RECOMMENDED CITATION

Geological Survey of Canada, 2017. Reconnaissance surficial geology, Tulemalu Lake, Nunavut, NTS 65-J; Geological Survey of Canada, Canadian Geoscience Map 325 (preliminary, Surficial Data Model v. 2.3 conversion of Map 37-1989), scale 1:125 000.
<https://doi.org/10.4095/305967>

ABSTRACT

This new surficial geology map product represents the conversion of Map 37-1989 and its legend, using the Geological Survey of Canada's Surficial Data Model (SDM version 2.3) which can be found in Open File 8236. All geoscience knowledge and information from Map 37-1989 that conformed to the current SDM were maintained during the conversion process. Additional material such as marginal notes or figures which exist on the original map, are not included here. Supplementary, limited legacy information was added to complement the converted geoscience data. This consists of glacial striations from Lee (1959) and Wright (1967). It is identified in the accompanying geodatabase. The purpose of converting legacy map data to a common science language and common legend is to enable and facilitate the efficient digital compilation, interpretation, management and dissemination of geologic map information in a structured and consistent manner. This provides an effective knowledge management tool designed around a geodatabase which can expand following the type of information to appear on new surficial geology maps.

RÉSUMÉ

Ce nouveau produit dérivé de la carte de formations superficielles 37-1989 a été produit avec le Modèle de données des formations superficielles (MDFS version 2.3) de la Commission géologique du Canada qui a été publié sous forme de dossier public 8236. La connaissance et toutes les données de la carte 37-1989 se retrouvant dans le MDFS ont été maintenues pendant le processus de conversion. Des éléments supplémentaires tels que les notes marginales ou les figures sur la carte originale, ne sont pas incluses ici. Des données complémentaires limitées ont été ajoutées pour compléter les données géoscientifiques converties. Ce sont des stries glaciaires de Lee (1959) et Wright (1967). Elles sont identifiées dans la base de données géospatiales. Le but de convertir les cartes publiées antérieurement en langage scientifique commun et en légende commune est de permettre et faciliter la compilation, l'interprétation, la gestion et la diffusion numériques efficace d'information de cartes géologiques de façon structurée et cohérente. Cette base de données géospatiales est un outil de gestion qui pourra évoluer suivant le type d'information à paraître sur les nouvelles cartes des formations superficielles.

SHEET 1 OF 1, RECONNAISSANCE SURFICIAL GEOLOGY

GENERAL INFORMATION

Author: Geological Survey of Canada

Geology by J.M. Aylsworth and M.D. Clarke, based on airphoto interpretation. Striation measurements by J.G. Fyles, R.C Shields, and J.A. Fraser, 1954.

Geology conforms to Surficial Data Model v. 2.3

Data conversion by D.E. Kerr, 2012, 2015, 2016

Geomatics by A. Noad and J. Kingsley

Cartography by E. Everett

Initiative of the Geological Survey of Canada, conducted under the auspices of Natural Resources Canada's Geo-mapping for Energy and Minerals (GEM) Program.

Map projection Universal Transverse Mercator, zone 14.
North American Datum 1983

Base map at the scale of 1:250 000 from Natural Resources Canada, with modifications.

Elevations in metres above mean sea level

Mean magnetic declination 2017, 2°10'E, decreasing 6' annually. Readings vary from 0°38'E in the NE corner to 3°35'E in the SW corner of the map.

This map is not to be used for navigational purposes.

The Geological Survey of Canada welcomes corrections or additional information from users.

Data may include additional observations not portrayed on this map. See map info document accompanying the downloaded data for more information about this publication.

This publication is available for free download through GEOSCAN (<http://geoscan.nrcan.gc.ca/>).

This publication has been scientifically reviewed, but it has not undergone a formal edit.

MAP VIEWING FILES

The published map is distributed as a Portable Document File (PDF), and may contain a subset of the overall geological data for legibility reasons at the publication scale.

COORDINATE SYSTEM

Projection: Universal Transverse Mercator

Units: metres

Zone: 14

Horizontal Datum: NAD83

Vertical Datum: mean sea level

BOUNDING COORDINATES

Western longitude: 100°00'00"W

Eastern longitude: 98°00'00"W

Northern latitude: 63°00'00"N

Southern latitude: 62°00'00"N

SOFTWARE VERSION

Data has been originally compiled and formatted for use with ArcGIS™ desktop version 10.2.2 developed by ESRI®.

DATA MODEL INFORMATION

Surficial

The Geological Survey of Canada (GSC) through the Geo-mapping for Energy and Minerals Program (GEM) has undertaken the Geological Map Flow to develop protocols for the collection, management (compilation, interpretation), and dissemination of

surficial and bedrock geology data and map information. To this end, a data model has been created.

The Surficial Data Model (SDM) was designed using ESRI geodatabase architecture. The XML workspace document provided can be imported into a geodatabase, and the geodatabase will then be populated with the feature datasets, feature classes, tables, relationship classes, subtypes, and domains.

Shapefile and table (.dbf) versions of the data are included within the data. Column names have been simplified and the text values have been maintained within the shapefile attributes. The direction columns are numerical, to display rotation for points, and the symbol fields will hold the correct values to be matched to the appropriate style file.

For a more in depth description of the data model please refer to the official publication:
