

RURAL MUNICIPALITY OF STONEHENGE NO-73, SASKATCHEWAN

FIGURE 1

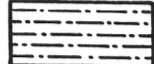

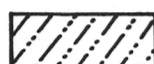

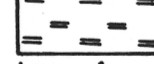

Map showing the surface and bedrock geology as it affects the supply of ground water, and areas in which the ground water occurs

FIGURE 2

Map showing the drainage and relief, and the location and types of wells with source of ground water supply

-  Recent stream deposits in which small supplies of water can be obtained within 15 feet of the surface
-  Glacial outwash sands and gravels in which ample supplies of water can be obtained at depths of 10 to 30 feet
-  Glacial lake clay in which little water can be obtained. Water is obtained from scattered sand or gravel beds at the contact of the lake clay and the underlying glacial drift or from the bedrock
-  Area of knolls and depressions in glacial drift (moraine) in which water is found in pockets of sands and gravels at depths of 10 to 100 feet
-  Glacial till or boulder clay (till plain) in which water is obtained from isolated pockets of sands and gravels at depths of 10 to 100 feet
-  Area in which the Ravenscrag formation immediately underlies the glacial drift
-  Area in which the Eastend formation immediately underlies the glacial drift

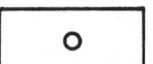

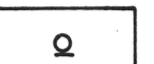

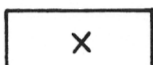

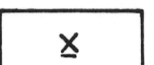

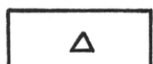

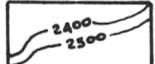

NOTE:

Areas in which only glacial drift symbols are shown are underlain by the Bearpaw formation

 Approximate geological boundary

 Outcrop of bedrock

 Coal pits

-  Well class 1
In drift In bedrock
-  Flowing wells (These are usually designated as Flowing Artesian wells)
-  Well class 2
In drift In bedrock
-  Wells in which the water is under pressure but does not rise to the surface (These are usually designated as Non-Artesian wells)
-  Well class 2
In drift In bedrock
-  Wells in which the water does not rise above the water table (These are usually designated as Non-Artesian wells)
-  Dry holes
In drift In bedrock
- 
-  Contours (interval 100 feet)
