres of infection were constantly being introduced, a condition of affairs not likely to be modified so long as compensation was paid on this side of the line only.

Full reports of the work done in regard to glanders and its results will be found elsewhere.

It is worthy of note that the British Board of Agriculture has recently adopted a policy of slaughtering reacting horses, similar to that which this country was the first to adopt in 1904. There is every reason to believe that a number of other countries will soon be forced to adopt similar measures.

Maladie du Coit or dourine still continues to exist to a limited extent in Southern Alberta, several outbreaks having been discovered and dealt with. This disease is one which, from its nature, is exceedingly difficult to stamp out under range conditions. It is most insidious and in temperate climates will persist for a very long period in a chronic and practically unrecognizable form, only to develop suddenly in some specially susceptible individual, or under conditions peculiarly favourable. All doubt as to its identity with the dourine of Asia, Africa and France has been set at rest by the isolation at Lethbridge in February, 1907 by Drs. Watson and Gallivan, of the specific causal agent the *Trypanosoma Equiperdum*.

Experiments are still being conducted in the hope of our being able to secure some more reliable and easily applicable means of diagnosis, than is at present available. Fuller notes on this disease and the work done in connection with it will be found further on, while the reports of our pathologists are also attached.

Tuberculosis in cattle is, as heretofore, frequently reported, but as no practical and effective method of dealing with this disease, except by slaughter, has yet been discovered, no change has been made in the existing regulations. The slaughtering of large numbers of valuable cattle on the strength of the tuberculin test, which, though fairly reliable in detecting the presence of the disease, affords absolutely no indication of the extent to which it prevails in the individual, is, in my opinion, neither practical nor justifiable, involving, as it does, a most serious economic waste without, under ordinary circumstances, providing any guarantee of future safety. Further remarks on this subject are reserved for the special report on tuberculosis, which will be published I trust in my next annual report and which will include an

8-9 EDWARD VII., A. 1909

account of the interesting experiments by that time brought to a conclusion with the view of ascertaining the value of the open air treatment for affected herds.

Anthrax has been reported from several localities, but does not appear to be prevalent except in one or two districts which have been affected to a greater or less extent for some time past. The only effective method of combatting this disease is apparently preventive inoculation, which, together with the destruction of carcasses and debris and the disinfection of premises, should enable any one unfortunate enough to occupy infected territory to safeguard his stock.

As will be seen later, this branch of your department is now in a position to supply, through the Biological Laboratory, preventive vaccines for both anthrax and black-quarter.

The laboratory continues to demonstrate its constantly growing usefulness, not only by furnishing reliable information to farmers and veterinary practitioners as to the nature of obscure or rare diseases through reports on specimens sent in, of which the number is yearly increasing, but also by the production of diagnostic agents such as mallein and tuberculin and the preventive vaccines for anthrax and black quarter. In regard to the manufacture of the two last named preparations we were exceedingly fortunate in being able to secure the services of Dr. Adrian Loir, formerly of the Pasteur Institute, in Paris. His engagement, which extended for a period of six months, was of very great value to the branch and was the means of enabling our pathological staff to prepare these prophylactic vaccines and so put us in a position to supply absolutely reliable preparations at a fraction of the cost which Canadian stock owners were formerly forced to pay to the firms engaged in their manufacture.

Our pathologists are also continually engaged in carrying on, in addition to the duties mentioned above, research work on lines likely to be useful to the department in its efforts to control and minimize the ravages of various animal plagues. The work of these gentlemen has been increased with the bringing into effect of the new Meat and Canned Foods Act, and will undoubtedly still increase to a very much greater extent. Meanwhile, their reports for the past two years will be found both interesting and instructive.

There have been several changes in the personnel and disposition of our inspection staff, the most important of which has already been mentioned, viz. the taking over on July 1, 1907, from the Royal Northwest Mounted Police, of the work of the Health of Animals Branch in Alberta and Saskatchewan, formerly carried on by that force through its commissioner, under directions from this office.

On the date mentioned, Dr. Hilton, my chief assistant, established offices at Regina and detailed his inspectors, the greater number of whom had been veterinary staff sergeants in the police and who had been granted discharges on transfer to the Department of Agriculture, to different parts of the two provinces. In addition to the former veterinary staff sergeants, Drs. Patton, McKay, Christie, Paxton, McMurtry, Gebbie, Hawke, Head, Meakings and Ovens have been added to the staff in those provinces.

In Halifax, the removal to Sydney and consequent resignation of Dr. Jakeman, led to the appointment in 1906 of Dr. H. S. McFatridge as inspector and superintendent of quarantine. A number of additional inspection stations for animals entering Canada from the United States along the New Brunswick boundary, were established in 1907, and Inspector D. McCuaig appointed and placed in charge thereof.

In Quebec Dr. Etienne and Dr. Guy having resigned, Dr. J. H. Vigneau of Three Rivers and Dr. F. X. Beauchemin, of Beauce, were appointed inspectors, the latter being stationed at St. Johns for the purpose of enforcing the quarantine regulations at that point. In order to enable us to cope in an effective manner with the outbreak of glanders in north-eastern Quebec, Dr. Henri Gauvin was selected to deal

SESSIONAL PAPER No. 15a

specially with that district. Later in the same year Dr. A. Dauth of Coteau du Lac, was added to the staff and has since been actively employed. In Montreal, owing to the discontinuance of the system of marking export cattle, it has been possible to dispense with the services of four of the men formerly employed in this work, one man only being retained at each of the two yards to assist the inspector in examining shipments.

In Ontario there have been practically no changes in the staff. At Port Arthur Dr. D. B. Fraser has been appointed to deal with possible importations at that point, while at Rainy River and Fort Frances Dr. William Lawson, formerly employed for a short time in British Columbia is in charge. Dr. E. C. Oliver, previously inspector at Nelson, B.C., has been placed in Toronto to take charge of market and other inspections there, thus relieving Dr. Stork for outside duties. Dr. A. G. Hopkins, formerly veterinary inspector at Vancouver, B.C., was engaged for duty at headquarters where he performed Dr. Hilton's duties while that officer was organizing the new staff in Alberta and Saskatchewan.

In Manitoba, Dr. J. A. Stevenson, formerly of Carman, has been appointed on salary and placed in charge of the new quarantine station at Gretna. Dr. H. N. Thompson, of Melita, has been located in a similar capacity at Bannerman. Dr. J. P. Molloy, of Morden, resigned in 1906, while the recent changes in the quarantine regulations have practically abolished the positions held by the inspectors at Morden, Deloraine, Melita and Crystal City. I regret to report that Dr. Scurfield, of the last named place, who had been in the service of the department for some years, died during the winter of 1906-7.

Dr. W. H. McKenzie was appointed veterinary inspector at Emerson, and Dr. Robinson, the officer formerly stationed there, was transferred for duty at Winnipeg.

In British Columbia there have been but few changes. The outbreak of glanders in the Okanagan Valley having been brought under control, the services of Dr. George, who had been temporarily employed, were no longer required and his engagement was therefore terminated. On the removal of Dr. Oliver to Toronto, Dr. Frank was transferred to Nelson from Grand Forks, the latter post being placed in charge of Dr. Tambllyn, our officer at Midway. Dr. Knight who was early in the year employed for the purpose of dealing with outbreaks of disease in the Fraser River Valley, was entrusted with the work of boundary inspection at Myncaster and Bridesville on the new V.V. & E. Ry., while Dr. Jermyn formerly relieving at Osoyoos was employed during the summer of 1906 in dealing with a serious outbreak of glanders in the Bulkley Valley district of Northern British Columbia and subsequently stationed at Myncaster on Inspector Knight handing in his resignation. Dr. T. Bowhill has just been specially engaged for experimental work at Vancouver in connection with the disease known as Red Water. A report of the work done by this officer is published herewith.

In the Yukon Territory, Inspector A. Hawes was engaged with headquarters at Dawson, to replace Veterinary Staff-Sergeant Acres whose term of service in the Royal Northwest Mounted Police had expired.

On September 3, 1907, the Meat and Canned Foods Act went into effect and on that date inspectors of the department commenced the inspection of all meat and meat food products entering and leaving all packing houses throughout the Dominion which exported meat products to other provinces or countries. The services of Dr. S. H. Ward as chief meat inspector were obtained and a large staff of veterinarians who had passed the special examination at Chicago previously referred to, was engaged. The labour involved in getting the machinery in sufficiently satisfactory working order to have it running smoothly on the date set by the Act was by no means inconsiderable. It has, of course, been necessary in many cases to educate the parties concerned as to the necessity for certain portions of the regulations, but I

SESSIONAL PAPER No. 15a

In British Columbia there were 6 outbreaks, 3 of which were on Vancouver Island, 2 in the New Westminster, and 1 in the Kootenay District.

125 hogs, valued at \$1,309.60 were destroyed at a cost of \$873.05.

In Manitoba one hog, valued at \$3 was killed for purpose of examination, at a cost of \$2, and was found not to have been affected with hog cholera.

In Quebec, 1 hog, valued at \$15, was killed for purposes of examination, at a cost of \$10, and was found not to have been affected with hog cholera.

The total number of hogs slaughtered throughout the Dominion as being affected with hog cholera, therefore, was 228, the value of which was \$3,290.60 and the compensation paid, \$2,193.66.

STATISTICS FOR THE TWELVE MONTHS ENDING MARCH 31, 1908.

In Ontario, 437 hogs, valued at \$3,624.50 were destroyed in the following counties, at a cost of \$2,416.58 in compensation:—

| | Outbreaks. | Hogs destroyed. |
|-------------------------------|------------|--------------------|
| County of Kent— | | |
| Harwich township. | 7 | 61 |
| Raleigh township. | 1 | 16 |
| County of Essex— | | |
| W. Sandwich township. | 5 | 154 |
| Pelee Island. | 13 | 175 |
| Maidstone township. | 1 | 19 |
| County of Simcoe— | | |
| Vespra Township. | 1 | 12 |
| | <hr/> 28 | <hr/> 437 |

In British Columbia there were 8 outbreaks, all at the Pacific coast, where 116 animals, valued at \$992.89 were destroyed at a cost of \$663.05 in compensation.

The total number of hogs slaughtered throughout the Dominion as being affected with hog cholera, therefore, was 553, the value of which was \$4,617.39, and the compensation paid, \$3,079.63.

TUBERCULOSIS.

No change has been made in the policy of the department in regard to this disease. Cattle imported into Canada for breeding purposes or milk production are tested in quarantine, except in the case of cattle from the United States which are admitted on inspection only when accompanied by a satisfactory test chart signed by an inspector of the United States Bureau of Animal Industry. Our officers test similar classes of cattle exported to the United States as also the cattle in a few herds which are placed entirely under their control and supervision. All reactors are permanently earmarked and their exportation prohibited.

The tuberculosis circular printed hereunder has been very extensively distributed and as a result, a considerably increased number of doses of tuberculin have been sent out from the biological laboratory to private practitioners, the number of animals thus tested during the years ending March 31, 1907 and 1908 being 1,527 and 1,978, respectively.

TUBERCULOSIS.

REGULATIONS RELATING TO TUBERCULOSIS.

By Order in Council dated 23rd December, 1904, in virtue of "The Animal Contagious Diseases Act, 1903."

'(1) The disease of tuberculosis is hereby exempted from the operation of Sections 5, 6, 7, and 8 of the 'Animal Contagious Diseases Act, 1903.' R. S. 1906.

'(2) Cattle which have re-acted to the tuberculin test shall be deemed to be affected with tuberculosis, and shall be permanently marked, in such manner as the Veterinary Director General may, from time to time prescribe

'(3) Cattle which have re-acted to the tuberculin test, shall not be permitted to be exported from the Dominion of Canada.'

Extract from Canadian Quarantine Regulations, in regard to Cattle from Countries other than the United States and Mexico.

'Cattle six months old or over imported from countries other than the United States and Mexico shall not be discharged from quarantine until they have been submitted to the tuberculin test by the Superintendent of the quarantine or other duly authorized officer.

'Cattle re-acting to the tuberculin test, but not showing clinical symptoms, shall be permanently marked in the right ear with the letter 'T' by the officer making the test, and may then be released at the expiry of the prescribed period of quarantine if found free from all other infectious or contagious diseases.

'Cattle showing clinical symptoms of tuberculosis shall be destroyed or otherwise disposed of as the Minister may direct.'

Extract from Canadian Quarantine Regulations, in regard to cattle from the United States.

'Cattle for breeding purposes and milk production six months old or over, if unaccompanied by a satisfactory tuberculin test chart signed by a veterinarian of the United States Bureau of Animal Industry, must be detained in quarantine for one week or such further period as may be deemed necessary and subjected to the tuberculin test; cattle re-acting thereto must be returned to the United States or slaughtered without compensation.

'Importers may be required to furnish a statutory declaration that the chart produced applies to the cattle it purports to describe and no other.'

Export of Cattle to the United States.

To enable exporters to comply with that portion of the United States Regulations printed below, the Department, will, on receiving not less than one week's notice, arrange for the testing with tuberculin, by one of its regular salaried Inspectors, of Canadian animals about to be exported to that country.

"A certificate for cattle over six months old for breeding purposes and for milch cows must also show that they have been submitted to the tuberculin test by a Canadian official veterinarian or an inspector of the Bureau of Animal Industry, and found free from tuberculosis, giving the date and place of testing, with a chart of reaction, and a description of the cattle, with age and marking

"All cattle imported for breeding, milk production, grazing, or feeding, when not accompanied by the required affidavits, must be detained in quarantine for one week, at the expense of the owner or importer, under the supervision of the inspector in charge. During this detention a rigid inspection will be made, and cattle over six months old for breeding and milk production, will be tested with tuberculin. Animals found free from disease at the end of that period will be released."

SESSIONAL PAPER No. 15a

CONDITIONS UNDER WHICH TUBERCULIN IS SUPPLIED.

The department does not test any cattle for tuberculosis, except those imported and exported for breeding purposes, and such herds as are placed entirely under the control and supervision of its officers.

If any owner of cattle desires to have his animals tested, and will send in to the department the number of doses required, and the name of any reputable qualified Veterinary Surgeon whom he wishes to employ to do the work, the latter will be furnished free with sufficient tuberculin, on condition that he reports to the department the results of the test on charts which are supplied for that purpose.

The department does not order the slaughter of tuberculous animals, and consequently no compensation is or can be paid.

It must be distinctly understood that the remuneration of the Veterinarian making the test is to be paid by the owner of the animals and not by the department.

Directions for Applying the Tuberculin Test.

To obtain the normal temperature of the animal to be tested, at least four temperatures, three hours apart should be taken on the day the tuberculin is to be injected.

The requisite dose should be injected under the skin with a hypodermic syringe that has been previously sterilized. The skin at the point of the injection should be saturated with an antiseptic solution before the injection is made.

(The most convenient agents for the sterilization of the syringe and the saturation of the skin are carbolic acid or creolin in solution. The solution is made by the addition of one part of carbolic acid or of creolin to twenty parts of water.)

The hypodermic needle should be dipped in the antiseptic solution after each injection before proceeding to again fill the syringe or inject another animal.

After injection five temperatures should be taken at intervals of three hours commencing with the *tenth* hour.

In cattle which have recently undergone a previous test the re-action frequently begins much earlier, and it is then advisable to take the first temperature not more than two hours after injection, and to continue taking temperatures every third hour thereafter up to the usual time.

Veterinarians about to apply the test should carefully study the chart on which its results are to be recorded. The hours are not fixed, as under pressure of work, these may vary.

The Veterinarian must mark, in the space for that purpose, the actual hours at which temperatures are taken, so that no misunderstanding of the record may be possible.

Attention is also directed to the note in the column for decision.

The plan at one time followed of deciding as to the health or disease of an animal tested with tuberculin, viz.: by a rise of 2° in the temperature after injection, is no longer considered satisfactory. Under that system it was possible, where the normal temperature was low, to condemn an animal with a temperature under 103° . On the other hand, an animal with a high normal temperature on injection might be passed as healthy, although showing a re-action approximating 105° , which is entirely out of the normal range.

Under the system now followed animals whose temperatures after injection do not exceed 103° are to be classed as healthy unless clinical symptoms of tuberculosis are present.

Animals showing temperatures after injection of 104° or over are to be classed as tuberculous.

Animals whose temperatures after injection do not reach 104° , but rise above 103° , are to be marked suspicious, unless some extenuating circumstance accounts

8-9 EDWARD VII., A. 1909

plainly for the rise, in which event a clinical report is to be attached to the chart as indicated in the note

Earmarking of Re-actors.

Attention is specially directed to the fact that cattle re-acting under any circumstances are permanently earmarked by one of the regular officers of the department, and may then be dealt with as the owner sees fit, subject to the approval of the local health authorities, except that their exportation will not be permitted

J. G. RUTHERFORD,
Veterinary Director General.

HEALTH OF ANIMALS BRANCH,
DEPARTMENT OF AGRICULTURE,
OTTAWA, July, 1906

STATISTICS FOR THE TWELVE MONTHS ENDING MARCH 31, 1907.

435 cattle were tested for export, 39 of which re-acted, 1 was classed as suspicious, and 395 successfully withstood the test.

386 cattle were tested on being imported into Canada, 23 of which re-acted, 3 were classed as suspicious and 360 proved healthy.

1,527 cattle were tested by private practitioners with tuberculin supplied by this department, 183 of which re-acted, 25 were classed as suspicious and 1,319 proved to be healthy.

STATISTICS FOR THE TWELVE MONTHS ENDING MARCH 31, 1908.

502 cattle were tested for export, 11 of which reacted, 2 were classed as suspicious, 489 thus successfully withstanding the test.

366 cattle were tested on being imported into Canada, of which 27 re-acted, two were classed as suspicious and 337 healthy.

1,978 cattle were tested throughout the Dominion by private practitioners, with tuberculin supplied by this department, 263 of which re-acted and 60 were classed as suspicious.

With regard to this general testing it must be borne in mind that in many cases the existence of tuberculosis is suspected in a herd before tuberculin is applied for, and the proportion of re-actors cannot be cited as that obtained from indiscriminate testing.

All re-actors were permanently earmarked by a veterinary inspector in cases where the owner did not voluntarily destroy them.

GLANDERS.

The statistics printed in connection with this highly dangerous and insidious malady cannot fail to give great satisfaction.

While the efforts of our inspectors have been as energetic as formerly, and the number engaged in the work considerably increased, it is very gratifying to note that in the twelve months ending March 31, 1907, nearly 250 fewer horses were slaughtered than in the similar period ending October 31, 1905, while the figures for the twelve months ending March 31, 1908, show a still further decrease of more than 550 over the 1907 figures. I am convinced that this disease is being systematically and thoroughly eradicated, but its ravages are in many cases so insidious that the work is obviously one which cannot be completed rapidly nor dealt with in a manner other than systematic.

SESSIONAL PAPER No. 15a

The testing of all American horses entering Canada, a policy which has now been inaugurated, will undoubtedly result in the prevention of fresh centres of infection being introduced into Canada, and I can confidently predict a still further large decrease in the number of horses slaughtered and the corresponding amount of compensation involved.

The number of doses of mallein issued to our inspectors during the two years ending March 31, 1907 and 1908 was 14,303 and 20,946 respectively.

STATISTICS FOR THE TWELVE MONTHS ENDING MARCH 31, 1907.

Dominion.

During the year, 1,881 horses were slaughtered, as hereunder shown:—

| | | | | | | |
|------|---------------------------|---|-----------------|--|---|---|
| 1881 | 177 killed on inspection. | | | | } | Valued at \$213,086.00. At a cost of \$142,057.07. |
| | 1,531 | " | after 1st test. | | | |
| | 160 | " | " 2nd " | | | |
| | 7 | " | " 3rd " | | | |
| | 2 | " | " 4th " | | | |
| | 4 | " | " 6th " | | | |

954 showed clinical symptoms.

8687 horses were tested with mallein, of which 1,704 reacted and were destroyed.

Of the 1,704 re-actors, 777 showed clinical symptoms of glanders at or during the test.

There was one ceased re-actor.

Fifty-six horses are under control for re-test.

New Brunswick.

3 { 2 killed on inspection } valued at \$375.00.
 3 { 1 killed after first test } at a cost of \$249.98.

3 showed clinical symptoms.

3 horses were tested, one of which re-acted, and also showed clinical symptoms during the test.

All three horses were in Carleton county.

Nova Scotia.

Three horses were tested with mallein, but proved to be healthy.

Quebec.

| | | | | | | |
|-----|----------------------------|---|-----------------|--|---|---|
| 227 | { 16 killed on inspection. | | | | } | Valued at \$25,960.00. At a cost of \$17,306.21. |
| | 198 | " | after 1st test. | | | |
| | 7 | " | 2nd " | | | |
| | 2 | " | 4th " | | | |
| | 4 | " | 6th " | | | |

104 showed clinical symptoms.

992 horses were tested with mallein, of which 211 re-acted and were destroyed. Of the 211 re-actors, 88 showed clinical symptoms of glanders at or during the test.

There were no ceased re-actors. No horses are being held for re-test.

Of the 227 horses slaughtered—

| | | |
|-----|---------|----------------------------|
| 5 | were in | Drummond and Arthabasca, |
| 2 | " | Richmond and Wolfe, |
| 3 | " | Pontiac, |
| 11 | " | Wright, |
| 1 | " | Hochelaga, |
| 1 | " | St. Johns and Iberville, |

Of the 44 re-actors 18 showed clinical symptoms.

All the horses slaughtered were in the Dawson and Forty Mile district.

PICTOU CATTLE DISEASE.

The results of the experiments conducted at Antigonish, Nova Scotia, having, as reported last year, shown beyond question that the specific hepatic cirrhosis, locally known as Pictou Cattle Disease, is due to the continued eating of Ragwort or *Senecio Jacobea*, the work at this station would have been discontinued but for the wish to secure definite information as to the value of sheep and incidentally of other animals as agents in the extirpation of the weed in question.

Experimental work, with this object, has, as stated in previous reports, been for some time in progress and I am glad to be able to report that the results, are of the most gratifying nature. Sheep appear to eat the weed, both green and in a dried state, with perfect impunity. The work of eradicating the weed is thus greatly simplified, as much of the infested territory is of such a nature that the adoption of ordinary agricultural methods for weed extermination is a practical impossibility. While there is in the weedy area a great deal of excellent agricultural land, much of which has however been unfortunately allowed to run down, there is a considerable proportion of bush, also, many hills too steep and in some cases too rocky for cultivation. The weed is everywhere, in the fields, in the bush, on the hills, along the sea-shore and by the roadsides. It has secured such a foothold that ordinary methods will be powerless to eradicate it. It is apparently true that it is only injurious to cattle when fed in the dry state, as among hay or other fodder, this theory being confirmed from a practical point of view but of course weakened theoretically by the ascertained fact that these animals never, of their own accord, eat it when green if any other food is procurable. While this would seem to indicate that in order to

prevent the disease it is only necessary to effect its eradication from fields and hay meadows, it must be remembered that it is a free seeder and the seeds being light and furnished with down are carried long distances by the wind, to say nothing of other agencies. It will be seen therefore that unless the weed is eradicated or at least kept under control on the surrounding hills and road-sides, the residents of the infested area have before them an interminable task in attempting to keep their fields and hay meadows in a weed-free condition, while permitting it to grow elsewhere.

As we have succeeded in showing that sheep can eat the weed and continue to thrive, it will undoubtedly pay the farmers of the infested area to go into the sheep raising industry, more especially as there is not, to my knowledge, any district in Canada, with perhaps the exception of some part of the Eastern Townships, in which weed or no weed, richer returns from this particular branch of husbandry could reasonably be expected. The country is an ideal one for sheep raising, being capable of producing an abundance of winter feed, while the hilly pastures and other rough lands are admirably adapted to this class of stock. Wolves are unknown, and while there are yet a few bears in the deeper woods, they are not in sufficient numbers to constitute a serious menace to the flocks. The future of the sheep industry for many years to come is assured, inasmuch as the present supply is far from equal to the demand, which, in this particular district is very large and constantly increasing, the export trade to New England furnishing a regular and ready market. Wool is also rising in price, and if the proper breeds are selected there is no doubt but that this product also will return a large profit. Last, but by no means least important is the fact that if the sheep are properly handled so as to give the long cultivated and run down arable lands on each farm the benefit of their attentions from time to time, as can easily be arranged by the adoption of a simple system of rotation in which crops suitable for the purpose may be grown, the fertility of the crop worn fields will shortly be restored to the lasting advantage of their owners and of the district in general.

It must of course be admitted that while sheep are, beyond question one of the most profitable of farm products, they differ somewhat from cattle and even from swine, inasmuch as while animals of the two last-named species will, even when badly bred, poorly fed and ill-cared for, still pay for their keep and perhaps yield a small profit, the sheep require constant watchful care and many special attentions, which can only be given by men of practical knowledge and some skill.

Many farmers in Nova Scotia, as elsewhere in Canada, have hitherto paid but little attention to sheep, and this fact must be borne in mind and proper steps taken to supervise and safeguard the industry, otherwise disappointment and loss will be certain to follow, and the last state of the weedy district will be worse than the first.

The Government of Nova Scotia is, through the Provincial Department of Agriculture and the Agricultural College at Truro, carrying on a good deal of educational work with reference to the sheep industry as well as to other branches of farming, a task in which it is being assisted to a considerable extent by the Live Stock Branch of your department, which from time to time furnishes skilled and practical speakers for the various meetings held throughout the province. I would however respectfully suggest that this department might with advantage go somewhat farther and undertake on its own account to furnish the farmers of the weedy area with practical object lessons in sheep raising by the establishment of a few small experimental stations somewhat similar to that at Antigonish, on which, at a small cost, flocks could be maintained under the care of an expert practical shepherd. The station at Antigonish is visited by very large numbers of farmers from the surrounding country and although no special attempt has been made to demonstrate scientific farming or feeding, the attention of those in charge having been almost entirely directed to the conduct of the experiments already described, the systematic way in which the farm has been carried

SESSIONAL PAPER No. 15a

on and the results as shown by the condition in which the healthy animals have been turned off, have evoked much favourable comment and the example has had an excellent effect as is shown by the improved condition of many neighbouring farms. This fact is simply cited in support of the views which I have held ever since my first visit to the district for purposes of investigation, namely, that the Nova Scotia farmer, like many others of his class elsewhere, though perhaps owing to his long isolation to a much greater degree, is more likely to be benefited by practical ocular demonstration of fact than by the most erudite essays or eloquent addresses on farm topics. I am convinced that stations such as I have described can be carried on, if not at an actual profit, at least at very small expense, while the permanent benefits which would result from their establishment can scarcely be over-estimated, from the view point of local economics.

Immediately on the conclusion of the experiments, a full and complete bulletin on the results obtained was published and thoroughly disseminated throughout the Maritime Provinces, and as a result the population of that portion of the Dominion are now well aware of the easy and profitable method by which the pest may be overcome.

MANGE IN CATTLE.

I regret to report that this troublesome and highly contagious disease still prevails to a somewhat serious extent in Southern Alberta and South Western Saskatchewan. The compulsory dipping orders of 1904 and 1905, were, especially the latter, very generally and thoroughly enforced with most beneficial results. In fact so free from disease were the cattle of the quarantined area during the winter of 1905-6, that there was a very general feeling among the stock men interested that a repetition of the compulsory order was unnecessary, and, at the annual meeting of the Western Stock Growers' Association held at Macleod in May of 1906, a strongly worded resolution to that effect was unanimously carried. I may say that my own view of the case was somewhat different, but as circumstances rendered my attendance at the meeting impossible, and as it would have been a very difficult matter to enforce a compulsory dipping order against the wishes of and without the active co-operation of the large owners who had thus declared against it, it was decided to let one season pass without active measure further than the quarantining and treatment of all herds found to be affected. Every effort was therefore made to locate and deal with infected herds and until well on in the season, it appeared as if the results would be reasonably satisfactory. Shortly after winter set in however, the presence of the disease in a number of unsuspected and untreated herds became only too evident, and, as the weather precluded any attempt at curative measures, we had to content ourselves with endeavouring to keep under quarantine such animals as we knew to be affected or to have been exposed to infection. Under ordinary climatic conditions this policy might have been effective at least in confining the disease to the original infected herds but the winter which set in very early proved to be the most severe ever experienced since the settlement of the country, with the result that restrictive measures were utterly useless. Storms of exceptional severity were frequent and of long duration while the cold was intense and continuous. Cattle drifted for immense distances, fences were broken down or cut to prevent the storm-driven animals from piling, the diseased herds mixed freely with the others and through their huddling together for protection against the intense cold, the disease spread with extraordinary rapidity, until it was perhaps fully as prevalent, at least in some districts, as it was in 1904. Its effects combined with those of the unprecedentedly severe winter and consequent lack of feed caused heavy losses.

8-9 EDWARD VII., A. 1909

Psoroptic scabies among domestic cattle, where the animals of each individual owner are closely confined to his own premises either in buildings or behind proper fences, is anything but a serious malady, as the danger of its spread is reduced to a minimum, while it can always be detected in the incipient stages and effectively dealt with, yielding, as it does, to simple treatment. On the range it is a very different matter. It is not only very easily transmitted from the animals of one owner to those of another either by direct contact, or indirectly through inanimate objects which have become contaminated, but owing to the fact that, especially during the mild season, it has a well marked tendency to assume a latent form, taken in conjunction with the further fact that range animals are not kept under regular and frequent observation, it rapidly gets beyond control. The result is that herds, which during the summer may appear and in fact may actually be absolutely free from infection, having perhaps even been thoroughly treated, are not unfrequently found, on the arrival of cold weather, to be badly infected through contact on the range with the diseased stock of some other owner who possibly did not believe in treatment or was too careless or indolent to look after the health of his animals.

Under range conditions therefore, the policy likely to prove most effective in eradicating the disease is that which we have on three separate occasions endeavoured to enforce namely, the universal and, as far as possible, simultaneous treatment of all the cattle within the affected area, whether showing signs of the disease or not. That we have not been more successful is due very largely, in my opinion, to the fact that, as above stated, a considerable proportion of the smaller owners have, instead of co-operating heartily with us in our efforts to promote and safeguard their interests, assumed a more or less antagonistic attitude.

In the spring of 1907, it was obvious that compulsory dipping was absolutely essential and it was therefore proceeded with as rapidly as possible. The area involved was divided into districts, in charge of veterinary inspectors, and again subdivided into sub-districts under the charge of experienced cowmen. Thousands of bulletins containing full descriptions of the disease and the methods of combatting it, together with the terms of the compulsory order under which the operations were conducted, were distributed throughout the country and as a result 382,921 cattle were treated. It is unfortunate that the oil emulsion, authorized for use in addition to the lime and sulphur dip, and with which over 110,000 cattle were treated, did not prove satisfactory and its discontinuance under the auspices of the department was decided on as soon as the results were observed during the following winter.

Lime and sulphur is by far the best dip obtainable and the ranchers are now limited to its use when our officers supervise the treatment of their cattle.

STATISTICS FOR THE TWELVE MONTHS ENDING MARCH 31, 1907.

In Saskatchewan, 332 cattle were quarantined on twenty-two premises.

In Alberta, forty bands of cattle were quarantined, involving the control of 15,699 cattle. Only 1,673 of these were, however, found to be affected.

STATISTICS FOR THE TWELVE MONTHS ENDING MARCH 31, 1908.

In Ontario there were two outbreaks, 91 cattle being quarantined.

In Saskatchewan there were two outbreaks, 1,760 cattle being quarantined.

In Alberta 187 bands of cattle were quarantined, involving the control of 53,518 cattle. A large number of these were quarantined on account of their owners failing to dip, in accordance with the provisions of the Compulsory Mange Dipping Order.

382,921 cattle were treated, subdivided as follows:—

265,301 dipped once, of which 259,354 were dipped twice.

110,351 treated with oil emulsion.

7,269 hand treatment.

SESSIONAL PAPER No. 15a

MALADIE DU COIT.

A marked diminution in the number of animals slaughtered by reason of their being infected with this insidious malady is shown in the statistics for the two years covered by this report. In the previous seventeen months 412 horses had been destroyed, while in the past 24 months only 216 were found to be affected.

A number of animals of the doubtful class are being held in quarantine as suspects, and it can safely be said that, so far as is humanly possible, the disease is well under control. One animal was found to be diseased at Battleford, Sask., but all the other cases were discovered in Southern Alberta or in that part of Western Saskatchewan immediately adjacent thereto. The compensation involved in the last twelve months was under \$3,500.

A most interesting series of experiments has been under way at the branch experiment station at Lethbridge, in charge of Inspector E. A. Watson, and that officer, assisted by Inspector M. V. Gallivan has recently been successful in isolating the *Trypanosoma equiperdum*, in cases drawn from the infected district, thus demonstrating that the disease as found on this continent is similar to that of European and tropical countries.

STATISTICS FOR THE TWELVE MONTHS ENDING MARCH 31, 1907.

167 animals valued at \$15,505 were slaughtered as being affected with this disease, at a cost of \$10,336.44, distributed as follows:—

Saskatchewan.

| District. | Slaughtered. |
|----------------------|--------------|
| Rush Lake | 24 |
| Battleford | 1 |
| | <hr/> |
| | 25 |

Value, \$2,850; compensation, \$1,899.90.

Alberta.

| | <hr/> | <hr/> |
| | 49 | 131 |

49 horses were slaughtered, valued at \$5,175, at a cost of \$3,449.92.

8-9 EDWARD VII., A. 1909

MANGE IN HORSES.

This disease has been prevalent to a small extent in certain districts in Quebec, while a few cases are also dealt with in the provinces further west.

It is very difficult to entirely eradicate this disease when the modern facilities for transportation and the ease with which the infection is transmitted are considered. The outbreaks are however, isolated, and being detected early, and the disease promptly dealt with, very little opportunity is afforded for it to spread.

STATISTICS FOR THE TWELVE MONTHS ENDING MARCH 31, 1907.

| | Outbreaks. | Animals Affected |

SHEEP SCAB.

A number of cases of this disease were detected, all being confined to western Ontario. Middlesex county furnished the largest number of cases, and needless to say, prompt and effective measures were instituted with a view to eradicating the pest.

All sheep quarantined were dipped twice under the supervision of our inspectors, while frequent visits were made to infected premises before they were finally disinfecting and released from quarantine restrictions.

STATISTICS FOR THE TWELVE MONTHS ENDING MARCH 31, 1907.

In Ontario 455 animals were found to be affected with sheep scab, involving the quarantine of 1,678 sheep on 56 premises, distributed as follows:

SESSIONAL PAPER No. 15a

| County. | Affected. | Quarantined. |
|---------------------------|-----------|--------------|
| Manitoulin Island.. . . . | 53 | 663 |
| Lambton.. . . . | 2 | 15 |

ANTHRAX.

Several outbreaks of this disease have been reported in the provinces of Ontario and Quebec, the disease having also appeared on one farm in New Brunswick.

In every case reported, an inspector has been promptly sent to make an investigation, and to take measures as effective as possible to prevent the spread of the disease. As a rule, all contact animals were inoculated with the preventive vaccine now manufactured at our laboratory, although for obvious reasons this work is not done by our own inspectors, but by veterinarians engaged by the owners themselves. The results are almost without exception of the most satisfactory nature, the spread of the disease being more immediately checked by this method than by any other. Much good, nevertheless results in other ways from the visit of the inspector. In more than one instance, human beings were found to have become infected, and to be in a dangerous condition, the disease not having been recognized by the attending physician who was unfamiliar with the disease or its symptoms.

In one instance, in which no animals were affected, but in regard to which I was notified, and sent an inspector to inquire into the circumstances, two men died of anthrax, becoming infected through unloading a car of South American hides.

In the event of an ordinary outbreak of anthrax among live stock, much depends upon prompt action in dealing with carcasses and debris. These if carelessly handled, rapidly spread the infection, one case thus being likely to give rise to many more. Our inspectors are instructed to see that all carcasses of infected animals, together with excreta, bedding, &c., are thoroughly destroyed, preferably by burning, although

8-9 EDWARD VII., A. 1909

where this is not possible, deep burying with lime is practised. The handling of the carcasses and other articles mentioned is a matter of great importance as the infection is frequently spread over a considerable area by carelessness in this regard.

All stables, fences, troughs and other articles with which the diseased animals have been in contact are thoroughly cleansed and disinfected. As a rule, where any doubt exists as to the nature of the disease, specimens of blood are forwarded to the Biological Laboratory for confirmative microscopic diagnosis. 1,801 doses of anthrax vaccine have been supplied during the past two years.

The following outbreaks were reported and dealt with in the twelve months ending March 31, 1907.

| | Outbreaks. | Animals Died. |
|------------------|------------|---------------|
| Quebec. | 4 | 26 |
| Ontario. | 20 | 74 |
| | <hr/> | <hr/> |
| | 24 | 100 |

The four outbreaks in Quebec were in the counties of Napierville, Three Rivers, Bagot and Berthier respectively.

In Ontario, eighteen outbreaks were in Dundas county, one in Durham and one in Renfrew county.

The following outbreaks were reported and dealt with during the year, ending March 31, 1908:

| Province. | Outbreaks. | Animals Died. |
|------------------------|------------|---------------|
| New Brunswick. | 1 | 4 |
| Quebec. | 5 | 12 |
| Ontario. | 5 | 13 |
| | <hr/> | <hr/> |
| | 11 | 29 |

The New Brunswick outbreak was in Queen's county.

In Quebec, three outbreaks were in St. Hyacinthe county, one in Megantic and one in Quebec.

In Ontario, three outbreaks were in Simcoe county and two in Dufferin.

BLACK QUARTER.

Black quarter has, as usual, prevailed to a certain extent in different provinces. No statistics are available in regard to it as it is not dealt with under the Animal Contagious Diseases Act.

The practice of preventive inoculation is very generally adopted, 8,054 doses of blackleg vaccine being shipped from Ottawa in addition to that sold by druggists throughout the Dominion.

RABIES.

I regret to have to report that rabies has made its appearance in a number of different districts throughout the Dominion. Several outbreaks have taken place in the Niagara peninsula some of which have been directly traceable to dogs from the United States.

In Western Canada also, both in Manitoba and Saskatchewan outbreaks have occurred, in all probability due to infection derived from dogs brought in by settlers from the United States, in which country the disease prevails to a considerable extent.

SESSIONAL PAPER No. 15a

All outbreaks reported were promptly dealt with, and in the western provinces, considerable districts were placed under the operation of the muzzling order provided in the regulations a copy of which is printed herewith.

DOMINION OF CANADA.

REGULATIONS RELATING TO RABIES.

By Order in Council dated 10th August, 1905, in virtue of 'The Animal Contagious Diseases Act, 1903.'

1. No dog or other animal which is affected with or has been exposed to the infection of rabies, shall be permitted to run at large, or to come in contact with other animals.

2. Any veterinary inspector may declare to be an infected place within the meaning of 'The Animal Contagious Diseases Act, 1903,' any place or premises where the infection of rabies is known or suspected to exist.

3. Veterinary inspectors are hereby authorized to order the slaughter of any dog or other animal affected with rabies, or suspected of being so affected, and to order the disposition of the carcase of such animal.

4. Veterinary inspectors are hereby authorized to order dogs or other animals which have been exposed to the infection of rabies, to be detained, isolated or muzzled.

5. No dog or other animal, nor any part thereof, shall be removed out of an infected place without a license signed by an inspector.

6. Every yard, stable or outhouse, or other place or premises, and every wagon, cart, carriage, car or other vehicle, and every vessel and every utensil or other thing infected or suspected of being infected with rabies, shall be thoroughly cleansed and disinfected by and at the expense of the owner or occupier in a manner satisfactory to a veterinary inspector.

7. On receiving the report of an inspector to the effect that rabies is known or suspected to exist in any locality, the Minister of Agriculture may order that all dogs, or other animals, within such an area as he may determine or describe, shall be detained, isolated or muzzled during such period as he may see fit.

J. G. RUTHERFORD,
Veterinary Director General.

Health of Animals Branch,
Department of Agriculture,
Ottawa.

' LOCO ' POISONING.

In one or two districts in the West, the peculiar disease known, rightly or wrongly, as 'Loco' poisoning, has for a number of years existed to a greater or less extent.

The matter has always been one of interest to this Branch and Drs. Hargrave and Warnock, who are perhaps more familiar with Western conditions than the majority of our officers, have devoted considerable attention to it, as will be seen from previous reports.

Owing to representations made by stock owners in the affected districts, a thorough investigation has now been undertaken, and the Special Report of Dr. Hilton is published herewith.

A series of extensive experiments is being conducted at our Lethbridge Station. This work, which has never, so far as I know, been previously undertaken on exactly similar lines, will be not only interesting but possibly very valuable, especially if the findings of Mr. Albert C. Crawford, Govt. Pharmacologist at Washington, who attributes the condition known as 'Loco' poisoning to the introduction to the animal economy of salts of barium, for which it has been shown that the 'Loco' plant (*Oxytropis Lambertii*) has a marked affinity, is verified by our work.

BIOLOGICAL LABORATORY.

The work performed at the Biological Laboratory under Dr. C. H. Higgins has been very satisfactory. The routine work of supplying mallein, tuberculin, blackleg vaccine, reporting on specimens received, etc., has very largely increased. Dr. Hadwen, formerly in charge of the Experiment Station at Lethbridge, was transferred in 1906 to headquarters, being replaced by Dr. A. E. Watson.

The interesting report of Dr. Higgins gives full details of the work performed and the progress made at the Laboratory.

EXPORT INSPECTIONS.

Export inspections have, as heretofore, been conducted at Montreal, Bridgeburg, Toronto, Niagara Falls, Winnipeg, St. John and Halifax, while local shipments from Canada have been inspected at other points as circumstances warranted, a considerable number of animals passing through Bayfield and Mulgrave, N.S., Charlottetown, P.E.I., and Sydney, N.S.

The excessive severity of the winter of 1906-7, resulted in a serious diminution in the number of western cattle exported the following season.

All cars conveying cattle from the range country are thoroughly cleansed and disinfected after use, while the system of double inspection, by which all western cattle are unloaded and carefully inspected at Winnipeg, and again on arrival at Montreal some days later, renders it highly improbable that affected animals can leave Canada.

ANIMALS Inspected for Export from April 1, 1906, to March 31, 1907.

SESSIONAL PAPER No. 15a

EXPORT Animals Rejected at Following Ports from April 1, 1906, to March 31, 1907.

| Port. | Horses. | Cattle. | Sheep. |
|-------------------------|---------|---------|--------|
| Montreal..... | 1 | 369 | 122 |
| St. John, N.B..... | | 22 | 1 |
| Charlottetown, P.E.I. . | | 1 | |
| Total..... | 1 | 392 | 123 |

Of the above, 112 cattle at Montreal and 2 at St. John were rejected for actinomycosis, and 8 cattle at Montreal for mange, 1 head of cattle at Montreal and 1 at Charlottetown were rejected on account of tuberculosis.

The one horse was rejected on account of strangles.

The rest of the animals rejected were suffering from lameness, or injuries received during transportation and showed no indication of contagious or infectious disease.

EXPORT Inspections for the Twelve Months ending March 31, 1908.

| Bayfield and Mulgrave to Newfoundland | 49 | 1,035 | 321 | 1 |
| Total..... | 535 | 149,447 | 116,207 | 272 |

ANIMALS REJECTED.

| | Cattle. | Sheep. |
|---------------|---------|--------|
| St. John..... | | |
| Montreal..... | 240 | 125 |

Eighty-nine were rejected on account of actinomycosis, 2 suspected mange, and the balance for lameness or injury received.

IMPORTATIONS.

For the year ending March 31, 1907, the number of horses imported into Canada almost doubled any previous year, while large increases were observed in the numbers of cattle and sheep. The imposition of a thirty-day quarantine on hogs has resulted in an almost total cessation of the importation of this class of animal, with the result that the danger of hog cholera being imported other than by illegal methods, a much-dreaded possibility in view of our previous experience of this disease, is almost nil.

An interesting return is shown hereunder, which gives the number of animals refused admission to Canada during the past twelve months on account of the existence of disease. The results which would accrue from the admission of these animals may readily be realized, and the figures given are ample justification for the organization of a thorough and effective quarantine service along our southern boundary.

SESSIONAL PAPER No. 15a

QUARANTINE.

In the light of six years experience as the chief veterinary officer of your department and of that gained during a very much longer period as a Canadian practitioner and provincial inspector, and after very full and careful consideration of the whole question of the exclusion of animal diseases, I, in 1906, recommended to you the addition of certain further changes in the quarantine regulations. These, meeting with your approval, were accordingly in January, 1907, adopted by Order in Council and brought into force on March 1.

The most important of these amendments forbids altogether the introduction of unbroken range horses, while at the same time providing for the testing with mallein of all horses imported from the United States. A regulation of this kind is naturally somewhat irritating and difficult of enforcement, but its absolute necessity was very clearly shown by the reports of our inspectors engaged in dealing with glanders, especially in the west, these indicating that a large percentage of the outbreaks of that disease were directly due to horses imported from the United States. The danger to Canadian horses was largely increased by the fact that while some few of the state governments are trying to deal with glanders in more or less effective ways, the federal authorities have not, as yet, adopted any systematic general policy looking towards its control or eradication. These conditions, taken in conjunction with the fact that the government of Canada is paying generously for horses slaughtered as being affected, a policy followed only in one or two states and in these to a very limited extent, rendered almost imperative the taking of prompt measures to protect our own interests. The new arrangement is, I am glad to say, working in an exceedingly satisfactory manner, although it has, of course, been subjected to more or less adverse criticism by those directly affected. It has, however, imposed a large amount of additional work on this branch of the department, besides rendering necessary the erection of a number of extra buildings, both at quarantine stations already existing and at those more recently established.

It having been found necessary in 1905 to increase the period of quarantine on American swine from fifteen to thirty days, it was deemed advisable to apply the same rule to animals of this species imported from Europe. The period of detention in the case of the latter is reckoned from the clearance of the ship from her European port. In order to avoid confusion the same rule was, in the new regulations, made applicable to sheep imported from Europe. The new ruling may, in some cases, be the means of increasing, by two or three days, the period of quarantine formerly imposed on sheep, namely fifteen days from the date of landing. The period is now a definite thirty days, which is none too long to ensure safety to Canadian flockmasters.

The excellent modern and conveniently situated quarantine stations mentioned in my last report as being in course of construction at St. John, New Brunswick, and Halifax, Nova Scotia, were completed early last summer and are now in full working order.

At Lennoxville, Quebec, which owing to its prominence as a railway centre was some time ago selected as a suitable location for a quarantine station, small but convenient buildings have been erected.

At Bridgeburg, Ontario, a building will shortly be erected for the accommodation of stock to be held for inspection or quarantine. Meanwhile, a small stable has been leased for this purpose.

At Emerson, Manitoba, it has been found necessary to enlarge the accommodation for incoming live stock and work with this end in view is now in progress.

At Grctna and Bannerman, the points where the new lines of the Hill system cross the boundary between Dakota and Manitoba and at the former of which there

8-9 EDWARD VII., A. 1909

is also a Canadian Pacific Railway connection, new stations, have been arranged for. Meanwhile, as also at Emerson, rented stables, conveniently located, are in use.

In Saskatchewan, greatly needed further accommodation has been furnished at North Portal, Wood Mountain and Willow Creek.

Similar additions have been made to our stations in Alberta which are situated at Pendant d'Oreille, Coutts and Twin Lakes.

In British Columbia the stations at Gateway and Midway have been completed by the addition of stables to the existing corrals, while at Nelson, a building already owned by the department has been fitted up for similar use.

The completion of the Canadian Pacific line from Spokane has necessitated the establishment of an entirely new quarantine station at Kingsgate, the point where it enters Canadian territory. Owing to unavoidable difficulty in the acquisition of a site, construction work on this station was somewhat delayed but was finally brought to a successful conclusion. It is anticipated that the traffic over this line will be very heavy and that as a result, the number of animals entering at Gateway and Nelson will be greatly lessened. Temporary arrangements have been made for the protection of that portion of the boundary lying between Midway and the Similkameen valley, this territory being now traversed by the Victoria, Vancouver and Eastern Railway, forming part of the Hill system. Owing however to uncertainty as to the locations of future towns and customs ports, no buildings have, as yet, been erected, although some slight improvements have been made at Osoyoos, where, for some years, an inspector has been stationed to guard against the entry of diseased stock by trail to the Okanagan and Similkameen valleys.

The quarantine station at Victoria has been greatly improved and is now well adapted for quarantine purposes. Strenuous efforts in the direction of systematizing and rendering more effective the work of our inspectors at boundary points have been continued and I am pleased to be able to report that these gentlemen, with but few exceptions, appear to realize the importance of their positions and the responsibility resting upon them, with the result that their duties, often arduous and sometimes anything but pleasant, are now performed in a very thorough and satisfactory manner.

CAR INSPECTION AND STOCK YARDS.

Special attention is paid to the condition of cars containing hogs entering Canada in connection with the transit trade between Detroit and Buffalo. Inspectors are detailed specially, to watch this traffic with the result that it is conducted under conditions which are as satisfactory as can be expected.

Mr. J. F. Robb has been appointed as car and yard inspector and as such has travelled extensively throughout Western Canada with the result that considerable improvements have been made to the conditions existing in regard to facilities provided for the accommodation of stock.

All stock cars reaching Montreal from the range country and those reaching Winnipeg and held there, are cleansed and disinfected under the supervision of our inspectors.

All stock yards have been ordered cleaned whenever such action was deemed necessary by our inspectors, while the markets at Toronto and Montreal are visited daily by officers detailed for that purpose.

MEAT INSPECTION.

The inauguration of the Inspection Service under the provisions of the Meat and Canned Foods Act which was passed in 1907, is perhaps the most noteworthy matter dealt with in this report. This new legislation not only adds very considerably to the

SESSIONAL PAPER No. 15a

work as well as to the importance of the Health of Animals Branch, but marks for the Dominion a distinct forward step in the practical application of sanitary science.

The results of the work as shown in the detailed report published herewith are such as to indicate that it was undertaken none too soon. It is regrettable that, as matters stand, it is only possible to apply the operation of the Act to those establishments which are engaged in export or interprovincial trade, and it is to be hoped that ere long municipal authorities throughout the Dominion will be roused by the conditions shown to exist and will inaugurate similar systems of dealing with food products. This can be done in most communities by the abolition of the private slaughter house with all its abominations, and the establishment of municipal abattoirs conducted under a system of inspection similar to that now enforced by this department in the export houses.

At the time of the passing of the Act there were absolutely no trained meat inspectors in Canada, and it therefore became necessary to provide without delay the nucleus of an inspection staff. This was done by arranging for a special course in meat inspection and kindred branches of knowledge at the Chicago Veterinary College, to which through the kindness of the United States authorities was added the great privilege of a course of practical work in the large packing establishments in that city. Sixty-four Canadian veterinarians were authorized to take this course, which lasted five weeks, on the understanding that if they were successful in passing the examination to be held at its close, they would receive a bonus of \$100 and be eligible for appointment to the Canadian meat inspection service.

Fifty-nine of those gentlemen availed themselves of the opportunity above mentioned, and 46 succeeded in passing the examination. The course was concluded in April, but as some time was required to draft the regulations and make other preparations necessary for the inauguration of the service, it was not until September 3, 1907, that the Act was actually brought into operation. On that date 39 veterinary inspectors were distributed according to the size and importance of the plants, throughout 27 establishments engaged in the slaughter and packing of meat food products for export or interprovincial trade.

The number of inspectors being shortly found insufficient, a number of those who failed to pass the examination in Chicago were given another opportunity to qualify themselves for appointment. Several other veterinarians who were anxious to engage in the work were also subjected to examination and placed on duty as probationers, with the prospect of being advanced to the rank of inspector after acquiring sufficient practical knowledge to warrant their engagement in that capacity. The supply being found yet inadequate, it has been decided to hold in the near future an examination covering the principal points in the Dominion at which any veterinarian may present himself on the understanding that if he succeeds in passing, his name will be placed on the list of those eligible for appointment to the service.

In view of the possibility that it may be necessary from time to time to exchange inspectors between the diseases of animals and the meat inspection divisions, it has been considered advisable, with your authority, to insist that all veterinarians desiring engagement in the first mentioned division shall also pass this examination. This arrangement will render it possible to exchange inspectors between the two divisions, the passing of the examination being compulsory under the Meat and Canned Foods Act.

Since its inauguration, the work has, all things considered, progressed in a very satisfactory manner. There has been of course more or less friction here and there but this is not a matter of surprise in view of the large interests involved and the serious interference not only in the methods of work but in the premises of the packers brought about by the application of the Act and the introduction of our officers into their establishments.

8-9 EDWARD VII., A. 1909

The report of Dr. Ward who has been in charge of the work since its inauguration, will be found most interesting giving as it does a number of details which it is not possible to deal with here.

I cannot, however, leave this subject without expressing my very high appreciation of the excellent spirit shown by the members of the inspection staff. These gentlemen have almost without exception performed their duties, often arduous and severe, in a most satisfactory manner and have displayed so much enthusiasm and ambition as to afford the best grounds for the belief that in the near future our Meat Inspection Service will not be surpassed, even if it is equalled, by that of any other country.

Dr. Ward himself has been most energetic, and has shown a remarkable capacity for organization and attention to detail.

The work of Dr. Barnes as travelling inspector is all that could be desired. Dr. Kellam who is in charge of the Montreal staff, and Dr. Wilson who, on the promotion of Dr. Barnes, succeeded the latter in a similar capacity in Toronto have both shown themselves to be capable and energetic officers.

So far as the others are concerned, their work, generally speaking, has been so satisfactory that it would be invidious and unfair to make special mention of any. I therefore simply append a list of the establishments at present under inspection and of the officers engaged in each.

| Decomposed | 1,207 | 2,999 | 60 | 240 |
| Dirty | 70 | | | |
| Total | 27,318 | 90,754 | 3,237 | 240 |

Total amount condemned on reinspection..... 121,549 lbs

THE LIVE STOCK BRANCH.

Since the union in July, 1906, of the Live Stock Branch with the Health of Animals Branch, under my supervision as Veterinary Director General and Live Stock Commissioner, a number of new lines of work have been inaugurated and pursued.

With a view to learning the exact condition of the commercial live stock industry of the western provinces and the transportation facilities from the west to the seaboard, a special officer, Mr. J. F. Robb, has been occupied in examining the industry in its various phases. Much valuable information gathered by this officer appears in his official report, which is published herewith. This work will be continued and extended with the object of bringing about in the near future a marked improvement in existing methods.

In co-operation with a number of record associations for cattle of dairy breeds, the record of performance, which was inaugurated shortly before I assumed control, has been put into successful operation.

The education work which has been a prominent feature in the branch ever since its inception, and which comprises encouragement and assistance to winter fairs and co-operation with provincial Departments of Agriculture and other organizations in supplying expert judges of live stock and holding live stock judging schools and farmers' institute meetings, has been continued and expanded. The better distribution of pure bred males; the expansion of the National Live Stock record system; the reform of the record for French Canadian horses; the removal of the grievances of the sheep-breeders of Quebec; the holding of a National Live Stock Convention; the preparation and publication of bulletins upon various branches of the live stock industry, have all received attention.

COMMERCIAL LIVE STOCK INDUSTRY OF WESTERN CANADA.

In June, 1907, Mr. James Robb began his investigation of commercial live stock conditions in the west and the transportation of animals destined for export. After making full inquiry into the conditions affecting the meat supply of British Columbia, both in the coast cities and at interior points, he devoted considerable time to the study of live stock and meat markets in Alberta, Saskatchewan and Manitoba, and was successful in obtaining a great deal of most valuable information in regard to a number of matters which have hitherto received but little attention from any one except those directly engaged in the trade. As soon as the shipment of range cattle eastward commenced, Mr. Robb devoted his time to the close observation of

SESSIONAL PAPER No. 15a

the methods of handling and transportation of this class of stock. He not only kept the whole trade under general observation, but followed individual shipments from point to point, noting carefully all circumstances having any bearing on the trade. Towards the end of the season he accompanied a trainload of cattle from Winnipeg to Montreal, paying special attention to the manner in which they were handled and the conditions at the various points where they were unloaded for feed and water. He also visited the Chicago stock yards, to which shipments of cattle were made last season for the first time in the history of our western cattle trade. His notes on the above points, as also on the comparative returns obtained in the different markets, will be found most interesting reading.

In January and February, 1908, he spent some time investigating the conditions affecting the winter feeding of live stock in the west.

The work outlined above, which is fully detailed in his report, is the first step in the direction of obtaining, as far as may be possible, full and reliable information as to our commercial live stock trade. Once this is obtained, which will, I trust, be in the very near future, the department will be in a position to deal intelligently with the whole question, and to inaugurate such reforms, whether by legislation or otherwise, as will improve existing conditions.

THE RECORD OF PERFORMANCE.

The yearly testing of pure bred dairy cows in connection with the record of performance commenced in the spring of 1906. Under the arrangement agreed upon between you as minister and the several record associations for dairy breeds of cattle the testing of the animals is supervised by officers of this branch. The associations co-operating in this work agree to certain regulations, and to publish as an appendix to their several herd books the records of cows that reach the standard for registration in the record of performance. The regulations imposed by the branch require, among other things, that a cow to qualify for registration must be a regular breeder. That is to say, if mature she must have two calves at separate births within fifteen months of the time she freshened for the test year; and cows must again calve within fifteen months of the same freshening date. This regulation guards against abnormal records made at the expense of regular breeding, and insures the year to year excellence of all cows duly registered in the Record of Performance.

The standards of production for registration differ for the various breeds according to the decision of each respective record association. Applications for entry of animals are made by owners through the secretaries of the associations, for the several breeds. The various forms used in the work are supplied on application. The weights of milkings are recorded by the owner of the cows and reported at the end of each month, and a final, complete report, sworn to before a proper legal officer, is supplied by the owner at the end of the milking period. The weights of milk are verified by officers of the branch who visit the farms at irregular intervals and unannounced, at least eight times a year, to weigh all the milkings of two successive days, and by comparison with these verify the weights of previous milkings recorded by the owner. In addition, the inspecting officers make fat tests, by the Babcock method, of all the milk drawn during each official visit.

Up to the end of the fiscal year ending March 31, 1908, about three hundred cows have been accepted for test. Of this number, which includes Ayrshires, Holsteins and French Canadians, thirty had completed their year's test, and their records had been duly registered in the record of performance.

The records of these cows, rules governing the tests and other information bearing upon the work appear in a separate publication, which may be obtained on application to this office.

8-9 EDWARD VII., A. 1909

The rapid extensions of the operations of the branch in this line having rendered it impossible for Mr. Drummond, who was the first officer employed, to cover the ground, it became necessary in May, 1907, to obtain further assistance, and Mr G. W. Clemons was accordingly appointed to co-operate with him.

EXPERT JUDGES FOR FAIRS.

During the months of the year when the agricultural fairs are in progress many requests for expert judges of the several classes of live stock from the different provinces have been complied with. In doing this it is felt that a valuable service is bestowed on the live stock industry, not only in encouraging competition by securing for each exhibitor justice in the show ring but also the further reaching benefit of teaching the observing public the correct ideals to be striven for in purchasing and breeding farm animals. Judges have been supplied for winter fairs, fat stock shows, horse shows and the summer and fall agricultural fairs held in the various provinces.

For the winter fairs, in connection with which series of lectures are given, such expert judges are supplied as are able to deliver authoritative lectures upon the practical application of the scientific principles of breeding, feeding and care of live stock. At these fairs block tests of many of the prize winning animals are made and as a rule the carcasses are judged and lectures delivered upon them by the men supplied by this branch.

In December, 1906, and December, 1907, expert judges and lecturers were supplied for the Maritime Winter Fair, which is held each year at Amherst, N.S., and during each of these years a grant of \$1,000 was made towards the development and maintenance of the educational features of this exhibition.

Judges and lectures were supplied in 1907 for the summer and fall fairs and fat stock shows held in Manitoba, Saskatchewan, Alberta and British Columbia. In the spring of 1908 speakers and judges were supplied for the Manitoba, Saskatchewan and Alberta fat stock and horse shows, in conjunction with which were held the annual conventions of the several provincial live stock associations.

Delegations of judges were supplied in the summer and autumn of the years 1906 and 1907 for circuits of agricultural fairs held in Saskatchewan, Alberta and British Columbia. The delegations consisted of from two to three men, each member being qualified to judge two or more classes of stock. Frequently the same person judges heavy horses, beef, cattle and perhaps sheep. The judges of dairy cattle can usually judge swine, while the light horse judges selected are generally able to assist with some of the other classes. The circuits, which are arranged by the Provincial Departments of Agriculture, usually last from three to four weeks. This branch engages the judges and pays their salaries and travelling expenses until they reach the province in which they are to work, and also for the return journey, the provincial departments defraying these bills during the terms of the circuits.

In the autumn of 1906, a similar arrangement was entered into with the province of New Brunswick and in that year judges were also supplied for the Charlottetown exhibition and the fair held at Yarmouth, Nova Scotia. In 1907 the Provincial Exhibitions of New Brunswick and Prince Edward Island were similarly served.

In the province of Quebec the fairs are not arranged in circuits each association or society separately arranging its own dates. This arrangement renders it difficult to afford the assistance that might with advantage be given to the fairs in this province. During the past two years, however, judges have been supplied for a large number of exhibitions. This work was commenced in Quebec several years ago and each year the judges returning from their work report great improvement in the classification and condition of the exhibits. Many societies that formerly awarded prizes to grade sires

SESSIONAL PAPER No. 15a

have come to see the error of such classification. Great improvement is noted also in the soundness of horses exhibited, it being learned that an unsoundness of hereditary character is not overlooked by competent judges even in animals of better appearance than sound prize winners.

Whenever practicable, judges supplied by the branch explain to the spectators the reasons for their decisions. This is done in the ring before the competing animals are returned to their stalls. Keen interest is taken in this branch of the work which is year by year doing much to enlighten especially the younger stockmen who have thus clearly demonstrated to them the distinguishing marks of quality in animals as seen by experts who judge for utility and breed type. These characteristics, as compared with unusual size and fatness, are being recognized in their true relationship wherever the expert judges supplied by the Live Stock Branch have an opportunity of teaching these lessons.

FARMERS' INSTITUTES, JUDGING SCHOOLS.

The several provincial Departments of Agriculture depend upon this branch to supply expert teachers for special meetings and classes devoted to animal husbandry. Most of the provinces hold separate series of Farmers' Institutes and Stock Judging Schools, the former as a rule during the summer and fall, the latter usually during winter months. In some cases the meetings are composite in character, that is live animals are used at institute meetings by the speakers to demonstrate desirable and undesirable formation.

In 1906, and again in 1907, two delegations of two men each were supplied to the province of Prince Edward Island. Each year general institute meetings were held in June and July and judging schools in November. At the former the subjects taken up related closely to the practice of mixed farming with the keeping of live stock as the chief factor. In the autumn meetings the judging, breeding and feeding of live stock were the topics taken up. In 1906, a car of high-class animals of different breeds accompanied the speakers about the country, while in 1907 the animals required were wherever possible secured from local breeders. The meetings or schools, were of from one to two days' duration and were in every case well attended.

In Nova Scotia two series of meetings were held each year and in New Brunswick one series covering the agricultural sections of the province. In the former province the meetings were held in June and July, and again in November and December. Many of the summer meetings were held in conjunction with farmers' picnics. The New Brunswick meetings were held each year in September, October and November. The topics discussed in Nova Scotia were general live stock improvement with special reference to horses, dairy cattle and sheep. In New Brunswick, horses and dairy cattle were given most attention. The delegations sent to Nova Scotia usually consisted of two men while three were each year sent to New Brunswick.

In the province of Quebec owing to the lack of a provincial farmers' institute system the institute work accomplished by this branch in that province has to be arranged for and carried out by officials of your department. The local agricultural societies and farmers clubs co-operate with the department in providing halls and advertising the meetings which are arranged in circuits. In this way a very large number of farmers are addressed each year by expert teachers at comparatively little expense.

In the winter of 1907 and again in 1908, series of meetings were held during a portion of February and March. Each year five series were held—three in French and two in English speaking districts. The delegations consisted of from two to three men. For the French delegations most of the men employed were French speaking

8-9 EDWARD VII., A. 1909

ex-students of the Ontario Agricultural College the others being successful stock farmers of the province. The English speaking delegations were prominent institute workers such as are sent to other provinces. The estimated attendance each year was about twelve thousand in the French counties and four thousand in the English. The subjects discussed were chiefly advanced dairy farming, hog raising, and the breeding and rearing of sound, serviceable draft horses. The speakers reported a manifestation of the keenest interest at practically all of the meetings. In Saskatchewan and Alberta, both summer and winter meetings were attended by lecturers supplied by this branch. The summer meetings, as in the eastern provinces, were general farmers' institute meetings while the winter meetings were chiefly judging schools. The Alberta winter series of 1907 was of almost three months duration. Eight points on the main lines of railway were given visits of from four days to two weeks. Two carloads of live stock of superior quality representing various classes and types were carried along for demonstration purposes. A block test was a valuable feature of each school. The live stock was contributed for the use of the schools by public spirited breeders in the province. Most of the teachers were supplied by this branch.

Practically the same service was given in British Columbia as in the other western provinces. Speakers and judging school teachers were placed at the disposal of the province at different periods of each year for series of meetings arranged by the province.

The services of Mr. C. M. McRae, who is a permanent officer of the branch, were much in demand, as judge, speaker and teacher at judging schools especially in the western provinces, and his time has therefore been largely occupied in this way.

Many outsiders were also engaged, their fitness in the special duties required being always carefully considered prior to their being employed.

DISTRIBUTION OF IMPROVED BREEDING STOCK.

The better distribution of pure-bred live stock for breeding purposes continues to receive much attention. The work is undertaken in two principal ways; first, by direct grants to provincial live stock associations to assist in holding co-operative sales of pure bred stock, and second by organized distribution of breeding animals.

In the year 1906-7, a grant of \$650 was made towards a co-operative sale in each of the provinces of Manitoba, Saskatchewan, Alberta and British Columbia. In all of these provinces, except Manitoba, fat stock shows were held in conjunction with the cattle sales. Towards a similar sale held in Nova Scotia that year a grant of \$200 was made. For the year ending March 31, 1908, grants for sales were given to Manitoba, Saskatchewan and Alberta, neither Nova Scotia nor British Columbia holding sales that year.

Through these sales large numbers of pure bred males were disposed of, as affording a market for the produce of pure bred herds, as well as a source of supply for ranchmen and others requiring males to improve and females to strengthen their herds. By means of the co-operative system, the quality of the offerings is safeguarded by a rigid inspection, and the expense of advertising and transportation is reduced to a minimum. It is the intention, although it is not thus specified, that the grants given shall be used to cover the expenses of advertising, transportation and selling, thus eliminating for the purchaser and breeder the item of distance which so frequently precludes business. Until recently each of the western associations has closed its sale to animals outside of the province in which it is held. In my opinion, to continue federal financial assistance towards purely provincial sales, excluding improved blood from other provinces, is inconsistent. Accordingly a

SESSIONAL PAPER No. 15a

removal of provincial barriers is being insisted upon if the grant is to be continued. This the Manitoba association has complied with, and the rules in the other provinces are being similarly amended, otherwise the grant to each will in future years be withheld.

SALES OF STOCK CONDUCTED BY THE BRANCH.

Two series of sales of pure bred hogs of the breeds suitable for the production of bacon have been held in the province of Quebec. These sales were held at eight points—four in the spring and four in the fall months of 1906. The animals were selected from leading breeders in the provinces of Ontario and Quebec. In the two series upwards of 200 hogs—about 70 per cent of which were boars and about 20 per cent sows in farrow—were distributed. The districts in which the sales were held were selected by the large pork packers of Montreal, who were conversant with the character of the hogs reared in the various districts. The packers, as also the Quebec Department of Agriculture, contributed towards the expenses of the sales. In the English-speaking sections, in which half of the sales were held, most of the animals were purchased by individual farmers, while in the French-speaking districts most of the sales were made to farmers' clubs for use in the herds of their several members. As a result of these sales, the quality of the hogs now raised in these sections is much better than it was previously.

At the present time preparations are being made to select and purchase a shipment of pure bred rams to be pastured on the Experiment Station Farm at Antigonish, Nova Scotia, during the summer months and in the autumn to be sold at auction to mutton-raisers in the maritime provinces. Apart from the purpose of improving the quality of the sheep stock of these provinces, this work has also the object of assisting the development of the sheep-raising industry, which is recognized as the salvation of agriculture in the districts infested with ragwort, the weed which our experiments have now shown to be the undoubted cause of the malady locally known as Pictou cattle disease.

THE NATIONAL LIVE STOCK RECORDS.

The National Live Stock Records continue to receive much assistance from the department. This combination of pedigree registers for all breeds of live stock in Canada except Holstein Friesian cattle, which was originated by my predecessor the late live stock commissioner, is conducted as an entirely separate and independent organization, although in a manner, under the wing of the branch.

According to the agreement between yourself as minister and the several record associations, as each comes into the National Records system, the branch provides office accommodation and supplies office furnishings and stationery, and in addition, certain financial assistance to the newer and weaker associations which later under the national system are expected to become self-supporting. An annual grant of between four and five thousand dollars is also given for the purpose of defraying the expenses of the National Record Committee, the executive body of the National Record Board.

The branch also renders assistance through its officers in the organization of new record associations. During the past two fiscal years it has assisted in the organizing of record associations for Thoroughbred, French Canadian, Belgian draft and Percheron horses, the several breeds of ponies, and Red polled and Aberdeen Angus cattle. For each of these as well as the several breeds of sheep, national records have been opened.

8-9 EDWARD VII., A. 1909

Under the National Records system records are opened for the following classes and breeds of stock:—

Horses.—Clydesdales, Shire, Percheron, Belgian Draft, Hackney, Thoroughbred, French Canadian.

Ponies.—Shetland, Welsh, New Forest, Polo and Riding, Exmoor, Connemara Hackney.

Cattle.—Shorthorn, Hereford, Aberdeen Angus, Galloway, Guernsey, Jersey, Ayrshire, French Canadian and Red Polled.

Sheep.—Shropshire, Oxford, Leicester, Cotswold, Lincoln, Dorset, Hampshire, Southdown.

Swine.—Yorkshire, Berkshire, Tamworth, Chester White, Poland China Duroc Jersey, Essex.

Of pedigree certificates of the above breeds there were issued during the years 1906 and 1907, 25,962 and 31,909 respectively. These certificates were examined by an officer of this branch and when found to correspond with the applications and the office records were signed by him on your behalf and the seal of the department affixed to each.

REFORM OF THE RECORD FOR FRENCH CANADIAN HORSES.

Special work in connection with a portion of these records has been done. The Stud Book for French Canadian horses which was taken over from the General Breeders' Association of Quebec for nationalization was found to contain pedigrees of horses that on account of breeding and other characteristics, did not conform to the original Canadian horse. The old book was accordingly closed and a new one opened under the National system with inspected foundation stock of approved type, quality and breeding. Co-operating with the French Canadian Horse Breeders' Association, the branch carried out the inspection which was done by a commission of five men, two representing the association, two representing the branch, and a veterinary inspector of the Health of Animals Branch, who also acted as secretary.

This commission has made tours of inspection into most of the counties of the province where French Canadian horses are being reared, and is to complete the work in 1908. Inspections are made of animals recorded in the old book and such others three years old and over as are presented before the commission. The total number which have passed the inspection is about 750 head and such of these as are presented for registration, will form the basis of the National French Canadian Stud Book.

REGISTRATION OF SHEEP FROM THE PROVINCE OF QUEBEC.

The branch has also carried out an inspection of the sheep recorded in the old Quebec record, for which registration in the National Records was desired. As in the Horse Record, it was discovered that certain flocks of sheep recorded at Quebec could not without investigation be recorded in the National Sheep Record. In order to avoid hardship to Quebec breeders and to safeguard the records by reason of the transfer, a commission consisting of an experienced Ontario sheep breeder and one of our French Canadian veterinary inspectors was appointed by the branch to examine the flocks recorded in the Quebec books, in regard to the eligibility of which any doubt existed. Those which were good specimens of the breeds to which they belonged were ear-tagged and such of those tagged as conformed in breeding to the rules of entry, as laid down by the Dominion Sheep Breeders' Association, have been accepted for registration.

NATIONAL LIVE STOCK CONVENTION.

In accordance with your policy of calling together from time to time the leading men in the Dominion connected with the several branches of agriculture, the

SESSIONAL PAPER No. 15a

National Live Stock Association was convened at Ottawa on February 5th, 6th and 7th, 1908.

This association is composed of provincial Ministers of Agriculture, representative officers and elected members of provincial Live Stock Associations, Record Associations and Agricultural Societies. The attendance at the convention was about one hundred and fifty, and included stockmen from every province, duly delegated to represent every provincial Live Stock Association and every incorporated Record Association in Canada.

The programme prepared included exhaustive reviews of the live stock conditions in each province, the transportation and marketing of all classes of live stock, the export trade, the import trade, customs regulations, and many other subjects that bear on the live stock industry of Canada. On a number of subjects keen discussions took place, and strong resolutions were passed, some of these as acted upon having far reaching influence on the live stock industry of Canada. One result will probably be the amendment of the regulations governing the free admission to Canada of pure bred live stock. Under the old regulations which have been in force since 1887, much stock of questionable breeding was admitted duty free. In the future free entry is likely to be granted only for such animals as are accompanied either by a Canadian certificate of registration, or, where no Canadian record exists, by an import certificate issued by the Accountant of the Canadian National Records, after he has ascertained by an examination of the foreign certificate of registration that the animal has its pedigree recorded in a reliable record in the country of origin of the breed.

A full report of the convention is published as a separate volume and may be secured on application.

PUBLICATIONS.

During the two past fiscal years, several publications have been issued. A large edition of Bulletin No. 10, 'The Production of Bacon for the British market,' issued in 1905, became exhausted early the following year and had to be re-issued. This was done in 1907 after a thorough revision and with the addition of a number of new sections and an almost entirely new set of illustrations.

Bulletin No. 11, 'The Leading Breeds of Swine,' was issued in 1907. This work gives in concise form the history, chief characteristics and standards of excellence of the six leading breeds of swine reared in Canada. Each breed is represented by distinct photographs of typical animals.

A very exhaustive treatise on sheep raising has been prepared and will shortly be issued as Bulletin No. 12, 'Sheep Husbandry in Canada.' This work covers for sheep somewhat the same ground as Bulletins Nos. 10 and 11 do for swine, with such variations as become the subject. It comprises about 150 pages replete with illustrations which will add greatly to an understanding of the reading matter.

These valuable bulletins have been compiled by Mr. J. B. Spencer, B.S.A., who combines with a thorough practical and scientific knowledge of animal husbandry, the faculty of placing his views and those of others before the public in a manner at once remarkably lucid and attractive.

I have the honour to be,
Sir,

Your obedient servant,

J. G. RUTHERFORD,

Veterinary Director General and Live Stock Commissioner.

The Honourable
The Minister of Agriculture,
Ottawa.

8-9 EDWARD VII., A. 1909

GEORGE HILTON, V.S.

REGINA, SASK., March 31, 1908.

SIR,—I have the honour to submit herewith my report for years ending March 31, 1907 and 1908.

During the first period my services were principally engaged in connection with the work in your head office. I, however, investigated a few reported cases of glanders in the counties of Haldimand, Frontenac and Lincoln, in Ontario, and Wright, in Quebec. This necessitated the testing of 29 horses with mallein, six of which reacted, and were dealt with in accordance with the regulations. I also applied the tuberculin test to four pure bred cattle sold for export to the United States, with negative results. It was further my duty wherever possible to visit the tuberculosis experiment station at Hull to observe and note any change in the condition and symptoms of the individual animals comprising the herd.

During the first three months of the latter period my work was confined to your office. I left Ottawa, however, for Regina on June 26, 1907, in accordance with your instructions, to take over the work of this branch in the provinces of Alberta and Saskatchewan, which had hitherto been conducted under the supervision of Commissioner Perry, of the Royal Northwest Mounted Police.

Upon my arrival there I found Dr. Higgins awaiting me, having returned to Regina from the mange area in Alberta, where he had been engaged in checking dips and solving difficulties in connection with the emulsifying of oil preparations. On July 2 he accompanied me to the police barracks, where we met the Commissioner, who, after consultation, kindly assisted us by placing at our disposal facilities for the transference of the departmental supplies to these offices. Steps were then immediately taken to place the work of the branch on lines similar to those carried out by you in the other provinces of the Dominion, with a clerical staff consisting of Miss Cresswell as stenographer, and Inspector Ayre as clerk. The latter having had considerable experience in this particular work in the office under the Commissioner, gave valuable assistance.

Dr. Burnett, chief veterinary officer of the R.N.W.M.P., who had previously given excellent service to this branch, naturally preferred to remain with the force, but arrangements with the Commissioner for the transference of the veterinary staff sergeants, resulted in all except one taking appointments as veterinary inspectors, thus making a total available force of 24 officers, in addition to three veterinary inspectors, whose duties were, and have been, limited to the local inspection of shipments of stock in the mange area. The force, although apparently adequate, has been taxed to its utmost; six of its members being stationed permanently at boundary points, have not been available for other work unless it has been in the immediate vicinity of their stations. Eleven other inspectors were restricted during the summer and fall months to mange districts, where the work in connection with the eradication of this disease occupied their undivided attention. The remaining seven had to contend with reported cases of contagious diseases, and as these were very numerous, and many originating from remote parts, considerable difficulty was experienced in attending to them as promptly as the nature of the work demanded. The force was, however, strengthened by the appointment of Dr. E. A. Meakings, who had previous experience under the police, and it was also found necessary, owing to the fact that the rush of work required Inspector Ayre's absence from Regina, to increase the office staff, and Mr. T. P. Spanner was accordingly appointed through your instructions.

In order to expedite the work and carry it on to the best possible advantage it was found necessary to assign inspectors to definite locations. This was not possible, however, until the compulsory dipping was completed; immediately this was accomplished inspectors were stationed at the most suitable points, as follows:—Inspector Ovens was

SESSIONAL PAPER No. 15a

moved from Southern Alberta to Yorkton, Inspector Paxton from Claresholm to Edmonton, Inspector Gray from the northern boundary of the mange area to Saskatoon, from which point he was later transferred to the Willow Creek Boundary Station, this being necessary owing to an extended leave of absence having been given to Inspector Douglas. Inspector Olsen was removed from Wood Mountain to Saskatoon, Inspector Meakings replacing him. The headquarters of the other inspectors were not changed, their distribution appearing to be quite satisfactory. In view of the large number of inspections needing daily attention at various points along the railways in the Calgary division, also to the required inspection of a large number of premises in quarantine for cattle mange, and the placing of restrictions on others where the owners had neglected to comply with the compulsory mange dipping order, it was necessary to keep four inspectors working from this point. Directly it was possible, however, Inspector Busselle was sent to the Lethbridge quarantine station to familiarize himself with the existing conditions in Dourine patients under Dr. Watson, in order that his services might be available in investigating that disease. He was later stationed at Macleod, where the control of contagious diseases and the frequent inspections of stock for shipment, and of stock cars used in the carriage of cattle to various points in Southern Alberta necessitated the stationing of an inspector at that point. Inspectors Head, McMurtry and Gebbie, have been working from Regina, their attention being directed principally to the control of glanders along the Soo and Arcola lines, the main line east and west and the country traversed by the Kirkella branch of the Canadian Pacific Railway.

Due to dissatisfaction occurring among a number of cattle owners along the northern boundary in the mange described area in Alberta, it was found necessary to employ Dr. Hobbs, of Strathmore, and Dr. Talbot of Lacombe temporarily, for the purpose of making a special inspection of cattle in the townships lying along and south of the extreme northern boundary of the mange area. The nature of the country, together with the lack of transportation facilities, resulted in considerable time being expended in this investigation, and before satisfactory information was available it was necessary to send Inspector Riddell to assist in this work. Upon receiving a report as to the conditions found, it was possible to recommend exemption of a portion of the territory under consideration.

Although I fully appreciate the advantages to be gained by personal visits to infected centres, the inauguration of the work demanded my presence here, and therefore with the exception of my investigation, together with Dr. Warnock, of suspected loco poisoning in animals on the Porcupine Slopes, and of the outbreak of rabies in the Moosomin district, in which Dr. McGilvray co-operated with me, and also my recent visit to Ottawa, my duties have been confined to executive work in this office.

Fortunately in Saskatchewan, glanders is apparently the only disease, with which this branch deals, existing to any serious extent, and while mange in horses and cattle is not by any means absent, it is limited very largely to the southwest quarter of this province, and I have reason to believe can be practically exterminated during the coming season, if thorough measures are adopted for the treatment of infected stock, and especially so, if re-infection can be prevented from the province to the west.

The control of Glanders in this province is still a serious problem, notwithstanding the fact that all possible steps have been vigorously taken for its eradication. It is interesting to note that the most badly infected centres have been in districts lying along the railway route to the south, and I firmly believe that your action demanding the malleination of all import horses, and forbidding the introduction of unbroken equines, is the only solution of the probable extermination of glanders and makes the possibility of riding these provinces from this troublesome disease practical, so long as your policy in dealing with this malady is strictly carried out. The past and existing rapid development of the country has been the means of

8-9 EDWARD VII., A. 1909

introducing this disease into remote parts of this province, and while a large number of horse owners appear quite willing to co-operate with our officers in stamping out this malady, there are also unfortunately a large number who appear to be grossly ignorant of the nature of the disease, and are quite unable to realize its presence, until very serious results are vividly apparent. Several large outbreaks have been directly the result of this lack of knowledge. Cases have been reported persistently and have been so numerous that it has not yet been possible to make a systematic inspection throughout the province. It was deemed advisable to keep inspectors in districts where Glanders was found to exist, until all possible steps had been taken to ensure the testing of all contact animals, with a view of effectively stamping out the disease, and cleaning up such districts, that progress might be made.

Your instructions regarding the necessity of holding for retest all contacts with clinical cases, have proven to be quite justifiable, reactors having been found upon second test, where only non-clinicals were destroyed previously. More or less inconvenience naturally results to the owners by holding such animals until a sufficient time has expired to make a second malleination reliable, but I believe that such action is essential for a successful issue. A great deal of care, however, and good judgment, is required on the part of the inspector in charge of an outbreak, and it is therefore most important that only men are employed who possess these qualities, in addition to the others required in public work, as the possibility of non-clinical reactors infecting contacts is apparently largely influenced by existing conditions, and appears to exist in ratio to the gross unsanitary conditions, or otherwise, in which the reacting animals have been housed. While the second test reactors are not numerous, they are sufficiently so to warrant serious and careful attention, as they are often the cause of fresh outbreaks in districts where suspicion had been apparently removed.

The following figures give the total number of horses tested with mallein, as also the number destroyed in this province during the past fiscal year.

Number tested, 6,263. Number destroyed, 819.

MANGE.

Mange in cattle, as previously mentioned, does not exist to any serious extent in Saskatchewan. During the past compulsory dipping period the restricted area was divided, as in previous years, into three districts, each of which was placed in charge of a veterinary inspector, under whom a number of deputy mange inspectors were employed. The dipping in the two western districts progressed rapidly and satisfactorily, owing to the co-operation of the stock owners who appeared to be without exception quite anxious to conform with the terms of the order. The dipping in the eastern district was not accomplished as rapidly, owing to the fact that only one vat, the property of the branch, is located therein, and consequently the majority of the cattle were treated by spraymeters with oil preparations.

RABIES.

A serious outbreak of Rabies occurred in the vicinity of Moosomin, and although all possible steps were taken to obtain evidence of direct infection they were not successful. While a few years ago a number of suspicious cases were reported and investigated in the Oxbow district a positive diagnosis was not obtained, and no further reports were received in this province until the outbreak in question, which was reported during the latter part of July, when one of our inspectors was immediately detailed to investigate. Unfortunately upon his arrival the suspected cases had been disposed of, but upon information gathered the circumstances were very suggestive,

SESSIONAL PAPER No. 15a

and consequently instructions were given to report any further suspicions direct to this office. Shortly afterwards a report was received, and I proceeded to Moosomin, at which point I was met by Dr. McGilvray, who had had experience with this disease in Manitoba. On our arrival we found one dog exhibiting characteristic symptoms, and after its death the brain was removed and forwarded to the Biological Laboratory and our diagnosis later confirmed. Upon looking over the ground carefully it was found advisable to recommend the issue of a Rabies muzzling order covering twelve townships, including, and adjacent to, the Village of Moosomin. For the enforcement of this order, it was further necessary to employ two men to ride the townships in question. A large number of dogs were destroyed by owners within the mentioned territory, no doubt for causes other than Rabies, the owners assuming a natural suspicion regarding any dog developing abnormal symptoms. This action was no doubt responsible for the few suspicious cases detected by the inspectors, and also largely assisted in the control of this disease in that locality.

A rather peculiar fact observed during the enforcement of the muzzling order in this vicinity, and Manitoba, was the total absence of any suspected cases outside of the respective areas although the inspectors in charge of these outbreaks were specially instructed to obtain, and look for, any such information. We were, therefore, unable to find any positive or even suspicious knowledge of suspected cases which might connect the two outbreaks.

Although five months have elapsed since the removal of the Rabies order in this province no suspected cases have been reported, and it would therefore appear that we are justified in assuming that this disease has been successfully coped with and fortunately without any fatality to human life.

TUBERCULOSIS.

Owing to the lack of interest so far shown by cattle owners in this province in connection with this disease it is not possible to give satisfactory information regarding the extent to which it exists.

Seventy-two (72) head of cattle comprising one consignment were tested with tuberculin, by one of our officers, having been sold for export to the United States, all of which proved to be free from the disease in question.

BLACK QUARTER.

Judging from suspected cases reported at this office, black quarter has not been very prevalent during the last fiscal period. Stock owners are, however, fully alive to the benefits resulting from preventive treatment with Blackleg vaccine, which together with the prairie fires which swept large grazing areas last fall, have no doubt played an important part in the control of this malady.

QUARANTINE STATIONS.

No alterations have been made at any of the quarantine stations in this province since my arrival at Regina, with the exception of a few necessary repairs. The station at North Portal is still in charge of Inspector Mitchell, and is the point taken advantage of by the majority of settlers and importers. Inspector Meakings is in charge of the station at Wood Mountain and Inspector Gray in charge of the one at Willow Creek.

STOCK AND STOCK CAR INSPECTIONS.

The inspection of consignments of cattle in this province is limited to points on the main line in the range area, the majority of the shipments being made at Maple Creek and Swift Current. During the active shipping seasons it has been

necessary to station an inspector at the former point in order that no undue delay and inconvenience might result to the shipper.

The inspection of stock cars has taken up considerable time, and a great deal of difficulty was experienced during the fall months in connection with the holding and disinfection of such cars owing, in many cases, to the apparent indifference of the subordinate railway officials. They are now, however, alive to the situation, and this important feature of the work is receiving the attention it deserves.

GLANDERS (ALBERTA).

Glanders in the province of Alberta has not so far been detected to as serious an extent as within the limits of Saskatchewan. This, however, owing to totally different existing conditions, is not conclusive proof that this disease does not actually exist to a greater degree. The fact that this province until recent years has been almost entirely devoted to ranching, precluding the same possible close habitation of its animals and the further close observance by the owners, may possibly explain the dearth of reported cases. Although all such cases have been investigated as promptly as the exigencies of the service would allow, and steps taken to trace and deal effectively with all contact animals, the constant demand upon the services of officers in dealing with mange in this province has been so urgent and persistent, that it has not been possible to keep an officer in an infected district for any length of time without transferring him to some other point, for the investigation of other urgent cases.

The following figures give the number of animals tested with mallein, as also the number destroyed for glanders in this province during the past fiscal year:—

| | |
|--------------------------|-------|
| Number tested.. . . . | 1,489 |
| Number destroyed.. . . . | 126 |

MALADIE DU COIT.

Dourine is without doubt the most insidious disease with which this branch has to contend, and in view of the fact that its existence paralyses the horse breeding industry it requires persistent vigilance, and the utmost caution, and good judgment, on the part of the officers, who have been specially authorized for its investigation and control. The majority of horses in the suspected districts are only available for inspection at certain periods, and while the closest scrutiny is essential it is carried out under obvious difficulties. There is no doubt, therefore, that the only safe method to pursue in the control of this disease is the placing of restrictions on all suspected animals in districts where there is the least cause to suspect that dourine may possibly exist. While such a procedure results in more or less hardship to the owners and entails a serious drain upon their revenue, the horse breeders' interests at large demand such action.

Your decision in establishing an experimental station a few years ago at Lethbridge has been of inestimable value and has resulted in valuable achievements under Dr. Watson, the pathologist in charge, whose reports from time to time have contained full and minute information in connection with the peculiarities of this malady. The officers specially authorized to deal with this disease have all been given the opportunity to take advantage of Dr. Watson's experience and study under him the various conditions found at the quarantine station at Lethbridge, with its research advantages, and are therefore pre-eminently suited for satisfactory work. A great deal of credit is due to the officers in question, as this malady has, from our present knowledge, been kept well within the suspected vicinities. While many animals have been inspected, and then shipped from close lying districts, there has only been one report of a suspected case of dourine outside of the infected area.

SESSIONAL PAPER No. 15a

Range Rider Murphy's work is also worthy of special mention regarding the manner in which he has persistently ridden the range with good and effective results.

The following table gives the number of animals destroyed found affected with this disease during the past fiscal period, and although it is difficult, owing to the insidious nature of this malady, to determine positively the extent to which it exists, I have reason to believe that with one exception the limits of the infected areas have not increased.

Number destroyed, 49; number suspected and quarantined, 131.

MANGE.

Mange in horses exists to a limited but not serious extent, while in cattle it is the malady which predominates on the range, and has caused not only serious losses to owners and the cattle industry, but has been, as you are well aware, a continual source of worry, annoyance and expense to your branch. The infected area was as formerly divided into eleven districts, and as in Saskatchewan a veterinary inspector with deputy inspectors placed in charge of each. Considerable delay in commencing operations occurred in the majority of districts, due to the scarcity of sulphur, and the inspectors in charge therefore took all necessary steps to ensure that the owners of stock had made all efforts to place and procure their supplies. The intervening time was taken advantage of to visit the vats and make preparations to place all facilities into good working order, in order that no further delay might result. In only one or two districts in this province was dipping completed in the prescribed period, and the work carried on without the experience of considerable friction from the cattle owners. Unfortunately a large percentage of the ranchers appeared unwilling to co-operate with the officers, but preferred to use their influence with their neighbours to cause dissatisfaction, and apply for exemption where the conditions were not at all warrantable. For this reason, I found it only possible to recommend for your consideration, very few of the numerous applications forwarded to you through this office.

Compulsory mange dipping is without doubt a very feasible solution to the effective eradication of this disease, but in order to be successful requires the conscientious co-operation of all stock owners, without which, a successful issue cannot be made possible. Other difficulties in connection with such a measure, are caused by the tremendous range of open country, with its many coulees, and varied topographical characters, also by its climatic conditions, often accompanied by tormenting insects, with the resulting stampede of thousands of cattle into remote districts, therefore interfering with not only the roundups, but the actual enforcement of the order.

For the above reasons, although all possible measures are taken to make a clean round-up of cattle in the various districts, only too frequently this is impracticable, and has been the cause in many cases of the escape of animals after a round-up has been completed, and before treatment has been finished. It can, therefore, be easily appreciated, how essential it is, to receive the co-operation of every individual owner of cattle, in the mange area, if the best results are to be obtained and success expected.

Unfortunately it is evident that the oil preparations which were permitted and used by a number of ranchers were not effective, mange having been discovered in animals treated therewith, at various periods thereafter. It is quite probable, however, where the oil treatment proved ineffective, the fault may have been due, to, either, the quality of the oils used, or to the difficulty, or rather the impossibility, of obtaining soft water in such districts. Although Dr. Higgins after considerable trouble was able to produce emulsions, with the quality of water available, and personally instructed, and assisted, in making emulsions in these districts, and while in view of the fact that all possible steps were taken to keep reliable men supervising vats where oil was being used, it is quite probable that the urgency with which animals are treated, due to the difficulties already mentioned, was responsible for

8-9 EDWARD VII., A. 1909

the imperfect emulsifying of the preparations. Lime and sulphur treatment when properly prepared has given excellent results, and is without doubt the ideal treatment for mange, and any rancher therefore alive to his own interests, would refuse to use any other preparation. Its chief disadvantage, however, is the necessity for its second application, and the difficulty experienced in keeping a large number of animals under control during the interim. There is no doubt, that the enforcement of the compulsory dipping order was not only beneficial, but had a marked tendency toward checking the disease for which it was enforced. A large number of prominent ranchers are to be commended for the manner in which they assisted your officers, but unfortunately there are a greater number who cannot be too strongly condemned for their attitude, by any one interested in the cattle industry of this province. Mange in cattle exists in the restricted area to a more or less serious extent, and demands careful and energetic attention together with the co-operation of cattle owners if success is to be expected.

Your instructions regarding the appointment of range riders for the purpose of riding the infected territory are being followed and will result in valuable accumulation of existing facts. I have no doubt that the continuing of such a policy will result favourably, not only in increasing the activity of the cattle owners in adopting suitable methods for the eradication of this disease, but in convincing many of them of their closeness to infected centres.

TUBERCULOSIS.

No particular interest has been shown by the stock owners regarding this disease, very few applications having been received for tuberculin, and I am not therefore in a position to form a safe estimate as to the distribution of this malady.

ANTHRAX.

Although a few cases of Anthrax have been reported, upon investigation they have been found to be common maladies to which stock are heir, no cases of this disease having been detected in this province during the fiscal period in question.

BLACK QUARTER.

This disease does not appear to have been prevalent, very few cases having been reported. The preventive vaccine now supplied from the Laboratory of the Branch at Ottawa has been largely used in the districts formerly affected and from the facts as stated above, apparently with excellent results.

SUSPECTED LOCO WEED POISONING.

In accordance with your instructions, I proceeded during the latter part of September to the Poreupine hills in Southern Alberta, where serious losses in horses and cattle had been experienced, and investigated with Inspector Warnock, the existing conditions and reported fully thereon. As stated in the report in question, the cause of such losses appeared from our observations to be due to the ingestion of the loco weed plant, which was found flourishing in the district where the disease under investigation predominated. A number of animals were obtained and sent to Lethbridge Quarantine Station for observation and research, the results of which have been forwarded to you from time to time by Dr. Watson, who is in charge of the investigation at the station in question.

SESSIONAL PAPER No. 15a

QUARANTINE STATIONS.

The quarantine stations in this province are in charge of Inspectors Patton at Coutts, Pinhorn at Pendant d'Oreille, and Christie at Twin Lakes. At the former station a new pump for the dipping vat was purchased and installed during the present year, but beyond necessary repairs no other alterations have been made at any of the stations mentioned.

INSPECTION OF STOCK AND STOCK CARS.

The inspection of shipments of stock in the restricted area to points in or out thereof, have been numerous and persistent, and although the services of three resident veterinarians appointed inspectors for this purpose only, have been taken full advantage of, at Macleod, Claresholm, High River and intermediate points, your other officers have been in continual demand.

The inspection of stock cars in this province has taken a great deal of the time of your officers, necessitating numerous visits to various points persistently. This work, together with the inspection of stock is most exacting, owing to the fact that during the shipping seasons delays are costly. I am pleased to state, however, that although considerable trouble was first experienced with the railway companies, they are now assisting your officers very materially.

I have the honour to be, sir,

Your obedient servant,

GEORGE HILTON,
Inspector.

The Veterinary Director General,
Ottawa.

C. H. HIGGINS, B.S., D.V.S., PATHOLOGIST.

March 31, 1907.

SIR,—I have the honour to transmit this my report as pathologist to the Department of Agriculture covering my work and the work of the Biological Laboratory from April 1, 1906, to March 31, 1907.

As formerly, a steady increase in the work of this laboratory is to be noted, and with this increase some new lines of work have been undertaken in the preparation of biological products as well as original research.

There have been examined 173 series of specimens during the course of the year, a somewhat smaller number than detailed in my last report which included autopsy findings in one hundred and sixteen cases of *Maladie du Coût*. From the nature of the specimens examined, I believe that our efforts to assist inspectors and others are more fully appreciated at this time than at any former period, and their method of preparation prior to shipment to the laboratory shows an increased understanding of the requirements with which it is necessary to conform in this respect.

A great deal of attention has been given during the year just ended to differential counts of the blood from various horses, having particular reference to the findings in cases of *Dourine*. The details of this work will be considered in a special report on *Dourine* now in preparation where it will be possible to present some very interesting and valuable data in this connection.

As the training of Dr. Watson has progressed his assistance has relieved me of many details. His transfer to the Lethbridge Quarantine Station in November last and his finding of the *Trypanosoma equiperdum* in collaboration with Dr. Gallivan has demonstrated the importance of special training for this particular work, he having been given an opportunity during his stay at this laboratory to thoroughly familiarize himself with the details of hæmatological technique and more particularly with the characteristics of the *Trypanosoma gambiense*, the parasite responsible for the disease known as sleeping sickness in Africa. Apart from the demonstration of the *Trypanosoma equiperdum* he has shown that trypanosomata occur in the blood of the 'Cotton Tail' rabbit (*Lepus sylvesticus*) and the field mouse, animals well known throughout the Northwest of Canada.

The transfer of Dr. Watson to the quarantine station at Lethbridge provided the opportunity for us to utilize the services of Dr. Hadwen at this laboratory where his knowledge of methods and technique enables him to assume some of the responsibility in connection with the routine work of this institution. An opportunity has also been afforded him to become familiar with trypanosomata, he having found the *Trypanosoma lewisi* in a rat on January 24 last and subsequently in quite a number procured from various sources in the city and suburbs.

The employment of Dr. A. Loir for six months (July 27, 1906, to January 27, 1907) and attaching him to the laboratory has of itself increased the work of the regular staff, undertaking as we have the preparation of two products under his direction, namely, Anthrax and Black-Leg vaccines. In this connection, while Dr. Loir demonstrated his methods of procedure, we, however, were responsible for the results obtained from their subsequent manufacture, therefore, it was necessary for us to thoroughly familiarize ourselves with all of the technical details in connection therewith, as well as to originate packages and methods of application suitable to the requirements of this country.

Apart from the assistance rendered in the preparation of the above mentioned vaccines, Dr. Loir has, by his intimate knowledge of the methods in vogue at the Pasteur Institute, of France, demonstrated to us many of the details in technique peculiar to that institution and the knowledge of these details cannot fail to be of assistance for many years to come, furnishing as they have a stimulus to all our work.

Undoubtedly the greatest need of this laboratory at this time in additional assistance, for, as the work broadens greater specialization is necessary that the opinions given and the products manufactured may possess the highest possible merit.

Without further preliminary remarks I will proceed to enumerate under a few headings some of the features connected with the work of this laboratory which are of more than passing interest.

TUBERCULIN.

The amount of tuberculin disbursed from the laboratory by your order shows but a slight increase over the amounts sent out in previous years and totals 3,430 doses. For the purpose of comparison the following table indicates the total amounts disbursed during this and preceeding years.

| 1903-04 | 1904-05 | 1905-06 | 1906-07 |
|---------|---------|---------------------|---------|
| | | Five months only | |
| 2,649 | 3,145 | 1,967 | 3,430 |

SESSIONAL PAPER No. 15a

A detailed month statement of the amount sent out during the past year is as follows:—

| | |
|--------------------|-------|
| April | 267 |
| May | 349 |
| June | 160 |
| July | 184 |
| August | 161 |
| September | 254 |
| October | 118 |
| November | 423 |
| December | 336 |
| January | 589 |
| February | 437 |
| March | 152 |
| Total | 3,430 |

The printed circular which accompanies each shipment of this product is as follows:—

*Dominion of Canada—Department of Agriculture—Health of Animals Branch—
Biological Laboratory—Tuberculin, its Preparation and how to use it.
Preparation of Tuberculin.*

Tuberculin is the glycerinized extract of cultures of tubercle bacilli. During its preparation it is sterilized and contains no living germs, and therefore cannot communicate disease to a healthy animal.

Action of Tuberculin.

The injection of an appropriate dose of tuberculin under the skin of a tuberculous animal is followed by a specific febrile reaction which is characteristic.

Animals that are non-tuberculous suffer no inconvenience and present no reaction.

In advanced cases, where the disease has permeated the whole system, the reaction may be very slight or altogether absent.

How to Apply the Tuberculin Test.

To obtain the normal temperature of the animal to be tested, at least four temperatures, three hours apart, should be taken on the day the tuberculin is to be injected.

The requisite dose should be injected under the skin with a hypodermic syringe that has been previously sterilized. The skin at the point of the injection should be saturated with an antiseptic solution before the injection is made.

(The most convenient agents for the sterilization of the syringe and the saturation of the skin are, carbolic acid or creolin in solution. The solution is made by the addition of one part of carbolic acid or of creolin to twenty parts of water.)

The hypodermic needle should be dipped in the antiseptic solution after each injection before proceeding to again fill the syringe or inject another animal.

After injection, five temperatures should be taken at intervals of three hours, commencing with the tenth hour.

In cattle which have recently undergone a previous test the reaction begins much earlier, and it is then advisable to take the first temperature not more than two hours after injection and to continue taking temperatures every third hour thereafter up to the usual time.

The tuberculin as sent out is diluted ready for use. Each bottle is stamped with the amount of dilute tuberculin it contains.

Sixty minims is sufficient for a full-grown animal; thirty to forty minims for a younger animal, in proportion to age.

The date on each bottle indicates the limit of the time during which the contents should be considered reliable for diagnostic purposes.

GLANDERS.

The greater part of the work on the subject of glanders has been in connection with the preparation of mallein. Some new work, which is incomplete at this writing, has been undertaken with this affection.

MALLEIN.

Sufficient mallein has been forwarded from this laboratory at your request to test 14,303 head of horses, an amount which far exceeds that forwarded during any similar period. This entire amount was prepared at this laboratory. With the new facilities which are already installed there will be much less difficulty experienced in the preparation of this product than has formerly been the case. In preceding years mallein has been forward in the following amounts:—

| | |
|-------------------|--------|
| 1903-4.. | 3,153 |
| 1904-5.. | 7,819 |
| *1905-6.. | 6,453 |
| 1906-7.. | 14,303 |

A monthly statement of the disbursements during the past year is as follows:—

| | |
|---------------------|--------|
| April.. | 1,370 |
| May.. | 702 |
| June.. | 1,400 |
| July.. | 1,645 |
| August.. | 1,730 |
| September.. | 1,786 |
| October.. | 1,245 |
| November.. | 598 |
| December.. | 225 |
| January.. | 712 |
| February.. | 830 |
| March.. | 2,060 |
| Total.. | 14,303 |

The printed circular of instructions accompanying each shipment of mallein is as follows:—

Dominion of Canada—Department of Agriculture—Health of Animals Branch—Biological Laboratory.—Mallein, its Preparation and How to Use it.—Preparation of Mallein.

Mallein is the glycerinized extract of cultures of the bacillus mallein. During its preparation it is sterilized and contains no living germs, and, therefore, it cannot communicate disease to a healthy animal.

Action of Mallein.

The injection of an appropriate dose of mallein under the skin of an animal affected with glanders or farcy, is followed by a double reaction, either form of which

* Five months only.

SESSIONAL PAPER No. 15a

may be diagnostic, viz.:—A rise in temperature or a painful oedematous swelling at the point of inoculation, gradually increasing in size for a period of twenty-four hours or longer. Either form of reaction is usually accompanied by more or less debility.

Animals that are not affected with glanders or farcy suffer no inconvenience and present no reaction.

In advanced cases where the disease has permeated the whole system, the reaction may be very slight or altogether absent. It must be borne in mind that, in cases where there is abnormally high temperature and necessity prevents delay in applying the test, a lowering of the temperature should be considered as suspicious, and the animal held under observation for a re-test under normal conditions.

How to Apply the Mallein Test.

To obtain the normal temperature of the animal to be tested, at least two temperatures, three hours apart, should be taken on the day the mallein is to be injected.

The requisite dose should be injected under the skin with a hypodermic syringe that has been previously sterilized. The most convenient point of injection is the side of the neck, the local reaction being more prominent in this region. The skin at the point of injection should be saturated with an antiseptic solution before the injection is made.

(The most convenient agents for the sterilization of the syringe and the saturation of the skin are, carbolic acid or creolin in solution. The solution is made by the addition of one part of carbolic acid or of creolin to twenty parts of water.)

The hypodermic needle should be dipped in the antiseptic solution after each injection before proceeding to again fill the syringe or inject another animal.

After injection five temperatures should be taken at intervals of three hours commencing with the eighth hour.

The mallein solution as sent out is ready for use. Each bottle contains one dose of mallein solution, two and one-half cubic centimeters, or about forty minims.

The date on each bottle indicates the limit of time during which the contents should be considered reliable for diagnostic purposes.

ANTHRAX.

Anthrax has been positively diagnosed on several occasions during the past year and some of the material from suspected outbreaks has been in such a condition on its receipt at the laboratory that a positive diagnosis could not be made, therefore, it is necessary that greater care should be exercised in forwarding material for laboratory diagnosis as we can render but little assistance when the material is in an advanced state of decomposition due to improper preparation prior to forwarding.

The following was sent out from your office in September last to obviate the difficulties referred to above and while an improvement has since been noted there is still room for the exercise of greater care in this direction.

ANTHRAX (CHARBON)—BLACK-LEG (CHARBON SYMPTOMATIQUE).

In suspected cases of Anthrax (Charbon) the diagnosis can be positively confirmed by microscopic examination. A few drops of blood, placed on a clean piece of note paper, if allowed to thoroughly dry in the air before folding, will furnish sufficient material for diagnostic purposes.

In suspected cases of Black-leg (Charbon Symptomatique), the bloody serum from an affected portion of the animal, prepared in the manner above indicated for Anthrax will furnish material for a positive diagnosis.

Where it is impossible to exclude either of the diseases above mentioned and it is probable that death is due to one or the other, the placing of a small amount of

blood in an equal amount of pure glycerine will enable a positive laboratory diagnosis. (A drachm of this blood-glycerine preparation is all that is required.)

Anthrax bacilli are always abundant in the blood of animals dying from this disease. The bacilli of Black-leg are found in small numbers only, but are sufficiently numerous to infect experimental animals.

Glycerine prevents the growth of putrefactive bacteria, but does not affect the spores of either Antrax or Black-leg.

Full information concerning history, clinical symptoms, &c., should be given.

Specimens should be addressed: Biological Laboratory, Ottawa, Ont.

Ottawa, Sept. 1, 1906.

ANTHRAX VACCINE.

We are now preparing the vaccines for the immunization of animals against anthrax, and are supplying it in sealed tubes similar to the method employed by its originator, M. Pasteur. That the work of inoculation may be facilitated, it is advisable when ordering this vaccine to indicate the number of farms or places where the vaccine is to be used that a sufficient number of tubes may be furnished, rendering a fresh one available at each farm or place. This, of course, refers to the use of the vaccine in small outbreaks where the infected territory is comparatively large and the number of animals quartered thereon is correspondingly small. This vaccine is supplied at 5 cents per dose and full instructions for its use accompany each package.

A detailed statement of the amounts sent from the laboratory during the past year is as follows:—

| | |
|-------------------|-------|
| April.. . . . | |
| May.. . . . | |
| June.. . . . | |
| July.. . . . | 10 |
| August.. . . . | 380 |
| September.. . . . | 710 |
| October.. . . . | 200 |
| November.. . . . | |
| December.. . . . | |
| January.. . . . | |
| February.. . . . | |
| March.. . . . | 18* |
| Total.. . . . | 1,318 |

BLACK-LEG.

It will be noted that reference is made to this disease in the circular mentioned under the subject of Anthrax to which the reader is referred for information concerning the forwarding of material for diagnosis.

BLACK-LEG VACCINE.

The preparation of black-leg vaccine has also been undertaken at this laboratory during the past year and we are now prepared to supply this product. This vaccine which is an attenuated virus is supplied on silk threads each of which constitutes a full dose and these threads are held in a brass clip of our own special design. The

*The amount was prepared at the laboratory. All other figures in this table refer to the product of the Pasteur Vaccine Company of Chicago, their vaccine having been used prior to our undertaking the preparation of this product.

SESSIONAL PAPER No. 15a

brass clips are so arranged that they can be attached to the cork of the vial in which they are to be forwarded from the laboratory. By this simple means we are enabled to inclose in one of these small vials as high as fifty doses of vaccine. The threads in the slip are held with sufficient pressure to prevent their being accidentally pulled out with other threads, or dropping out when handling. Further, this method of disbursing provides an aseptic package of small size which will be found very convenient to large users of this material.

Black-leg vaccine is supplied at 5 cents per dose. Outfits for applying the same are also provided and can be obtained at 50 cents each. These outfits consist of a needle holder, two needles and a pair of forceps.

COITAL EXANTHEMA.

During the month of June two outbreaks of this affection were investigated by me, one in the vicinity of Simcoe, and the other at Campbellford, Ontario. In each instance the diagnosis was easily made. The investigation of the Simcoe outbreak afforded an opportunity for obtaining blood smears which gave the following differential counts:

HORSES EXAMINED JUNE 26 AND 27, 1908.

| | III. Clyde Stalion, 5 years old. Abrasions on sheath. | IV. B.D. Mare, 1,400 lbs.; slight vaginal discharge. Served June 14 and 15. | V. S.A. Mare Topsy. Served May 10. First symptoms May 23. | VI. S.A. Mare Kate. Served June 14. First symptoms six days after. Sear. Pigment re-appearing. |
|---|---|---|---|--|
| Total number cells counted..... | 1,358 | 1,706 | 1,051 | 1,018 |
| Polymorpho-nuclear neutrophiles..... | 62.2 | 60.4 | 60.3 | 60.0 |
| Eosiniphiles..... | 3.2 | 2.1 | 8.0 | 1.6 |
| Mast cells..... | 0.1 | 0.2 | 0.7 | 0.0 |
| Lymphocytes, including large and small mononuclear cells..... | 34.3 | 37.2 | 30.8 | 40.0 |

From these few counts it will be noted that there is no marked alteration from the normal in any of the cases cited.

MALADIE DU COIT.

In September last, accompanied by Dr. A. Loir, I proceeded to the Lethbridge quarantine station, where, in collaboration with Dr. Hadwen some special experimental work on Dourine was undertaken. Later, Dr. Loir and myself accompanied Dr. J. C. Hargrave of Medicine Hat, Alberta, to a ranch near Gleichen, in the anticipation that the cases to be seen, some of which were of recent origin, would furnish suitable material for the demonstration of the *Trypanosoma equiperdum*. None of us however, found any body in the fresh and stained preparations of blood and other fluids examined from well marked cases of *Maladie du Coit* that resembled in the slightest degree the parasite for which we were searching. I was able, however, to obtain many smears from horses known to be free from *Maladie du Coit* or Dourine, as well as from animals affected in various stages of that disease, with which to continue the investigations connected with the differential counts of the leucocytes of the blood and the significance of their variations from the normal in this affection. In March, I again visited the Lethbridge quarantine station for the pur-

pose of verifying the finding by Drs. Watson and Gallivan of the *Trypanosoma equiperdum* and was able to detect the parasite in preparations taken by me from the vagina of the 'Tiffin' mare on the 21st, 23rd and 25th of that month. Up to February 11, 1907, the date of the first finding of the *Trypanosoma equiperdum* by Drs. Watson and Gallivan, this parasite has not been observed by any individual working with this disease in Canada, nor had it been observed in material taken from naturally infected cases on the North American continent.

TRYPANOSOMATA.

During the past year it has been found that some of the animals of this country harbour in their blood trypanosomata. These are, so far as we have been able to determine, non-pathogenic, with the exception of the parasite demonstrated to be the cause of the Dourine in horses.

RABBIT TRYPANOSOMATA.

Organisms were first observed in the blood of a wild rabbit ('cotton-tail'), which was about to be used for experimental purposes by Dr. Watson at the Lethbridge quarantine station. Fortunately, however, the blood was examined previous to inoculation with material from a case of Dourine, and was found to contain trypanosomata. Dr. Watson has since found the organisms to be present in a large percentage of the rabbits examined by him. On December 28 last we received two rabbits at this laboratory, one of which was found by Dr. Watson to harbour trypanosomata in its blood; the other, however, did not show any parasites up to the time of leaving Lethbridge, but, on their arrival here the blood of both contained organisms. The rabbit referred to in whose blood trypanosomata were found by Dr. Watson at Lethbridge, came to an untimely end from an accidental cause, but the other has, whenever examined, presented a greater or less number of organisms and is otherwise in perfect health. Inoculations have been made into mice, guinea-pigs and rabbits with blood containing active trypanosomata, but in no instance has a subsequent examination of the blood of the inoculated animal revealed any organisms, and we have, therefore, concluded that the parasite is non-pathogenic and similar to the *Trypanosoma lewisi*, in that it cannot be transferred from its normal host.

Blood from the rabbit which we have at this laboratory, containing active trypanosomata, has been subjected by Dr. Hadwen to freezing in pipettes for eighteen hours ($+20^{\circ}$ F.) without any apparent harm to the organisms, they being very active when thawed out at the end of this period, but clumping was in progress.

Many fleas from the rabbit in question have been examined in fresh and stained preparations, and trypanosomata have been demonstrated in several instances to be in an evolutionary stage. Fleas removed from the rabbit and kept for twenty-four hours before crushing did not show anything simulating trypanosomata.

From the data which we have, it is evident that infection can take place from rabbit to rabbit through the medium of the flea, and in all probability is the result of direct inoculation.

MOUSE TRYPANOSOMATA.

Trypanosomata have also been found by Dr. Watson in the field mice, which are abundant at the Lethbridge quarantine station. This organism is different in its general and micro-chemical characteristics from the organism found in rabbits. No attempt has been made to transfer this parasite to other species.

SESSIONAL PAPER No. 15a

TRYPANOSOMA LEWISI.

These organisms were found by Dr. Hadwen in a rat obtained near this laboratory on January 24, 1907. Since this finding organisms have been demonstrated in the blood from six of the sixteen rats examined. These sixteen rats were obtained from three different localities several miles apart. We have not found any particular locality from which the rats have been obtained to be entirely free from non-infected rodents. Fleas from some of these infected rats have been crushed and trypanosomata have been observed in the debris. This organism has been under cultivation on blood agar.

TRYPANOSOMA GAMBIENSE.

While this organism is not native to Canada we have conducted a large number of experiments with it for the purpose of familiarizing ourselves with a pathogenic trypanosoma.

The organism was received from Dr. Adami, pathologist to McGill University, in August last, and is one of the original strains brought from Africa by Dutton and Todd. All of our work with this organism has been with guinea-pigs and the object has been to learn the characteristics of a pathogenic trypanosoma. During this study we have found certain facts which we have not seen recorded in the literature on this organism.

These trypanosomata have been kept alive for eleven days at room temperature, the blood containing them having been drawn into a pipette and the end left unsealed but the organisms lost their virulence by this exposure. Blood containing these trypanosomata has been subjected to a temperature of $+8^{\circ}\text{F}$ to 0°F for two hours and three quarters, the organism becoming active with the warming of the slide. Material taken from a guinea-pig forty-eight hours after death was infective and at sixty-two hours transitional forms were seen but the parasite was no longer pathogenic for guinea-pigs. These trypanosomata disappear very rapidly after the natural or artificial death of its host provided the body is not opened.

This parasite is a strict *aërobie* and some experimental work has been undertaken in the use of serum to treat infected, and to immunize susceptible animals. The serum used was obtained from sealed pipettes which contain no organisms a few hours after closing. This study, while very interesting has not progressed sufficiently for us to make any statement in this connection.

RABIES.

Owing to the reported existence of rabies in certain localities it was deemed advisable to issue the following circular on the subject which would enable the receipt at the laboratory of material suitable for the purpose of verifying diagnoses.

RABIES (HYDROPHOBIA).

'An animal suspected of being affected with rabies (hydrophobia), should, if possible, be captured alive, placed in a cage where it can do no harm and watched. If affected with rabies, symptoms will appear within forty-eight hours and death will occur within a few days. No affected animal recovers.

That other causes of death may be excluded, material should be forwarded to the laboratory for a confirmatory diagnosis. If the time necessary for transmission to the laboratory does not exceed twenty-four hours, the head may be severed from the body and forwarded by express packed in ice. In winter, the severed head, if frozen, may be sent any distance provided instructions are given to keep frozen.

Where the distance from the laboratory exceeds twenty-four hours a portion of the nervous system, (brain or spinal cord), the medulla or base of the brain is pre-

8-9 EDWARD VII., A. 1909

ferred, may be placed in pure glycerine and forwarded by mail. There should be an excess of glycerine over the bulk of material forwarded.

Full information concerning history, clinical symptoms, &c., should be given.

Specimens should be addressed,

Biological Laboratory,
Ottawa, Canada.'

POULTRY DISEASES.

The past year has shown that there is still much to be gained from a study of the causes of death among the domestic fowls. From the findings at many autopsies, it is evident that there is an error in the diet of the birds which have come under our notice. My views may possibly appear to be somewhat radical in this connection but they have been informed from the observation of the lesions seen in fowls sent to this laboratory with a request for assistance in the prevention of further losses among the flocks from which they originate. The main lesions consist of an erosion of the mucous membrane of the gizzard, an atrophy of its muscular structure and an accompanying muco-enteritis. In such cases a complete change of diet to the whole grains and the placing of muriatic acid (a teaspoonful to the quart) in the drinking water has, in every instance from which subsequent information has been received, wholly corrected the difficulty, and there have been no further losses in the same flock.

In many instances the birds have been supposed to be suffering from chicken cholera, but the autopsy findings have in no instance revealed this condition during the past five years, nor have I any knowledge of an outbreak of this affection in Canada, with the exception of an outbreak studied by me in 1895-6, and therefore it is evident that this serious affection is not as common as usually supposed.

ENTERO-HEPATITIS IN TURKEYS.

Some experimental work was undertaken in this connection during last fall, but the nocturnal disappearance of the experimental birds nullified investigations covering a period of six weeks. From the data obtained, however, it is evident that the infection is transmitted either through the egg or upon its surface, and that the buying of new stock in the egg will not wholly prevent losses from this disastrous disease. Other observers report that the treatment of the eggs with a weak solution of alcohol has, in some instances, prevented the appearance of the affection in the young stock hatched therefrom.

PHOTOGRAPHY.

Photography is an essential feature in conducting the routine and scientific investigations of this laboratory, for, by its application an accurate record may be made of any particular feature which comes under our notice, and such photographic records, apart from their value in the publication of a descriptive article on the work conducted, assist in a positive determination when comparing specimens from different sources. Apart from the above-mentioned assistance, the photographic work of this laboratory during the past few years has included the preparation of the majority of the photographs used as illustrations in the annual reports of this branch. In this connection, it is particularly gratifying to note that some of these photographs have been considered of sufficient scientific value to warrant their reproduction in other publications.

SESSIONAL PAPER No. 15a

ADDITIONAL FACILITIES PROVIDED.

Certain additional rooms deemed necessary that the various preparations manufactured at this laboratory may be thoroughly separated from one another are very nearly completed and will greatly facilitate our work. These rooms have been partitioned off in the basement—providing a large incubating chamber of special design, inoculation and preparation rooms for use in connection with the manufacture of mallein and tuberculin and a room for the preparation of virulent black-leg material for use in the manufacture of black-leg vaccine. In the attic, rooms have been provided for the anthrax and black-leg vaccines, thus, all of the products are effectually separated the one from the other and the general routine work of the institution.

ISOLATION STABLE.

The need of an isolation stable is still more urgent than at any previous period in the history of this laboratory. Such a stable would be invaluable in connection with the preparation and testing of the anthrax and black-leg vaccines as well as affording facilities for experimental observation of cases of virulent infectious disease in the larger domestic animals.

In closing this my report I desire to express my appreciation for the assistance and timely advice which you have so freely given.

I have the honour to be, sir,
Your obedient servant,

CHAS. H. HIGGINS, B.S., D.V.S.
Pathologist.

The Veterinary Director General,
Ottawa, Canada.

W. H. PETHICK, D.V.S.

GOVERNMENT EXPERIMENT STATION, ANTIGONISH, N.S.

March 31, 1907.

SIR,—I have the honour to submit a brief report of the experiments conducted at this station, together with other work in which I have been engaged during the year ending March 31, 1907.

Since the publication of your report dealing fully with Pictou Cattle Disease and in which you conclusively show that ragwort is the cause of that malady, we are often asked for advice as to the best means of ridding the farms of this weed, which, as you know, is slowly, but none the less surely, claiming new territory.

It has long been known that sheep are free eaters of weeds and the experiments, which I have the honour of conducting, under your direction, at the present time, are chiefly with a view of learning what dependence can safely be placed in these animals in clearing land of this weed. It was, therefore, necessary to learn the effect of continued ragwort eating upon sheep.

It is generally believed that these animals will tolerate a considerable quantity of the plant without ill effects. Notwithstanding all this, the comparison of our own observations with those of others, help to confirm the suspicion (well known to you) that sheep die annually on certain farms from the effect of ragwort eating. The exact condition of plant or animal which lead to these fatal results has not yet been explained, although many theories have been advanced.

It is thought by some that ragwort is injurious at any season or stage of growth. Others consider it harmless when green, but poisonous when dried. According to the third theory, the seeds of the plant are alone injurious. The weight of evidence is very much in favour of the view that the plant is only poisonous when frozen, or at least, after the hard frosts set in. The opinion is strengthened by the fact that the deaths usually occur late in the fall. This again gives rise to the question: Does freezing cause any chemical change in the juices or texture of the plant to render it hurtful, or is the loss accounted for by the fact that the sheep are compelled, owing to the scarcity of the usual fodder plants, which are wilted by the frost or covered with snow, to exist almost entirely upon the more hardy ragwort?

Some people claim that fat, adult sheep are only susceptible. Others again state that feeding upon the plant rarely produces death, but causes staining of the tissues, making the mutton unmarketable.

I do not think that you would wish me, at this stage of our work, to furnish a report of each experiment. Nearly all are yet in progress, and I know that you (very rightly) consider it unwise to anticipate results. You are thoroughly familiar with every detail. But I would just say, for the information of such as may read this report, that the opinions or theories outlined above are at present being investigated by various experiments, systematically conducted, at this station, under your direction.

The outlook is decidedly hopeful, and I trust that before the new year we may be able to speak with confidence, and from the knowledge gained you may be in a better position to advise effectual means of eradicating the plant, which is the source of so much worry and loss. Already we seem to have fairly well disproved certain theories, which, had they been true, would certainly have hindered the sheep industry within the weed area.

I am glad to be able to inform you that many of our farmers are increasing the number and strength of their flocks by keeping over a good many ewe lambs. I believe that there are, at least, 5 per cent more sheep wintering in this county this year than last.

Farmers are beginning to see that if weeds are to be successfully fought, sheep should be kept. I certainly concur in this opinion, and from the present outlook, might say that the better cultivation of the tillable portion of the farms, the free use of the hoe and scythe in the headlands, fence corners and roadsides assisted by the keeping of plenty sheep on pasture and waste lands are the best means towards stamping out this weed, that we could perhaps suggest at present.

While we are sparing neither time or trouble, both here and at the biological laboratory, in endeavouring to learn the cause for the loss of sheep upon certain farms, presumably due to the eating of ragwort after the plant has been frozen, and until more definite knowledge is obtained, I would suggest that sheep be removed from ragwort land before the fall frosts set in or the snow covers up the usual fodder plants. It certainly can do no good, but only harm, to keep sheep out at pasture as late in the fall as is the custom on many farms. They should at least (after the grass is wilted) be penned at night and fed hay in the morning before being turned free. This may prevent them from eating injurious plants.

Our goats continue in good health, but are not giving a very good account of themselves as ragwort eaters. In this particular, they do not compare with sheep, and, contrary to our expectations, the common variety are more destructive to the plant than are the Angoras, which very much prefer to feed upon browse.

The experiment in which cattle are employed, is still in progress. The three cows which have been fed, during two winters, upon native hay, from which the ragwort was carefully removed, are, apparently, in perfect health, while one of the three cattle fed upon the same kind and quality of hay, but containing ragwort, died of Pictou cattle disease in June last.

SESSIONAL PAPER No. 15a

While this experiment has, perhaps, not yet been extended over a sufficient period to justify us in making a public announcement, as to the safety of feeding cattle upon hay, from which the ragwort growing therewith, has been carefully removed by hand, it has certainly, already, clearly shown that neglect or carelessness in removing the plant will be surely followed by fatal results.

The mare, which has been fed for thirteen months on ragwort mixed with hay and chopped fine, is still alive and apparently healthy.

The experiment with guinea pigs has given nothing worthy of notice.

The vote of thanks tendered you by the Board of Trade and by the Municipal Council for the county of Antigonish, together with the many complimentary and encouraging letters from representative people of this county and elsewhere, show, clearly, that your work in eastern Nova Scotia is well understood and highly appreciated.

In addition to the work already mentioned, I have by your instructions, inspected all shipments of live stock from Bayfield and Mulgrave. The report, which I have the honour of sending you monthly, contains all particulars. You will have noticed that one hundred and thirty head of cattle, ten horses and twenty-three sheep were shipped from Bayfield and seven hundred and three head of cattle, ten horses and one hundred sheep from Mulgrave to St. Johns, Newfoundland. I wish to thank Mr. Edgar Whidden, the owner of the vessels engaged in the trade, for giving the best possible facilities for the proper performance of my duty.

I am glad to be able to say that so far as live stock is concerned, this has been one of the healthiest years in the history of this very healthy province. Glanders, rabies, cholera and other contagious diseases have been reported from time to time, but prompt and careful investigation proved the suspicious unfounded and suspected animals to be suffering from diseases of a non-contagious character. And with reference to this branch of the work, I wish to express my appreciation of the valuable services rendered by the biological laboratory under such capable management. It certainly is a great help to your inspectors, particularly in investigating obscure diseases.

I have the honour to be, sir,

Your obedient servant,

W. H. PETHICK,

Inspector.

The Veterinary Director General,
Ottawa.

F. TORRANCE, B.A., D.V.S.,

WINNIPEG, March 31, 1907.

SIR,—I have the honour to submit the following report of the investigation of Swamp Fever in horses during the past year.

Work began in January, when, on your instruction, I visited several farms in the vicinity of Dominion City and made an inquiry as to the prevalence of the disease in that locality, the result of which has already been communicated in my letter of February 3. There were no actual cases of disease discovered at that time, and nothing further was accomplished until June, when Mr. Baskerville wrote stating that the disease had again made its appearance in his own neighbouring farms. With your consent, I again visited the locality, and spent several days investigating the cases of the disease and obtaining specimens for further examination. The facts in connection with this trip to Dominion City have already been conveyed in my letter of June 26.

8-9 EDWARD VII., A. 1909

Through the kindness of Mr. Baskerville and his neighbour, Mr. Bratton, I obtained two mares afflicted with the disease, and shipped them to Winnipeg, where they remained under my constant supervision until they died. The Bratton mare was well advanced in disease, and lived only a few days after her arrival here, but the Baskerville mare survived until November 7. During this period daily observations of pulse and temperature were made, and at short intervals the blood was examined, in fresh and stained specimens under the microscope, and by counting the red and white corpuscles.

No trypanosomes, plasmodia or other organisms could be detected at any time, and cultures made from the living blood invariably remained sterile. A well marked peculiarity in the blood of the Baskerville mare was a greatly increased number of eosinophile cells, constituting the condition known as eosinophilia. This frequently indicates the presence of worms in the intestinal tract, and I consequently treated the mare vigorously with vermifuge remedies, but without causing the expulsion of any worms. At the post mortem, there were no worms discovered in the intestines, and the few specimens in a verminous aneurism of the great mesenteric artery could hardly be sufficient to account for this change in the blood.

Various remedies were tried, and during the first month there was a marked improvement in the mare under a course of arsenic, salol and nux vomica. She increased in weight, and the number of red blood corpuscles went up from 2,240,000 per c.c. to 4,650,000, and she seemed on the road to recovery. The improvement was, however, only transitory, and was followed by a retrograde movement, in which all the gain of the previous month was lost, and an additional amount as well. A progressive anæmia followed, accompanied by a gradual loss of bodily strength, the mare gradually became weaker and weaker until she could no longer rise without assistance, and finally died.

The postmortem in this case showed the following conditions: Body much emaciated, no subcutaneous or intermuscular fat. Pericardial sac contained several ounces of fluid. Interventricular septum of heart had a curious yellowish area an inch in diameter, extending from one ventricle to the other. Microscopic examination of this area showed the muscle fibres disappeared and replaced by cellular infiltration and commencement of fibrosis. This had probably resulted from thrombosis of a branch of one of the coronary arteries. The spleen was enlarged and adherent to the stomach by an inflammatory area enclosing a small abscess, which, was found to contain a pure culture of the colon bacillus. A verminous aneurism of the great mesenteric artery was found, also numerous calcified tumors of small size in the wall of the small intestine, the result of the activity of *strongylus armatus*. No other parasites found.

The postmortem in the Bratton mare revealed the following conditions: Body much emaciated and distended with gas. Yellow gelatinous infiltration beneath skin, along back and other regions. No fat muscles, pale and flabby.

Thorax.—Some effusion in pleural and pericardial sacs. Lungs resilient and mottled, and large vessels filled with clotted blood, clots chiefly yellow. Heart large, flabby, containing yellow (chicken fat) clots in ventricles. Numerous hæmorrhagic spots on endocardium and in heart muscle. Area of gelatinous infiltration surrounding coronary artery.

Abdomen.—Stomach small, contains about two gallons feed and one bot. Small intestines pale and nearly empty. Cæcum and colon similar. A few dead strongyles in cæcum. No other parasites. Lymph glands of mesentery enlarged and soft (Hyperplasia). Kidneys-right, pale and flabby, left enlarged and contained pus (pyo-nephritis). Spleen enlarged. Womb and ovaries normal.

Several other postmortems were made, but with a few exceptions, they did not vary from the usual result. In one case there was a marked enlargement of the lymph vessels of the small and large intestine, and some of them were as large as a

SESSIONAL PAPER No. 15a

lead pencil, and distended with a clear fluid, cultures of which remained sterile. The lymph glands were much enlarged and flabby, but showed only hyperplasia

Another case that apparently was typical of swamp fever, was found to be badly infested with parasites, the caecum and colon being filled with a squirming mass of tiny worms, the *sclerastoma tetracanthum*. These worms are known to produce anæmia in horses in other parts of the world where swamp fever is unknown, and probably their presence in this horse led to symptoms mistaken for swamp fever. Mr. Post, who lives on a farm, in the same locality as Mr. Baskerville, tells me he found the same kind of worms in a mare which died with, what was apparently, swamp fever, but he states the worms were found, not only in the bowel, but also in the muscles and beneath the skin. These may have been the agamous form of the *strongylus armatus*, a worm somewhat similar in appearance to the *sclerastoma tetracanthum* and well known in its usual habitations, the large intestine and the verminous aneurisms of the mesenteric arteries. They have been found in the muscles and connective tissues by European observers, but I am not aware of any American discoveries of them in this situation. However, the worm is well known, and frequently observed in American horses, and there is no reason to doubt the accuracy of Mr. Post's observations.

It is evident, from these facts, that a disease closely simulating swamp fever in its clinical manifestation, may be accompanied or caused by the presence of large number of worms belonging to two closely allied species, *sclerastoma*, *tetracanthum* and *strongylus armatus*, but as these forms are not present in every case of swamp fever, they cannot be the cause of that disease.

In this connection it may be noted that there is a tendency among farmers and others to name any disease of a lingering or wasting character, 'swamp fever,' and in this way, swamp fever appears to be much more prevalent than it really is. Many of these so-called cases of swamp fever would be found, on closer examination, to be diseases of another kind, such as typhoid influenza, verminous anæmia and ordinary debility. Swamp fever has enough to answer for, without having to take the responsibility of these other diseases, and it is to be regretted that so great confusion exists. It is very easy to distinguish typhoid influenza from swamp fever, by two only of its characteristics, the loss of appetite and the deeper colour of the mucous membranes. Swamp fever shows no loss of appetite, at least until near a fatal termination, and the mucous membranes are paler than usual.

Anæmia from worm invasion is more difficult to differentiate, but as this is a rarer condition, it is not of so great importance. A careful examination of the fæces for worms, or their ova, would decide most cases. Debility results from previous attacks of disease or from lack of proper food and care, and the history of the case should decide to which class it belongs.

In conclusion I wish to express my obligation to Dr. Bell for valuable assistance in making cultures and examining specimens, and to Messrs. Baskerville and Bratton for the gift of cases of swamp fever.

I have the honour to be, sir,

Your obedient servant,

F. TORRANCE, D.V.S.,

Inspector.

The Veterinary Director General,
Ottawa.

8-9 EDWARD VII., A. 1909

S. H. WARD, V.S.

March 31, 1908.

SIR,—I have the honour to submit herewith my report covering the inspection of meats under the 'Meat and Canned Foods Acts,' from September 3, 1907 to March 31, 1908.

At the time the Act went into force, September 3, 1907, there were twenty-seven establishments designated by Order in Council as coming within the provisions of the Act, each being known by an official number. To enforce and carry out the regulations promulgated for the enforcement of the Act, thirty-nine veterinary inspectors were appointed, each establishment being under the supervision of from one to four inspectors according to its capacity. The veterinary inspectors received a thorough course of training in Chicago in all branches of meat inspection, and, in addition, were required to pass an examination prescribed by Order in Council before being eligible for appointment.

The duties of the inspectors are clearly defined in the regulations appended herewith. In their essence, the regulations are the embodiment of the various inspection laws formulated by countries in which meat inspection is maintained. The organization and practical working out of a competent meat inspection system applicable to the immense interests and peculiar conditions that exist in Canada, involved an amount of work that can scarcely be appreciated except by one who, like yourself, has given a great amount of time and thought to framing regulations consistent with the Act, and which had, of necessity, to cover and protect an industry which is but in its infancy, and which, up to the time at which inspection was enforced, had governed itself. Under the conditions which surrounded the enforcement of the Act on September 3, 1907, the department has cause to congratulate itself on the harmonious development which has attended the work of inspection. This can only be credited to your forethought in training an intelligent body of men who have striven to their duty with tact and credit to themselves and to you as the head of the branch. I am confident that their successful efforts were the result of pride in the knowledge that upon them to a large extent devolved the successful inauguration of a system which is of the utmost importance to the packers, and of still more importance to the country at large.

It is not necessary for me to go into the reasons which prompted the passage of an Act of such vast importance to the agricultural community. It is sufficient to say that, without the government guarantee of meat exports, it was but a question of a short time until foreign competition would quietly and effectually have swallowed up our bacon trade with Great Britain, by reason of the fact that their countries were certifying that all meats exported by them were from inspected animals and were sound and wholesome at the time of shipment. Public sentiment in Great Britain is asserting itself and demanding some guarantee that this meat supply from abroad be free from suspicion.

An investigation of Canadian packing houses, made some time prior to the passage of the Meat and Canned Foods Act, revealed nothing of an alarming nature, yet some conditions were found to exist that were felt might be corrected advantageously to the packer and the consumer. These conditions were remedied as early as possible after the Act went into force and the changes, to one who had visited the establishments prior to the enforcement of the Act, are very perceptible. The sanitary conditions at the establishments are well marked, and still more marked is the method of handling, not only in the process of cure, but in the manufacture of the various meat products. Our inspectors were impressed with the necessity of furthering the sanitary conditions at each establishment, and were instructed to inculcate personal cleanliness into the minds of employees, and it is encouraging to note the good results which have followed.

SESSIONAL PAPER No. 15a

Shortly after the inauguration of the inspection it was deemed advisable that a travelling inspector be appointed, and R. Barnes, V.S., inspector in charge of Toronto, was promoted to the position. His duties consist in visiting the various establishments from time to time with a view to establishing uniformity in the general work of inspection, and in investigating and reporting on the various problems which arise at all times and which go hand in hand with the enforcement of compulsory measures. The wisdom of the appointment is apparent in the good work which he has performed.

The question has been raised as to the value of inspection to the packers and to the public in general. The opinion so far among packers is that it is a good thing and was needed as a stimulus to the export trade. There has been, if statements are to be accepted as true, an increased number of animals slaughtered over previous years. During the first month the Act was in force there were very few establishments but were required to work four or five hours almost every night of the week in order to clean up the consignments of live stock. These extra killings ran over the months of September, October and November, and of course necessitated our inspectors remaining on duty sixteen hours a day owing to the fact that there were not sufficient inspectors trained in the work of inspection to relieve them. The department is to be congratulated on the fact that the inspectors faithfully remained on duty whenever the exigencies of the establishment demanded, notwithstanding the wearisome, and by no means pleasant, work of inspection, handicapped as the inspectors were for the first two or three months by cramped and, in many cases, badly ventilated killing floors.

A synopsis of the method of inspection is perhaps necessary that the regulations may be thoroughly understood. Every animal intended for slaughter is examined by a veterinary inspector in the yards or pens of the abattoir before being allowed to enter the killing floor. Any animal found diseased, or suspected of being diseased, is tagged and held back until the end of the day's kill. As animals are killed the inspector makes a thorough examination of the carcass and all viscera. If no evidence of disease is found, the carcass is marked with a stamp or label showing the inspection legend,—The Crown and the words 'Canada Approved' together with the establishment number. Should any carcass be found showing evidence of disease such as to render it unfit for food, it is immediately marked with a 'condemned' tag. A carcass of which a doubt exists as to its condition has placed upon it a 'held' tag, and when the kill is over the inspector makes a further examination and disposes of the carcass according to his judgment. All condemned carcasses are tanked under the supervision of the employees of the department.

The postmortem inspection of swine is a most thorough one, and the inspectors have been impressed with the necessity of a systematic examination of the carcass. As you will perceive from the statistics, tuberculosis is the most common disease, the seat of the lesions in the majority of cases being the glands lying to the outside of the base of the tongue. So constant is the location of the disease in these glands, that it was deemed advisable that they be removed, and cut into by the inspector, as quite often evidence of disease can only be detected by section.

I feel at this time that some mention should be made in regard to the prevalence of tuberculosis in swine. It occurs to me that the virulence of the bacilli is greatly increased after gaining entrance to the organism of these animals. As glanders differs in virulence in the horse and the mule (running a remarkable rapid course in the latter animal), so does tuberculosis differ in virulence in the cow and in the hog. In the one animal it might be called a chronic disease, in the other, acute.

The question will suggest itself as to why this disease should be so prevalent and what means can be adopted to prevent its dissemination. The reports from our inspectors and our own observations tend to show that the creamery-fed hogs are very

8-9 EDWARD VII., A. 1909

prone to the disease, the infecting medium undoubtedly being the by-products of the creamery and cheese factory. Experiments have shown that skimmed milk contains as a rule, very large quantities of tubercle bacilli, as no means are taken at the creamery or cheese factory to render the milk innocuous. It is readily seen how dangerous the skimmed milk may be as a food, not only for swine but for rearing young calves. The remedy is an easy one and lies with the creamery and cheese factory, as the case may be. The sterilization of the by-products could easily be performed before the skimmed milk is handed back to the patron. It is necessary, however, in order to accomplish this end, that our provinces enact laws making sterilization compulsory, and appointing competent men to see that the same is properly carried out. It is questionable, however, if this will be done, at least in the near future. The prevalence of the disease in hogs has not yet been brought to the attention of legislators, nor have swine breeders realized the extent of the disease, and until this is brought to their notice, it is not expected that any active steps will be inaugurated looking to the control of the disease through the milk.

Your attention is directed to the large number of condemnations under the head of immaturity. The trade in calves usually opens up in March, it being the custom of farmers to sell their calves immediately they are born, shippers buying them from fifty cents to a dollar a head. They are loaded in double-decked cars and consigned to the large cities where they formerly entered into consumption for human food.

The fact that the carcasses of calves, anywhere from one to ten days old, were allowed to be placed upon the market for sale in our large centres, and designated as veal, was a disgrace to all connected with such traffic. Public health and sentiment were completely lost sight of by dealers in the profits which accrued from buying a 'food' (?) at one cent a pound and retailing to the housewife at fourteen cents. The custom of selling calves prevails in the dairy districts and is probably the result of the lack of forethought on the part of the farmer.

It would seem that two subjects, viz: The raising of calves and the thorough sterilization of all creamery skimmed milk, could with profit be brought to the attention of the farming community through the farmers institutes.

Section 19 of the regulations prohibits the entry into establishments of any carcasses or portion thereof, unless the same are marked or certified to as having passed inspection. Exception is made, however, in the case of dressed carcasses when the head, heart, lungs and liver are held by their natural attachments. This provision had in view the large trade carried on in dressed carcasses in certain sections of the Dominion. This trade is a relic of the times which prevailed two decades ago when farmers found a readier market for dressed carcasses than prevails at the present time. During the development of the country the demand for domestic cured meats was very large giving way, however, to the products of the various abattoirs which sprang into existence with the advent of transportation facilities. Some opposition was experienced against this section, confined however, to the Counties of Essex and Kent, many breeders in these counties believing that all carcasses slaughtered by them upon their own premises, would come within the provisions of this section and that it would be necessary that the head, heart, lungs and liver be left attached, no matter to whom the carcass was sold. Representations were made that the dressed hog trade from this district would be killed were the department to enforce the regulation. In order to overcome the difficulty, it was suggested to the minister that local veterinarians be appointed and certain railway points designated at which shipments of carcasses could be inspected. Acting under instructions from the minister, an examination was held in Chatham on November 30, 1907, in order that veterinarians might be qualified as inspectors *pro tem*. The candidates presenting themselves for examination were informed in the presence of C. H. Higgins, D.V.S., pathologist, and A. G. Hopkins, M.D.V., who, with myself, conducted the examina-

SESSIONAL PAPER No. 15a

tion, that appointments as inspectors would not make them eligible for permanent appointments. Notices were sent to various points in the counties of the proposed action by the department, and shippers were instructed to notify M. B. Perdue, V.S., of Chatham, of intended shipments. This inspection went into force on November 27, 1907, and from that time until this date only ten carloads, or a total of one thousand, eight hundred and thirty-seven carcasses, were shipped to four establishments at which inspection is maintained. It is somewhat strange that farmers persist in dressing their hogs, selling them at seven and a half cents a pound, when live hogs are worth from five to five and a half cents. As a rule a hog weighing two hundred pounds, live weight, will dress one hundred and forty pounds, or seventy per cent of the live weight. There can therefore be no advantage in slaughtering swine upon the farm.

A small trade in dressed carcasses of sheep is carried on in the Maritime provinces, the principal shipments being from Charlottetown, P.E.I. The trade usually opens in the late fall months, and shipments are made to centres in the Dominion as far west as Winnipeg.

Since the inauguration of the Meat and Canned Foods Act, considerable agitation has arisen in various cities favourable to the establishment of public abattoirs under direct municipal supervision. This agitation indicates that the inspection of foods is becoming popular, and will develop and become more necessary with time.

I have the honour to be, sir,
Your obedient servant,

S. H. WARD,
Chief Meat Inspector.

The Veterinary Director General,
Ottawa.

C. H. HIGGINS, B. Sc., D.V.S.

BIOLOGICAL LABORATORY,
OTTAWA, Canada, March 31, 1908.

SIR,—I have the honour to transmit this my report as Pathologist for the year ending March 31, 1908.

A great increase in my work and in the work of the Biological Laboratory, over that of any previous year has been witnessed. Not only has the routine connected with the examination of material forwarded for diagnosis, exceeded that of other years, but there has also been an increased amount of work in connection with the manufacture of biological products. Our disbursements in this direction are partially indicated from the fact that 879 registered packages have been forwarded from the laboratory containing anthrax and black-leg vaccines, mallein and tuberculin.

The pursuit of special research work has been impossible during the year, save in connection with some minor investigations where only a limited number of examinations were necessary, as we have been overwhelmed with the duties connected with the work above outlined.

We have, in addition to preparing all the mallein used by the department, prepared anthrax and black-leg vaccines and it is gratifying to note that these two pro-

8-9 EDWARD VII., A. 1909

ducts have given almost universal satisfaction wherever used. This year, through a slight change in the package and the designing of a new means of administration, the application of either vaccine is so simplified that less trouble is to be anticipated in disbursing than has hitherto been the case.

The alterations in the building which was completed early in the year have greatly simplified our work and the several preparations which we manufacture have been effectively separated, the one from the other, thus, the liability of any of our products to contamination from another or from the infectious work of the laboratory is reduced to a minimum. Each branch of the work is confined to a limited space, a feature which is absolutely essential where material of such widespread importance to the live stock interests of the country is prepared.

The inception of the meat inspection service under the Meat and Canned Foods Act, has caused an increase in our work through the necessity for diagnosis of conditions commonly seen in slaughter houses but which have hitherto received no attention nor have they been accurately diagnosed. Aside from the assistance which we have been able to render in this direction, we have obtained through this service many rare and valuable specimens which have been added to the museum of the laboratory.

Aside from the work of the laboratory and from my duties as Pathologist, I proceeded to Regina in June last, at at your request, placing myself at the disposal of the Commissioner of the Royal North West Mounted Police as a special agent of the Branch to exercise a general supervision over the enforcement of the compulsory mange dipping order. To this end, at the direction of the Commissioner and accompanied by Inspector Burnett, I visited Calgary, Macleod, Lethbridge, Medicine Hat and Maple Creek for the purpose of meeting and instructing the various inspectors who were to organize and supervise the work in their respective districts.

The transfer of the executive administration of the Health of Animals Branch in Saskatchewan and Alberta to an officer of your Branch having been decided upon, I later proceeded to Regina, remaining there to assist at its consummation by arranging for such details as were possible prior to the arrival of Dr. Hilton, the officer commissioned to effect the change. After this transfer and assisting in a few minor inspections for which no officer was available, I completed the inspection of the Boundary Stations in these two Provinces which was started previous to the change of administration, and also witnessed the operations of the Seabury Spraying Machine.

BOUNDARY STATIONS.

The Boundary Stations at North Portal, Wood Mountain, Willow Creek, Pendant d'Oreille, Coutts and Twin Lakes were visited by me for the purpose of ascertaining what changes were required to place the dipping plants at these points in first class order. The conditions found at these points as well as my detailed recommendations in connection with each were forwarded to your office immediately following the inspection and, therefore, need no further consideration at this time.

SEABURY SPRAYING MACHINE.

I was present at a point on the Little Bow river, about forty miles north of Lethbridge, during the setting of the Seabury Spraying machine in connection with a series of corrals and a chute erected for this purpose. Some difficulty had already been experienced by the men in charge of this apparatus prior to their arrival at this point in obtaining a proper emulsification of the oil and they found a similar difficulty with water taken from the Little Bow river.*

*A sample of the water from the Little Bow river taken at this time, (July 21st, 1907), was on my return to Ottawa, analyzed by Prof. Shutt of the Experimental Farm, who found that the total hardness was 11.5°. Basing an estimation on this degree of hardness it would take seventeen pounds of quick lime to soften one thousand gallons of this water.

SESSIONAL PAPER No. 15a

In order to overcome the trouble and to determine the manner in which we could improve the emulsion, I conducted a series of experiments with this end in view. After the preparation of many trial emulsions it was found that an excellent emulsion resulted when twice the amount of hard soap recommended by the compulsory order for use with boiling soft water was used with the oil on hand (Beaumont) and the water taken direct from the river without treatment. Having thus arrived at the cause of the difficulty in the preparation of the emulsion a sufficient amount was prepared to operate the machine. After the thorough mixing of the emulsion by forcing it through the machine a number of times a sample was taken and this sample shows but a slight separation of the oil even at this writing (over nine months).

This machine, while thoroughly applying the emulsion to the cattle passing through it, so frightens the animals that considerable persuasion is at times required to induce an obstinate steer to enter the sprayer. To me it appeared much slower than a dipping vat and the only advantages which I could see that it possessed over such an arrangement, were, the small amount of material required to treat the cattle and the portability of the apparatus. These advantages, however, are of doubtful value when considered with the disadvantages. The general idea of the machine is good but it seemed to me that a machine into which the animals could be driven without such excessive prodding would possess many advantages over the apparatus that I saw.

Another difficulty in the application of oil emulsions with this machine seems later, to have been experienced through the alkali taken into it by the feet and on the hair and hides of the cattle to be sprayed. From some of the results it is apparent that the emulsion was improperly prepared or that there was sufficient of this alkali to alter the emulsification of the oil. Such a contingency was not considered when I witnessed the operation of the machine, therefore, no steps were then taken to provide for such errors.

Oil emulsions are such delicate mixtures that it will be necessary, if they are to be used in the future, to have their use more thoroughly supervised by men better trained in their preparation than was possible during last summer.

* * * * *

Without further preliminary remarks I will proceed to enumerate a few of the special features connected with the work of the laboratory which will indicate the wide range in the scope of our work and some of the special means by which we have been able to assist in the general efficiency of the branch.

EXAMINATION OF SPECIMENS.

During the past year 339 series of specimens have been received from various sources throughout the country representing an increase of 166 series more than were received during the year immediately preceding.

The specimens which have been received during the year represent a far greater variety of conditions than has been the case during the whole period that the laboratory has been in operation. Many are valuable representatives of their respective classes and an examination of our records indicates that the senders in many instances are not individuals from whom we have received material previously.

From the laboratory standpoint, it is desirable that more care should be exercised in the preparation of specimens that they may reach us in better condition for diagnostic purposes. As a rule Inspectors who have had particular training in this respect or who are careful to follow the simple instructions which have been issued from time to time, supply specimens which are in excellent condition when we receive them. There are, however, many specimens with which we could have done

8-9 EDWARD VII., A. 1909

more to assist interested individuals had more care been exercised in preparation prior to their shipment.

We are in a position to render great assistance to the practitioner of veterinary medicine, a fact which has already been exemplified in numerous instances and such practitioners should be more eager to avail themselves of the opportunity offered by the facilities of this institution which are at their command.

In order that the greatest possible assistance may be available I will outline some of the main principles which should be observed in taking and preparing material for laboratory diagnosis.

The possibility of an accurate diagnosis is often nullified by the apparent carelessness in the manner of preparing the specimen transmitted to the laboratory and foreign micro-organisms have become so abundant that the lesions are obscured or the causative factor destroyed by the changes which have taken place during transit.

It must be borne in mind, however, that any solution which will preserve the tissue cells intact, or hold the form of an organ is necessarily antiseptic and will prevent the recovery of the organism in pure culture. Thus, where cultures are desired the greatest care must be exercised in the preparation of material and freezing is usually the most convenient solution of such a difficulty. As this procedure is out of the question during a greater portion of the year we have indicated on a special circular, which is reprinted herewith, instances in which bacteriological diagnoses may be made from easily prepared material. Further, it is almost impossible to issue any general guides which will assist in preparing material so that we may make some use of it from a bacteriological standpoint.

To retain the peculiar selective staining characteristics of individual cells it is necessary to use such preservative solutions as have proven to be most suitable for the purpose, and the individual forwarding the material should consider the general rules prepared for his guidance in the various circulars which have been issued from time to time for this purpose.

The special general circular is reproduced herewith and the details to be observed in connection with the forwarding of material from suspected cases of anthrax, black-leg and rabies were outlined in my report of last year which is printed as a portion of the report of the Veterinary Director General, therefore, they require no further consideration at this time.

Dominion of Canada—Department of Agriculture.

Health of Animals Branch.

Instructions for sending Specimens for Microscopic Examination

In forwarding specimens of diseased tissues or organs for diagnostic purposes the following suggestions should be noted and carefully carried out in order to ensure their arrival at the laboratory in good condition.

Specimens for Pathological Examination.

Unless a specimen is so remarkable and characteristic that it should be preserved as an exhibition or museum specimen, it is unnecessary to send large portions. Small portions about an inch cube well selected from different regions are sufficient. They should be taken in such a manner as to exhibit the normal tissue passing into the diseased tissue. Together with the material which shows actual lesions, portions of an inch cube should be taken from the lung, heart, spleen and kidney. In many instances the microscopical lesions in apparently healthy organs give the clue to the affection from which the animal suffered. These small portions should be placed in a wide mouthed bottle or jar, with at least five times their volume of alcohol, or better still 4 per cent solution of formaldehyde.

Specimens from different animals should be placed in separate containers.

Large specimens may be packed in ice or frozen.

SESSIONAL PAPER No. 15a

Hog Cholera.

Where this disease is suspected, in addition to the material above designated, a portion of the intestine is necessary, consisting of the last portion of the small intestine and the first portion of the large intestine, including the ileo-caecal valve.

Specimens for Bacteriological Examination.

Bacteriological specimens are easily contaminated by the many putrefactive organisms which exist in the air and soil and, with few exceptions, must be taken by some one thoroughly trained in bacteriological methods.

Anthrax.—A few drops of blood from an animal suspected of having died of this disease, placed on a clean piece of note paper, allowed to dry in the air, folded, placed in an envelope and forwarded to the laboratory provides sufficient material for diagnostic purposes.

Specimens for examination should be accompanied by a letter giving complete information concerning the case in question, with its history, clinical symptoms, &c.

Specimens must be labelled in order that they may be identified. The name and address of the owner of the animal and the name and address of the sender of the material are necessary in order that records may be kept and reports promptly forwarded to the proper parties.

Specimens not exceeding five pounds in weight after being securely packed, to prevent breakage of the containers or leakage (see Sec. 106 and Sec. 107, page XX, Canada Postal Guide), should be sent by mail.

Specimens exceeding five pounds in weight should be sent by express.

J. G. RUTHERFORD,
Veterinary Director General.

Specimens should be addressed,
Biological Laboratory, Ottawa, Canada."

When material is forwarded by mail the Post Office regulations must be complied with, otherwise the authorities may confiscate and destroy the material at the first office, in which case we never receive the material nor is there a record of its disposition. When sent by express equal care should be observed in ascertaining the regulations of the Express company thus avoiding the delays through the omission of some slight detail. Special precautions must be taken when the specimen forwarded is presumably of an infectious nature.

The details of labeling the material forwarded and of accompanying information therewith should be faithfully observed that delays may be avoided in examinations and that a report may be promptly issued to the proper party.

PRESERVATION OF SPECIMENS.

There may be and doubtless are many veterinary surgeons and others reading this report who may desire to preserve some curious or rare specimen prior to transmittal or for purposes of their own. To secure the desired preservation there are many methods which may be followed and therefore, I will detail those which have been found of greatest assistance.

Alcohol.—Until recently alcohol was the only preservative generally used for this purpose which did not destroy the structure of the tissue or the staining qualities of the cells. It is largely used at the present time for special purposes but for general use has the disadvantage of being expensive and causing a loss of the natural colour, bleaching the entire tissue to an almost pure white. It is however of value where formaldehyde, cannot be obtained and should never be used in less than an eighty per cent solution.

8-9 EDWARD VII., A. 1909

Formaldehyde.—The introduction of formaldehyde has overcome many of the obstacles formerly encountered in the preservation of specimens for museum and other purposes. In watery solution it has taken first rank over any other method of procedure during the past few years. Its use is attended with many modifications each of which possesses some particular advantage for special purposes. Ordinarily it is used in a four per cent solution, which is prepared by adding one part of the commercial formaldehyde (40 per cent watery solution) to nine parts of water. Such a solution not only preserves the specimen but hardens it, rendering quite soft tissues very firm. The only objection to the solution for the general preservation of specimens for museum purposes is, that the tissues will show considerable bleaching, but, for material which is to be subsequently used for microscopic purposes it is very serviceable. Special modifications in the dilution with water and the addition of other chemical agents are used for special purposes.

Kaiserling's Method of Preserving Museum Specimens.—By following the procedure recommended by Kaiserling specimens are obtained which preserve their natural colours almost indefinitely provided they are not exposed where the light is too strong. The method of procedure is somewhat tedious, and requires the use of a number of solutions which are as follows:—

No. 1.—Potassium nitrate, 15 grammes; potassium acetate, 30 grammes; formaldehyde (40 per cent.), 200 cubic centimetres; water, 1,000 cubic centimetres.

Medium sized specimens are usually left in this solution for five days after which they are removed to the solution No. 2, which is an 80 per cent solution of alcohol, in which they remain for one to six hours. They are removed to 95 per cent alcohol for one to two hours to restore the colour which is somewhat affected in the fixing solution.

The final preservation is in solution No. 3 which is as follows:—

No. 3.—Acetate of potassium, 200 grammes; glycerine, 400 cubic centimetres; water, 2,000 cubic centimetres.

Unless the water available for the last solution is very clear it is better to use distilled water. This last solution is liable to contamination when no preservative is added, but the specimens as a rule contain sufficient formaldehyde or alcohol to prevent the growth of moulds or fungi. By this method the original colours are preserved in almost their original shades on placing the specimen in its final preservative fluid.

When the surface of the specimen has lost some of its natural colouring, due to prolonged exposure to light, the colours can be restored by placing in 95 per cent alcohol for variable length of time till the colour returns, or a thin slice may be cut from its surface exposing the unbleached tissue.

Heidenreich's method of Preserving Museum Specimens.—While it is necessary to use a very expensive solution in the preservation of museum specimens by Heidenreich's method, it is ultimately less expensive than the foregoing in that the technique is much simpler and the results are fully as effective. We are at present using this method in preference to any of the many methods for holding the colours on valuable museum material. The details are as follows: A stock solution, Holzin, consisting of three parts of 40 per cent. formaldehyde and two parts of methyl alcohol is prepared. The solution is made by adding this holzin to the following mixture:—

Holzin, 70 cubic centimetres; glycerine, 700 cubic centimetres; water, 300 cubic centimetres; chloral hydrate, 150 to 200 grammes.

This is the only solution required and the specimens are placed directly in this fluid in which they will harden. There is no handling of specimens impregnated with chemicals which are dangerous to handle with the unprotected hands and much less time is required in the preparation of the material.

SESSIONAL PAPER No. 15a

In the placing of specimens in this or any other preservative great care should be exercised to prevent pressure on any part through the use of too small a container or by the weight of the specimen being so great as to flatten it on the bottom of the container, otherwise valuable material will be so distorted in shape and general appearance as to render it almost valueless for exhibition purposes.

A few specimens prepared according to Heidenreich's method have been exposed to bright daylight in the laboratory for varying periods up to three months without any apparent alteration in the colours. While this has been the case it is far safer to keep specimens either in subdued light or complete darkness. This method has an advantage over that of Kaiserling in that specimens preserved by it may subsequently be used for microscopic purposes, there being no marked alteration of the staining qualities. Unless we find some defect in this method not apparent at the present time we will continue its exclusive use for museum material.

As in the past we shall be very glad to receive material which is of value for museum purposes and due acknowledgement will be given to the individual forwarding the same in the labeling of specimens on the shelves of our museum. It will be a pleasure for us to show interested parties our museum which contains specimens illustrative of many of the features connected with the general work of the branch.

In a report on the work of the laboratory for the year just ended it is not our purpose to describe each individual specimen with which we have dealt, some, however, have been of more than passing interest, not only to laboratory workers but to the various inspectors attached to the Health of Animals Branch and to the individuals whose interests have been involved in the diagnoses rendered by us. It is, therefore, my intention to briefly describe such material and in some instances to reproduce photographs or drawings. These data are classified alphabetically as it has seemed the most appropriate for the purpose.

ABNORMALITIES.

A very interesting specimen of a bifurcation of the small intestine and its subsequent anastomosis was forwarded to the laboratory by Inspector T. M. Pine.

ACTINOMYCOSIS.

Three cases of this affection have come to our notice during the year. In two instances the differential diagnosis was established from *Actinobacillosis* by animal inoculation. In the other instance a positive identification from *Actinobacillosis* was impossible owing to the condition of the material on its receipt at the laboratory.

ANTHRAX.

Material has been examined from twenty-two suspected outbreaks, although we were able to positively identify the diseases in one instance only. The identified outbreak occurred at Collingwood, Ont., and there is a history of this disease having been manifest on this same farm two years previously. Another outbreak was investigated by Dr. Hadwen in the vicinity of St. Hyacinthe, Que.

Some difficulty is still experienced in the examination of material from suspected cases of this disease owing to the lack of care in taking material for microscopic examination. The instructions given in the circular should be followed very carefully if it is desired that we render the greatest possible assistance in diagnosing this affection.

BLACK-LEG.

Material from six suspected cases of Black-Leg has been dealt with, one with a positive finding, two were negative and three were doubtful. The general idea seems

8-9 EDWARD VII., A. 1909

to prevail that infection in Black-Leg is similar to that of anthrax and that the blood is equally serviceable for diagnostic purposes in either case. This idea is correct to a certain degree, but the blood should be diluted with an equal amount of pure glycerine and forwarded in a small vial which must be properly sealed. The glycerine destroys the saprophytic non-spore bearing bacteria, but does not kill the spores of either Black-Leg or Anthrax. We, therefore, are able, when material is furnished as directed, to positively identify and differentiate between the two diseases by animal inoculation.

As a rule, the presence of gas beneath the skin covering the affected muscles together with the discoloured appearance of the muscles themselves and the fact that the blood clots after death are sufficient for a diagnosis in the field. When a confirmation of a clinical or post mortem diagnosis is desired, a few drops of the bloody serum from the affected muscles placed on a clean piece of note paper and allowed to dry in the air, furnishes sufficient material for examination.

CALCULI.

Two excellent specimens of biliary calculi have been received and are valuable additions to our museum. One is about an inch in diameter and was forwarded by Inspector H. E. Marshall from Hamilton, Ont., while the other is about two by three inches and was forwarded to us by Inspector Ransom of Peterboro, Ont.

CYSTICERCUS BOVIS.

An excellent specimen of this condition was forwarded by Inspector Fisher while he was stationed in Winnipeg, Man. Portions of the masseter muscles, pillars of the diaphragm, lymphatic glands, and the heart presented numbers of these encysted parasites. This is the only specimen of beef measles which has come to our notice during the existence of the laboratory.

CYSTICERCUS CELLULOSAE.

Three specimens of this condition have reached us, two from Toronto and one from Calgary. We have from this material been able to obtain a sufficient number of cysts for purposes of demonstration to interested parties when visiting the laboratory and also have a number of specimens for the shelves of our museum.

CYSTICERCUS TENUICOLLIS.

Three specimens of this condition have been received, the first having been forwarded by Inspector Fisher of Winnipeg and was taken from a sheep. The second was forwarded by Geo. W. Collison, M.D., Brinston Corners, Ont., and was also removed from a sheep. The third was forwarded by Inspector J. H. George who removed them from a hog and we were able to demonstrate a pyelo-nephritis involving the kidney as well as the cystic form of the parasite under consideration.

ECHINOCOCCI.

The first specimen of echinococci was forwarded to the laboratory by Inspector Marshall from Stratford, Ont., who reported that there were eighteen cysts in the liver. This specimen proved to be of the multilocular variety. The other specimen was furnished by Inspector Thompson of Collingwood and was of the polymorphous variety.

FATTY DEGENERATION.

Inspector Kellam of Montreal forwarded a portion of a carcass to the laboratory for us to determine the cause of a peculiar colouration of the muscle and strong odour which was present. Microscopically we found this tissue to be greatly de-

SESSIONAL PAPER No. 15a

generated and infiltrated with fat, in all probability a result of the food which the animal received for some time prior to its slaughter.

FLOATING KIDNEY.

A live sheep was brought to the laboratory in May for us to determine the trouble from which it was suffering, it having been decided that the animal was of no further value. There was a history of its having been handled the day previous for the purpose of shearing, after which it was noticed to be very unsteady on its legs. The sheep was destroyed and we found that both kidneys were floating in the abdominal cavity. There was considerable fluid contained in the abdomen and this was found to have been due to hemorrhage through the capsule of the kidneys. The hæmorrhage was considered to have been the result of the twisting of the kidney upon itself occluding the renal vein and thereby increasing the blood pressure within the organ, a result of the handling during shearing.

GLANDERS.

A number of examinations of material from suspected cases of glanders have been made during the year, some of which were undertaken with a view of recovering the causative organisms for use in the manufacture of mallein. As our remarks upon mallein are more fully considered elsewhere in this report I will not consider the details in this connection at this point.

HOG CHOLERA.

There has been a marked decrease in the number of instances in which we have been called upon to determine the presence of the lesions of this disease in material forwarded for examination. We have received specimens from seven outbreaks only, two of which were positively identified as hog cholera.

LEUKAEMIA.

One suspected case of this disease in a hog was dealt with during the year. We were, however, unable to assist in its positive identification owing to the fact that some delay was experienced during the transit of this material from the packing house to the laboratory. An allied condition in the human being has been the subject of much study from laboratory workers and it would be interesting for us to avail ourselves of all material which may be obtained from similar cases in the lower animals. Apart from the examination of the spleen, the lymphatic system, and the medullary substance of bone, the kidneys and liver should be supplied for examination as they are at times involved. Perhaps the most important detail in a study of such cases is a careful examination of the blood, and to this end blood smears should be furnished in addition to the organs above mentioned.

NECROSIS.

Three forms of necrosis have been observed in material received,—cold necrosis in the hog, fat necrosis in an ox and osseous in material taken from a hog. In no case have we encountered a necrotic condition which could be ascribed to the bacillus necrophorus.

NEPHRITIS.

An opportunity has been afforded us to study a chronic interstitial nephritis in a hog where both kidneys were involved. The kidneys in question were supplied by Inspector Pine of London, Ont., and were taken from a hog presenting no other lesions as observed at post mortem inspection. There was no suspicion of such a change

8-9 EDWARD VII., A. 1909

prior to the slaughter of this animal. This is the first time that such a condition has come under our observation although it has been quite frequently observed in material of human origin. The study of such a condition is interesting, not only from the bearing which it may have on the traffic in the lower animals which are utilized for food purposes, but also in the relationship which conditions in the lower animals bear to those of the human family.

OESOPHAGOSTOMA COLUMBIANUM.

We have received two good specimens of this affection during the year and these are now preserved and placed in our museum. One was taken from a sheep while the other was found in an ox. The principal economic importance of this nematode infestation is that the presence of the nodules induced by this parasite destroys the intestines for sausage casing purposes. Where the lesions are extensive there may be a marked anæmic condition observed in the host animal.

OILS.

During the early part of the year some experimental work was undertaken with various oils to determine the best method to combine them in an oil emulsion, and the effects which they produced when applied in varying strengths on cattle. That more satisfactory conclusions might be arrived at individuals of the experimental tubercular herd were sprayed with emulsions of various formulæ and with proprietary dips. We were able to gain much valuable information through these experiments and this information assisted greatly in advising the Inspectors directly concerned with the enforcement of the compulsory mange-dipping order. It may be well to point out in this connection that we do not observe similar results from such emulsions applied under the conditions existing in Eastern Canada as are observed when they are applied to cattle on the range where the conditions are so vastly different. A harmless preparation to eastern cattle might be followed with quite serious consequences when applied to cattle on the range.

PICTOU CATTLE DISEASE.

Our studies on this disease were confined almost exclusively to an examination of the tissues forwarded by Inspector Pethick, obtained from the various experimental animals under observation in the investigation of this disease. Material from one hundred and fourteen cases was examined and in the material from two of these cases we were able to detect positive evidence of the affection under consideration. No experiments have been conducted at the laboratory during the year with this disease.

PNEUMONIA.

Four cases in which the condition proved to be a pneumonia have been dealt with. One is of particular interest coming as it did from a horse which had been improperly drenched and was of mechanical origin.

PYAEMIA.

Material from a single case of this affection in a hog was forwarded to us in which the infectious agent, streptococcus pyogenes was isolated in pure culture.

RABIES.

We have been called upon to diagnose nine suspected cases of this disease during the year and four of these suspected cases have given positive evidence of its existence in the animal from which the material was obtained. Of our positive findings, one was received from Niagara Falls, Ont., one from Bridgeburg, Ont., one from Shoal

SESSIONAL PAPER No. 15a

Lake, Manitoba, and the other from Moosomin, Sask. In diagnosing this affection at this laboratory we have used the older method of animal inoculation exclusively for the confirmatory evidence, although we have also searched for the bodies of Negri. While the presence of the Negri bodies is considered an almost certain means of diagnosing this affection, we have preferred the older method as we have to deal with such a limited amount of material that it is necessary to be absolutely certain of our diagnosis in every instance. Then too, the examinations for the Negri bodies require considerable skill and constant practice on the part of the examiner. This constant practice is denied us from the fact, that we are called upon to diagnose but a very small number of cases each year.

We would particularly direct the attention to the method of taking, and forwarding material from suspected cases of this disease which appears in another portion of your report.

STRONGYLIDAE.

That these parasites are still causing considerable loss particularly to the hog industry, is indicated by the large number of lesions observed by some of the Inspectors stationed at slaughter houses. We have been called upon to diagnose the affection in but two instances in each of which the strongylidae were found. In one case the strongylus paradoxus was found in the lungs of a hog sent in from one of the packing houses for identification of the lesion which was reported as a very frequent one. In this instance the hogs originated from southwestern Ontario where we observed some years ago enormous numbers of these parasites in the lungs of hogs which had been slaughtered on account of having been affected with Hog Cholera. The other instance of finding strongylidae was in the lungs of a sheep which were forwarded from Nova Scotia, where the owner had lost a number which he reported were similarly affected. In this instance we were able to identify the strongylus rufescens.

TRICHINOSIS.

This affection appears to exist to a very limited degree only, among Canadian hogs. We have observed its presence twice in material from three suspected cases. It is of very little economic importance when it is considered that thorough curing or cooking will destroy the life of the parasite. The detection of its presence is somewhat difficult and we have examined fully one fourth of a cubic inch of muscle taken from the pillars of the diaphragm without finding evidence of its presence and after this have been able to find an occasional parasite.

TUMORS.

Probably the most interesting feature of our work during the year has been the examination of various tumors which have been sent to the laboratory with a view to their accurate classification. We have received nine from the lower animals and a number from human beings. The tumors originating in the lower animals only, will receive our consideration at this time, as the material from the human subject has been largely received from local medical practitioners and hospitals, to confirm clinical diagnoses and to determine the advisability of operations, or the liability of certain new growths to reoccur after their removal.

Tumors from the lower animals have received very little attention and we shall be glad to receive available material that we may continue our studies, not only with a view of determining their relative frequency of occurrence, but also the frequency of certain forms in particular species and the bearing which this may have on tumor formation in the human subject.

8-9 EDWARD VII., A. 1909

CARCINOMA.

A tumor removed from the rumen of a bovine was forwarded to the laboratory by Inspector Ross of Winnipeg. This tumor which weighed 1800 grammes consisted of many lobules containing a jelly like substance. Microscopically the tumor was found to be a gelatinous carcinoma.

DERMOIDS.

A specimen received in February, consisting of small nodules in the parietal and visceral peritoneum, was detected by Inspector Evelyn and forwarded from Winnipeg. These nodules were found to contain hair, rudiments of teeth, skin and other structures which originate from the epiblast. The condition is a rare one and results from the embryonic inclusion of cells properly belonging to other portions of the system.

ENCHONDROMA.

A single specimen of this form of tumor, which is not uncommon in cattle was received from Chas. Haley, V.S., of Iroquois, Ont., and exhibited the usual structures. It was located on the sternum of a cow ten years of age.

ENDOTHELIOMA.

In one instance only have we observed this form of tumor, the material having been forwarded by Inspector Kellam of Montreal. The history of this case and the description of the lesions found at autopsy are described by him as follows:—

‘The specimens sent are typical in appearance, but not in size and were taken from the peritoneum in the region of the upper flank, rumen, omentum and diaphragm. The animal was an aged cow, in fair condition, pregnant about the sixth month, and the abdomen was pendulous.

Post Mortem.—All organs in a healthy condition except the liver, spleen and peritoneum. The parietal portion of the peritoneum was literally covered with growths varying in size from a pea to that of a half bushel basket. Two of the growths were considerably larger than a half bushel basket. The smaller lesions were sessile, of a uniform white colour and firm in consistency. Those from the size of a pigeon’s egg and larger, were cystic, pedunculated, having a strong fibrous capsule within which was a gelatinous substance, white or pale yellow, and in the centre there was a quantity of pale yellow fluid. The peritoneum covering the uterus, spleen, liver and intestines was also involved. The growths were not found on any membrane except the peritoneum, and there were sufficient of these growths to nearly fill a two bushel basket.’

This form of neoplasm is rare in bovines and we were very glad of the opportunity afforded for its minute examination.

SARCOMA.

Opportunity has been afforded to study sarcomatous lesions in the fish, ox and hog.

The fish sarcoma was observed in two pike forwarded to the laboratory by Inspector Fisher. Both fish had several large, irregular, rough looking white growths on their bodies and were in poor condition. They were caught in Mississippi lake near Carleton Place. Microscopically the growths exhibit the characteristics of a round celled sarcoma. They were evidently of rapid growth and as instanced by the large number of mitotic figures were decidedly malignant. Dr. Fisher reports that numbers of fish are caught each year exhibiting similar growths. These tumors are interesting, mainly from the fact that it establishes that this class of tumors can and do occur in cold blooded animals.

SESSIONAL PAPER No. 15a

The sarcoma of the ox which we studied occurred in the region of the hock, extending up the quarter to within a foot of the tail. The enlargements were subcutaneous, irregular in size and the portion examined was one centimetre thick ten centimetres long and five centimetres wide, of a yellowish colour and quite soft in consistency. On section, portions were found to be semi-gelatinous. Microscopically, numerous mitotic figures were to be observed and there were also degenerated areas containing a homogenous mass. A slight amount of fibrous tissue was present and many atypical cells were noted. The specimen was forwarded by Inspector Pine.

The hog sarcoma which we examined was forwarded by Inspector Walsh and was attached to the kidney. It weighed two hundred grammes, was of a pinkish colour, fairly firm and attached by a band to the base of the kidney. Microscopically it proved to be an adeno-sarcoma.

TUBERCULOSIS.

We have, as formerly, dealt with a large number of suspected cases of tuberculosis, and of those received during the year we have made nineteen positive identifications and in seventeen suspected cases have failed to find evidence of the characteristic lesions. The details connected with the examination of the above mentioned material is of general interest. In addition to the routine work with this disease we have isolated the causative organism from a number of cases retaining the cultures thus obtained for future study as time and opportunity permit.

WATER EXAMINATIONS.

We are occasionally called upon to examine water for an opinion as to its potability. Four such samples have been received, three of which were found on examination to be unfit for human drinking purposes. The remaining sample was sent in a container that had previously held medicinal agents and it was, therefore, impossible to arrive at a definite conclusion as to its potability.

WHITE DIARRHOEA OF YOUNG CHICKENS.

The subject of 'white diarrhoea' has received a great deal of attention from poultry raisers and scientific investigators in Canada and the United States within the past few years. It has cost each country an immense amount of money through the loss of chicks, and this at times when they were most needed by interested individuals to keep up certain strains, or to replenish the stock used for food or egg purposes. Unfortunately the term is a decidedly bad one, for, under this name it is quite evident that various observers are describing affections widely different from one another.

My first interest in this disease was a visit from Prof. Graham of Guelph, Mr. L. H. Baldwin of Deer Park, and Mr. Elford, Chief of the Poultry Division of this Department, during their investigations as members of a special commission appointed by the Ontario Agricultural College. During their visit to the laboratory we discussed the various phases of the subject and arrangements were made by which I was to examine material which they should send for investigation purposes from a poultry ranch within a short distance of Ottawa. As the manifestations of this affection at the ranch in question had ceased prior to their visit, chicks were not received, but, having become interested in the subject I at once took the necessary steps to secure the material required for purposes of investigation.

Very recently articles on the subject have been issued by Morse,* and by Rettger and Harvey.†

*Circular No. 128 Bureau of Animal Industry, Washington, D.C., 'White Diarrhoea of Chicks With Notes on Coccidiosis in Birds,' by Geo. Byron Morse, M.D., D.V.S.

†Journal of Medical Research. Vol. XVI:1 No. 2, 1908. 'A Fatal Septicaemia in Young Chickens, or White Diarrhoea,' Rettger and Harvey

8-9 EDWARD VII., A. 1909

The conditions which these authors have studied seem to be quite different from each other and from the observations which I have made, and while the white diarrhœa is a manifestation in each instance, I have been unable to find the lesions or etiological agents which they record. Further, I have been unable to reproduce the condition by co-habitation, either with affected chicks or in an infected brooder. I have not seen the chronic lesions reported by Morse, nor have I observed the condition in older chicks as instanced by Morse or by Rettger and Harvey.

In all of the instances where I have observed the affection the manifestations appeared within the first week after hatching.

I make the above statements that there may be no mistaking the condition to which my remarks refer, as it is very evident that this common term has been used to designate a number of affections widely separated from an etiological standpoint. These variations in etiological factors are undoubtedly the source of much of the present chaotic state in which we find ourselves on the subject of white diarrhœa. It seems that investigators and poultrymen consider that the form of this manifestation with which they are familiar is the only one which occurs, and hence, any remedy which is efficacious in one instance will prove a panacea in all instances where this condition in any of its varied forms is dealt with.

That poultrymen should make this mistake is not to be wondered at, but, it is scarcely excusable for scientific workers to consider that the existence of white diarrhœa is due to but one etiological factor and we should at once endeavor, when advising poultrymen on the subject of this disease, to properly analyse their statements that we may acquaint them with the best means of preventing that form of disease accompanied by this manifestation, with which they are familiar.

In the study of this affection material has been used from three outbreaks and certain opinions have been formulated as to its cause in these particular instances. We have not developed the theory that it is due to an infectious agent for we have had conclusive evidence, in at least one instance, that it was not communicated to chickens which were purposely placed in a brooder containing a large number of chicks affected with the disease. No effort was made to disinfect, nor were any precautions taken which would tend to eliminate the disease from the brooder in question, had the affection been due to a specific infectious agent. The details of the theory which was formulated from these observations, has, I believe, been made public through the poultry press of Canada, but is deserving of a little fuller explanation at this time.

The experiment conducted at my suggestion, and the various steps taken, were closely observed from day to day. Strict care was exercised in the identification of the chickens by markings placed in the webs of their feet and every precaution was taken to prevent the possibility of an error occurring through a lack of system in our observations. The conclusion reached, is, that the 'white diarrhœa,' with which we are familiar, is due, not to an infective agent, but to a defective anatomical development prior to the emerging of the chick from the shell. I am, however, unable to offer an opinion as to the exact cause of this defective anatomical development but, it is a fact that the chicks which I have examined, dead of the so-called 'white diarrhœa,' have only a partial absorption of the yolk sac. Normally this yolk sac is wholly absorbed at the completion of the period of incubation, or within the first few days after the chicks emerge from the shell. Where this sac is not absorbed, 'white diarrhœa' is extremely liable to make its appearance soon after the chick commences to eat and the food fills the proventriculus, the gizzard and intestine. By the distention of the above named organs with food the yolk sac is mechanically pressed against the cloaca or posterior portion of the bowel, rendering the passage of fœces to the vent impossible, and no relief being afforded the chick dies of stoppage. The 'white diarrhœa' is merely a coincidence occasioned by the fact that the ureters enter the cloaca from above and posterior to the point at which closure is caused by the pressure of the yolk sac, and there being no obstruction they are easily voided. The urates are white, and of semi-

SESSIONAL PAPER No. 15a

solid consistence, hence the name 'white diarrhœa.' That the condition referred to may not result from defective incubation or an inherent weakness in the parent stock is beyond our present knowledge.

I consider that it is non-infectious from the fact that during the experiment above referred to the affection was not communicated to newly hatched chicks placed with chicks which were dying as a result of this condition, and the circumstances were those which would assist in the propagation of a disease of an infectious nature. Chicks subsequently placed in this brooder were not troubled with the affection. Concerning the details of the affected chickens in this instance, they were hatched in an incubator, but nothing is known of their parent stock, &c., as they were shipped from a distance of 800 miles, arriving the third day after hatching.

From chicks dead of the so-called 'white diarrhœa,' I have obtained a variable bacterial flora, but it was impossible to associate any single organism with a series of cases.

If individuals observing this affection will make careful autopsies, they will undoubtedly be able to observe the conditions found at this laboratory in all cases examined to date.

The treatment of affected chicks offers little encouragement, as we are unable to reconstruct the defective anatomy of individual chicks. Pressure on the yolk sac, and by this pressure the removal of a certain amount of its fluid material may relieve the trouble, or even pressure, with a view of emptying the posterior portion of the bowel, is attended with variable results. These methods must be practiced with great care, otherwise the chick will be killed by manipulation.

In chicks which are found to have the yolk sac only partially absorbed when emerging from the shell, the retention of all food for at least four days may be a precautionary measure of some value.

BIOLOGICAL PRODUCTS.

Our routine work during the past year has been largely taken up in the preparation of biological products. Those with which we have been particularly concerned are anthrax vaccines, black-leg vaccine and tuberculin. The anthrax and black-leg vaccines were manufactured by us for the first time during the early part of the year, and we have obtained experience in this connection that cannot fail to be of immense service to the live stock interests of the country in the future.

Aside from the ability to prepare these products, there is the commercial gain to the live stock interests of the country which must be considered. A careful estimate of the cost of labour, supplies, &c., used in their manufacture, compared with the amount which would have to be paid to commercial houses for these products, indicates that there is a saving sufficient to very nearly compensate for the cost of conducting the whole work of the laboratory. The commercial feature, in this instance, however, should not alone be considered, for the direct control of the Health of Animals Branch over the preparation of a product where such interests are at stake as is the case in the testing of horses with mallein, should alone be a sufficient guarantee for a liberality far greater than has been necessary in the conduct of this institution.

MALLEIN.

We have disbursed 20,946 doses of mallein during the year on instructions received from your office. This is about one-third more than was disbursed during the same period of the previous year. With our new facilities, and the new methods which we have adopted in its preparation, there will be little difficulty in maintaining the supply required by the branch.

8-9 EDWARD VII., A. 1909

A statement of the amounts disbursed each month is as follows:—

| | 1906-7. | 1907-8. |
|--------------------|---------|---------|
| April. | 1,370 | 1,750 |
| May. | 702 | 1,600 |
| June. | 1,400 | 1,308 |
| July. | 1,645 | 2,205 |
| August. | 1,730 | 1,675 |
| September. | 1,786 | 1,150 |
| October. | 1,245 | 1,835 |
| November. | 598 | 1,895 |
| December. | 225 | 553 |
| January. | 712 | 2,090 |
| February. | 830 | 1,320 |
| March. | 2,060 | 3,565 |
| Total. | 14,303 | 20,946 |

It has been our experience that mallein is the most difficult of all the products which we have been called upon to prepare either experimentally or for general distribution. The care required in its preparation is great and the impossibility of following any hard and fast rule in its standardization increases the personal element in maintaining its potency. The experience which we are in possession of enables us to prepare a very uniform product, judged by the satisfactory results obtained by the various inspectors entrusted with its use.

TUBERCULIN.

There have been shipped from the laboratory, on instruction from your office, 5,934 doses. The product which we have disbursed has been of German origin. We have now a large amount of this material of our own manufacture at the laboratory, and can easily furnish the requisite amount required to meet the needs of the branch.

I append hereto a statement of the amounts as they have been disbursed month by month.

| | 1906-7. | 1907-8. |
|--------------------|---------|---------|
| April. | 267 | 509 |
| May. | 349 | 848 |
| June. | 160 | 206 |
| July. | 184 | 257 |
| August. | 161 | 336 |
| September. | 254 | 583 |
| October. | 118 | 276 |
| November. | 423 | 565 |
| December. | 336 | 735 |
| January. | 589 | 562 |
| February. | 437 | 575 |
| March. | 152 | 482 |
| Total. | 3,430 | 5,934 |

SESSIONAL PAPER No. 15a

BLACK-LEG VACCINE.

We have forwarded from the laboratory, as directed by your office, 7,031 doses of black-leg vaccine and 115 outfits for its administration, during the year just ended. A detailed statement of the monthly disbursements is as follows:—

| | 1907-8. | |
|--------------------|-----------------------|---------------------------------|
| | Black-leg Vaccine. | Instruments for Application. |
| April. | 250 | 4 |
| May. | 392 | 9 |
| June. | 554 | 3 |
| July. | 392 | 29 |
| August. | 254 | 9 |
| September. | 586 | 11 |
| October. | 998 | 11 |
| November. | 785 | 9 |
| December. | 1,560 | 12 |
| January. | | .. |
| February. | 270 | 5 |
| March. | 990 | 13 |
| Total. | 7,031 | 115 |

While it is but natural that we should encounter difficulties in the preparation of this product, we have learned much during the past year concerning the details of its preparation and have been able to design special appliances which have greatly reduced the labour connected with its manufacture. The circular which accompanies our disbursements of this vaccine is as follows:—

*“Dominion of Canada—Department of Agriculture—Health of Animals Branch—
Biological Laboratory.*

Black-leg Vaccine.

Black-leg vaccine, properly used, affords protection or immunity to a subsequent artificial or natural infection. The vaccine for protecting cattle against black-leg prepared at this laboratory is dried on braided silk threads, and these braided silk threads are held by a special spring clip to the stopper of their sterile container. Black-leg vaccine is an attenuated or weakened virus prepared from virulent black-leg material. The process of attenuating or reducing the strength of this virus is confined to the laboratory, and cannot with safety be conducted elsewhere.

To protect or immunize an animal against black-leg we prepare a single vaccine, and protection or immunity is the result of the animal passing through a mild, properly graded attack of the disease, which, as a rule, causes no inconvenience to the patient, save a slight elevation in the temperature. During this mild attack of the disease it is advisable to take particular care of the animals, protecting them from inclement weather, extremes of heat or cold, &c. Protection or immunity is established in from twelve to twenty days after the administration of the vaccine. During this interval from the administration of the vaccine until immunity is established, vaccinated animals should be kept from grazing on infected pastures, and no hay from infected lands should be used for feeding.

Vaccine used on an animal already affected with black-leg will not protect such an animal, nor will it prevent its death. The use of black-leg vaccine during or immediately after the occurrence of an outbreak of black-leg may be followed by death, in some instances due to the stimulation of the black-leg germs already in the system

8-9 EDWARD VII., A. 1909

of the animal, and such accidents cannot be prevented. In the use of black-leg vaccine it is well to take the temperature immediately before inoculating and in the event of the temperature being elevated, vaccination should be deferred until the temperature of the animal is again normal.

EACH CONSTITUTES A SINGLE DOSE AND IS READY FOR USE AS SUPPLIED.

The threads should be handled with the needle only.

Method of application.—By using the vaccine prepared at the Biological Laboratory, together with the vaccinating outfit supplied by the department, the method of introducing the vaccine beneath the skin of the animal is very simple. (See special instructions for the use of the outfit.) The site of inoculation should be prepared by clipping away the hair and washing with alcohol or boiled water.

With the needle properly placed in the needle holder and the braided silk thread of impregnated vaccine on the needle, a fold of skin is grasped with the left hand, while the right forces the needle, carrying the braided silk through the skin until the silk is lost from sight, when the needle is immediately withdrawn and the impregnated silk is left behind.

The most convenient point for inoculating is behind the shoulder; however, any point where the thread may be introduced beneath the skin into the cellular tissue of the animal to be vaccinated is suitable.

Cattle over four years of age are not, as a rule, susceptible to the disease. Calves under six months are not fully immunized by vaccination, and if vaccinated prior to this age should be revaccinated in three months. It is preferable to use the vaccine in the spring before the animals are allowed access to infected areas, for at this time of the year they are usually less resistant to a natural infection than at other periods, and, unless vaccinated, they are more liable to a fatal infection.

In the manufacture of black-leg vaccine at the Biological Laboratory every possible precaution during its preparation and subsequent testing is taken, but the department can assume no responsibility for untoward effects following its use.

The price of black-leg vaccine is 5 cents per dose, a dose consisting of a single thread of vaccine.

The price of the vaccinating outfit is 50 cents.

Black-leg vaccine and vaccinating outfits may be procured by applying to the Veterinary Director General, Ottawa, Canada."

A NEW VACCINE PACKAGE.

After having successfully manufactured black-leg vaccine I was confronted with the problem of devising a suitable package for its disbursement. The older method of having it in powder form and the user preparing a solution of this powder in the field, was at once discarded as being too complicated, entailing too much detail work under very unfavourable conditions. After carefully examining the various existing devices used by commercial houses, each was discarded on account of defects which were very apparent. Consequently, I devised an entirely new scheme, briefly detailed in my report of last year on which some improvements have been made, and we now have a package to which scarcely an objection can be offered. The impregnated threads are attached by a spring clip to the cork of their sterile container and these threads are held with sufficient firmness to prevent their dropping out, yet, they can easily be removed with the special needle which I have designed for the administration of the vaccine prepared at this laboratory or in fact with any vaccine which is dried on a braided filament. The package is perfectly aseptic and is sealed at the laboratory when the vaccine is placed in it. In vaccinating the use of the special needle obviates the necessity of touching the impregnated threads with the fingers,

SESSIONAL PAPER No. 15a

or in fact, with anything but the needle, thus reducing to the minimum, the liability to contamination with foreign bacteria, dirt, &c., features which are not possessed by any other method in the administration of similar vaccine.

To protect this package and the needle for the administration of the vaccine, the necessary steps have been taken to have it patented in Canada, and it is my intention to assign the same to the Crown that the device may be preserved for the benefit of the live stock interests of the country.

The circular which accompanies the vaccinating outfit, which outfit can be used for either the anthrax or black-leg vaccines, is as follows:—

“DOMINION OF CANADA.

Department of Agriculture—Health of Animals Branch.

BIOLOGICAL LABORATORY.

Vaccinating Outfit for the Administration of Anthrax and Black-Leg Vaccines.

The Anthrax and Black-Leg Vaccines prepared at the Biological Laboratory are dried on Braided Silk Threads and require a special instrument for their administration.

The outfit consists of a handle and two inoculating needles. The handle of wood is hollow and the needles are placed in this recess for protection during shipment, and when they are not in actual use. The needle is of special construction with a bayonet point and a small hook about one half inch from the sharp end.

Method of Vaccination.

The Needle may be dipped in Alcohol before Vaccination and allowed to thoroughly dry before engaging a Thread of Vaccine. If disinfectants such as Carbolic Acid or Creolin are used on the needle, the Virus on the thread will be destroyed, in consequence of which the vaccination will be of no protective value to the animal.

The needle is placed in the holder, the ferule is screwed down tight to securely hold the needle and the outfit is ready for use. The stopper of the vaccine container—to which the vaccine is attached by means of a spring clip—is removed from the vial and reversed. The fine hook of the needle is passed through the braiding of the silk and by a slight pressure away from the spring clip, the thread of vaccine is removed from the clip and remains on the hook of the needle. With the thread of vaccine on the hook of the needle, the site of inoculation on the animal having been properly prepared, the skin is grasped with the free hand and the needle carrying the thread is forced under the skin parallel to the body of the patient. When the thread is lost from sight the needle is removed, leaving the vaccine beneath the skin and the process of vaccination is complete.

The price of the Vaccinating Outfit is fifty cents.

The price of Vaccinating Needles separate from the handle, is twenty-five cents for two.

The price of Anthrax Vaccine is five cents per dose.

The price of Black-Leg Vaccine is five cents per dose.

Vaccinating outfits and vaccines may be obtained by applying to the Veterinary Director General, Ottawa, Canada.”

ANTHRAX VACCINES.

There have been disbursed from the laboratory during the year just ended, as directed by your office, 483 doses of each of the first and second vaccines. A detailed monthly statement is as follows:—

8-9 EDWARD VII., A. 1909

| | 1907-8. |
|--------------------|---------|
| April. | 239 |
| May. | 17 |
| June. | .. |
| July. | 98 |
| August. | 77 |
| September. | 5 |
| October. | 15 |
| November. | .. |
| December. | 32 |
| January. | .. |
| February. | .. |
| March. | .. |
| Total. | 483 |

In all instances these vaccines have been supplied in hermetically sealed tubes, the vaccine being a liquid culture of properly attenuated anthrax germs. Owing to the excessive amount of labour required in the preparation of the vaccine and the danger of improper handling by individuals using it, I conducted a series of experiments to determine the feasibility of drying this vaccine on specially prepared braided silk filaments. The experiments were satisfactory, and we were able to immunize sheep and calves against virulent anthrax, which killed control sheep in 52 hours. As there is less danger connected with the preparation, disbursing, shipping and use of dried vaccine, than is the case with the liquid vaccine, I have, with your approval, prepared sufficient vaccine for the demands of the year. The package used is similar to that in which we place our black-leg vaccine, with the difference that an amber vial is used as a container and the first vaccine bears a yellow label and seal, while the second vaccine has a green label and seal.

I believe that this preparation of dried anthrax vaccine is the first instance in which it has been prepared in this manner, and it is very gratifying to note that at least one commercial house is at present investigating and seriously considering the advisability of preparing their output in a similar manner.

The instrument for the administration of this vaccine is the same as for the administration of black-leg vaccine.

The following is a reprint of the circular which accompanies all disbursements of anthrax vaccine:—

*“Dominion of Canada—Department of Agriculture—Health of Animals Branch—
Biological Laboratory.*

Anthrax Vaccine.

Anthrax vaccines properly used, afford protection or immunity to a subsequent artificial or natural anthrax infection. The vaccines for protecting against anthrax prepared at this laboratory are dried on braided silk threads and these braided silk threads are held by a special spring clip to the stopper of their sterile container. Anthrax vaccines are attenuated or weakened cultures of the germ causing anthrax (*baeillus anthracis*). The process of attenuating or reducing the strength of the germ is confined to the laboratory and cannot with safety be conducted elsewhere.

To protect or immunize an animal against anthrax, two vaccines are required and protection or immunity is the result of the animal passing through two mild, properly graded attacks of the disease, which, as a rule, cause no inconvenience to the patient save a slight elevation in temperature. During these two mild attacks of the disease it is advisable to take particular care of the animals, protecting them from inclement weather, extremes of heat or cold, &c.

SESSIONAL PAPER No. 15a

The first anthrax vaccine (yellow label), is a very weak virus and is only intended to protect against a subsequent administration, after the proper interval, (twelve days), of the second anthrax vaccine, (green label), which is a very much stronger virus and this in turn protects against virulent anthrax. Protection or immunity against anthrax is established in from twelve to twenty days after the administration of the second vaccine. During this interval, from the administration of the first vaccine until immunity is established in the vaccinated animals, they should be kept from grazing on infected pastures and no hay from infected lands should be used for feeding.

Vaccine used on an animal already affected with anthrax will not protect such an animal, nor will it prevent its death. The use of anthrax vaccine, during or immediately after the occurrence of an outbreak of anthrax, may be followed by death, in some instances due to the stimulation of the anthrax germs already in the system of the animal and such accidents cannot be prevented. In the use of anthrax vaccine it is well to take the temperature of the animal to be vaccinated immediately before inoculating and in the event of the temperature being elevated, vaccination should be deferred until the temperature of the animal is again normal.

Method of Vaccination.

By using the vaccine prepared at the Biological laboratory, together with the vaccinating outfit supplied by the department, the method of introducing the vaccine beneath the skin of the animal is very simple. (See circular with vaccinating outfit). The site of inoculation should be prepared by clipping away the hair and washing with alcohol or boiled water.

With the needle properly placed in the needle holder and the braided silk thread of impregnated vaccine on the needle, a fold of skin is grasped with the left hand while the right forces the needle carrying the braided silk through the skin until the silk is lost to sight when the needle is immediately withdrawn and the impregnated silk is left behind.

The most convenient points for inoculating are, the side of the neck in horses, behind the shoulder in cattle and behind the shoulder or the inside of the thigh in sheep. Any point where the thread can be introduced beneath the skin into the cellular tissue of the animal to be vaccinated is suitable.

Each thread of vaccine constitutes a single dose for the horse, cow, sheep and hog.

In the manufacture of anthrax vaccines at the Biological Laboratory, every possible precaution in their preparation and subsequent testing is taken, but the department can assume no responsibility for untoward effects following their use.

The price of anthrax vaccine is 5 cents per dose, a dose consisting of a thread each, of the first and second vaccines.

The price of the vaccinating outfit is 50 cents.

Anthrax vaccines and vaccinating outfits may be procured by applying to the Veterinary Director General, Ottawa, Canada."

While I have endeavoured to outline the various phases of our work and to describe certain special features which are of more than passing interest, there are many details connected with all of the work of the laboratory, which, if mentioned, would be uninteresting and add little of general value to my remarks on the various subjects which have been treated.

The greatest need of the laboratory at the present time is additional assistance which will afford a relief from the routine, thus enabling the devotion of a portion of the time to original research that we may more intelligently understand some of the peculiar phases manifested by some of the contagious diseases of animals.

8-9 EDWARD VII., A. 1909

Without further remarks, I desire to acknowledge the great appreciation which you have manifested in the work of the laboratory, and also the interest taken from time to time in the development of its varied features.

I have the honour to be, sir,
Your obedient servant,

The Veterinary Director General,
Ottawa.

CHAS. H. HIGGINS,
Pathologist.

W. H. PETHICK, V.S.

GOVERNMENT EXPERIMENT STATION.

ANTIGONISH, N.S., March 31, 1908.

SIR,—I have the honour to submit a report of experiments conducted under your direction at this station particularly, of such as were completed recently. As this report may possibly be read by others, I beg liberty to make a few general remarks, which otherwise would be unnecessary.

Since the distribution of your special report, in which it is clearly shown that ragwort is the cause of Pictou cattle disease, renewed interest is taken in the matter, and farmers and others now realize that if cattle-raising is to be conducted with safety and profit, that ragwort must be exterminated. This may be accomplished without great difficulty on tillable land by a short rotation of crops and the usual weed-destroying implements. But the firm foothold the plant has obtained on the hill-sides, rocky pastures, among stumps and on waste land, where it is practically impossible to use hoe, plough or scythe, and from whence the seed is carried by the wind and distributed freely, renders the task anything but an easy one.

The hope that sheep might prove of valuable assistance in the work, and no doubt the commendable desire to gain information of interest from a scientific standpoint, led you to conduct a series of experiments, which form the subject of this report.

It is true that these animals have long been known as free eaters of ragwort and a great help in keeping it in check. But it was just as generally believed that the weed was injurious to sheep. By some it was thought to cause sickness and death as in cattle. By others it was believed to produce staining of the tissues, making the mutton unmarketable, and as we recall the loss and discouragements which attended the raising of cattle on ragwort-infested farms, we are not surprised that unless these and other questions were satisfactorily settled, that the farmers within the weed area would hesitate to stock up with sheep and await with interest the result of our work here.

It will be noticed that these experiments were conducted not only with a view of settling the two important questions referred to, but also to test several popular theories regarding the season and stage of growth of the plant when the harm is supposed to be done.

The many callers at the station agree that the farm upon which these experiments were conducted was very suitable. On it thirty-six head of cattle had died of Pictou Cattle Disease. It is traversed from end to end by a stream of pure water. The north portion of about fifty acres, was practically weed free. The centre of the farm was under hay and contained considerable ragwort in places, while the field towards the south was literally covered with the plant. It will thus be readily seen that by a suit-

SESSIONAL PAPER No. 15a

able arrangement of fences, we were able to confine sheep on weedy or weed free pasture as desired.

The experimental pens for winter feeding consisted of framed buildings well lighted and ventilated and divided into separate apartments, a door in each leading to separate paddocks enclosed by a suitable fence. Fresh running water was always within reach.

The sheep employed were the crosses usually met with in eastern Nova Scotia, long and short wooled breeds being about equally represented. All were marked 'E.R.' on the side and a plain figure gave the subdivision and pen to which the animals belonged, while other marks enabled us to decide as to the individual and rendered a mistaken identity impossible.

In order to avoid repetition when dealing with each experiment separately, I would state here that all our sheep suffered during December, 1905 and January, 1906, with contagious ophthalmia, and while nearly all made a rapid and complete recovery, a few aged ewes became much emaciated and died. Post mortem examinations showed that ragwort was in no way accountable. The places thus made vacant were filled by young sheep born on the premises.

We were most fortunate in meeting with very small loss by accident or ordinary causes.

Careful post mortem examinations were held on all animals dying from any cause and specimens forwarded to the biological laboratory for microscopic examination, thus removing any doubt that might exist, as to the cause of death.

EXPERIMENT NO. 1.

To ascertain the effect, if any, upon sheep of ragwort feeding during winter only (with dried plants), on December 1, 1905, ten healthy sheep were placed in a suitable pen at the new stable and fed three times daily upon ragwort hay such as is found upon cattle disease farms. Great care was taken to secure only such hay as contained an abundance of ragwort, and which, consequently, would be fatal to cattle, if fed thereon. All had good appetites and were particularly fond of ragwort. In fact they would pick it from among the common fodder plants, strip off the leaves and flowers refusing only the coarse stalks. Their health continued good. We thought, however, that the wool had lost some of its lustre. (It now seems that this condition was over-rated).

On May 24, 1906, these sheep with their lambs were turned upon fifty acres of weed free pasture. The continued bright and healthy during summer and on December 1 were again placed on the winter ration previously described. Nothing unusual was noticed in their behaviour. Their appetite for ragwort continued good and when turned out on May 21, 1907, to their weed free pasture, had, if anything, a better appearance than during the preceding fall. They did as well during the summer as could be expected. (The season was unfavourable). All were slaughtered under my inspection between November 1 and December 3, 1907.

Ante-mortem examination.—All had the appearance of health. Numbers one and six, being old, were thin, the others were in good marketable condition.

Post-mortem examination.—The organs were normal in every case. Flesh of good colour and firm. The pathologist reports that he examined the specimens forwarded, and that all were normal.

EXPERIMENT No. 2.

To ascertain the effect, if any, upon sheep of ragwort feeding in summer only (while the plant was green), ten healthy sheep were kept from December 1, 1905, to May 24, 1906, in a suitable pen situate at a considerable distance from such as were

8-9 EDWARD VII., A. 1909

occupied by sheep receiving ragwort. The hay fed three times daily to this lot, was similar in kind and quality to that fed in the preceding experiment, except that in this instance all ragwort plants had been carefully removed. As might be expected, all wintered well, and on May 24, they were turned into a field containing thirty-five acres where ragwort was growing abundantly. They were noticed to eat freely of the plant and were particularly fond of the young succulent leaves. By fall, they had somewhat improved in condition. On December 21, they were again stabled and fed as formerly on weed free hay, and while not gaining much in flesh, remained quite thrifty. They were returned to their weedy pasture on May 16. As they had so reduced the ragwort another weedy field of sixteen acres was taken in. Here, they remained, apparently in perfect health until slaughtered between November 15 and December 30, 1907.

Ante-mortem examination.—All bright and healthy. Three old sheep rather thin; remainder in good condition.

Post-mortem examination.—No evidence of disease. The pathologist reports all organs normal.

EXPERIMENT No. 3.

To ascertain the effect, if any, upon the health of sheep of ragwort feeding during the entire year, this lot of ten sheep were fed from December 1, 1905 to May 24, 1906 on ragwort hay, this being similar in every respect to that fed to pen No. 1. They were also kept with this lot (pen No. 1) at the new stable. These animals were also fond of the weed, eating it freely and thriving upon it. On May 24, they were turned to pasture on the weed infested land with pen No. 2. They gained somewhat in flesh during the summer and were penned again on December 1 and fed upon ragwort hay. Their health and appetite continued good. Their fondness for dry ragwort was very noticeable. On May 24, they were again turned to pasture on ragwort land, where they remained until slaughtered between November 15 and December 30, 1907.

Ante-mortem examination.—All apparently healthy. Two old ewes and one wether thin. The remainder in good flesh.

Post-mortem examination.—All organs healthy. Flesh normal in colour and firm. Pathologist reports no evidence of disease in specimens forwarded.

EXPERIMENT No. 4.

The opinion prevailed in certain sections that fat adult sheep only are susceptible to the injurious properties of ragwort. The following experiment, will, therefore, be interesting.

Four healthy well fed wethers reached the station on February 3, 1905, and were at once placed in a suitable pen not previously occupied. They were fed three times daily upon native hay, which contained a liberal admixture of ragwort. During the winter these animals were observed to eat freely of ragwort—in fact, seemed to prefer it to the ordinary hay. They continued in good health and condition. On May 24 they were sheared and turned into a four-acre field where ragwort was growing abundantly. By fall they had almost exterminated the plant. On December 1 they were returned to the pen and fed on very weedy hay until May 24, when they were again turned upon weed-infested land. Here they remained all summer, eating the ragwort with relish and without injury to themselves. On December 2 they were penned and fed as during the two preceding winters. We observed in January that the two older animals were losing flesh, and, although showing unmistakable evidence of old age, were bright and healthy. On May 26 they were again turned into weedy pasture, where they remained until slaughtered between November 24 and December 30, 1907.

Ante-mortem examination.—All bright and apparently healthy. Nos. 1 and 3 rather thin; 2 and 4 fat.

SESSIONAL PAPER No. 15a

Post-mortem examination.—All organs appeared normal. Flesh good colour and firm. Specimens of liver, spleen, kidney and lymph glands were examined by the pathologist, who reports that he finds no evidence of disease.

EXPERIMENT No. 5.

In order to control the preceding experiments, ten healthy sheep were fed during the winters of 1905-6, 1906-7, with pen No. 2 receiving the same kind and quality of hay, which, as it will be remembered, was absolutely free from ragwort. During the summers of 1906 and 1907, they were pastured with pen No. 1 on weed free land. Care was taken that these animals should not eat ragwort in any form. As might be expected, all remained healthy. They were slaughtered between November 16 and December 30, 1907.

Ante-mortem examination.—Three aged ewes rather thin. Remainder in good marketable condition.

Post-mortem examination revealed no evidence of disease. This was confirmed by the pathologist's report.

It is both interesting and significant that careful ante-mortem and post-mortem examinations failed to show any material difference between this lot and such as had lived more or less constantly upon ragwort. As this is a most important point, and in order that we might have the opinion of an expert and recognized authority, I requested Mr. A. G. Bailey, sheep buyer for the Maxwell Meat Company, a branch of Swift & Company, of Chicago, to compare the different subdivisions of pens, judging them from the standpoint of health and condition. The following is a copy of his letter:—

ANTIGONISH, N.S., Nov. 4, 1907.

'I have to-day visited the government experiment station at Cloverdale, and have looked over the sheep employed in the various experiments held there, with the view of ascertaining whether or not the continued feeding on ragwort, would produce sickness or death in these animals or in any way effect their value for market.

"Taking the flock as a whole, I would say that while a few sheep show unmistakable evidence of being old, all are strong and thrifty and none have the appearance of being sick.

'After judging the five experimental subdivisions and comparing each of these with a pen of ten sheep which have been kept altogether upon a weed-free ration, I cannot see that the ragwort has had any injurious effect upon their health, appearance or condition.

(Sgd.) E. G. BAILEY,
'Swift Company, Chicago.'

EXPERIMENT No. 6.

The supposition that the ragwort seeds might be more potent than the leaves and flowering tops, led to the following test.

A quantity of ragwort cut while the plant was bearing ripe seed was mixed with an equal quantity of fine native hay which in addition to affording nourishment would hold such seeds as might shake out from the heads while feeding. Three healthy sheep, which had eaten ragwort during summer, three healthy sheep which had never eaten ragwort and three lambs from weed free pasture, were fed for forty-one days (December 1, 1906, to January 10, 1907) on the mixture mentioned above. They were observed to eat the seed heads and leaves of the ragwort with as much relish as they did the true grasses. No ill effects were observed, except a gradual loss of flesh, a condition which was fully expected in consequence of the bleached and innutritious ration. On January 10 our supply of seed heads was exhausted and the

8-9 EDWARD VII., A. 1909

animals were then fed on ordinary ragwort hay. They were slaughtered between November 20 and December 30, 1907.

Ante-mortem examination.—All bright and healthy. The shearlings were in good condition; four aged sheep very thin. Two sheep in good condition.

Post-mortem examination.—All organs appeared healthy. Flesh of normal colour. Pathologist reports no evidence of disease.

EXPERIMENT No. 7.

To ascertain whether or not feeding upon ragwort causes staining of the flesh, and if so, at what stage does the discolouration begin. On June 17, 1905, five ewes with their lambs procured from outside the weed area were put in very weedy pasture. On August 1, lamb No. 1, was killed. Flesh normal. On September 1, lamb No. 2 was killed. Flesh normal. On November 1, lamb No. 3 was killed. Flesh normal. On December 1 the survivors were stabled and fed upon hay, which contained a large proportion of ragwort. On December 6, ewe No. 1, died (from accident). Flesh normal. On January 1, 1906, ewe No. 2 was killed. Flesh normal. March 19, ewe No. 3 was killed. Flesh normal. On April 20, ewe No. 4 was killed. Flesh normal. On July 14, ewe No. 5 was killed. Flesh normal.

It seems in place to state here that eleven lambs born in the early spring of 1906 were pastured on ragwort infested land, and when slaughtered for market during September were found to be in good condition and the flesh of normal colour. Regarding this phase of the subject, I would also say that Mr. E. G. Bailey, who has this summer purchased over three thousand lambs in Antigonish and Pictou counties, informs me that he has not heard a word of complaint from his butchers regarding the colour of the flesh, and when we realize that at least fifteen hundred of these lambs had pastured on ragwort infested land, it is at least significant, and confirms our opinion that lambs may be pastured on ragwort without depreciating their value for market.

There are unfortunately certain places throughout the weed area where conditions are particularly favourable to the vigorous growth of ragwort, such as amongst stumps in burnt land. In such places the hoe and scythe cannot be used to advantage. Pulling the weed up by hand seems an endless task, and one not readily undertaken by our farmers. Consequently, the weed grows in such places undisturbed, and year after year the seed is distributed by the wind over the surrounding fields. Therefore, the following experiment, conducted with a view of learning what dependence could be placed in sheep, under such conditions, is of much practical importance.

On May 25, 1907, I leased by your direction 110 acres of weed-infested land of the character above indicated. Sixty sheep were turned in as early as possible, but as there was some unavoidable delay in securing suitable animals, the ragwort plants had gained quite a start, and for a time we were very doubtful as to the outcome. By July 10 we were satisfied that the sheep had the mastery. In August, only a close observer would notice any ragwort. At no time did the sheep allow a plant within their reach to bloom. A few plants growing out of brush piles, and which the animals could not reach, were pulled by hand. Otherwise, the sheep cleared off this land unaided.

It is true that many plants will come again, both from root and from seed that may blow during winter. But the fact that sheep will reclaim the most weedy land has been clearly demonstrated, and to the satisfaction of many visitors who agree that this is a most valuable object lesson, settling as it does a point upon which there was much doubt.

As to the health of the animals engaged in this experiment, none had the appearance at any time of being sick. An aged ewe died on June 21 from accident; otherwise we had no loss. All the sheep have now been slaughtered under my inspection.

SESSIONAL PAPER No. 15a

The flesh was of good colour (no yellow carcasses). All organs were healthy to the naked eye. The pathologist reports that he found no evidence of ragwort disease in the specimens, which I forwarded to him from each animal.

The result of our experiments prove clearly that sheep may be employed without risk in the extermination of this plant. We would not, however, be warranted in assuming that these animals are absolutely immune to the effect of ragwort under all conditions, for we occasionally have reports of a few sheep dying upon certain farms, presumably from ragwort poisoning. Several theories are advanced as accounting for these deaths, which I may say occur during fall and early winter. First, that the frost causes some chemical change in the juices of the plant. Second, that the snow covers up the low-growing fodder plants and the sheep are compelled to subsist entirely upon the more hardy ragwort. Third, that the ragwort is not in any way accountable.

In the absence of experimental proof, I am inclined to favour the second theory as most reasonable, and as the preventive measures which will naturally present themselves will apply alike to all, I would advise that sheep be removed from ragwort-infested lands before the hard frosts set in or the snow covers up the true grasses. It certainly can do no good, but only harm to keep sheep out at pasture as late in the fall as is the practice on certain farms.

Our experiments with sheep as ragwort destroyers is certainly most encouraging. In this particular, they have exceeded our expectations. Our farm, once so weedy, and which for many years bore the undesirable distinction of 'a cattle disease farm,' is now weed free, and one upon which cattle-raising may be engaged in with safety and profit. And while this favourable change was brought about through the agency of sheep (and what they have done for us they will do for others); it must, however, be remembered that the experimental flock, which allowed one sheep for about two acres, was much larger than is usually pastured on the same acreage throughout the weed area. And while we admit that the influence of a few sheep will be noticed over a considerable tract of land, yet too much must not be expected from a small flock over a large territory.

The area of Antigonish county is 355,850 acres, while the number of sheep thereon is estimated at 24,886 (only one sheep to fourteen acres). It is scarcely necessary to say that the number is far too small to cope successfully with ragwort, particularly where it has a strong foothold.

It is generally admitted that the extermination of ragwort will increase the value of farms so reclaimed from twenty-five to seventy-five per cent, and, the fact that sheep will do the work effectively, should in itself be sufficient inducement to stock the land much more heavily with these animals. But, apart from the ragwort question, I cannot see why the flocks in eastern Nova Scotia, should not be greatly increased with profit, for it is difficult to imagine a country possessing more natural advantages for successful sheep raising.

EXPERIMENTS WITH GOATS.

(Extending over a period of two years).

Numbers one and two were fed during winter upon weed free hay and pastured on ragwort infested land.

Numbers three and four were fed upon ragwort hay and pastured on weed free land.

Numbers five and six were fed upon ragwort hay and pastured on ragwort infested land.

Numbers seven and eight were kept upon a weed free diet and controlled the experiment.

8-9 EDWARD VII., A. 1909

Towards the close of this experiment, numbers one and two were killed by accident. The others were slaughtered, under my inspection, on January 28, 1908. Post mortem examination gave no evidence of disease in any of the eight. The pathologist has found all organs healthy.

The results of our observations will not warrant us in recommending these animals as ragwort destroyers. In this particular they do not compare at all favourably with sheep. It is true that they seem able to eat the plant with impunity and remain perfectly healthy throughout the entire test. But they are small eaters of ragwort and very much prefer to feed upon browse. Strange to say, those of the common variety are more destructive to this weed, than are the Angoras.

You will be pleased to learn that the suggestions we have been able to offer from time to time as a result of our experimental work have been well received and acted upon with the result that cases of Pictou cattle disease are now few, as compared with former years. The majority of our farmers are, I believe, making an honest effort to exterminate the plant, and now, with the aid of sheep, they should certainly succeed. But this cannot be accomplished at once, so while the good work is going on it is important to know whether or not native hay, from which the ragwort plants have been removed as thoroughly as possible, may be fed with safety to cattle. The following experiment answers the question affirmatively.

Three healthy young cattle were fed twice daily from November 1, 1905 to May 30, 1906, on native hay, from which the ragwort had been removed as thoroughly as possible after the mowing machine. On May 30, they were turned to pasture till October 30, when they were stabled and fed as during the preceding winter. On June 1, 1907, they were again at pasture, where they remained all summer. These animals continued in perfect health during the entire test and when slaughtered in the fall, were in excellent condition. All organs were normal to the naked eye. The pathologist found no lesions of Pictou cattle disease in the specimens forwarded from each animal.

An experiment covering the same period in which three healthy young cattle were fed upon hay of the same kind, in fact part of the same field. But in this case, no attention was paid to the ragwort, which was permitted to go into the mow with the hay. These animals were also at pasture during the summer season. On July 16, 1906, animal number one died of Pictou Cattle Disease. On February 8, 1908, numbers two and three were slaughtered. These animals were rather thin. Microscopic examinations of the liver revealed characteristic lesions of Pictou Cattle Disease.

The foregoing experiments show clearly, that if ordinary care is exercised in removing the ragwort plants, then native hay may be fed to cattle without risk, while neglect or carelessness in picking the weed, will be surely followed by fatal results.

EXPERIMENTS WITH HORSES.

For many years, a peculiar and fatal disease affecting horses has been reported from the ragwort area, both in Nova Scotia and Prince Edward Island. Public opinion and circumstantial evidence pointed strongly to ragwort as the cause.

On January 1, 1906, I purchased, with your authority, a mare eight years old, which though disabled and of little value, was in good health. She was at once placed in a comfortable box stall and bedded with sawdust. Her constant ration consisted of dried ragwort chopped fine and mixed with a small quantity of native hay. Her appetite was good and during the first six weeks, she improved a little in condition. On June 1, 1906, she was turned to pasture, where she remained until October 5, when she was again stabled and fed as before stated. No change was noticed in her condition or behaviour until June 1, when she became uneasy. Her temperature, hitherto about one hundred and one, reached one hundred and three, with little change for

SESSIONAL PAPER No. 15a

some days. She now began to fail and look unthrifty. On June 23 her temperature fell suddenly to one hundred. Her appetite remained good until July 1, when it became variable and somewhat depraved. She was now losing flesh rapidly. At times she was dull then excitable. Pulse fast and hard; temperature and respiration about normal; bowels constipated.

As the symptoms became more violent she was, on July 6, turned into a small field, where she wandered aimlessly about, exhibiting certain symptoms, which I considered to be characteristic of the disease. The visible mucous membranes were pale, slightly yellow. The muscles, particularly of the face and neck seem rather rigid. Slight dropsical swelling in legs and belly. Occasionally seems in slight pain. Urine scanty and voided often. Walks with unsteady gait and if interrupted or turned sharply around would stagger and even fall. When standing quietly, the ears are kept alternately in motion, and a peculiar stamping with one hind foot (usually the left) is very characteristic. The foot is drawn up close to the body and returned to the ground with considerable violence. This action is usually repeated every three or four minutes. Temperature remained fairly normal, but respiration is laboured. Pulse quick and intermittent. All the symptoms became daily more aggravated. The dropsical swelling increased, appetite entirely gone. There was grinding of the teeth and an escape of sticky saliva from the mouth. After July 18 she was entirely indifferent to her surroundings; paid no attention to flies, but would stand for hours with her head pressed against a fence or other firm object. She died on July 22, being eighteen months and twenty-two days from beginning of experiment and fifty-two days from first symptom of sickness.

An autopsy was held immediately after death. Lungs and pleura normal. Pericardium contains about three ounces fluid. The abdominal cavity contains about three quarts dropsical effusion. The fat wherever situated, was soft and yellow. The mesenteric lymph glands are enlarged. The stomach and intestines show no change of importance. Kidneys are dark. Spleen slightly enlarged and soft. Liver normal in size and hard and showed morbid changes to the naked eye. Other organs and glands appear fairly normal.

Specimens from the liver, spleen, kidney and lymph glands together with pipettes and smearings from each were forwarded to the laboratory.

As you have the pathologist's report on the subject, further comment by me is uncalled for, except to admit the uncertainty regarding the true nature of the disease, which Dr. Higgins finds is not hepatic cirrhosis and is, consequently, a different disease to that produced in cattle by ragwort feeding.

While I do not wish to attach too much importance to the result of a single experiment, yet, when confirmed by careful observation of outside cases, I submit that the result is, at least, definite enough to carry conviction and to throw the strongest suspicion upon ragwort as being at the bottom of the trouble.

During the past season, I have inspected all shipments of live stock at the ports of Bayfield and Mulgrave. You will have noticed by my monthly reports that eight hundred and eighty-seven (887) cattle, thirty-two (32) horses, two hundred and eighty-four (284) sheep and one pig were shipped from Mulgrave, and one hundred and forty eight (148) cattle, seventeen (17) horses and thirty seven (37) sheep from Bayfield to St. John's, Newfoundland.

In accordance with your instructions, I have from time to time visited different points in this Province, as well as in New Brunswick and Prince Edward Island, and am glad to state that the health of farm animals, during the past year, has been excellent. No contagious disease was discovered, although about the usual number of suspected cases, were reported and promptly investigated, of which I have given full particulars in my special reports, which were duly forwarded to you.

8-9 EDWARD VII., A. 1909

In addition to my regular work, I have attended and taken part at a number of Farmers Meetings, as well as at the Short Course at the Agricultural College, Truro, N.S. and at the Dairy School at Sussex, N.B.

I have the honour to be, sir,
Your obedient servant.

W. H. PETHICK,
Inspector.

The Veterinary Director General,
Ottawa.

DEPARTMENT OF AGRICULTURE, ANIMALS QUARANTINE STATION.

Box 477, LETHBRIDGE, ALBERTA, March 31, 1908.

SIR,—I have the honour to submit herewith the Annual Report of the Quarantine Station, Lethbridge, Alberta, for the year ending March 31, 1908.

The main work of the station has been an investigation into the disease of horses known as Dourine or *Maladie du Coit*. A fully detailed report under date of November 15, 1907, has recently been submitted to you, and I will therefore only briefly mention the results of the investigation, and the aim of the experimental work now in progress.

In the first place the identity of the disease has been fully established by the frequent finding of the infective agent, namely, the *trypanosoma equiperdum*, in affected mares, and, subsequently, by producing the disease in healthy equines by inoculation of this parasite, and by again isolating the trypanosomes from typical lesions of dourine in these experimentally infected animals.

For the purpose of gaining information as to the duration under favourable circumstances, and the mortality or percentages of recovery from the disease, a number of infected animals are being held under close observation. Evidence is accumulating in support of the belief that the disease is an extremely chronic and insidious one. The fatality is higher in stallions than in mares, every infected stallion that has been admitted to the quarantine station having succumbed to the disease, whereas a number of mares have returned to a condition of apparently perfect health. However, in some cases, and after lengthy periods, there have occurred relapses, recoveries must therefore be considered with great suspicion. Under such conditions diagnosis is often an extremely difficult task. A careful study of certain cases that have been under almost daily observation for a period of twelve months, convinces me that there are times when it is quite impossible to diagnose the malady on clinical grounds, and yet, even at such times, the infective trypanosomata have been demonstrated, and the animal is capable of propagating the disease. Efforts are being made to prepare a serum for test purposes, to assist in diagnosing these 'latent' conditions. Lastly, the medicinal treatment of dourine-affected animals is being attempted, experiments which are only commencing, and in which very little can be said at present. One of the remedies being tried in the administration of Atozyl, a drug from which very encouraging results are being obtained in the treatment of trypanosomiasis or sleeping sickness in man, a disease which in many respects bears a striking resemblance to dourine in equines. Very interesting in this connection is the fact, recently brought forward by Prof. Koch, that human trypanosomiasis may be transmitted by coitus. Koch, who has treated some 2,000 cases says, 'We have in Atoyl the specific drug for trypanosomiasis, as we have in quinine that for malaria,' and that sleeping sickness may be cured by Atozyl by a six months treatment. Sir Patrick Manson, however, points out that the limit of the duration of the infection in man is not yet

SESSIONAL PAPER No. 15a

known, and that it certainly may run a course of three or four years. We have similar evidence as to the duration of dourine, so that even if Atoxyl is proved to be a valuable remedy, it could scarcely ever be economically applied in the latter disease, the prolonged and expensive course of treatment under quarantine conditions, that would be necessary, prohibiting its use save, possibly, in the case of an exceptionally valuable animal. But should Atoxyl prove to possess a preventive action, then it might be extensively employed for the protection of breeding studs in dourine-infected districts.

LOCO-DISEASE.

On October 27, 1907, a carload of thirteen animals, six bovines and seven equines, all suspected of loco-poisoning, and showing distinct evidence of a chronic disease, were shipped to this station for investigation. These animals had been collected in the Tennessee Coulee and Livingstone ranges, Western Alberta. The removal of these animals to a district where Loco-disease is unknown, and where they could be hand fed and well cared for, would, it was thought, result in recovery for at least some of them. Up to the present time seven of the thirteen have succumbed, three of the remainder have made a markedly downward progress and are apparently in the final stages, and the other three, all bovines, are in about the same condition as on arrival, and may ultimately recover. In the study of these cases an interesting fact has been brought to light, namely, the extensive infection in all cases examined with the parasite *Sarcocystis*, a sporozoan parasite invading the musculature in a manner somewhat resembling that of the more familiar spiral nematode *Trichina*. As pointed out in a detailed study in sarcosporidia separately submitted to you, this infection occurs probably as a sequel, in these cases, to loco-weed poisoning, the latter condition is being further investigated and will be reported upon at a later date. It is a pleasure to acknowledge my indebtedness to Dr. M. V. Gallivan, who has, whenever time permitted rendered much assistance at autopsies, in field-work, etc.

I have the honour to be, sir,
Your obedient servant,

A. WATSON,

To the Veterinary Director General, Ottawa, Ont.

SPECIAL REPORT ON LOCO POISONING.

REGINA, Sask., October 5th, 1907.

SIR.—I have the honour herewith to submit my report in connection with my recent visit to the Porcupine Hills, Alberta, whither I proceeded in accordance with your instructions, to inquire into the reported serious losses among stock ranging in the Tennessee Coulee, Jack O'Neil Coulee, Beaver Creek, Meadow Creek, Willow Creek, and Livingstone districts, and also to select a number of suitable cases showing characteristics symptoms of the disease under consideration, for removal to the Quarantine Station, at Lethbridge, in order that the disease might be closely studied under favourable conditions. I was fortunately able to arrange for Dr. Warnock to accompany me, and found that his knowledge of the various districts, and long experience with the prevailing conditions on the range, and also his close observance during the past few years, of the disease under investigation in its varied stages, was of the greatest possible assistance to me.

We proceeded first to the Tennessee Coulee district, where the losses in horses and cattle during recent years had evidently been the greatest, although the present season's mortality had not attained the high percentage of former ones.

The topographical lay of this district is one strongly conducive to healthy conditions, it is rolling in character, interspersed with numerous fast running streams, containing an abundance of clear water. The soil is of a light gravelly nature, and there are no depressions containing stagnant water, the natural fall of the country being well defined and continuous, making the sanitary aspect all that could be desired.

The vegetation, however, was not as prolific as in other districts visited, although the Loco Plant was very much in evidence everywhere and had been liberally eaten off wherever stock had access.

In the vicinity of Summerview we found on one premises four horses and five young cattle affected. The owner had only resided in the district three years, having come direct from Manitoba, bringing his stock with him. The year following his arrival some of his animals commenced exhibiting nervous symptoms, which gradually increased. His work horses, previously fearless, began to fight the halter and finally refused to have their heads handled, followed by apparent defective vision. Their gait attracted attention, upon coming to a small object in their path they would step unusually high, or endeavour to jump over it. The appearance of their eyes became unnatural, assuming a wild distant glare. One mare tied in her stall was found dead in the morning, after having battered the wall in front of her up to the ceiling with her front feet in an endeavour to climb up, and falling over the partition, which gave way, injured herself fatally.

At the time of our visit one two year old and one three year old colt were in an unthrifty condition, a portion of their winter coats were still visible, they were dull, sleepy, presenting a condition of malaise when undisturbed. Upon being approached they would trot away a short distance, with heads carried semi-erect, exhibiting a stilty, jerky, and uncertain gait. A lachrymal discharge was noticeable in both animals, which appeared to be simply an increased flow of that fluid. These colts were showing the same symptoms last summer, they were kept in during the winter and well fed, resulting in a marked improvement. Upon being turned out, however, the symptoms reappeared with increased severity in the course of five or six weeks.

Two mares, one seventeen, the other fourteen years, brought from Manitoba, after being in the district one year commenced to act strangely, exhibiting nervous movements, were unable to back, or did so with great difficulty. The symptoms disappeared to a certain extent during the winter months but returned during July and August, after the mares had been on pasture for a short time. At the date of our visit they were in very fair condition, lachrymation marked in both animals, salivation apparent, but not profuse, they moved in a slow careless manner and presented a similar appearance of the eyes as the colts above-mentioned. These mares were being worked with caution, the owner keeping them off the pasture as much as possible. Their condition, however, would suggest that if the exciting cause could be eliminated a complete recovery would be probable.

Four two year old heifers, one three year old, were also affected. Three of these appeared dull, while the other two were excitable, erratic, and nervous. They were all very much stunted, and in an unthrifty condition, showing decided lachrymation and salivation, prehension appeared difficult, grazing being accomplished in a slow grubbing manner, accompanied by marked rigors of the muscles of the head, neck and forequarters. Upon being approached suddenly they would trot away for a short distance, all exhibiting the same typical outline, the head carried semi-erect, arched spine, very similar to opisthotonos, while their gait was of a jerky, stumbling and uncertain nature. One of these animals presented a marked swelling in the submaxillary space, accompanied by a thickening of the inferior maxilla.

A stallion, kept for breeding purposes, does not show any symptoms of this disease, although he is continually coming in contact with affected animals, being also stabled with them. He has not, however, at any time been out on pasture.

SESSIONAL PAPER No. 15a

We found the loco plant growing plentifully on all sides and elicited the information that the owner had never seen a disease similar to the one affecting his stock before coming to this district. In his experience the stabling of affected animals resulted in the majority of cases in a decided abatement of the symptoms.

Proceeding along this coulee the loco-weed could be easily detected on all sides, noticing a live animal in the distance we drove up to it and found a two year old colt in an unthrifty condition, and of a dejected appearance. He gazed at us in a semi-crazed manner for a few moments, then suddenly trotted away exhibiting a similar gait to the other colts we had seen.

In conversation with an old resident we learned that he had been compelled to reduce his breeding stud, owing to the mortality he had experienced in his young stock, ranging from one to two years. He had resided in the district for twenty-five years but had not noticed this disease until six years ago, since when he had lost a very large percentage of his young stock, evidently from the same cause, as the symptoms and progress of the disease appeared in all of his cases to be similar. During the last winter this gentleman had stabled a number of his affected colts, with a resulting improvement in their condition when turned out in the spring. After a few months on the range, however, they rapidly fell back to their former condition. One ten year old mare with colt at foot died a few weeks ago, with identical symptoms of the disease affecting his younger animals. The colt which was being specially cared for by his neighbour, was presenting a very unthrifty appearance, he was sleepy, dull and erratic, and moved along in a slow careless and unsteady manner. Lachrymation was well marked, while a slight flow of saliva was dribbling from his mouth.

A stray mare showing characteristic symptoms, although not far advanced, was noticed among this man's horses. He has now only 80 head, and has lost during the past season 27 colts, aged from one to three years. The location of his premises are excellent, the water supply abundant, obtained from rapid running streams, while the drainage and sanitary outlook appear perfect. The soil is of a light gravelly nature, and the loco plant well distributed over the range.

Upon visiting another premises we found the owner had recently lost one mare, which had exhibited symptoms similar to those already described. He had also at the time of our visit one colt and one six-year old cow affected with this disease. We had not, however, the opportunity of seeing these animals, as they were out on the range, and approaching darkness preventing the possibility of finding them in sufficient time for examination purposes. The owner had not lost many animals during the last two seasons, but had been a heavy loser four of five years ago. He had found that affected stock improved in condition and that the symptoms abated when housed and fed, but that they returned again some weeks after the animals were let out on the range. In his experience young stock were most susceptible and cattle were affected almost as readily as horses, the symptoms appearing most pronounced during the months of July and August.

We proceeded to the premises of another resident in this vicinity and were informed by the owner that they had lost seven horses during the last few years, which they attributed to the disease prevalent on the range. They have never engaged in stock raising extensively, having given their attention to farming. One of their work mares was still showing some of the peculiar symptoms, although she had been stabled for some time and given careful attention. This animal at the time of purchase by her present owners had been been working in a neighbouring town, and was gentle and fearless. After being out on the range, however, for a short time she developed pronounced nervous symptoms, and when first taken in could only be handled with considerable difficulty. She was at the time of our visit in good condition and appeared to be in perfect health while standing undisturbed. Upon being turned loose in the corral with the halter rope hanging, she immediately began to tremble, fixed her eyes upon it and became quite excited, and while endeavouring to

8-9 EDWARD VII., A. 1909

get away from it exhibited the same gait previously observed in other affected animals, but not to such a marked degree. We found no cattle on these premises but the owner stated that a neighbour had lost about forty head a few years ago, and that owing to continued losses was obliged to dispose of his remaining stock.

Upon arriving at the last premises visited along this coulee we found that the owner had lost fifty horses, and a number of cattle during the last few years, all of which exhibited similar symptoms before death. These animals had been grazing on a portion of the range where the soil was of a light nature. He removed his remaining animals, having detected that they were developing symptoms of a similar nature, to another portion of the range, where the soil was heavier and the loco plant not so abundant, with the result that the mortality among them was reduced considerably and the survivors have improved. His experience with this disease was that affected animals did not develop naturally, appeared to lose their senses, saw imperfectly, ran into fences constantly, remained in an unthrifty condition, and when nearing death would wander about in a circle, finally fall and die after a few convulsive kicks. A stallion owned by this gentleman, and kept constantly stabled on his premises, is quite healthy, and has not shown any symptoms at any time similar to those noticed in his other animals on the range. A number of his affected stock have been stabled each winter, and have shown marked improvement in the spring, upon being turned out, but a few weeks on the range have been sufficient to produce a return of the symptoms, which appear to become more pronounced during the midsummer months. One young mare showing decided symptoms last fall has been kept off the range, stabled and fed constantly since, which has resulted in a marked abatement of the symptoms. At the time of our visit it was with difficulty that anything abnormal could be detected. This animal had been visibly affected for two years.

Proceeding to Jack O'Neil Coulee we found on one premises two colts badly affected, the symptoms having developed a year ago. They were fed during the last winter on sheaf oats, and improved considerably, only, however, to return to their previous condition after a month on the range.

While in this vicinity we obtained the information that a resident a few years ago owned 400 head of cattle. After losing 150 of them, all of which developed similar symptoms, he disposed of the remaining apparently healthy animals and removed 80 affected one to the vicinity of Pincher Creek. These animals gradually improved and fattened, and were all finally sold for beef, not one of them dying after removal. They remained, however, small, undersized and stunted, no growth or development taking place.

A noticeable feature in this connection is the fact that no other animals became affected in the vicinity where these diseased animals were removed, although no precautions were taken, and they were allowed the freedom of the range. Dr. Warnock in his report on loco poisoning, two years ago, dealt fully with this outbreak, having had the opportunity of examining the animals and holding a few post-mortems.

A badly affected horse was shipped to Cranbrook, B.C., where he remained useless for two years, but gradually recovered and is working daily attached to a dray in that town.

Returning to the Tennessee Coulee in consultation with another resident we found that he had lost five horses during the last few years, after exhibiting similar symptoms to those described. They were brought in from Eastern Canada, two of them became visibly affected six weeks after arrival, dying a few weeks later, while the remaining three continued in an unthrifty and nervous state with erratic tendencies for eighteen months before succumbing. At the time of our visit a two year old was still showing some of the abnormal symptoms. This animal had been kept off the range for some time, and according to the owner's statement, with marked

SESSIONAL PAPER No. 15a

beneficial results. This gentleman informed us that the eastern horses had always been perfectly gentle, until a short time after being turned out, when they became dull, moved sluggishly, attempted to jump, or step unusually high over the smallest objects, and finally refused to be haltered, or have their heads handled. If this was persisted in they would strike, or rear, and fall backwards. These animals rapidly became reduced and remained so, and it was found impossible to handle the three, which lived for eighteen months, at any time during their illness without considerable danger.

We next visited the Livingstone range district where we found conditions very similar to those already described. The soil, however, varies; along the hill slopes it is of a clay consistency, while it appears to change to a lighter nature in the bottoms of the flats. The loco weed, although quite noticeable on some portions of the pastures, does not appear to be as general, or as widely distributed, as on other parts visited. The same excellent sanitary conditions, however, prevail.

An old resident informed us that he first noticed the disease among his stock one year ago, and has since lost six yearling colts, the character of their illness being strongly suggestive of the same exciting cause. He had at the time of our visit two two-year old colts evidently affected with the disease under consideration. They commenced to develop symptoms as yearlings, and upon the advice of Dr. Warnock, he put them into a pasture, which included 25 acres of oat stubble and 25 acres of green fall wheat. The change appeared to benefit them, although they still maintained the peculiar gait, and did not regain their usual vigour.

The colts which succumbed to this disease had been running in the same pasture as those of his neighbour, none of whose stock, however, have so far become affected, neither have any symptoms been detected in 150 cattle grazing under the same conditions.

The only difference between the pasturing of this gentleman's colts and those of his neighbour was that the former's were turned out earlier in the spring.

Proceeding a few miles to another premises the owner informed us that this disease had never affected any of his animals. Another neighbour, however, lost three young cattle, three colts, and one mature horse, all of them exhibiting similar symptoms during their illness, which coincided with those of other animals already described.

On arriving at another premises we found that the owner had no animals affected although he had lost last winter four two-year old cattle and two two-year old colts, evidently from the same cause. This was his first experience with this disease, the animals developing symptoms during the summer of 1906, all of them dying upon the advent of cold weather. The soil in this vicinity is noticeably of a heavier nature than in the Tennessee coulee, and the loco plant, while in evidence, is not by any means abundant.

Upon proceeding farther up the Livingstone range we elicited the information from two stock owners, who were in partnership, that nine of their yearling colts began to act strangely a year ago, followed by unthriftiness. They became sluggish in their actions, erratic, and nervous, and finally developed a jerky stumbling gait. Five of them died this spring, while the remaining four were disposed of. They have not detected any cases among their cattle, although they have 300 head grazing on the range. The loco plant was in evidence, but to a very limited extent.

Proceeding to a large range in this vicinity we interviewed the owner, who stated that they had lost a number of valuable colts this spring, some of them succumbing to attacks of Cerebro Spinal Meningitis, while others were the victims of Verminous Aneurisms. Two yearling colts, in which Aneurisms were suspected, were receiving special care and attention in the hospital corrals, their diet consisting of green feed and oats, while medicinally vermifuges were being administered daily. They were in a very fair condition, appeared dull, exhibited nervous symptoms on being approached, while their gait denoted inco-ordination to a certain extent.

8-9 EDWARD VII., A. 1909

The symptoms presented, although similar, were not as typical as the majority of cases witnessed in the other districts. These colts, however, were under far more favourable conditions, which would naturally have a mitigating effect upon the symptoms in a disease of a sub-acute nature.

After a drive of eight miles up the range we came to a special enclosed portion known as the calf pasture. The grass was very luxuriant, and the local sanitary conditions excellent, the latter features being all that could be desired on any part of the ranch visited by us. One three-year old colt and one two-year old were kept in this pasture, in addition to a number of other animals. They were suspected of being affected with Chronic Cerebro Spinal Meningitis. Their illness was ushered in with an attack of irregular strangles, but upon recovery from this malady nervous symptoms developed, accompanied by unthriftiness, great excitability upon being handled, finally becoming unmanageable. When trotting their gait was of a stilty, jerky character, one of them showing a stringhalt tendency. Lachrymation and salivation were not visible in these animals, although the other symptoms had many aspects similar to those noticed in affected stock in other districts. The owner stated that he had not experienced any unusual disease among his cattle, and that they had no cases of the diseases prevalent on the range in his herd. On returning along the range, however, we noticed a three year-old black steer, within the limits of the ranch, showing the characteristic symptoms observed in the affected cattle on the Tennessee Coulee. This animal was in a very unthrifty condition, arched back, exhibiting nervous symptoms when approached, careless, stumbling and erratic gait, wild glaring appearance of the eyes, lachrymation and salivation marked. It is therefore evident that the main disease does occur among the cattle on this ranch, although possibly not to a serious extent, otherwise the owner's attention would have been directed to it. In conversation with him regarding the strong suggestive features pointing to the loco plant, as the exciting cause of the mortality among stock in the districts visited, he was strongly inclined to believe that the plant in question was not of a poisonous nature, and that the conditions existing outside of this ranch were probably of a different nature to those found thereon.

Specimens obtained from two yearlings were shown us, consisting of Aneurisms of the Posterior Aorta, Anterior Mesenteric and Renal arteries, as also a section of a kidney containing sclerostomes. These were well marked cases, the thrombi formed, owing to the irritation of those parasites, almost occluding the arteries.

I am quite satisfied, however, from symptoms observed in the affected animals in the other districts visited, that the exciting cause is not a parasitic infection. Conditions resulting from the causative agent would naturally lower the resistance of the individual, and explain the seriousness of such parasitic infestations.

On the next premises visited we examined a three year old filly, which had been running on the range in the Tennessee Coulee district from a yearling, and developed abnormal symptoms during last winter. In the month of July the owner brought her to Macleod and has since given her the very best care and attention. At the time of our visit she was in very fair condition, a portion of her winter coat was still in evidence, there was a slight edematous swelling on the inferior portion of the abdomen, lachrymation and salivation quite visible, the glaring appearance of the eyes noticeable, while her gait was uncertain and erratic. Her demeanour was of a nervous excitable nature, and although her appetite was good she exhibited difficulty in prehension. A marked improvement had taken place since she was removed from the range, Dr. Warnock especially noticing the improvement since his last visit. The mother of the colt in question had also pastured in the same district but had not developed similar symptoms, neither have any of this gentleman's horses at Macleod, which have been in contact with this colt but have not been on the range, developed any symptoms of an abnormal nature.

SESSIONAL PAPER No. 15a

Leaving this district we proceeded to Meadow Creek and on the first premises visited we found three yearlings and two two year old colts showing symptoms of the same disease, and learned that the owner had lost one three year old affected in the same manner. These colts, after having been wintered, were let out on to the range, the abnormal symptoms being first detected during the month of July last. At the time of our visit the two year olds were being kept in close proximity to the stables and were receiving special attention. They were in fair condition, showing signs of unthriftiness, slight lachrymation, and presented to a less marked degree the staring glare noticed in the eyes of other affected animals. They were dull and sleepy, changing to excitement upon being approached. Previously gentle, they were now difficult to handle, and moved in a careless stumbling manner. Although this gentleman has 100 head of cattle, he has not so far detected any abnormal symptoms among them.

We found the sanitary conditions excellent, the soil not as light in nature as in other districts coming under our observation, and the loco plant growing on the hillsides to a limited extent, appearing, however, to be smaller and of younger growth.

Calling upon another resident of this district we found that he had one two-year old and one yearling calf affected; they had presented peculiar symptoms shortly after weaning. While grazing, prehension appeared difficult, the animals nipping off the grass in a slow grubbing manner, this act being accompanied by rigors of the muscles of the head, neck, and forequarters. They were undersized, one in very fair condition, the other very unthrifty, the nervous condition apparent in other animals was almost lacking, while the gait was not at all characteristic. The owner informed us that he had lost eight two year-old cattle last fall, and that at the commencement of their illness the symptoms were similar to those exhibited by the animals at present affected. As the disease advanced they became very dull and sleepy, charging rapidly into an excitable state upon being approached. In some of them he noticed a swollen condition of the head, especially of the lower jaw. They developed a peculiar gait, which he could not describe, and fell frequently.

The loco plant is found growing in this district and is well distributed especially along the hillsides.

The last premises visited are divided by Willow Creek, a rapid flowing stream containing an abundance of clear water; the range running west terminates along the Porcupine Hills, while easterly it changes into a farming country. The loco weed grows profusely along the Porcupines, but has not yet been detected east of the creek. The owner informed us that he had lost sixty head of horses, as well as a number of cattle, during the last two seasons. He had not noticed this disease until they commenced to pasture their stock west of the creek. He has at the present time a number of colts and cattle affected, all exhibiting the following symptoms, varying in intensity, defective vision, unthriftiness, peculiar slow gait, lachrymation, salivation, and a wild glaring appearance of the eyes. The mortality among his stock has been largely due to the affected animals walking over the cliffs and falling into the creek below, thereby fatally injuring themselves.

One six year old cow was at the time of our visit, commencing to develop symptoms similar to those of his other affected stock, the wild glaring appearance of the eye was quite noticeable, her condition was not one denoting vigour, and her movements were sluggish, unless disturbed, when they changed to those of a quick, unsteady, jerky nature. The owner appeared very familiar with this disease and stated that in his experience all affected animals had ranged on the west side of the creek, and that he had never heard of stock developing similar symptoms that had not at some time grazed on the Porcupine slopes. He has also observed that animals turned out in the spring rarely developed abnormal conditions before the months of July and August, while those turned out during the month of July rapidly became visibly affected, frequently exhibiting symptoms of a more pronounced character than many of those grazing on the same pasture from early spring. He is endeavouring to keep

8-9 EDWARD VII., A. 1909

his animals on the eastern side, and is of the opinion that if he is successful his losses will be partially, or completely reduced. There is no doubt that the disease under consideration has caused considerable losses in the districts visited, and, as is generally the case, where a distinct malady predominates, has also been unjustly blamed for many fatalities resulting from ordinary ailments to which stock are heir. It would appear, however, from information gathered that there is a decided decrease in the number of affected animals during the present year. This can possibly be accounted for by the past unusually severe winter claiming as its victims a large percentage of affected animals, in preference to those whose constitutions had not been undermined.

The disease under consideration, however, from the constant similarity and uniformity of the symptoms observed by us, must necessarily under ordinary conditions be classed as a distinctive one, attributable to a definite exciting cause. The fact, however, that animals of all ages, including horses and cattle of varied constitutions, continually in contact with affected ones, kept under certain limitations, do not contract this disease under any circumstances, together with the endemic tendency of these outbreaks, constricted as they are to definite areas, makes the possibility of a contagium as the exciting cause most remote, and can therefore, I think, be safely eliminated from further serious attention.

Ever since this disease has been recognized, it has been a common practice for individuals living in districts where the malady was unknown, to purchase at nominal figures affected animals, removing them to such districts where they either recovered, or died, without in any instance establishing this disease, and extending the limits of the already defined area. There is no doubt that parasitic infestations do occur, a fact which has long been recognized, in prairie fed and range animals. Stock reared under such conditions are seldom found free from some of their species. It is difficult to conceive, however, how such disastrous results could be produced by them in a country where the existing conditions are totally at variance to their vitality, if such causes were deserving of serious consideration. Neither was the uniform chain of symptoms witnessed by us, in all affected animals, suggestive of abnormalities resulting from the invasion of such parasites. It would also be impossible to satisfactorily explain the phenomena persistently apparent when badly affected animals of both species are removed from certain limited districts and allowed their freedom on other portions of the range, or housed, and fed on ordinary fodders without any medicinal treatment.

A very striking feature noticed was the fact that the Loco weed was in evidence everywhere where affected animals had grazed, and that its growth was most profuse in districts where the greatest mortalities had occurred. The disease appeared to exist in proportion to the growth of this plant. In vicinities where the Loco weed was apparently of young growth and sparsely scattered the young colts appeared to be the only animals visibly affected, while in districts where this weed flourished abundantly mature animals of the equine and bovine species were exhibiting characteristic symptoms, with a serious percentage of mortalities. Unfortunately the grazing of sheep is prohibited on the range in the districts visited, and we were therefore unable to obtain any data regarding them. There is no doubt, however, that some animals, whether or not due to abnormal desires, do pick out and eat this plant, as was evidenced in several instances in pastures where the vegetation was of luxurious growth, and the weed very limited, the latter having been eaten off so systematically that it was with difficulty an undisturbed plant was found.

Hay cut in July or August on the range, containing the Loco weed in abundance and fed to stock in the winter months, has resulted in a number of the animals developing the same symptoms as those detected in stock grazing on the range, while those fed on cultivated fodders, or upon hay obtained where this weed has not been detected, do not become affected.

SESSIONAL PAPER No. 15a

After carefully considering the evidence, the indications point most strongly to the cause of this malady being one of a dietetic origin. The symptoms produced in affected animals, accompanied by their tendency to fluctuate according to the choice of pastures, and fodders, denote the ingestion of a toxic principle contained therein, which apparently exerts its influence directly upon the nervous system, in ratio to the amount consumed and the regularity with which it is taken. The persistent presence of the loco plant, where the disease exist, and its total absence where this malady is unknown, together with its unfavourable history, point most strongly to this plant as being the exciting cause of the disease witnessed by us in the Tennessee Coulee, Jack O'Neil Coulee, Beaver Creek, Meadow Creek, Willow Creek and Livingstone districts, and which had been diagnosed by Dr. Warnock some years ago, along the Porcupine slopes, as loco poisoning, and reported upon by him.

The remedial treatment from present appearances resolves itself into one of removal, either of the plant, an apparently impossible task, or of the animals from the districts in which it flourishes. A number of affected animals were selected in accordance with your instructions for experimental purposes, and arrangements made for their collection and shipment to the Lethbridge Quarantine Station. A great deal of difficulty will, I am satisfied be experienced, however, in their removal. It is almost impossible to handle or drive them, due to their excitable tendencies and erratic nature. We fortunately secured the services of a man who had lost a large number of animals with this disease, and therefore one quite familiar with the peculiarities, to take charge of their collection and removal to Pincher Creek for shipment.

A list and description of each animal will be forwarded immediately they are shipped, as it is most probable a number of those selected will become unmanageable and their removal abandoned.

I have the honour to be, sir,
Your obedient servant,

GEORGE HILTON,
Inspector.

The Veterinary Director General,
Health of Animals Branch,
Ottawa., Ont.

T. BOWHILL, F.R.C.V.S.

VANCOUVER, March 31, 1908.

RED WATER INVESTIGATIONS IN BRITISH COLUMBIA.

SIR,—In my preliminary report forwarded December 9th, 1907, I drew your attention to the occurrence of a species of *Piroplasma* infection of the erythrocytes of the blood of animals suffering from the so-called Red Water disease, prevalent in certain portions of this Province. I also informed you of the discovery of some ticks belonging to the Genus *Rhipicephalus* some of the female ticks, obtained on that occasion are still alive and commenced ovipositing on the 18th of February, 1908.

I visited Chilliwack and Mount Lehman. At the former place, I saw several well marked chronic cases of Red-Water; blood smears were obtained and examined on my return to Vancouver, only a few parasites were present. It was only after a prolonged examination, that I was able to demonstrate the presence of a few piroplasmata, a twin parasite was rarely observed and this fact also applies to the examinations previously conducted. In many instances, the number of parasites observed averaged

8-9 EDWARD VII., A. 1909

6-8 per smear and many of them were extra-corpuseular, others were dimorphic, while some were disintegrated and exhibited no distinct karyosome staining. Both of the cases examined at one farm, 7 miles from Chilliwaek, were of long standing, one of the cows had been infected at intervals during the past three years, no history of ticks ever having been found on these cattle could be elicited but ticks were stated to have been observed on the rabbits. At Mount Lehman, I visited another farm, and with the kindly assistance of the Local Farmer's Institute, one of the owner's cows was purchased and slaughtered. I was extremely anxious to obtain a post-mortem examination, consequently, the offer of the above cow, a chronic case was taken advantage of, in order to determine if possible the nature of the lesions peculiar to this disease and at the same time note the comparative differences if any, to allied diseases in other countries.

The subject was 8 years old and had had 3 attacks of Red-Water extending over a period of three years, the animal being attacked in the Fall and Winter and was apparently healthy during the Summer months. On examination, previous to slaughter the following clinical symptoms were noted—marked hæmaturia, general marasmus, severe muscular tremors, especially in the posterior region and flanks, visible mucosæ and hairless spots exhibited a distinct hæmapheic icterus, a small swelling was also present in the parotidian region close to the angle of the mandible. The cow was shot and on removal of the skin the carcass was observed to be very emaciated, the subcutaneous fat and tissues icteric, the blood was very red and watery, coagulated quickly and the serum was distinctly hæmoglobinæmic. The swelling in the parotidian region also involved the periosteum of the mandible and was caused by Actinomycotic infection. The lungs were practically normal, only a few pigmentary spots being observed and a small lesion of hæmostatic pneumonia. The walls of the heart were very thin and a few petechiæ were present on the ventricular endocardium. The liver was slightly enlarged, fatty and engorgement of the gall capillaries was well marked in the portions of the organ contiguous to the gall bladder, the latter contained a quantity of dark green coloured bile, thicker than normal but not inspissated. The stomach did not show any marked lesion but the mucosa of the Abomasum was slightly hyperæmic, no ulcerations were present. The mucosa of the entire intestinal tract was markedly anæmic, the Duodenum, in the region of the Ductus Choledochus was slightly bile stained. Spleen slightly enlarged and indurated, the capsule being thickened, blood vessels swollen, cut surface dark purplish-colour, trabeculæ also thickened. The Suprarenal capsules were slightly enlarged. The kidneys were slightly enlarged, firmer to the touch than normal, capsule slightly adherent, a number of cysts were present on the margin of the cortex, about the size of a small pea, they contained a yellowish-brown viscid fluid, there was no trace of hydatids on section, the cut surface presented a reddish brick colour, no pus was present in the pelvis and no blood clot, although the lining membranes of the pelvis were swollen and studded with hæmorrhagic centres. The bladder was full of claret wine coloured urine, mucosa swollen, congested, in rugæ and studded with numerous ecchymotic hæmorrhages. Studded here and there, but most pronounced at the openings of the ureters were several fibro-papillomatous growths. A few of the Mesenteric lymph-glands were enlarged, the parenchyma, being of a brownish-red colour (but not juicy.) The above are the principal lesions observed, the other parts of the carcass were anæmic.

BLOOD EXAMINATION.

Smears were prepared from the blood, kidneys, liver, heart and spleen, fixed and stained on my return to Vancouver. On examining one of the smears prepared from the peripheral circulation, I was astonished to find a large flagellate body belonging to the Trypanosomidæ. I am uncertain to which genus it belongs as in this research. I was not looking for Trypanosomidæ, consequently, the technique usually adopted in such research was not observed. I believe this is the first instance in North America,

SESSIONAL PAPER No. 15a

where this type of parasite has been found in cattle. This flagellate may be the cause of considerable loss and presuming, that it has been recently introduced, or even that it is indigenous to the Fraser River Valley, I would draw your attention to the danger of neglecting the determination of what species of blood sucking Diptera or Anophelinæ may be responsible for the spread of this parasite. In dealing with double flagellated trypanoplasma, Prowazek, considered that in the course of phylogenesis sometimes one pole or the other has been suppressed. Schaudinn, expressed the opinion that the flagellate *Herpetomonas muscæ domesticæ* could be traced to a doubly flagellated trypanoplasma. These observations and results of other investigators point to the importance of tracing, if possible, the origin of the flagellate body I discovered in the blood of Mr. Turner's cow at Mount Lehman.

In the blood smears, also the smears prepared from the heart, kidneys and the spleen, a few piroplasmata were observed, the most were present in the kidney smears—the piroplasmata were mostly amœboid forms, a few dividing forms and flagellated parasites were also observed. The erythrocytes exhibited a distinct poikilocytosis and in the smears prepared from the peripheral circulation, polychromatophilia of the erythrocytes was well marked—

PATHOLOGICAL ANATOMY.

The following is the result of the microscopical examination of the principal lesions observed in the cow slaughtered at Mount Lehman. Pieces of the organs and the tissue were hardened and sections cut and stained—*Spleen*—the spaces contained less cells than normal and many of the leucocytes and endothelial cells contained a red pigment—some of the malpighian bodies exhibited more or less fibrillated tissue and the trabeculæ were hypertrophied.

Kidneys.—The changes were those of a well marked chronic parenchymatous nephritis; pigmentary deposits were present in the stroma and the cysts on the surface of the cortex were probably due to the obstruction of the tubules, caused either by the inflammatory changes in the parenchyma or pigmentary deposits—the walls of the cavity of the cysts were lined with flattened epithelial cells—considerable interstitial infiltration was also present.

Bladder.—Sections of the wall of this organ showed the presence of well marked subepithelial hæmorrhages, while the growths on the mucosa, especially those at the entrance of the ureters were found to resemble vascular papillomatous fibromata, an extravasation of blood was present in the center of the growths and associated with this were marked pigmentary deposits, probably due to hæmosiderosis. A bacterial invasion was also observed, associated with the subepithelial hæmorrhages, the cocci being arranged in zooglea—these organisms are probably associated with a terminal infection or a contamination from without—the recurrence of the disease and altered condition of the urine injuring the mucosa of the bladder and thus forming a suitable nidus for a bacterial growth, as well as favouring the extension of infection by way of the uro-genital tract, owing to the albuminous condition of the urine causing a contamination of the vagina and external labia. The valves at the oblique entrance of the ureters at the postero-superior portion of the bladder were thickened and continuous with the largest of the above described vascular papillomatous fibromata.

Lymph-Glands.—Sections were examined from one of the enlarged mesenteric glands—the endothelial lining of the lymph spaces, as well as the follicular cords were disintegrated—there was a well marked extravasation of blood cells in and around the blood vessels contiguous to the interfollicular cords. The connective tissue of the trabeculæ was slightly hypertrophied and fibrillated tissue containing pigment occurred in portions of the stroma. This concludes the pathological changes I have observed in the principal lesions present in the cow slaughtered at Mount Lehman. The animal was a marked instance of a mixed infection viz.—Actinomycotic, Trypanosomidæ and Piroplasmata infection, associated with a bacterial inva-

8-9 EDWARD VII., A. 1909

sion of the submucosa of the bladder. It is self evident that this subject although afflicted with typical chronic Red Water as it occurs in this province, was far from being a satisfactory case to determine the typical lesions peculiar to this type of Red Water. It is very insidious and where hæmaturia is absent, can be overlooked and owing to climatic conditions serious epidemics do not occur—on the other hand, the cold prevalent in British Columbia within a radius of about 100 miles from the coast does not appear to be severe enough to kill off the infection. It must also be borne in mind that a region not previously infected can ultimately become a zone of permanent infection. In 1887, I had occasion to investigate a severe outbreak in California and at present the mortality is nothing like as severe, although the area of permanent infection is much more extensive. Many farmers have informed me that the ravages of this disease practically kills off the increase. Medicinal treatment is practically useless and at the best, can only alleviate individual cases temporarily, consequently preventive measures must be introduced. It is a peculiar chronic type of piroplasmata infection and bears a closer resemblance clinically to human malaria than any other form of piroplasmoses I have met with.

The above concludes the result of my observations to date regarding the Red Water disease in this province. The role of the tick or other intermediary host remains to be determined. The further consideration of the Trypanosomidæ infection is less important and on receipt of authority, same will be dealt with.

Tuberculosis.—This is the only other important disease that has come under my observation since I commenced original research in your department. I can only refer to the disease in swine and I have no doubt that you have read the observations I made in my special report dealing with the outbreak of swine plague, &c., at South Vancouver. At that time I was astonished to note the enormous number of swine that were infected with tubercular lesions, both generalized and localised in the mesenteric glands. It is well known that tuberculosis becomes generalised very quickly in swine, consequently, the consumption of the flesh of such animals is a source of great danger to mankind, especially where no trained veterinary inspection is carried out.

Respectfully submitted,

THOS. BOWHILL, F.R.C.V.S., F.R.P.S.,

Inspector.

The Veterinary Director General,
Ottawa.

REPORT ON A SO-CALLED CASE OF LOCKJAW SEEN AT LETHBRIDGE DOURINE EXPERIMENT STATION.

SIR,—On June the 15th, at 9.30 in the evening a number of horses were driven into the corrals, all were in apparent good health at the time, they had come some ten or fifteen miles, but had not been over driven.

No food or water was given to those horses until noon next day. At 11 a.m. I noticed that a mare branded X A was ailing, she had a very distressed look; her hips and nostrils appeared to be distorted.

The horses were taken out to graze at noon, and I did not see this mare again till 3 p.m., at this time a cowboy came to me and asked if I could do anything for her, as she was in a very bad way.

The symptoms then noticeable were as follows:

Gait, abduction of hind limbs, and extreme flexion (spasmodic), I observed her strike her belly several times.

Facial muscles twitching, the superficial shoulder muscles also twitching, otherwise the muscles did not seem harder than usual, except the facial; along the back they felt quite normal.

SESSIONAL PAPER No. 15a

Lips and nostrils distorted and very hard.

The jaws were set tightly, a few blades of grass were held between the lips, and had been there for at least two hours.

Membrana nictitans not more in evidence than usual. The eyes were somewhat sunken. The ears were laid back close together. The parotid gland stood out very plainly and was hard to the touch. Spasms of the pharyngeal muscles were not very marked; the animal sucked up a little water when it was offered. The heart beats were tumultuous, the temperature 101½. The animal was cast, and struck the ground very hard, the jaws relaxed for a minute, but set tight again. Chloroform was administered and the animal kept under its influence for half an hour. The twitchings gradually ceased, the nostrils regained their normal position and the mare was easier, she was allowed to lie for some time, then a little cold water was thrown on her head, and she got up. She was then driven down to the river, there was marked improvement in her gait at this time. On reaching the water she walked in belly deep, and remained there voluntarily for over an hour, dipping her head in and out of the water. Her condition improved gradually from that on, and when I saw her later in the evening she could trot. The nervous symptoms did not return though at this time the muscles of the jaws still looked somewhat tense. Complete recovery had taken place next morning, the mare had a full belly and looked as well as ever. Later in the day she was driven several miles, the symptoms did not return, and she has remained well ever since.

The local superstition about this disease is that if horses are run hard several miles, then put into a corral, without feed and water they will develop lock jaw within a variable time, but generally in from 12 to 24 hours.

I had frequently heard cowboys speaking about horses getting the lockjaw if kept in a corral without feed and water, but had always thought it was true tetanus and that the infective agent gained entrance by wounds; hungry horses will often gnaw a fence and doubtless get many dusty splinters into their gums.

Dr. Gallivan and I saw another case at Stirling where some horses had been rounded up for inspection similar in all outward appearances to the one just quoted. In this instance the horses had been driven a long way and had been put into a corral, also without feed and water.

The period of incubation in this case was about 18 hours.

The cowboys have a number of quack methods for unlocking the jaws, but I have not met any one who knew of a sure cure. Some horses seem to recover, others die.

The affection seems to be fairly common, but is rarely seen by practitioners as it generally occurs out on the range.

Dr. Higgins when in the West last summer with Dr. Hargrave diagnosed a case at McHugh Bros., Gleichen, through having read my report, and corroborates my statements with regard to the symptoms.

Dr. Warnock tells me he has seen a number of fatal cases.

Dr. Hargrave treated a case successfully near Medicine Hat, and I heard of another case where recovery had taken place in Lethbridge.

Dr. Fritz, Assistant Dourine Inspector for the Bureau of Animal Industry, informs me that the affection is common in the western States.

This case appears to me to have many points which are out of the common, the rapid onset of the disease, the short incubative period, the favourable termination, and above all the similarity which exists between it and true tetanus.

I have the honour to be, sir,

Your obedient servant,

SEYMOUR HADWEN,

Assistant Pathologist.

The Veterinary Director General,
Ottawa.

8-9 EDWARD VII., A. 1909

SPECIAL REPORT ON GLANDERS.

By J. G. RUTHERFORD, VETERINARY DIRECTOR-GENERAL AND LIVE STOCK COMMISSIONER.

OTTAWA, September 1st, 1906.

SIR,—I have the honour to present a special report upon the work performed during the last four years by this Branch of your Department in dealing with glanders.

This disease has long been rightly looked upon as one of the most serious and dangerous of animal plagues, and even were there no recent striking developments, or rather circumstances, demanding special attention, a report of this kind would not be out of place.

As matters stand now, however, there are grave reasons for the careful summing up of the whole situation, and in my opinion for the serious reconsideration of the views held regarding the disease by a majority of the veterinary practitioners of this continent, and for a radical change in the attitude generally assumed by governmental bodies in dealing with it.

It is quite unnecessary to occupy your time by any dissertation on the general history and pathology of glanders, or on the serious consequences not only to horses, but to human beings, which its continued existence in any community is liable to entail. It is equally needless to descant upon its prevalence on this continent and the importance of the adoption of an intelligent and comprehensive policy, having in view its immediate control and ultimate eradication.

As statistical and other details have been furnished in my various annual reports, I propose to confine myself to a brief history of our recent work in connection with the disease, followed by a short summary of the conclusions reached, on several points regarding which opinions, even to-day, differ somewhat widely.

It is almost exactly four years since the discovery of a serious outbreak of glanders in the City of Ottawa rendered necessary a prompt decision as to whether the control of this disease was to be assumed by the Federal authorities, or left, as it had up till then been, except in the North-West Territories, and in the case of one or two isolated outbreaks elsewhere, in the hands of the Provinces.

After carefully considering my representations, you decided that it would be in the best interests of all concerned to bring the disease under the direct control of the Health of Animals' Branch of your Department. This was accordingly done, except in Manitoba, where, owing to the fact that the legislation had long been such as to enable the Provincial authorities to deal with it, if they chose to do so, in a most thorough manner, the work was not taken over by the Federal government until 1905.

From August, 1902, until the present we have maintained a continuous effort to eradicate glanders in the Dominion, a work, I may say, of no small difficulty, when the size of the country, its climate and the conditions under which horses are kept in many districts are taken into full consideration.

The discovery of mallein in 1890 revolutionized entirely the views of veterinarians regarding glanders. Older veterinarians will remember the formidable chain of symptoms which, in their student days, were considered essential to a diagnosis of glanders, as also the various ironclad rules to be followed in differentiating between it and that now somewhat dubious disease 'nasal gleet.'

It is now recognized that horses may be, and only too frequently are, seriously affected with glanders while presenting, so far as outward and visible symptoms are concerned, an appearance of perfect health. The knowledge of this fact has, of course, necessitated a complete change in the methods of dealing with outbreaks of the disease. Whereas it was in former years, and in some countries is, even to-day, considered sufficient to slaughter animals showing clinical symptoms, while ignoring entirely those which may have been in contact, the conscientious modern veterinarian

SESSIONAL PAPER No. 15a

insists on the latter being submitted to the mallein test, and if found to react, either slaughtered or segregated for observation and further tests.

In studs where clinical cases have occurred there is a strong likelihood that some of the contact horses will be found to be affected, although for a time at least they may present no external symptoms.

Any system, therefore, which ignores this frequent condition is faulty and likely to cause a dissemination of the infection, particularly when, as is often done, studs in which glanders has been found to exist, are dispersed among innocent purchasers.

Under ordinary circumstances, especially when no provision for reasonable compensation exists, the problem presented by the condition outlined above is exceedingly difficult of solution. While horse owners, unless very poor, very ignorant or very unprincipled, are generally willing to have clinical cases destroyed, they quite naturally object to the slaughter of animals which may have reacted to mallein, but show no evidence of disease and remain in good working order.

In some countries the authorities overcome the difficulty after a fashion by leaving the contact horses severely alone, thus avoiding the responsibility which would have to be assumed if the animals, on being tested, were found to react. Untested, they are presumably healthy and are left free from restrictions.

As an illustration of the results of pursuing a policy of this kind, the following figures from the returns of the Board of Agriculture for Great Britain are very interesting:—

| | Horses destroyed. |
|---------------|----------------------|
| 1898. | 1,385 |
| 1899. | 1,472 |
| 1900. | 1,858 |
| 1901. | 2,370 |
| 1902. | 2,073 |
| 1903. | 2,499 |
| 1904. | 2,628 |

It is not, however, necessary to go to Great Britain for proof of the folly of ignoring the contact horse. Similar object lessons are furnished by the conditions prevailing in more than one district in Canada, and while, of course, I cannot presume to speak authoritatively on these matters, I feel confident that in some of the United States of America glanders is rapidly increasing owing to this cause.

The evil is greatly intensified by the fact that, where the proper authorities are inert, private testing of infected studs is continually going on, the reactors being subsequently sold as expeditiously as possible. Prominent veterinarians in Great Britain credit these private mallein tests, conducted by unscrupulous owners through equally unscrupulous practitioners, with the notoriously rapid spread of the disease in that country during recent years.

The same thing is undoubtedly true in America, and here let me point out another condition which, taken in conjunction with the private test, constitutes an additional and very important factor in the spread of glanders.

I refer to the great facility with which, in these modern days of cheap steam transportation, horses may be moved in large numbers from place to place.

While, especially in communities where mixed husbandry prevails, glanders may never obtain a foothold, because in these districts horses from a distance are, with perhaps the exception of valuable and generally healthy breeding stock, but seldom introduced, I would remind you that the great fluctuations in the value of horse flesh during the decade just passed have brought about the movements of large numbers of these animals from one district to another, and that glanders has, beyond doubt, been extensively spread by this means.

8-9 EDWARD VII., A. 1909

Perhaps the most dangerous agents in thus disseminating glanders are the western range horses, which, during the last ten years, have been distributed in large numbers through the country. Glanders on the range exists to a considerable extent in a latent and often very mild form, but it rapidly develops when the animals are broken, stabled and put to work. Many of the most widespread and most serious outbreaks with which we in Canada have had to deal are directly traceable to importations of range horses. Mallein is, of course, seldom used on the range but it is a common thing for owners to shoot down any clinical cases they may notice, the others, showing no symptoms, being sold as healthy, with the result above-mentioned.

Having made this digression in order to clear the way for what follows, I will, with your permission, revert to the time when, in 1902, I was called upon to formulate a definite policy for the control of glanders in the Dominion. At that time there existed no provision whatever for the payment of compensation, and this, of course, rendered quite impossible the slaughter of non-clinical reactors, even if I had then been anxious to adopt this radical policy.

As a matter of fact, however, I was, like many other veterinarians, under the impression obtained from a number of reliable professional sources, that it was quite unnecessary to kill horses of this class, and that satisfactory results would follow the adoption of a policy of testing all contacts with mallein, and retesting from time to time such as reacted until they either ceased to react, or through repeated reactions, furnished conclusive evidence that they were curable. For a period of slightly over two years this plan was carefully and conscientiously followed, but as time progressed it became evident that the results obtained were altogether disproportionate to the risk and labour involved. Not only did the number of horses on our hands keep constantly increasing, but in many cases individual reactors held among others for future tests developed clinical symptoms, and thus established fresh centres of infection. Such horses not only endangered the other reactors with which they were being kept, and some of which might have a possible chance of recovery, but indirectly threatened, through the various every-day channels which horsemen well understand, the health of other animals not actually housed with them.

As our opportunities for observation increased and further experience was obtained, serious doubts as to the conclusions previously reached by eminent veterinarians, both in Europe and America, as to the impossibility of glanders being transmitted by reactors not showing clinical symptoms, or by ceased reactors began to assert themselves. As the work went on evidence gradually accumulated that many of the so-called ceased reactors were not only not permanently cured, but were properly to be looked on with grave suspicion as being likely to introduce glanders among healthy horses with which they might be brought in contact. Several outbreaks of more or less severity and extent can be traced directly to these ceased reactors, and before I conclude, I shall endeavour to demonstrate the advisability of dealing with animals of this class as possible future centres of infection. As the owners of ceased reactors are generally more than willing to dispose of them as soon as possible after their release from official control, the risk of bringing infection to the stables of their unsuspecting purchasers constitutes an added danger which cannot reasonably be ignored.

The conclusion that neither non-clinical reactors nor ceased reactors could, with safety, be considered non-infective, having been thus forced upon me, there remained only two alternatives, either to follow the futile and already discredited policy of killing clinical cases and ignoring contact animals, or to face the situation and adopt the only intelligent course, the destruction of all horses showing the typical reaction to mallein whether presenting any external manifestations of glanders or not.

I need scarcely say that this would have been absolutely impracticable without provision for the payment of liberal compensation. The question of compensation

SESSIONAL PAPER No. 15a

for the slaughter of diseased animals has always, and in all countries, been one of great difficulty, and the disinclination of those in authority to assume the financial outlay involved, has been one of the chief obstacles encountered by veterinary sanitarians engaged in dealing with animal plagues.

When, however, the situation was clearly laid before you, you did not hesitate to ask parliament for the needed authority, and the no less necessary funds, with the result that in September, 1904, we were enabled to begin the slaughter of reactors and to pay for them at a reasonable, and when their intrinsic value is considered, a most liberal rate.

From September, 1904, to March, 1905, compensation was paid for non-clinical cases only, but it was soon seen that in order to avoid friction, as well as to secure prompt notification of outbreaks, it would be necessary to pay for all animals slaughtered, whether visibly affected or not. On March 25, 1905, therefore, the following regulations came into effect:—

Dominion of Canada.—Regulations Relating to Glanders.—By Order in Council dated March 25, 1905, in virtue of 'The Animal Contagious Diseases Act, 1903.'

1. No animal which is affected with or has been exposed to glanders shall be permitted to run at large or to come in contact with any animal which is not so affected.

2. Any veterinary inspector may declare to be an infected place within the meaning of the 'Animal Contagious Diseases Act, 1903,' any steamship, or steam or other vessel, or any place or premises where the contagion of glanders is known or suspected to exist.

3. No horse, mule or ass shall be removed out of an infected place without a license signed by an inspector.

4. Veterinary inspectors are hereby authorized to inspect and to subject to the mallein test any horses, mules or asses affected with glanders or suspected of being so affected, or which have been in contact with animals so affected, or suspected of being so affected, or which have been in any way whatsoever exposed to the contagion or infection of the disease of glanders, and for the purpose of making such inspection or test to order any such animals to be collected, detained or isolated.

5. Horses, mules or asses affected with glanders, whether such animals show clinical symptoms of the disease, or react to the mallein test without showing such symptoms, shall on an order signed by a duly appointed inspector of the Department of Agriculture, be forthwith slaughtered and the carcasses disposed of as in such order prescribed, compensation to be paid to the owners of such animals if and when the Act so provides.

6. In the event of the owner objecting to the slaughter of animals which react to mallein, but show no clinical symptoms of glanders, the inspector may order such animals to be kept in close quarantine and retested, such retests, however, in no case to exceed two in number and to be completed within four months of the first test, provided, however, that owners deciding to have their animals quarantined rather than slaughtered shall forfeit all right to compensation.

7. Horses, mules or asses reacting to the third test with mallein shall be forthwith slaughtered on an order signed by an inspector, and the carcasses disposed of as ordered.

8. Inspectors are hereby authorized to permit owners of horses, mules or asses which give no reaction to the third test with mallein and which have at no time shown any clinical symptoms of glanders, to retain and use such animals, subject to the conditions contained in the license signed by the inspector.

9. Before an order is made for the payment of compensation in any of the cases aforesaid, there must be produced to the Minister of Agriculture a satisfactory report,

8-9 EDWARD VII., A. 1909

order for slaughter, certificate of valuation and slaughter, and certificate of cleansing and disinfection, all signed by an inspector.

10. The certificate of an inspector to the effect that an animal has reacted to the mallein test or has shown clinical symptoms of glanders, shall, for the purpose of the said Act and of this order be *prima facie* evidence in all courts of justice and elsewhere of the matter certified.

11. Every yard, stable, outhouse or other place or premises, and every wagon, cart, carriage, ear or other vehicle, and every utensil or other thing infected with glanders shall be thoroughly cleansed and disinfected by and at the expense of the owner or occupier, in a manner satisfactory to a veterinary inspector.

J. G. RUTHERFORD,
Veterinary Director General.

Department of Agriculture,
Ottawa.

Although the time which has elapsed since the inauguration of the policy of compensation and slaughter is altogether too short to enable us to form a definite and decided opinion as to its wisdom and probable effectiveness in securing the eradication of glanders, the following figures furnish convincing proof that it has a strong tendency to remove the disinclination generally evinced by owners to report outbreaks of the disease and to permit the slaughter of their horses:—

| | Tested. | Reacted. | Killed. | Clinical. |
|-------------------------------|---------|----------|---------|-----------|
| 1902-3 | 1,062 | 466 | 219 | 219 |
| 1903-4 | 1,387 | 420 | 499 | 499 |
| Inclusive of Manitoba— | | | | |
| 1904-5 | 4,899 | 1,854 | 2,113 | 932 |
| 1905-6 (to March 31) | 3,957 | 1,285 | 1,387 | 561 |
| 1906-7 (to Aug. 31) | 4,200 | 850 | 946 | 502 |
| Total | 15,505 | 4,875 | 5,164 | 2,713 |

In considering these figures I desire particularly to draw your attention to the large increase, not only in the numbers of those tested and killed as reactors, but of those showing clinical symptoms. These figures furnish incontestable evidence that the present system brings to light a very large number of cases of glanders, which, without provision for payment of compensation, would never have been reported.

Under the conditions formerly existing, there was a tendency on the part of owners, and doubtless of some veterinarians, to avoid trouble and loss by concealing the existence of glanders. Where no compensation is paid many owners, otherwise quite respectable, are undoubtedly in the habit of allowing clinically affected cases to run their course, working them as long as possible, and finally either permitting them to die or having them quietly destroyed; while those less honest or more unprincipled have no hesitation in subjecting them to palliative treatment, with a view to removing or concealing suspicious symptoms, and subsequently disposing of them to the best advantage.

I am satisfied that the system now followed in Canada will, by removing temptation, prove effective in overcoming, at least to a very great extent, these tendencies shown by depraved human nature under less favourable circumstances.

It is interesting to note the manner in which the new regulations are received in different parts of the Dominion. In districts where the disease has prevailed to any considerable extent, and where horse owners realize its serious nature and the importance of stamping it out, the new order of things is heartily welcomed. On the other hand, in places where the people are comparatively unfamiliar with glanders, the new regulations are looked upon as unnecessarily severe, and people complain bitterly that their horses are being slaughtered without good and sufficient reason. The claim is

SESSIONAL PAPER No. 15a

made that our inspectors destroy more horses than the disease itself would ever be likely to kill, the argument being advanced that only a very limited number of horses die from glanders under ordinary conditions, and that the disease seldom or never becomes epizootic.

Facts, however, are entirely against this contention. The figures already quoted from the returns of the Board of Agriculture of Great Britain indicate that, under modern conditions, the disease, unless properly controlled, is certain to spread rapidly and to cause a constantly increasing loss in horseflesh.

As an illustration of this, I would quote from our own experience the case of one Canadian lumber company in a remote part of the country, which reported last year for the first time the existence of glanders among its horses. Inquiry elicited the fact that in less than four years upwards of fifty head of valuable horses, owned by this company, had died of glanders. Of thirty-six survivors, thirty-four reacted to mallein, and were destroyed. Of the two remaining, neither had been in contact with the diseased horses.

We have a number of similar cases on record, but it would scarcely be possible to furnish a better illustration of the evil results certain to follow carelessness or neglect in dealing with glanders.

In this connection I cannot refrain from quoting an extract from the *London Lancet* of July 5, 1905, which, in a review of the report of the Board of Agriculture, speaks as follows:—

‘Glanders is admittedly on the increase, and it is time that some radical measures were taken to control the disease. In 1894 there were only 502 outbreaks reported, but in 1904 these had increased to 1,539, and 2,658 horses were killed as glandered. More power ought certainly to be given to the veterinary inspectors to test the in-contact horses with mallein, as by this agent an almost infallible diagnosis can be made within 24, or at most, 48 hours. The expense, although great the first year, would not be excessive if allowed to spread over a period of years; and where a preventable disease, which also causes the deaths of numbers of human beings each year, is concerned, the cost ought certainly not to be considered too seriously as the reason why it should not be taken thoroughly in hand.’

It is gratifying to note that the British authorities are being urged to introduce the identical policy which we have already adopted in Canada.

While dealing with this phase of the subject, I would point out that if the adoption of our system is deemed necessary in a small country like Great Britain, where police and inspection work has been reduced to a science, there can be no doubt of the wisdom of its adoption in the Dominion of Canada, where the distances are magnified and the population, especially in some districts, sparse to a degree, although I am glad to say that the last named condition is being rapidly altered by the constant influx of desirable settlers who are coming from all parts of the world, but perhaps in greatest number from the western United States.

In this connection, I would say that while we do not think it necessary to test the human immigrants from that country, I think it altogether likely that we will be compelled, in the near future, to impose this precautionary restriction upon those of the equine species, as the records in our possession indicate that a considerable number of the outbreaks of glanders in western Canada are due to imported American horses, of which we have for a number of years back been absorbing from 25,000 to 30,000 per annum.

Having now indicated, perhaps at too great length, our present attitude in relation to glanders, I would like to lay before you, as briefly as possible, some of the facts brought to light in the course of our work, which have convinced us that in the war against glanders no quarter should be given to the typical reactor, whether he shows clinical symptoms or not.

8-9 EDWARD VII., A. 1909

I have already given you some figures as to the number of horses with which we have dealt during the last four years. In connection with what I am about to say, however, I would call your attention to the fact that up till August 31, 1906, we have tested 15,505 horses, and have actually made 18,177 mallein tests.

The marked disproportion between the number of horses tested and the number of tests made is attributable to the fact that from 1902 to 1904 we, as already stated, followed a retesting policy. It will, I think, be conceded that the number of tests made, each of which was carefully reported, is sufficient to furnish a reasonable basis for definite and intelligent opinions on the various points relative to mallein, its uses, effects and the conclusions which may reasonably be drawn therefrom.

While perhaps to some extent reversing the natural sequence of events, I propose to refer first to the danger inseparable from the keeping alive of ordinary non-clinical reactors. With regard to this point, I am not in a position to furnish any great amount of statistical information for the reason that from the very beginning of our present operations animals of this class falling into our hands have been, except in the case of a few which early became ceased retractors, so dealt with as to prevent the possibility of their coming into contact, direct or indirect, with healthy horses.

When engaged in private practice, however, I had an opportunity of forming an opinion on the subject, for although, after the use of mallein was adopted, which, with me, was in the year 1893, I invariably advised my clients to destroy all typical reactors, the law did not make their slaughter compulsory, and many were permitted to live. Not a few subsequent outbreaks of which I was cognizant were undoubtedly due to the retention and distribution of infection by these apparently healthy animals.

As a matter of fact, there has never been, at least among intelligent and single minded veterinarians, any great tendency to belief in the harmlessness of horses which continue to give typical reactions to mallein, even when they present no visible symptoms of glanders. The departmental committee appointed in 1901 by the Board of Agriculture of Great Britain for the purpose of conducting experimental investigations with regard to this and kindred subjects, reached the conclusion that these apparently healthy reactors are capable of transmitting glanders. The committee in question comprised the late Mr. A. C. Cope, Mr. Wm. Hunting, Sir John McFadyean and Dr. James McL. McCall, all men of high professional attainments and great experience in dealing with glanders. One of the points dwelt upon by them, viz., the suddenness with which a reactor may become clinically glandered, is worthy of special note. Our experience in Canada has demonstrated beyond question the danger arising from this liability of reactors to suddenly develop acute symptoms, and has shown further that a considerable proportion of these superficially healthy animals are in reality clinical cases.

As under our present regulations such horses are slaughtered, opportunities for post-mortem examinations have not been wanting, and in many cases showing absolutely no external symptoms, extensive ulcerations have been found high up in the nasal passages, while the presence in this situation of minute nodular lesions, undoubtedly specific, has been strikingly frequent. These discoveries bear out the opinion which I have long held and frequently expressed regarding the importance, from an infective point of view, of enlarged submaxillary glands in reacting animals. There is never smoke without fire, and these glands are not likely to show tumefaction without a definite pathological reason.

Leaving nasal lesions aside, it is well known that in typical reactors glanders nodules are invariably found in the lungs, and not unfrequently in other organs, although the tendency to localization in the lymph nodes, so common in bovine tuberculosis, is much less frequently noted in glanders.

Again, I would remind you of the days before mallein was heard of, when, in spite of all our efforts and precautions, case after case, and outbreak after outbreak, of glanders would occur in the same stable. After each fresh outbreak the most

SESSIONAL PAPER No. 15a

thorough disinfection was practised, and all the surviving horses subjected to careful scrutiny and continued close observation. Six months, or perhaps a year, would elapse and then another case or series of cases would occur. We blamed the stables, we thought the contagion, or, as we then called it, the virus, was immortal and indestructible. Now we know that, outside of the animal body, the life of the bacillus mallei is, under the most favourable conditions, limited to three or four months. In the animal body it is a different matter, and the cause of the mysterious recurrent outbreaks was the chronic latent case of glanders, then unrecognized, but now, through the agency of mallein, marked down and known as a reactor.

In tracing the origin of primary outbreaks in hitherto uninfected localities, we almost invariably find that the disease has been introduced not by a well marked case of glanders, but by a non-clinical contact horse, often a reactor, generally purchased by an unsuspecting farmer, ignorant of the fact that his new bargain has recently come from an infected district, and possibly from a badly infected stud.

Further evidence against the reactor will be incidentally adduced in the notes which I am about to lay before you regarding his close connection, the so-called ceased reactor.

Ceased reactors, so-called, should, in the light of our experience, be divided into three distinct classes:—

- 1 Those which, while not properly reacting to mallein, are, owing to a slight thermal rise or a septic infection, more or less serious at the point of injection, erroneously classed as reactors by the veterinarian making the test.

2. Actual ceased reactors, comparatively few in number, and almost invariably, in our experience, consisting of horses tested when in the incipient stages of glanders, or at any rate when but slightly affected, as evidenced by the fact that their original reactions, though typical, are not as well marked either thermally or locally, as those given by clinical cases or by these animals which, while perhaps not showing external symptoms, are suffering from the disease in an advanced form.

3. Those which having on one or more occasions definitely reacted, develop an acquired tolerance to the test, the latter being, however, of a temporary character, so that after the lapse of a varying period, generally from six to twelve months, a typical reaction again follows the injection of mallein.

The first-mentioned class are of but little importance, and demand no attention at our hands beyond a due consideration of the part they have already played, and doubtless will for some time continue to play, in prompting bootless discussion, and thus, to some extent, retarding the general adoption of mallein as an authoritative diagnostic agent.

The various causes which contribute to their being wrongly classified as reactors will, however, be shortly dealt with when we take up the question of reactions, typical and atypical.

The second class is naturally much more interesting, consisting as it does of horses which actually overcome the infection of glanders either through the action of mallein or by the efforts of nature unaided, or at least aided only by favourable physical conditions.

We have in Canada under supervision at present a considerable number of horses which have at one time or another, during the past four years, given a typical reaction to mallein, but which are now, so far as we can ascertain by periodical inspection and repeated testing, absolutely free from glanders. These animals, however, constitute a lamentably small proportion of the total number which reacted without showing clinical symptoms in the two years during which we followed the retesting system. Two years ago I stated that about 25 per cent of our non-clinical reactors had ceased to react, and were apparently free from glanders. At that time I expressed my great disappointment with the small return which this percentage gave for the risk and labour involved in carrying on the retests, and announced that

it was our intention to discontinue that method of dealing with glanders and adopt the plan which we are now following.

I am sorry to have to tell you that in classing all these horses as safely ceased reactors we were seriously in error. During the intervening period a considerable number of them have rejoined the reacting ranks, and have been condemned as diseased. There are still, however, a number which have continued to stand not only the mallein test, but the test of time. These give absolutely no indication of being other than healthy horses, and thus, so far as can be seen at present, there is no reason to doubt that, in a proportion of comparatively mild cases of glanders recovery may and does take place.

We have found, moreover, that while it is not by any means possible to tell at the first, or even the second, test which of the affected horses will eventually become permanent ceased reactors, we can at one or other of these stages make reasonably certain of those which will not do so.

Animals which, on being first tested, show a thermal rise exceeding 104° Fahrenheit, accompanied by a characteristic reaction, those which give a more pronounced reaction to a second or subsequent test than they do to the first, and those which suddenly cease to react without showing a gradual lowering of the temperature and a corresponding abatement of the local reaction are not likely to become permanent ceased reactors.

Sound pathological reasons can, I think, be advanced for the lack of improvement shown by the first and second classes, but I must confess that I have no mental theory to fit the case of those last mentioned.

Having now dealt with the supposititious ceased reactors and with those which appear to make an actual and permanent recovery, it becomes our duty to discuss those animals, and they are, in our experience, by far the most frequently encountered and, needless to say, the most dangerous, which acquire a temporary tolerance to mallein, but which again give a definite reaction when tested, after sufficient time has elapsed to nullify the effects of previous injections. In the report of the special committee appointed by the British Board of Agriculture, to which I have already referred, the records given indicate that all the ceased reactors dealt with in the experiments showed an abnormally high temperature when tested with mallein some time after they had apparently ceased to react. I considered this a very suspicious circumstance, and one which furnished food for serious thought. In order to discover, if possible, the reason for this peculiar phenomenon, I determined to again submit to the mallein test a number of horses which had been kept for varying periods under supervision as ceased reactors. The results are very interesting, as may be gathered from the following examples from the report of Dr. A. E. Moore, one of our most careful and capable officers, who was entrusted with the task of conducting the investigations. The pathological work was, of course, done by Dr. Higgins.

Results of post-mortem examinations conducted on ceased reactors which again reacted on being tested, after a period of not less than six months:

SESSIONAL PAPER No. 15a

Result of post-mortem of No. 304:—

Very few nodules scattered in the lungs, around some of these nodules a small quantity of lymph-like substance was seen, others encysted.

Jerry, Grey Gelding, aged, No. 307.

From 20 to 30 small nodules seen in the lungs from the size of a pea to small bean, several places in right lung showing cicatricial tissue, all the nodules were deep seated, mostly encysted, and followed the large bronchial tubes. Three guinea pigs inoculated and from one bacillus mallei was isolated in pure culture.

About ten very small nodules encysted, all deep seated in the lungs and near the bronchial tubes.

Two guinea pigs were inoculated 7-12-'04. They were still thrifty 8-6-'05, and had gained considerably in weight. They were chloroformed, no lesions found and cultures remained sterile.

8-9 EDWARD VII., A. 1909

About 15 very small nodules found in lungs, all deep seated, and following the main bronchial tubes, mostly encysted.

Three guinea pigs inoculated 7-12-'04. From one pure culture of bacillus mallei were obtained.

In all these autopsies there was noted the peculiar injected appearance of the lungs which is seen when a reacting animal is destroyed immediately after testing. In all but one of these five ceased reactors a pure culture of the bacillus mallei was obtained. In this case the lesions found were characteristic, and it is probable that the bacilli were present. Only two guinea pigs were used for this inoculation.

The following very striking record is that of a horse which has ceased to react no less than three times in the course of the last three years. This animal is still isolated under close supervision, and although performing ordinary farm work daily, is in the pink of condition, and, to all outward appearance, absolutely healthy.

King, Bay Gelding.

I append here three tables showing the different results obtained in testing, 1st. horses which have become permanent ceased reactors; 2nd, horses which after having once ceased to react, have again given a characteristic reaction to mallein after a period of from six months to 2 years; and 3rd, horses which have shown no improvement when tested at intervals of 30, 60 and 90 days, although never developing clinical symptoms.

Five guinea pigs were inoculated, and from the organs of one a pure culture of bacillus mallei was obtained.

12 Horses which did not show any improvement by injection of mallein at intervals of about 30, 60 and 90 days, although never developing any clinical symptoms.

SESSIONAL PAPER No. 15a

I do not think it necessary to make any extended comment on the facts brought to light by this series of retests. So far as the possibility of the latter reactions being due to reinfection is concerned, I would say that this danger was fully considered and guarded against. If reinfection occurred in any of these cases it was through one or other of the so-called ceased reactors, and not from any outside source.

I may add that while the work performed by Dr. Moore was the most systematic and thorough of any which we undertook on similar lines, the results obtained by him were corroborated by like retests conducted by other officers in various parts of the Dominion.

Further proof of the dangerous character of these horses, which, through an acquired tolerance to Mallein, are erroneously classed as ceased reactors, is, I am sorry to say, furnished by our own official records, several instances having occurred in which horses held under supervision for periods deemed sufficient to ensure safety, were permitted to mingle with healthy animals, with disastrous results.

Not the least remarkable feature of these cases is the fact that they seldom develop clinical symptoms themselves, although, beyond doubt, many of them are capable of transmitting infection to others.

This report has already exceeded a reasonable length, but I cannot well close without giving the consensus of opinion arrived at by our inspectors as to what constitutes an actual and typical Mallein reaction. Ability to differentiate with certainty, at least in the majority of cases, between typical and non-typical reactions, is, for obvious reasons, perhaps the most important factor in the use of Mallein.

We are fortunate in having on our inspection staff a number of careful and closely observant men, and the results of their experience have been condensed as follows:

In horses affected with glanders from the 4th to the 15th hour after the injection of the usual dose of reliable mallein a distinct rise of temperature takes place, except in certain cases which will be specially mentioned later. The temperature gradually rises until the 14th or 15th hour after injection, when, after remaining at about the same height for a longer or shorter period, it gradually declines, the downward course being not unfrequently preceded by a slight secondary elevation.

This thermal disturbance should, under ordinary circumstances, indicate a rise of at least 2.5 degrees Fahrenheit over the highest control temperature taken before injection. The wide variation in normal temperature shown by the equine species, especially in Western America, demands the application to this rule of certain definite limitations. For instance, if invariably followed, a horse having a pre-injection temperature of, say, 99°, would be condemned at 101.5°, which might be well within his normal range. On the other hand, an animal with a pre-injection temperature of 102°, which is not at all strikingly abnormal in the west, would be allowed to reach without condemnation 104.4°, a point entirely outside of the normal range.

Other things being equal, 103° Fahrenheit would appear to indicate the danger line, but no fixed rule can possibly be adopted, close observation and sound judgment in the operator being of more importance than hard and fast ruling.

The thermal rise is accompanied, or rather followed, by a hard, tense and exceedingly painful swelling at the point of injection. This swelling is usually circular, and shows a tendency to increase from the eighth hour after injection, at the same time becoming more painful, affecting the muscles and causing marked lameness in the forelimb of the side on which the injection was made. It is often accompanied by swelling of the surrounding lymphatics, which also become intensely painful.

The local reaction does not, as a rule, entirely disappear for several days.

Besides the thermal and local reactions mallein produces well marked constitutional effects on animals suffering from glanders. The pulse and respiration are increased, rigors are frequent, sometimes slight, but occasionally violent, and continuing throughout the whole reaction. There is great depression, while loss of appetite, staring coat and disinclination to move are also commonly noted.

8-9 EDWARD VII., A. 1909

In clinical cases reaction is, as a rule, early and well marked, and most of our inspectors agree that the severity of the reaction is in direct ratio to the degree of infection or the stage which the disease has reached. Clinical symptoms not unfrequently make their first appearance during the test, generally from 24 to 30 hours after injection. In advanced cases they may persist, the animal rapidly breaking down, while in incipient cases they may gradually recede, the animal regaining a normal and comparatively healthy appearance. Clinical symptoms already evident are almost invariably aggravated by the test. One especially noteworthy feature is that in animals showing only a slight enlargement of the submaxillary lymphatic glands, these will become tense, swollen and painful as the test progresses. This also applies to other enlarged nodes. Dr. Moore describes one case in which both inguinal glands, slightly enlarged before the test, became, during its progress, so much swollen and so painful that the animal could scarcely walk. Post-mortem revealed specific lesions in both glands.

Occasionally all evidences of reaction are present, except the thermal rise, while in others the opposite is the case, and it may be noted that these eccentricities are not unfrequently shown by all the horses tested in certain outbreaks, and further that they persist throughout repeated tests of the same animals, although, under ordinary conditions, the local reaction has a tendency to become less well marked with each succeeding test.

In animals in the last stages of glanders, old horses, young foals and others of inferior vitality, a lowering of temperature not unfrequently follows the injection of Mallein. This is especially noticeable in advanced cases where the temperature is high at the time of injection. In actual outbreaks, contact horses, even when showing no clinical symptoms, but having a high initial temperature, dropping or remaining stationary after injection, should be condemned, especially when a local reaction occurs.

In fact it may be laid down as a general rule that a typical local reaction is proof positive of the existence of glanders, even when no thermal disturbance takes place.

There is not, as a rule, much difficulty in distinguishing between a typical and a non-typical reaction. The former has been already described. In the latter the thermal rise seldom exceeds 2° , and reaches its greatest height at or before the 12th hour, returning to normal before the 20th hour.

The swelling, when circular, rarely exceeds three inches in diameter. It is only slightly painful, is quite superficial, soft and moveable, does not increase after the 8th hour, and is rapidly absorbed during the course of the second day. It never affects the action of the muscles, nor does it cause lameness. Sometimes a fluctuating dependent swelling of considerable size follows a careless or unskillful injection, but this, as a rule, is absorbed rapidly during the first 24 hours.

With ordinary precautions septic infection seldom takes place, and abscess formation is rare except in typical reactions, when it is not uncommon. Occasionally considerable swelling, sometimes accompanied by a thermal rise, will occur in horses suffering from influenza and similar affections. Such so-called reactions are not typical, and should not be ascribed to the action of mallein, but to the already existing febrile condition of the animal.

Cases sometimes occur in which, at the end of 24 hours after injection, neither thermal nor local conditions are sufficiently definite to enable the veterinarian to reach a decision. In these circumstances the animal should be kept under close observation for a further period of 24 hours, when, if it is diseased, the increased swelling and marked lameness which almost invariably follow will remove any possible doubt. Suspected cases which have failed to give a decided reaction will not unfrequently develop clinical symptoms if put to hard work immediately after being tested.

SESSIONAL PAPER No. 15a

Reaction, both thermal and local, but especially the latter, is not as well marked in mules as in horses, but as in the former acute symptoms are more likely to develop early in the course of the disease, the risk from latent cases is less serious.

It may be laid down as a general rule that while an apparent improvement in health and condition may, and frequently does, follow the application of the test in mild or incipient cases, the effects of mallein on animals in advanced stages of the disease are invariably bad, and that the testing of such cases hastens a fatal termination.

Local reactions are more pronounced in hot weather than when the atmospheric conditions are moderate. In connection with this statement I would call attention to the fact that under temperate weather conditions, as, for instance, on the Pacific slope, the prevailing type of glanders, while decidedly infectious, is much milder than that seen in most other parts of the country.

Sudden changes of weather seem to favour the development of acute cases, while under steady heat or cold the disease frequently remains dormant. For this reason serious outbreaks are with us more common in spring and fall than in the steady weather of winter and summer.

I am aware that my conclusions as to what constitutes a typical reaction to mallein differ somewhat from those arrived at by the Eighth International Veterinary Congress held at Budapest last year. I have, however, been guided entirely by the results of our own work, and as these are most convincing, I am inclined to attribute the variation, which is, after all, more apparent than real, to a possible difference in conditions between Europe and America.

I need hardly point out that, in order to secure satisfactory results, the conditions surrounding the animals should be normal while the test is being conducted. The administration of water, and even of food, the regulation of body heat and of ventilation, must all be carefully watched, in view of their relation to thermal change. For the same reason no exercise whatever should be permitted while the test is being carried on.

In conclusion I would say that the operations which we have conducted, and their results, have shown in the most convincing manner the great value of Mallein as a diagnostic agent when intelligently used by careful and experienced veterinarians. The expressed views of our inspectors on this point indicate that it can be absolutely relied upon in about 98 per cent. of the animals submitted to its action.

I take this opportunity of expressing my sense of obligation to those Inspectors whose comprehensive reports have rendered it possible for me to thus summarize the results of our work.

I would add that on the occasion of the last annual meeting of the American Veterinary Medical Association, which was held in New Haven, Connecticut, in August of this year, I laid before that body the facts set forth in this report, with the result that the following resolution was unanimously passed by the Association:

'Whereas, in the presentation of Canadian state control work with Glanders by Veterinary Director-General Dr. J. G. Rutherford, it is apparent that the Canadian Government has undertaken control work with infectious disease of animals upon a scale that is highly creditable and in a way commensurate with the importance of the work, and

'Whereas, actual results shown in this report plainly justify the heavy expenditures incurred; therefore be it

'Resolved, That we commend those in higher Canadian Government authority for thus generously supporting this work, and commend the general organization and plan of the Canadian work to the consideration of the Federal authorities and to our various state authorities in so far as it may be applicable to their conditions and not already in force.'

8-9 EDWARD VII., A. 1909

This hearty endorsation of our policy by the leading veterinarians of this continent is very gratifying, especially when considered along with the movement now on foot in Great Britain to bring about the adoption of measures similar to those in force here.

I have the honour to be, sir,
Your obedient servant,

J. G. RUTHERFORD,
*Veterinary Director-General and Live
Stock Commissioner.*

The Honourable, The Minister of Agriculture.

THE COMMERCIAL LIVE STOCK INDUSTRY IN WESTERN CANADA.

March 31, 1908.

SIR,—Early in the month of June, 1907, acting under your instructions I attended the annual meeting of the Central Alberta Stock Growers' Association. I listened to the various discussions that took place and learned much regarding the conditions under which ranching is carried on in Central Alberta. I also had an opportunity of meeting many of the ranchers, as well as a number of prominent cattlemen, some of whom represented large dealing concerns in Canada and the United States.

BRITISH COLUMBIA MEAT MARKET.

Returning from Erskine to Calgary, I proceeded direct to Vancouver to investigate the source of the imported meat supply of British Columbia. I interviewed your representative, Dr. S. F. Tolmie, and also met a number of inspectors connected with the Health of Animals Branch, all of whom gave me what assistance they could in obtaining information.

With regard to the importation of Australian meat, I found that there had been imported between the 1st of January and the 14th of June, 1907, 774,104 lbs. of mutton and 4,022 lbs. of veal. The mutton carcasses would average from 60 to 75 lbs., and the cost laid down in Vancouver was about 7½ cents to 8 cents per lb. It was of fairly good quality and apparently gave good satisfaction to consumers. It was not all used in British Columbia as a considerable quantity of it found its way into Alberta. The importations of Australian mutton are made during the winter months. One firm does all the importing as it controls all space on the Canadian Pacific Railway boats.

From the United States the importation returns for 1908 up to the 16th of June show:—

To Victoria, 7,026 sheep; to New Westminster and Vancouver, 4,390 sheep and 74 cattle; via Gateway, Kingsgate, Midway, Grand Forks and North Portal, 456 cattle and 134 calves.

The above figures may include a number of animals imported by settlers. From Alberta, for the first six months of the current year, the reports, as far as I have been able to obtain them, show the shipments of cattle to have been 6,989 head. In addition to this, there were large shipments of dressed beef, pork, &c., from Alberta to British Columbia, but of this I was unable to obtain statistics.

I also obtained some information as to the importation of horses, &c., for the first six months of the current year, as follows:—

From United States to Victoria, 116 horses; from the United States to New Westminster and Vancouver, 340 horses, 4 mules, 24 goats, 1 swine, pure bred.

SESSIONAL PAPER No. 15a

Via Gateway, Kingsgate, 288 horses; Midway, Grand Forks, 19 mules; North Portal, 2 hogs, pure bred; from Alberta, 288 horses.

LOCAL WESTERN MARKETS.

During the month of July conditions of the local markets were investigated. I spent some time in Winnipeg stock yards and visited Brandon, Regina, Moosejaw, and some of the other small towns in order to learn if possible from whence the local meat supplies were derived. All the above towns obtained practically their total supply of fresh meat from the farmers in the district immediately surrounding them. Moosejaw, however, was importing considerable dressed meat in refrigerator cars from the Winnipeg abattoirs.

WINNIPEG HOG MARKET.

In Winnipeg I found that the average price for live hogs from January 1 to July 25, weighed off cars was $7\frac{1}{2}$ cents. Eighty-five per cent of the hogs received were from Manitoba points, the remainder from Saskatchewan and Alberta with a very few from Ontario. The packers reported that farmers had been marketing great numbers of brood sows, which movement was doubtless occasioned by the high price offered and the general scarcity of money. During 1906 the J. Y. Griffin Co. imported 3,000,000 lbs. of pork products from the United States, upon which they paid \$60,000 in duty. They imported about the same quantity from Ontario, and doubtless the Gordon Ironsides and Fares Co. imported about the same quantity. This shows the splendid market which is still open to the farmers in the western provinces in supplying this demand.

HORSE MARKET.

The market for horses for both farm work and railway construction was exceedingly active up to July, when it became quiet and dealers do not look for an early arrival. The stock yards returns show receipts of horses from the south and east for the first six months of the year, of 19,843 head. In addition there were probably 600 to 700 horses picked up from Manitoba farms at about \$200 a piece to the farmers. Most of these horses were disposed of in Saskatchewan and Alberta, a few going to British Columbia—about 75 per cent for settlers and railway work and the remainder for city draying purposes. Prices run about as follows:—

For teams averaging 2,800 lbs., \$400 to \$550 per team; for teams averaging 3,200 lbs., \$650 to \$900 per team; express horses from 1,200 to 1,300 lbs., \$225 to \$300 per head.

There has been a good demand for carriage horses and one shipper from Iowa brought in two carloads which sold at an average of about \$600. Ontario shipments are usually fed and watered at North Bay and Schreiber. Toronto and Montreal freight for ordinary stock cars are $58\frac{1}{2}$ cents per 100 lbs.; palace cars, $87\frac{1}{2}$ cents per 100 lbs. Dealers usually figure for freight and expenses, \$10 to \$12 a head.

WINNIPEG CATTLE MARKET.

The average price for cattle from January to July on the Winnipeg market was $4\frac{1}{2}$ to $5\frac{1}{2}$ cents. On July 25 I saw a train load of western export steers weighed at Winnipeg stock yards. These cattle were said to be from P. Burns & Co., Calgary, and sold to Gordon, Ironsides & Fares, at 5 cents, Winnipeg weights. They were fed hay during the past winter and arrived in Winnipeg in fair condition, the 349 head, weighing 470,770, an average of 1,350 lbs. per head. They were billed through from Calgary to Montreal with stop-over privileges at Winnipeg to cull out. The through rate was 85 cents per 100 lbs. from Calgary to Montreal and 45 cents per 100 lbs. from Calgary to Winnipeg.

8-9 EDWARD VII., A. 1909

MOVEMENT OF RANGE CATTLE.

The range cattle began to move to market about a month later than usual owing to the severe winter and the backwardness of the spring. The first shipments were made in the latter part of August. On the 19th of that month I arrived at Moosejaw and saw a train load of cattle unloaded there. They had been shipped from Carstairs on Friday night the 17th, arriving at Moosejaw on Sunday morning, there they were fed and watered, and reloaded at 4 p.m., leaving that evening at 7.30 and arriving in Winnipeg at 10 p.m. on Monday night, taking 72 hours, with the Moosejaw stop-over included, to make the trip. These cattle were a mixed lot of butchers and exporters (the latter would average about 1,350 lbs.), consigned to J. Y. Griffin & Co. The price weighed off cars at Winnipeg was about 4½ cents. These cattle arrived at Winnipeg in fair condition, much better than another lot of cattle I saw unloaded there on the same day that came through without feeding at Moosejaw. I also saw two train loads of cattle that came through from Calgary to Winnipeg without feeding at Moosejaw. I learned that they made the run in 48 hours. The shipper being anxious to get them east to catch a certain boat, they were run through without feeding at Moosejaw.

The custom of dealers is to buy at a given price per pound weighed off cars in Winnipeg, consequently it is to their advantage to bring cattle through without feeding at Moosejaw. It is also to the advantage of the C.P.R., as it saves them the expense and delay of holding over the trains. For cattle for immediate slaughter it appears no detriment, as of course they will not shrink in dressed weight. It does, however, appear to be a hardship on the rancher who sells under such conditions, as the cattle shrink from 100 to 150 lbs. from the time they are loaded until they arrive in Winnipeg, and it is a hardship on the cattle as they are frequently held on board the cars from 40 to 70 hours making the run. This, in addition to the fact that they are frequently held on bare ground in the neighbourhood of the loading platforms for many hours waiting for cars and to be unloaded, makes a long period without feed and water. Shippers all agree that the principal shrinkage in range cattle takes place between the point of shipment and Winnipeg. After resting and feeding at Winnipeg the cattle generally do not shrink much more.

It must be remembered that these range cattle are very wild and every time they are handled in and out of the cars and yards they bruise themselves and knock themselves about badly, so that considering all things it is difficult to lay down any hard and fast rule that might be applied. For instance if they were well watered and fed immediately before loading and got a good run through from loading point to Winnipeg, say 35 or 40 hours, it might be better for all concerned, including the cattle, not to be unloaded until they arrive in Winnipeg yards, where they will generally settle down and feed better than they will if unloaded before they are thoroughly hungry.

MOOSEJAW YARDS.

I examined the Moosejaw Yards and found them well constructed and supplied with good water and fairly good hay. The yards are leased from the railway company to the Moosejaw Brewing Co., at rates for the different seasons as follows:—

For months of July, August and September:—

Hay for lots of ten cars or more, \$12. per ton or 20 cents per head.

In smaller lots 22 cents per head or \$14. per ton for 1 feed.

Each individual yard \$4.50, well-hayed and watered.

For October, November and December:—

In lots of 10 cars of cattle or more, hay \$13.50 per ton or 22 cents per head.

In smaller lots 25 cents per head or \$15. per ton for 1 feed.

Each individual yard \$5.00 well hayed and watered.

SESSIONAL PAPER No. 15a

For January, February, March, April, May and June:—

Loose hay \$16. per ton, baled \$20. per ton.

The company agrees to keep one man at the Stock Yards continually and when reasonable notice is given they have sufficient help on hand to assist in taking care of all stock passing through.

CANADIAN CATTLE SHIPMENT TO THE UNITED STATES.

I was in Moosejaw again on September 11th and inspected the loading of a train of 21 cars that were going through from the Red Deer country billed to Chicago. They were a mixed lot of steers 3 or 4 years old and cows. These cattle paid the duty of 27½ per cent on an appraisement per head as follows:—cows \$20; 3 year old steers \$30; and 4 year old steers \$40.

| | | | | | | |
|---------------------|-----------|---------|-------|----------|---------|----------|
| 17 steers averaging | 1396 lbs. | brought | \$610 | grossing | \$85.18 | per head |
| 21 | " | 1374 | " | 5.50 | " | 75.57 |
| 122 | " | 1245 | " | 5.30 | " | 66.00 |
| 66 | " | 1159 | " | 4.60 | " | 53.34 |

Cows medium weights grossed \$40 to \$60 per head.

I next proceeded to Strathmore and saw a shipment of cattle loaded for Chicago. They were a select lot of Hereford grades, and very uniform. The lot included 360, 3 and 4 year olds, and were American cattle that had been on Canadian grass for less than 2 years, and consequently were entitled to re-enter the States duty free—I afterwards learned that they were sold as follows:—

360 head, averaging 1,233 lbs., brought \$5.75.

7 head (the tail enders) brought \$4.40.

Later in the season (early in November) I had an opportunity of seeing a shipment of Alberta cattle unloaded in the Chicago yards. This particular lot were shipped by C. J. Reed and C. Gissenger from Red Deer, which point they left on Saturday, October 26. They were fed and watered at Moosejaw for 24 hours; at Velva, N.D., 16 hours at St. Paul, 24 hours; arriving in Chicago, November 4th, making the trip in 9½ days. The shippers were well satisfied with the run and the accommodation en route, but complained that they were obliged to hold the cattle for a week after ordering the cars before they could ship, and further that they had to use a large number of box cars. The freight from Red Deer to Chicago is 83 cents per 100 lbs. This consignment was of a very mixed lot of two, three and four year old steers, and cows, upon all of which duty had to be paid.

| | | | | | | |
|---------------------|-----------|---------|---------|----------|---------|----------|
| 13 steers averaging | 1327 lbs. | brought | \$5.55, | grossing | \$69.66 | per head |
| 20 | " | 1405 | " | 5.10 | " | 71.65 |

Steers of other grades sold down from \$4.35 to \$4 per head, while cows sold at from \$3.90 to \$3 per head.

At this time the market was very bad. The shippers claim that they lost heavily on this shipment.

I also saw another shipment made by the Cresswell Cattle Co. from Swift Current, from which point the freight was 71 cents per 100 lbs. This bunch of cattle was not in good shape. The tops only brought \$4.65; the next grade \$4.05 with cows selling from \$3.60 to \$2.80. They entered the United States free of duty.

WHITE RIVER YARDS.

Acting under instructions I left Winnipeg on October 10 for White River. While there a train load of cattle were unloaded and fed. These cattle had left Lethbridge on October 9, at 4.30 p.m. They were fed and watered at Moosejaw and arrived in Winnipeg on the 12th at 1.30 p.m., arriving at White River at 3 p.m. on the 14th, leaving again at 9 p.m. the same day for Montreal where they arrived at

6 p.m. They were again shipped from Montreal at 11 a.m. on the 17th for Boston, making the trip from Lethbridge to Montreal in about 7 days. The short stop at White river did not allow the cattle much time to feed but a liberal supply of hay was put in the cars. This particular consignment was being rushed through to catch a boat. The man in charge reported some delay between Winnipeg and White river, but made no complaint regarding other portions of the trip. The yards at White river were in first class order and very conveniently arranged for handling large numbers of cattle. They were charging \$24 a ton for hay at that time.

EARLY WINTER CONDITIONS OF ALBERTA CATTLE.

Early in the month of January, 1908, I made a careful investigation of the live stock conditions throughout Alberta, inquiring into the live stock and range conditions. Up to the time of my visit, the winter had been very mild and favourable, I found that a very large number, probably twelve or fifteen thousand head of cattle were being hay fed during the winter, and they were reported doing remarkably well under the favourable weather conditions.

In order to see some cattle that were being fed, I went out on the Stettler Branch to Alix, and from there drove out 6 miles to Mr. Wm. Graft's where 190 head were being fed. As the method followed by Mr. Graft is very similar to that in vogue throughout Central Alberta, I shall describe it. A small lake surrounded with steep, partly wooded banks provides abundant water and some shelter. The feed which consists chiefly of hay is drawn direct from the stack and scattered on the ground, along the banks of this little lake. In addition to hay an allowance is given of one sheaf and a half of green cut oats per head per day. The cattle were three and four year old range steers selected from the surrounding district. They were, when I saw them, in fine thrifty condition, and should make early exporters. The intention of the feeders was to ship them early off grass, if they continued to thrive. At the time of my visit buyers were offering to contract for spring delivery at the rate of 4½ cents for hay fed cattle, and 4¾ cents for grain fed cattle, but there were not many 'takers' at these prices.

Owing to the favourable winter and the good quality and abundance of feed, there is no doubt that Alberta cattle will be shipped early and in better condition than during the year previous. This, however, may to a corresponding extent reduce the fall shipments.

Shipments have continued from Alberta throughout the winter up to the present time. During the month of January, from 1,400 to 1,500 head were shipped to the Winnipeg market, about 1,100 of which were forwarded as exports. The remainder can be classed as 'butchers' being mixed lots of cows and heifers. Butchers' cattle are bringing on the Winnipeg market from 3 to 3¾ cents per lb.

ALBERTA CATTLE SHIPMENTS FOR 1907.

The total shipments east off the Alberta ranges during 1907 amounted to 80,043 head, the following tables show the disposal of same:—

Shipped east via C.P.R.:—

| | |
|--|--------|
| Exports. | 40,000 |
| Stockers | 4,000 |
| Butchers (slaughtered in Winnipeg) | 27,321 |
| | <hr/> |
| | 71,321 |

To Chicago via C.P.R.:—

| | |
|---------------------|-------|
| Duty paid | 2,158 |
| Duty free | 2,591 |

SESSIONAL PAPER No. 15a

To Chicago via Great Northern:—

| | |
|---------------------|--------|
| Duty paid | 2,733 |
| Duty free | 1,240 |
| Total | 80,043 |

HOGS.

A considerable number of hogs are now being shipped from farms in Central Alberta, and from interviews with a good many settlers, I gathered that this was a profitable industry, and with increased facilities, for obtaining cheap feed it is likely to grow into a very important branch of the live stock industry. While I was at Lacombe two car loads were shipped to British Columbia the price paid to farmers being 4 to 4½ cents.

THE SHEEP INDUSTRY.

The very heavy blow sustained by the sheep ranches during the severe winter of 1906-07 has, to a large extent, paralyzed this industry. During the two previous winters, a considerable number of sheep were fed at Moosejaw and Port Arthur on wheat screenings. Little feeding however is being done this winter. On my way west I saw a small bunch of about 300 being fed near Moose Jaw. They were Merino grades of rather indifferent quality but when seen on my return 2 weeks later had improved wonderfully. The method of feeding is very inexpensive, large, cheaply constructed sheds are built in a sheltered location, under a steep bank near a creek, where water is available. In these sheds self feeding pens are placed in which the screenings are dumped and to which the sheep had access at all times. In addition to the screenings hay is fed. The sheep made excellent gains at comparatively little expense and command the top market price.
